debug, show and clear Commands

- Cisco PIX Firewall
- Checkpoint:

Troubleshoot

- Network Summarization
- Sample Debug Output from the PIX

Related Information

Introduction

This sample configuration demonstrates how to form an IPSec tunnel with pre-shared keys to join two private networks. In our example, the joined networks are the 192.168.1.X private network inside the Cisco Secure Pix Firewall (PIX) and the 10.32.50.X private network inside the Checkpoint. It is assumed that traffic from inside the PIX and inside the Checkpoint 4.1 Firewall to the Internet (represented here by the 172.18.124.X networks) flows prior to beginning this configuration.

Prerequisites

Requirements

There are no specific requirements for this document.

Components Used

The information in this document is based on these software and hardware versions:

- PIX Software version 5.3.1
- Checkpoint 4.1 Firewall

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Conventions

Refer to the Cisco Technical Tips Conventions for more information on document conventions.

Configure

In this section, you are presented with the information to configure the features described in this document.

Note: To find additional information on the commands used in this document, use the Command Lookup Tool (registered customers only).

Network Diagram

This document uses the network setup shown in this diagram:

Configurations

This document uses the configurations shown in this section.

```

Checkpoint Firewall

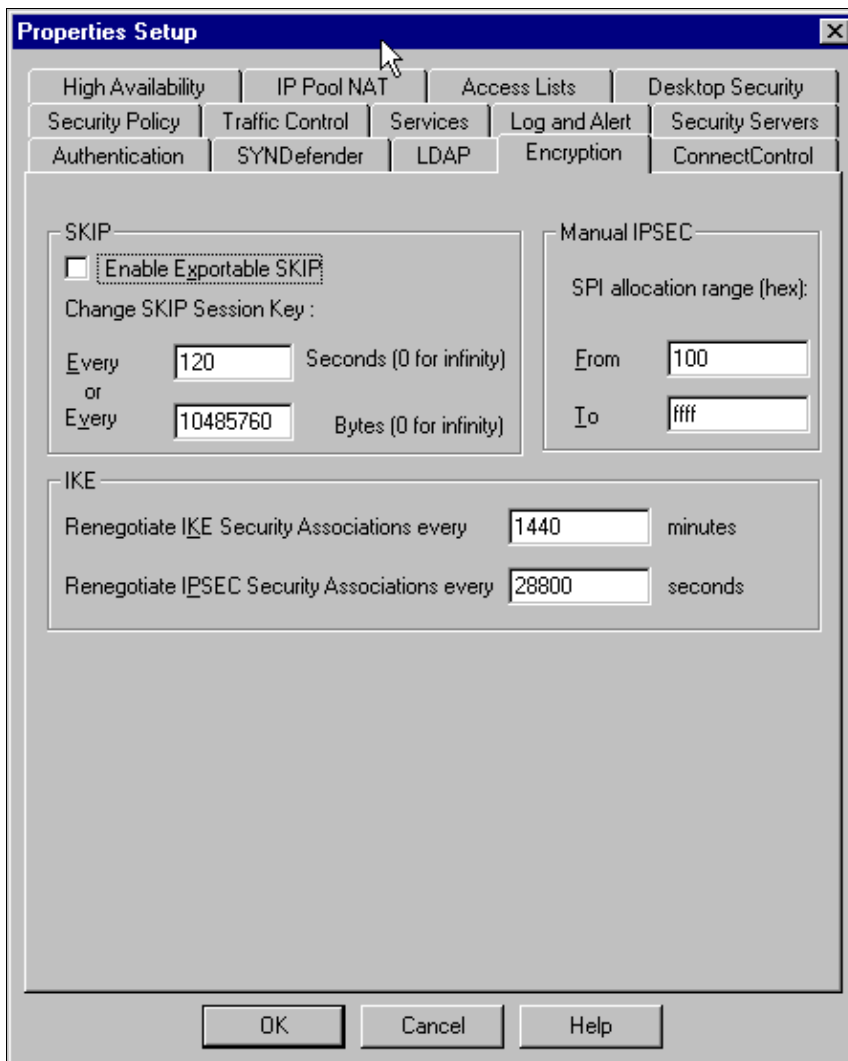

1. Since the IKE and IPSec default lifetimes differ between vendors, select **Properties > Encryption** to set the Checkpoint lifetimes to agree with the PIX defaults.

The PIX default IKE lifetime is 86400 seconds (=1440 minutes), modifiable by this command:
isakmp policy # lifetime 86400

The PIX IKE lifetime can be configured between 60–86400 seconds.

The PIX default IPSec lifetime is 28800 seconds, modifiable by this command: **crypto ipsec security-association lifetime seconds #**

You can configure a PIX IPSec lifetime between 120–86400 seconds.

2. Select **Manage > Network objects > New (or Edit) > Network** to configure the object for the internal ("cpinside") network behind the Checkpoint.

This must agree with the destination (second) network in this PIX command: **access-list 115 permit ip 192.168.1.0 255.255.255.0 10.32.50.0 255.255.255.0**

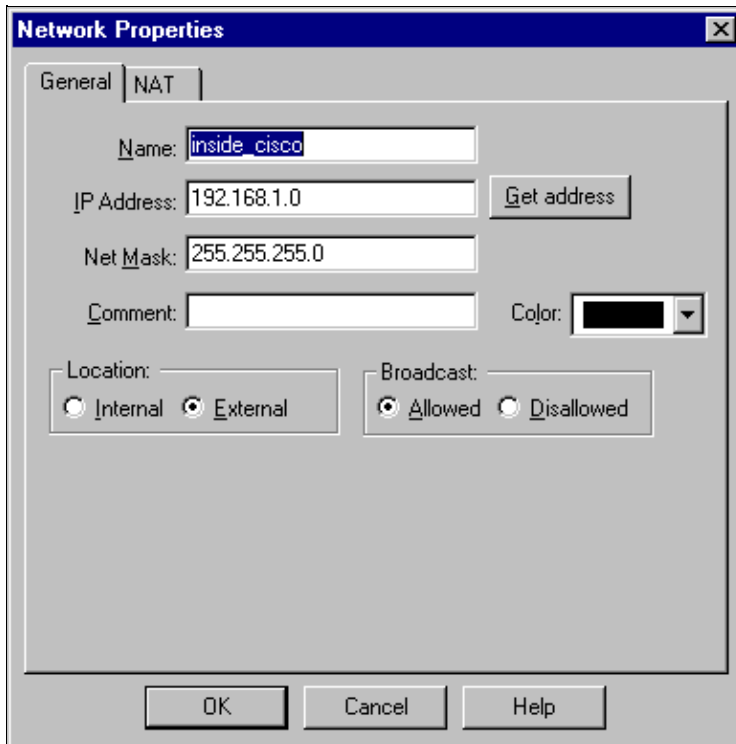

3. Select **Manage > Network objects > Edit** to edit the object for the gateway ("RTPCPVPN" Checkpoint) endpoint that the PIX points to in this command: **crypto map name # set peer ip_address**

Under Location, select **Internal**. For Type, select **Gateway**. Under Modules Installed, select the **VPN-1 & FireWall-1** checkbox, and also select the **Management Station** checkbox:

4. Select **Manage > Network objects > New > Network** to configure the object for the external ("inside_cisco") network behind the PIX.

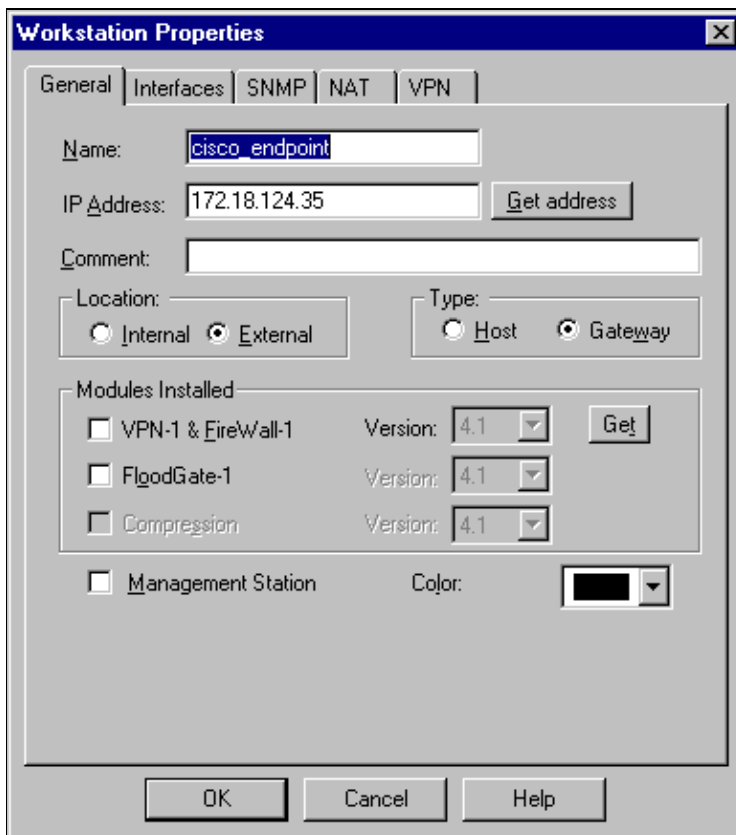

This must agree with the source (first) network in this PIX command: **access-list 115 permit ip 192.168.1.0 255.255.255.0 10.32.50.0 255.255.255.0**

5. Select **Manage > Network objects > New > Workstation** to add an object for the external ("cisco_endpoint") PIX gateway. This is the PIX interface to which this command is applied: **crypto map name interface outside**

Under Location, select **External**. For Type, select **Gateway**.

Note: Do not select the VPN-1/FireWall-1 checkbox.

6. Select **Manage > Network objects > Edit** to edit the Checkpoint gateway endpoint (called "RTPCPVPN") VPN tab. Under Domain, select **Other** and then select the inside of the Checkpoint network (called "cpinside") from the drop-down list. Under Encryption schemes defined, select **IKE**, and then click **Edit**.

7. Change the IKE properties for DES encryption to agree with this command:

isakmp policy # encryption des

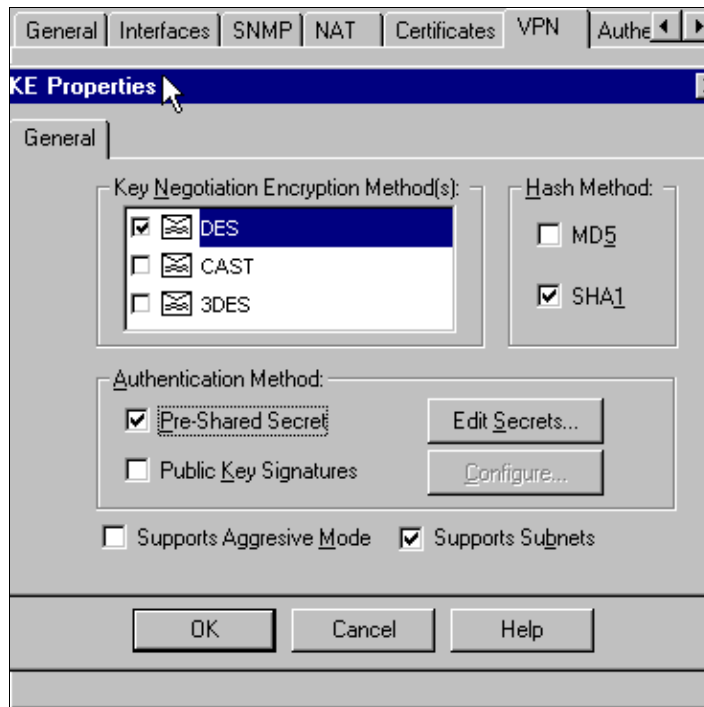

8. Change the IKE properties to SHA1 hashing to agree with this command:

isakmp policy # hash sha

Change these settings:

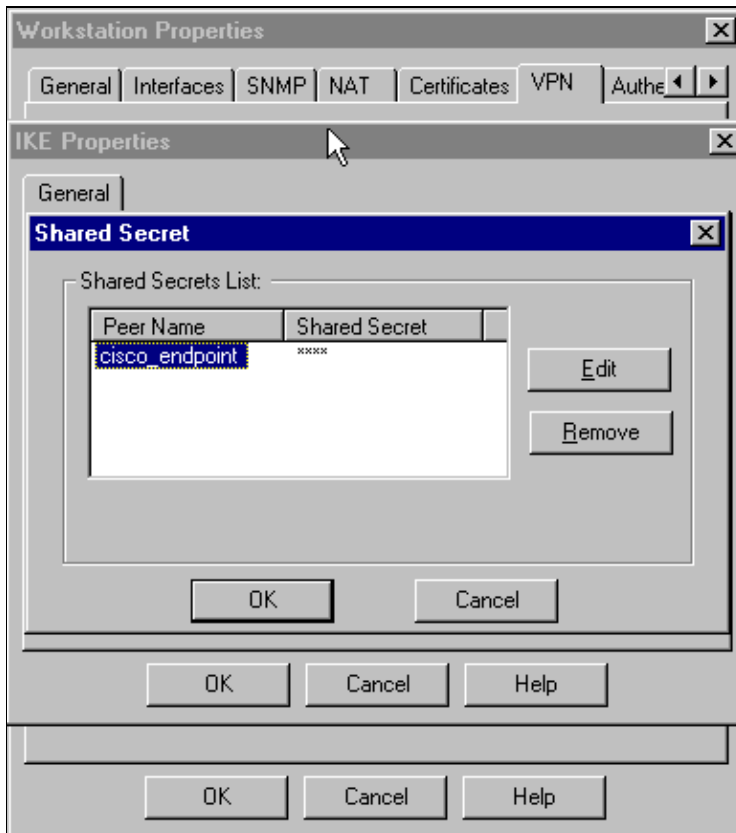

- a. De-select **Aggressive Mode**.
- b. Select the **Supports Subnets** checkbox.
- c. Under Authentication Method, select the **Pre-Shared Secret** checkbox. This agrees with this command:

isakmp policy # authentication pre-share

9. Click **Edit Secrets** to set the pre-shared key to agree with the PIX command:

isakmp key key address address netmask netmask

10. Select **Manage > Network Objects > Edit** to edit the "cisco_endpoint" VPN tab. Under Domain, select **Other**, and then select the inside of the PIX network (called "inside_cisco"). Under Encryption schemes defined, select **IKE**, and then click **Edit**.

11. Change the IKE properties DES encryption to agree with this command:

isakmp policy # encryption des

12. Change the IKE properties to SHA1 hashing to agree with this command:

crypto isakmp policy # hash sha

Change these settings:

- De-select **Aggressive Mode**.
- Select the **Supports Subnets** checkbox.
- Under Authentication Method, select the **Pre-Shared Secret** checkbox. This action agrees with this command:

isakmp policy # authentication pre-share

13. Click **Edit Secrets** to set the pre-shared key to agree with this PIX command:

isakmp key key address address netmask netmask

14. In the Policy Editor window, insert a rule with both Source and Destination as "inside_cisco" and "cpinside" (bidirectional). Set **Service=Any**, **Action=Encrypt**, and **Track=Long**.

15. Under the Action heading, click the green **Encrypt** icon and select **Edit properties** to configure encryption policies.

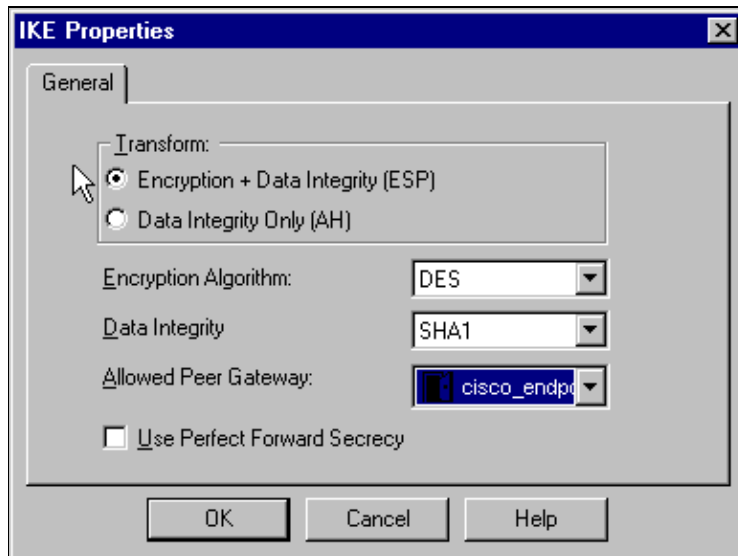

16. Select **IKE**, and then click **Edit**.

17. On the IKE Properties screen, change these properties to agree with the PIX IPsec transforms in this command:

crypto ipsec transform-set myset esp-des esp-sha-hmac

Under Transform, select **Encryption + Data Integrity (ESP)**. The Encryption Algorithm must be **DES**, Data Integrity must be **SHA1**, and the Allowed Peer Gateway must be the external PIX gateway (called "cisco_endpoint"). Click **OK**.

18. After the Checkpoint is configured, select **Policy > Install** on the Checkpoint menu in order for the changes to take effect.

debug, show and clear Commands

This section provides information you can use to confirm your configuration is working properly.

Certain **show** commands are supported by the Output Interpreter Tool (registered customers only) , which allows you to view an analysis of **show** command output.

Before you issue **debug** commands, refer to Important Information on Debug Commands.

Cisco PIX Firewall

- **debug crypto engine** Display debug messages about crypto engines, which perform encryption and decryption.
- **debug crypto isakmp** Display messages about IKE events.
- **debug crypto ipsec** Display IPsec events.
- **show crypto isakmp sa** View all current IKE security associations (SAs) at a peer.
- **show crypto ipsec sa** View the settings used by current security associations.
- **clear crypto isakmp sa** (from configuration mode) Clear all active IKE connections.
- **clear crypto ipsec sa** (from configuration mode) Delete all IPsec security associations.

Checkpoint:

Because the Tracking was set for Long in the Policy Editor window shown in step 14, denied traffic appears in red in the Log Viewer. A more verbose debug can be obtained by entering:

```
C:\WINNT\FW1\4.1\fwstop  
C:\WINNT\FW1\4.1\fw d -d
```

and in another window:

```
C:\WINNT\FW1\4.1\fwstart
```

Note: This was a Microsoft Windows NT installation.

You can clear SAs on the Checkpoint with these commands:

```
fw tab -t IKE_SA_table -x
fw tab -t ISAKMP_ESP_table -x
fw tab -t inbound_SPI -x
fw tab -t ISAKMP_AH_table -x
```

and answering **yes** at the Are you sure? prompt.

Troubleshoot

This section provides information you can use to troubleshoot your configuration.

Network Summarization

When multiple adjacent inside networks are configured in the encryption domain on the Checkpoint, the device can automatically summarize them with regard to interesting traffic. If the crypto ACL on the PIX is not configured to match, the tunnel likely fails. For example, if the inside networks of 10.0.0.0 /24 and 10.0.1.0 /24 are configured to be included in the tunnel, they can be summarized to 10.0.0.0 /23.

Sample Debug Output from the PIX

```
