Introduction

In many environments, you need to configure an Access Server that can accept incoming calls from both Async and ISDN users. These users are then able to seamlessly connect to the network as if they were physically present. Such a setup is commonly used to provide network connectivity to users who travel and are telecommuters, and also for Small Office–Home Office (SOHO) sites.

This document describes how to configure an Access Server to accept incoming Async and ISDN calls on ISDN T1 PRI circuits. The configuration provides the minimum setup required for the network access server (NAS) to accept the call. You can add additional features to this configuration based on your needs.

Prerequisites

Requirements

There are no specific requirements for this document.

Components Used

The information in this document is based on these software and hardware versions:

- Cisco AS5300 with 192 MICA modems and eight T1 ports that run Cisco IOS® Software Release 12.2(5).
- Two T1 PRIs.
- A PC that runs Microsoft Windows. This PC has an analog modem and a phone connection to the Public Switch Telephone Network. The PC dials the T1 PRI that is connected to the AS5300.
- Cisco 800 and 1600 series routers with ISDN BRI circuits. These routers are the ISDN dialin clients.

The configuration for the Cisco 1600 is provided. You can apply this client configuration to any router with a BRI interface.

- Local Authentication, Authorization and Accounting (AAA). If you have a AAA Radius or Tacacs+ Server, you can use either of them to provide AAA for the incoming calls. Refer to Implementing the Server-Based AAA Subsystem for more information.

Note: The configuration of the Cisco 800 router is similar to the configuration of the Cisco 1600 router, and is not included in this document.

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Related Products

You can use this configuration with any router that has T1 or PRI Cards and Internal Digital Modems (for example, MICA, NextPort or Microcom). Any AS5xxx series router with a T1 or PRI card and digital modems can use the concepts in this configuration.

Cisco 2600 series routers do not support Internal Digital Modems. You can configure Cisco 2600 series routers to accept only ISDN calls, provided the router has a T1 or PRI WIC or Network Module.

Cisco 3600 series routers can support both ISDN and Modem calls. However, Cisco 3600 series routers require a T1 or PRI WIC or Network Module, and the NM-xDM Digital Modem Network Module.

You can also make modifications to use this configuration with E1 or PRI Ports. Configure the E1 controller with the linecoding, framing and other physical characteristics that your Telco supplies. The D-channel configuration (interface Serial x:15 for E1s) is similar to the one shown in this document.

Conventions

For more information on document conventions, refer to the Cisco Technical Tips Conventions .

Configure

In this section, you are presented with the information to configure the features described in this document.

Note: To find additional information on the commands used in this document, use the Command Lookup Tool (registered customers only) .

    no cdp enable
    ppp authentication chap
    ppp multilink
    !
interface Group-Async0

!--- This group-async interface is the configuration template for all modems.
!--- You need not configure individual async interfaces because you can
!--- clone the interfaces from one managed copy.

    ip unnumbered Loopback0

!--- A Loopback interface is always up/up. So, unnumber the loopback interface
!--- for stability.

    encapsulation ppp
    dialer in-band
    dialer idle-timeout 900
    dialer-group 5

!--- Interesting traffic is defined in dialer-list 5.
!--- Note: The specified dialer-group number must be the same as the
!--- dialer-list number. In this example, the number is defined as "5".

    async mode interactive

!--- Users can dial in and get to a shell or PPP session on that line.
!--- You can use this command in conjunction with autoselect ppp
!--- under the line configuration to automatically detect the connection type.

    peer default ip address pool ASYNC

!--- Clients are assigned addresses from the IP address pool named ASYNC.

    no fair-queue
    ppp authentication chap

!--- Use CHAP authentication.

    ppp multilink
    group-range 1 192

!--- Modems 1 through 192 are members of this group async interface.

```

```

!
interface Dialer10

!--- Configuration for rotary group 10.
!--- The Dialer interface number (10) must exactly match rotary
!--- group number configured on the physical interfaces.

    ip unnumbered Loopback1

!--- A Loopback interface is always up/up. So, unnumber the loopback interface
!--- for stability.

    encapsulation ppp
    dialer in-band

!--- Enable V.25bis on this interface.

    dialer idle-timeout 900

!--- Idle timeout for incoming calls is 900 seconds (15 mins).

    dialer-group 5

!--- Apply interesting traffic definition from dialer-list 5.
!--- Note: The specified dialer-group number must be the same
!--- as the dialer-list number.
!--- In this example, the number is defined as "5".

    peer default ip address pool ISDN

!--- Clients are assigned addresses from the IP address pool named ISDN.

    ppp authentication chap
    ppp multilink

isdn switch-type basic-ni

!--- Switch-type for the BRI circuit. Obtain this information from the Telco.

!
interface Ethernet0
  ip address 10.0.0.1 255.255.255.0
  no keepalive
!
interface Serial0
  no ip address
  shutdown
!
interface BRI0

!--- BRI physical interface configuration.

  no ip address

```

```

!--- An IP address is not required on the physical BRI interface because
!--- this is a dialer pool.
!--- The IP addressing functionality is in interface Dialer 1 (dialer pool).

encapsulation ppp
dialer pool-member 1

!--- Places the interface into dialer pool 1 from which Dialer interfaces
!--- can draw channels as needed.
!--- Links the physical interface with the logical dialer interfaces.
!--- Dialer Pool 1 is defined in interface Dialer 1.

isdn switch-type basic-ni
isdn spid1 51255511110101 5551111
isdn spid2 51255511120101 5551112

!--- Service Profile IDentifiers (SPIDs) are found primarily in North America.
!--- SPIDs are not required for certain switch types. Confirm with your Telco.
!--- If the Telco informs you that you do not need SPIDs, do not use these
!--- two SPID commands.

ppp authentication chap callin

!--- Perform one way CHAP authentication.

ppp multilink

!--- Permit multilink on this BRI interface.

!
interface Dialer1

!--- This dialer is the logical interface for the dialer pool.

ip address negotiated

!--- IP address for this interface is obtained from the NAS during
!--- IPCP negotiation. Alternatively, you can also unnumber this interface
!--- to a working interface (example, ethernet 0).

encapsulation ppp
dialer pool 1

!--- Defines Dialer pool 1.
!--- BRI 0 is a member of this pool.

dialer idle-timeout 900

!--- Idle-timout for this link is 900 seconds (15 minutes).
!--- The link is disconnected if there is no interesting traffic for 900 secs.

dialer string 81560 class 56k

!--- Dial 81560 and use the map-class named "56k".

dialer load-threshold 1 outbound

!--- Sets the outbound load level for traffic at which
!--- additional connections are added to the MP bundle load level.
!--- Values range from 1 (unloaded) to 255 (fully loaded).
!--- With a threshold of 1, the additional links are immediately
!--- brought up and added to the bundle.

dialer-group 1

!--- Apply interesting traffic definition from dialer-list 1.

```

```
ppp authentication chap callin

!--- Use one way PPP CHAP authentication.

ppp chap hostname austin_isdn

!--- Use the CHAP username austin_isdn to authenticate to the other router.

ppp chap password 7 <deleted>

!--- Use this CHAP password to authenticate to the other router.

ppp multilink

!--- Allow multilink for the dialer profile.
!--- Without this command multilink is NOT negotiated.

!
!
ip classless
ip route 0.0.0.0 0.0.0.0 Dialer1

!--- Set the default route to be interface Dialer 1 (the dialer pool).
!--- Traffic sent to int Dialer1 causes the dialer pool member (int BRI 0)
!--- to be dialed.

no ip http server
!
!
map-class dialer 56k

!--- Map-class named "56k" that you used with the dialer string in int Dialer1.

dialer isdn speed 56

!--- Set the speed of the call to be 56k (the default speed is 64k).
!--- This setting is optional for your connection.
!--- Consult your Telco to find out if you need to configure the dial
!--- speed to 56k.

access-list 101 remark Interesting traffic for dialer-list 1
access-list 101 deny    udp any any eq ntp
access-list 101 permit ip any any

!--- Define NTP traffic as NOT interesting to prevent periodic NTP traffic
!--- from keeping the link up indefinitely.
!--- All other IP traffic is interesting.
!--- Change this depending on your traffic needs.

dialer-list 1 protocol ip list 101

!--- Access-list 101 defines interesting traffic.
!--- Apply this to interface Dialer 1 through the command dialer-group 1.
!--- Note: The specified dialer-list number must be the same as the
!--- dialer-group number. In this example, the number is defined as "1"

```

Verify

This section provides information you can use to confirm your configuration is working properly.

Certain **show** commands are supported by the Output Interpreter Tool (registered customers only) , which allows you to view an analysis of **show** command output.

- **show isdn status** ensures that the router communicates properly with the ISDN switch. In the output, ensure that `Layer 1 Status` is `ACTIVE`, and that the `Layer 2 Status state = MULTIPLE_FRAME_ESTABLISHED` appears. This command also displays the number of active calls. Refer to [Using the show isdn status Command for BRI Troubleshooting](#) for more information.
- **show ppp multilink** displays information on active multilink bundles. Use this command to verify the multilink connection.
- **show dialer [interface type number]** displays general diagnostic information for interfaces configured for DDR. If the dialer comes up properly, the `Dialer state is data link layer up` message must appear. If `physical layer up` appears, the implication is that line protocol came up, but the Network Control Protocol (NCP) did not. The source and destination addresses of the packet that initiated the dialing are shown in the `Dial reason` line. This **show** command also displays the configuration of the timer, and the time before the connection times out.
- **show caller user username detail** shows parameters for the particular user, for example, the IP address assigned, PPP and PPP bundle parameters. If your version of the Cisco IOS software does not support this command, use the **show user** command.
- **show dialer map** displays configured dynamic and static dialer maps. You can use this command to check whether a dynamic dialer map is created. You cannot route packets without a dialer map.

Sample show Output

Here are some **show** command outputs for successful calls. Pay attention to the bold sections and the comments provided in the output. Compare the output that you obtain with the results shown here.

General View

IP: Local 172.22.61.1, remote 172.22.61.2

```

*!--- Dialer interface (Local) IP address
!--- and the IP address assigned to the peer.*

```

Bundle: First link of austin_isdn, 2 links, last input 00:00:01
Counts: 12 packets input, 1712 bytes, 0 no buffer
        0 input errors, 0 CRC, 0 frame, 0 overrun
        67 packets output, 5030 bytes, 0 underruns
        0 output errors, 0 collisions, 0 interface resets

```

Troubleshoot

This section provides information you can use to troubleshoot your configuration.

Troubleshooting Resources

Use these resources as required:

- Incoming Modem Call Troubleshooting Use this document to troubleshoot Analog Call Failure.
- PRI Async Modem Callin Use this document for additional Information to troubleshoot Analog Call Failures.
- Incoming ISDN Call Troubleshooting Use this document to troubleshoot ISDN Call Failure.
- PRI ISDN Callin Use this document for additional Information to troubleshoot ISDN Call Failures.

- T1 troubleshooting flowchart Use this flowchart if you suspect that the T1 circuit does not work properly.
- Loopback Tests for T1/56K Lines Use this document to confirm that the T1 Port on the router functions correctly.

Troubleshooting Commands

Certain **show** commands are supported by the Output Interpreter Tool (registered customers only) , which allows you to view an analysis of **show** command output.

Note: Before issuing **debug** commands, please see Important Information on Debug Commands.

- **debug dialer** displays DDR debugging information about the packets received on a dialer interface. This information can help to ensure there is interesting traffic that uses the dialer interface.
- **debug isdn q931** shows call setup and tear down of the ISDN network connection (Layer 3).
- **debug modem** displays modem line activity on an access server. The output displays when the modem line changes state.
- **debug modem csm** enables you to troubleshoot Call Switching Module (CSM) problems on routers with internal digital modems. With this command, you can trace the complete sequence of switching incoming and outgoing calls.
- **debug ppp negotiation** displays information on the PPP traffic and exchanges, and negotiates Link Control Protocol (LCP), Authentication, and Network Control Protocol (NCP). A successful PPP negotiation first opens the LCP state, then authenticates, and finally negotiates NCP. Multilink Parameters such as Maximum Receive Reconstructed Unit (MRRU) are established during LCP negotiation.
- **debug ppp authentication** displays PPP authentication protocol messages, including CHAP packet exchanges and Password Authentication Protocol (PAP) exchanges.
- **debug ppp error** displays protocol errors and error statistics associated with PPP connection negotiation and operation.

Sample debug Output

Here are some **debug** outputs for successful calls. Pay attention to the bolded sections and the comments provided in the outputs. Compare the output that you obtain with the result shown here.

For an Analog Call

```
maui-nas-02#debug isdn q931
ISDN Q931 packets debugging is on
maui-nas-02#debug modem
Modem control/process activation debugging is on
maui-nas-02#debug modem csm
Modem Management Call Switching Module debugging is on
maui-nas-02#debug ppp negotiation
PPP protocol negotiation debugging is on
maui-nas-02#debug ppp authentication
PPP authentication debugging is on
