Configure

- Enable Zero Touch Configuration (Enabled by Default)
- Add the MIC to the AP Authorization List
- Configure Bridging Parameters for the APs

Verify

Troubleshoot

- Troubleshooting Commands

Related Information

Introduction

This document provides a basic configuration example for how to establish a point-to-point bridged link using the Mesh Network solution. This example uses two lightweight access point (LAPs). One LAP operates as a roof-top access point (RAP), the other LAP operates as a pole-top access point (PAP), and they are connected to a Cisco Wireless LAN (WLAN) Controller (WLC). The RAP is connected to the WLC through a Cisco Catalyst switch.

Prerequisites

- The WLC is configured for basic operation.
- The WLC is configured in Layer 3 mode.
- The switch for the WLC is configured.

Requirements

Ensure that you meet these requirements before you attempt this configuration:

- Basic knowledge of the configuration of LAPs and Cisco WLCs
- Basic knowledge of Lightweight AP Protocol (LWAPP). Refer to Understanding the Lightweight Access Point Protocol (LWAPP) for more information.
- Knowledge of the configuration of an external DHCP server and/or domain name server (DNS)
- Basic configuration knowledge of Cisco switches

Components Used

The information in this document is based on these software and hardware versions:

- Cisco 4402 Series WLC that runs firmware 3.2.150.6
- Two (2) Cisco Aironet 1510 Series LAPs
- Cisco Layer 2 Switch

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Conventions

Refer to Cisco Technical Tips Conventions for more information on document conventions.

Background Information

Cisco Aironet 1510 Series Lightweight Outdoor Mesh AP

The Cisco Aironet 1510 Series Lightweight Outdoor Mesh AP is a wireless device designed for wireless client access and point-to-point bridging, point-to-multipoint bridging, and point-to-multipoint mesh wireless connectivity. The outdoor access point is a standalone unit that can be mounted on a wall or overhang, on a rooftop pole, or on a street light pole.

The AP1510 operates with controllers to provide centralized and scalable management, high security, and mobility. Designed to support zero-configuration deployments, the AP1510 easily and securely joins the mesh network and is available to manage and monitor the network through the controller GUI or CLI.

The AP1510 is equipped with two simultaneously operating radios: a 2.4-GHz radio used for client access and a 5-GHz radio used for data backhaul to other AP1510s. Wireless LAN client traffic passes through the backhaul radio of the AP or is relayed through other AP1510s until it reaches the controller Ethernet connection.

Roof-top Access Point (RAP)

RAPs have a wired connection to a Cisco WLC. They use the backhaul wireless interface to communicate with neighboring PAPs. RAPs are the parent node to any bridging or mesh network and connect a bridge or mesh network to the wired network. Therefore, there can only be one RAP for any bridged or mesh network segment.

Note: When you use the mesh networking solution for LAN-to-LAN bridging, do not connect a RAP directly to a Cisco WLC. A switch or router between the Cisco WLC and the RAP is required because Cisco WLCs do not forward Ethernet traffic that comes from an LWAPP-enabled port. RAPs can work in Layer 2 or Layer 3 LWAPP mode.

Pole-top Access Point (PAP)

PAPs have no wired connection to a Cisco WLC. They can be completely wireless, and support clients that communicate with other PAPs or RAPs, or they can be used to connect to peripheral devices or a wired network. The Ethernet port is disabled by default for security reasons, but you should enable it for PAPs.

Note: Cisco Aironet 1030 Remote Edge LAPs support single-hop deployments while Cisco Aironet 1500 Series Lightweight Outdoor APs support both single- and multi-hop deployments. As such, Cisco Aironet 1500 Series Lightweight Outdoor APs can be used as rooftop APs and as PAPs for one or more hops from the Cisco WLC.

Features Not Supported on Mesh Networks

These controller features are not supported on mesh networks:

- Multi-country support
- Load-based CAC (Mesh networks support only bandwidth-based, or static, CAC.)
- High availability (fast heartbeat and primary discovery join timer)
- EAP-FASTv1 and 802.1X authentication
- EAP-FASTv1 and 802.1X authentication
- Locally significant certificate
- Location-based services

Access Point Startup Sequence

This list describes what happens when the RAP and PAP start up:

- All traffic travels through the RAP and the Cisco WLC before it is sent to the LAN.
- When the RAP comes up, the PAPs automatically connect to it.
- The connected link uses a shared secret to generate a key that is used to provide Advanced Encryption Standard (AES) for the link.
- Once the remote PAP connects to the RAP, the mesh APs can pass data traffic.
- Users can change the shared secret or configure the mesh APs using the Cisco command line interface (CLI), the Cisco web user interface of the controller, or the Cisco Wireless Control System (Cisco WCS). Cisco recommends that you modify the shared secret.

Configure

Complete these steps in order to configure the WLC and the APs for point-to-point bridging.

1. Enable Zero Touch Configuration on the WLC.
2. Add the MIC to the AP authorization list.
3. Configure bridging parameters for the APs.
4. Verify the configuration.

Enable Zero Touch Configuration (Enabled by Default)

GUI Configuration

Enable Zero Touch Configuration enables the APs to get the shared secret key from the controller when it registers with the WLC. If you uncheck the this box, the controller does not provide the shared secret key, and the APs use a default pre-shared key for secure communication. The default value is enabled (or checked). Complete these steps from the WLC GUI:

Note: There is no provision for Zero-Touch configuration in WLC version 4.1 and later.

1. Choose **Wireless > Bridging** and click **Enable Zero Touch Configuration**.
2. Select the Key Format.
3. Enter the Bridging Shared Secret Key.
4. Enter the Bridging Shared Secret Key again in the Confirm Shared Secret Key.

The screenshot shows the Cisco WLC configuration interface. On the left is a navigation menu with categories: Wireless, Access Points (All APs, 802.11a Radios, 802.11b/g Radios, Third Party APs), Bridging, Rogues (Rogue APs, Known Rogue APs, Rogue Clients, Adhoc Rogues), Clients, Global RF (802.11a Network, 802.11b/g Network, 802.11h), Country, and Timers. The main content area is titled 'Bridging' and contains a section for 'Zero Touch Configuration'. This section has four fields: 'Enable Zero Touch Configuration' with a checked checkbox, 'Key Format' with a dropdown menu set to 'ASCII', 'Bridging Shared Secret Key' with a text input field containing three dots, and 'Confirm Shared Secret Key' with another text input field containing three dots.

CLI Configuration

Complete these steps from the CLI:

1. Issue the **config network zero-config enable** command in order to enable the zero touch configuration.

```
(Cisco Controller) >config network zero-config enable
```

2. Issue the **config network bridging-shared-secret <string>** command in order to add the bridging shared secret key.

```
(Cisco Controller) >config network bridging-shared-secret Cisco
```

Add the MIC to the AP Authorization List

The next step is to add the AP to the authorization list on the WLC. In order to do this, choose **Security > AP Policies**, enter the AP MAC address under Add AP to Authorization List and click **Add**.

Configure Bridging Parameters for the APs

This section provides instructions on how to configure the role of the AP in the mesh network and related bridging parameters. You can configure these parameters using either the GUI or the CLI.

1. Click **Wireless** and then **All APs** under Access Points. The All APs page appears.
2. Click the **Detail** link for your AP1510 in order to access the All APs > Details page

On this page, the AP Mode under General is automatically set to Bridge for APs that have bridge functionality, such as the AP1510. This page also shows this information under Bridging Information. Under Bridging Information, choose one of these options in order to specify the role of this AP in the mesh network:

- **MeshAP** Choose this option if the AP1510 has a wireless connection to the controller.
- **RootAP** Choose this option if the AP1510 has a wired connection to the controller.

Bridging Information

AP Role	MeshAP
Bridge Type	Outdoor
Bridge Group Name	<input type="text"/>
Ethernet Bridging	<input type="checkbox"/>
Backhaul Interface	802.11a
Bridge Data Rate (Mbps)	18

Verify

Use this section to confirm that your configuration works properly.

After the APs register with the WLC, you can view them under the Wireless tab at the top of the GUI of the WLC:

MONITOR WLANs CONTROLLER WIRELESS SECURITY MANAGEMENT COMMANDS HELP						
All APs						
Search by Ethernet MAC		<input type="text"/>	<input type="button" value="Search"/>			
AP Name	AP ID	Ethernet MAC	Admin Status	Operational Status	Port	
lab120br1510ip152	8	00:0b:85:5e:5a:80	Enable	REG	1	Detail Bridging Information
lab120br1510ip150	10	00:0b:85:5e:40:00	Enable	REG	1	Detail Bridging Information

On the CLI, you can use the **show ap summary** command in order to verify that the APs registered with the WLC:

```
(Cisco Controller) >show ap summary
```

AP Name	Slots	AP Model	Ethernet MAC	Location	Port
lab120br1510ip152	2	OAP1500	00:0b:85:5e:5a:80	default_location	1
lab120br1510ip150	2	OAP1500	00:0b:85:5e:40:00	default_location	1

```
(Cisco Controller) >
```

Click **Bridging Details** in the GUI in order to verify the role of the AP:

Bridging Details		Bridging Links	
AP Role	RAP	Parent	
Bridge Group Name		Child	lab120br1510ip150 : 00:0b:85:5e:
Backhaul Interface	802.11a		
Switch Physical Port	1		
Routing State	Maintenance		
Malformed Neighbor Packets	0		
Poor Neighbor SNR reporting	0		
Blacklisted Packets	0		
Insufficient Memory reporting	0		
Rx Neighbor Requests	37		
Rx Neighbor Responses	0		
Tx Neighbor Requests	0		
Tx Neighbor Responses	37		
Parent Changes count	0		
Neighbor Timeouts count	0		
Node Hops	0		

On the CLI, you can use the **show mesh path <Cisco AP>** and **show mesh neigh <Cisco AP>** commands in order to verify that the APs registered with the WLC:

```
(Cisco Controller) >show mesh path lab120br1510ip152
00:0B:85:5E:5A:80 is RAP
```

```

(Cisco Controller) >show mesh neigh lab120br1510ip152

(Cisco Controller) >

```

Troubleshoot

Mesh APs doesn't associate to the WLC is one of the most common issues seen in the Mesh deployment. Complete these checks:

1. Check that the MAC Address of the access point is added in the Mac Filter list in the WLC. This can be seen under **Security > Mac Filtering**.
2. Check the shared secret between the RAP and the MAP. You can see this message in the WLC when there is a mismatch in the key.

```
" LWAPP Join-Request AUTH_STRING_PAYLOAD, invalid BRIDGE key hash AP
00:0b:85:68:c1:d0"
```

Note: Always try to use the **Enable Zero Touch Configuration** option if available for a version. This automatically configures the key for the Mesh APs and avoids misconfigurations.

3. RAPs do not forward any broadcast messages on their Radio interface. So configure the DHCP server to send IP addresses through unicast so that MAP can get their IP addresses forwarded by RAP. Otherwise use a static IP for the MAP.
4. Either leave the Bridge Group Name at default values or make sure that Bridge Group Names are configured exactly the same on MAPs and the corresponding RAP.

These are issues that are specific to Mesh Access Points. For connectivity issues that are common between the WLC and an access point, refer to Troubleshoot a Lightweight Access Point Not Joining a Wireless LAN Controller.

Troubleshooting Commands

Note: Refer to Important Information on Debug Commands before you use **debug** commands.

You can use these debug commands to troubleshoot the WLC:

- **debug pem state enable** Used to configure the access policy manager debug options.

- **debug pem events enable** Used to configure the access policy manager debug options.
- **debug dhcp message enable** Shows the debug of DHCP messages that are exchanged to and from the DHCP server.
- **debug dhcp packet enable** Shows the debug of DHCP packet details that are sent to and from the DHCP server.

Some additional **debug** commands that you can use to troubleshoot are:

- **debug lwapp errors enable** Shows the debug of LWAPP errors.
- **debug pm pki enable** Shows the debug of certificate messages that are passed between the AP and the WLC.

This **debug lwapp events enable** WLC command output shows that the LAP gets registered to the WLC:

```
(Cisco Controller) >debug lwapp events enable
