Related Information

Introduction

This document explains the capabilities of a L2TP access concentrator (LAC) that performs load balancing and failover functions to multiple L2TP network servers (LNS).

Prerequisites

Requirements

There are no specific requirements for this document.

Components Used

This document is not restricted to specific software and hardware versions.

Conventions

Refer to Cisco Technical Tips Conventions for more information on document conventions.

LNS Load Balancing

When using RADIUS to deliver virtual private dial-up network (VPDN) tunnel information to a LAC, it is possible to forward users of the same dialed number identification service (DNIS) or domain to multiple LNS. This is a requirement when the incoming tunnels and sessions need to be shared across multiple LNSs to aid in load distribution and offer higher levels of redundancy. In order to enable the load balancing feature, the IP addresses for each LNS that is available as a tunnel endpoint must be delivered in the Cisco vendor-specific attribute (VSA) attribute/value pair.

```
Cisco:Avpair = "vpdn:ip-addresses=10.51.6.82,10.51.6.59"
```

The ',' is used as a delimiter to indicate that there are multiple endpoints available to the LAC (you can also use a space as the delimiter to indicate equal priority of tunnel endpoints). The LAC selects which endpoint to use based on the random selection of the first non-active IP address delivered. If this is busy (the LAC cannot connect to the IP address) the next IP address is selected. If there are no non-active IP addresses available, the next selection is based on an IP address that is in 'open tunnel state', and finally an IP address that is 'pending tunnel state'.

LNS Failover

Cisco IOS® software allows a maximum of six priority levels when utilizing multiple LNSs. By using the '/' as the delimiter, you can assign different priority groups to the LNS that are downloaded to the LAC. This allows certain LNSs to operate as the primary LNS and others as a backup. As before, the tunnel endpoints are delivered in the Cisco VSA attribute/value pair.

```
Cisco:Avpair = "vpdn:ip-addresses=10.51.6.82/10.51.6.59"
```

The '/' delimiter indicates that 10.51.6.82 is in Priority Group 1 and 10.51.6.59 is in Priority Group 2.

LNS Load Balancing and Failover

It is possible to use both load balancing and failover in the same profile. This is achieved by using the Cisco VSA attribute/value pair "vpdn:ip-addresses", as shown here:

```
Cisco:Avpair = "vpdn:ip-addresses=  
1.1.1.1,2.2.2.2/3.3.3.3,4.4.4.4/5.5.5.5,6.6.6.6"
```

This is interpreted as:

- tunnel endpoints 1.1.1.1 and 2.2.2.2 are in Priority Group 1
- tunnel endpoints 3.3.3.3 and 4.4.4.4 are in Priority Group 2
- tunnel endpoints 5.5.5.5 and 6.6.6.6 are in Priority Group 3

The load balancing function is performed on Priority Group 1 – non-active/non-busy, open, pending. If none are available at this priority level, go to the next priority level, and continue the selection logic.

Lab Testing

The testing in this section shows three different scenarios for using the load balancing and failover features:

- LNS load balancing using Cisco vendor-specific attribute/value pairs
- LNS Failover using Cisco vendor-specific attribute/value pairs
- LNS load balancing and failover using Cisco vendor-specific attribute/value pairs

LNS Load Balancing using Cisco Vendor-Specific Attribute/Value Pairs

RADIUS Profile

RADIUS user and tunnel profiles on Merit RADIUS Server 3.6B:

```
2500-1 Password = "cisco"  
Service-Type = Framed,  
Framed-Protocol = PPP,  
Framed-IP-Address = 255.255.255.255
```

```
dnis:614629 Password = "cisco"  
Service-Type = Outbound,  
Cisco:Avpair = "vpdn:tunnel-type=l2tp",  
Cisco:Avpair = "vpdn:tunnel-id=hgw",  
Cisco:Avpair = "vpdn:ip-addresses=10.51.6.82,10.51.6.59",  
Cisco:Avpair = "vpdn:l2tp-tunnel-password=hello"
```
