Introduction

This document describes installation of the Default Cache database (DB).

Problem

After a failed installion attempt or a manual deletion of an installation from the windows file system, you might still have the Repository service or the server's service entry present in the Windows Service Manager.

It is recommended to remove these before you attempt the next install, in order to avoid superfluous entries or potential confusion for the next installation attempt.

Solution

Open a CMD session and run;

This removes the service entry.
