

ISR G2 Data License Now Part of AppX License

Update Orders by August 21, 2014

The Data Technology Packaging License for the Cisco Integrated Services Router (ISR) G2 reached end-of-sale status in May. To help your customers migrate, electronic delivery of the license has been extended.

The data license features are now a part of the AppX license. The AppX features are key components of [Cisco IWAN](#). They allow the branch router to efficiently manage and maximize efficiency with features such as; Application Visibility and Control (AVC), Wide Area Application Services (WAAS), Performance Routing v3, Akamai Transport and Akamai SaaS features.

The AppX license includes all the required features typically deployed by both enterprise and service provider customers and includes all the feature sets of the DATA license, but also includes all required licensing for AVC, and WAAS.

Benefits of the AppX License:

- **Simplification of the ordering process** so that customers now need only order one SKU for all features that are generally deployed by enterprise and service provider customers.
- **The combined licenses are 80% less expensive** than if each license was purchased separately.

To help your customers migrate, the electronic delivery of the license is extended until August 21, 2014. **Update any existing or open quotes to reflect software license migration to the new AppX license now.** Contact your Cisco account manager if you have questions.
