Cisco has more than 200 offices worldwide. Addresses, phone numbers, and fax numbers are listed on the Cisco website at www.cisco.com/go/offices.

Abstract

The Cisco Container Platform 5.0.0 API Guide gives information on Cisco Container Platform APIs and development features.

THE SPECIFICATIONS AND INFORMATION REGARDING THE PRODUCTS IN THIS MANUAL ARE SUBJECT TO CHANGE WITHOUT NOTICE. ALL STATEMENTS, INFORMATION, AND RECOMMENDATIONS IN THIS MANUAL ARE BELIEVED TO BE ACCURATE BUT ARE PRESENTED WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED. USERS MUST TAKE FULL RESPONSIBILITY FOR THEIR APPLICATION OF ANY PRODUCTS.

THE SOFTWARE LICENSE AND LIMITED WARRANTY FOR THE ACCOMPANYING PRODUCT ARE SET FORTH IN THE INFORMATION PACKET THAT SHIPPED WITH THE PRODUCT AND ARE INCORPORATED HEREIN BY THIS REFERENCE. IF YOU ARE UNABLE TO LOCATE THE SOFTWARE LICENSE OR LIMITED WARRANTY, CONTACT YOUR CISCO REPRESENTATIVE FOR A COPY.

1 Overview

Cisco Container Platform API provides REST API as a language-agnostic programmatic interface for applications to send requests to a Cisco Container Platform deployment.

An API conforms to the RESTful conventions and is defined by using resource and methods. A resource is a collection of information that is identified by a Uniform Resource Identifier (URI). For example, `providerclientconfig` is a resource that is used to represent configuration information to connect to an infrastructure provider such as vCenter. Methods are HTTP methods that are exposed for a resource. The commonly used HTTP methods are POST, GET, PATCH, PUT and DELETE.

2 Accessing Cisco Container Platform API

You can access the Cisco Container Platform APIs using the following URL:
`https://<CCP IP>/2/swaggerapi`

Where, `<CCP IP>` is the virtual IP address that you provided during the installation of Cisco Container Platform. It is the Ingress Controller LoadBalancer IP address.

3 Key Concepts

3.1 Provider Client Configuration

Cisco Container Platform connects to infrastructure providers such as vCenter to create and manage Virtual Machines that are used for Kubernetes Clusters. The configuration information to connect to the infrastructure provider is represented by a `providerclientconfig` resource.

3.2 Cluster

Cisco Container Platform automates the creation and lifecycle operations for Kubernetes Clusters. Each Kubernetes Cluster corresponds to a cluster resource type in Cisco Container Platform. It is identified by name for GET methods allowing you to poll the status of a Kubernetes cluster before its creation is complete. All other methods on a cluster object identify the cluster by its UUID in the URI.

3.3 User Management and Authorization

3.3.1 LDAP and Local Users

Cisco Container Platform supports Active Directory users and local users. Active directory configuration and authorization correspond to the ldap resource type in Cisco Container Platform. Local User management and authorizations correspond to the localusers resource type.

3.4 Subnets and Virtual IP Address Pools

Cisco Container Platform enables you to select an existing network, create a subnet in that network, and then create a Cisco Container Platform Virtual IP Address (VIP) pool within that subnet.

VIP pools are reserved ranges of IP addresses that are assigned as virtual IP addresses within the Cisco Container Platform clusters. Subnets correspond to network_service/subnets resource and VIP pools are a sub-resource of subnets of the type pools.

4 Examples of API Use Cases for vSphere v2 Clusters

4.1 Creating vSphere Tenant Clusters

Before you Begin

Ensure that curl and jq are installed on your client machine.

Procedure

1. Export Cisco Container Platform Virtual IP to the MGMT_HOST environment variable.

Command

```
export MGMT_HOST=<Control Plane VIP>
```

Example

```
export MGMT_HOST=10.20.30.40
```

2. Obtain a cookie using the username and password for your Cisco Container Platform instance.

Command

```
curl -k -c cookie.txt -H "Content-Type:application/x-www-form-urlencoded" -d 'username=admin&password=<Password from the installer>' https://$MGMT_HOST/2/system/login/
```

Example

```
curl -k -c cookie.txt -H "Content-Type:application/x-www-form-urlencoded" -d 'username=admin&password=<Password from the installer>' https://$MGMT_HOST/2/system/login/
```

3. Get list of Provider Client Configurations.

Command

```
curl -sk -b cookie.txt -H "Content-Type: application/json" https://$MGMT_HOST/2/providerclientconfigs/ | jq '.[].uuid'
```

Example

```
curl -sk -b cookie.txt -H "Content-Type: application/json" https://$MGMT_HOST/2/providerclientconfigs/ | jq '.[].uuid'
```

Response

```
"fb53eae8-d973-4644-b13f-893949154a22"
```

4. Configure the provider client that you want to use.

Command

```
export PCC=<Selected Provider Client Configuration>
```

Example

```
export PCC=fb53eae8-d973-4644-b13f-893949154a22
```

5. Get the list of datacenters.

Command

```
curl -sk -b cookie.txt  
https://$MGMT_HOST/2/providerclientconfigs/${PCC}/vsphere/datacenter | jq  
'Datacenters[]'
```

Example

```
curl -sk -b cookie.txt  
https://$MGMT_HOST/2/providerclientconfigs/${PCC}/vsphere/datacenter | jq '.Datacenters[]'
```

Response

```
"RTP09"
```

6. Configure the datacenter that you want to use.

Command

```
export DCC=<from list of DataCenters>
```

Example

```
export DCC=RTP09
```

7. Get the list of tenant image VMs.

Command

```
curl -sk -b cookie.txt  
https://$MGMT_HOST/2/providerclientconfigs/${PCC}/vsphere/datacenter/${DCC}/vm | jq '.VMs[] | select(.| startswith("ccp-tenant-image")) | sort -u
```

Example

```
curl -sk -b cookie.txt  
https://$MGMT_HOST/2/providerclientconfigs/${PCC}/vsphere/datacenter/${DCC}/vm | jq '.VMs[] | select(.| startswith("ccp-tenant-image")) | sort -u
```

Response

```
"ccp-tenant-image-1.14.6-5.0.0.ova"  
"ccp-tenant-image-1.13.10-5.0.0.ova"
```

8. Configure the name of the VM image that you want to use.

Command

```
export VM=<from list of VMs>
```

Example

```
export VM= ccp-tenant-image-1.14.6-5.0.0.ova
```

9. Get the list of networks.

Command

```
curl -sk -b cookie.txt
https://$MGMT_HOST/2/providerclientconfigs/${PCC}/vsphere/datacenter/${DCC}/network| jq '.Networks[]'
```

Example

```
curl -sk -b cookie.txt
https://$MGMT_HOST/2/providerclientconfigs/${PCC}/vsphere/datacenter/${DCC}/network| jq '.Networks[]'
```

Response

```
"r9-hx2-ccp"
"Storage Controller Data Network"
"k8-priv-iscsivm-network"
```

10. Configure the network that you want to use.

Command

```
export NETWORK=<From list of Networks>
```

Example

```
export NETWORK=r9-hx2-ccp
```

11. Get the list of clusters.

Command

```
curl -sk -b cookie.txt
https://$MGMT_HOST/2/providerclientconfigs/${PCC}/vsphere/datacenter/${DCC}/cluster| jq '.Clusters[]'
```

Example

```
curl -sk -b cookie.txt
https://$MGMT_HOST/2/providerclientconfigs/${PCC}/vsphere/datacenter/${DCC}/cluster| jq '.Clusters[]'
```

Response

```
"r9-hx2"
```

12. Configure the name of the cluster you want to use.

Command

```
export CLUSTER=<from list of clusters>
```

Example

```
export CLUSTER=r9-hx2
```

13. Get the list of pools.

Command

```
curl -sk -b cookie.txt
https://$MGMT_HOST/2/providerclientconfigs/${PCC}/vsphere/datacenter/${DCC}/cluster/${CLUSTER}/pool| jq ".Pools[]"
```

Example

```
curl -sk -b cookie.txt
https://$MGMT_HOST/2/providerclientconfigs/${PCC}/vsphere/datacenter/${DCC}/cluster/${CLUSTER}/pool| jq ".Pools[]"
```

Response

`"Resources"`
`"Resources/Infrastructure"`

14. Configure the vSphere resource pool you want to use.

Command

```
export POOL=<from list of Pools>
```

Example

```
export POOL=Resources
```

15. Get the list of datastores.

Command

```
curl -sk -b cookie.txt  
https://$MGMT_HOST/2/providerclientconfigs/${PCC}/vsphere/datacenter/${DCC}/datastore | jq -r '.Datastores[] | select(. | startswith("SpringpathDS"))|not'
```

Example

```
curl -sk -b cookie.txt  
https://$MGMT_HOST/2/providerclientconfigs/${PCC}/vsphere/datacenter/${DCC}/datastore | jq -r '.Datastores[] | select(. | startswith("SpringpathDS") | not)'
```

Response

```
ds1  
ISOs  
Hxdump  
r9-hx2-datastore-1
```

16. Configure the datastore that you want to use.

Command

```
export DATASTORE=<from list of datastores>
```

Example

```
export DATASTORE=r9-hx2-datastore-1
```

17. Configure a name for the tenant cluster.

Note: The cluster name must start with an alphanumeric character (a-z, A-Z, 0-9). It can contain a combination of hyphen (-) symbols and alphanumeric characters (a-z, A-Z, 0-9). The maximum length of the cluster name is 46 characters.

Command

```
export NAME=<Name of cluster>
```

Example

```
export NAME=tc4
```

18. Configure a username to remotely access cluster nodes with a given sshkey.

Command

```
export USER=<Username>
```

Example

```
export USER=ccpuser
```

19. Configure the ssh public key for remote access.

Command

```
export SSHKEY=<Selected ssh public key for remote access>
```

Example

```
export SSHKEY=`head -1 ~/.ssh/id_rsa.pub`
```

Note: If there is no public key file, please run `ssh-keygen` to create a key pair.

20. Get the list of subnets.

Command

```
curl -sk -b cookie.txt -H "Content-Type: application/json"
https://$MGMT_HOST/2/network_service/subnets/ | jq -r '[0].uuid'
```

Example

```
curl -sk -b cookie.txt -H "Content-Type: application/json"
https://10.20.30.40:32442/2/network\_service/subnets/ | jq -r
'[0].uuid'
```

Response

```
"842e4baf-4877-4330-a3e3-
4249983922a4"
```

21. Configure the subnet for the cluster.

Command

```
export SUBNET=<From the list of subnets>
```

Example

```
export SUBNET=842e4baf-4877-4330-a3e3-4249983922a4
```

22. Get the list of VIP pools in the subnet that you have chosen.

Command

```
curl -sk -b cookie.txt -H "Content-Type: application/json"
https://$MGMT_HOST/2/network_service/subnets/${SUBNET}/pools | jq -r '[0].uuid'
```

Example

```
curl -sk -b cookie.txt -H "Content-Type: application/json"
https://10.20.30.40:32442/2/network\_service/subnets/\${SUBNET}/pools/ | jq -r
'[0].uuid'
```

Response

```
"fef830ce-dc92-46fe-8acb-01eaa539dc46"
```

23. Select the appropriate VIP pool if there are multiple options.

Command

```
export VIP_POOL=<From the list of pools>
```

Example

```
export VIP_POOL=fef830ce-dc92-46fe-8acb-01eaa539dc46
```

24. Copy and paste the following code to create a cluster json payload.

```
#-----
cat <<EOF > cluster_create.json
{
  "provider_client_config_uuid": "${PCC}",
  "type": 1,
  "cluster": "${CLUSTER}",
  "name": "${NAME}",
  "description": "",
  "workers": 2,
  "masters": 1,
```

```

    "vcpus": 2,
    "memory": 8192,
    "datacenter": "${DCC}",
    "datastore": "${DATASTORE}",
    "networks": [
      "${NETWORK}"
    ],
    "ingress_vip_pool_id": "${SUBNET}",
    "load_balancer_ip_num": 1,
    "resource_pool": "${CLUSTER}/${POOL}",
    "template": "${VM}",
    "ssh_user": "${USER}",
    "ssh_key": "${SSHKEY}",
    "deployer_type": "kubeadm",
    "kubernetes_version": "1.11.3",
    "deployer": {
      "provider_type": "vsphere",
      "provider": {
        "vsphere_datacenter": "${DCC}",
        "vsphere_datastore": "${DATASTORE}",
        "vsphere_client_config_uuid": "${PCC}",
        "vsphere_working_dir": "\/${DCC}/vm"
      }
    }
  }
}
EOF

#-----

```

25. Edit the `cluster_create.json` file to modify the number of workers, CPUs, memory, Kubernetes version, or description as needed.
26. Create a tenant cluster.

Command

```
curl -sk -X POST -b cookie.txt -H "Content-Type: application/json" -d
@cluster_create.json https://$MGMT_HOST/2/clusters | tee output.txt | jq
'.name,.uuid,.state'
```

Example

```
curl -sk -X POST -b cookie.txt -H "Content-Type:
application/json" -d @cluster_create.json
https://$MGMT_HOST/2/clusters | tee output.txt | jq
'.name,.uuid,.state'
```

Response

```
"tc4"
"8ccaa3a1-8a11-4996-9224-5723b7ecfdfd"
"READY"
```

27. Configure the tenant cluster UUID.

Command

```
#export TC=<UUID of the selected tenant cluster>
```

Example

```
export TC=8ccaa3a1-8a11-4996-9224-5723b7ecfdfd
```

28. Download the KUBECONFIG environment file.

Command

```
curl -sk -b cookie.txt https://$MGMT_HOST/2/clusters/${TC}/env -o ${TC}.env
```

Example

```
curl -sk -b cookie.txt https://$MGMT_HOST/2/clusters/${TC}/env -o ${TC}.env
```

29. Export the config file to KUBECONFIG environment variable.

Command

```
export KUBECONFIG=./${TC}.env
```

Example

```
export KUBECONFIG=./${TC}.env
```

30. View nodes on a tenant cluster.

Command

```
kubectl get nodes -o wide
```

Example

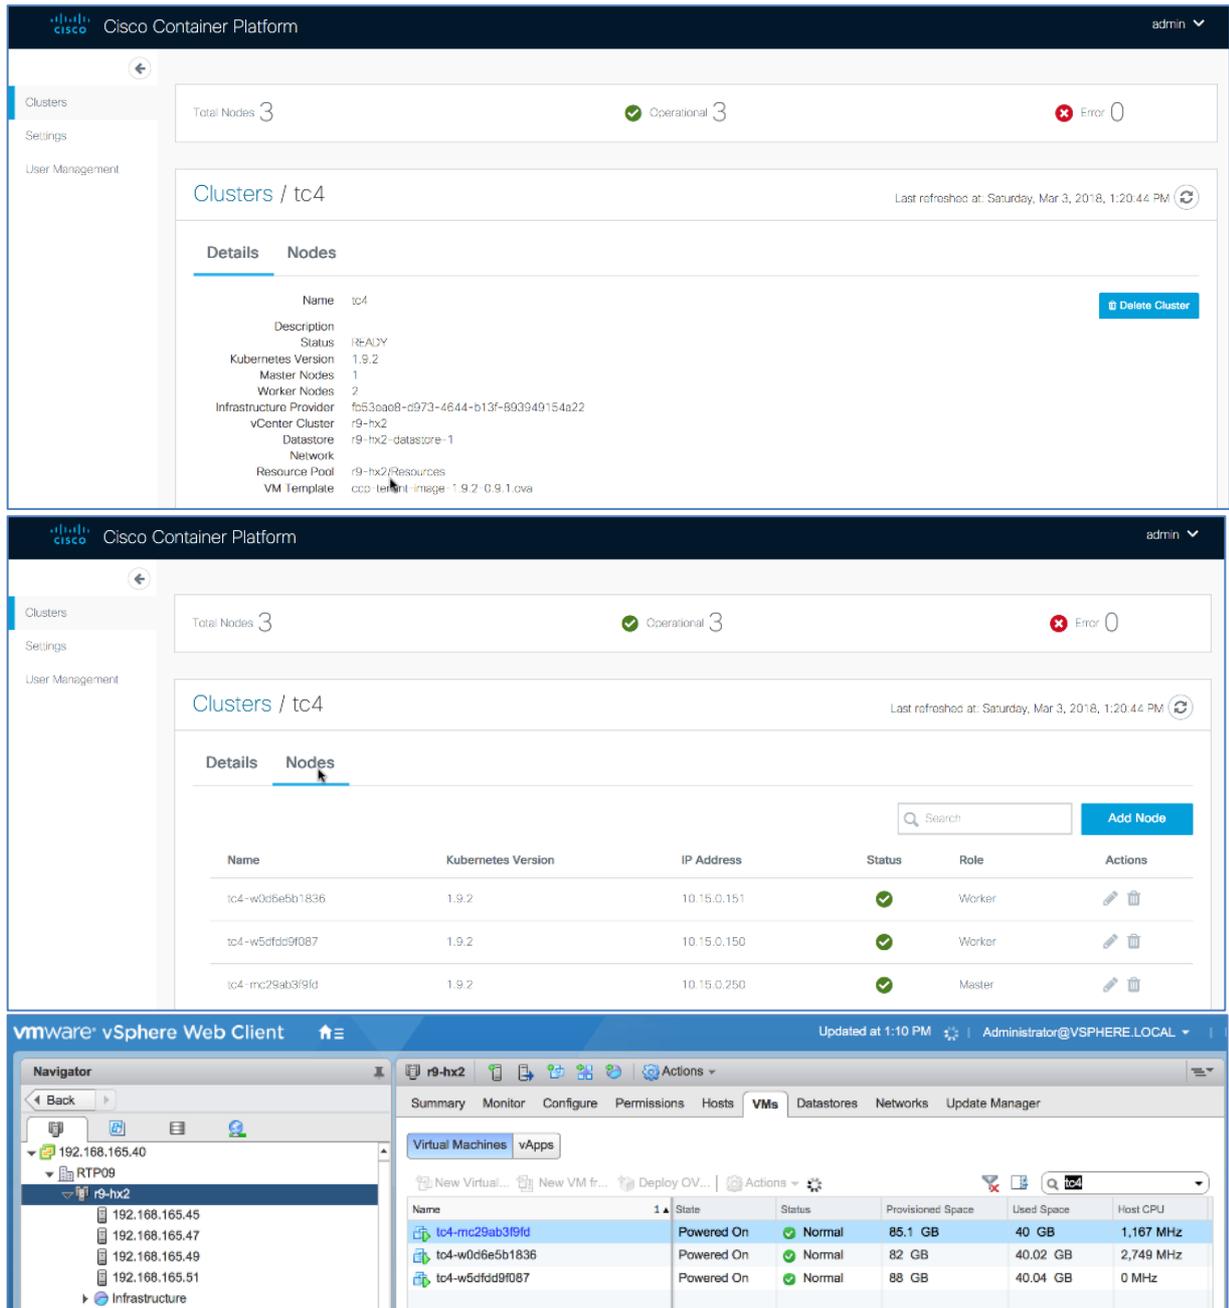

```
kubectl get nodes -o wide
```

Response

NAME	STATUS	ROLES	AGE	VERSION	EXTERNAL-IP	OS-IMAGE	KERNEL VERSION	CONTAINER RUNTIME
tc4-mc29ab3f9fd	Ready	master	3m	v1.9.2	10.15.0.250	Ubuntu 16.04.3 LTS	4.4.0-104-generic	Docker://1.13.1
tc4-w0d6e5b1836	Ready	<none>	2m	v1.9.2	10.15.0.151	Ubuntu 16.04.3 LTS	4.4.0-104-generic	Docker://1.13.1
Tc4-w5dfdd9f087	Ready	<none>	2m	v1.9.2	10.15.0.150	Ubuntu 16.04.3 LTS	4.4.0-104-generic	Docker://1.13.1

The screenshot shows the Cisco Container Platform web interface. At the top, it displays 'Total Clusters 4', 'Healthy 4', 'Warning 0', and 'Error 0'. Below this is a table of clusters. The cluster 'tc4' is highlighted with a yellow box. The table has columns for Name, Description, Status, Kubernetes Version, Nodes, and Actions.

Name	Description	Status	Kubernetes Version	Nodes	Actions
tc1	Tenant Cluster One	✓	1.9.2	Masters: 1 Workers: 3	[Icons]
tc2	Test Cluster Two	✓	1.8.4	Masters: 1 Workers: 2	[Icons]
tc3		✓	1.9.2	Masters: 1 Workers: 2	[Icons]
tc4		✓	1.9.2	Masters: 1 Workers: 2	[Icons]

4.2 Deleting vSphere Tenant Clusters

Before you Begin

Ensure that curl and jq are installed on your client machine.

Procedure

1. Export Cisco Container Platform Virtual IP to the MGMT_HOST environment variable.

Command

```
export MGMT_HOST=<Control Plane VIP>
```

Example

```
export MGMT_HOST=10.20.30.40
```

2. Obtain a cookie using the username and password for your Cisco Container Platform instance.

Command

```
curl -k -c cookie.txt -H "Content-Type:application/x-www-form-urlencoded" -d 'username=admin&password=<Password from the installer>' https://$MGMT_HOST/2/system/login/
```

Example

```
curl -k -c cookie.txt -H "Content-Type:application/x-www-form-urlencoded" -d 'username=admin&password=<Password from the installer>' https://$MGMT_HOST/2/system/login/
```

3. List tenant clusters.

Command

```
curl -sk -b cookie.txt https://$MGMT_HOST/2/clusters| jq -r '.[].name, .uuid'
```

Example

```
curl -sk -b cookie.txt https://$MGMT_HOST/2/clusters| jq -r '.[].name, .uuid'
```

Response

```
tc1
aef65a35-c013-4d91-9edb-e2ef8359f95b
tc2
8dab31ef-3efa-4de6-9e0d-07e6ff68bc24
tc3
a523fce7-b71e-444a-9626-871e17fe1fcd
tc4
8ccaa3a1-8a11-4996-9224-5723b7ecfdfd
```

4. Export the tenant cluster.

Command

```
export TC=<selected cluster from list>
```

Example

```
export TC=8ccaa3a1-8a11-4996-9224-5723b7ecfdfd
```

5. Delete the tenant cluster.

Command

```
curl -sk -b cookie.txt -X DELETE https://$MGMT_HOST/2/clusters/${TC}
```

Example

```
curl -sk -b cookie.txt -X DELETE https://$MGMT_HOST/2/clusters/${TC}
```

4.3 Configuring Windows AD Service Account for Authentication

Before you Begin

Ensure that curl and jq are installed on your client machine.

Procedure

1. Export Cisco Container Platform Virtual IP to the MGMT_HOST environment variable.

Command

```
export MGMT_HOST=<Control Plane VIP>
```

Example

```
export MGMT_HOST=10.20.30.40
```

2. Obtain a cookie using the username and password for your Cisco Container Platform instance.

Command

```
curl -k -c cookie.txt -H "Content-Type:application/x-www-form-urlencoded" -d 'username=admin&password=<Password from the installer>' https://$MGMT_HOST/2/system/login/
```

Example

```
curl -k -c cookie.txt -H "Content-Type:application/x-www-form-urlencoded" -d 'username=admin&password=<Password from the installer>' https://$MGMT_HOST/2/system/login/
```

3. Query Windows AD server to verify the Service Account connection and members of the Cisco Container Platform accounts.

Command

```
ldapsearch -x -h <AD Server> -D "<Bind Distinguished Name>" -w '<Password>' -b "<Base Distinguished Name>" -s "<Scope>"
```

Example

```
ldapsearch -x -h 192.0.2.1 -D "CN=Adam A. Arkanis,CN=Users,DC=r9-hx,DC=local" -w 'Password' -b "dc=r9-hx,dc=local" -s sub "(cn=CCP*)" member cn
```

Response

```
# extended LDIF
#
# LDAPv3
# base <dc=r9-hx,dc=local> with scope subtree
# filter: (cn=CCP*)
# requesting: member cn
#
# CCPAdmins, Users, r9-hx.local
dn: CN=CCPAdmins,CN=Users,DC=r9-hx,DC=local
cn: CCPAdmins
member: CN=Andrew A. Andres,CN=Users,DC=r9-hx,DC=local
member: CN=Adam A. Arkanis,CN=Users,DC=r9-hx,DC=local
# CCPDevOps, Users, r9-hx.local
dn: CN=CCPDevOps,CN=Users,DC=r9-hx,DC=local
cn: CCPDevOps
member: CN=Bob B. Bondurant,CN=Users,DC=r9-hx,DC=local
member: CN=Becky B. Bartholemew,CN=Users,DC=r9-hx,DC=local
```

4. Create json payload file for creating AD service account in Cisco Container Platform.

Command

```
cat << EOF > ldap_serviceaccount.json
{
  "Server": "<AD Server>",
```

```
"Port": 3268,  
"ServiceAccountDN": "<Bind Distinguished Name>",  
"ServiceAccountPassword": "<Password>",  
"StartTLS": false,  
"InsecureSkipVerify": true  
}  
EOF
```

Example

```
cat << EOF > ldap_serviceaccount.json  
{  
  "Server": "192.0.2.1",  
  "Port": 3268,  
  "ServiceAccountDN": "CN=Adam A. Arkanis,CN=Users,DC=r9-  
hx,DC=local",  
  "ServiceAccountPassword": "Password",  
  "StartTLS": false,  
  "InsecureSkipVerify": true  
}  
EOF
```

5. Create the service account for Cisco Container Platform.

Command

```
curl -sk -b cookie.txt -X PUT -H "Content-Type: application/json" -d  
@ldap_serviceaccount.json https://$MGMT_HOST/2/ldap/setup
```

Example

```
curl -sk -b cookie.txt -X PUT -H "Content-Type:  
application/json" -d @ldap_serviceaccount.json  
https://$MGMT_HOST/2/ldap/setup
```

Response

```
{  
  "Server": "192.0.2.1",  
  "Port": 3268,  
  "BaseDN": "DC=r9-hx,DC=local",  
  "ServiceAccountDN": "CN=Adam A. Arkanis,CN=Users,DC=r9-  
hx,DC=local",  
  "ServiceAccountPassword": "",  
  "StartTLS": false,  
  "InsecureSkipVerify": true  
}
```

6. Confirm service account configuration.

Command

```
curl -k -b cookie.txt https://$MGMT_HOST/2/ldap/setup
```

Example

```
curl -k -b cookie.txt https://$MGMT_HOST/2/ldap/setup
```

Response

```
{
  "Server": "192.0.2.1",
  "Port": 3268,
  "BaseDN": "DC=r9-hx,DC=local",
  "ServiceAccountDN": "CN=Adam A. Arkanis,CN=Users,DC=r9-
hx,DC=local",
  "ServiceAccountPassword": "",
  "StartTLS": false,

}
```

4.4 Managing Windows AD Group Authorizations for Tenant Clusters

Before you Begin

Ensure that curl and jq are installed on your client machine.

Procedure

1. Export Cisco Container Platform Virtual IP to the MGMT_HOST environment variable.

Command

```
export MGMT_HOST=<Control Plane VIP>
```

Example

```
export MGMT_HOST=10.20.30.40
```

2. Obtain a cookie using the username and password for your Cisco Container Platform instance.

Command

```
curl -k -c cookie.txt -H "Content-Type:application/x-www-form-urlencoded" -d
'username=admin&password=<Password from the installer>'
https://$MGMT_HOST/2/system/login/
```

Example

```
curl -k -c cookie.txt -H "Content-Type:application/x-www-form-
-urlencoded" -d 'username=admin&password=<Password from the
installer>' https://$MGMT_HOST/2/system/login/
```

3. Create json payload file for assigning an AD group to a SysAdmin or DevOps role.

```
cat << EOF > ldap_devops_group.json
{
  "LdapDN": "CN=CCPDevOps,CN=Users,DC=r9-hx,DC=local",
  "Role": "DevOps"
}
EOF
```

4. Create an LDAP group.

An error message is displayed, if an LDAP group already exists and can continue with script.

Command

```
curl -sk -b cookie.txt -X POST -H "Content-Type: application/json" -d
@ldap_devops_group.json https://$MGMT_HOST/2/ldap/groups
```

Example

```
curl -sk -b cookie.txt -X POST -H "Content-Type:
```

```
application/json" -d @ldap_devops_group.json
https://$MGMT_HOST/2/ldap/groups
```

Response

```
{
  "LdapDN": "CN=CCPDevOps,CN=Users,DC=r9-hx,DC=local",
  "Role": "DevOps"
}
```

5. Get list of configured AD groups in Cisco Container Platform.

Command

```
curl -sk -b cookie.txt https://$MGMT_HOST/2/ldap/groups
```

Example

```
curl -sk -b cookie.txt https://$MGMT_HOST/2/ldap/groups
```

Response

```
[
  {
    "LdapDN": "CN=CCPDevOps,CN=Users,DC=r9-hx,DC=local",
    "Role": "DevOps"
  }
]
```

#Return list of clusters to assign AD group to

6. Get list of clusters for which you want to assign an AD group.

Command

```
curl -sk -b cookie.txt https://$MGMT_HOST/2/clusters| jq -r '[]|.name, .uuid'
```

Example

```
curl -sk -b cookie.txt https://$MGMT_HOST/2/clusters| jq -r
'[]|.name, .uuid'
```

Response

```
tc1
aef65a35-c013-4d91-9edb-e2ef8359f95b
tc2
8dab31ef-3efa-4de6-9e0d-07e6ff68bc24
tc3
a523fce7-b71e-444a-9626-871e17fe1fcd
tc4
8ccaa3a1-8a11-4996-9224-5723b7ecfdfd
```

7. Export the selected tenant cluster.

Command

```
export TC=<Selected tenant cluster>
```

Example

```
export TC=8ccaa3a1-8a11-4996-9224-5723b7ecfdfd
```

8. Create a json payload for assigning AD group to a tenant cluster.

```
cat << EOF > ldap_authz.json
```

```
{
  "name": "CN=CCPDevOps,CN=Users,DC=r9-hx,DC=local",
  "local": false
}
EOF
```

9. Authorize group access to the selected tenant cluster.

Command

```
curl -sk -b cookie.txt -X POST -H "Content-Type: application/json" -d
@ldap_authz.json https://$MGMT_HOST/2/clusters/${TC}/authz
```

Example

```
curl -sk -b cookie.txt -X POST -H "Content-Type:
application/json" -d @ldap_authz.json
https://$MGMT_HOST/2/clusters/${TC}/authz
```

```
{
  "AuthID": "743e54da-037e-4386-99a7-a3da36e51936",
  "Name": "CN=CCPDevOps,CN=Users,DC=r9-hx,DC=local",
  "Local": false
}
```

10. Verify authorization of AD group to the tenant cluster.

Command

```
curl -sk -b cookie.txt https://$MGMT_HOST/2/clusters/${TC}/authz
```

Example

```
curl -sk -b cookie.txt
https://$MGMT_HOST/2/clusters/${TC}/authz
```

Response

```
{
  "AuthList": [
    {
      "AuthID": "743e54da-037e-4386-99a7-a3da36e51936",
      "Name": "CN=CCPDevOps,CN=Users,DC=r9-hx,DC=local",
      "Local": false
    }
  ]
}
```

11. Authenticate as a user from an AD DevOps group.

Command

```
curl -sk -c cookie_user.txt -H "Content-Type:application/x-www-form-urlencoded" -d
"username=<AD User>&password=<Password>"
https://$MGMT_HOST/2/system/login/
```

Example

```
curl -sk -c cookie_user.txt -H "Content-Type:application/x-www-
form-urlencoded" -d "username=BobBB&password=Password"
https://$MGMT_HOST/2/system/login/
```

12. Verify tenant cluster access list for an AD user.

Command

```
curl -sk -b cookie_user.txt https://$MGMT_HOST/2/clusters| jq -r '[]|.name, .uuid'
```

Example

```
curl -sk -b cookie_user.txt https://$MGMT_HOST/2/clusters| jq -r '[]|.name, .uuid'
```

Response

```
tc4
8ccaa3a1-8a11-4996-9224-5723b7ecfdfd
```

13. Export the selected tenant cluster.

Command

```
export TC=<Selected tenant cluster>
```

Example

```
export TC=8ccaa3a1-8a11-4996-9224-5723b7ecfdfd
```

14. Download the KUBECONFIG environment file.

Command

```
curl -sk -b cookie.txt https://$MGMT_HOST/2/clusters/${TC}/env -o ${TC}.env
```

Example

```
curl -sk -b cookie.txt https://$MGMT_HOST/2/clusters/${TC}/env -o ${TC}.env
```

15. Export the config file to KUBECONFIG environment variable.

Command

```
export KUBECONFIG=./${TC}.env
```

Example

```
export KUBECONFIG=./${TC}.env
```

16. View nodes on the tenant cluster.

Command

```
kubectl get nodes -o wide
```

Example

```
kubectl get nodes -o wide
```

Response

NAME	STATUS	ROLES	AGE	VERSION	EXTERNAL-IP	OS-IMAGE	KERNEL VERSION
CONTAINER-RUNTIME							
tc4-mc29ab3f9fd docker://1.13.1	Ready	master	1h	v1.9.2	10.20.30.250	Ubuntu 16.04.3 LTS	4.4.0-104-generic
tc4-w0d6e5b1836 docker://1.13.1	Ready	<none>	1h	v1.9.2	10.20.30.151	Ubuntu 16.04.3 LTS	4.4.0-104-generic
tc4-w5dfdd9f087 docker://1.13.1	Ready	<none>	1h	v1.9.2	10.20.30.150	Ubuntu 16.04.3 LTS	4.4.0-104-generic

17. Remove AD group access.

Command

```
#curl -sk -b cookie.txt -X DELETE https://$MGMT_HOST/2/ldap/groups/<DN of Group>
```

Example

```
curl -sk -b cookie.txt -X DELETE
https://$MGMT_HOST/2/ldap/groups/CN=CCPDevOps,CN=Users,DC=r9-
hx,DC=local
```

18. Verify that authorization of AD group to tenant cluster is removed.

Command

```
curl -sk -b cookie.txt https://$MGMT_HOST/2/clusters/${TC}/authz
```

Example

```
curl -sk -b cookie.txt
https://$MGMT_HOST/2/clusters/${TC}/authz

{
  "AuthList": []
}
```

4.5 Downloading Tenant Cluster KUBECONFIG Environment File

Before you Begin

Ensure that curl and jq are installed on your client machine.

Procedure

1. Export Cisco Container Platform Virtual IP to the MGMT_HOST environment variable.

Command

```
export MGMT_HOST=<Control Plane VIP>
```

Example

```
export MGMT_HOST=10.20.30.40
```

2. Obtain a cookie using the username and password for your Cisco Container Platform instance.

Command

```
curl -k -c cookie.txt -H "Content-Type:application/x-www-form-urlencoded" -d
'username=admin&password=<Password from the installer>'
https://$MGMT_HOST/2/system/login/
```

Example

```
curl -k -c cookie.txt -H "Content-Type:application/x-www-form-
-urlencoded" -d 'username=admin&password=<Password from the
installer>' https://$MGMT_HOST/2/system/login/
```

3. List tenant clusters.

Command

```
curl -sk -b cookie.txt https://$MGMT_HOST/2/clusters| jq -r '[]|.name, .uuid
```

Example

```
curl -sk -b cookie.txt https://$MGMT_HOST/2/clusters| jq -r
'[]|.name, .uuid'
```

Response

```
tc1
aef65a35-c013-4d91-9edb-e2ef8359f9gb
```

```
tc2
8dab31ef-3efa-4de6-9e0d-07e6ff68bc24
tc3
a523fce7-b71e-444a-9626-871e17fe1fcd
tc4
8ccaa3a1-8a11-4996-9224-5723b7ecfdfd
```

4. Export a tenant cluster.

Command

```
export TC=<selected cluster from list>
```

Example

```
export TC=8ccaa3a1-8a11-4996-9224-5723b7ecfdfd
```

5. Download the KUBECONFIG environmental file.

Command

```
curl -sk -b cookie.txt https://$MGMT_HOST/2/clusters/${TC}/env -o ${TC}.env
```

Example

```
curl -sk -b cookie.txt https://$MGMT_HOST/2/clusters/${TC}/env
-o ${TC}.env
```

6. Export the config file to KUBECONFIG environment variable.

Command

```
export KUBECONFIG=./${TC}.env
```

Example

```
export KUBECONFIG=./${TC}.env
```

7. View nodes on the tenant cluster.

Command

```
kubectl get nodes -o wide
```

Example

```
kubectl get nodes -o wide
```

Response

NAME	STATUS	ROLES	AGE	VERSION	EXTERNAL-IP	OS-IMAGE	KERNEL VERSION	CONTAINER-RUNTIME
tc4-mc29ab3f9fd	Ready	master	1h	v1.9.2	10.20.30.250	Ubuntu 16.04.3 LTS	4.4.0-104-generic	docker://1.13.1
tc4-w0d6e5b1836	Ready	<none>	1h	v1.9.2	10.20.30.151	Ubuntu 16.04.3 LTS	4.4.0-104-generic	docker://1.13.1
tc4-w5dfdd9f087	Ready	<none>	1h	v1.9.2	10.20.30.150	Ubuntu 16.04.3 LTS	4.4.0-104-generic	docker://1.13.1

4.6 Obtaining TC Master and Ingress VIPs

FOR MASTER

```
`curl -sk -X GET -b temp/cookie.txt
https://$MGMT_HOST/2/clusters/<clustername> | jq '.master_vip`
```

FOR INGRESS VIPs

```
`curl -sk -X GET -b temp/cookie.txt
https://$MGMT_HOST/2/clusters/<cluster> | jq '.ingress_vips`
```

5 Examples of API Use Cases for AWS EKS Clusters

V3 API support providers and clusters for EKS. vSphere and AKS clusters. Sections 5 and 6 give examples for usage with EKS and vSphere respectively using v3 API.

5.1 Logging in to Cisco Container Platform

Command

```
curl -c cookies.txt -k -X POST -d "username=admin&password=<your_password>" -H "Content-Type:application/x-www-form-urlencoded" "https://<ccp_url>/2/system/login"
```

Example

1. Log in to Cisco Container Platform.

```
curl -c cookies.txt -k -X POST -d
"username=admin&password=my_password" -H "Content-
Type:application/x-www-form-urlencoded"
"https://10.20.30.40/2/system/login"
```

2. Retrieve the token from the cookies.txt file created as a result of the above command and then store it in an environment variable like this:

```
$ cat cookies.txt
# Netscape HTTP Cookie File
# https://curl.haxx.se/docs/http-cookies.html
# This file was generated by libcurl! Edit at your own
risk.

10.20.30.40 FALSE / FALSE 0 CXAccessToken
eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9.eyJBTExfQ0xVU1RFU1
NfQVVUSCI6dHJlZSwiZXhwIjoxNTQ4NjM5MDMyLCJyb2xlIjoiQWRtaW5pc
3RyYXRvciJ9.yypjTZFKKmfuBvRxodu-MLedIkQROVNqHdqXgKKdAv7M
```

3. Set your env variable using the token value obtained from Step 2.

```
export
TOKEN=eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9.eyJBTExfQ0xVU1RF
U1NfQVVUSCI6dHJlZSwiZXhwIjoxNTQ4NjM5MDMyLCJyb2xlIjoiQWRtaW5pc
3RyYXRvciJ9.yypjTZFKKmfuBvRxodu-MLedIkQROVNqHdqXgKKdAv7M
```

5.2 Creating Providers for EKS

Command

```
curl -k -X POST -H "x-auth-token: $TOKEN" -d \
'{
  "type": "eks",
  "name": "name_of_your_eks_cluster",
  "role_arn": "you_aws_role_arn",
  "access_key_id": "your_AWS_access_key_id",
  "secret_access_key": "your_AWS_secret_access_key"
}' https:// <ccp-url>/v3/providers/
```

Example

```
curl -k -X POST -H "x-auth-token: $TOKEN" -d \
'{
  "type": "eks",
  "name": "selvi-eks-provider",
```

```

        "role_arn":
"arn:aws:iam::123456789123:role/eksServiceRole",
        "access_key_id": "ABCDEFGHijklmnopqrst",
        "secret_access_key":
"THISISNOTAREALSECRETKEYBUTLOOKSLIKEONE"
    }' https://10.20.30.40/v3/providers/

```

5.3 Retrieving List of Providers for EKS

Command

```
curl -k -X GET -H "X-Auth-Token": "$TOKEN" https://<ccp-url>/v3/providers
```

Example

```
curl -k -X GET -H "X-Auth-Token": "$TOKEN"
https://10.20.30.40/v3/providers
```

5.4 Retrieving Specific Provider for EKS

Command

```
curl -k -X GET -H "X-Auth-Token": "$TOKEN" https:// <ccp-
url>/v3/providers/<provider_uuid>/
```

Example

```
curl -k -X GET -H "X-Auth-Token": "$TOKEN" https://
10.20.30.40/v3/providers/17d7d949-cf95-4676-80a7-ae3d773dc3b0/
```

Response

```

[
  {
    "access_key_id": "ABCDEFGHijklmnopqrst",
    "id": "7edd7790-a776-4a91-91f3-0938483dbf78",
    "name": "selvi-eks-provider",
    "role_arn": "arn:aws:iam::12345678912:role/ccp-eks-
7edd7790-a776-4a91-91f3-0938483dbf78",
    "type": "eks"
  }
]

```

5.5 Modifying Providers for EKS

You cannot update the provider details once it is created. This includes parameters such as the Role_ARN, Type, Access_Key_ID, and Secret_Access_Key.

5.6 Deleting Providers for EKS

Command

```
curl -k -X DELETE -H "x-auth-token: $TOKEN" https:// <ccp-
url>/v3/providers/<provider_uuid>/
```

Example

```
curl -k -X DELETE -H "x-auth-token: $TOKEN"
https://10.20.30.40/v3/providers/7edd7790-a776-4a91-91f3-
0938483dbf78/
```

5.7 Creating EKS clusters

Command

```
curl -k -X POST -H "x-auth-token: $TOKEN" -d \
'{
  "provider": "provider_uuid",
  "vpc_sizing": {
    "subnet": "<your_desired_subnet>",
    "public_subnets": ["<desired_pub_subnet1>", "<desired_pub_subnet2>", "<desired_pub_subnet3>"],
    "private_subnets": ["<desired_priv_subnet1>", "<desired_priv_subnet2>", "<desired_priv_subnet3>"]
  },
  "region": "<aws_region_string>",
  "type": "eks",
  "ami": "<ami_id>",
  "instance_type": "<amazon_instance_type>",
  "worker_count": <number_of_workers_in_eks_cluster>,
  "access_role_arn": "<arn_of_role_in_your_aws_account>",
  "name": "<name_of_your_eks_cluster>",
  "ssh_keys": ["<your_ssh_key_to_be_able_to_access_your_workers>", "<optionally_another_ssh_key>"]
}' https://<ccp_url>/v3/clusters/
```

Example

```
curl -k -X POST -H "x-auth-token: $TOKEN" -d \
'{
  "provider": "17d7d949-cf95-4676-80a7-ae3d773dc3b0",
  "vpc_sizing": {
    "subnet": "10.20.0.0/16",
    "public_subnets": ["10.20.1.0/24", "10.20.2.0/24", "10.20.3.0/24"],
    "private_subnets": ["10.20.4.0/24", "10.20.5.0/24", "10.20.6.0/24"]
  },
  "region": "us-west-2",
  "type": "eks",
  "ami": "ami-09677889326e51ea1",
  "instance_type": "t2.small",
  "worker_count": 1,

  "access_role_arn": "arn:aws:iam::123456789123:role/KubernetesAdmin",
  "name": "selvi_eks_1",
  "ssh_keys": ["ssh-ed25519
AAAAC3NzaC1lZDI1NTE5AAAAIHdSrKkWhwED6awk9sjegF0dgcKnotmyrealkey
selvik@SELVIK-M-C1DM", "another_dummy"]
}' https://10.20.30.40/v3/clusters/
```

Response

```
{
  "id": "094c1544-58e5-46cf-8a3f-94de81f35574",
  "type": "eks",
  "name": "selvi_eks_1",
  "provider": "17d7d949-cf95-4676-80a7-ae3d773dc3b0",
  "region": "us-west-2",
  "status": "CREATING",
```

```

    "status_detail":null,
    "access_role_arn":"arn:aws:iam::123456789123:role/KubernetesAd
min",
    "kubeconfig":null,
    "vpc_sizing":{
      "subnet":"10.20.0.0/16",
      "public_subnets":[
        "10.20.1.0/24",
        "10.20.2.0/24",
        "10.20.3.0/24"
      ],
      "private_subnets":[
        "10.20.4.0/24",
        "10.20.5.0/24",
        "10.20.6.0/24"
      ]
    },
    "ami":"ami-09677889326e51ea1",
    "instance_type":"t2.small",
    "ssh_key_name":"",
    "worker_count":1,
    "vpc_id":null
  }
}

```

Note: The API returns the values immediately and the status is indicated as *CREATING*.

5.8 Retrieving all EKS clusters

Command

```
curl -k -X GET -H "X-Auth-Token":"$TOKEN" https://<ccp_url>/v3/clusters
```

Example

```
curl -k -X GET -H "X-Auth-Token":"$TOKEN"
https://10.10.99.190/v3/clusters
```

Response

```

[
  {
    "id":"094c1544-58e5-46cf-8a3f-94de81f35574",
    "type":"eks",
    "name":"selvi_eks_1",
    "provider":"17d7d949-cf95-4676-80a7-ae3d773dc3b0",
    "region":"us-west-2",
    "status":"CREATING_MASTER",
    "status_detail":"","
    "access_role_arn":"arn:aws:iam::123456789123:role/Kubernet
sAdmin",
    "kubeconfig":null,
    "vpc_sizing":{
      "subnet":"10.20.0.0/16",
      "public_subnets":[
        "10.20.1.0/24",
        "10.20.2.0/24",
        "10.20.3.0/24"
      ],
      "private_subnets":[
        "10.20.4.0/24",
        "10.20.5.0/24",
        "10.20.6.0/24"
      ]
    }
  }
]

```

```

    },
    "ami": "ami-09677889326e51ea1",
    "instance_type": "t2.small",
    "ssh_key_name": "",
    "worker_count": 1,
    "vpc_id": "vpc-thisis72e6cnotreal"
  }
]

```

5.9 Retrieving Specific EKS Clusters

Command

```

curl -k -X GET -H "X-Auth-Token": "$TOKEN"
https://<ccp_url>/v3/clusters/<your_cluster_uuid>/

```

Example

```

curl -k -X GET -H "X-Auth-Token": "$TOKEN"
https://10.10.99.190/v3/clusters/5a5f0db5-110c-4151-80e8-
9b78889d30bc/

```

Response

```

[
  {
    "id": "094c1544-58e5-46cf-8a3f-94de81f35574",
    "type": "eks",
    "name": "selvi_eks_1",
    "provider": "17d7d949-cf95-4676-80a7-ae3d773dc3b0",
    "region": "us-west-2",
    "status": "CREATING_MASTER",
    "status_detail": "",
    "access_role_arn": "arn:aws:iam::123456789123:role/Kubernet
sAdmin",
    "kubeconfig": null,
    "vpc_sizing": {
      "subnet": "10.20.0.0/16",
      "public_subnets": [
        "10.20.1.0/24",
        "10.20.2.0/24",
        "10.20.3.0/24"
      ],
      "private_subnets": [
        "10.20.4.0/24",
        "10.20.5.0/24",
        "10.20.6.0/24"
      ]
    },
    "ami": "ami-09677889326e51ea1",
    "instance_type": "t2.small",
    "ssh_key_name": "",
    "worker_count": 1,
    "vpc_id": "vpc-thisis72e6cnotreal"
  }
]

```

5.10 Modifying EKS clusters

Command

```
curl -k -X PATCH -H "x-auth-token: $TOKEN" -d \
'{
  "worker_count": 2
}' https://<ccp_url>/v3/clusters/<cluster_uuid>/
```

Example

```
curl -k -X PATCH -H "x-auth-token: $TOKEN" -d \
'{
  "worker_count": 2
}' https://10.20.99.190/v3/clusters/5a5f0db5-110c-4151-80e8-
9b78889d30bc/
```

Response

```
[
  {
    "id": "094c1544-58e5-46cf-8a3f-94de81f35574",
    "type": "eks",
    "name": "selvi_eks_1",
    "provider": "17d7d949-cf95-4676-80a7-ae3d773dc3b0",
    "region": "us-west-2",
    "status": "CREATING_MASTER",

    "worker_count": 1,
    "vpc_id": "vpc-thisis72e6cnotreal"
  }
]
```

5.11 Deleting EKS clusters

Command

```
curl -k -X DELETE -H "x-auth-token: $TOKEN"
https://<ccp_url>/v3/clusters/cluster_uuid/
```

Example

```
curl -k -X DELETE -H "x-auth-token: $TOKEN"
https://10.10.99.190/v3/clusters/5a5f0db5-110c-4151-80e8-
9b78889d30bc/
```

6 Examples of API Use Cases for vSphere v3 Clusters

6.1 Logging in to Cisco Container Platform

Commands

```
export CCP=https://<Cisco Container Platform URL>
export TOKEN=$(curl -v -k -X POST \
  -H "Content-Type:application/x-www-form-urlencoded" \
  -d "username=<CCP Username>&password=<CCP Password>" \
  $CCP/v3/system/login 2> >(grep x-auth-token) | \
  grep x-auth-token | awk -F ":" '{print $2}' | tr -d '\n\r')
```

Example

Log in to Cisco Container Platform and get the X-Auth-Token

```
export TOKEN=$(curl -v -k -X POST \
  -H "Content-Type:application/x-www-form-urlencoded" \
  -d "username=admin&password=password" \
  $CCP/v3/system/login 2> >(grep x-auth-token) | \
  grep x-auth-token | awk -F ":" '{print $2}' | tr -d '\n\r')
echo $TOKEN
```

6.2 Creating Providers for vSphere v3

Command

```
curl -k -X POST -H "x-auth-token: $TOKEN" -d \
'{
  "type": "vsphere",
  "name": "name_of_vsphere_provider",
  "address": "vCenter_url",
  "username": "vCenter_username",
  "password": "vCenter_password",
  "port": "vCenter_port",
  "insecure_skip_verify": true_or_false
}' $CCP/v3/providers/
```

Example

```
curl -k -X POST -H "x-auth-token: $TOKEN" -d \
'{
  "type": "vsphere",
  "name": "hx3",
  "address": "vcenter.domain.com",
  "username": "administrator@vsphere.local",
  "password": "password",
  "port": "443",
  "insecure_skip_verify": true
}' $CCP/v3/providers/
```

6.3 Retrieving List of Providers

Command

```
curl -k -X GET -H "X-Auth-Token: $TOKEN" $CCP/v3/providers/
```

Example

```
curl -k -X GET -H "x-auth-token: $TOKEN" $CCP/v3/providers/
```

6.4 Retrieving Specific Provider

Command

```
curl -k -X GET -H "X-Auth-Token:$TOKEN" $CCP/v3/providers/<provider_uuid>
```

Example

```
curl -k -X GET -H "X-Auth-Token: $TOKEN"
$CCP/v3/providers/b54efda6-78c7-4418-9b89-955da6585984/
```

Response

```
{
  "id": "b54efda6-78c7-4418-9b89-955da6585984",
  "type": "vsphere",
  "name": "vcenter",
  "address": " vcenter.domain.com",
  "port": 443,
  "username": "administrator@vsphere.local",
  "insecure_skip_verify": true
}
```

6.5 Modifying Providers

Command

```
curl -k -X PATCH -H "x-auth-token: $TOKEN" -d \
'{
  "type": "vsphere",
  "name": "name_of_vsphere_provider",
  "address": "vCenter_url",
  "username": "vCenter_username",
  "password": "vCenter_password",
  "port": "vCenter_port",
  "insecure_skip_verify": true_or_false
}' $CCP/v3/providers/your_provider_id/
```

Example

```
curl -k -X PATCH -H "x-auth-token: $TOKEN" -d \
'{
  "type": "vsphere",
  "name": "vcenter-1",
  "address": "vcenter.domain.com",
  "username": "administrator@vsphere.local",
  "password": "password",
  "port": "443",
  "insecure_skip_verify": true
}' $CCP/v3/providers/b54efda6-78c7-4418-9b89-955da6585984/
```

Response

```
{
  "id": "b54efda6-78c7-4418-9b89-955da6585984",
  "type": "vsphere",
  "name": "vcenter-1",
  "address": " vcenter.domain.com",
  "port": 443,
  "username": "administrator@vsphere.local",
  "insecure_skip_verify": true
}
```

6.6 Deleting Providers

Command

```
curl -k -X DELETE -H "x-auth-token: $TOKEN" https:// <ccp-url>/v3/providers/<provider_uuid>/
```

Example

```
curl -k -X DELETE -H "x-auth-token: $TOKEN"
$CCP/v3/providers/7edd7790-a776-4a91-91f3-0938483dbf78/
```

6.7 Creating vSphere V3 clusters

Command

```
curl -k -X POST -H "x-auth-token: $TOKEN" -d \
'{
  "provider": "provider_uuid",
  "vpc_sizing": {
    "subnet": "<your_desired_subnet>",
    "public_subnets": ["<desired_pub_subnet1>", "<desired_pub_subnet2>", "
<desired_pub_subnet3>"],
    "private_subnets": ["<desired_priv_subnet1>", "<desired_priv_subnet2>",
"<desired_priv_subnet3>"]
  },
  "region": "<aws_region_string>",
  "type": "eks",
  "ami": "<ami_id>",
  "instance_type": "<amazon_instance_type>",
  "worker_count": <number_of_workers_in_eks_cluster>,
  "access_role_arn": "<arn_of_role_in_your_aws_account>",
  "name": "<name_of_your_eks_cluster>",
  "ssh_keys": ["<your_ssh_key_to_be_able_to_access_your_workers>",
"<optionally_another_ssh_key>"]
}' https://<ccp_url>/v3/clusters/
```

Example

```
curl -k -X POST -H "x-auth-token: $TOKEN" -d \
'{
  "provider": "17d7d949-cf95-4676-80a7-ae3d773dc3b0",
  "vpc_sizing": {
    "subnet": "10.20.0.0\16",
    "public_subnets": [
      "10.20.1.0\24",
      "10.20.2.0\24",
      "10.20.3.0\24"
    ],
    "private_subnets": [
      "10.20.4.0\24",
      "10.20.5.0\24",
      "10.20.6.0\24"
    ]
  },
  "region": "us-west-2",
  "type": "eks",
  "ami": "ami-09677889326e51ea1",
  "instance_type": "t2.small",
  "worker_count": 1,
  "access_role_arn":
"arn:aws:iam::123456789123:role\KubernetesAdmin",
```

```

    "name": "selvi_eks_1",
    "ssh_keys": [
      "ssh-ed25519
AAAAC3NzaC1lZDI1NTE5AAAAIHdSrKkWhwED6awk9sjegF0dgcKnotmyrealkey
selvik@SELVIK-M-C1DM",
      "another_dummy"
    ]
  }' https://10.20.30.40/v3/clusters/

```

Response

```

{
  "id": "094c1544-58e5-46cf-8a3f-94de81f35574",
  "type": "eks",
  "name": " selvi_eks_1",
  "provider": "17d7d949-cf95-4676-80a7-ae3d773dc3b0",
  "region": "us-west-2",
  "status": "CREATING",
  "status_detail": null,
  "access_role_arn": "arn:aws:iam::123456789123:role\\KubernetesAdmin",
  "kubeconfig": null,
  "vpc_sizing": {
    "subnet": "10.20.0.0\\16",
    "public_subnets": [
      "10.20.1.0\\24",
      "10.20.2.0\\24",
      "10.20.3.0\\24"
    ],
    "private_subnets": [
      "10.20.4.0\\24",
      "10.20.5.0\\24",
      "10.20.6.0\\24"
    ]
  },
  "ami": "ami-09677889326e51ea1",
  "instance_type": "t2.small",
  "ssh_key_name": "",
  "worker_count": 1,
  "vpc_id": null
}

```

Note: The API returns the values immediately, and the status is indicated as *CREATING*.

6.8 Retrieving all clusters

Command

```
curl -k -X GET -H "X-Auth-Token": "$TOKEN" $CCP/v3/clusters
```

Example

```
curl -k -X GET -H "X-Auth-Token": "$TOKEN" $CCP/v3/clusters
```

Response

```

[
  {
    "id": "35de61b9-5175-40d5-bea3-1b058fb22c45",

"skip_management": false,
"docker_no_proxy": [],
"routable_cidr": null,
"image_prefix": null,
"aci_profile": null
}

```

6.10 Deleting clusters

Command

```
curl -k -X DELETE -H "x-auth-token: $TOKEN" $CCP/v3/clusters/cluster_uuid/
```

Example

```
curl -k -X DELETE -H "x-auth-token: $TOKEN" $CCP/v3/clusters/35de61b9-5175-40d5-bea3-1b058fb22c45/
```

6.11 Creating ACI Profile

```

curl -XPOST -d '{
  "name": "example-aci-profile5",
  "apic_username": "username",
  "apic_password": "password",
  "aci_tenant": "aci_tenant",
  "apic_hosts": "apic_hosts",
  "aci_vmm_domain_name": "aci_vmm_domain_name",
  "vrf_name": "vrf_name",
  "l3_outside_policy_name": "l3_outside_policy_name",
  "l3_outside_network_name": "l3_outside_network_name",
  "aaep_name": "aaep_name",
  "nameservers": "nameservers",
  "aci_infra_vlan_id": 1234,
  "node_vlan_start": 1,
  "node_vlan_end": 100,
  "multicast_range": "10.0.0.0\16",
  "service_subnet_start": "20.15.1.1\16",
  "pod_subnet_start": "10.2.0.0\16",
  "aci_profile_name": "asdf"
}' -H 'content-type: application/json' localhost:8000/v3/aci-profiles/

```

6.12 Creating ACI-enabled vSphere Cluster

```

curl -d '{"type": "vsphere", "provider": "276ed502-1b95-4329-859e-12289d37953b", "name": "example-vsphere-cluster", "kubernetes_version": "1.12.7", "vsphere_infra": {"folder": "yeet", "datacenter": "foo", "datastore": "foo", "networks": ["foo"], "cluster": "foo", "resource_pool": "ayyy"}, "master_group": {"name": "foo", "size": 1234}, "network_plugin_profile": {"details": {"pod_cidr": "10.0.0.0/24"}}, "node_groups": [], "ip_allocation_method": "ccpnet"}'

```

```
, "master_vip": "1.2.3.4", "skip_management": true,
"docker_no_proxy": ["foo", "bar"],
"load_balancer_num": 3, "subnet_id": "5c2f63d5-5821-439f-acd5-
fb8ddd559cac", "aci_profile": "aadb0435-775d-445d-9bac-37dfcad1eb89",
"routable_cidr": "10.10.123.1/
24", "image_prefix": "this is not validated yet"}'
localhost:8000/v3/clusters/
```

6.13 Updating ACI Profile

Command

```
curl -XPATCH -d '{"aaep_name": "new_aaep_name"}' localhost:8000/v3/aci-
profiles/aadb0435-775d-445d-9bac-37dfcad1eb89/
```

Note: The cluster has to be PATCHed to pick up the new ACI details (this is by design).

Example

```
curl -s -XPATCH -d '{} ' localhost:8000/v3/clusters/d7dc05c7-78a6-
4ff7-9657-1ac48ee09dcb/
```

6.14 Deleting ACI Profile

Example

```
curl -XDELETE localhost:8000/v3/aci-profiles/aadb0435-775d-445d-
9bac-37dfcad1eb89/
```

6.15 Listing Addons

Helm charts can be managed using the addons API.

Command

```
curl -k -X GET -H "X-Auth-Token": "$TOKEN"
$CCP/v3/clusters/<your_cluster_uuid>/addons/
```

Example

```
export CLUSTER=35de61b9-5175-40d5-bea3-1b058fb22c45
curl -k -X GET -H "X-Auth-Token": "$TOKEN"
$CCP/v3/clusters/$CLUSTER/addons/
```

Response

```
{
  "count": 2,
  "next": null,
  "previous": null,
  "results": [
    {
      "name": "ccp-monitor",
      "namespace": "default",
      "overrides": "",
      "overrideFiles": [],
      "status": {},
      "url": "/opt/ccp/charts/ccp-monitor.tgz"
    }
  ],
}
```

```

    {
      "name": "metrics",
      "namespace": "default",
      "overrides": "",
      "overrideFiles": [],
      "status": {},
      "url": "metrics-server"
    }
  ]
}

```

6.16 Listing Catalog

Built-in addons can be listed using the catalog.

Command

```
curl -k -X GET -H "X-Auth-Token:$TOKEN"
$CCP/v3/clusters/<your_cluster_uuid>/catalog/
```

Example

```
export CLUSTER=35de61b9-5175-40d5-bea3-1b058fb22c45
curl -k -X GET -H "X-Auth-Token:$TOKEN"
$CCP/v3/clusters/$CLUSTER/addons/
```

Response

```

{
  "_ccp-monitor": {
    "name": "ccp-monitor",
    "description": "Monitoring",
    "chart": "/opt/ccp/charts/ccp-monitor.tgz",
    "url": "/opt/ccp/charts/ccp-monitor.tgz"
  },
  "_ccp-efk": {
    "name": "ccp-efk",
    "description": "Logging",
    "chart": "/opt/ccp/charts/ccp-efk.tgz",
    "url": "/opt/ccp/charts/ccp-efk.tgz"
  },
  "_ccp-kubernetes-dashboard": {
    "name": "kubernetes-dashboard",
    "description": "Dashboard",
    "chart": "/opt/ccp/charts/kubernetes-dashboard.tgz",
    "overrideFiles": [
      "/opt/ccp/charts/kubernetes-dashboard.yaml"
    ],
    "url": "/opt/ccp/charts/kubernetes-dashboard.tgz"
  }
}

```

6.17 Adding an Addon

Command

```
curl -k -v -H "Content-Type:application/json" -H "X-Auth-Token:$TOKEN"
https://$HOST/v3/clusters/$CLUSTER/addons/ -d '{"name":"addon_name", "url":
"addn_url"}'
```

For built-in add-ons, the response for an addon for the /catalog listing can be used as payload for the addon creation.

Example

```
curl -k -H "Content-Type:application/json" -X POST -H "X-Auth-Token:$TOKEN" $CCP/v3/clusters/$CLUSTER/addons/ -d '{"name": "ccp-monitor",
    "description": "Monitoring",
    "chart": "/opt/ccp/charts/ccp-monitor.tgz",
    "url": "/opt/ccp/charts/ccp-monitor.tgz"}'
```

Response

```
{
  "name": "ccp-monitor",
  "namespace": "default",
  "url": "/opt/ccp/charts/ccp-monitor.tgz"
}
```

6.18 Adding a Cisco Container Platform Addon

Command

```
curl -k -v -H "Content-Type:application/json" -H "X-Auth-Token:$TOKEN" https://$HOST/v3/clusters/$CLUSTER/addons/ -d '{"name": "addon_name", "url": "addn_url"}'
```

For built-in add-ons, the response for an addon for the /catalog listing can be used as payload for the addon creation.

Example

```
curl -k -H "Content-Type:application/json" -X POST -H "X-Auth-Token:$TOKEN" $CCP/v3/clusters/$CLUSTER/addons/ -d '{"name": "ccp-monitor",
    "description": "Monitoring",
    "chart": "/opt/ccp/charts/ccp-monitor.tgz",
    "url": "/opt/ccp/charts/ccp-monitor.tgz"}'
```

Response

```
{
  "name": "ccp-monitor",
  "namespace": "default",
  "url": "/opt/ccp/charts/ccp-monitor.tgz"
}
```

6.19 Adding an Addon with Overrides

For example, consider the following override:

prometheus:

nodeExporter:

enabled: false

This override translates to: {"overrides": "prometheus:\n nodeExporter:\n enabled: false"}

```
curl -k -v -H "Content-Type:application/json" -H "X-Auth-Token:$TOKEN" $CCP/v3/clusters/$CLUSTER/addons/ -d '{
  "name": "ccp-monitor",
  "url": "_ccp-monitor",
  "overrides": "prometheus:\n nodeExporter:\n enabled: false"
}'
```

swagger-api.json

Schemes

HTTP

/v3 CCP v3 API

DELETE /v3/{resource} forwards v3 API requests to the v3 API service

GET /v3/{resource} forwards v3 API requests to the v3 API service

HEAD /v3/{resource} forwards v3 API requests to the v3 API service

PATCH /v3/{resource} forwards v3 API requests to the v3 API service

POST /v3/{resource} forwards v3 API requests to the v3 API service

PUT /v3/{resource} forwards v3 API requests to the v3 API service

2/aci_api accessing ACI api

POST /2/aci_api/login ACI login

2/aci_profiles List of ACI profile endpoints

GET /2/aci_profiles Get all ACI profiles

POST /2/aci_profiles Create an ACI profile with the given configuration

GET /2/aci_profiles/{aciProfileName} Get an ACI profile by name

DELETE /2/aci_profiles/{aciProfileUUID} Delete an ACI profile

PATCH /2/aci_profiles/{aciProfileUUID} Update an ACI profile

2/clusters List of cluster endpoints

GET /2/clusters Get all clusters

POST /2/clusters Create a cluster with the given specification

GET /2/clusters/{clusterID}/authz List authorizations for a cluster

POST /2/clusters/{clusterID}/authz Add authorization for a cluster

DELETE /2/clusters/{clusterID}/authz/{authID} Delete authorization for a cluster

GET /2/clusters/{clusterName} Get a cluster by name

DELETE /2/clusters/{clusterUUID} Delete a cluster

PATCH /2/clusters/{clusterUUID} Patch a cluster

PUT /2/clusters/{clusterUUID} Update a cluster

GET /2/clusters/{clusterUUID}/dashboard Get dashboard

GET /2/clusters/{clusterUUID}/env Get cluster environment

GET /2/clusters/{clusterUUID}/helmcharts Get HelmCharts object for a given cluster

POST /2/clusters/{clusterUUID}/helmcharts Create a helmChart for cluster with the given specification

DELETE /2/clusters/{clusterUUID}/helmcharts/{HelmChartUUID} Delete helm chart for cluster

POST /2/clusters/{clusterUUID}/nodepools Create a node pool for a cluster

DELETE /2/clusters/{clusterUUID}/nodepools/{nodePoolID} Delete a node pool from a cluster

PATCH /2/clusters/{clusterUUID}/nodepools/{nodePoolID} Update a node pool in a cluster

PATCH /2/clusters/{clusterUUID}/upgrade Upgrade a cluster

2/keyvalues List of endpoints for key values

GET /2/keyvalues/{key}

POST /2/keyvalues/{key}

2/ldap List of ldap endpoints

GET /2/ldap/groups Get CX LDAP Groups

POST /2/ldap/groups Create CX LDAP Group

PUT /2/ldap/groups Update a CX LDAP Group.

GET /2/ldap/groups/authz Get CX the cluster authorizations for a CX LDAP group

DELETE /2/ldap/groups/{ldapDN} Delete CX LDAP Group specified by LDAP DN

GET /2/ldap/setup Get LDAP parameters

PUT /2/ldap/setup Setup/update LDAP parameters

2/license List of licensing endpoints

DELETE /2/license/{resource} Refer to the smart licensing documentation

GET /2/license/{resource} Refer to the smart licensing documentation

DELETE /2/license/{resource}/{agentID} Refer to the smart licensing documentation

GET /2/license/{resource}/{agentID} Refer to the smart licensing documentation

POST /2/license/{resource}/{agentID} Refer to the smart licensing documentation

2/localusers

GET /2/localusers Get CX local users

POST /2/localusers Create CX local user

DELETE /2/localusers/{username} Delete a local user

PATCH /2/localusers/{username} Update a local user. Can provide either or both parameters.

PATCH /2/localusers/{username}/password Update

2/providerclientconfigs List of provider client config endpoints

GET /2/providerclientconfigs Get provider client configuration list

POST /2/providerclientconfigs Add provider client configuration

DELETE /2/providerclientconfigs/{clientconfigUUID} Delete provider client configuration

GET /2/providerclientconfigs/{clientconfigUUID} Get provider client configuration

PATCH /2/providerclientconfigs/{clientconfigUUID} Update provider client configuration

GET /2/providerclientconfigs/{clientconfigUUID}/clusters Get list of clusters who are using providerclientconfig

GET /2/providerclientconfigs/{clientconfigUUID}/vsphere/datacenter Gets the list of vSphere Data Centers.

GET /2/providerclientconfigs/{clientconfigUUID}/vsphere/datacenter/{datacenterName}/cluster Gets the list of vSphere Clusters in a datacenter.

GET /2/providerclientconfigs/{clientconfigUUID}/vsphere/datacenter/{datacenterName}/cluster/{clusterName}/gpu Gets the list of vSphere GPUs.

GET /2/providerclientconfigs/{clientconfigUUID}/vsphere/datacenter/{datacenterName}/cluster/{clusterName}/pool Gets the list of vSphere Pools.

GET /2/providerclientconfigs/{clientconfigUUID}/vsphere/datacenter/{datacenterName}/datastore Gets the list of vSphere Datastores.

GET /2/providerclientconfigs/{clientconfigUUID}/vsphere/datacenter/{datacenterName}/network Gets the list of vSphere Networks.

GET /2/providerclientconfigs/{clientconfigUUID}/vsphere/datacenter/{datacenterName}/vm Gets the list of vSphere Virtual Machines.

2/rbac

GET /2/rbac get the role of the current user

2/system List of system endpoints

GET /2/system/CorcHealth Get corc health

GET /2/system/health Returns the health of the system

GET /2/system/livenessHealth Returns a string representing the health of the system

POST /2/system/login Management server login
