

Sourcefire 3D System

User Guide

Version 5.2

Legal Notices

Cisco, the Cisco logo, Sourcefire, the Sourcefire logo, Snort, the Snort and Pig logo, and certain other trademarks and logos are trademarks or registered trademarks of Cisco and/or its affiliates in the United States and other countries. To view a list of Cisco trademarks, go to this URL: www.cisco.com/go/trademarks. Third-party trademarks mentioned are the property of their respective owners. The use of the word partner does not imply a partnership relationship between Cisco and any other company.

The legal notices, disclaimers, terms of use, and other information contained herein (the "terms") apply only to the information discussed in this documentation (the "Documentation") and your use of it. These terms do not apply to or govern the use of websites controlled by Cisco or its subsidiaries (collectively, "Cisco") or any Sourcefire-provided or Cisco-provided products. Sourcefire and Cisco products are available for purchase and subject to a separate license agreement and/or terms of use containing very different terms and conditions.

The copyright in the Documentation is owned by Cisco and is protected by copyright and other intellectual property laws of the United States and other countries. You may use, print out, save on a retrieval system, and otherwise copy and distribute the Documentation solely for non-commercial use, provided that you (i) do not modify the Documentation in any way and (ii) always include Cisco's copyright, trademark, and other proprietary notices, as well as a link to, or print out of, the full contents of this page and its terms.

No part of the Documentation may be used in a compilation or otherwise incorporated into another work or with or into any other documentation or user manuals, or be used to create derivative works, without the express prior written permission of Cisco. Cisco reserves the right to change the terms at any time, and your continued use of the Documentation shall be deemed an acceptance of those terms.

Table of Contents

Chapter 1:	Introduction to the Sourcefire 3D System	37
	Sourcefire 3D System Appliances	38
	Defense Centers.....	39
	Managed Devices	39
	Understanding Appliance Series, Models, and Capabilities.....	40
	Sourcefire 3D System Components	44
	Redundancy and Resource Sharing	44
	Network Traffic Management	45
	FireSIGHT.....	46
	Access Control.....	46
	Intrusion Detection and Prevention	47
	File Tracking, Control, and Malware Protection.....	48
	Application Programming Interfaces.....	49
	Security, Internet Access, and Communication Ports.....	50
	Internet Access Requirements	50
	Open Communication Ports Requirements	52
	Documentation Resources	54
	Documentation Conventions	54
	License Conventions.....	55
	Supported Device and Defense Center Conventions	56
	Access Conventions	56
	IP Address Conventions.....	57
	Logging into the Appliance	58
	Logging into the Appliance to Set Up an Account.....	60
	Logging Out of the Appliance	62
	Using the Context Menu	63

Chapter 2:	Using Dashboards	66
	Understanding Dashboard Widgets.....	70
	Understanding Widget Availability	71
	Understanding Widget Preferences	73
	Understanding the Predefined Widgets	74
	Understanding the Appliance Information Widget.....	75
	Understanding the Appliance Status Widget.....	76
	Understanding the Correlation Events Widget	77
	Understanding the Current Interface Status Widget	77
	Understanding the Current Sessions Widget	78
	Understanding the Custom Analysis Widget.....	79
	Understanding the Disk Usage Widget	96
	Understanding the Interface Traffic Widget.....	97
	Understanding the Intrusion Events Widget.....	97
	Understanding the Network Compliance Widget.....	99
	Understanding the Product Licensing Widget.....	101
	Understanding the Product Updates Widget.....	101
	Understanding the RSS Feed Widget.....	103
	Understanding the System Load Widget.....	104
	Understanding the System Time Widget	104
	Understanding the White List Events Widget	105
	Working with Dashboards	106
	Creating a Custom Dashboard.....	106
	Viewing Dashboards	109
	Modifying Dashboards.....	111
	Deleting a Dashboard	116
Chapter 3:	Using the Context Explorer.....	117
	Understanding the Context Explorer	119
	Understanding the Traffic and Intrusion Event Counts Time Graph	119
	Understanding the Network Information Section	120
	Understanding the Application Information Section	126
	Understanding the Intrusion Information Section.....	131
	Understanding the Files Information Section	135
	Understanding the Geolocation Information Section.....	140
	Understanding the URL Information Section.....	143
	Refreshing the Context Explorer.....	146
	Setting the Context Explorer Time Range	147
	Minimizing and Maximizing Context Explorer Sections	147
	Drilling Down on Context Explorer Data	148
	Working with Filters in the Context Explorer	150
	Adding and Applying Filters	151
	Creating Filters with the Context Menu	155
	Bookmarking Filters	156

Chapter 4:	Using Objects and Security Zones.....	158
	Using the Object Manager.....	159
	Grouping Objects.....	159
	Browsing, Sorting, and Filtering Objects	161
	Working with Network Objects	161
	Working with Security Intelligence Lists and Feeds	162
	Working with the Global Whitelist and Blacklist	166
	Working with the Sourcefire Intelligence Feed.....	167
	Working with Custom Security Intelligence Feeds.....	168
	Manually Updating Security Intelligence Feeds.....	170
	Working with Custom Security Intelligence Lists.....	170
	Working with Port Objects.....	173
	Working with VLAN Tag Objects	174
	Working with URL Objects	175
	Working with Application Filters	176
	Working with the Global Malware Whitelist	180
	Adding a File to the Whitelist from the Event View.....	181
	Adding a File to the Whitelist by Uploading the File	182
	Adding a File to the Whitelist Using the SHA-256 Value	184
	Modifying Files on the Global Malware List	185
	Working with Security Zones.....	187
Chapter 5:	Managing Devices.....	190
	Management Concepts	191
	What Can Be Managed by a Defense Center?	191
	Beyond Policies and Events	192
	Using Redundant Defense Centers	193
	Working in NAT Environments.....	193
	Configuring High Availability	194
	Using High Availability.....	195
	Guidelines for Implementing High Availability	199
	Setting Up High Availability	200
	Monitoring and Changing High Availability Status	202
	Disabling High Availability and Unregistering Devices	204
	Pausing Communication Between Paired Defense Centers.....	205
	Restarting Communication Between Paired Defense Centers.....	205
	Working with Devices.....	206
	Understanding the Device Management Page.....	206
	Adding Devices to the Defense Center	208
	Applying Changes to Devices	211
	Using the Device Management Revision Comparison Report.....	212
	Deleting Devices.....	212

Table of Contents

Configuring Remote Management	213
Editing Remote Management.....	216
Changing the Management Port.....	217
Managing Device Groups	217
Adding Device Groups	218
Editing Device Groups	218
Deleting Device Groups.....	219
Clustering Devices.....	220
Establishing Device Clusters	223
Editing Device Clusters.....	224
Configuring Individual Devices in a Cluster.....	225
Configuring Individual Device Stacks in a Cluster	226
Configuring Interfaces on a Clustered Device	227
Switching the Active Peer in a Cluster	228
Placing a Clustered Device into Maintenance Mode	229
Replacing a Device in a Clustered Stack.....	229
Establishing Clustered State Sharing.....	230
Troubleshooting Clustered State Sharing.....	233
Separating Clustered Devices.....	236
Managing Stacked Devices.....	237
Establishing Device Stacks	239
Editing Device Stacks	241
Configuring Individual Devices in a Stack	242
Configuring Interfaces on a Stacked Device	243
Separating Stacked Devices	243
Editing Device Configuration	244
Editing Assigned Device Names.....	244
Enabling and Disabling Device Licenses.....	246
Editing Device System Settings.....	247
Viewing the Health of a Device.....	248
Editing Device Management Settings	249
Understanding Advanced Device Settings.....	250
Editing Advanced Device Settings	251
Configuring Fast-Path Rules.....	253
Configuring Interfaces	258
Configuring the Management Interface.....	260
Configuring HA Link Interfaces	262
Configuring the Interface MTU	263
Disabling Interfaces	264
Preventing Duplicate Connection Logging.....	265
Chapter 6: Setting Up an IPS Device	266
Understanding Passive IPS Deployments.....	266
Configuring Passive Interfaces	267

	Understanding Inline IPS Deployments	269
	Configuring Inline Interfaces	269
	Configuring Inline Sets.....	271
	Viewing Inline Sets	271
	Adding Inline Sets.....	271
	Configuring Advanced Inline Set Options	275
	Deleting Inline Sets.....	279
Chapter 7:	Setting Up Virtual Switches	281
	Configuring Switched Interfaces.....	282
	Configuring Physical Switched Interfaces	283
	Adding Logical Switched Interfaces.....	285
	Deleting Logical Switched Interfaces.....	287
	Configuring Virtual Switches	288
	Viewing Virtual Switches.....	288
	Adding Virtual Switches	289
	Configuring Advanced Virtual Switch Settings	291
	Deleting Virtual Switches	294
Chapter 8:	Setting Up Virtual Routers.....	295
	Configuring Routed Interfaces	296
	Configuring Physical Routed Interfaces	296
	Adding Logical Routed Interfaces	300
	Deleting Logical Routed Interfaces.....	304
	Configuring SFRP.....	304
	Configuring Virtual Routers	306
	Viewing Virtual Routers.....	307
	Adding Virtual Routers	307
	Setting up DHCP Relay	310
	Setting up Static Routes	313
	Setting up Dynamic Routing	316
	Setting up RIP Configuration.....	316
	Setting Up OSPF Configuration	323
	Setting up Virtual Router Filters	335
	Adding Virtual Router Authentication Profiles	339
	Viewing Virtual Router Statistics.....	340
	Deleting Virtual Routers	341
	Configuring NAT on a Virtual Router	341
	Understanding the NAT Entry List.....	343
	Adding NAT Entries.....	344
	Deleting NAT Entries	350

Chapter 9:	Setting Up Hybrid Interfaces	352
	Adding Logical Hybrid Interfaces	352
	Deleting Logical Hybrid Interfaces	356
Chapter 10:	Using Gateway VPN	358
	Understanding IPSec	359
	Understanding IKE	359
	Understanding VPN Deployments	360
	Understanding Point-to-Point VPN Deployments	360
	Understanding Star VPN Deployments	360
	Understanding Mesh VPN Deployments	361
	Managing VPN Deployments	362
	Configuring VPN Deployments	363
	Configuring Advanced VPN Deployment Settings	374
	Applying a VPN Deployment	377
	Viewing VPN Deployment Status	377
	Viewing VPN Statistics and Logs	378
	Using the VPN Deployment Comparison View	381
Chapter 11:	Using NAT Policies	383
	Planning and Implementing a NAT Policy	384
	Configuring NAT Policies	385
	Managing NAT Policy Targets	387
	Organizing Rules in a NAT Policy	389
	Working with NAT Rule Warnings and Errors	390
	Managing NAT Policies	391
	Creating a NAT Policy	392
	Editing a NAT Policy	394
	Copying a NAT Policy	395
	Viewing a NAT Policy Report	396
	Comparing Two NAT Policies	397
	Applying a NAT Policy	401
	Creating and Editing NAT Rules	404
	Understanding NAT Rule Types	406
	Understanding NAT Rule Conditions and Condition Mechanics	409
	Understanding NAT Rule Conditions	410
	Adding Conditions to NAT Rules	411
	Searching NAT Rule Condition Lists	413
	Adding Literal Conditions to NAT Rules	414
	Using Objects in NAT Rule Conditions	415

	Working with Different Types of Conditions in NAT Rules.....	415
	Adding Zone Conditions to NAT Rules.....	415
	Adding Source Network Conditions to Dynamic NAT Rules.....	418
	Adding Destination Network Conditions to NAT Rules.....	419
	Adding Port Conditions to NAT Rules	421
Chapter 12:	Using Access Control Policies	424
	Configuring Policies	426
	Setting the Default Action.....	428
	Logging Connections for the Default Action.....	431
	Using Custom User Roles with Access Control Policies	433
	Managing Policy Targets	434
	Adding an HTTP Response Page	436
	Filtering Traffic Based on Security Intelligence Data.....	438
	Configuring Advanced Access Control Policy Settings	447
	Organizing Rules in a Policy	449
	Working with Rule Categories	451
	Searching for Rules.....	453
	Filtering Rules by Device	454
	Working with Warnings and Errors	455
	Managing Access Control Policies.....	456
	Creating an Access Control Policy	458
	Editing an Access Control Policy.....	459
	Copying an Access Control Policy.....	460
	Viewing an Access Control Policy Report	461
	Comparing Two Access Control Policies.....	462
	Applying an Access Control Policy.....	466
Chapter 13:	Understanding and Writing Access Control Rules	472
	Creating and Editing Access Control Rules	474
	Understanding Rule Actions	478
	Understanding Rule Conditions and Condition Mechanics	482
	Understanding Rule Conditions	483
	Adding Rule Conditions.....	485
	Searching Condition Lists	489
	Adding Literal Conditions.....	490
	Using Objects in Conditions	491

Table of Contents

Working with Different Types of Conditions	491
Adding Zone Conditions.....	492
Adding Network Conditions.....	493
Adding VLAN Tag Conditions.....	495
Adding User Conditions.....	497
Working with Application Conditions.....	498
Adding Port Conditions.....	504
Adding URL Conditions.....	506
Performing File and Intrusion Inspection on Allowed Traffic.....	511
Logging Connection, File, and Malware Information.....	515
Adding Comments to a Rule.....	521
Chapter 14:	
 Configuring External Alerting.....	524
Working with Alert Responses	526
Creating an Email Alert Response	527
Creating an SNMP Alert Response.....	528
Creating a Syslog Alert Response.....	530
Modifying an Alert Response	534
Deleting an Alert Response	534
Enabling and Disabling Alert Responses	534
Configuring Impact Flag Alerting	535
Configuring Discovery Event Alerting	536
Configuring Advanced Malware Protection Alerting.....	537
Chapter 15:	
 Working With Connection Data.....	539
Understanding Connection Data.....	540
Understanding Connection Summaries	542
Connection Data Fields.....	543
Information Available in Connection Events.....	550
Uses for Connection Data in the Sourcefire 3D System.....	554
Viewing Connection Data Graphs and Tables	555
Working with Connection Graphs	555
Changing the Graph Type.....	557
Selecting Datasets.....	560
Viewing Information About Aggregated Connection Data	563
Manipulating a Connection Graph on a Workflow Page.....	563
Drilling Down Through Connection Data Graphs	564
Recentering and Zooming on Line Graphs	565
Selecting Data to Graph.....	565
Detaching Connection Graphs	569
Exporting Connection Data.....	569

Table of Contents

	Working with Connection Data Tables	570
	Working with Connection Events Associated with Monitor Rules	571
	Viewing Files Detected in a Connection	572
	Viewing Intrusion Events Associated with a Connection	574
	Searching for Connection Data	575
	Viewing the Connection Summary Page	578
Chapter 16:	Introduction to Sourcefire Intrusion Prevention	581
	Understanding How Traffic Is Analyzed	583
	Capturing and Decoding Packets	584
	Processing Packets	585
	Generating Events	586
	Analyzing Intrusion Event Data	587
	Using Intrusion Event Responses	588
	Understanding Intrusion Prevention Deployments	588
	The Benefits of Custom Intrusion Policies	591
Chapter 17:	Working with Intrusion Events.....	593
	Viewing Intrusion Event Statistics	595
	Host Statistics.....	596
	Event Overview	597
	Event Statistics	598
	Viewing Intrusion Event Performance.....	598
	Generating Intrusion Event Performance Statistics Graphs.....	599
	Viewing Intrusion Event Graphs.....	601
	Viewing Intrusion Events	602
	Understanding Intrusion Events	604
	Viewing Connection Data Associated with Intrusion Events	610
	Reviewing Intrusion Events	611
	Understanding Workflow Pages for Intrusion Events	612
	Using Drill-Down and Table View Pages	616
	Using the Packet View	622
	Viewing Event Information.....	625
	Viewing Frame Information.....	634
	Viewing Data Link Layer Information	635
	Viewing Network Layer Information	636
	Viewing Transport Layer Information	638
	Viewing Packet Byte Information.....	641

	Using Impact Flags to Evaluate Events	641
	Searching for Intrusion Events	644
	Using the Clipboard	652
	Generating Clipboard Reports.....	652
	Deleting Events from the Clipboard.....	654
Chapter 18:	Handling Incidents.....	656
	Incident Handling Basics.....	657
	Definition of an Incident.....	657
	Common Incident Handling Processes.....	657
	Incident Types in the Sourcefire 3D System.....	660
	Creating an Incident.....	661
	Editing an Incident	663
	Generating Incident Reports.....	664
	Creating Custom Incident Types.....	665
Chapter 19:	Configuring Intrusion Policies	667
	Planning and Implementing an Intrusion Policy	668
	Managing Intrusion Policies	670
	Creating an Intrusion Policy	672
	Editing an Intrusion Policy.....	675
	Using the Navigation Panel.....	678
	Committing Intrusion Policy Changes	679
	Reapplying an Intrusion Policy	680
	Viewing an Intrusion Policy Report	682
	Comparing Two Intrusion Policies	685
	Setting Drop Behavior in an Inline Deployment	689
	Understanding the Base Policy	691
	Using Default Intrusion Policies	692
	Using a Custom Base Policy	693
	Allowing Rule Updates to Modify the Base Policy.....	694
	Selecting the Base Policy.....	695
	Accepting Rule Setting Changes from a Custom Base Policy	696
	Managing Variables.....	698
	Understanding Existing Variables.....	699
	Modifying Variables.....	701
	Creating New Variables.....	703
	Deleting Unused Variables.....	709
	Understanding Custom Variables.....	710
	Defining IP Addresses and Ports for Your Network	711
	Defining IP Addresses in Variables and Rules.....	713
	Defining Ports in Variables and Rules	715

Chapter 20:	Managing Rules in an Intrusion Policy	717
	Understanding Intrusion Prevention Rule Types	718
	Viewing Rules in an Intrusion Policy	719
	Sorting the Rule Display.....	722
	Viewing Rule Details	723
	Filtering Rules in an Intrusion Policy	729
	Understanding Rule Filtering in an Intrusion Policy.....	730
	Setting a Rule Filter in an Intrusion Policy	741
	Setting Rule States	743
	Filtering Intrusion Event Notification Per Policy	746
	Configuring Event Thresholding.....	747
	Configuring Suppression Per Intrusion Policy	753
	Adding Dynamic Rule States	756
	Understanding Dynamic Rule States	757
	Setting a Dynamic Rule State	758
	Adding Alerts	761
	Adding SNMP Alerts	761
	Adding Rule Comments.....	762
	Managing FireSIGHT Rule State Recommendations	764
	Understanding Basic Rule State Recommendations	765
	Understanding Advanced Rule State Recommendations	766
	Using FireSIGHT Recommendations	768
Chapter 21:	Using Advanced Settings in an Intrusion Policy	773
	Modifying Advanced Settings	774
	Understanding Preprocessors	780
	Meeting Traffic Challenges with Preprocessors	781
	Understanding Preprocessor Execution Order	782
	Reading Preprocessor Events	784
	Automatically Enabling Advanced Settings	787
	Understanding Troubleshooting Options	790
Chapter 22:	Using Layers in an Intrusion Policy	792
	Understanding Intrusion Policy Layers.....	792
	Sharing Layers	794
	Using Rules in Layers	795
	Removing Multi-Layer Rule Settings.....	797
	Using the FireSIGHT Recommendations Layer	799
	Using Layers with Advanced Settings	800
	Configuring User Layers	803

Chapter 23: Using Application Layer Preprocessors 809

- Decoding DCE/RPC Traffic 810
 - Selecting Global DCE/RPC Options 811
 - Understanding Target-Based DCE/RPC Server Policies 813
 - Understanding DCE/RPC Transports..... 814
 - Selecting DCE/RPC Target-Based Policy Options 818
 - Configuring the DCE/RPC Preprocessor 821
- Detecting Exploits in DNS Name Server Responses..... 827
 - Understanding DNS Preprocessor Resource Record Inspection 827
 - Detecting Overflow Attempts in RData Text Fields 829
 - Detecting Obsolete DNS Resource Record Types..... 829
 - Detecting Experimental DNS Resource Record Types 830
 - Configuring the DNS Preprocessor..... 830
- Decoding FTP and Telnet Traffic..... 832
 - Understanding Global FTP and Telnet Options 832
 - Configuring Global FTP/Telnet Options 833
 - Understanding Telnet Options 835
 - Configuring Telnet Options 836
 - Understanding Server-Level FTP Options 838
 - Configuring Server-Level FTP Options 842
 - Understanding Client-Level FTP Options 846
 - Configuring Client-Level FTP Options 847
- Decoding HTTP Traffic 850
 - Selecting Global HTTP Normalization Options 851
 - Configuring Global HTTP Configuration Options 853
 - Selecting Server-Level HTTP Normalization Options 854
 - Selecting Server-Level HTTP Normalization Encoding Options..... 862
 - Configuring HTTP Server Options..... 865
 - Enabling Additional HTTP Inspect Preprocessor Rules 868
- Using the Sun RPC Preprocessor 869
 - Configuring the Sun RPC Preprocessor 870
- Decoding the Session Initiation Protocol 872
 - Selecting SIP Preprocessor Options 873
 - Configuring the SIP Preprocessor..... 875
 - Enabling Additional SIP Preprocessor Rules 876
- Configuring the GTP Command Channel..... 878
- Decoding IMAP Traffic 880
 - Selecting IMAP Preprocessor Options 881
 - Configuring the IMAP Preprocessor 882
 - Enabling Additional IMAP Preprocessor Rules 884
- Decoding POP Traffic 884
 - Selecting POP Preprocessor Options 885
 - Configuring the POP Preprocessor..... 887
 - Enabling Additional POP Preprocessor Rules 889

Decoding SMTP Traffic	889
Understanding SMTP Decoding	890
Configuring SMTP Decoding	895
Enabling SMTP Maximum Decoding Memory Alerting	899
Detecting Exploits Using the SSH Preprocessor	899
Selecting SSH Preprocessor Options	901
Configuring the SSH Preprocessor	903
Using the SSL Preprocessor	905
Understanding SSL Preprocessing	905
Enabling SSL Preprocessor Rules	907
Configuring the SSL Preprocessor	907
Working with SCADA Preprocessors	909
Configuring the Modbus Preprocessor	909
Configuring the DNP3 Preprocessor	911

Chapter 24: Using Transport & Network Layer Preprocessors 915

Verifying Checksums	915
Ignoring VLAN Headers	917
Normalizing Inline Traffic	918
Understanding Protocol Normalization	919
Configuring Inline Normalization	922
Defragmenting IP Packets	927
Understanding IP Fragmentation Exploits	928
Target-Based Defragmentation Policies	929
Selecting Defragmentation Options	930
Configuring IP Defragmentation	932
Understanding Packet Decoding	934
Configuring Packet Decoding	938
Using TCP Stream Preprocessing	940
Understanding State-Related TCP Exploits	941
Initiating Active Responses with Drop Rules	941
Selecting TCP Global Options	943
Understanding Target-Based TCP Policies	943
Selecting TCP Policy Options	945
Reassembling TCP Streams	949
Configuring TCP Stream Preprocessing	952
Using UDP Stream Preprocessing	956
Configuring UDP Stream Preprocessing	957

Chapter 25:	Detecting Specific Threats	959
	Detecting Back Orifice	959
	Detecting Portscans.....	961
	Configuring Portscan Detection	965
	Understanding Portscan Events.....	968
	Preventing Rate-Based Attacks	971
	Understanding Rate-Based Attack Prevention	971
	Rate-Based Attack Prevention and Other Filters	974
	Configuring Rate-Based Attack Prevention	981
	Detecting Sensitive Data	983
	Deploying Sensitive Data Detection	985
	Selecting Global Sensitive Data Detection Options	985
	Selecting Individual Data Type Options.....	987
	Using Predefined Data Types.....	988
	Configuring Sensitive Data Detection	989
	Selecting Application Protocols to Monitor.....	993
	Special Case: Detecting Sensitive Data in FTP Traffic	995
	Using Custom Data Types	996
Chapter 26:	Using Adaptive Profiles	1003
	Understanding Adaptive Profiles	1004
	Using Adaptive Profiles with Preprocessors.....	1004
	Adaptive Profiles and FireSIGHT Recommended Rules.....	1005
	Configuring Adaptive Profiles.....	1006
Chapter 27:	Using Global Rule Thresholding	1009
	Understanding Thresholding.....	1009
	Understanding Thresholding Options	1010
	Configuring Global Thresholds	1012
	Disabling the Global Threshold	1014
Chapter 28:	Using Performance Settings in an Intrusion Policy	1015
	Event Queue Configuration	1016
	Understanding Packet Latency Thresholding.....	1017
	Setting Packet Latency Thresholding Options	1019
	Configuring Packet Latency Thresholding.....	1020
	Understanding Rule Latency Thresholding	1021
	Setting Rule Latency Thresholding Options.....	1024
	Configuring Rule Latency Thresholding	1025

	Performance Statistics Configuration	1026
	Constraining Regular Expressions	1028
	Rule Processing Configuration.....	1030
Chapter 29:	Configuring External Responses to Intrusion Events.....	1033
	Using SNMP Responses	1034
	Configuring SNMP Responses	1037
	Using Syslog Responses	1038
	Configuring Syslog Responses	1040
	Understanding Email Alerting	1042
	Configuring Email Alerting	1044
Chapter 30:	Understanding and Writing Intrusion Rules.....	1046
	Understanding Rule Anatomy	1047
	Understanding Rule Headers.....	1049
	Specifying Rule Actions	1050
	Specifying Protocols	1051
	Specifying Source and Destination IP Addresses.....	1051
	Specifying Source and Destination Ports.....	1053
	Specifying Direction.....	1055

Table of Contents

Understanding Keywords and Arguments in Rules	1055
Defining Intrusion Event Details	1057
Searching for Content Matches	1063
Constraining Content Matches	1065
Replacing Content in Inline Deployments.....	1078
Using Byte_Jump and Byte_Test.....	1079
Searching for Content Using PCRE.....	1086
Adding Metadata to a Rule	1096
Inspecting IP Header Values	1101
Inspecting ICMP Header Values	1104
Inspecting TCP Header Values and Stream Size.....	1106
Enabling and Disabling TCP Stream Reassembly	1112
Extracting SSL Information from a Session	1113
Inspecting Application Layer Protocol Values	1116
Inspecting Packet Characteristics	1153
Reading Packet Data into Keyword Arguments	1156
Initiating Active Responses with Rule Keywords.....	1160
Filtering Events	1165
Evaluating Post-Attack Traffic	1166
Detecting Attacks That Span Multiple Packets	1168
Generating Events on the HTTP Encoding Type and Location	1175
Pointing to a Specific Payload Type.....	1177
Pointing to the Beginning of the Packet Payload.....	1178
Decoding and Inspecting Base64 Data.....	1179
Constructing a Rule	1181
Writing New Rules.....	1182
Modifying Existing Rules	1184
Adding Comments to Rules.....	1187
Deleting Custom Rules.....	1188
Searching for Rules.....	1189
Filtering Rules on the Rule Editor Page	1192
Using Keywords in a Rule Filter	1192
Using Character Strings in a Rule Filter	1194
Combining Keywords and Character Strings in a Rule Filter.....	1195
Filtering Rules	1195
Chapter 31: Working with Malware Protection and File Control.....	1197
Understanding Malware Protection and File Control	1199
Configuring Malware Protection and File Control	1201
Logging Events Based on Malware Protection and File Control	1202
Integrating FireAMP with the Sourcefire 3D System	1202
Network-Based AMP vs Endpoint-Based FireAMP	1204

Table of Contents

Understanding and Creating File Policies	1206
Creating a File Policy	1213
Working with File Rules	1214
Comparing Two File Policies	1217
Working with Sourcefire Cloud Connections for FireAMP.....	1219
Creating a Sourcefire Cloud Connection	1220
Deleting or Disabling a Sourcefire Cloud Connection	1221
Working with File Events	1222
Viewing File Events.....	1223
Understanding the File Events Table	1224
Searching for File Events	1227
Working with Malware Events.....	1229
Viewing Malware Events	1232
Understanding the Malware Events Table	1233
Searching for Malware Events	1239
Working with Network File Trajectory.....	1241
Reviewing Network File Trajectory	1242
Analyzing Network File Trajectory.....	1244
Chapter 32: Introduction to Network Discovery	1250
Understanding Discovery Data Collection	1251
Understanding Host Data Collection	1252
Understanding User Data Collection	1252
Understanding Application Detection	1263
Importing Third-Party Discovery Data	1269
Uses for Discovery Data	1270
Understanding NetFlow.....	1271
Differences Between NetFlow and FireSIGHT Data	1272
Preparing to Analyze NetFlow Data	1274
Creating a Network Discovery Policy	1275
Working with Discovery Rules	1276
Restricting User Logging	1285
Configuring Advanced Network Discovery Options.....	1287
Applying the Network Discovery Policy	1297
Obtaining User Data from LDAP Servers	1298
Creating LDAP Connections with the Defense Center	1298
Enabling and Disabling User Awareness LDAP Connections	1306
Performing an On-Demand User Data Retrieval for Access Control..	1307
Configuring Defense Center-User Agent Connections	1307

Chapter 33:	Using the Network Map.....	1314
	Understanding the Network Map	1315
	Working with the Hosts Network Map	1316
	Working with the Network Devices Network Map.....	1318
	Working with the Mobile Devices Network Map.....	1319
	Working with the Applications Network Map	1321
	Working with the Vulnerabilities Network Map	1323
	Working with the Host Attributes Network Map	1325
	Working with Custom Network Topologies	1326
	Creating Custom Topologies.....	1327
	Managing Custom Topologies	1332
Chapter 34:	Using Host Profiles	1334
	Viewing Host Profiles.....	1337
	Working with Basic Host Information in the Host Profile	1338
	Working with IP Addresses in the Host Profile.....	1341
	Working with Operating Systems in the Host Profile	1341
	Viewing Operating System Identities.....	1343
	Editing an Operating System	1344
	Resolving Operating System Identity Conflicts	1345
	Working with Servers in the Host Profile.....	1347
	Server Detail	1349
	Editing Server Identities.....	1352
	Resolving Server Identity Conflicts.....	1353
	Working with Applications in the Host Profile	1354
	Viewing Applications in the Host Profile	1354
	Deleting Applications from the Host Profile	1356
	Working with VLAN Tags in the Host Profile	1357
	Working with User History in the Host Profile.....	1357
	Working with Host Attributes in the Host Profile.....	1358
	Assigning Host Attribute Values	1358
	Working with Host Protocols in the Host Profile	1359
	Working with White List Violations in the Host Profile	1360
	Creating a White List Host Profile from a Host Profile	1361
	Working with Malware Detections in the Host Profile	1362

Table of Contents

Working with Vulnerabilities in the Host Profile	1363
Viewing Vulnerability Details	1365
Setting the Vulnerability Impact Qualification	1367
Downloading Patches for Vulnerabilities	1368
Setting Vulnerabilities for Individual Hosts	1368
Working with the Predefined Host Attributes	1369
Working with User-Defined Host Attributes	1370
Creating User-Defined Host Attributes	1372
Editing a User-Defined Host Attribute	1374
Deleting a User-Defined Host Attribute	1375
Working with Scan Results in a Host Profile	1375
Scanning a Host from the Host Profile	1376

Chapter 35: Working with Discovery Events..... 1377

Viewing Discovery Event Statistics.....	1378
Statistics Summary.....	1379
Event Breakdown.....	1381
Protocol Breakdown.....	1382
Application Protocol Breakdown	1382
OS Breakdown.....	1383
Viewing Discovery Performance Graphs.....	1384
Understanding Discovery Event Workflows	1386
Working with Discovery and Host Input Events	1388
Understanding Discovery Event Types	1389
Understanding Host Input Event Types	1394
Viewing Discovery and Host Input Events.....	1396
Understanding the Discovery Events Table	1397
Searching for Discovery Events	1399
Working with Hosts	1401
Viewing Hosts.....	1402
Understanding the Hosts Table	1403
Creating a Traffic Profile for Selected Hosts	1407
Creating a Compliance White List Based on Selected Hosts	1408
Searching for Hosts	1408
Working with Host Attributes	1412
Viewing Host Attributes	1412
Understanding the Host Attributes Table.....	1413
Setting Host Attributes for Selected Hosts.....	1415
Searching for Host Attributes.....	1416
Working with Servers	1418
Viewing Servers.....	1418
Understanding the Servers Table.....	1419
Searching for Servers.....	1422

Table of Contents

Working with Applications	1424
Viewing Applications	1425
Understanding the Applications Table	1425
Searching for Applications	1427
Working with Application Details	1429
Viewing Application Details	1429
Understanding the Application Detail Table	1430
Searching for Application Details	1432
Working with Sourcefire Vulnerabilities	1434
Viewing Sourcefire Vulnerabilities	1435
Understanding the Sourcefire Vulnerabilities Table	1436
Deactivating Sourcefire Vulnerabilities	1438
Searching for Sourcefire Vulnerabilities	1439
Working with Third-Party Vulnerabilities	1441
Viewing Third-Party Vulnerabilities	1441
Understanding the Third-Party Vulnerabilities Table	1442
Searching for Third-Party Vulnerabilities	1444
Working with Users	1445
Viewing Users	1447
Understanding the Users Table	1447
Understanding User Details and Host History	1449
Searching for Users	1451
Working with User Activity	1453
Viewing User Activity Events	1454
Understanding the User Activity Table	1455
Searching for User Activity	1456
Chapter 36: Configuring Correlation Policies and Rules.....	1459
Creating Rules for Correlation Policies	1461
Providing Basic Rule Information	1464
Specifying Correlation Rule Trigger Criteria	1464
Adding a Host Profile Qualification	1481
Adding a Connection Tracker	1486
Adding a User Qualification	1496
Adding Snooze and Inactive Periods	1498
Understanding Rule Building Mechanics	1499
Managing Rules for Correlation Policies	1508
Modifying a Rule	1508
Deleting a Rule	1509
Creating a Rule Group	1509

Table of Contents

Grouping Correlation Responses	1510
Creating a Response Group	1511
Modifying a Response Group	1512
Deleting a Response Group	1512
Activating and Deactivating Response Groups	1512
Creating Correlation Policies	1513
Providing Basic Policy Information	1515
Adding Rules and White Lists to a Correlation Policy	1515
Setting Rule and White List Priorities	1516
Adding Responses to Rules and White Lists	1517
Managing Correlation Policies	1519
Activating and Deactivating Correlation Policies	1520
Editing a Correlation Policy	1520
Deleting a Correlation Policy	1520
Working with Correlation Events	1521
Viewing Correlation Events	1521
Understanding the Correlation Events Table	1524
Searching for Correlation Events	1526

Chapter 37: Using the Sourcefire 3D System as a Compliance Tool .. 1530

Understanding Compliance White Lists	1532
Understanding White List Targets	1533
Understanding White List Host Profiles	1534
Understanding White List Evaluations	1538
Understanding White List Violations	1539
Creating Compliance White Lists	1541
Surveying Your Network	1543
Providing Basic White List Information	1545
Configuring Compliance White List Targets	1545
Configuring Compliance White List Host Profiles	1548
Managing Compliance White Lists	1563
Modifying a Compliance White List	1563
Deleting a Compliance White List	1564
Working with Shared Host Profiles	1564
Creating Shared Host Profiles	1565
Modifying a Shared Host Profile	1567
Deleting a Shared Host Profile	1571
Resetting Built-In Host Profiles to Their Factory Defaults	1571
Working with White List Events	1572
Viewing White List Events	1573
Understanding the White List Events Table	1575
Searching for Compliance White List Events	1576

	Working with White List Violations	1579
	Viewing White List Violations	1579
	Understanding the White List Violations Table	1581
	Searching for White List Violations	1582
Chapter 38:	Creating Traffic Profiles	1585
	Providing Basic Profile Information	1587
	Specifying Traffic Profile Conditions	1588
	Syntax for Traffic Profile Conditions	1589
	Adding a Host Profile Qualification	1590
	Syntax for Host Profile Qualifications	1591
	Setting Profile Options	1593
	Saving a Traffic Profile	1595
	Activating and Deactivating Traffic Profiles	1595
	Editing a Traffic Profile	1596
	Understanding Condition-Building Mechanics	1596
	Building a Single Condition	1597
	Adding and Linking Conditions	1599
	Using Multiple Values in a Condition	1602
	Viewing Traffic Profiles	1603
Chapter 39:	Configuring Remediations	1606
	Creating Remediations	1607
	Configuring Remediations for Cisco IOS Routers	1608
	Configuring Remediations for Cisco PIX Firewalls	1617
	Configuring Nmap Remediations	1623
	Configuring Set Attribute Remediations	1629
	Working with Remediation Status Events	1633
	Viewing Remediation Status Events	1633
	Working with Remediation Status Events	1636
	Understanding the Remediation Status Table	1636
	Searching for Remediation Status Events	1638
Chapter 40:	Enhancing Network Discovery	1641
	Assessing Your Detection Strategy	1642
	Are Your Managed Devices Correctly Placed?	1642
	Do Unidentified Operating Systems Have a Unique TCP Stack?	1643
	Can the Sourcefire 3D System Identify All Applications?	1644
	Have You Applied Patches that Fix Vulnerabilities?	1644
	Do You Want to Track Third-Party Vulnerabilities?	1644

Table of Contents

Enhancing Your Network Map	1644
Understanding Passive Detection.....	1645
Understanding Active Detection.....	1645
Understanding Current Identities.....	1646
Understanding Identity Conflicts	1648
Using Custom Fingerprinting	1649
Fingerprinting Clients.....	1650
Fingerprinting Servers.....	1655
Managing Fingerprints	1660
Activating Fingerprints	1660
Deactivating Fingerprints	1661
Deleting Fingerprints	1661
Editing Fingerprints.....	1662
Working with Application Detectors	1663
Creating a User-Defined Application Protocol Detector	1666
Managing Detectors	1673
Importing Host Input Data	1680
Enabling the Use of Third-Party Data.....	1681
Managing Third-Party Product Mappings.....	1682
Mapping Third-Party Vulnerabilities.....	1687
Managing Custom Product Mappings	1688
Chapter 41: Configuring Active Scanning	1692
Understanding Nmap Scans	1693
Understanding Nmap Remediations.....	1693
Creating an Nmap Scanning Strategy	1697
Sample Nmap Scanning Profiles.....	1699
Setting up Nmap Scans	1702
Creating an Nmap Scan Instance.....	1702
Creating an Nmap Scan Target	1704
Creating an Nmap Remediation	1705
Managing Nmap Scanning.....	1710
Managing Nmap Scan Instances	1710
Managing Nmap Remediations	1712
Running an On-Demand Nmap Scan	1713
Managing Scan Targets	1714
Editing a Scan Target	1715
Deleting a Scan Target.....	1716

Table of Contents

Working with Active Scan Results	1716
Viewing Scan Results	1716
Understanding the Scan Results Table	1718
Analyzing Scan Results	1719
Monitoring Scans	1719
Importing Scan Results	1720
Searching for Scan Results	1721
Chapter 42: Working with Reports.....	1724
Generating Reports.....	1725
Creating a Report Template from an Event View	1725
Creating a Report Template by Importing a Dashboard or Workflow	1727
Generating Reports from a Report Template	1729
Using Report Generation Options.....	1732
Managing Reports	1733
Understanding Report Templates	1733
Using Report Templates	1736
Creating Report Templates from Existing Templates.....	1737
Creating New Report Templates.....	1740
Editing the Sections of a Report Template	1743
Working with Searches in Report Template Sections	1749
Using Input Parameters	1750
Editing Document Attributes in a Report Template	1756
Customizing a Cover Page	1759
Managing Logos	1760
Using Report Generation Options.....	1763
Generating Reports Using the Scheduler	1763
Distributing Reports by Email at Generation Time.....	1763
Using Remote Storage for Reports.....	1765
Managing Report Templates and Report Files.....	1766
Exporting and Importing Report Templates	1766
Deleting Report Templates	1768
Downloading Reports	1768
Deleting Reports.....	1769
Chapter 43: Searching for Events.....	1770
Performing and Saving Searches	1770
Performing a Search.....	1771
Loading a Saved Search	1774
Deleting a Saved Search	1774
Using Wildcards and Symbols in Searches.....	1775
Using Objects and Application Filters in Searches.....	1775

	Specifying Time Constraints in Searches.....	1775
	Specifying IP Addresses in Searches.....	1776
	Specifying Ports in Searches.....	1777
Chapter 44:	Using Custom Tables	1779
	Understanding Custom Tables.....	1780
	Understanding Possible Table Combinations.....	1780
	Creating a Custom Table.....	1783
	Modifying a Custom Table	1786
	Deleting a Custom Table.....	1786
	Viewing a Workflow Based on a Custom Table	1787
	Searching Custom Tables	1788
 Chapter 45:	 Understanding and Using Workflows.....	 1791
	Components of a Workflow.....	1792
	Comparing Predefined and Custom Workflows	1794
	Comparing Workflows for Predefined and Custom Tables	1794
	Predefined Intrusion Event Workflows	1794
	Predefined Malware Workflows	1797
	Predefined File Workflows.....	1798
	Predefined Connection Data Workflows.....	1798
	Predefined Host Workflows.....	1800
	Predefined Applications Workflows	1801
	Predefined Application Details Workflows.....	1802
	Predefined Servers Workflows	1803
	Predefined Host Attributes Workflows	1803
	Predefined Discovery Events Workflows.....	1804
	Predefined User Workflows.....	1804
	Predefined Vulnerabilities Workflows	1804
	Predefined Third-Party Vulnerabilities Workflows	1805
	Predefined Correlation and White List Workflows.....	1805
	Predefined System Workflows	1806
	Saved Custom Workflows	1807

Table of Contents

Using Workflows	1808
Selecting Workflows	1809
Understanding the Workflow Toolbar	1812
Using Workflow Pages.....	1812
Setting Event Time Constraints	1820
Constraining Events	1830
Using Compound Constraints.....	1832
Sorting Table View Pages and Changing Their Layout	1834
Sorting Drill-Down Workflow Pages.....	1835
Selecting Rows on a Workflow Page	1835
Navigating to Other Pages in the Workflow.....	1836
Navigating Between Workflows	1836
Using Bookmarks.....	1838
Using Custom Workflows.....	1840
Creating Custom Workflows.....	1841
Creating Custom Connection Data Workflows	1843
Viewing Custom Workflows	1846
Editing Custom Workflows	1847
Deleting Custom Workflows.....	1847
Chapter 46: Managing Users.....	1849
Understanding Sourcefire User Authentication	1849
Understanding Internal Authentication	1851
Understanding External Authentication	1851
Understanding User Privileges	1852
Managing Authentication Objects	1854
Understanding LDAP Authentication	1854
Preparing to Create an LDAP Authentication Object	1859
Quick Start to LDAP Authentication.....	1860
Creating Advanced LDAP Authentication Objects	1866
LDAP Authentication Object Examples	1880
Editing LDAP Authentication Objects	1884
Understanding RADIUS Authentication	1885
Creating RADIUS Authentication Objects.....	1885
RADIUS Authentication Object Examples	1894
Editing RADIUS Authentication Objects	1896
Deleting Authentication Objects.....	1897

Table of Contents

Managing User Accounts	1897
Viewing User Accounts.....	1898
Adding New User Accounts.....	1899
Managing Command Line Access	1901
Managing Externally Authenticated User Accounts.....	1902
Managing User Login Settings.....	1903
Configuring User Roles	1905
Managing Custom User Roles	1908
Modifying User Privileges and Options	1912
Understanding Restricted User Access Properties.....	1912
Modifying User Passwords.....	1913
Deleting User Accounts.....	1914
User Account Privileges.....	1914
Managing User Role Escalation	1925
Configuring the Escalation Target Role	1926
Configuring a Custom User Role for Escalation.....	1926
Escalating Your User Role	1928
Chapter 47: Scheduling Tasks	1929
Configuring a Recurring Task	1930
Automating Backup Jobs	1932
Automating Certificate Revocation List Downloads.....	1934
Automating Nmap Scans	1936
Preparing Your System for an Nmap Scan	1936
Scheduling an Nmap Scan	1936
Automating Applying an Intrusion Policy.....	1938
Automating Reports.....	1940
Automating Geolocation Database Updates.....	1942
Automating FireSIGHT Recommendations.....	1943
Automating Software Updates	1945
Automating Software Downloads.....	1946
Automating Software Pushes	1948
Automating Software Installs.....	1949
Automating Vulnerability Database Updates	1951
Automating VDB Update Downloads.....	1952
Automating VDB Update Installs	1953
Automating URL Filtering Updates	1955
Viewing Tasks	1957
Using the Calendar	1957
Using the Task List.....	1958

	Editing Scheduled Tasks	1959
	Deleting Scheduled Tasks	1959
	Deleting a Recurring Task	1960
	Deleting a One-Time Task	1960
Chapter 48:	Managing System Policies.....	1961
	Creating a System Policy	1962
	Editing a System Policy.....	1963
	Applying a System Policy	1965
	Comparing System Policies	1965
	Deleting System Policies	1969
	Configuring a System Policy	1969
	Configuring Access Control Policy Preferences	1970
	Configuring the Access List for Your Appliance	1971
	Configuring Audit Log Settings	1973
	Configuring Authentication Profiles	1975
	Configuring Dashboard Settings	1977
	Configuring Database Event Limits	1978
	Configuring DNS Cache Properties	1981
	Configuring a Mail Relay Host and Notification Address	1983
	Configuring Intrusion Policy Preferences	1985
	Specifying a Different Language	1986
	Adding a Custom Login Banner	1987
	Configuring SNMP Polling.....	1988
	Synchronizing Time	1991
	Configuring User Interface Settings.....	1994
	Mapping Vulnerabilities for Servers	1996
Chapter 49:	Configuring Appliance Settings.....	1998
	Viewing and Modifying the Appliance Information	1999
	Using Custom HTTPS Certificates	2002
	Viewing the Current HTTPS Server Certificate	2002
	Generating a Server Certificate Request	2003
	Uploading Server Certificates	2004
	Configuring User Certificates.....	2006
	Enabling Access to the Database	2007
	Configuring Network Settings.....	2009
	Editing Management Interface Configurations	2012
	Shutting Down and Restarting the System.....	2014

Table of Contents

Setting the Time Manually	2015
Managing Remote Storage	2017
Using Local Storage	2018
Using NFS for Remote Storage	2019
Using SSH for Remote Storage	2020
Using SMB for Remote Storage	2022
Understanding Change Reconciliation	2024
Managing Remote Console Access	2025
Configuring Remote Console Settings on the Appliance	2026
Enabling Lights-Out Management User Access	2028
Using a Serial Over LAN Connection	2029
Using Lights-Out Management	2030
Enabling Sourcefire Cloud Communications	2032
Chapter 50: Licensing the Sourcefire 3D System	2036
Understanding Licensing	2036
License Types and Restrictions	2037
Licensing High Availability Pairs	2045
Licensing Stacked and Clustered Devices	2045
Licensing Series 2 Appliances	2045
Understanding FireSIGHT Host and User License Limits	2045
Viewing Your Licenses	2048
Adding a License to the Defense Center	2050
Deleting a License	2052
Changing a Device's Licensed Capabilities	2052
Chapter 51: Updating System Software	2054
Understanding Update Types	2055
Performing Software Updates	2056
Planning for the Update	2056
Understanding the Update Process	2058
Updating a Defense Center	2062
Updating Managed Devices	2064
Monitoring the Status of Major Updates	2066
Uninstalling Software Updates	2068
Updating the Vulnerability Database	2070
Importing Rule Updates and Local Rule Files	2072
Using One-Time Rule Updates	2074
Using Recurring Rule Updates	2077
Importing Local Rule Files	2080
Viewing the Rule Update Log	2082
Updating the Geolocation Database	2092

Chapter 52:	Monitoring the System.....	2095
	Viewing Host Statistics.....	2096
	Monitoring System Status and Disk Space Usage	2099
	Viewing System Process Status	2100
	Understanding Running Processes.....	2103
	Understanding System Daemons.....	2103
	Understanding Executables and System Utilities	2105
Chapter 53:	Using Health Monitoring.....	2109
	Understanding Health Monitoring	2110
	Understanding Health Policies	2111
	Understanding Health Modules	2112
	Understanding Health Monitoring Configuration	2115
	Configuring Health Policies.....	2116
	Understanding the Default Health Policy	2117
	Creating Health Policies	2118
	Applying Health Policies.....	2145
	Editing Health Policies	2147
	Comparing Health Policies	2150
	Deleting Health Policies	2154
	Using the Health Monitor Blacklist	2155
	Blacklisting Health Policies or Appliances	2156
	Blacklisting a Health Policy Module	2158
	Configuring Health Monitor Alerts.....	2159
	Creating Health Monitor Alerts	2159
	Interpreting Health Monitor Alerts.....	2161
	Editing Health Monitor Alerts	2162
	Deleting Health Monitor Alerts	2163
	Using the Health Monitor	2163
	Interpreting Health Monitor Status	2165
	Using Appliance Health Monitors	2166
	Viewing Alerts by Status.....	2167
	Running All Modules for an Appliance	2167
	Running a Specific Health Module.....	2168
	Generating Health Module Alert Graphs.....	2170
	Using the Health Monitor to Troubleshoot.....	2171
	Working with Health Events	2174
	Understanding Health Event Views	2174
	Viewing Health Events.....	2175
	Understanding the Health Events Table.....	2183
	Searching for Health Events.....	2184

Chapter 54:	Auditing the System	2187
	Managing Audit Records	2187
	Viewing Audit Records.....	2188
	Suppressing Audit Records.....	2191
	Understanding the Audit Log Table.....	2196
	Using the Audit Log to Examine Changes	2196
	Searching Audit Records.....	2197
	Viewing the System Log.....	2200
	Filtering System Log Messages	2201
Chapter 55:	Using Backup and Restore.....	2204
	Creating Backup Files	2205
	Creating Backup Profiles.....	2208
	Backing up Your Managed Devices with a Defense Center.....	2209
	Uploading Backups from a Local Host	2210
	Restoring the Appliance from a Backup File	2211
Chapter 56:	Specifying User Preferences.....	2215
	Changing Your Password	2216
	Changing an Expired Password	2216
	Specifying Your Home Page.....	2217
	Configuring Event View Settings	2218
	Event Preferences	2218
	Default Time Windows	2219
	Default Workflows	2221
	Setting Your Default Time Zone	2222
	Specifying Your Default Dashboard.....	2223
Appendix A:	Importing and Exporting Objects.....	2225
	Exporting Objects	2226
	Importing Objects	2231
Appendix B:	Purging Discovery Data from the Database.....	2236
Appendix C:	Viewing the Status of Long-Running Tasks.....	2238
	Viewing the Task Queue	2238
	Managing the Task Queue	2240

Appendix D: **Command Line Reference** 2242

- Basic CLI Commands 2243
 - configure password 2244
 - end 2244
 - exit 2244
 - help 2245
 - history 2245
 - logout 2245
 - ? (question mark) 2246
 - ?? (double question marks) 2246

Table of Contents

Show Commands	2246
access-control-config	2248

CHAPTER 1

INTRODUCTION TO THE SOURCEFIRE 3D SYSTEM

The Sourcefire 3D® System combines the security of an industry-leading network intrusion protection system with the power to control access to your network based on detected applications, users, and URLs. You can also use Sourcefire appliances to serve in a switched, routed, or hybrid (switched and routed) environment; to perform network address translation (NAT); and to build secure virtual private network (VPN) tunnels among the virtual routers on Sourcefire managed devices, or from managed devices to remote devices or other third-party VPN endpoints.

The Sourcefire Defense Center® provides a centralized management console and database repository for the Sourcefire 3D System. Managed devices installed on network segments monitor traffic for analysis.

Devices in a passive deployment monitor traffic flowing across a network, for example, using a switch SPAN, virtual switch, or mirror port. Passive sensing interfaces receive all traffic unconditionally and no traffic received on these interfaces is retransmitted.

Devices in an inline deployment allow you to protect your network from attacks that might affect the availability, integrity, or confidentiality of hosts on the network. Inline interfaces receive all traffic unconditionally, and traffic received on these interfaces is retransmitted unless explicitly dropped by some configuration in your deployment. Inline devices can be deployed as a simple intrusion prevention system. You can also configure inline devices to perform access control as well as manage network traffic in other ways.

In addition to physical appliances, Sourcefire packages 64-bit virtual Defense Centers® and virtual devices for the VMware ESX/ESXi hosting environment.

This guide provides information about the features and functionality of the Sourcefire 3D System. The explanatory text, graphics, and procedures in each chapter provide detailed information to help you navigate the user interface, maximize the performance of your system, and troubleshooting complications.

The topics that follow introduce you to the Sourcefire 3D System, describe its key components, explain how to log in and out of Sourcefire appliances, contain some basic information about using the system's web interface, and help you understand how to use this guide:

- [Sourcefire 3D System Appliances](#) on page 38
- [Sourcefire 3D System Components](#) on page 44
- [Security, Internet Access, and Communication Ports](#) on page 50
- [Documentation Resources](#) on page 54
- [Documentation Conventions](#) on page 54
- [IP Address Conventions](#) on page 57
- [Logging into the Appliance](#) on page 58
- [Logging into the Appliance to Set Up an Account](#) on page 60
- [Logging Out of the Appliance](#) on page 62
- [Using the Context Menu](#) on page 63

Sourcefire 3D System Appliances

A Sourcefire *appliance* is either a traffic-sensing managed *device* or a managing *Defense Center*.

Physical devices are fault-tolerant, purpose-built network appliances available in a range of throughputs and with a range of capabilities. Defense Centers serve as central management points for these devices, and automatically aggregate and correlate the events they generate. There are several *models* of each physical appliance type; these models are further grouped into *series* and *family*.

You can also host 64-bit virtual Defense Centers and devices on VMware ESX/ESXi. Virtual Defense Centers can manage physical devices, and physical Defense Centers can manage virtual devices.

Many Sourcefire 3D System capabilities are appliance dependent. For more information, see the following sections:

- [Defense Centers](#) on page 39
- [Managed Devices](#) on page 39
- [Understanding Appliance Series, Models, and Capabilities](#) on page 40

Defense Centers

The Defense Center provides a centralized management point and event database for your Sourcefire 3D System deployment. Defense Centers, which can be physical or virtual, aggregate and correlate intrusion, file, malware, discovery, connection, and performance data. This allows you to monitor the information that your devices report in relation to one another, and to assess and control the overall activity that occurs on your network.

Key features of the Defense Center include:

- device, license, and policy management
- event and contextual information displayed in tables, graphs, and charts
- health and performance monitoring
- external notification and alerting
- correlation and remediation features for real-time threat response
- custom and template-based reporting

For many physical Defense Centers, a high availability (redundancy) feature can help you ensure continuity of operations.

Managed Devices

Physical Sourcefire devices are fault-tolerant, purpose-built network appliances available in a range of throughputs. You can also host virtual devices. Devices deployed passively help you gain insight into your network traffic. Deployed inline, you can use Sourcefire devices to affect the flow of traffic based on multiple criteria. You must manage Sourcefire devices with a Defense Center.

Depending on model and license, managed devices:

- gather detailed information about your organization's hosts, operating systems, applications, users, files, networks, and vulnerabilities
- block or allow network traffic based on various network-based criteria, as well as other criteria including applications, users, URLs, IP address reputations, and the results of intrusion or malware inspections
- have switching, routing, DHCP, NAT, and VPN capabilities, as well as configurable bypass interfaces, fast-path rules, and strict TCP enforcement
- have clustering (redundancy) to help you ensure continuity of operations, and stacking to combine resources from multiple devices

Understanding Appliance Series, Models, and Capabilities

Version 5.2 of the Sourcefire 3D System is available on two series of physical appliances, as well as virtual appliances. Many Sourcefire 3D System capabilities are appliance dependent. For more information, see:

- [Series 2 Appliances](#) on page 40
- [Series 3 Appliances](#) on page 41
- [Virtual Appliances](#) on page 41
- [Appliances Delivered with Version 5.2](#) on page 41
- [Supported Capabilities by Appliance Model](#) on page 42

Series 2 Appliances

Series 2 is the second series of Sourcefire physical appliances. Because of resource and architecture limitations, Series 2 devices support a restricted set of Sourcefire 3D System features.

Although Sourcefire does not deliver Version 5.2 on Series 2 appliances other than 3D500/1000/2000 devices, you can reimage the following Series 2 devices and Defense Centers to Version 5.2:

- 3D2100/2500/3500/4500
- 3D6500
- 3D9900
- DC500/1000/3000

WARNING! There is no update path from Version 4.10.x to Version 5.2. Reimaging results in the loss of **all** configuration and event data on the appliance. You **cannot** import this data onto an appliance after a reimage. For more information, see the *Sourcefire 3D System Installation Guide*.

When running Version 5.2, Series 2 devices automatically have most of the capabilities associated with a Protection license: intrusion detection and prevention, file control, and basic access control. However, Series 2 devices cannot perform Security Intelligence filtering, advanced access control, or advanced malware protection. You also cannot enable other licensed capabilities on a Series 2 device. With the exception of the 3D9900, which supports fast-path rules, stacking, and tap mode, Series 2 devices do not support any of the hardware-based features associated with Series 3 devices: switching, routing, NAT, and so on.

When running Version 5.2, DC1000 and DC3000 Series 2 Defense Centers support all the features of the Sourcefire 3D System; the DC500 has more limited capabilities.

Series 3 Appliances

Series 3 is the third series of Sourcefire physical appliances. All 7000 Series and 8000 Series devices are Series 3 appliances. 8000 Series devices are more powerful and support a few features that 7000 Series devices do not.

Virtual Appliances

You can host 64-bit virtual Defense Centers and devices on VMware ESX/ESXi. Virtual Defense Centers can manage up to 25 physical or virtual devices; physical Defense Centers can manage virtual devices.

Regardless of the licenses installed and applied, virtual appliances do not support any of the system's hardware-based features: redundancy and resource sharing, switching, routing, and so on. Also, virtual devices do not have web interfaces.

Appliances Delivered with Version 5.2

The following table lists the appliances that Sourcefire delivers with Version 5.2 of the Sourcefire 3D System.

Version 5.2 Sourcefire Appliances

MODELS/FAMILY	SERIES	TYPE
Series 2 devices: • 3D500/1000/2000	Series 2	device
70xx Family: • 3D7010/7020/7030	Series 3 (7000 Series)	device
71xx Family: • 3D7110/7120 • 3D7115/7125	Series 3 (7000 Series)	device
81xx Family: • 3D8120/8130/8140	Series 3 (8000 Series)	device
82xx Family: • 3D8250 • 3D8260/8270/8290	Series 3 (8000 Series)	device
virtual devices	none	device
Series 3 Defense Centers: • DC750/1500/3500	Series 3	Defense Center
virtual Defense Centers	none	Defense Center

Although Sourcefire does not deliver Version 5.2 on Series 2 appliances other than 3D500/1000/2000 devices, you can reimage the following Series 2 devices and Defense Centers to Version 5.2:

- 3D2100/2500/3500/4500
- 3D6500
- 3D9900
- DC500/1000/3000

Reimaging results in the loss of **all** configuration and event data on the appliance. See the *Sourcefire 3D System Installation Guide* for more information.

Supported Capabilities by Appliance Model

Many Sourcefire 3D System capabilities are appliance dependent. The table below matches the major capabilities of the system with the appliances that support those capabilities, assuming you have the correct licenses installed and applied.

The Defense Center column for device-based capabilities (such as stacking, switching, and routing) indicates whether that Defense Center can manage and configure devices to perform their functions. For example, you can use a Series 2 DC1000 to manage NAT on Series 3 devices.

Supported Capabilities by Appliance Model

FEATURE	SERIES 2 DEVICE	SERIES 2 DEFENSE CENTER	SERIES 3 DEVICE	SERIES 3 DEFENSE CENTER	VIRTUAL DEVICE	VIRTUAL DEFENSE CENTER

Sourcefire 3D System Components

The topics that follow describe some of the key capabilities of the Sourcefire 3D System that contribute to your organization's security, acceptable use policy, and traffic management strategy:

- [Redundancy and Resource Sharing](#) on page 44
- [Network Traffic Management](#) on page 45
- [FireSIGHT](#) on page 46
- [Access Control](#) on page 46
- [Intrusion Detection and Prevention](#) on page 47
- [File Tracking, Control, and Malware Protection](#) on page 48
- [Application Programming Interfaces](#) on page 49

TIP! Many Sourcefire 3D System features are appliance model, license, and user role dependent. This documentation includes information about which Sourcefire 3D System licenses and devices are required for each feature, and which user roles have permission to complete each procedure. For more information, see [Documentation Conventions](#) on page 54.

Redundancy and Resource Sharing

The redundancy and resource-sharing features of the Sourcefire 3D System allow you to ensure continuity of operations and to combine the processing resources of multiple physical devices.

Defense Center High Availability

To ensure continuity of operations, a Defense Center *high availability* feature allows you to designate redundant DC1000, DC1500, DC3000, or DC3500 Defense Centers to manage devices. Event data streams from managed devices

to both Defense Centers; certain configuration elements are maintained on both Defense Centers. If one Defense Center fails, you can monitor your network without interruption using the other Defense Center.

Device Stacking

Device stacking allows you to increase the amount of traffic inspected on a network segment by connecting two to four physical devices in a stacked configuration. When you establish a stacked configuration, you combine the resources of each stacked device into a single, shared configuration.

Device Clustering

Device clustering (sometimes called device high availability) allows you to establish redundancy of networking functionality and configuration data between two or more Series 3 devices or stacks. Clustering two or more peer devices or stacks results in a single logical system for policy applies, system updates, and registration. With device clustering, the system can fail over either manually or automatically.

In most cases, you can achieve Layer 3 redundancy without clustering devices by using the Sourcefire Redundancy Protocol (SFRP). SFRP allows devices to act as redundant gateways for specified IP addresses. With network redundancy, you can configure two or more devices or stacks to provide identical network connections, ensuring connectivity for other hosts on the network.

Network Traffic Management

The Sourcefire 3D System's network traffic management features allow managed devices to act as part of your organization's network infrastructure. You can configure Series 3 devices to serve in a switched, routed, or hybrid (switched and routed) environment; to perform network address translation (NAT); and to build secure virtual private network (VPN) tunnels.

Switching

You can configure the Sourcefire 3D System in a Layer 2 deployment so that it provides packet switching between two or more network segments. In a Layer 2 deployment, you configure switched interfaces and virtual switches on managed devices to operate as standalone broadcast domains. A virtual switch uses the MAC address from a host to determine where to send packets.

Routing

You can configure the Sourcefire 3D System in a Layer 3 deployment so that it routes traffic between two or more interfaces. In a Layer 3 deployment, you configure routed interfaces and virtual routers on managed devices to receive and forward traffic. The system routes packets by making packet forwarding decisions according to the destination IP address. Routers obtain the destination from the

outgoing interface based on the forwarding criteria, and access control rules designate the security policies to apply.

When you configure virtual routers, you can define static routes. In addition, you can configure Routing Information Protocol (RIP) and Open Shortest Path First (OSPF) dynamic routing protocols. You can also configure a combination of static routes and RIP or static routes and OSPF. You can set up DHCP relay for each virtual router you configure.

If you use both virtual switches and virtual routers in your Sourcefire appliance configuration, you can configure associated hybrid interfaces to bridge traffic between them. These utilities analyze traffic to determine its type and the appropriate response (route, switch, or otherwise).

NAT

In a Layer 3 deployment, you can configure network address translation (NAT). You can expose an internal server to an external network, or allow an internal host or server to connect to an external application. You can also configure NAT to hide private network addresses from an external network by using a block of IP addresses, or by using a limited block of IP addresses and port translation.

VPN

A virtual private network (VPN) is a network connection that establishes a secure tunnel between endpoints via a public source, such as the Internet or other network. You can configure the Sourcefire 3D System to build secure VPN tunnels from the virtual routers of Series 3 devices to remote devices or other third-party VPN endpoints.

FireSIGHT

FireSIGHT™ is Sourcefire's discovery and awareness technology that collects information about hosts, operating systems, applications, users, files, networks, geolocation information, and vulnerabilities, in order to provide you with a complete view of your network.

You can use the Defense Center's web interface to view and analyze data collected by FireSIGHT. You can also use this data to help you perform access control and modify intrusion rule states.

Access Control

Access control is a policy-based feature that allows you to specify, inspect, and log the traffic that can traverse your network. An *access control policy* determines how the system handles traffic on your network. You can use a policy that does

not include *access control rules* to handle traffic in one of the following ways, using what is called the *default action*:

- block all traffic from entering your network
- trust all traffic to enter your network without further inspection
- allow all traffic to enter your network, and inspect the traffic with a network discovery policy only
- allow all traffic to enter your network, and inspect the traffic with intrusion and network discovery policies

You can include access control rules in an access control policy to further define how traffic is handled by targeted devices, from simple IP address matching to complex scenarios involving different users, applications, ports, and URLs. For each rule, you specify a rule *action*, that is, whether to trust, monitor, block, or inspect matching traffic with an intrusion or file policy.

For each access control policy, you can create a custom HTML page that users see when the system blocks their HTTP requests. Optionally, you can display a page that warns users, but also allows them to click a button to continue to the originally requested site.

As part of access control, the Security Intelligence feature allows you to blacklist—deny traffic to and from—specific IP addresses before the traffic is subjected to analysis by access control rules.

Access control includes intrusion detection and prevention, file control, and advanced malware protection. For more information, see the next sections.

Intrusion Detection and Prevention

Intrusion detection and prevention allows you to monitor your network traffic for security violations and, in inline deployments, to block or alter malicious traffic.

Intrusion prevention is integrated into access control, where you can associate an intrusion policy with specific access control rules. If network traffic meets the conditions in a rule, you can analyze the matching traffic with an intrusion policy. You can also associate an intrusion policy with the default action of an access control policy.

An intrusion policy contains a variety of components, including:

- rules that inspect the protocol header values, payload content, and certain packet size characteristics
- rule state configuration based on FireSIGHT recommendations
- advanced settings, such as preprocessors and other detection and performance features
- preprocessor rules that allow you to generate events for associated preprocessors and preprocessor options

File Tracking, Control, and Malware Protection

To help you identify and mitigate the effects of malware, the Sourcefire 3D System's file control, network file trajectory, and advanced malware protection components can detect, track, and optionally block the transmission of files (including malware files) in network traffic.

File Control

File control allows managed devices to detect and block your users from uploading (sending) or downloading (receiving) files of specific types over specific application protocols. You configure file control as part of your overall access control configuration; file policies associated with access control rules inspect network traffic that meets rule conditions.

Network-Based Advanced Malware Protection (AMP)

Network-based *advanced malware protection* (AMP) allows the system to inspect network traffic for malware in several types of files, including PDFs, many Microsoft Office documents, and other types. When a managed device detects one of these file types, the Defense Center obtains the file's disposition from the *Sourcefire cloud*. The managed device uses this information to block or allow the file.

You configure malware protection as part of your overall access control configuration; file policies associated with access control rules inspect network traffic that meets rule conditions.

FireAMP Integration

FireAMP is Sourcefire's enterprise-class, advanced malware analysis and protection solution that discovers, understands, and blocks advanced malware outbreaks, advanced persistent threats, and targeted attacks.

If your organization has a FireAMP subscription, individual users install *FireAMP Connectors* on their computers and mobile devices (also called *endpoints*). These lightweight agents communicate with the Sourcefire cloud, which in turn communicates with the Defense Center. After you configure the Defense Center to connect to the cloud, you can use the Defense Center web interface to view endpoint-based malware events generated as a result of scans, detections, and quarantines on the endpoints in your organization.

Use the *FireAMP portal* (<http://amp.sourcefire.com/>) to configure your FireAMP deployment. The portal helps you quickly identify and quarantine malware. You can identify outbreaks when they occur, track their trajectories, understand their effects, and learn how to successfully recover. You can also use FireAMP to create custom protections, block execution of certain applications based on group policy, and create custom whitelists.

Network File Trajectory

The network file trajectory feature allows you to track a file's transmission path across a network. The system uses SHA-256 hash values to track files; so, to track a file, the system must either:

- calculate the file's SHA-256 hash value and perform a malware cloud lookup using that value
- receive endpoint-based threat and quarantine data about that file, using the Defense Center's integration with your organization's FireAMP subscription

Each file has an associated trajectory map, which contains a visual display of the file's transfers over time as well as additional information about the file.

Application Programming Interfaces

There are several ways to interact with the system using application programming interfaces (APIs). For detailed information, you can download additional documentation from the Support Site.

eStreamer

The Event Streamer (eStreamer) allows you to stream several kinds of event data from a Sourcefire appliance to a custom-developed client application. After you create a client application, you can connect it to an eStreamer server (Defense Center or managed device), start the eStreamerservice, and begin exchanging data.

eStreamer integration requires custom programming, but allows you to request specific data from an appliance. If, for example, you display network host data within one of your network management applications, you could write a program to retrieve host criticality or vulnerability data from the Defense Center and add that information to your display.

External Database Access

The database access feature allows you to query several database tables on a Sourcefire Defense Center, using a third-party client that supports JDBC SSL connections.

You can use an industry-standard reporting tool such as Crystal Reports, Actuate BIRT, or JasperSoft iReport to design and submit queries. Or, you can configure your own custom application to query Sourcefire data. For example, you could build a servlet to report intrusion and discovery event data periodically or refresh an alert dashboard.

Host Input

The host input feature allows you to augment the information in the network map by importing data from third-party sources using scripts or command-line files.

The web interface also provides some host input functionality; you can modify operating system or application protocol identities, validate or invalidate vulnerabilities, and delete various items from the network map, including clients and server ports.

Remediation

The system includes an API that allows you to create *remediations* that your Defense Center can automatically launch when conditions on your network violate an associated correlation policy or compliance white list. This can not only automatically mitigate attacks when you are not immediately available to address them, but can also ensure that your system remains compliant with your organization's security policy. In addition to remediations that you create, the Defense Center ships with several predefined remediation modules.

Security, Internet Access, and Communication Ports

To safeguard the Defense Center, you must install the Defense Center on a protected internal network. Although the Defense Center is configured to have only the necessary services and ports available, you must make sure that attacks cannot reach it from outside the firewall.

If the Defense Center and the managed device reside on the same network, you can connect the management interface on the device to the same protected internal network as the Defense Center. This allows you to securely control the device from the Defense Center and aggregate the event data generated on the managed device's network segment. By using the Defense Center's filtering capabilities, you can analyze and correlate data from attacks across your network to evaluate how well your security policies are being implemented.

Note, however, that Sourcefire appliances are configured to directly connect to the Internet. Specific features of the Sourcefire 3D System require this direct connection, and others support use of a proxy server. Additionally, the system requires that certain ports remain open for basic intra-appliance communication, as well as to allow you to access appliances' web interfaces. By default, several other ports are open to allow the system to take advantage of additional features and functionality.

For more information, see:

- [Internet Access Requirements](#) on page 50
- [Open Communication Ports Requirements](#) on page 52

Internet Access Requirements

By default, Sourcefire appliances are configured to directly connect to the Internet. Specific features of the Sourcefire 3D System require this direct connection, and others support use of a proxy server; see [Configuring Network](#)

[Settings](#) on page 2009.

TIP! You can manually upload system software, intrusion rule, GeoDB, and VDB updates to appliances.

To ensure continuity of operations, both Defense Centers in a high availability pair must have Internet access. For specific features, the primary Defense Center contacts the Internet, then shares information with the secondary during the synchronization process. Therefore, if the primary fails, you should promote the secondary to primary as described in [Monitoring and Changing High Availability Status](#) on page 202.

The following table describes the Internet access requirements of the Sourcefire 3D System.

Sourcefire 3D System Internet Access Requirements

FOR..	INTERNET ACCESS IS REQUIRED TO...	HIGH AVAILABILITY CONSIDERATIONS	PROXY?
RSS Feed dashboard widget	download RSS feed data from an external source, including Sourcefire.	Feed data is not synchronized.	yes
Security Intelligence feeds	download Security Intelligence feed data from an external source, including the Sourcefire Intelligence Feed.	The primary Defense Center downloads feed data and shares it with the secondary. In case of primary failure, you must switch roles.	yes
URL filtering data	download cloud-based URL category and reputation data for access control, and perform lookups for uncategorized URLs.	The primary Defense Center downloads URL filtering data and shares it with the secondary. In case of primary failure, you must switch roles.	yes
malware cloud lookups (Malware licensed)	perform cloud lookups to determine if files detected in network traffic contain malware.	Paired Defense Centers perform cloud lookups independently, although file policies are synchronized.	no

Sourcefire 3D System Internet Access Requirements (Continued)

FOR..	INTERNET ACCESS IS REQUIRED TO...	HIGH AVAILABILITY CONSIDERATIONS	PROXY?
FireAMP integration (FireAMP subscription)	receive endpoint-based malware events from the Sourcefire cloud.	Cloud connections are not synchronized. Configure them on both Defense Centers.	no
system, intrusion rule, GeoDB, and VDB updates	download or schedule the download of an intrusion rule, GeoDB, VDB, or system update directly to the appliance.	Rule, GeoDB, and VDB updates are synchronized; system updates are not. All appliances that download updates must have Internet access.	yes
obtaining whois information using the IP address context menu	obtain whois information.	Any appliance requesting whois information must have Internet access.	yes

Open Communication Ports Requirements

The Sourcefire 3D System requires that ports 443 (inbound) and 8305 (inbound and outbound) remain open for basic intra-appliance communication, as well as to allow you to access appliances' web interfaces.

By default, several other ports are open to allow the system to take advantage of additional features and functionality. The following table lists these ports. Note that DHCP on ports 67 and 68 is disabled by default.

Sourcefire 3D System Open Communication Ports Requirements

PORTS	DESCRIPTION	PROTOCOL	DIRECTION	THIS PORT IS OPEN TO...
22	SSH/SSL	TCP	Bidirectional	allow a secure remote connection to the appliance.
25	SMTP	TCP	Outbound	send email notices and alerts from the appliance.
53	DNS	TCP	Outbound	use DNS.
67, 68	DHCP	UDP	Outbound	use DHCP. Disabled by default.

Sourcefire 3D System Open Communication Ports Requirements (Continued)

PORTS	DESCRIPTION	PROTOCOL	DIRECTION	THIS PORT IS OPEN TO...
80	HTTP	TCP	Outbound or Bidirectional	allow the RSS Feed dashboard widget to connect to a remote web server (outbound). Adding inbound access allows the Defense Center to update custom and third-party Security Intelligence feeds via HTTP, and to download URL filtering information.
161, 162	SNMP	UDP	Bidirectional (161); Outbound (162)	provide access if you enabled SNMP polling (inbound) and SNMP traps (outbound).
389, 636	LDAP	TCP	Outbound	track user activity and for authentication.
443	HTTPS/AMQP	TCP	Inbound or Bidirectional	access the appliance. Required. Adding outbound access allows the Defense Center to download or receive software updates, VDB and GeoDB updates, URL filtering information, secure Security Intelligence feeds, and endpoint-based (FireAMP) malware events.
514	syslog	UDP	Outbound	send alerts to a remote syslog server.
623	SOL/LOM	UDP	Bidirectional	allow you to perform Lights-Out Management (LOM) using a Serial Over LAN (SOL) connection on a Series 3 appliance.
1500, 2000	database access	TCP	Inbound	access the Defense Center if external database access is enabled.
1812, 1813	RADIUS	UDP	Outbound or Bidirectional	use RADIUS. Adding inbound access ensures that RADIUS authentication and accounting function correctly. Ports 1812 and 1813 are the default, but you can configure RADIUS to use other ports; see Configuring RADIUS Connection Settings on page 1886.
3306	Sourcefire User Agent	TCP	Inbound	allow communication between the Defense Center and Sourcefire User Agents.

Sourcefire 3D System Open Communication Ports Requirements (Continued)

PORTS	DESCRIPTION	PROTOCOL	DIRECTION	THIS PORT IS OPEN TO...
8302	eStreamer	TCP	Bidirectional	use an eStreamer client.
8305	device management	TCP	Bidirectional	communicate between the Defense Center and managed devices. Required.
8307	host input client	TCP	Bidirectional	allow communication between the Defense Center and host input clients.
32137	malware cloud lookups	TCP	Outbound	allow the Defense Center to perform cloud lookups to determine if a file detected in network traffic contains malware, and to track files' trajectories.

Documentation Resources

The Sourcefire 3D System documentation set includes online help and PDF files. You can reach the online help in two ways:

- by clicking the context-sensitive help links on each page
- by selecting **Help > Online**

The online help includes information about the tasks you can complete on the web interface, including procedural and conceptual information about user management, system management, and event analysis.

The Documentation CD contains PDF versions of:

- the *Sourcefire 3D System User Guide*, which includes the same content as the online help, but in an easy-to-print format
- the *Sourcefire 3D System Installation Guide*, which includes information about installing Sourcefire appliances as well as hardware specifications and safety information
- the *Sourcefire 3D System Virtual Installation Guide*, which includes information about installing, managing, and troubleshooting virtual devices and virtual Defense Centers
- various API guides and supplementary material

You can access the most up-to-date versions of the PDF documentation on the Sourcefire Support site (<https://support.sourcefire.com/>).

Documentation Conventions

This documentation includes information about which Sourcefire 3D System licenses and appliance models are required for each feature, and which user roles

have permission to complete each procedure. For more information, see the following sections:

- [License Conventions](#) on page 55
- [Supported Device and Defense Center Conventions](#) on page 56
- [Access Conventions](#) on page 56

License Conventions

The License statement at the beginning of a section indicates the license required to use the feature described in the section, as follows:

FireSIGHT

A FireSIGHT license is included with your Defense Center and is required to perform host, application, and user discovery. The FireSIGHT license on your Defense Center determines how many individual hosts and users you can monitor with the Defense Center and its managed devices, as well as how many users you can use to perform user control.

If your Defense Center was previously running Version 4.10.x, you may be able to use legacy RNA Host and RUA User licenses instead of a FireSIGHT license.

Protection

A Protection license allows managed devices to perform intrusion detection and prevention, file control, and Security Intelligence filtering.

Control

A Control license allows managed devices to perform user and application control. It also allows devices to perform switching and routing (including DHCP relay), NAT, and to cluster devices and stacks. A Control license requires a Protection license.

URL Filtering

A URL Filtering license allows managed devices to use regularly updated cloud-based category and reputation data to determine which traffic can traverse your network, based on the URLs requested by monitored hosts. A URL Filtering license requires Protection and Control licenses.

Malware

A Malware license allows managed devices to perform network-based advanced malware protection (AMP), that is, to detect and block malware in files transmitted over your network. It also allows you to view trajectories, which track files transmitted over your network. A Malware license requires a Protection license.

VPN

A VPN license allows you to build secure VPN tunnels among the virtual routers on Sourcefire managed devices, or from managed devices to remote devices or other third-party VPN endpoints. A VPN license requires Protection and Control licenses.

Because licensed capabilities are often additive, this documentation only provides the highest required license for each feature. For example, if a feature requires FireSIGHT, Protection, and Control licenses, only Control is listed.

An “or” statement in a License statement indicates that a particular license is required to use the feature described in the section, but an additional license can add functionality. For example, within a file policy, some file rule actions require a Protection license while others require a Malware license. So, the License statement for the documentation on file rules lists “Protection or Malware.”

Note that because of architecture and resource limitations, not all licenses can be applied to all managed devices. In general, you cannot license a capability that a device does not support; see [Supported Capabilities by Appliance Model](#) on page 42. For more information on how your licenses affect the features you can use, including information on using legacy RNA Host and RUA User licenses, see [Understanding Licensing](#) on page 2036.

Supported Device and Defense Center Conventions

The Supported Devices statement at the beginning of a section indicates that a feature is supported only on the specified device series, family, or model. For example, stacking is only supported on Series 3 devices. If a section does not have a Supported Devices statement, the feature is supported on all devices, or the section does not apply to managed devices.

For more information on platforms supported by this release, see [Understanding Appliance Series, Models, and Capabilities](#) on page 40.

Access Conventions

The Access statement at the beginning of each procedure in this documentation indicates the predefined user role required to perform the procedure. A forward slash separating roles indicates that any of the listed roles can perform the

procedure. The following table defines common terms that appear in the Access statement.

Access Conventions

ACCESS TERM	INDICATES
Access Admin	User must have the Access Control Admin role
Admin	User must have the Administrator role
Any	User can have any role
Any/Admin	User can have any role, but only the Administrator role has unrestricted access (such as the ability to view other users' data saved as private)
Any Security Analyst	User can have either the Security Analyst or Security Analyst (Read Only) role
Database	User must have the External Database role
Discovery Admin	User must have the Discovery Admin role
Intrusion Admin	User must have the Intrusion Admin role
Maint	User must have the Maintenance User role
Network Admin	User must have the Network Admin role
Security Analyst	User must have the Security Analyst role
Security Approver	User must have the Security Approver role

Users with custom roles may have permission sets that differ from those of the predefined roles. When a predefined role is used to indicate access requirements for a procedure, a custom role with similar permissions also has access. For more information on custom user roles, see [Managing Custom User Roles](#) on page 1908.

IP Address Conventions

You can use IPv4 Classless Inter-Domain Routing (CIDR) notation to define address blocks in many places in the Sourcefire 3D System. In those places that allow IPv6 addresses (for example, in intrusion policies) you can also use the similar IPv6 prefix length notation.

CIDR notation uses a network IP address combined with a bit mask to define the IP addresses in the specified block of addresses. For example, the following table lists the private IPv4 address spaces in CIDR notation.

CIDR Notation Syntax Examples

CIDR BLOCK	IP ADDRESSES IN CIDR BLOCK	SUBNET MASK	NUMBER OF IP ADDRESSES
10.0.0.0/8	10.0.0.0 - 10.255.255.255	255.0.0.0	16,777,216
172.16.0.0/12	172.16.0.0 - 172.31.255.255	255.240.0.0	1,048,576
192.168.0.0/16	192.168.0.0 - 192.168.255.255	255.255.0.0	65,536

Similarly, IPv6 uses a network IP address combined with a prefix length to define the IP addresses in a specified block. For example, 2001:db8::/32 specifies the IPv6 addresses in the 2001:db8:: network with a prefix length of 32 bits, that is, 2001:db8:: through 2001:db8:ffff:ffff:ffff:ffff:ffff:ffff.

When you use CIDR or prefix length notation to specify a block of IP addresses, the Sourcefire 3D System uses **only** the portion of the network IP address specified by the mask or prefix length. For example, if you type 10.1.2.3/8, the Sourcefire 3D System uses 10.0.0.0/8.

In other words, although Sourcefire recommends the standard method of using a network IP address on the bit boundary when using CIDR or prefix length notation, the Sourcefire 3D System does not require it.

Logging into the Appliance

LICENSE: Any

The Defense Center has a web-based interface that you can use to perform administrative, management, and analysis tasks. Physical managed devices have a limited web-based interface that you can use to perform initial setup and basic analysis and configuration tasks. Virtual managed devices do not have web interfaces. You can access the web interface by logging into the appliance using a web browser. For information on browser requirements, refer to the release notes for this version of the Sourcefire 3D System.

If you are the first user to log into the appliance after it is installed, you must log in using the administrative (**admin**) user account to complete the initial setup process, which is described in the *Sourcefire 3D System Installation Guide*. After you create other user accounts as described in [Adding New User Accounts](#) on

page 1899, you and other users should use those accounts to log in to the web interface.

IMPORTANT! Because Sourcefire appliances audit user activity based on user accounts, make sure that users log into the system with the correct account.

After you log into the appliance, the features you can access are controlled by the privileges granted to your user account. However, the procedures for logging into and out of the appliance remain the same. If your organization uses SecurID® tokens when logging in, append the token to your SecurID PIN and use that as your password to log in. For example, if your PIN is 1111 and the SecurID token is 222222, type 1111222222.

WARNING! If you supply incorrect credentials multiple times, your shell access account may be locked. Even after the account is locked, you are prompted to supply your credentials again. If you supply correct credentials and the login is refused, contact your system administrator rather than repeatedly attempting to log in.

The first time you visit the appliance home page during a web session, you can view information about your last login session for that appliance. You can see the following information about your last login:

- the day of the week, month, date, and year of the login
- the appliance-local time of the login in 24-hour notation
- the host and domain name last used to access the appliance

By default, your session automatically logs you out after 1 hour of inactivity, unless you are otherwise configured to be exempt from session timeout. Users with the Administrator role can change the session timeout interval in the system policy. For more information, see [Managing User Login Settings](#) on page 1903 and [Configuring User Interface Settings](#) on page 1994.

Note that some processes that take a significant amount of time may cause your web browser to display a message that a script has become unresponsive. If this occurs, make sure you allow the script to continue until it finishes.

To log into the appliance via the web interface:

ACCESS: Any

1. Direct your browser to `https://hostname/`, where *hostname* corresponds to the host name of the appliance.

The Login page appears.

2. In the **Username** and **Password** fields, type your user name and password. User names are case sensitive.
If your company uses SecurID, append the SecurID token to the end of your SecurID PIN and use that as your password when you log in. You must have already generated your SecurID PIN before you can log into the Sourcefire 3D System.
3. Click **Login**.
The default start page appears. If you selected a new home page for your user account, that page is displayed instead. See [Specifying Your Home Page](#) on page 2217 for more information.
The menus and menu options listed at the top of the page are based on the privileges for your user account. However, the links on the default home page include options that span the range of user account privileges. If you click a link that requires different privileges from those granted to your account, the following warning message is displayed:

You are attempting to view an unauthorized page. This activity has been logged.

You can either select a different option from the available menus or click **Back** in your browser window.

To log into a Series 3 or virtual device via the command line:

ACCESS: CLI Basic Configuration

1. Open an SSH connection to the appliance at *hostname*, where *hostname* corresponds to the host name of the appliance.
The **login as:** command prompt appears.
2. Type your user name and press Enter.
The **Password:** prompt appears.
3. Type your password and press Enter.
The login banner appears, followed by the > prompt.
You can use any of the commands allowed by your level of command line access. See the [Command Line Reference](#) on page 2242 for more information on available CLI commands.

Logging into the Appliance to Set Up an Account

LICENSE: Any

Some user accounts may be authenticated through an external authentication server. If your organization allows you to log on to the Sourcefire 3D System using LDAP or RADIUS credentials, the first time you log into the appliance using your external user credentials, the appliance associates those credentials with a set of permissions by creating a local user record. The permissions for that local user

record can then be modified, unless they are granted through group or list membership, as follows:

- If the default role for externally authenticated user accounts is set to a specific access role, you can log into the appliance using your external account credentials without any additional configuration by the system administrator.
- If an account is externally authenticated and by default receives no access privileges, you can log in but cannot access any functionality. You (or your system administrator) can then change the permissions to grant the appropriate access to user functionality.

If you are a shell access user, the system does not create a local user account for you on the appliance. Shell access is controlled entirely through either the shell access filter or PAM login attribute set for an LDAP server, or the shell access list on a RADIUS server.

Shell users should log in using usernames with all lowercase letters. LDAP usernames can include underscores (_), periods (.), and hyphens (-), but otherwise only alphanumeric characters are supported.

If your organization uses SecurID tokens when logging in, append the token to your SecurID PIN and use that as your password to log in. For example, if your PIN is 1111 and the SecurID token is 222222, type 1111222222.

IMPORTANT! If you do not have access to the web interface, contact your system administrator to modify your account privileges, or log in as a user with Administrator access and modify the privileges for the account. For more information, see [Modifying User Privileges and Options](#) on page 1912.

To create an externally authenticated account on the appliance:

ACCESS: Any

1. Direct your browser to `https://hostname/`, where *hostname* corresponds to the host name of the appliance.
The Login page appears.
2. Type your **Username** and **Password**.

IMPORTANT! If your company uses SecurID, append the SecurID token to your SecurID PIN and use that as your password when you log in.

3. Click **Login**.

The page that appears depends on the default access role for external authentication:

- If a default access role is selected in the authentication object or the system policy, the default start page appears. If you selected a new home page for your user account, then that page is displayed instead. See [Specifying Your Home Page](#) on page 2217 for more information.

The menus and menu options that are available to you at the top of the page are based on the privileges for your user account. However, the links on the default home page include options that span the range of user account privileges. If you click a link that requires different privileges from those granted to your account, the following warning message is displayed:

You are attempting to view an unauthorized page. This activity has been logged.

You can either select a different option from the available menus or click **Back** in your browser window.

- If no default access role is selected, the Login page reappears, with the following error message:

unable to authorize access. If you continue to have difficulty accessing this device, please contact the system administrator.

Note that when you use a RADIUS server using attribute matching as your authentication method, your first login attempt is rejected as your user account is created. You must log in a second time.

Logging Out of the Appliance

LICENSE: Any

When you are no longer actively using the web interface, Sourcefire recommends that you log out, even if you are only stepping away from your web browser for a short period of time. Logging out ends your web session and ensures that no one can use the appliance with your credentials.

By default, your session automatically logs you out after 1 hour of inactivity, unless you are otherwise configured to be exempt from session timeout. Users with the Administrator role can change the session timeout interval in the system policy. For more information, see [Managing User Login Settings](#) on page 1903 and [Configuring User Interface Settings](#) on page 1994.

To log out of the appliance:

ACCESS: Any

- ▶ Click **Logout** on the toolbar.

Using the Context Menu

LICENSE: feature dependent

For your convenience, certain pages in the web interface support a pop-up context menu that you can use as a shortcut for accessing other features in the Sourcefire 3D System. The contents of the menu depend on the *hotspot* where you access it—not only the page but also the specific data.

For example, *IP address hotspots* in event views, intrusion event packet views, the dashboard, and the Context Explorer provide additional options. Use the IP address context menu by right-clicking on the hotspot to learn more about the host associated with that address, including any available whois and host profile information. Except on the DC500 Defense Center, which does not support Security Intelligence filtering, you can also add an individual IP address to the Security Intelligence global whitelist or blacklist.

As another example, *SHA-256 value hotspots* in event views and the dashboard allow you to add a file's SHA-256 hash value to the global malware whitelist. Note that this functionality is also not supported on the DC500 Defense Center.

The following list describes many of the options available in the context menu on various pages of the web interface. On pages or locations where the Sourcefire context menu is not supported, the normal context menu for your browser appears.

Access Control Policy Editor

The access control policy editor contains hotspots over each access control rule. You can use the context menu to insert new rules and categories; cut, copy, and paste rules; set the rule state; and edit the rule.

NAT Policy Editor

The NAT policy editor contains hotspots over each NAT rule. You can use the context menu to insert new rules; cut, copy, and paste rules; set the rule state; and edit the rule.

Intrusion Rule Editor

The intrusion rule editor contains hotspots over each intrusion rule. You can use the context menu to edit the rule, set the rule state (including disabling the rule), configure thresholding and suppression options, and view rule documentation.

Event Viewer

Event pages (drill-down pages and table views) contain hotspots over each events, IP address, and certain detected files' SHA-256 hash values. For most event types, you can use the context menu to view related information in the Context Explorer, or drill down into event information in a new window. In places where an event field contains text too long to fully display in the event view, such as a file's SHA-256 hash value, a vulnerability description, or a URL, you can use the context menu to view the full text.

For intrusion events, you can also use the context menu to perform similar tasks to those in the intrusion rule editor: edit the triggering rule, set the rule state (including disabling the rule), configure thresholding and suppression options, and view rule documentation.

Packet View

Intrusion event packet views contain IP address hotspots. Note that the packet view uses a left-click context menu instead of a right-click menu.

Dashboard

Many dashboard widgets contain hotspots to view related information in the Context Explorer. Dashboard widgets can also contain IP address and SHA-256 value hotspots.

Context Explorer

The Context Explorer contains hotspots over its charts, tables, and graphs. If you want to examine data from graphs or lists in more detail than the Context Explorer allows, you can drill down to the table views of the relevant data. You can also view related host, user, application, file, and intrusion rule information.

Note that the Context Explorer uses a left-click context menu, which also contains filtering and other options unique to the Context Explorer. For detailed information, see [Drilling Down on Context Explorer Data](#) on page 148.

To access the context menu:

ACCESS: Any

1. On a hotspot-enabled page in the web interface, hover your pointer over a hotspot.
Except in the Context Explorer, a **right-click for menu** message appears.
2. Invoke the context menu:
 - In the Context Explorer or packet view, left-click your pointing device.
 - On all other hotspot-enabled pages, right-click your pointing device.A pop-up context menu appears with options appropriate for the hotspot.

3. Select one of the options by left-clicking the name of the option.
A new browser window opens based on the option you selected.

CHAPTER 2

USING DASHBOARDS

The Sourcefire 3D System dashboard provides you with at-a-glance views of current system status, including data about the events collected and generated by the system. You can also use the dashboard to see information about the status and overall health of the appliances in your deployment. Only certain user roles (Administrator, Maintenance User, Security Analyst, Security Analyst [Read Only], and custom roles with the Dashboards permission) have access to the dashboard. Other roles see as their default start pages a page relevant to the role; for example, a Discovery Admin sees the Network Discovery page.

A dashboard has one or more tabs, each of which can display one or more widgets in a three-column layout. Widgets are small, self-contained components that provide insight into different aspects of the Sourcefire 3D System. The Sourcefire 3D System is delivered with several predefined widgets. For example, the Appliance Information widget tells you the appliance name, model, remote manager, and currently running version of the Sourcefire 3D System software.

The dashboard has a time range that constrains its widgets. You can change the time range to reflect a period as short as the last hour or as long as the last year.

The dashboard is a complex, highly customizable monitoring feature. Another way to view many types of system data is the Context Explorer, which presents information using intrusion, connection, and discovery data in a set of preset visual contexts that you change, only temporarily, with filters to add granularity. In contrast to the exhaustive data available in the Sourcefire 3D System dashboard, the Context Explorer offers a broad, brief, and colorful picture of how your monitored network looks and acts. For more information on the Context Explorer, see [Using the Context Explorer](#) on page 117.

Each type of appliance is delivered with a default dashboard, named Summary Dashboard. This dashboard provides the casual user with general FireSIGHT,

intrusion, geolocation, and system status information for your Sourcefire 3D System deployment. Note that because some widgets are useful only for specific types of appliances, the Summary Dashboard differs depending on whether you are using a Defense Center or managed device.

By default, the home page for your appliance displays the Summary Dashboard, although you can configure your appliance to display a different default home page.

TIP! If you change the home page, you can access dashboards by selecting **Overview > Dashboards**. For more information, see [Viewing Dashboards](#) on page 109.

Note that the data displayed depends on such factors as how you license and deploy your managed devices, whether you configure features that provide the data and, in the case of Series 2 appliances, whether the appliance supports a feature that provides the data. For example, because neither the DC500 Defense Center nor Series 2 devices support URL filtering by category and reputation, the DC500 Defense Center does not display data for this feature and Series 2 devices do not detect this data.

In addition to the Summary Dashboard, the Defense Center is delivered with the following predefined dashboards:

- The Application Statistics dashboard provides detailed information about application activity and intrusion events on your monitored network. You can use this dashboard to track which applications produce the most traffic, allowed and denied connections, and intrusion events, as well as the number of unique applications in use and the estimated risk and business relevance of those applications.
- The Connection Summary dashboard uses connection data to create tables and charts of the activity on your monitored network. You can use this dashboard to track the ports, applications, and initiator and responder IPs associated with connections and traffic on your network, the overall volume of connections and traffic, and geolocation information. You must log connections for this dashboard to generate data; see [Understanding Connection Data](#) on page 540. Note that the output of this widget depends on your connection logging configuration.

TIP! Widgets on this dashboard list total traffic in kilobytes (KB). The total traffic in KB is equal to the traffic in KB/s multiplied by the total seconds covered by the selected time window.

- The Detailed Dashboard provides advanced users with detailed information about their Sourcefire 3D System deployment and includes multiple widgets that summarize collected intrusion event, network discovery, compliance, correlation, traffic, and system status data, as well as providing information about Sourcefire news and product updates. You can use this dashboard to monitor a very broad variety of network information at once.
- The Files Dashboard provides detailed information about the files (including malware files) detected on your network by managed devices, as well as malware detected using a subscription-based FireAMP strategy. Note that you must have a Malware license and enable malware detection for this dashboard to include network-based malware data. Note also that neither the DC500 nor Series 2 devices support advanced malware detection, so the DC500 cannot display this data and Series 2 devices do not detect it. For more information, see [Working with Malware Protection and File Control](#) on page 1197.
- The URL Statistics dashboard provides detailed information about allowed and denied traffic from your monitored network to external URLs, sorted by URL category and reputation. Note that you must have a URL Filtering license and enable URL Filtering for this dashboard to include URL category and reputation data. Note also that neither the DC500 nor Series 2 devices support URL filtering by reputation and category, so the DC500 cannot display this data and Series 2 devices do not detect it. See [Adding URL Conditions](#) on page 506.
- The User Statistics dashboard provides detailed information about user activity and intrusion events on your monitored network. You can use this dashboard to track allowed and denied connections, traffic, and intrusion events associated with users on your network, as well as the number of unique users on the network. Because this dashboard depends on user awareness data, for this dashboard to display meaningful statistics you must configure at least one Sourcefire User Agent and a Defense Center-Active Directory LDAP server connection; see [Obtaining User Data from LDAP Servers](#) on page 1298.

You can use the predefined dashboards, modify the predefined dashboards, or create a custom dashboard to suit your needs. You can share custom dashboards among all users of an appliance, or you can create a custom dashboard solely for your own use. You can also set a custom dashboard as your default dashboard.

Some drill-down pages and table views of events include a **Dashboard** toolbar link that you can click to view a relevant predefined dashboard. The [Event Table Dashboard Links](#) table lists which event views correspond to which predefined

dashboards. Note that if you delete a predefined dashboard or tab, the associated Dashboard links do not function.

Event Table Dashboard Links

TABLE	DASHBOARD LINK
Connection Events (Analysis > Connections)	Connection Summary
Intrusion Events (Analysis > Intrusion > Events)	Summary (Intrusion Events tab)
Malware Events (Analysis > Malware)	Files (Malware tab)
File Events (Analysis > Files)	Files (Files tab)
Applications (Analysis > Hosts > Applications)	Application Statistics
Application Details (Analysis > Hosts > Application Details)	Application Statistics
Users (Analysis > Users > Users)	User Statistics
User Activity (Analysis > Users > User Activity)	User Statistics
Correlation Events (Analysis > Correlation > Correlation Events)	Detailed (Correlation tab)
White List Events (Analysis > Correlation > White List Events)	Detailed (Correlation tab)

For more information on dashboards and their contents, see the following sections:

- [Understanding Dashboard Widgets](#) on page 70
- [Understanding the Predefined Widgets](#) on page 74
- [Working with Dashboards](#) on page 106

Understanding Dashboard Widgets

LICENSE: Any

A dashboard has one or more tabs, each of which can display one or more widgets in a three-column layout. The Sourcefire 3D System is delivered with many predefined dashboard widgets, each of which provides insight into a different aspect of the Sourcefire 3D System. Widgets are grouped into three categories:

- *Analysis & Reporting widgets* display data about the events collected and generated by the Sourcefire 3D System.
- *Miscellaneous widgets* display neither event data nor operations data. Currently, the only widget in this category displays an RSS feed.
- *Operations widgets* display information about the status and overall health of the Sourcefire 3D System.

The dashboard widgets that you can view depend on the type of appliance you are using and on your user role. In addition, each dashboard has a set of preferences that determines its behavior. You can minimize and maximize widgets, add and remove widgets from tabs, as well as rearrange the widgets on a tab.

IMPORTANT! For widgets that display event counts over a time range, the total number of events may not reflect the number of events for which detailed data is available in the event viewer. This occurs because the system sometimes prunes older event details to manage disk space usage. To minimize the occurrence of event detail pruning, you can fine-tune event logging to log only those events most important to your deployment. For more information, see [Logging Connection, File, and Malware Information](#) on page 515.

For more information, see:

- [Understanding Widget Availability](#) on page 71
- [Understanding Widget Preferences](#) on page 73
- [Understanding the Predefined Widgets](#) on page 74
- [Working with Dashboards](#) on page 106

Understanding Widget Availability

LICENSE: Any

The Sourcefire 3D System is delivered with several predefined dashboard widgets. The dashboard widgets that you can view depend on the type of appliance you are using and on your user role:

- An *invalid* widget is one that you cannot view because you are using the wrong type of appliance.
- An *unauthorized* widget is one that you cannot view because you do not have the necessary account privileges.

For example, the Current Sessions widget is available on all appliances, but only to users with Administrator account privileges, while the Appliance Status widget is available only on the Defense Center for users with Administrator, Maintenance User, Security Analyst, or Security Analyst (Read Only) account privileges.

Although you cannot add an unauthorized or invalid widget to a dashboard, if you import a dashboard created either on a different kind of appliance or by a user with different access privileges, that dashboard may contain unauthorized or invalid widgets. These widgets are disabled and display error messages that indicate the reason why you cannot view them.

Also note that widgets cannot display data to which an appliance has no access. For example, managed devices cannot access correlation events, intrusion events, discovery events, and so on. If you import a dashboard onto a managed device that contains a Custom Analysis widget configured to display one of those data types, the widget displays an error message. Individual widgets also display error messages when those widgets have timed out or are otherwise experiencing problems.

The content of a widget can differ depending on the type of appliance you are using. For example, the Custom Analysis widget on a Defense Center can display discovery information, but this feature is not available when you configure the Custom Analysis widget on a managed device. Note that you can sort any content generated in table format by clicking on the table column header.

You can delete or minimize unauthorized and invalid widgets, as well as widgets that display no data, keeping in mind that modifying a widget on a shared dashboard modifies it for all users of the appliance. For more information, see [Minimizing and Maximizing Widgets](#) on page 115 and [Deleting Widgets](#) on page 116.

The [Sourcefire Appliances and Dashboard Widget Availability](#) table lists the valid widgets for each appliance. An X indicates that the appliance can display the widget.

Sourcefire Appliances and Dashboard Widget Availability

WIDGET	DEFENSE CENTER	ANY MANAGED DEVICE
Appliance Information	X	X
Appliance Status	X	
Correlation Events	X	
Current Interface Status	X	X
Current Sessions	X	X
Custom Analysis	X	
Disk Usage	X	X
Interface Traffic	X	X
Intrusion Events	X	
Network Compliance	X	
Product Licensing	X	
Product Updates	X	X
RSS Feed	X	X
System Load	X	X
System Time	X	X
White List Events	X	

The [User Roles and Dashboard Widget Availability](#) table lists the user account privileges required to view each widget. An X indicates the user can view the widget. Only user accounts with Administrator, Maintenance User, Security Analyst, or Security Analyst (Read Only) access can use dashboards.

Users with custom roles may have access to any combination of widgets, or none at all, as their user roles permit.

User Roles and Dashboard Widget Availability

WIDGET	ADMINISTRATOR	MAINTENANCE USER	SECURITY ANALYST	SECURITY ANALYST (RO)
Appliance Information	X	X	X	X
Appliance Status	X	X	X	
Correlation Events	X		X	X
Current Interface Status	X	X	X	X
Current Sessions	X			
Custom Analysis	X		X	X
Disk Usage	X	X	X	X
Interface Traffic	X	X	X	X
Intrusion Events	X		X	X
Network Compliance	X		X	X
Product Licensing	X	X		
Product Updates	X	X		
RSS Feed	X	X	X	X
System Load	X	X	X	X
System Time	X	X	X	X
White List Events	X		X	X

Understanding Widget Preferences

LICENSE: Any

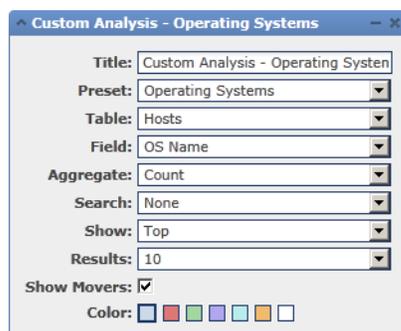

Each widget has a set of preferences that determines its behavior.

Widget preferences can be simple. For example, the following graphic shows the preferences for the Current Interface Status widget, which displays the current

status of all enabled interfaces on the internal network. You can only configure the update frequency for this widget.

Widget preferences can also be more complex. For example, the following graphic shows the preferences for the Custom Analysis widget, which is a highly customizable widget that allows you to display detailed information on the events collected and generated by the Sourcefire 3D System.

To modify a widget's preferences:

ACCESS: Admin/Any Security Analyst/Maint

1. On the title bar of the widget whose preferences you want to change, click the show preferences icon (▾).
The preferences section for that widget appears.
2. Make changes as needed.
Your changes take effect immediately. For information on the preferences you can specify for individual widgets, see [Understanding the Predefined Widgets](#) on page 74.
3. On the widget title bar, click the hide preferences icon (▲) to hide the preferences section.

Understanding the Predefined Widgets

LICENSE: Any

The Sourcefire 3D System is delivered with several predefined widgets that, when used on dashboards, can provide you with at-a-glance views of current system status, including data about the events collected and generated by the system, as well as information about the status and overall health of the appliances in your deployment.

For detailed information on the widgets delivered with the Sourcefire 3D System, see the following sections:

- [Understanding the Appliance Information Widget](#) on page 75
- [Understanding the Appliance Status Widget](#) on page 76
- [Understanding the Correlation Events Widget](#) on page 77
- [Understanding the Current Interface Status Widget](#) on page 77
- [Understanding the Current Sessions Widget](#) on page 78
- [Understanding the Custom Analysis Widget](#) on page 79
- [Understanding the Disk Usage Widget](#) on page 96
- [Understanding the Interface Traffic Widget](#) on page 97
- [Understanding the Intrusion Events Widget](#) on page 97
- [Understanding the Network Compliance Widget](#) on page 99
- [Understanding the Product Licensing Widget](#) on page 101
- [Understanding the Product Updates Widget](#) on page 101
- [Understanding the RSS Feed Widget](#) on page 103
- [Understanding the System Load Widget](#) on page 104
- [Understanding the System Time Widget](#) on page 104
- [Understanding the White List Events Widget](#) on page 105

IMPORTANT! The dashboard widgets you can view depend on the type of appliance you are using and on your user role. For more information, see [Understanding Widget Availability](#) on page 71.

Understanding the Appliance Information Widget

LICENSE: Any

The Appliance Information widget provides a snapshot of the appliance. It appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard.

The screenshot shows a window titled "Appliance Information" with a list of system parameters and their values. The parameters are grouped into "Versions" and other system details.

Name	katsura
IPv4 Address	10.10.0.2 (eth0)
IPv6 Address	Disabled
Model	Defense Center 3500 (66)
Versions	
Software	5.0.0-652
OS	Sourcefire Linux OS 5.0.0-27
Snort	2.9.2-41
Rule Update	2011-08-30-001-dev
Geolocation Update	None
Rulepack	753
Module Pack	1253
VDB	70.2017

The widget provides:

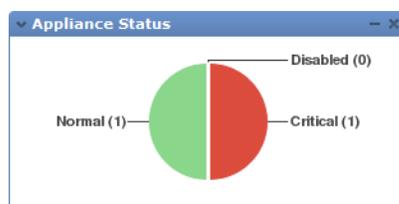

- the name, IPv4 address, IPv6 address, and model of the appliance
- the versions of the Sourcefire 3D System software, operating system, Snort, rule update, rule pack, module pack, vulnerability database (VDB), and geolocation update installed on the appliance
- for managed appliances, the name and status of the communications link with the managing appliance
- for Defense Centers in a high availability pair, the name, model, and Sourcefire 3D System software and operating system versions of the peer Defense Center, as well as how recently the Defense Centers made contact

You can configure the widget to display more or less information by modifying the widget preferences to display a simple or an advanced view; the preferences also control how often the widget updates. For more information, see [Understanding Widget Preferences](#) on page 73.

Understanding the Appliance Status Widget

LICENSE: Any

The Appliance Status widget indicates the health of the appliance and of any appliances it is managing. Note that because the Defense Center does not automatically apply a health policy to managed devices, you must manually apply a health policy to devices or their status appears as **Disabled**. This widget appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard.

You can configure the widget to display appliance status as a pie chart or in a table by modifying the widget preferences.

A table titled "Appliance Status" showing the count of appliances in different health states. The table has two columns: "Type" and a count column. The "Type" column includes icons for error (red X), warning (yellow triangle), normal (green checkmark), and info (blue question mark).

Type	Count
Managed Device	1
Defense Center	1

The preferences also control how often the widget updates. For more information, see [Understanding Widget Preferences](#) on page 73.

You can click a section on the pie chart or one of the numbers on the appliance status table to go to the Health Monitor page and view the compiled health status

of the appliance and of any appliances it is managing. For more information, see [Using the Health Monitor](#) on page 2163.

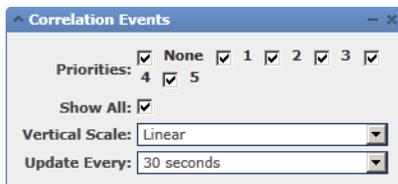

Understanding the Correlation Events Widget

LICENSE: FireSIGHT

The Correlation Events widget shows the average number of correlation events per second, by priority, over the dashboard time range. It appears by default on the Correlation tab of the Detailed Dashboard.

You can configure the widget to display correlation events of different priorities by modifying the widget preferences, as well as to select a linear (incremental) or logarithmic (factor of ten) scale.

Select one or more **Priorities** check boxes to display separate graphs for events of specific priorities, including events that do not have a priority. Select **Show All** to display an additional graph for all correlation events, regardless of priority. The preferences also control how often the widget updates. For more information, see [Understanding Widget Preferences](#) on page 73.

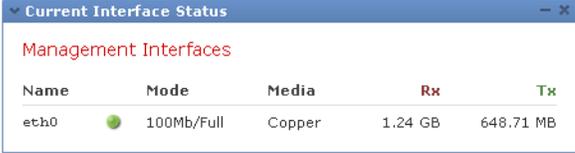

You can click a graph to view correlation events of a specific priority, or click the **All** graph to view all correlation events. In either case, the events are constrained by the dashboard time range; accessing correlation events via the dashboard changes the events (or global) time window for the appliance. For more information on correlation events, see [Viewing Correlation Events](#) on page 1521.

Understanding the Current Interface Status Widget

LICENSE: Any

The Current Interface Status widget shows the status of all enabled interfaces for the appliance, grouped by type: management, inline, passive, switched, routed, stacking, and unused. Note that Defense Centers have only management

interfaces. This widget does not appear by default on any of the predefined dashboards.

The screenshot shows a window titled "Current Interface Status" with a sub-header "Management Interfaces". Below the header is a table with columns: Name, Mode, Media, Rx, and Tx. The table contains one row for the interface "eth0".

Name	Mode	Media	Rx	Tx
eth0	100Mb/Full	Copper	1.24 GB	648.71 MB

For each interface, the widget provides:

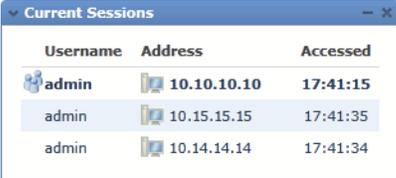

- the name of the interface
- the link state of the interface, represented by a green ball (up) or a gray ball (down)
- the link mode (for example, 100Mb full duplex, or 10Mb half duplex) of the interface
- the type of interface, that is, copper or fiber
- the amount of data received (Rx) and transmitted (Tx) by the interface

The widget preferences control how often the widget updates. For more information, see [Understanding Widget Preferences](#) on page 73.

Understanding the Current Sessions Widget

LICENSE: Any

The Current Sessions widget shows which users are currently logged into the appliance, the IP address associated with the machine where the session originated, and the last time each user accessed a page on the appliance (based on the local time for the appliance). The user that represents you, that is, the user currently viewing the widget, is marked with a user icon (👤) and rendered in bold type. Sessions are pruned from this widget's data within one hour of logoff or inactivity. This widget appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard.

The screenshot shows a window titled "Current Sessions" with a table containing columns: Username, Address, and Accessed. The first row shows a session for "admin" with IP "10.10.10.10" accessed at "17:41:15". The second row shows a session for "admin" with IP "10.15.15.15" accessed at "17:41:35". The third row shows a session for "admin" with IP "10.14.14.14" accessed at "17:41:34". The first row is highlighted and has a user icon next to the username.

Username	Address	Accessed
admin	10.10.10.10	17:41:15
admin	10.15.15.15	17:41:35
admin	10.14.14.14	17:41:34

On the Current Sessions widget, you can:

- click any user name to manage user accounts on the User Management page; see [Managing User Accounts](#) on page 1897
- click the host icon (🖨️) next to any IP address to view the host profile for the associated machine; see [Using Host Profiles](#) on page 1334 (Defense Center with network discovery only)
- click any IP address or access time to view the audit log constrained by that IP address and by the time that the user associated with that IP address logged on to the web interface; see [Viewing Audit Records](#) on page 2188

The widget preferences control how often the widget updates. For more information, see [Understanding Widget Preferences](#) on page 73.

Understanding the Custom Analysis Widget

LICENSE: Any

The Custom Analysis widget is a highly customizable widget that allows you to display detailed information on the events collected and generated by the Sourcefire 3D System.

The Custom Analysis widget is delivered with numerous widget presets, which are groups of configurations that are predefined by Sourcefire. The presets serve as examples and can provide quick access to information about your deployment. You can use these presets or create a custom configuration.

When you configure the widget preferences, you must select which table and individual field you want to display, as well as the aggregation method that configures how the widget groups the data it displays.

For example, you can configure the Custom Analysis widget to display a list of recent intrusion events by configuring the widget to display data from the **Intrusion Events** table. Selecting the **Classification** field and aggregating this data by **Count** tells you how many events of each type were generated.

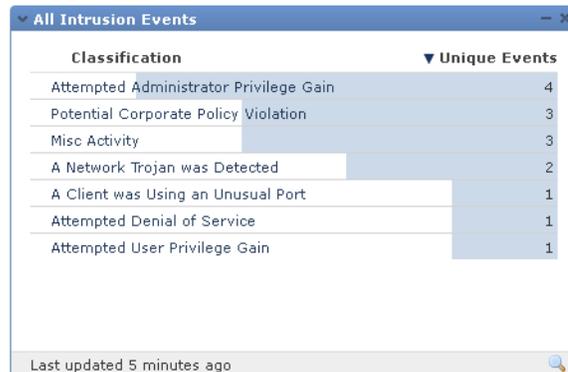

Classification	Count
A Client was Using an Unusual Port	15,003
Potential Corporate Policy Violation	955
Attempted User Privilege Gain	42
Attempted Administrator Privilege Gain	18
Misc Activity	16
A Network Trojan was Detected	5
Attempted Denial of Service	1

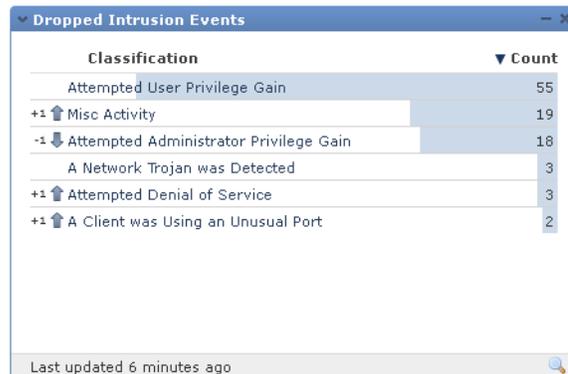

Last updated 1 minute ago

On the other hand, aggregating by **Unique Events** tells you how many unique intrusion events of each type have occurred (for example, how many detections

of network trojans, potential violations of corporate policy, attempted denial-of-service attacks, and so on).

Optionally, you can further constrain the widget using a saved search, either one of the predefined searches delivered with your appliance or a custom search that you created. For example, constraining the first example (intrusion events using the **Classification** field, aggregated by **Count**) using the **Dropped Events** search tells you how many intrusion events of each type were dropped.

The colored bars in the widget background show the relative number of occurrences of each event; you should read the bars from right to left. You can change the color of the bars as well as the number of rows that the widget displays. You can also configure the widget to display the most frequently occurring events or the least frequently occurring events.

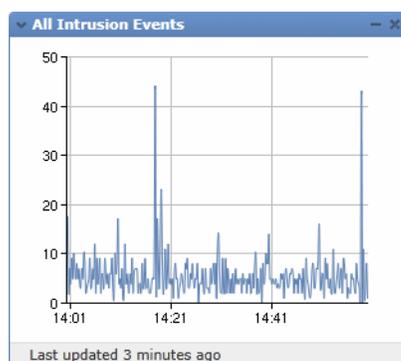

The direction icon (▼) indicates and controls the sort order of the display. A downward-pointing icon indicates descending order; an upward-pointing icon indicates ascending order. To change the sort order, click the icon.

Next to each event, the widget can display one of three icons to indicate any changes from the most recent results:

- The new event icon (+) signifies that the event is new to the results.
- The up arrow icon (↑) indicates that the event has moved up in the standings since the last time the widget updated. A number indicating how many places the event has moved up appears next to the icon.
- The down arrow icon (↓) indicates that the event has moved down in the standings since the last time the widget updated. A number indicating how many places the event has moved down appears next to the icon.

The widget displays the last time it updated, based on the local time of the appliance. The widget updates with a frequency that depends on the dashboard time range. For example, if you set the dashboard time range to an hour, the widget updates every five minutes. On the other hand, if you set the dashboard time range to a year, the widget updates once a week. To determine when the dashboard will update next, hover your pointer over the **Last updated** notice in the bottom left corner of the widget.

If you want information on events or other collected data over time, you can configure the Custom Analysis widget to display a line graph, such as one that displays the total number of intrusion events generated in your deployment over time. For graphs over time, you can choose the time zone that the widget uses as well as the color of the line.

Finally, you can choose a custom title for the widget.

From Custom Analysis widgets, you can invoke event views (that is, workflows) that provide detailed information about the events displayed in the widget. To do so, click the event for which you want more information.

You can also right-click any IP address in the custom analysis widget to display a context menu that allows you to obtain more information on the associated host,

as well as add it to the global blacklist or whitelist for Security Intelligence filtering.

IMPORTANT! Depending on how you configure them, Custom Analysis widgets may place a drain on an appliance's resources; a red-shaded Custom Analysis widget indicates that its use is harming system performance. If the widget continues to stay red over time, you should remove the widget.

For more information, see the following sections:

- [Configuring the Custom Analysis Widget](#) on page 82
- [Viewing Associated Events from the Custom Analysis Widget](#) on page 94
- [Custom Analysis Widget Limitations](#) on page 96
- [Using the Context Menu](#) on page 63

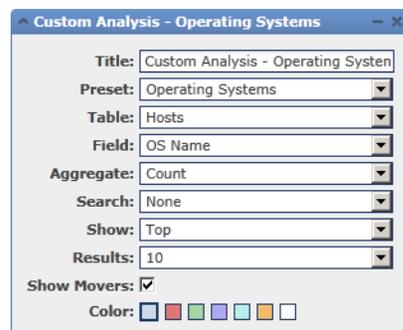

Configuring the Custom Analysis Widget

LICENSE: Any

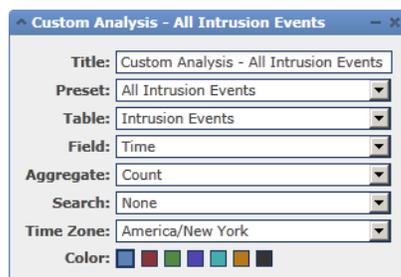

Like all widgets, the Custom Analysis widget has preferences that determine its behavior. To configure a Custom Analysis widget, show the preferences as described in [Understanding Widget Preferences](#) on page 73.

A different set of preferences appears depending on whether you configure the widget to show relative occurrences of events (that is, a bar graph), or configure the widget to show a graph over time (that is, a line graph).

To configure the widget to show a bar graph, select any value except **Time** from the **Field** drop-down list.

To configure the widget to show a line graph, select **Time** from the **Field** drop-down list.

The following table describes the various preferences you can set in the Custom Analysis widget.

Custom Analysis Widget Preferences

USE THIS PREFERENCE...	TO CONTROL...
Title	<p>the title of the widget.</p> <p>If you do not specify a title, the appliance uses the configured event type as the widget title.</p>
Preset	<p>the preset for the widget.</p> <p>The Custom Analysis widget is delivered with numerous presets, which are widget configurations predefined by Sourcefire. The presets serve as examples and can provide quick access to information about your deployment. You can use these presets or you can create a custom configuration.</p> <p>For a detailed list of presets, see the Custom Analysis Widget Presets table on page 85.</p>
Table	<p>the table of events which contains the event data the widget displays.</p>
Field	<p>the specific field of the event type you want to display.</p> <p>TIP! To display a graph over time, select Time.</p>
Aggregate	<p>the aggregation method for the widget.</p> <p>The aggregation method configures how the widget groups the data it displays. For most event types, the default aggregation criterion is Count.</p>

Custom Analysis Widget Preferences (Continued)

USE THIS PREFERENCE...	TO CONTROL...
Filter	<p>a user-defined application filter that you want to use to further constrain the data that the widget displays.</p> <p>You can only use application filters if you are displaying data from the Application Statistics or Intrusion Event Statistics by Application tables. For more information on application filters, see Working with Application Filters on page 176.</p>
Search	<p>the saved search you want to use to further constrain the data that the widget displays.</p> <p>You do not have to specify a search, although some presets use predefined searches.</p>
Show	<p>whether you want to display the most frequently occurring events (Top) or the least frequently occurring events (Bottom).</p>
Results	<p>the number of result rows you want to display.</p> <p>You can display from 10 to 25 result rows, in increments of five.</p>
Show Movers	<p>whether you want to display the icons that indicate changes from the most recent results.</p>
Time Zone	<p>which time zone you want to use to display results.</p> <p>The time zone appears whenever you select a time-based field.</p>
Color	<p>the color of the bars in the widget background that show the relative number of occurrences of each result.</p>

The following table describes the available presets for the Custom Analysis widget. It also indicates which, if any, Defense Center predefined dashboard uses each preset. Note the following:

- Predefined dashboards on managed devices do not include Custom Analysis widgets.
- The DC500 Defense Center does not display and Series 2 devices do not detect data for features they do not support. See the [Supported Capabilities by Appliance Model table](#) on page 42 for a summary of Series 2 appliance features.

Custom Analysis Widget Presets

PRESET	DESCRIPTION	PREDEFINED DASHBOARDS	LICENSES
All Intrusion Events	Displays a graph of the total number of intrusion events on your monitored network over the dashboard time range.	Detailed Dashboard Summary Dashboard	Protection
All Intrusion Events (Not Dropped)	Displays the most frequently occurring types of intrusion events, by classification, where the packet was not dropped as part of the event.	Detailed Dashboard	Protection

Viewing Associated Events from the Custom Analysis Widget

LICENSE: Any

Depending on the kind of data that a Custom Analysis widget is configured to display, you can invoke an event view (that is, a workflow) that provides detailed information about the events displayed in the widget.

When you invoke an event view from the dashboard, the events appear in the default workflow for that event type, constrained by the dashboard time range. This also changes the appropriate time window for the appliance, depending on

how many time windows you have configured and on what type of event you are trying to view.

For example, if you configure multiple time windows on your Defense Center and then access health events from a Custom Analysis widget, the events appear in the default health events workflow, and the health monitoring time window changes to the dashboard time range.

As another example, if you configure a single time window and then access any type of event from the Custom Analysis widget, the events appear in the default workflow for that event type, and the global time window changes to the dashboard time range.

For more information on time windows, see [Default Time Windows](#) on page 2219 and [Specifying Time Constraints in Searches](#) on page 1775.

To view associated events from the Custom Analysis Widget:

ACCESS: Admin/Any Security Analyst/Maint

- ▶ You have two options, depending on how you configured the widget:
 - On widgets configured to show relative occurrences of events (that is, bar graphs), click any event to view associated events constrained by the widget preferences, as well as by that event. You can also click the view all icon () in the lower right corner of the widget to view all associated events, constrained by the widget preferences.
 - On widgets configured to show connection data over time, click the view all icon in the lower right corner of the widget to view all associated events, constrained by the widget preferences.

For information on working with specific event types, see the following sections:

- [Working with Security Intelligence Lists and Feeds](#) on page 162

Custom Analysis Widget Limitations

LICENSE: Any

There are some important points to keep in mind when using the Custom Analysis widget.

If you are configuring the widget on a shared dashboard, remember that not all users can view data of all event types, depending on the user's account privileges. For example, Maintenance Users cannot view discovery events.

Similarly, if you are using a dashboard imported from another appliance, remember that not all appliances have access to data of all event types. For example, managed devices do not store correlation data. If your dashboard includes a Custom Analysis widget that displays data you cannot see, the widget indicates that you are unauthorized to view the data. Note, however, that you (and any other users who share the dashboard) can modify the preferences of the widget to display data that you can see, or even delete the widget. If you want to make sure that this does not happen, save the dashboard as private.

Remember that only you can access searches that you have saved as private. If you configure the widget on a shared dashboard and constrain its events using a private search, the widget resets to not using the search when another user logs in. This affects your view of the widget as well. If you want to make sure that this does not happen, save the dashboard as private.

You enable or disable the Custom Analysis widget from the Dashboard settings in your system policy. For more information, see [Configuring Dashboard Settings](#) on page 1977.

Understanding the Disk Usage Widget

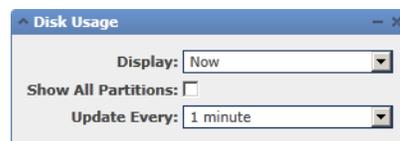

LICENSE: Any

The Disk Usage widget indicates the percentage of space used on each partition of the appliance's hard drive. It also shows the capacity of each partition. This

widget appears by default on the Status tabs of the Default Dashboard and the Summary Dashboard.

You can configure the widget to display only admin (/) and /volume partition usage, or you can show these plus the /boot partition usage by modifying the widget preferences.

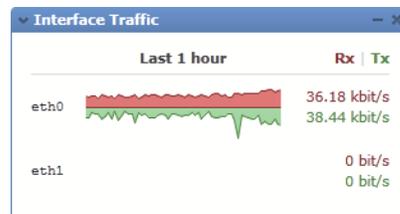

The widget preferences also control how often the widget updates, as well as whether it displays the current disk usage or collected disk usage statistics over the dashboard time range. For more information, see [Understanding Widget Preferences](#) on page 73.

Understanding the Interface Traffic Widget

LICENSE: Any

The Interface Traffic widget shows the rate of traffic received (Rx) and transmitted (Tx) on the appliance's enabled interfaces over the dashboard time range. It does not appear by default on any of the predefined dashboards.

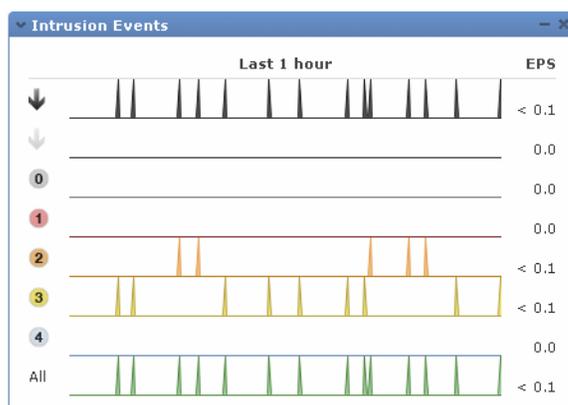

The widget preferences control how often the widget updates. On managed devices, the preferences also control whether the widget displays the traffic rate for unused interfaces (by default, the widget only displays the traffic rate for active interfaces). For more information, see [Understanding Widget Preferences](#) on page 73.

Understanding the Intrusion Events Widget

LICENSE: Protection

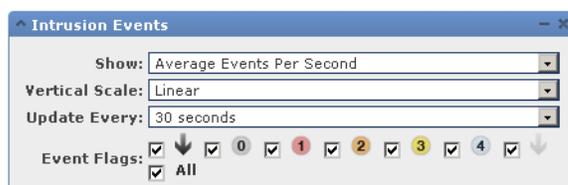

The Intrusion Events widget shows the intrusion events that occurred over the dashboard time range, organized by priority. This includes statistics on intrusion

events with dropped packets and different impacts. This widget appears by default on the Intrusion Events tab of the Summary Dashboard.

On managed devices, the widget can display statistics for dropped (or, on passively deployed devices, would have dropped) intrusion events, all intrusion events, or both. Note that you must enable local event storage or the widget will not have any data to display. Note also that the total rate represented by **All** does not include the dropped event rate.

On the Defense Center, but not managed devices, you can configure the widget to display intrusion events with dropped/would have dropped packets and different impacts by modifying the widget preferences. You can display dropped and would have dropped events on Defense Centers and devices. The following graphic shows the Defense Center version of the widget preferences.

In the widget preferences, you can:

- on a Defense Center, select one or more **Event Flags** check boxes to display separate graphs for events with dropped packets, would have dropped packets, or specific impacts; select **All** to display an additional graph for all intrusion events, regardless of impact or rule state; see [Using Impact Flags to Evaluate Events](#) on page 641 for more information
- select **Show** to choose **Average Events Per Second** or **Total Events**
- select **Vertical Scale** to choose **Linear** (incremental) or **Logarithmic** (factor of ten) scale

The preferences also control how often the widget updates. For more information, see [Understanding Widget Preferences](#) on page 73.

On the Intrusion Events widget, you can:

- on a Defense Center, click a graph corresponding to dropped packets, to would have dropped packets, or to a specific impact to view intrusion events of that type
- click the graph corresponding to dropped events to view dropped events
- click the graph corresponding to would have dropped events to view would have dropped events
- click the **All** graph to view all intrusion events

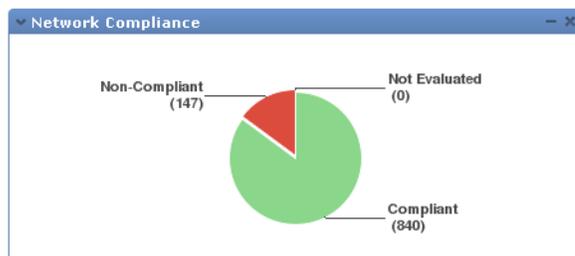

Note that the resulting event view is constrained by the dashboard time range; accessing intrusion events via the dashboard changes the events (or global) time window for the appliance. For more information on intrusion events, see [Viewing Intrusion Events](#) on page 602.

Note also that packets in a passive deployment are not dropped, regardless of the rule state or the inline drop behavior of the intrusion policy. For more information, see [Setting Rule States](#) on page 743 and [Setting Drop Behavior in an Inline Deployment](#) on page 689.

Understanding the Network Compliance Widget

LICENSE: FireSIGHT

The Network Compliance widget summarizes your hosts' compliance with the white lists you configured (see [Using the Sourcefire 3D System as a Compliance Tool](#) on page 1530). By default, the widget displays a pie chart that shows the number of hosts that are compliant, non-compliant, and that have not been evaluated, for all compliance white lists in active correlation policies. This widget appears by default on the Correlation tab of the Detailed Dashboard.

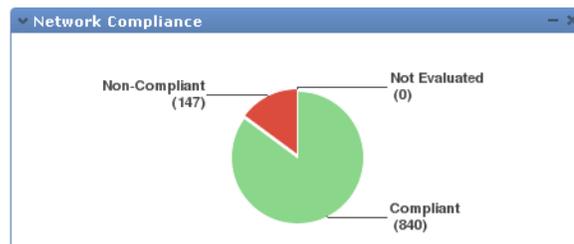

You can configure the widget to display network compliance either for all white lists or for a specific white list by modifying the widget preferences.

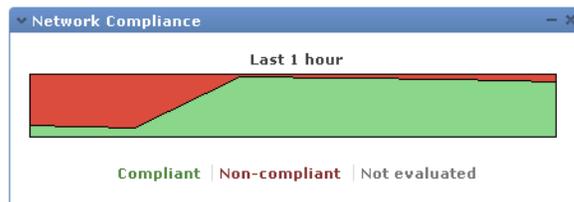

If you choose to display network compliance for all white lists, the widget considers a host to be non-compliant if it is not compliant with any white list in an active correlation policy.

You can also use the widget preferences to specify which of three different styles you want to use to display network compliance.

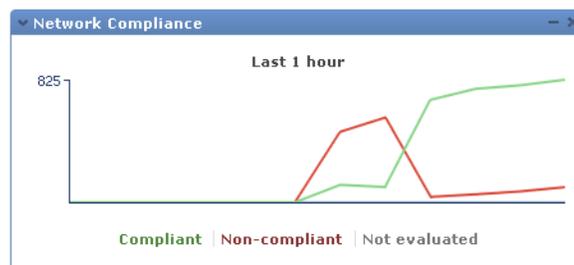

The **Network Compliance** style (the default) displays a pie chart that shows the number of hosts that are compliant, non-compliant, and that have not been evaluated. You can click the pie chart to view the host violation count, which lists the hosts that violate at least one white list. For more information, see [Viewing White List Violations](#) on page 1579.

The **Network Compliance over Time (%)** style displays a stacked area graph showing the relative proportion of hosts that are compliant, non-compliant, and that have not yet been evaluated, over the dashboard time range.

The **Network Compliance over Time** style displays a line graph that shows the number of hosts that are compliant, non-compliant, and that have not yet been evaluated, over the dashboard time range.

The preferences control how often the widget updates. You can check the **Show Not Evaluated** box to hide events which have not been evaluated. For more information, see [Understanding Widget Preferences](#) on page 73.

Understanding the Product Licensing Widget

LICENSE: Any

The Product Licensing widget shows the device and feature licenses currently installed on the Defense Center. It also indicates the number of items (such as hosts or users) licensed and the number of remaining licensed items allowed. It does not appear by default on any of the predefined dashboards.

License Type	Licensed	Remaining	%
3D8250 Control	100	99	99%
3D8250 Protection	100	99	99%
3D8250 URL Filtering	100	99	99%
DC3500 FireSIGHT Host	300,000	290,579	96%
DC3500 FireSIGHT User	300,000	299,998	99%

Expiring Licenses

License Type	Expires	Licensed
3D8250 URL Filtering	2012-05-19	100

The top section of the widget displays all device and feature licenses installed on the Defense Center, including temporary licenses, while the Expiring Licenses section displays only temporary and expired licenses. For example, if you have two feature licenses for FireSIGHT Hosts, one of which is a permanent license and allows 750 hosts, and another that is temporary and allows an additional 750 hosts, the top section of the widget displays a FireSIGHT Hosts feature license with 1500 licensed hosts, while the Expiring Licenses section displays a FireSIGHT Hosts feature license with 750 hosts.

The bars in the widget background show the percentage of each type of license that is being used; you should read the bars from right to left. Expired licenses are marked with a strikethrough.

You can configure the widget to display either the features that are currently licensed, or all the features that you can license, by modifying the widget preferences. The preferences also control how often the widget updates. For more information, see [Understanding Widget Preferences](#) on page 73.

You can click any of the license types to go to the License page of the local configuration and add or delete feature licenses. For more information, see [Licensing the Sourcefire 3D System](#) on page 2036.

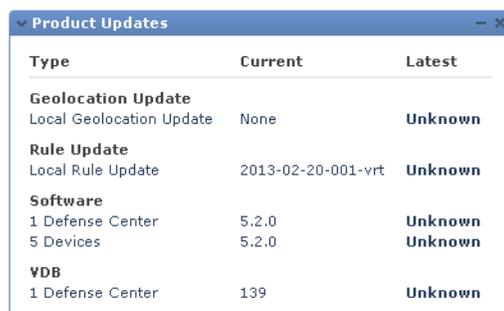

Understanding the Product Updates Widget

LICENSE: Any

The Product Updates widget provides you with a summary of the software (Sourcefire 3D System software and rule updates) currently installed on the appliance as well as information on available updates that you have downloaded, but not yet installed, for that software. This widget appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard.

Note that the widget displays **Unknown** as the latest version of the software unless you have configured a scheduled task to download, push, or install software updates; the widget uses scheduled tasks to determine the latest version. For more information, see [Scheduling Tasks](#) on page 1929.

The widget also provides you with links to pages where you can update the software; the Defense Center version of the widget provides you with similar links so you can update the software on your managed devices.

Type	Current	Latest
Geolocation Update		
Local Geolocation Update	None	Unknown
Rule Update		
Local Rule Update	2013-02-20-001-vrt	Unknown
Software		
1 Defense Center	5.2.0	Unknown
5 Devices	5.2.0	Unknown
VDB		
1 Defense Center	139	Unknown

You can configure the widget to hide the latest versions by modifying the widget preferences. The preferences also control how often the widget updates. For more information, see [Understanding Widget Preferences](#) on page 73.

On the Product Updates widget, you can:

- manually update an appliance by clicking the current version of the Sourcefire 3D System software, rule update, geolocation update, or VDB:
 - to update the system software, geolocation database, or VDB, see [Updating System Software](#) on page 2054.
 - to import the newest rule update, see [Importing Rule Updates and Local Rule Files](#) on page 2072.
- create a scheduled task to download the latest version of the Sourcefire 3D System software, rule update, or VDB by clicking either the latest version or the **Unknown** link in the Latest column; see [Scheduling Tasks](#) on page 1929.

Understanding the RSS Feed Widget

LICENSE: Any

The RSS Feed widget adds an RSS feed to a dashboard. By default, the widget shows a feed of Sourcefire security news. It appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard.

You can also configure the widget to display a preconfigured feed of Sourcefire company news, the Snort.org blog, or the Vulnerability Research Team (VRT) blog, or you can create a custom connection to any other RSS feed by specifying its URL in the widget preferences.

Feeds update every 24 hours (although you can manually update the feed), and the widget displays the last time the feed was updated based on the local time of the appliance. Keep in mind that the appliance must have access to the Sourcefire web site (for the two preconfigured feeds) or to any custom feed you configure.

When you configure the widget, you can also choose how many stories from the feed you want to show in the widget, as well as whether you want to show descriptions of the stories along with the headlines; keep in mind that not all RSS feeds use descriptions.

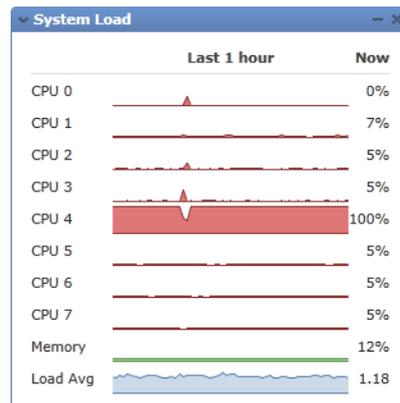

On the RSS Feed widget, you can:

- click one of the stories in the feed to view the story
- click the **more** link to go to the feed's web site
- click the update icon (🔄) to manually update the feed

Understanding the System Load Widget

LICENSE: Any

The System Load widget shows the CPU usage (for each CPU), memory (RAM) usage, and system load (also called the load average, measured by the number of processes waiting to execute) on the appliance, both currently and over the dashboard time range. It appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard.

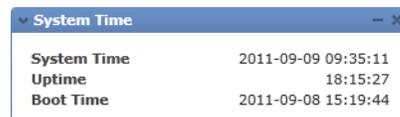

You can configure the widget to show or hide the load average by modifying the widget preferences. The preferences also control how often the widget updates. For more information, see [Understanding Widget Preferences](#) on page 73.

Understanding the System Time Widget

LICENSE: Any

The System Time widget shows the local system time, uptime, and boot time for the appliance. It appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard.

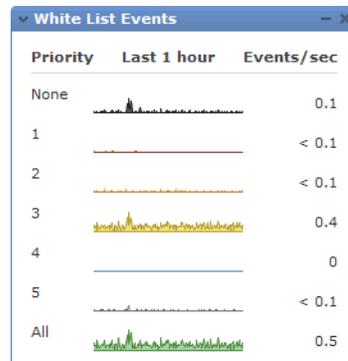

You can configure the widget to hide the boot time by modifying the widget preferences. The preferences also control how often the widget synchronizes with the appliance's clock. For more information, see [Understanding Widget Preferences](#) on page 73.

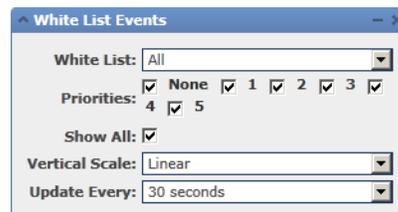

Understanding the White List Events Widget

LICENSE: FireSIGHT

The White List Events widget shows the average events per second by priority, over the dashboard time range. It appears by default on the Correlation tab of the Default Dashboard.

You can configure the widget to display white list events of different priorities by modifying the widget preferences.

In the widget preferences, you can:

- select one or more **Priorities** check boxes to display separate graphs for events of specific priorities, including events that do not have a priority
- select **Show All** to display an additional graph for all white list events, regardless of priority
- select **Vertical Scale** to choose **Linear** (incremental) or **Logarithmic** (factor of ten) scale

The preferences also control how often the widget updates. For more information, see [Understanding Widget Preferences](#) on page 73.

You can click a graph to view white list events of a specific priority, or click the **All** graph to view all white list events. In either case, the events are constrained by the dashboard time range; accessing white list events via the dashboard changes the events (or global) time window for the Defense Center. For more information on white list events, see [Viewing White List Events](#) on page 1573.

Working with Dashboards

LICENSE: Any

You can view and modify the widgets that appear on the dashboard.

You manage dashboards on the Dashboard Management page (see [Viewing Dashboards](#) on page 109). You can create, view, modify, export, and delete dashboards.

Name	Owner	Private	Default	
Application Statistics Provides traffic and intrusion event statistics by application	admin	No	No	   
Connection Summary Provides tables and charts of the activity on your monitored network segment organized by different criteria	admin	No	No	   
Detailed Dashboard Provides a detailed view of activity on the appliance	admin	No	No	   
Files Dashboard Provides an overview of Malware and File Events	admin	No	No	   
Summary Dashboard Provides a summary of activity on the appliance	admin	No	Yes	   
URL Statistics Provides traffic statistics by URL category and reputation	admin	No	No	   
User Statistics Provides traffic and intrusion event statistics by user	admin	No	No	   

For each dashboard, the page indicates the owner (that is, the user who created it) and whether a dashboard is private. Note that, unless you have Administrator access, you can only see your own private dashboards; you cannot view or modify private dashboards created by other users.

Finally, the page indicates which dashboard is the default. You specify the default dashboard in your user preferences; for more information, see [Specifying Your Default Dashboard](#) on page 2223.

For more information on working with dashboards, see:

- [Creating a Custom Dashboard](#) on page 106
- [Viewing Dashboards](#) on page 109
- [Modifying Dashboards](#) on page 111
- [Deleting a Dashboard](#) on page 116
- [Exporting Objects](#) on page 2226

Creating a Custom Dashboard

LICENSE: Any

When you create a new dashboard, you can choose to base it on any existing dashboard, whether user-created or predefined by Sourcefire. This makes a copy of the preexisting dashboard; you can modify this copy to suit your needs. Optionally, you can create a blank new dashboard by choosing not to base your dashboard on any preexisting dashboards.

You must also specify (or disable) the tab change and page refresh intervals. These settings determine how often the dashboard cycles through its tabs and how often the entire dashboard page refreshes.

Refreshing the entire dashboard allows you to see any preference or layout changes that were made to a shared dashboard by another user, or that you made to a private dashboard on another computer, since the last time the dashboard refreshed. This may be useful, for example, in a network operations center (NOC) where a dashboard is displayed at all times. If you want to make changes to the dashboard, you can make the changes at a local computer. Then, the dashboard in the NOC automatically refreshes at the interval you specify and displays your changes without you having to manually refresh the dashboard in the NOC. Note that you do not need to refresh the entire dashboard to see data updates; individual widgets update according to their preferences.

Finally, you can choose to associate the new dashboard with your user account by saving it as a private dashboard. If you choose not to save the dashboard as private, all other users of the appliance can view it.

Keep in mind that because not all user roles have access to all dashboard widgets, users with fewer permissions viewing a dashboard created by a user with more permissions may not be able to use all of the widgets on the dashboard. Although the unauthorized widgets still appear on the dashboard, they are disabled.

You should also keep in mind that any user with dashboard access, regardless of role, can modify shared dashboards. If you want to make sure that only you can modify a particular dashboard, save it as private.

TIP! Instead of creating a new dashboard, you can export a dashboard from another appliance, then import it onto your appliance. You can then edit the imported dashboard to suit your needs. Note that the dashboard widgets you can view depend on the type of appliance you are using and on your user role; for example, a dashboard created on the Defense Center and imported onto a managed device may display some invalid, disabled widgets. For more information, see [Importing and Exporting Objects](#) on page 2225.

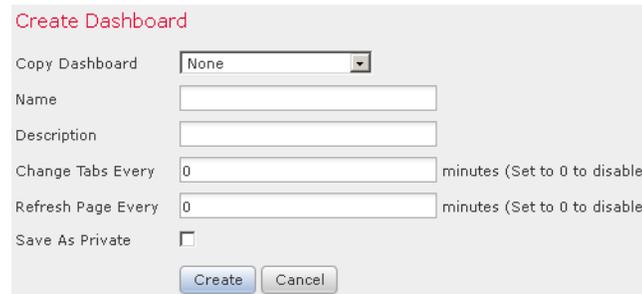

To create a new dashboard:

ACCESS: Admin/Any Security Analyst/Maint

1. Select **Overview > Dashboards > Management**.
The Dashboard Management page appears.

2. Click **Create Dashboard**.

The Create Dashboard page appears.

3. Use the **Copy Dashboard** drop-down list to select the dashboard on which you want to base the new dashboard.

You can select any predefined or user-defined dashboard. Optionally, select **None** (the default) to create a blank dashboard.

4. Type a name and optional description for the dashboard.

5. In the **Change Tabs Every** field, specify (in minutes) how often the dashboard should change tabs.

Unless you pause the dashboard or your dashboard has only one tab, this setting advances your view to the next tab at the interval you specify. To disable tab cycling, enter 0 in the **Change Tabs Every** field.

6. In the **Refresh Page Every** field, specify (in minutes) how often the current dashboard tab should refresh with new data. This value must be greater than the **Change Tabs Every** setting.

Unless you pause the dashboard, this setting will refresh the entire dashboard at the interval you specify. To disable the periodic page refresh, enter 0 in the **Refresh Page Every** field.

Note that this setting is separate from the update interval available on many individual widgets; although refreshing the dashboard page resets the update interval on individual widgets, widgets will update according to their individual preferences even if you disable the **Refresh Page Every** setting.

7. Optionally, select the **Save As Private** check box to associate the dashboard with your user account and to prevent other users from viewing and modifying the dashboard.

8. Click **Save**.

Your dashboard is created and appears in the web interface. You can now tailor it to suit your needs by adding tabs and widgets (and, if you based it on a preexisting dashboard, by rearranging and deleting widgets). For more information, see [Modifying Dashboards](#) on page 111.

Viewing Dashboards

LICENSE: Any

By default, the home page for your appliance displays the default dashboard. If you do not have a default dashboard defined, the home page shows the Dashboard Management page, where you can choose a dashboard to view. At any time, to view the default dashboard you have configured for your appliance, select **Overview > Dashboards**; to view details of all available dashboards, select **Overview > Dashboards > Management**.

TIP! You can configure your appliance to display a different default home page, including pages that are not dashboard pages. You can also change the default dashboard. For more information, see [Specifying Your Home Page](#) on page 2217 and [Specifying Your Default Dashboard](#) on page 2223.

Each dashboard has a time range that constrains its widgets. You can change the time range to reflect a period as short as the last hour (the default) or as long as the last year. When you change the time range, the widgets that can be constrained by time automatically update to reflect the new time range.

Note that not all widgets can be constrained by time. For example, the dashboard time range has no effect on the Appliance Information widget, which provides information that includes the appliance name, model, and current version of the Sourcefire 3D System software.

Keep in mind that for enterprise deployments of the Sourcefire 3D System, changing the time range to a long period may not be useful for widgets like the Custom Analysis widget, depending on how often newer events replace older events.

You can also pause a dashboard, which allows you to examine the data provided by the widgets without the display changing and interrupting your analysis. Pausing a dashboard has the following effects:

- Individual widgets stop updating, regardless of any **Update Every** widget preference.
- Dashboard tabs stop cycling, regardless of the **Cycle Tabs Every** setting in the dashboard properties.
- Dashboard pages stop refreshing, regardless of the **Refresh Page Every** setting in the dashboard properties.
- Changing the time range has no effect.

When you are finished with your analysis, you can unpause the dashboard. Unpausing the dashboard causes all appropriate widgets on the page to update to reflect the current time range. In addition, dashboard tabs resume cycling and the dashboard page resumes refreshing according to the settings you specified in the dashboard properties.

If you experience connectivity problems or other issues that interrupt the flow of system information to the dashboard, the dashboard automatically pauses and an error notice appears until the problem is resolved.

IMPORTANT! Your session normally logs you out after 1 hour of inactivity (or another configured interval), regardless of whether the dashboard is paused. If you plan to passively monitor the dashboard for long periods of time, consider exempting some users from session timeout, or changing the system timeout settings. For more information, see [Managing User Login Settings](#) on page 1903 and [Configuring User Interface Settings](#) on page 1994.

To view a dashboard:

ACCESS: Admin/Any Security Analyst/Maint

- ▶ Select **Overview > Dashboards**. You have two options, depending on whether you have a default dashboard defined:
 - If you have a default dashboard defined, it appears. To view a different dashboard, use the **Overview > Dashboards** menu.
 - If you do not have a default dashboard defined, the Dashboard Management page appears. Click **View** next to the dashboard you want to view.

The dashboard you selected appears.

To change the dashboard time range:

ACCESS: Admin/Any Security Analyst/Maint

- ▶ From the **Show the Last** drop-down list, choose a dashboard time range. Unless the dashboard is paused, all appropriate widgets on the page update to reflect the new time range.

To pause the dashboard:

ACCESS: Admin/Any Security Analyst/Maint

- ▶ On the time range control, click the pause icon (⏸). The dashboard is paused until you unpauses it.

To unpauses the dashboard:

ACCESS: Admin/Any Security Analyst/Maint

- ▶ On the time range control of a paused dashboard, click the play icon (▶). The dashboard is unpaused.

Modifying Dashboards

LICENSE: Any

A dashboard has one or more tabs. You can add, delete, and rename tabs. Note that you cannot change the order of dashboard tabs.

Each tab can display one or more widgets in a three-column layout. You can minimize and maximize widgets, add and remove widgets from tabs, as well as rearrange the widgets on a tab.

You can also change the basic dashboard properties, which include its name and description, the tab cycle and page refresh intervals, and whether you want to share the dashboard with other users.

Note that any user with dashboard access, regardless of role, can modify shared dashboards. If you want to make sure that only you can modify a particular dashboard, make sure to set it as a private dashboard in the dashboard properties.

Every configuration of the Custom Analysis widget in the Sourcefire predefined dashboards corresponds to a preset for that widget. If you change or delete one of these widgets, you can restore it by creating a new Custom Analysis widget based on the appropriate preset. For more information, see

TIP! Every configuration of the Custom Analysis widget in the Sourcefire predefined dashboards corresponds to a system preset for that widget. If you change or delete one of these widgets, you can restore it by creating a new Custom Analysis widget based on the appropriate preset. For more information, see [Configuring the Custom Analysis Widget](#) on page 82.

For more information, see the following sections:

- [Changing Dashboard Properties](#) on page 111
- [Adding Tabs](#) on page 112
- [Deleting Tabs](#) on page 113
- [Renaming Tabs](#) on page 113
- [Adding Widgets](#) on page 113
- [Rearranging Widgets](#) on page 115
- [Minimizing and Maximizing Widgets](#) on page 115
- [Deleting Widgets](#) on page 116

Changing Dashboard Properties

LICENSE: Any

Use the following procedure to change the basic dashboard properties, which include its name and description, the tab cycle and page refresh intervals, and whether you want to share the dashboard with other users.

To change a dashboard's properties:

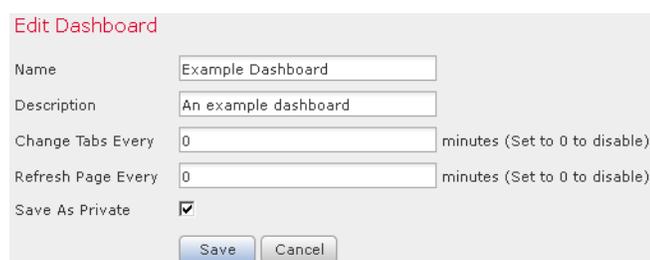

ACCESS: Admin/Any Security Analyst/Maint

1. Select **Overview > Dashboards > Management**.

The Dashboard Management page appears.

2. Click the edit icon (✎) next to the dashboard whose properties you want to change.

The Edit Dashboard page appears. See [Creating a Custom Dashboard](#) on page 106 for information on the various configurations you can change.

3. Make changes as needed and click **Save**.

The dashboard is changed.

Adding Tabs

LICENSE: Any

Use the following procedure to add a tab to a dashboard.

To add a tab to a dashboard:

ACCESS: Admin/Any Security Analyst/Maint

1. View the dashboard where you want to add a tab.
For more information, see [Viewing Dashboards](#) on page 109.

2. To the right of the existing tabs, click the add tab icon (+).
A pop-up window appears, prompting you to name the tab.

3. Type a name for the tab (maximum 25 characters) and click **OK**, or simply click **OK** to accept the default name. Note that you can rename the tab at any time; see [Renaming Tabs](#) on page 113.

The new tab is added.

You can now add widgets to the new tab. For more information, see [Adding Widgets](#) on page 113.

Deleting Tabs

LICENSE: Any

Use the following procedure to delete a dashboard tab and all its widgets. You cannot delete the last tab from a dashboard; each dashboard must have at least one tab.

To delete a tab from a dashboard:

ACCESS: Admin/Any Security Analyst/Maint

1. View the dashboard where you want to delete a tab.
For more information, see [Viewing Dashboards](#) on page 109.
2. On the tab you want to delete, click the delete icon (✕).
3. Confirm that you want to delete the tab.
The tab is deleted.

Renaming Tabs

LICENSE: Any

Use the following procedure to rename a dashboard tab.

To rename a tab:

ACCESS: Admin/Any Security Analyst/Maint

1. View the dashboard where you want to rename a tab.
For more information, see [Viewing Dashboards](#) on page 109.
2. Click the tab you want to rename.
3. Click the tab title.
A pop-up window appears, prompting you to rename the tab.
4. Type a name for the tab (maximum 25 characters) and click **OK**.
The tab is renamed.

Adding Widgets

LICENSE: Any

To add a widget to a dashboard, you must first decide to which tab you want to add the widget. When you add a widget to a tab, the appliance automatically adds it to the column with the fewest widgets. If all columns have an equal number of

widgets, the new widget is added to the leftmost column. You can add a maximum of 15 widgets to a dashboard tab.

TIP! After you add widgets, you can move them to any location on the tab. You cannot, however, move widgets from tab to tab. For more information, see [Rearranging Widgets](#) on page 115.

To add a widget to a dashboard:

ACCESS: Admin/Any Security Analyst/Maint

1. View the dashboard where you want to add a widget.
For more information, see [Viewing Dashboards](#) on page 109.
2. Select the tab where you want to add the widget.
3. Click **Add Widgets**.

The Add Widgets page appears.

The screenshot shows the 'Add Widgets' interface. On the left, a 'Categories' sidebar lists 'All Categories (16)', 'Analysis & Reporting (5)', 'Miscellaneous (1)', and 'Operations (10)'. On the right, three widget cards are displayed:

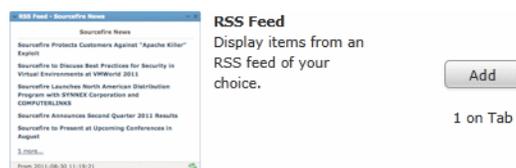

- Appliance Information:** This widget displays local appliance information including software versions, Remote Management, and High Availability status. It includes a table with fields like Name, IP# Address, Model, Versions (Software, S/N, VDB), and their values. An 'Add' button and '1 on Tab' are shown.
- Appliance Status:** This widget displays the current Health Monitoring appliance status. It features a pie chart showing 'Normal (1)' in green and 'Warning (1)' in yellow. An 'Add' button and '1 on Tab' are shown.
- Correlation Events:** This widget displays Correlation events. It shows a line graph with 'Priority' on the y-axis (None, 1, 2, 3, 4, 5, All) and 'Events/sec' on the x-axis. An 'Add' button and '1 on Tab' are shown.

The widgets that you can add depend on the type of appliance you are using and on your user role. They are organized according to function: Analysis & Reporting, Miscellaneous, and Operations. You can view the widgets in each category by clicking on the category name, or you can view all widgets by clicking **All Categories**.

4. Click **Add** next to the widgets you want to add.

TIP! To add multiple widgets of the same type (for example, you may want to add multiple RSS Feed widgets, or multiple Custom Analysis widgets), click **Add** again.

The widget is immediately added to the dashboard. The Add Widgets page indicates how many widgets of each type are on the tab, including the widget you just added.

5. Optionally, when you are finished adding widgets, click **Done** to return to the dashboard.

The tab where you added the widgets appears again, reflecting the changes you made.

Rearranging Widgets

LICENSE: Any

You can change the location of any widget on a tab. Note, however, that you cannot move widgets from tab to tab. If you want a widget to appear on a different tab, you must delete it from the existing tab and add it to the new tab.

To move a widget:

ACCESS: Admin/Any Security Analyst/Maint

- ▶ Click the title bar of the widget you want to move, then drag it to its new location.

Minimizing and Maximizing Widgets

LICENSE: Any

You can minimize widgets to simplify your view, then maximize them when you want to see them again.

To minimize a widget:

ACCESS: Admin/Any Security Analyst/Maint

- ▶ Click the minimize icon () in a widget's title bar.

To maximize a widget:

ACCESS: Admin/Any Security Analyst/Maint

- ▶ Click the maximize icon () in a minimized widget's title bar.

Deleting Widgets

LICENSE: Any

Delete a widget if you no longer want to view it on a tab.

To delete a widget:

ACCESS: Admin/Any Security Analyst/Maint

1. Click the close icon () in the title bar of the widget.
2. Confirm that you want to delete the widget.
The widget is deleted from the tab.

Deleting a Dashboard

LICENSE: Any

Delete a dashboard if you no longer need to use it.

If you delete your default dashboard, you must define a new default or the appliance will force you to select a dashboard to view every time you attempt to view a dashboard. For more information, see [Specifying Your Default Dashboard](#) on page 2223.

To delete a dashboard:

ACCESS: Admin/Any Security Analyst/Maint

1. Select **Overview > Dashboards > Management**.
The Dashboard Management page appears.
2. Click the delete icon () next to the dashboard you want to delete.
3. Confirm that you want to delete the dashboard.
The dashboard is deleted.

CHAPTER 3

USING THE CONTEXT EXPLORER

The Sourcefire 3D System Context Explorer displays detailed, interactive graphical information in context about the status of your monitored network, including data on applications, application statistics, connections, geolocation, intrusion events, hosts, servers, users, files (including malware files), and relevant URLs. Up to six distinct sections present this data in the form of vivid line, bar, pie, and donut graphs, accompanied by detailed lists.

You can easily create and apply custom filters to fine-tune your analysis, and you can examine data sections in more detail by simply clicking or hovering your cursor over graph areas. You can also configure the explorer's time range to reflect a period as short as the last hour or as long as the last year. Only users with the Administrator, Security Analyst, or Security Analyst (Read Only) user roles have access to the Context Explorer.

The Sourcefire 3D System dashboard is highly customizable and compartmentalized and updates in real time. In contrast, the Context Explorer is manually updated, designed to provide broader context for its data, and has a single, consistent layout designed for active user exploration.

You use the dashboard to monitor real-time activity on your network and appliances according to your own specific needs. Conversely, you use the Context Explorer to investigate a predefined set of recent FireSIGHT data in granular detail and clear context: for example, if you notice that only 15% of hosts on your network use Linux, but account for almost all YouTube traffic, you can quickly apply filters to view data only for Linux hosts, only for YouTube-associated application data, or both. Unlike the compact, narrowly focused dashboard widgets, the Context Explorer sections are designed to provide striking visual representations of system activity in a format useful to both expert and casual users of the Sourcefire 3D System.

Note that the data displayed depends on such factors as how you license and deploy your managed devices, whether you configure features that provide the data and, in the case of Series 2 appliances, whether the appliance supports a feature that provides the data. For example, because neither the DC500 Defense Center nor Series 2 devices support URL filtering by category and reputation, the DC500 Defense Center does not display data for this feature and Series 2 devices do not detect this data.

The following table summarizes some of the key differences between the dashboard and the Context Explorer.

Comparison: Dashboard and Context Explorer

FEATURE	DASHBOARD	CONTEXT EXPLORER
Displayable data	Anything monitored by the Sourcefire 3D System	Applications, application statistics, geolocation, intrusion events, files (including malware files), hosts, servers, users, and URLs
Customizability	<ul style="list-style-type: none"> Selection of widgets for a dashboard is customizable Individual widgets can be customized to varying degrees 	<ul style="list-style-type: none"> Cannot change base layout Applied filters appear in explorer URL and can be bookmarked for later use
Data update frequency	Automatic (default); user-configured	Manual
Data filtering	Possible for some widgets (must edit widget preferences)	Possible for all parts of the explorer, with support for multiple filters
Graphical context	Some widgets (particularly Custom Analysis) can display data in graph form	Extensive graphical context for all data, including uniquely detailed donut graphs
Links to relevant web interface pages	In some widgets	In every section
Time range of displayed data	User-configured	User-configured

For more information on the related Sourcefire 3D System dashboard, see [Using Dashboards](#) on page 66.

Understanding the Context Explorer

LICENSE: FireSIGHT

The Context Explorer comprises seven distinct sections that together offer a complete overview of FireSIGHT data on your monitored network. The first section, a line chart of traffic and event counts over time, provides an at-a-glance picture of recent trends in your network's activity.

The other sections are sets of interactive graphs and lists that provide greater detail for network, application, intrusion, file, geolocation, and URL data. Except for the traffic and events time graph, you can view or hide any section. You can also apply filters to constrain the data that appears in all sections; see [Working with Filters in the Context Explorer](#) on page 150 for more information.

For in-depth information on the content and function of Context Explorer sections, see the following topics:

- [Understanding the Traffic and Intrusion Event Counts Time Graph](#) on page 119
- [Understanding the Network Information Section](#) on page 120
- [Understanding the Application Information Section](#) on page 126
- [Understanding the Intrusion Information Section](#) on page 131
- [Understanding the Files Information Section](#) on page 135
- [Understanding the Geolocation Information Section](#) on page 140
- [Understanding the URL Information Section](#) on page 143

For information on how to configure the Context Explorer as a whole, see the following topics:

- [Refreshing the Context Explorer](#) on page 146
- [Setting the Context Explorer Time Range](#) on page 147
- [Minimizing and Maximizing Context Explorer Sections](#) on page 147
- [Drilling Down on Context Explorer Data](#) on page 148

For information on configuring and using Context Explorer filters, see the following topics:

- [Working with Filters in the Context Explorer](#) on page 150
- [Adding and Applying Filters](#) on page 151
- [Creating Filters with the Context Menu](#) on page 155
- [Bookmarking Filters](#) on page 156

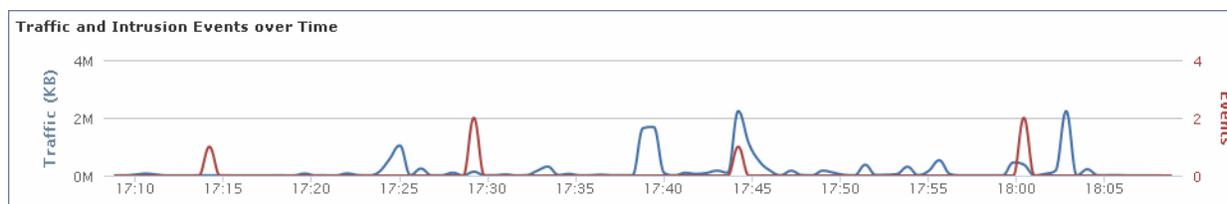

Understanding the Traffic and Intrusion Event Counts Time Graph

LICENSE: FireSIGHT

At the top of the Context Explorer is a line chart of traffic and intrusion events over time. The X-axis plots time intervals (which range from five minutes to one

month, depending on the selected time window). The Yaxis plots traffic in kilobytes (blue line) and intrusion event count (red line).

Note that the smallest X-axis interval is five minutes. To accommodate this, the system will round the beginning and ending points in your selected time range down to the nearest five-minute interval.

By default, this section shows all network traffic and all generated intrusion events for the selected time range. If you apply filters, the chart changes to display only traffic and intrusion events associated with the criteria specified in the filters. For example, filtering on the **OS Name** of **windows** causes the time graph to display only traffic and events associated with hosts using Windows operating systems.

If you filter the Context Explorer on intrusion event data (such as a **Priority of High**), the blue Traffic line is hidden to allow greater focus on intrusion events alone.

You can hover your pointer over any point on the graph lines to view exact information about traffic and event counts. Hovering your pointer over one of the colored lines also brings that line to the forefront of the graph, providing clearer context.

This section draws data primarily from the Intrusion Events and Connection Events tables.

Understanding the Network Information Section

LICENSE: FireSIGHT

The Network Information section of the Context Explorer contains six interactive graphs that display an overall picture of connection traffic on your monitored network: sources, destinations, users, and security zones associated with traffic, a breakdown of operating systems used by hosts on the network, as well as a

proportional view of access control actions your Sourcefire 3D System has performed on network traffic.

For more information on the graphs in the Network Information section, see the following topics:

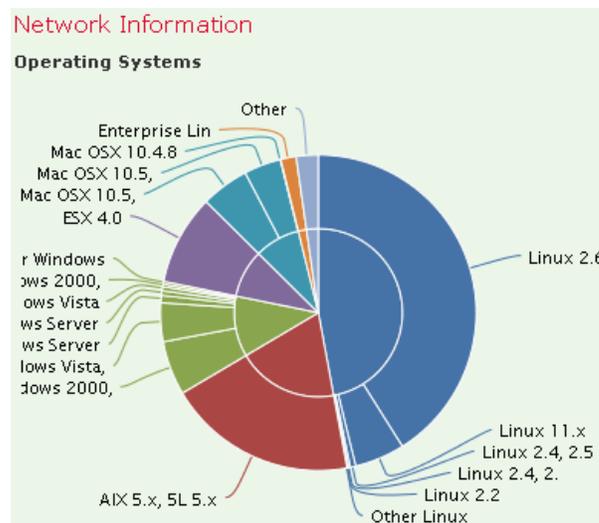

- [Viewing the Operating Systems Graph](#) on page 121
- [Viewing the Traffic by Source IP Graph](#) on page 122
- [Viewing the Traffic by Source User Graph](#) on page 122
- [Viewing the Connections by Access Control Action Graph](#) on page 124
- [Viewing the Traffic by Destination IP Graph](#) on page 124
- [Viewing the Traffic by Ingress/Egress Security Zone Graph](#) on page 125

Viewing the Operating Systems Graph

LICENSE: FireSIGHT

The Operating Systems graph, in donut form, displays a proportional representation of operating systems detected on hosts on your monitored network. The inner ring divides by OS name (such as **windows** or **Linux**), while the outer ring further divides that data by specific operating system version (such as **windows Server 2008** or **Linux 11.x**). Some closely related operating systems (such as Windows 2000, Windows XP, and Windows Server 2003) are grouped together. Very scarce or unrecognized operating systems are grouped under **Other**.

Note that this graph reflects all available data regardless of date and time constraints. If you change the explorer time range, the graph does not change.

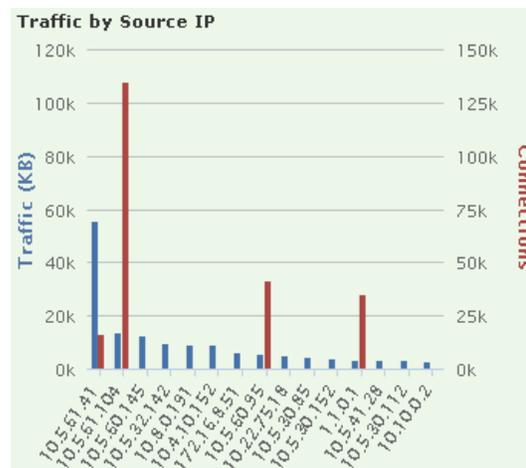

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

This graph draws data primarily from the Hosts table.

Viewing the Traffic by Source IP Graph

LICENSE: FireSIGHT

The Traffic by Source IP graph, in bar form, displays counts of network traffic (in kilobytes per second) and unique connections for the top 15 most active source IP addresses on your monitored network. For each source IP listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

IMPORTANT! If you filter on intrusion event information, the Traffic by Source IP graph is hidden.

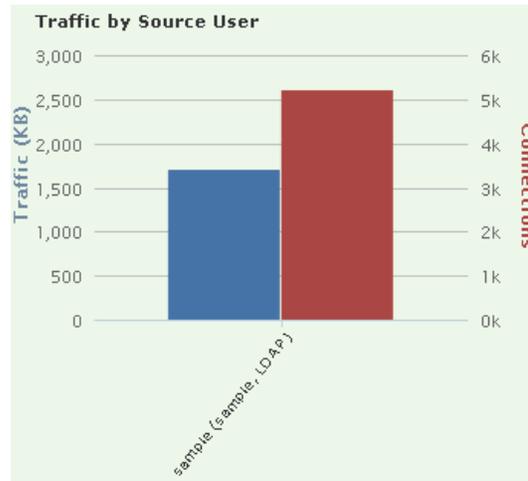

This graph draws data primarily from the Connection Events table.

Viewing the Traffic by Source User Graph

LICENSE: FireSIGHT

The Traffic by Source User graph, in bar form, displays counts of network traffic (in kilobytes per second) and unique connections for the top 15 most active source

users on your monitored network. For each source IP listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

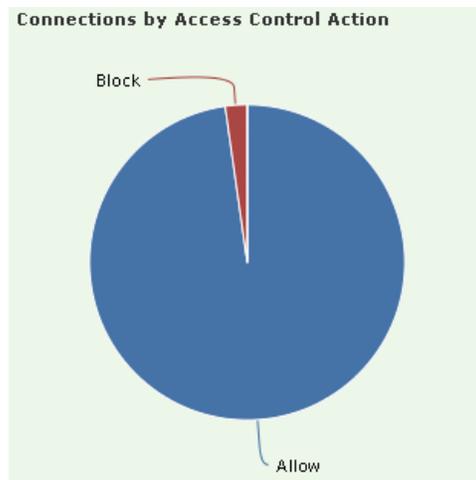

IMPORTANT! If you filter on intrusion event information, the Traffic by Source User graph is hidden.

This graph draws data primarily from the Connection Events table. Note that it displays only users reported by the Sourcefire User Agent.

Viewing the Connections by Access Control Action Graph

LICENSE: FireSIGHT

The Connections by Access Control Action graph, in pie form, displays a proportional view of access control actions (such as **B**lock or **A**llow) that your Sourcefire 3D System deployment has taken on monitored traffic.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

IMPORTANT! If you filter on intrusion event information, the Traffic by Source User graph is hidden.

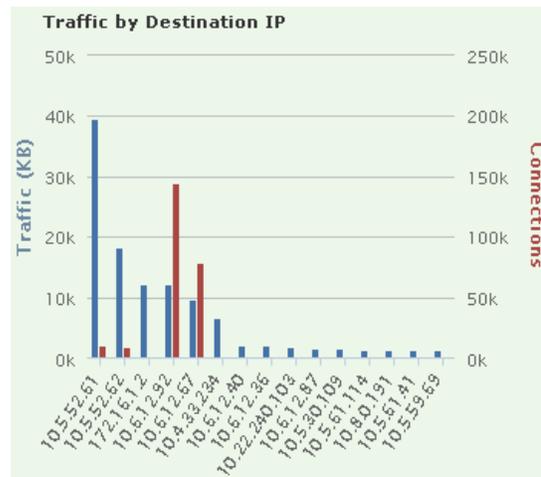

This graph draws data primarily from the Connection Events table.

Viewing the Traffic by Destination IP Graph

LICENSE: FireSIGHT

The Traffic by Destination IP graph, in bar form, displays counts of network traffic (in kilobytes per second) and unique connections for the top 15 most active

destination IP addresses on your monitored network. For each destination IP listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

IMPORTANT! If you filter on intrusion event information, the Traffic by Destination IP graph is hidden.

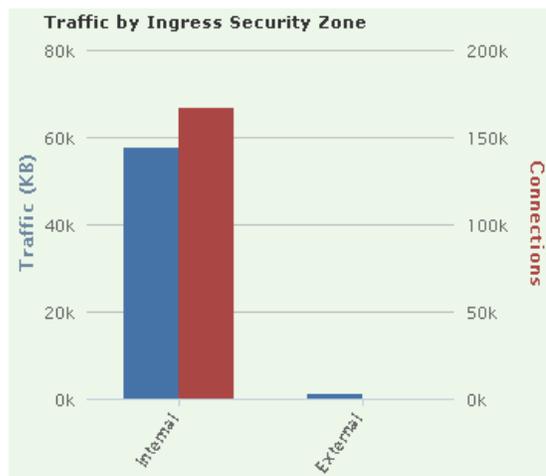

This graph draws data primarily from the Connection Events table.

Viewing the Traffic by Ingress/Egress Security Zone Graph

LICENSE: FireSIGHT

The Traffic by Ingress/Egress Security Zone graph, in bar form, displays counts of incoming or outgoing network traffic (in kilobytes per second) and unique connections for each security zone configured on your monitored network. You can configure this graph to display either ingress (the default) or egress security zone information, according to your needs.

For each security zone listed, blue bars represent traffic data and red bars represent connection data. For information about security zones, see [Working with Security Zones](#) on page 187.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information

TIP! To constrain the graph so it displays only traffic by egress security zone, hover your pointer over the graph, then click **Egress** on the toggle button that appears. Click **Ingress** to return to the default view. Note that navigating away from the Context Explorer also returns the graph to the default Ingress view.

IMPORTANT! If you filter on intrusion event information, the Traffic by Ingress/Egress Security Zone graph is hidden.

This graph draws data primarily from the Connection Events table.

Understanding the Application Information Section

LICENSE: FireSIGHT

The Application Information section of the Context Explorer contains three interactive graphs and one table-format list that display an overall picture of application activity on your monitored network: traffic, intrusion events, and hosts associated with applications, further organized by the estimated risk or business relevance assigned to each application. The Application Details list provides an interactive list of each application and its risk, business relevance, category, and host count.

For all instances of "application" in this section, the Application Information graph set, by default, specifically examines application protocols (such as DNS or SSH).

You can also configure the Application Information section to specifically examine client applications (such as PuTTY or Firefox) or web applications (such as Facebook or Pandora).

For more information on the graphs and list in the Application Information section, see the following topics:

- [Viewing the Traffic by Risk/Business Relevance and Application Graph](#) on page 127
- [Viewing the Intrusion Events by Risk/Business Relevance and Application Graph](#) on page 128
- [Viewing the Hosts by Risk/Business Relevance and Application Graph](#) on page 129
- [Viewing the Application Details List](#) on page 130

To configure the **Application Information** section focus:

ACCESS: Admin/Any Security Analyst

1. Select **Analysis > Context Explorer**.

The Context Explorer appears.

2. Hover your pointer over the **Application Protocol Information** section. (Note that if you previously changed this setting in the same Context Explorer session, the section title may appear as **Client Application Information** or **Web Application Information** instead.)

The section option buttons appear at the upper right.

3. Click **Application Protocol**, **Client Application**, or **Web Application**.

The Application Information section refreshes according to the option you selected.

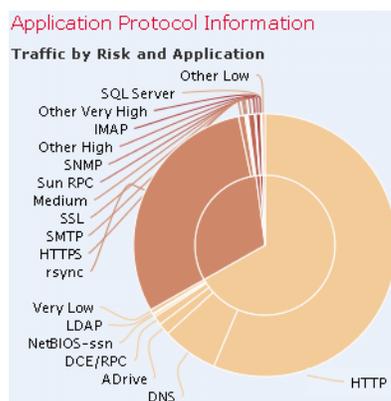

IMPORTANT! If you navigate away from the Context Explorer, this section reverts to its default state (Application Protocol).

Viewing the Traffic by Risk/Business Relevance and Application Graph

LICENSE: FireSIGHT

The Traffic by Risk/Business Relevance and Application graph, in donut form, displays a proportional representation of application traffic detected on your monitored network, arranged by the applications' estimated risk (the default) or estimated business relevance. The inner ring divides by estimated risk/business relevance level (such as **Medium** or **High**), while the outer ring further divides that data by specific application (such as **SSH** or **NetBIOS**). Scarcely detected applications are grouped under **Other**.

Note that this graph reflects all available data regardless of date and time constraints. If you change the explorer time range, the graph does not change.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

TIP! To constrain the graph so it displays traffic by business relevance and application, hover your pointer over the graph, then click **Business Relevance** on the toggle button that appears. Click **Risk** to return to the default view. Note that navigating away from the Context Explorer also returns the graph to the default Risk view.

IMPORTANT! If you filter on intrusion event information, the Traffic by Risk/Business and Application graph is hidden.

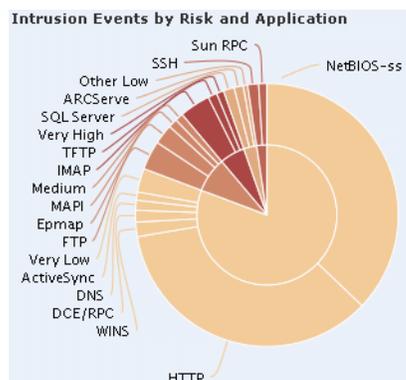

This graph draws data primarily from the Connection Events and Application Statistics tables.

Viewing the Intrusion Events by Risk/Business Relevance and Application Graph

LICENSE: FireSIGHT

The Intrusion Events by Risk/Business Relevance and Application graph, in donut form, displays a proportional representation of intrusion events detected on your monitored network and the applications associated with those events, arranged by the applications' estimated risk (the default) or estimated business relevance. The inner ring divides by estimated risk/business relevance level (such as **Medium**

or **High**), while the outer ring further divides that data by specific application (such as **SSH** or **NetBIOS**). Scarcely detected applications are grouped under **Other**.

Hover your pointer over any part of the donut graph to view more detailed information. Click any part of the graph to filter or drill down on that information, or (where applicable) to view application information.

TIP! To constrain the graph so it displays intrusion events by business relevance and application, hover your pointer over the graph, then click **Business Relevance** on the toggle button that appears. Click **Risk** to return to the default view. Note that navigating away from the Context Explorer also returns the graph to the default Risk view.

IMPORTANT! If you filter on URL information, the Intrusion Events by Risk/Business and Application graph is hidden.

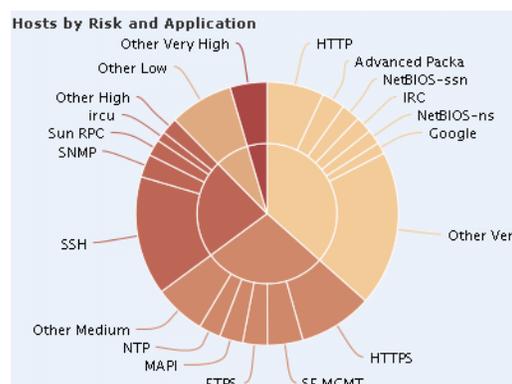

This graph draws data primarily from the Intrusion Events and Application Statistics tables.

Viewing the Hosts by Risk/Business Relevance and Application Graph

LICENSE: FireSIGHT

The Hosts by Risk/Business Relevance and Application graph, in donut form, displays a proportional representation of hosts detected on your monitored network and the applications associated with those hosts, arranged by the applications' estimated risk (the default) or estimated business relevance. The inner ring divides by estimated risk/business relevance level (such as **Medium** or

High), while the outer ring further divides that data by specific application (such as SSH or NetBIOS). Very scarce applications are grouped under **Other**.

Hover your pointer over any part of the donut graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

TIP! To constrain the graph so it displays hosts by business relevance and application, hover your pointer over the graph, then click **Business Relevance** on the toggle button that appears. Click **Risk** to return to the default view. Note that navigating away from the Context Explorer also returns the graph to the default Risk view.

This graph draws data primarily from the Applications table.

Viewing the Application Details List

LICENSE: FireSIGHT

At the bottom of the Application Information section is the Application Details List, a table that provides estimated risk, estimated business relevance, category, and hosts count information for each application detected on your monitored network. The applications are listed in descending order of associated host count.

Application Details				
Application	Risk	Business Relevance	Category	Hosts
NetBIOS-ns	Very Low	High	network protocols/services	14
MySQL	Very Low	High	database	13
DNS	High	Medium	network protocols/services	11
Google Analytics	Very Low	High	web services provider	11
Shockwave	Low	Medium	multimedia (TV/video)	11
SMTP	Medium	High	email	11

The Application Details List table is not sortable, but you can click on any table entry to filter or drill down on that information, or (where applicable) to view

application information. This table draws data primarily from the Applications table.

Note that this list reflects all available data regardless of date and time constraints. If you change the explorer time range, the list does not change.

Understanding the Intrusion Information Section

LICENSE: Protection

The Intrusion Information section of the Context Explorer contains six interactive graphs and one table-format list that display an overall picture of intrusion events on your monitored network: impact levels, attack sources, target destinations, users, priority levels, and security zones associated with intrusion events, as well as a detailed list of intrusion event classifications, priorities, and counts.

IMPORTANT! If you filter on URL information, the entire Intrusion Information Section is hidden.

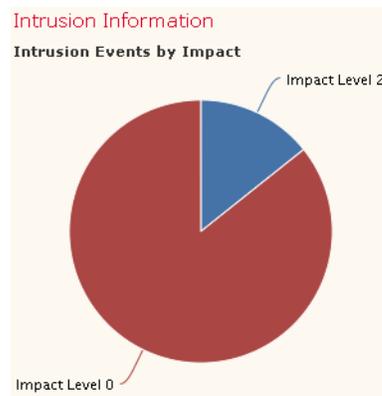

For more information on the graphs and list in the Network Information section, see the following topics:

- [Viewing the Intrusion Events by Impact Graph](#) on page 132
- [Viewing the Top Attackers Graph](#) on page 132
- [Viewing the Top Users Graph](#) on page 133
- [Viewing the Intrusion Events by Priority Graph](#) on page 133
- [Viewing the Top Targets Graph](#) on page 134
- [Viewing the Top Ingress/Egress Security Zones Graph](#) on page 134
- [Viewing the Intrusion Event Details List](#) on page 135

Viewing the Intrusion Events by Impact Graph

LICENSE: Protection

The Intrusion Events by Impact graph, in pie form, displays a proportional view of intrusion events on your monitored network, grouped by estimated impact level (from 0 to 4).

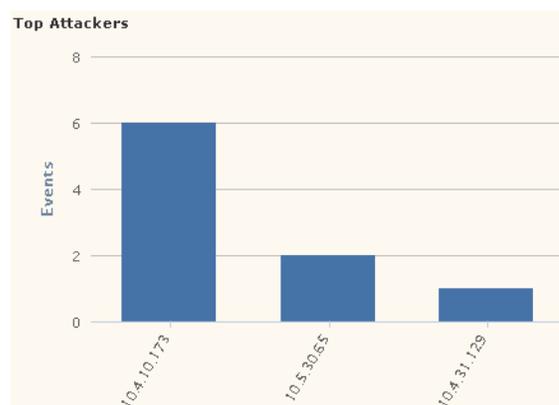

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

This graph draws data primarily from the IDS Statistics and Intrusion Events tables.

Viewing the Top Attackers Graph

LICENSE: Protection

The Top Attackers graph, in bar form, displays counts of intrusion events for the top attacking host IP addresses (causing those events) on your monitored network.

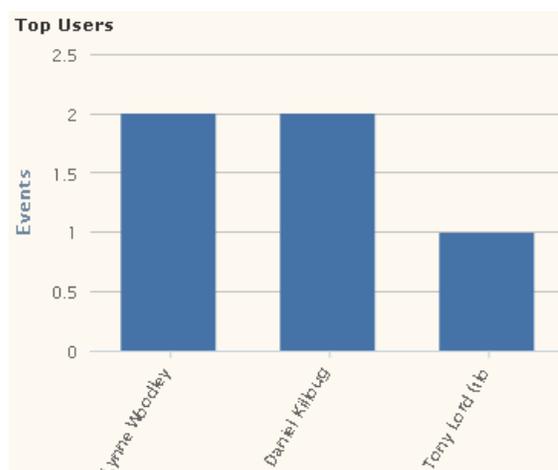

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

This graph draws data primarily from the Intrusion Events table.

Viewing the Top Users Graph

LICENSE: Protection

The Top Users graph, in bar form, displays users on your monitored network that are associated with the highest intrusion event counts, by event count.

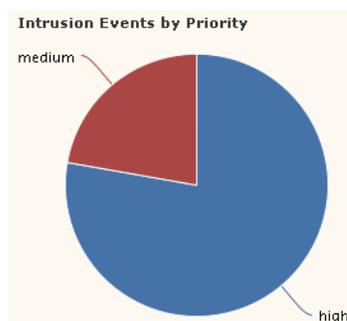

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

This graph draws data primarily from the IDS User Statistics and Intrusion Events tables. Note that it displays only users reported by the Sourcefire User Agent.

Viewing the Intrusion Events by Priority Graph

LICENSE: Protection

The Intrusion Events by Priority graph, in pie form, displays a proportional view of intrusion events on your monitored network, grouped by estimated priority level (such as **H**igh, **M**edium, or **L**ow).

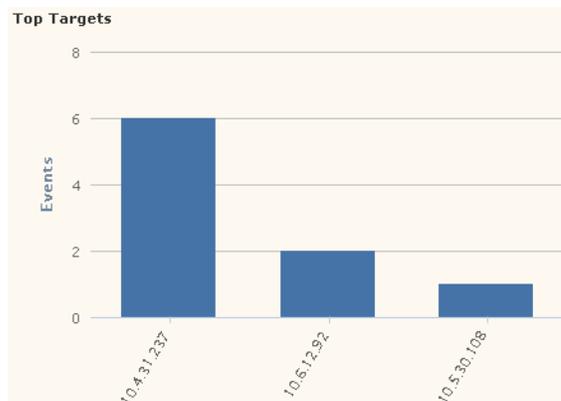

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

This graph draws data primarily from the Intrusion Events table.

Viewing the Top Targets Graph

LICENSE: Protection

The Top Targets graph, in bar form, displays counts of intrusion events for the top target host IP addresses (targeted in the connections causing those events) on your monitored network.

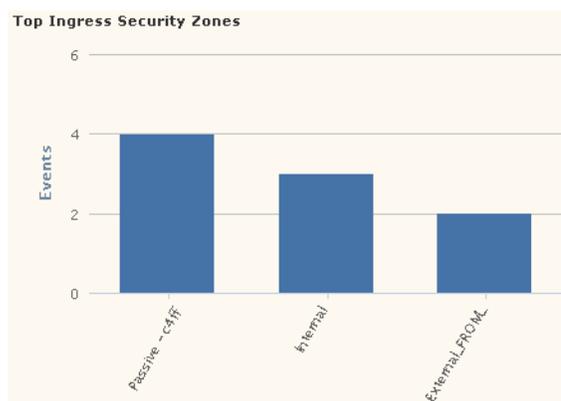

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

This graph draws data primarily from the Intrusion Events table.

Viewing the Top Ingress/Egress Security Zones Graph

LICENSE: Protection

The Top Ingress/Egress Security Zones graph, in bar form, displays counts of intrusion events associated with each security zone (ingress or egress, depending on graph settings) configured on your monitored network. For information about security zones, see [Working with Security Zones](#) on page 187.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

TIP! To constrain the graph so it displays only traffic by egress security zone, hover your pointer over the graph, then click **Egress** on the toggle button that appears. Click **Ingress** to return to the default view. Note that navigating away from the Context Explorer also returns the graph to the default Ingress view.

This graph draws data primarily from the Intrusion Events table.

You can configure this graph to display either ingress (the default) or egress security zone information, according to your needs.

Viewing the Intrusion Event Details List

LICENSE: Protection

At the bottom of the Intrusion Information section is the Intrusion Event Details List, a table that provides classification, estimated priority, and event count information for each intrusion event detected on your monitored network. The events are listed in descending order of event count.

Intrusion Event Details			
Event	Classification	Priority	Events
ICMP-INFO unassigned type 1 undefined	Misc Activity	low	7
DNS dns response for rfc1918 10/8 addr	Potential Corporate Policy Violation	high	7
DNS dns response for rfc1918 192.168/1	Potential Corporate Policy Violation	high	4
DOS tcpdump tcp LDP print zero length r	Attempted Denial of Service	medium	2

The Intrusion Event Details List table is not sortable, but you can click on any table entry to filter or drill down on that information. This table draws data primarily from the Intrusion Events table.

Understanding the Files Information Section

LICENSE: Protection or Malware

SUPPORTED DEVICES: feature dependent

SUPPORTED DEFENSE CENTERS: feature dependent

The Files Information section of the Context Explorer contains six interactive graphs that display an overall picture of file and malware events on your monitored network. Five of the graphs display the file types, file names, and malware dispositions of the files detected in network traffic, as well as the hosts sending (uploading) and receiving (downloading) those files. The final graph displays the malware threats detected on your network and, if you have a

FireAMP subscription, on the endpoints where your users installed FireAMP Connectors.

IMPORTANT! If you filter on intrusion information, the entire Files Information Section is hidden.

Note that you must have a Malware license and enable malware detection for Files Information graphs to include network-based malware data. Note also that neither the DC500 Defense Center nor Series 2 devices support advanced malware detection, so the DC500 Defense Center cannot display this data and Series 2 devices do not detect it. See [Working with Malware Protection and File Control](#) on page 1197.

For more information on the graphs in the Files Information section, see the following topics:

- [Viewing the Top File Types Graph](#) on page 136
- [Viewing the Top File Names Graph](#) on page 137
- [Viewing the Files by Disposition Graph](#) on page 137
- [Viewing the Top Hosts Sending Files Graph](#) on page 138
- [Viewing the Top Hosts Receiving Files Graph](#) on page 139
- [Viewing the Top Malware Detections Graph](#) on page 140

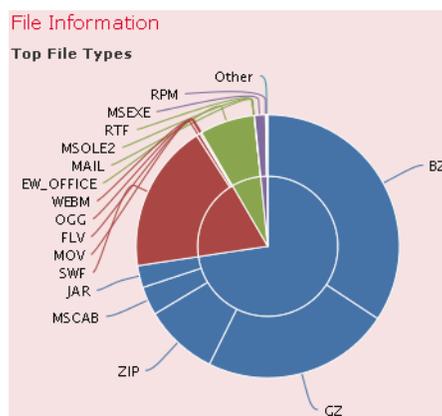

Viewing the Top File Types Graph

LICENSE: Protection or Malware

SUPPORTED DEVICES: feature dependent

SUPPORTED DEFENSE CENTERS: feature dependent

The Top File Types graph, in donut form, displays a proportional view of the file types detected in network traffic (outer ring), grouped by file category (inner ring).

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Note that you must have a Malware license and enable malware detection for this graph to include network-based malware data. Note also that neither the DC500 Defense Center nor Series 2 devices support advanced malware detection, so the DC500 Defense Center cannot display this data and Series 2 devices do not detect it. See [Working with Malware Protection and File Control](#) on page 1197.

This graph draws data primarily from the File Events table.

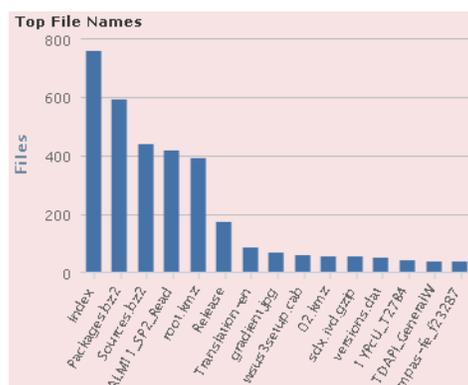

Viewing the Top File Names Graph

LICENSE: Protection or Malware

SUPPORTED DEVICES: feature dependent

SUPPORTED DEFENSE CENTERS: feature dependent

The Top File Names graph, in bar form, displays counts of the top unique file names detected in network traffic.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Note that you must have a Malware license and enable malware detection for this graph to include network-based malware data. Note also that neither the DC500 Defense Center nor Series 2 devices support advanced malware detection, so the DC500 Defense Center cannot display this data and Series 2 devices do not detect it. See [Working with Malware Protection and File Control](#) on page 1197.

This graph draws data primarily from the File Events table.

Viewing the Files by Disposition Graph

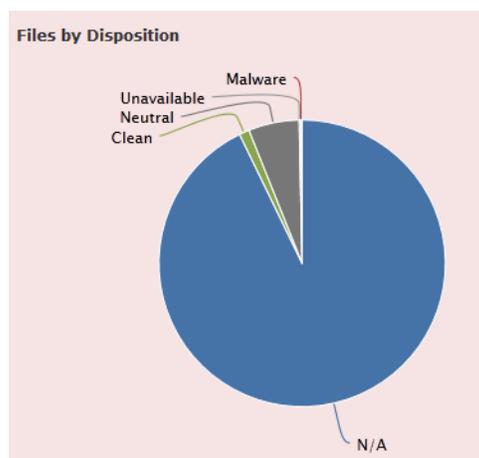

LICENSE: Protection or Malware

SUPPORTED DEVICES: feature dependent

SUPPORTED DEFENSE CENTERS: feature dependent

The Top File Types graph, in pie form, displays a proportional view of the malware dispositions for files detected in network traffic. Note that only files for which the Defense Center performed a malware cloud lookup (which requires a Malware license) have dispositions. Files that did not trigger a cloud lookup have a disposition of N/A. The disposition `unavailable` indicates that the Defense Center could not perform a malware cloud lookup. See [Understanding Malware](#)

[Protection and File Control](#) on page 1199 for descriptions of the other dispositions.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Note that you must have a Malware license and enable malware detection for this graph to include network-based malware data. Note also that neither the DC500 Defense Center nor Series 2 devices support advanced malware detection, so the DC500 Defense Center cannot display this data and Series 2 devices do not detect it. See [Working with Malware Protection and File Control](#) on page 1197.

This graph draws data primarily from the File Events table.

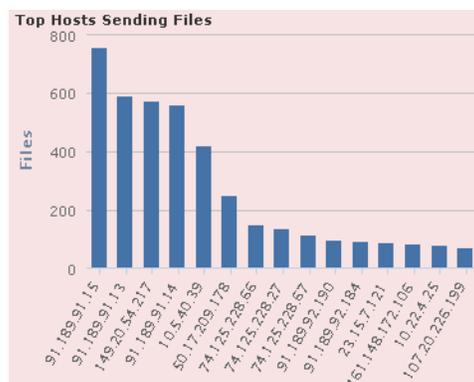

Viewing the Top Hosts Sending Files Graph

LICENSE: Protection or Malware

SUPPORTED DEVICES: feature dependent

SUPPORTED DEFENSE CENTERS: feature dependent

The Top Hosts Sending Files graph, in bar form, displays counts of the number of files detected in network traffic for the top file-sending host IP addresses.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

TIP! To constrain the graph so it displays only hosts sending malware, hover your pointer over the graph, then click **Malware** on the toggle button that appears. Click **Files** to return to the default files view. Note that navigating away from the Context Explorer also returns the graph to the default files view.

Note that you must have a Malware license and enable malware detection for this graph to include network-based malware data. Note also that neither the DC500 Defense Center nor Series 2 devices support advanced malware detection, so the DC500 Defense Center cannot display this data and Series 2 devices do not detect it. See [Working with Malware Protection and File Control](#) on page 1197.

This graph draws data primarily from the File Events table.

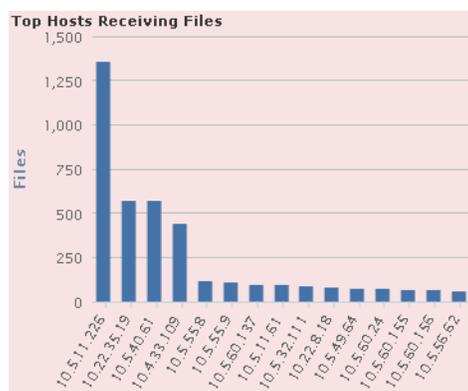

Viewing the Top Hosts Receiving Files Graph

LICENSE: Protection or Malware

SUPPORTED DEVICES: feature dependent

SUPPORTED DEFENSE CENTERS: feature dependent

The Top Hosts Receiving Files graph, in bar form, displays counts of the number of files detected in network traffic for the top file-receiving host IP addresses.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

TIP! To constrain the graph so it displays only hosts receiving malware, hover your pointer over the graph, then click **Malware** on the toggle button that appears. Click **Files** to return to the default files view. Note that navigating away from the Context Explorer also returns the graph to the default files view.

Note that you must have a Malware license and enable malware detection for this graph to include network-based malware data. Note also that neither the DC500

Defense Center nor Series 2 devices support advanced malware detection, so the DC500 Defense Center cannot display this data and Series 2 devices do not detect it. See [Working with Malware Protection and File Control](#) on page 1197.

This graph draws data primarily from the File Events table.

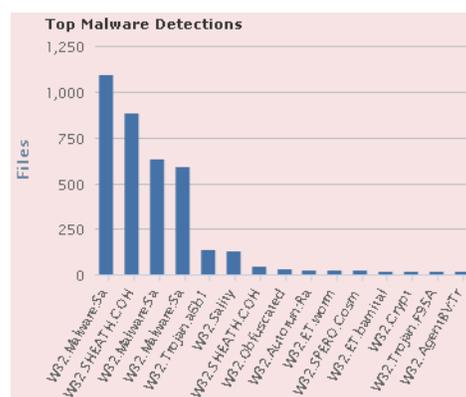

Viewing the Top Malware Detections Graph

LICENSE: Protection or Malware

SUPPORTED DEVICES: feature dependent

SUPPORTED DEFENSE CENTERS: feature dependent

The Top Malware Detections graph, in bar form, displays counts of the top malware threats detected on your network and, if you have a FireAMP subscription, on the endpoints where your users installed FireAMP Connectors.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

Note that you must have a Malware license and enable malware detection for this graph to include network-based malware data. Note also that neither the DC500 Defense Center nor Series 2 devices support advanced malware detection, so the DC500 Defense Center cannot display this data and Series 2 devices do not detect it. See [Working with Malware Protection and File Control](#) on page 1197.

This graph draws data primarily from the File Events and Malware Events tables.

Understanding the Geolocation Information Section

LICENSE: FireSIGHT

SUPPORTED DEFENSE CENTERS: Any except DC500

The Geolocation Information section of the Context Explorer contains three interactive donut graphs that display an overall picture of countries with which hosts on your monitored network are exchanging data: unique connections by initiator or responder country, intrusion events by source or destination country, and file events by sending or receiving country.

For more information on the graphs in the Geolocation Information section, see the following topics:

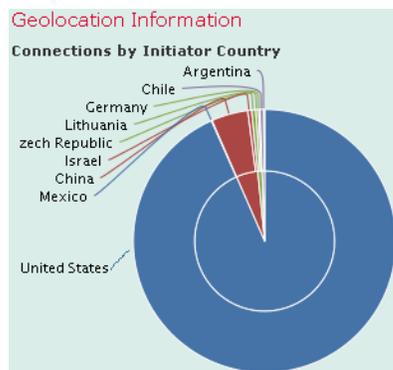

- [Viewing the Connections by Initiator/Responder Country Graph](#) on page 141
- [Viewing the Intrusion Events by Source/Destination Country Graph](#) on page 142
- [Viewing the File Events by Sending/Receiving Country Graph](#) on page 142

Viewing the Connections by Initiator/Responder Country Graph

LICENSE: FireSIGHT

SUPPORTED DEFENSE CENTERS: Any except DC500

The Connections by Initiator/Responder Country graph, in donut form, displays a proportional view of the countries involved in connections on your network as either the initiator (the default) or the responder. The inner ring groups these countries together by continent. For information about geolocation information, see [Using Geolocation](#) on page 1816. For information about connection data, see [Working With Connection Data](#) on page 539.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

TIP! To constrain the graph so it displays only countries acting as the responder in connections, hover your pointer over the graph, then click **Responder** on the toggle button that appears. Click **Initiator** to return to the default view. Note that navigating away from the Context Explorer also returns the graph to the default Initiator view.

This graph draws data primarily from the Connection Summary Data table.

Viewing the Intrusion Events by Source/Destination Country Graph

LICENSE: FireSIGHT

SUPPORTED DEFENSE CENTERS: Any except DC500

The Intrusion Events by Source/Destination Country graph, in donut form, displays a proportional view of the countries involved in intrusion events on your network as either the source of the event (the default) or the destination. The inner ring groups these countries together by continent. For information about geolocation information, see [Using Geolocation](#) on page 1816. For information about intrusion event data, see [Working with Intrusion Events](#) on page 593.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

TIP! To constrain the graph so it displays only countries acting as the destinations of intrusion events, hover your pointer over the graph, then click **Destination** on the toggle button that appears. Click **Source** to return to the default view. Note that navigating away from the Context Explorer also returns the graph to the default Source view.

This graph draws data primarily from the Intrusion Events table.

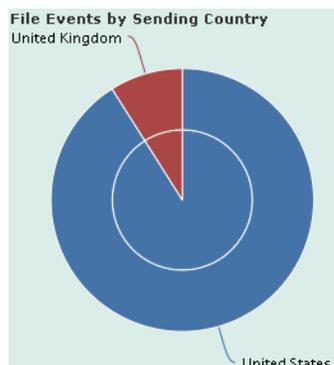

Viewing the File Events by Sending/Receiving Country Graph

LICENSE: FireSIGHT

SUPPORTED DEFENSE CENTERS: Any except DC500

The File Events by Sending/Receiving Country graph, in donut form, displays a proportional view of the countries detected in file events on your network as either sending (the default) or receiving files. The inner ring groups these countries together by continent. For information about geolocation information,

see [Using Geolocation](#) on page 1816. For information about file event data, see [Working with File Events](#) on page 1222.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

TIP! To constrain the graph so it displays only countries receiving files, hover your pointer over the graph, then click **Receiver** on the toggle button that appears. Click **Sender** to return to the default view. Note that navigating away from the Context Explorer also returns the graph to the default Sender view.

This graph draws data primarily from the File Events table.

Understanding the URL Information Section

LICENSE: FireSIGHT or URL Filtering

SUPPORTED DEVICES: feature dependent

SUPPORTED DEFENSE CENTERS: feature dependent

The URL Information section of the Context Explorer contains three interactive bar graphs that display an overall picture of URLs with which hosts on your monitored network are exchanging data: traffic and unique connections associated with URLs, sorted by individual URL, URL category, and URL reputation.

IMPORTANT! If you filter on intrusion event information, the entire URL Information Section is hidden.

Note that you must have a URL Filtering license and enable URL Filtering for URL filtering graphs to include URL category and reputation data. Note also that neither the DC500 Defense Center nor Series 2 devices support URL filtering by reputation and category, so the DC500 Defense Center cannot display this data and Series 2 devices do not detect it. See [Adding URL Conditions](#) on page 506.

For more information on the graphs in the URL Information section, see the following topics:

- [Viewing the Traffic by URL Graph](#) on page 144
- [Viewing the Traffic by URL Category Graph](#) on page 145
- [Viewing the Traffic by URL Reputation Graph](#) on page 145

Viewing the Traffic by URL Graph

LICENSE: FireSIGHT or URL Filtering

SUPPORTED DEVICES: feature dependent

SUPPORTED DEFENSE CENTERS: feature dependent

The Traffic by URL graph, in bar form, displays counts of network traffic (in kilobytes per second) and unique connections for the top 15 most requested URLs on your monitored network. For each URL listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

IMPORTANT! If you filter on intrusion event information, the Traffic by URL graph is hidden.

Note that you must have a URL Filtering license and enable URL Filtering for URL filtering graphs to include URL category and reputation data. Note also that neither the DC500 Defense Center nor Series 2 devices support URL filtering by reputation and category, so the DC500 Defense Center cannot display this data and Series 2 devices do not detect it. See [Enabling Sourcefire Cloud Communications](#) on page 2032.

This graph draws data primarily from the Connection Events table.

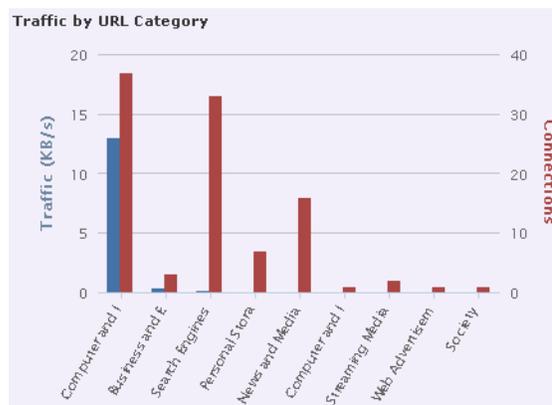

Viewing the Traffic by URL Category Graph

LICENSE: URL Filtering

SUPPORTED DEVICES: feature dependent

SUPPORTED DEFENSE CENTERS: feature dependent

The Traffic by URL Category graph, in bar form, displays counts of network traffic (in kilobytes per second) and unique connections for the most requested URL categories (such as **Search Engines** or **Streaming Media**) on your monitored network. For each URL category listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

IMPORTANT! If you filter on intrusion event information, the Traffic by URL Category graph is hidden.

Note that you must have a URL Filtering license and enable URL Filtering for URL filtering graphs to include URL category and reputation data. Note also that neither the DC500 Defense Center nor Series 2 devices support URL filtering by reputation and category, so the DC500 Defense Center cannot display this data and Series 2 devices do not detect it. See [Adding URL Conditions](#) on page 506.

This graph draws data primarily from the URL Statistics and Connection Events tables.

Viewing the Traffic by URL Reputation Graph

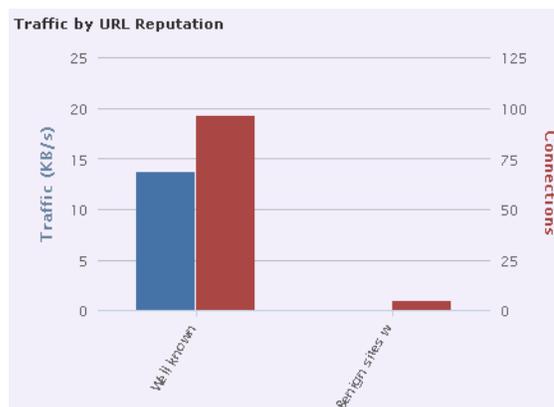

LICENSE: URL Filtering

SUPPORTED DEVICES: feature dependent

SUPPORTED DEFENSE CENTERS: feature dependent

The Traffic by URL Reputation graph, in bar form, displays counts of network traffic (in kilobytes per second) and unique connections for the most requested URL reputation groups (such as **well known** or **Benign sites with security**

risks) on your monitored network. For each URL reputation listed, blue bars represent traffic data and red bars represent connection data.

Hover your pointer over any part of the graph to view more detailed information. Click any part of the graph to filter or drill down on that information.

IMPORTANT! If you filter on intrusion event information, the Traffic by URL Reputation graph is hidden.

Note that you must have a URL Filtering license and enable URL Filtering for URL filtering graphs to include URL category and reputation data. Note also that neither the DC500 Defense Center nor Series 2 devices support URL filtering by reputation and category, so the DC500 Defense Center cannot display this data and Series 2 devices do not detect it. See [Adding URL Conditions](#) on page 506.

This graph draws data primarily from the URL Statistics and Connection Events tables.

Refreshing the Context Explorer

LICENSE: FireSIGHT

The Context Explorer does not automatically update the information it displays. To incorporate new data, you must manually refresh the explorer.

Note that, although reloading the Context Explorer itself (by refreshing the browser program or navigating away from, then back to, the Context Explorer) refreshes all displayed information, this does not preserve any changes you made to section configuration (such as the Ingress/Egress graphs and the Application Information section) and may cause delays in loading.

To refresh the Context Explorer:

ACCESS: Admin/Any Security Analyst

- ▶ On the Context Explorer, click **Reload** at the upper right.
The explorer updates to display the latest information within your selected time range. Note that the **Reload** button is grayed out until your refresh is finished.

Setting the Context Explorer Time Range

LICENSE: FireSIGHT

You can configure the Context Explorer time range to reflect a period as short as the last hour (the default) or as long as the last year. Note that when you change the time range, the Context Explorer does not automatically update to reflect the change. To apply the new time range, you must manually refresh the explorer.

Changes to the time range persist even if you navigate away from the Context Explorer or end your login session.

To change the Context Explorer time range:

ACCESS: Admin/Any Security Analyst

1. From the **Show the last** drop-down list, select a time range.
2. Optionally, to view data from the new time range, click **Reload**.
All sections of the Context Explorer update to reflect the new time range.

TIP! Clicking **Apply Filters** also applies any time range updates.

Minimizing and Maximizing Context Explorer Sections

LICENSE: FireSIGHT

You can minimize and hide one or more sections of the Context Explorer. This is useful if you want to focus on only certain sections, or if you want a simpler view. You cannot minimize the Traffic and Intrusion Event Counts Time Graph.

Note that Context Explorer sections retain the minimized or maximized states that you configure even if you refresh the page or log out of the appliance.

To minimize a Context Explorer section:

ACCESS: Admin/Any Security Analyst

- ▶ Click the minimize icon () in a section's title bar.

To maximize a Context Explorer section:

ACCESS: Admin/Any Security Analyst

- ▶ Click the maximize icon () in a minimized section's title bar.

Drilling Down on Context Explorer Data

LICENSE: feature dependent

If you want to examine graph or list data in more detail than the Context Explorer allows, you can drill down to the table views of the relevant data. (Note that you cannot drill down on the Traffic and Intrusion Events over Time graph.) For example, drilling down on an IP address in the Traffic by Source IP graph displays the Connections with Application Details view of the Connection Events table, including only data associated with the source IP address you selected.

Depending on the type of data you examine, additional options can appear in the context menu. Data points that are associated with specific IP addresses offer the option to view host or whois information on the IP address you select. Data points associated with specific applications offer the option to view application information on the application you select. Data points associated with a specific user offer the option to view that user's user profile page. Data points associated with an intrusion event message offer the option to view the rule documentation for that event's associated intrusion rule, and data points associated with a specific IP address offer the option to blacklist or whitelist that address.

The context menu that you use to drill down on data also contains options to filter that data. For more information on filtering, see [Working with Filters in the Context Explorer](#) on page 150.

To drill down on data in the Context Explorer:

ACCESS: Admin/Any Security Analyst

1. Select **Analysis > Context Explorer**.

The Context Explorer appears.

2. In any section but Traffic and Intrusion Events over Time, click a data point that you want to investigate.

The context menu pop-up window appears nearby. The following graphic shows the context menu window for NetBIOS in the Hosts by Risk and Application graph.

3. Depending on the data point you selected, you have several options:
 - To view more details of this data in a table view, select **Drill into Analysis**. A new window opens with a detailed table view of the data you selected.
 - If you selected a data point associated with a specific IP address and want more information about the associated host, select **View Host Information**. A new window opens with a host profile page for the IP address you selected. For more information on host attributes and host profiles, see [Using Host Profiles](#) on page 1334.
 - If you selected a data point with a specific IP address and want to make a whois search on that address, select **Whois**. A new window opens with the results of a whois query for the IP address you selected.
 - If you selected a data point associated with a specific application and want more information about that application, select **View Application Information**. A new window opens with information on the application you selected. For more information about application attributes, see [Understanding Application Detection](#) on page 1263.
 - If you selected a data point associated with a specific user and want more information about that user, select **View User Information**. A new window opens with a user profile page for the user you selected. For more information on user details, see [Understanding User Details and Host History](#) on page 1449.

- If you selected a data point associated with a specific intrusion event message and want more information about the associated intrusion rule, select **View Rule Documentation**.
A new window opens with a rule details page relevant to the event you selected. For more information on intrusion rule details, see [Viewing Rule Details](#) on page 723.
- If you selected a data point associated with a specific file and want to view that file's trajectory, select **View Network File Trajectory**.
A new window opens with the trajectory map for the selected file. For more information on using the network file trajectory feature, see [Working with Network File Trajectory](#) on page 1241.
- If you selected a data point associated with a specific IP address and want to add that IP address to the Security Intelligence global blacklist or whitelist, select the appropriate option: **Blacklist Now** or **Whitelist Now**. Confirm your choice in the pop-up window that appears.
The IP address is blacklisted or whitelisted. For more information, see [Working with the Global Whitelist and Blacklist](#) on page 166.
These options are not listed on the DC500 Defense Center, which does not support Security Intelligence data.

Working with Filters in the Context Explorer

LICENSE: FireSIGHT

Beyond the basic, wide-ranging data that the Context Explorer initially displays, you have the option to filter that data for a more granular contextual picture of activity on your network. Filters encompass all types of FireSIGHT data, support exclusion as well as inclusion, can be applied quickly by clicking on Context Explorer graph data points, and affect the entire explorer. You can apply up to 20 filters at once to create a highly specific portrait tailored to the needs of your network and organization. Filters that you apply are reflected in the Context Explorer URL so that you can bookmark useful filter sets in your browser program for later use.

For information on using filters in the Context Explorer, see the following topics:

- [Adding and Applying Filters](#) on page 151
- [Creating Filters with the Context Menu](#) on page 155
- [Bookmarking Filters](#) on page 156

Adding and Applying Filters

LICENSE: FireSIGHT, Protection, Control, URL Filtering, or Malware

SUPPORTED DEVICES: feature dependent

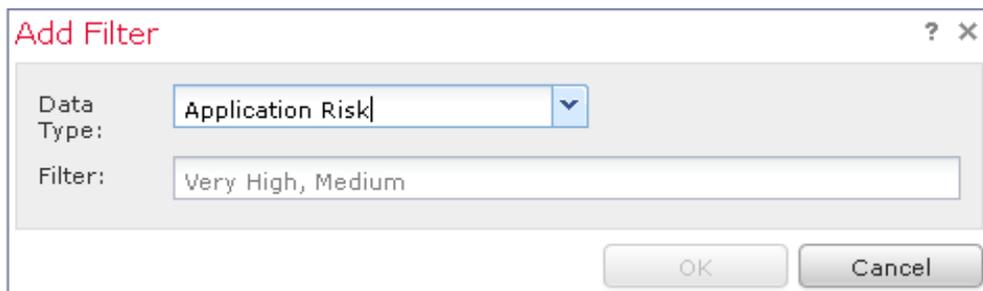

SUPPORTED DEFENSE CENTERS: feature dependent

You can add filters to Context Explorer data in several ways:

- from the Add Filter window
- from the context menu pop-up window, when you select a data point in the explorer
- from the Context Explorer icon (**sf**) or from text links that appear in certain detail view pages (Application Detail, Host Profile, Rule Detail, and User Profile). Clicking these links automatically opens and filters the Context Explorer according to the relevant data on the detail view page. For example, clicking the Context Explorer link on a user detail page for the user **jenkins** constrains the explorer to show only data associated with that user

This section focuses on creating filters from scratch with the Add Filter window. For information on using the context menu to create quick filters from Context Explorer graph and list data, see [Creating Filters with the Context Menu](#) on page 155.

The Add Filter window, which you access by clicking the plus icon (**+**) under **Filters** at the top left of the Context Explorer, contains only two fields: **Data Type** and **Filter**.

The screenshot shows a dialog box titled "Add Filter" with a question mark and close icon in the top right corner. It contains two main input fields: "Data Type" and "Filter". The "Data Type" field is a dropdown menu currently showing "Application Risk". The "Filter" field is a text input box containing the text "Very High, Medium". Below these fields are two buttons: "OK" and "Cancel".

The Data Type drop-down list contains over 25 different types of Sourcefire 3D System data you can use to constrain the Context Explorer. After you select a data type, you then enter a specific value for that type in the **Filter** field (for example, a value of Shopping for the type URL Category). To assist you, the Filter field presents several grayed-out example values for the data type you select. (These are erased when you enter data in the field.)

The [Filter Data Types](#) table lists the data types available as filters, with examples and brief definitions of each. Note that The DC500 Defense Center does not display and Series 2 devices do not detect data for features they do not support.

See the [Supported Capabilities by Appliance Model table](#) on page 42 for a summary of Series 2 appliance features.

Filter Data Types

TYPE	EXAMPLE VALUES	DEFINITION
Access Control Action	Allow, Block	Action taken by your access control policy to allow or block traffic
Application Category	web browser, email	General classification of an application's most essential function
Application Name	Facebook, HTTP	Name of an application
Application Risk	Very High, Medium	Estimated security risk of an application
Application Tag	encrypts communications, sends mail	Additional information about an application; applications can have any number of tags, including none
Application Type	Client, web Application	Type of an application: application protocol, client, or web application
Business Relevance	Very Low, High	Estimated relevance of an application to business activity (as opposed to recreation)
Continent	North America, Asia	Continent associated with a routable IP address detected on your monitored network
Country	Canada, Japan	Country associated with a routable IP address detected on your monitored network
Device	device1.example.com, 192.168.1.3	Name or IP address of a device on your monitored network
Event Classification	Potential Corporate Policy Violation, Attempted Denial of Service	Capsule description of an intrusion event, determined by the classification of the rule, decoder, or preprocessor that triggered it
Event Message	dns response, P2P	Message generated by an event, determined by the rule, decoder, or preprocessor that triggered it
File Disposition	Malware, Clean	Cloud-determined disposition of a file for which the Defense Center performed a malware cloud lookup
File Name	Packages.bz2	Name of a file detected in network traffic

Filter Data Types (Continued)

TYPE	EXAMPLE VALUES	DEFINITION
File SHA256	any 32-bit string	SHA-256 hash value of a file for which the Defense Center performed a malware cloud lookup
File Type	GZ, SWF, MOV	File type detected in network traffic
File Type Category	Archive, Multimedia, Executables	General category of file type detected in network traffic
IP Address	192.168.1.3, 2001:0db8:85a3::0000/24	IPv4 or IPv6 addresses, address ranges, or address blocks Note that searching for an IP address returns events where that address was either the source or the destination for the event
Impact Level	Impact Level 1, Impact Level 2	Estimated impact of an event on your monitored network
Inline Result	dropped, would have dropped	Whether traffic was dropped, would have been dropped, or was not acted upon by the system
Malware Threat Name	w32.Trojan.a6b1	The name of a malware threat
OS Name	windows, Linux	Name of an operating system
OS Version	xp, 2.6	Specific version of an operating system
Priority	high, low	Estimated urgency of an event
Security Zone	My Security Zone, Security Zone X	A set of interfaces through which traffic is analyzed and, in an inline deployment, passes
URL	example.com, loremipsum.net	URL requested by a host on your monitored network
URL Category	shopping, Travel	General category of a URL; URLs can have more than one category
URL Reputation	well known, high risk	Estimated potential security risk of a URL
User	wsmith, mtwain	Identity of a user logged in to a host on your monitored network

In the Filter field, you can input special search parameters such as * and ! essentially as you can in event searches. You can create exclusionary filters by prefixing filter parameters with the ! symbol. For more information on the search constraints typically supported by the Sourcefire 3D System, see [Using Wildcards and Symbols in Searches](#) on page 1775.

When multiple filters are active, values for the same data type are treated as OR search criteria: all data that matches at least one of the values appears. Values for different data types are treated as AND search criteria: to appear, data must match at least one value for each filtered data type. For example, data that appears for the filter set of **Application: 2channel**, **Application: Reddit**, and **User: edickinson** must be associated with the user **edickinson** **AND** either the application **2channel** **OR** the application **Reddit**.

After you confirm a data type and value for your filter, a filter widget appears at the top left of the page, displaying the new filter's data type and value.

Filters: Access Control Action **Allow** ✕ Application Type **Client** ✕

Because you may want to configure multiple filters before you apply them, and because the Context Explorer may take time to fully reload all sections, filters that you add are not automatically applied. To apply filters, you must click **Apply Filters**. Filters that are configured, but not yet applied, appear faded. You can have up to 20 filters at a time, and you can delete individual filters by clicking the delete icon (✕) on the filter's widget. If you want to delete all filters at once, you can click the **Clear** button.

Note that some filter types are incompatible with others: for example, URL-related filters (such as **URL**, **Category**, and **Reputation**) cannot be applied at the same time as intrusion event-related filters (such as **Device** and **Inline Result**) because the system cannot sort connection event data by intrusion event data. The system automatically prevents incompatible filters from simultaneously applying; when one filter type is more recently activated, filters of the incompatible type are hidden as long as the incompatibility exists.

Note that the data displayed depends on such factors as how you license and deploy your managed devices, whether you configure features that provide the data and, in the case of Series 2 appliances, whether the appliance supports a feature that provides the data. For example, because neither the DC500 Defense Center nor Series 2 devices support URL filtering by category and reputation, the DC500 Defense Center does not display data for this feature and Series 2 devices do not detect this data.

To create a new filter from the Add Filter window:

ACCESS: Admin/Any Security Analyst

1. Select **Analysis > Context Explorer**.

The Context Explorer appears.

2. Under **Filters** at the top right, click the plus icon (+).
The Add Filter pop-up window appears.
3. From the **Data Type** drop-down list, select the data type you want to filter on.
The Filter field populates with example values for that data type.
4. In the **Filter** field, type the data type value you want to filter on.
5. Click **OK**.
Your filter is added. The Context Explorer reappears and a corresponding filter widget appears.
6. Optionally, repeat the previous steps to add more filters until you have the filter set you need. Note that because the Context Explorer does not automatically refresh, your filters are not applied when you add them.
7. Click **Apply Filters**.
Your filters are applied and the Context Explorer refreshes to reflect the filtered data.

To delete a filter:

ACCESS: Admin/Any Security Analyst

- ▶ Click the delete icon (✕) on any filter widget.
The filter is deleted.

To clear all filters:

ACCESS: Admin/Any Security Analyst

- ▶ Click the **Clear** button that appears to the right of the filter widgets.

All filters are cleared.

Note that this button does not appear if no filters have been created.

Creating Filters with the Context Menu

LICENSE: FireSIGHT

While exploring Context Explorer graph and list data, you can click on data points, then use the context menu to quickly create a filter based on that data, either inclusive or exclusive. If you use the context menu to filter on information of data type Application, User, or Intrusion Event Message, or any individual host, the filter widget includes a widget information icon that links to the relevant detail page for that data type (such as Application Detail for application data).

You can also use the context menu to investigate specific graph or list data in more detail. For information, see [Drilling Down on Context Explorer Data](#) on page 148.

To create a filter from the context menu:

ACCESS: Admin/Any Security Analyst

1. Select **Analysis > Context Explorer**.

The Context Explorer appears.

2. In any explorer section except Traffic and Intrusion Events over Time, click a data point you want to filter on.

The context menu pop-up window appears nearby. The following graphic shows the context menu window for NetBIOS in the Hosts by Risk and Application graph.

3. You have two options:

- To add a filter for this data, click **Add Filter**.
The filter is added and its widget appears at upper left.
- To add an exclusion filter for this data, click **Add Exclude Filter**. The filter, when applied, displays all data **not** associated with the excluded value.
The filter is added and its widget appears at upper left. Exclude filters display an exclamation point before the filter value.

To view filter detail:

ACCESS: Admin/Any Security Analyst

- ▶ Click the information icon () on any eligible filter widget.

A new window opens with the detail page relevant to the filter's data type.

Bookmarking Filters

LICENSE: FireSIGHT

Filters function as a simple, agile tool to get the precise FireSIGHT data context you need at any given time. They are not intended as permanent configuration settings, and disappear when you navigate away from the Context Explorer or end your session. However, your organization may use certain filter combinations frequently. To preserve filter settings for later use, you can create a browser bookmark of the Context Explorer with your preferred filters applied. Because

applied filters are incorporated in the Context Explorer page URL, loading a bookmark of that page also loads the corresponding filters.

CHAPTER 4

USING OBJECTS AND SECURITY ZONES

For increased flexibility and web interface ease-of-use, the Sourcefire 3D System allows you to create named *objects*, which are reusable configurations that associate a name with a value so that when you want to use that value, you can use the named object instead.

You can create objects for IP addresses and networks, Security Intelligence feeds and lists, port/protocol pairs, VLAN tags, URLs, application filters, file lists, and security zones. You can then use these objects in various places in the system's web interface, including access control policies, intrusion policy variables, intrusion rules, network discovery rules, event searches, reports, dashboards, and so on.

Grouping objects allows you to reference multiple objects with a single configuration. You can group network, port, VLAN tag, and URL objects.

IMPORTANT! In most cases, editing an object used in an access control, network discovery, or intrusion policy requires a policy reapply for your changes to take effect. Editing a security zone also requires that you reapply the appropriate device configurations.

For more information, see the following sections:

- [Using the Object Manager](#) on page 159
- [Working with Network Objects](#) on page 161
- [Working with Security Intelligence Lists and Feeds](#) on page 162
- [Working with Port Objects](#) on page 173
- [Working with VLAN Tag Objects](#) on page 174

- [Working with URL Objects](#) on page 175
- [Working with Application Filters](#) on page 176
- [Working with the Global Malware Whitelist](#) on page 180
- [Working with Security Zones](#) on page 187

Using the Object Manager

LICENSE: Any

Create and manage objects, including application filters and security zones, using the object manager (**Objects > Object Management**). You can group network, port, VLAN tag, and URL objects; you can also sort, filter, and browse the list of objects and object groups.

The screenshot shows the Object Manager interface. On the left is a navigation pane with categories: Network, Security Intelligence, Port, VLAN Tag, and URL. Each category has sub-items for 'Individual Objects' and 'Object Groups'. The main area displays a table with columns 'Name' and 'Value'. There are two rows: 'IPv4 Private Networks' with values '192.168.0.0/16', '10.0.0.0/8', and '172.16.0.0/12'; and 'IPv6 Private Networks' with value 'fc00::/7'. Each row has edit and delete icons. At the top right are 'Add Network' and 'Filter' buttons. At the bottom, it says 'Displaying 1 - 2 of 2 rows' and 'Page 1 of 1'.

Name	Value	
IPv4 Private Networks	192.168.0.0/16 10.0.0.0/8 172.16.0.0/12	 
IPv6 Private Networks	fc00::/7	 

For more information, see:

- [Grouping Objects](#) on page 159
- [Browsing, Sorting, and Filtering Objects](#) on page 161

Grouping Objects

LICENSE: Any

You can group network, port, VLAN tag, and URL objects. The system allows you to use objects and object groups interchangeably in the web interface. For example, anywhere you would use a port object, you can also use a port object group. Objects and object groups of the same type cannot have the same name.

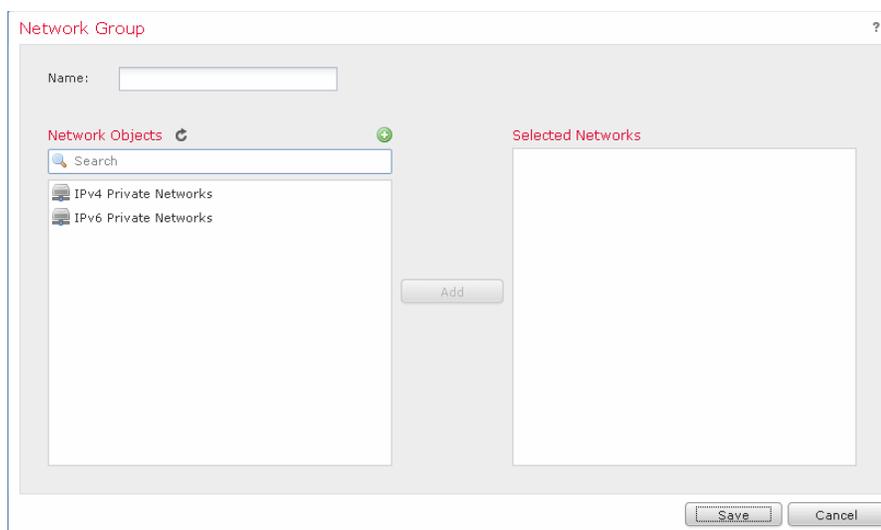

When you edit an object group used in a policy, for example, a network object group used in an access control, network discovery, or intrusion policy, you must reapply the policy for your changes to take effect.

Deleting a group does not delete the objects in the group, just their association with each other. Additionally, you cannot delete a group that is in use. For example, you cannot delete a VLAN tag group that you are using in a VLAN condition in a saved access control policy.

To group network, port, VLAN tag, or URL objects:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Objects > Object Management**.
The Object Management page appears.
2. Under the type of object you want to group, select **Object Groups**.
The page for the type of object you are grouping appears.
3. Click **Add Network Group**, **Add Port Group**, **Add VLAN Tag Group**, or **Add URL Group**.
A pop-up window appears where you can create the group. The following graphic shows the Network Group pop-up window.

4. Type a **Name** for the group. You can use any printable standard ASCII characters except curly braces ({}).
5. Select one or more objects and click **Add**.
 - Use Shift and Ctrl to select multiple objects, or right-click and **Select All**.
 - Use the filter field (🔍) to search for existing objects to include, which updates as you type to display matching items. Click the reload icon (🔄) above the search field or click the clear icon (✖) in the search field to clear the search string.
 - Click the add icon (+) to create objects on the fly if no existing objects meet your needs.

6. Click **Save**.
The group is created.

Browsing, Sorting, and Filtering Objects

LICENSE: Any

The object manager displays 20 objects or groups per page. If you have more than 20 of any type of object or group, use the navigation links at the bottom of the page to view additional pages. You can also go to a specific page or click the refresh icon () to refresh your view.

Displaying 1 - 20 of 21 rows  Page of 2 

By default, the page lists objects and groups alphabetically by name. However, you can sort each type of object or group by any column in the display. An up () or down () arrow next to a column heading indicates that the page is sorted by that column in that direction. You can also filter the objects on the page by name or value.

To sort objects or groups:

ACCESS: Admin/Access Admin/Network Admin

- ▶ Click a column heading. To sort in the opposite direction, click the heading again.

To filter objects or groups:

ACCESS: Admin/Access Admin/Network Admin

- ▶ Type your filter criteria in the **Filter** field.
The page updates as you type to display matching items. The field accepts one or more asterisks (*) as wild cards.

Working with Network Objects

LICENSE: Any

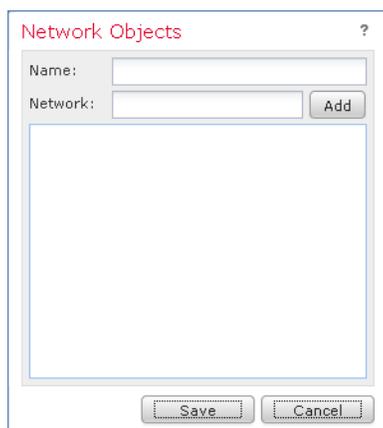

A network object represents one or more IP addresses that you can specify either individually or as address ranges. You can use network objects and groups (see [Grouping Objects](#) on page 159) in various places in the system's web interface, including access control policies, intrusion policy variables, intrusion rules, network discovery rules, event searches, reports, and so on.

You also cannot delete a network object that is in use. Additionally, after you edit a network object used in an access control, network discovery, or intrusion policy, you must reapply the policy for your changes to take effect.

To create a network object:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Objects > Object Management**.
The Object Management page appears.
2. Under **Network**, select **Individual Objects**.
3. Click **Add Network**.
The Network Objects pop-up window appears.

4. Type a **Name** for the network object. You can use any printable standard ASCII characters except curly braces ({}).
5. For each IP address or address range you want to add to the network object, type its value and click **Add**.
6. Click **Save**.
The network object is added.

Working with Security Intelligence Lists and Feeds

LICENSE: Protection

SUPPORTED DEVICES: Series 3, virtual

SUPPORTED DEFENSE CENTERS: Any except DC500

The Security Intelligence feature allows you to, per access control policy, specify the traffic that can traverse your network based on the source or destination IP address. This is especially useful if you want to blacklist — deny traffic to and from — specific IP addresses, before the traffic is subjected to analysis by access control rules. Similarly, you can add IP addresses to the whitelist to force the system to handle their connections using access control.

If you are not sure whether you want to blacklist a particular IP address, you can use a “monitor-only” setting, which allows the system to handle the connection using access control, but also logs the connection’s match to the blacklist.

A *global whitelist* and *global blacklist* are included by default in every access control policy, and apply to any zone. Additionally, within each access control policy, you can build a separate whitelist and blacklist using a combination of network objects and groups as well as Security Intelligence lists and feeds, all of which you can constrain by security zone.

IMPORTANT! Although they have all other Protection capabilities by default, Series 2 devices cannot perform Security Intelligence filtering.

Comparing Feeds and Lists

A Security Intelligence *feed* is a dynamic collection of IP addresses that the Defense Center downloads from an HTTP or HTTPS server at the interval you configure. Because feeds are regularly updated, the system can use up-to-date information to filter your network traffic. To help you build blacklists, Sourcefire provides the *Sourcefire Intelligence Feed*, which represents IP addresses determined by the Sourcefire VRT to have a poor reputation.

When the Defense Center downloads updated feed information, it automatically updates its managed devices. Although it may take a few minutes for a feed update to take effect throughout your deployment, you do not have to reapply access control policies after you create or modify a feed, or after a scheduled feed update.

IMPORTANT! If you want strict control over when the Defense Center downloads a feed from the internet, you can disable automatic updates for that feed. However, Sourcefire recommends that you allow automatic updates. Although you can manually perform on-demand updates, allowing the system to download feeds on a regular basis provides you with the most up-to-date, relevant data.

A Security Intelligence *list*, contrasted with a feed, is a simple static list of IP addresses that you manually upload to the Defense Center. Use custom lists to augment and fine-tune feeds and the global whitelist and blacklist. Note that editing custom lists (as well as editing network objects and removing IP addresses from the global whitelist or blacklist) require an access control policy apply for your changes to take effect.

Formatting and Corrupt Feed Data

Feed and list source must be a simple text file no larger than 500MB, with one IP address or address range per line. Comment lines must start with the # character. List source files must use the `.txt` extension.

If the Defense Center downloads a corrupt feed or a feed with no recognizable IP addresses, the system continues using the old feed data (unless it is the first download). However, if the system can recognize even one IP address in the

feed, the Defense Center updates its managed devices with the addresses it can recognize.

The default health policy includes the Security Intelligence module, which alerts in a few situations involving Security Intelligence filtering, including if the Defense Center cannot update a feed, or if a feed is corrupt or contains no recognizable IP addresses.

Internet Access and High Availability

The system uses port 443/HTTPS to download the Sourcefire Intelligence Feed, and either 443/HTTP or 80/HTTP to download custom or third-party feeds. To update feeds, you must open the appropriate port, both inbound and outbound, on the Defense Center. If your Defense Center does not have direct access to the feed site, it can use a proxy server (see [Configuring Network Settings](#) on page 2009).

IMPORTANT! The Defense Center does **not** perform peer SSL certificate verification when downloading custom feeds, nor does the system support the use of certificate bundles or self-signed certificates to verify the remote peer.

Although Security Intelligence objects are synchronized between Defense Centers in a high availability deployment, only the primary Defense Center downloads feed updates. If the primary Defense Center fails, you must not only make sure that the secondary Defense Center has access to the feed sites, but also must use the web interface on the secondary Defense Center to switch its role to **Active & Primary**. For more information, see [Monitoring and Changing High Availability Status](#) on page 202.

Managing Feeds and Lists

You create and manage Security Intelligence lists and feeds, collectively called Security Intelligence objects, using the object manager's Security Intelligence page. (For information on creating and managing network objects and groups, see [Working with Network Objects](#) on page 161.)

The screenshot shows a web interface for managing Security Intelligence objects. At the top, there are three buttons: "Update Feeds", "Add Security Intelligence" (with a green plus icon), and "Filter" (with a magnifying glass icon). Below these is a table with the following columns: "Name", "Type", and an empty column for actions. The table contains five rows of data:

Name	Type	
Global Blacklist	List	 
Global Whitelist	List	 
MyCompany Whitelist <i>Last Updated: 2012-05-17 07:21:53</i>	List	 
Sourcefire Intelligence Feed <i>Last Updated: 2012-05-17 06:58:22</i>	Feed	 
Zeus Blacklist <i>Last Updated: 2012-05-17 07:48:05</i>	Feed	 

Note that you cannot delete a custom list or feed that is currently being used in a saved or applied access control policy. You also cannot delete a global list,

although you can remove individual IP addresses. Similarly, although you cannot delete the Sourcefire Intelligence Feed, editing it allows you to disable or change the frequency of its updates.

Security Intelligence Object Quick Reference

The following table provides a quick reference to the objects you can use to perform Security Intelligence filtering.

Security Intelligence Object Capabilities

CAPABILITY	GLOBAL WHITELIST OR BLACKLIST	INTELLIGENCE FEED	CUSTOM FEED	CUSTOM LIST	NETWORK OBJECT
method of use	in access control policies by default	in any access control policy as either a whitelist or blacklist object			
can be constrained by security zone?	no	yes	yes	yes	yes
can be deleted?	no	no	yes, unless currently being used in a saved or applied access control policy		
object manager edit capabilities	delete IP addresses only (add IP addresses using the context menu)	disable or change update frequency	fully modify	upload a modified list only	fully modify
requires access policy control reapply when modified?	yes when deleting (adding IP addresses does not require reapply)	no	no	yes	yes

For more information on creating, managing, and using Security Intelligence lists and feeds, see:

- [Working with the Global Whitelist and Blacklist](#) on page 166
- [Working with the Sourcefire Intelligence Feed](#) on page 167
- [Working with Custom Security Intelligence Feeds](#) on page 168
- [Manually Updating Security Intelligence Feeds](#) on page 170
- [Working with Custom Security Intelligence Lists](#) on page 170
- [Filtering Traffic Based on Security Intelligence Data](#) on page 438

Working with the Global Whitelist and Blacklist

LICENSE: Protection

SUPPORTED DEVICES: Series 3, virtual

SUPPORTED DEFENSE CENTERS: Any except DC500

In the course of your analysis, you can build a Security Intelligence *global blacklist* by using the IP address context menu in an event view, the Context Explorer, or a dashboard. For example, if you notice a set of routable IP addresses in intrusion events associated with exploit attempts, you can immediately blacklist those IP addresses. You can also build a *global whitelist* in a similar fashion.

The system's global whitelist and blacklist are included by default in every access control policy, and apply to any zone. You can opt not to use these global lists on a per-policy basis.

When you add an IP address to a global list, the Defense Center automatically updates its managed devices. Although it may take a few minutes for your changes to take effect throughout your deployment, you do not have to reapply access control policies after adding an IP address to a global list. Conversely, after you delete IP addresses from the global whitelist or blacklist, you must apply your access control policies for your changes to take effect.

Note that although you can add network objects with a netmask of /0 to the whitelist or blacklist, address ranges using a /0 netmask in those objects will be ignored and whitelist and blacklist filtering will not occur based on those addresses. Address ranges with a /0 netmask from security intelligence feeds will also be ignored. If you want to monitor or block all traffic targeted by a policy, use an access control rule with the **Monitor** or **Block** rule action, respectively, and a default value of **any** for the **Source Networks** and **Destination Networks**, instead of security intelligence filtering.

Because adding an IP address to the global whitelist or blacklist affects access control, you must have one of the following:

- Administrator access
- a combination of default roles: Network Admin or Access Admin, plus Security Analyst and Security Approver
- a custom role with both Modify Access Control Policy and Apply Access Control Policy permissions; see [Using Custom User Roles with Access Control Policies](#) on page 433

To add an IP address to the global whitelist or blacklist using the context menu:

ACCESS: Admin/Custom

1. In an event view, packet view, the Context Explorer, or a dashboard, hover your pointer over an IP address hotspot.

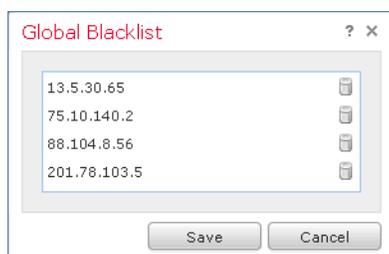

TIP! In an event view or dashboard, hover your pointer over an IP address, not the host icon () to its left.

2. Invoke the context menu:
 - In an event view or dashboard, right-click.
 - In the Context Explorer or packet view, left-click.
3. From the context menu, select either **Whitelist Now** or **Blacklist Now**.
For information on the other options in the context menu, see [Using the Context Menu](#) on page 63.
4. Confirm that you want to whitelist or blacklist the IP address.
A confirmation dialog appears, warning you that it can take several minutes for the addition to take effect.
5. Click **Close**.
After the Defense Center communicates your addition to its managed devices, your deployment begins filtering traffic according to your change.

To remove IP addresses from the global whitelist or blacklist:

ACCESS: Admin/Network Admin

1. On the object manager's Security Intelligence page, next to the global whitelist or blacklist, click the edit icon (✎).
The Global Whitelist or Global Blacklist pop-up window appears.

2. Next to the IP addresses you want to remove from the list, click the delete icon (🗑️).
To delete multiple IP addresses at once, use the Shift and Ctrl keys to select them, then right-click and select **Delete**.
3. Click **Save**.
Your changes are saved, but you must apply your access control policies for them to take effect.

Working with the Sourcefire Intelligence Feed

LICENSE: Protection

SUPPORTED DEVICES: Series 3, virtual

SUPPORTED DEFENSE CENTERS: Any except DC500

To help you build blacklists, Sourcefire provides the Sourcefire Intelligence Feed, which is comprised of several regularly updated lists of IP addresses determined

by the VRT to have a poor reputation. Each list in the feed represents a specific category: open relays, known attackers, bogus IP addresses (bogon), and so on. In an access control policy, you can blacklist any or all of the categories.

Because the intelligence feed is regularly updated, the system can use up-to-date information to filter your network traffic. Malicious IP addresses that represent security threats such as malware, spam, botnets, and phishing may appear and disappear faster than you can update and apply new policies.

Although you cannot delete the Sourcefire Intelligence Feed, editing it allows you to change the frequency of its updates. By default, the feed updates every two hours.

To modify the intelligence feed's update frequency:

ACCESS: Admin/Network Admin

1. On the object manager's Security Intelligence page, next to the Sourcefire Intelligence Feed, click the edit icon (✎).

The Sourcefire Security Intelligence pop-up window appears.

2. Edit the **Update Frequency**.

You can select from various intervals from two hours to one week. You can also disable feed updates.

3. Click **Save**.

Your changes are saved.

Working with Custom Security Intelligence Feeds

LICENSE: Protection

SUPPORTED DEVICES: Series 3, virtual

SUPPORTED DEFENSE CENTERS: Any except DC500

Custom or third-party Security Intelligence feeds allow you to augment the Sourcefire Intelligence Feed with other regularly-updated reputable whitelists and blacklists on the internet. You can also set up an internal feed, which is useful if you want to update multiple Defense Centers in your deployment using one source list.

When you configure a feed, you specify its location using a URL; the URL cannot be Punycode-encoded. By default, the Defense Center downloads the entire feed source on the interval you configure, then automatically updates its managed devices.

Optionally, you can configure the system to use an md5 checksum to determine whether to download an updated feed. If the checksum has not changed since

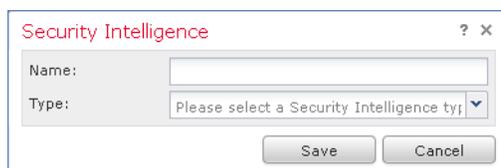

the last time the Defense Center downloaded the feed, the system does not need to re-download it. You may want to use md5 checksums for internal feeds, especially if they are large. The md5 checksum must be stored in a simple text file with only the checksum. Comments are not supported.

To configure a Security Intelligence feed:

ACCESS: Admin/Network Admin

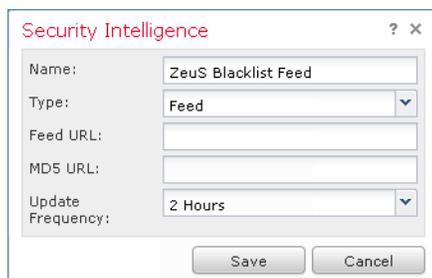

1. On the object manager's Security Intelligence page, click **Add Security Intelligence**.

The Security Intelligence pop-up window appears.

2. Type a **Name** for the feed. You can use any printable standard ASCII characters except curly braces ({}).
3. From the **Type** drop-down list, specify that you want to configure a **Feed**.

The pop-up window updates with new options.

4. Specify a **Feed URL** and optionally, an **MD5 URL**.
5. Select an **Update Frequency**.

You can select from various intervals from two hours to one week. You can also disable feed updates.

6. Click **Save**.

The Security Intelligence feed object is created. Unless you disabled feed updates, the Defense Center attempts to download and verify the feed. You can now use the feed object in access control policies.

Manually Updating Security Intelligence Feeds

LICENSE: Protection

SUPPORTED DEVICES: Series 3, virtual

SUPPORTED DEFENSE CENTERS: Any except DC500

Manually updating Security Intelligence feeds updates all feeds, including the Sourcefire Intelligence Feed.

To update all Security Intelligence feeds:

ACCESS: Admin/Access Admin/Network Admin

1. On the object manager's Security Intelligence page, click **Update Feeds**.
2. Confirm that you want to update all feeds.

A confirmation dialog appears, warning you that it can take several minutes for the update to take effect.

3. Click **OK**.

After the Defense Center downloads and verifies the feed updates, it communicates any changes to its managed devices. Your deployment begins filtering traffic using the updated feeds.

Working with Custom Security Intelligence Lists

LICENSE: Protection

SUPPORTED DEVICES: Series 3, virtual

SUPPORTED DEFENSE CENTERS: Any except DC500

A Security Intelligence list is a simple static list of IP addresses and address ranges that you manually upload to the Defense Center. Custom lists are useful if you want to augment and fine-tune feeds or one of the global lists, for a single Defense Center's managed devices.

Note that netmasks for address ranges can be integers from 0 to 32 or 0 to 128, for IPv4 and IPv6, respectively.

For example, if a reputable feed improperly blocks your access to vital resources but is overall useful to your organization, you can create a custom whitelist that contains only the improperly classified IP addresses, rather than removing the Security Intelligence feed object from the access control policy's blacklist.

Note that to modify a Security Intelligence list, you must make your changes to the source file and upload a new copy. For more information, see [Updating a Security Intelligence List](#) on page 172.

To upload a new Security Intelligence list to the Defense Center:

ACCESS: Admin/Access Admin/Network Admin

1. On the object manager's Security Intelligence page, click **Add Security Intelligence**.

The Security Intelligence pop-up window appears.

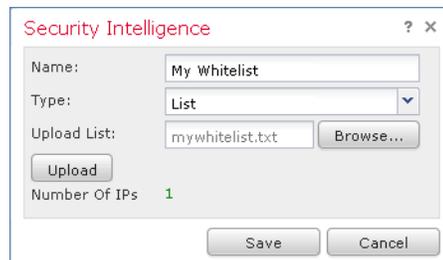

2. Type a **Name** for the list. You can use any printable standard ASCII characters except curly braces ({}).
3. From the **Type** drop-down list, specify that you want to upload a **List**.

The pop-up window updates with new options.

4. Click **Browse** to browse to the list .txt file, then click **Upload**.

The list is uploaded. The pop-up window displays the total number of IP addresses and address ranges that the system found in the list.

If the number is not what you expected, check the formatting of the file and try again.

5. Click **Save**.
The Security Intelligence list object is saved. You can now use it in access control policies.

Updating a Security Intelligence List

LICENSE: Protection

SUPPORTED DEVICES: Series 3, virtual

SUPPORTED DEFENSE CENTERS: Any except DC500

To edit a Security Intelligence list, you must make your changes to the source file and upload a new copy. You cannot modify the file's contents using the Defense Center web interface. If you do not have access to the source file, you can download a copy from the Defense Center.

To modify a Security Intelligence list:

ACCESS: Admin/Access Admin/Network Admin

1. On the object manager's Security Intelligence page, next to the list you want to update, click the edit icon (✎).

The Security Intelligence pop-up window appears.

2. If you need a copy of the list to edit, click **Download**, then follow your browser's prompts to save the list as a text file.
3. Make changes to the list as necessary.
4. On the Security Intelligence pop-up window, click **Browse** to browse to the modified list, then click **Upload**.

The list is uploaded.

5. Click **Save**.

Your changes are saved. If the list is being used by an active access control policy, you must apply the policy for your changes to take effect.

Working with Port Objects

LICENSE: Any

Port objects represent different protocols in slightly different ways:

- For TCP and UDP, a port object represents the transport layer protocol, with the protocol number in parentheses, plus an optional associated port or port range. For example: `TCP(6)/22`.
- For ICMP and ICMPv6 (IPv6-ICMP), the port object represents the internet layer protocol plus an optional type and code. For example: `ICMP(1):3:3`.
- A port object can also represent other protocols that do not use ports.

Note that Sourcefire provides default port objects for well-known ports. You can modify or delete these objects, but Sourcefire recommends that you create custom port objects instead.

You can use port objects and groups (see [Grouping Objects](#) on page 159) in various places in the system's web interface, including access control policies, network discovery rules, and event searches. For example, if your organization uses a custom client that uses a specific range of ports and causes the system to generate excessive and misleading events, you can configure your network discovery policy to exclude monitoring those ports.

You cannot delete a port object that is in use. Additionally, after you edit a port object used in an access control or network discovery policy, you must reapply the policy for your changes to take effect.

Note that you cannot add any protocol other than TCP or UDP for source port conditions in access control rules. Also, you cannot mix transport protocols when setting both source and destination port conditions in a rule.

If you add an unsupported protocol to a port object group used in a source port condition, the rule where it is used does not apply to the managed device on policy apply. Additionally, if you create a port object containing both TCP and UDP ports, then add it as a source port condition in a rule, you cannot add a destination port, and vice versa.

To create a port object:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Objects > Object Management**.
The Object Management page appears.
2. Under **Port**, select **Individual Objects**.

3. Click **Add Port**.

The Port Objects pop-up window appears.

4. Type a **Name** for the port object. You can use any printable standard ASCII characters except curly braces ({}).
5. Select a **Protocol**.
You can quickly select **TCP**, **UDP**, **IP**, **ICMP**, or **IPv6-ICMP**, or you can use the **Other** drop-down list to select either a different protocol or **All** protocols.
6. Optionally, restrict a TCP or UDP port object using a **Port** or port range.
You can specify any port from 1 to 65535 or any to match all ports. Use a hyphen to specify a range of ports.
7. Optionally, restrict a ICMP or IPV6-ICMP port object using a **Type** and, if appropriate, a related **Code**.
When you create an ICMP or IPv6-ICMP object, you can specify the type and, if applicable, the code. For more information on ICMP types and codes, see <http://www.iana.org/assignments/icmp-parameters/icmp-parameters.xml> and <http://www.iana.org/assignments/icmpv6-parameters/icmpv6-parameters.xml>. You can set the type to any to match any type or set the code to any to match any code for the specified type.
8. Optionally, select **Other** and a protocol from the drop-down list. If you select **All** protocols, type a port number in the **Port** field.
9. Click **Save**.
The port object is added.

Working with VLAN Tag Objects

LICENSE: Any

Each VLAN tag object you configure represents a VLAN tag or range of tags. You can use VLAN tag objects and groups (see [Grouping Objects](#) on page 159) in various places in the systems's web interface, including access control policies and event searches. For example, you could write an access control rule that applies only to a specific VLAN.

You cannot delete a VLAN tag object that is in use. Additionally, after you edit a VLAN tag object used in an access control policy, you must reapply the policy for your changes to take effect.

To add a VLAN tag object:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Objects > Object Management**.
2. Under **VLAN Tag**, select **Individual Objects**.
3. Click **Add VLAN Tag**.

The VLAN Tag pop-up window appears.

4. Type a **Name** for the VLAN tag. You can use any printable standard ASCII characters except curly braces ({}).
5. In the **VLAN Tag** field, type a value for the VLAN tag.
You can specify any VLAN tag from 1 to 4094. Use a hyphen to specify a range of VLAN tags.
6. Click **Save**.
The VLAN tag object is added.

Working with URL Objects

LICENSE: Any

SUPPORTED DEVICES: Series 3, virtual

SUPPORTED DEFENSE CENTERS: Any except DC500

Each URL object you configure represents a single URL or IP address. You can use URL objects and groups (see [Grouping Objects](#) on page 159) in various places in the system's web interface, including access control policies and event searches. For example, you could write an access control rule that blocks a specific URL.

Note that to block HTTPS traffic, you can enter the URL from the Secure Sockets Layer (SSL) certificate for the traffic. When entering a URL from a certificate, enter the domain name and omit subdomain information. (For example, type **example.com** rather than **www.example.com**.) If you block traffic based on the certificate URL, both HTTP and HTTPS traffic to that website are blocked.

You cannot delete a URL object that is in use. Additionally, after you edit a URL object used in an access control policy, you must reapply the policy for your changes to take effect.

To add a URL object:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Objects > Object Management**.
The Object Management page appears.
2. Under **URL**, select **Individual Objects**.
3. Click **Add URL**.
The URL Objects pop-up window appears.

4. Type a **Name** for the URL object. You can use any printable standard ASCII characters except curly braces ({}).
5. Type the **URL** or IP address for the URL object.
6. Click **Save**.
The URL object is added.

Working with Application Filters

LICENSE: FireSIGHT

SUPPORTED DEVICES: Series 3, virtual

When the Sourcefire 3D System analyzes IP traffic, it attempts to identify the commonly used applications on your network. Application awareness is crucial to performing application-based access control. The system is delivered with detectors for many applications, and Sourcefire frequently updates and adds additional detectors via system and vulnerability database (VDB) updates. You can also create your own application protocol detectors to enhance the system's detection capabilities.

Application filters group applications according to criteria associated with the applications' risk, business relevance, type, categories, and tags; see the [Application Characteristics table](#) on page 1264. When you create an application protocol detector, you must characterize the application using those criteria as well. Using application filters allows you to quickly create application conditions for access control rules because you do not have to search for and add applications individually; for more information, see [Working with Application Conditions](#) on page 498.

Another advantage to using application filters is that you do not have to update access control rules that use filters when you modify or add new applications. For example, if you configure your access control policy to block all social networking applications, and a VDB update includes a new social networking application

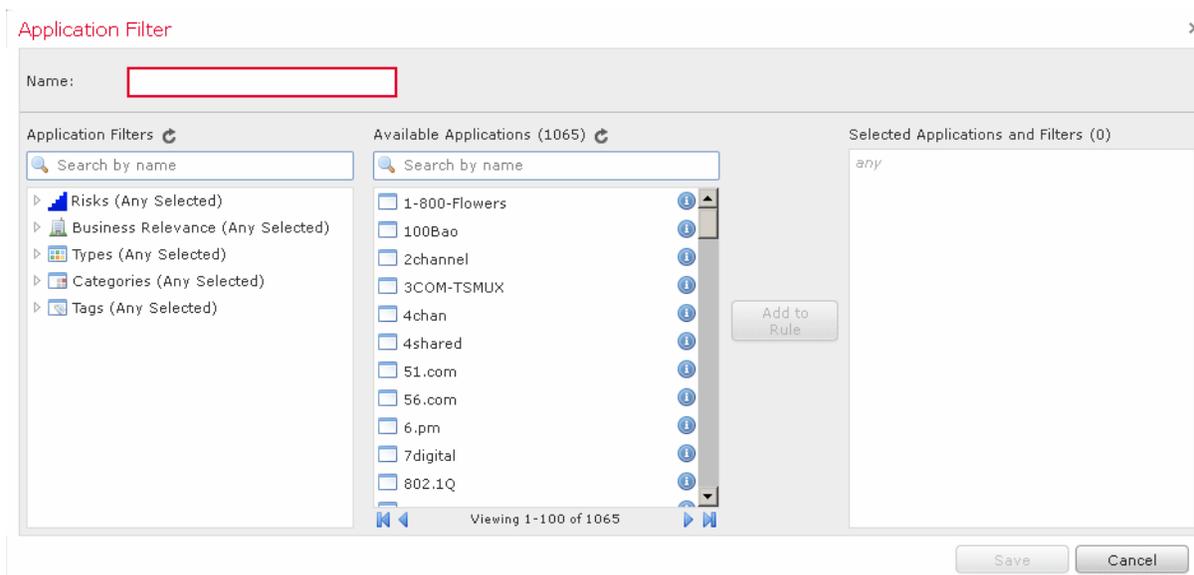

detector, the policy is updated when you update the VDB. Although you must reapply the policy before the system can block the new application, you do not have to update the access control rule that blocks the application.

If the Sourcefire-provided application filters do not group applications according to your needs, you can create your own filters. User-defined filters can group and combine Sourcefire-provided filters. For example, you could create a filter that would allow you to block all very high risk, low business relevance applications. You can also create a filter by manually specifying individual applications, although you should keep in mind those filters do **not** automatically update when you update the system software or the VDB.

As with Sourcefire-provided application filters, you can use user-defined application filters in access control rules. You can also use user-defined filters in the following additional ways:

- To search for applications using the event viewer; see [Using Objects and Application Filters in Searches](#) on page 1775
- To constrain a table view in a report template; see [Working with Searches in Report Template Sections](#) on page 1749
- To filter application statistics in a Custom Analysis dashboard widget; see [Configuring the Custom Analysis Widget](#) on page 82

You use the object manager (**Objects > Object Management**) to create and manage application filters. Note that you can also create an application filter on the fly while adding an application condition to an access control rule.

The Application Filters list contains the Sourcefire-provided application filters that you can select to build your own filter. You can constrain the filters that appear by using a search string; this is especially useful for categories and tags.

The Available Applications list contains the individual applications in the filters you select. You can also constrain the applications that appear by using a search string.

The system links multiple filters of the same filter type with an OR operation. Consider a scenario where the medium risk filter contains 100 applications and the high risk filter contains 50 applications. If you select both filters, the system would display 150 available applications.

The system links different types of filters with an AND operation. For example, if you select the medium and high risk filters and the medium and high business relevance filters, the system displays the applications that have medium or high risk, and also have medium or high business relevance.

TIP! Click an information icon () for more information about the associated application. To display additional information, click any of the Internet search links in the pop-up that appears.

After you determine the applications you want to add to the filter, you can add them either individually, or, if you selected an application filter, **All apps matching the filter**. You can add multiple filters and multiple applications, in any combination, as long as the total number of items in the Selected Applications and Filters list does not exceed 50.

After you create the application filter, it is listed on the Application Filters page of the object manager. The page displays the total number of conditions that comprise each filter.

Name	Value 	 
Very High Risk/Very Low Business Relevance	0 application(s) 2 filter(s)	 
Social Networking	1 Filter	 
MyOrganization Custom Apps	5 application(s) 0 filter(s)	 

For information on sorting and filtering the application filters that appear, see [Using the Object Manager](#) on page 159. Note that you cannot delete an application filter that is in use. Additionally, after you edit an application filter used in an access control policy, you must reapply the policy for your changes to take effect.

To create an application filter:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Objects > Object Management**.
The Object Management page appears.
2. Click **Application Filters**.
The Application Filters section appears.

3. Click Add Application Filter.

The Application Filter pop-up window appears.

4. Give the filter a Name. You can use any printable standard ASCII characters except curly braces ({}).

5. Optionally, use Sourcefire-provided filters in the Application Filters list to narrow the list of applications you want to add to the filter:

- Click the arrow next to each filter type to expand and collapse the list.
- Right-click a filter type and click **Check All** or **Uncheck All**. Note that the list indicates how many filters you have selected of each type.
- To narrow the filters that appear, type a search string in the **Search by name** field; this is especially useful for categories and tags. To clear the search, click the clear icon (✕).
- To refresh the filters list and clear any selected filters, click the reload icon (↻).
- To clear all filters and search fields, click **Clear All Filters**.

The applications that match the filters you select appear in the Available Applications list. The list displays 100 applications at a time.

6. Select the applications that you want to add to the filter from the Available Applications list:

- Select **All apps matching the filter** to add all the applications that meet the constraints you specified in the previous step.
- To narrow the individual applications that appear, type a search string in the **Search by name** field. To clear the search, click the clear icon (✕).
- Use the paging icons at the bottom of the list to browse the list of individual available applications.
- Use Shift and Ctrl keys to select multiple individual applications. Right-click to **Select All** currently displayed individual applications.
- To refresh the applications list and clear any selected applications, click the reload icon (↻).

You cannot select individual applications and **All apps matching the filter** at the same time.

7. Add the selected applications to the filter. You can click and drag, or you can click **Add to Rule**.

The result is the combination of:

- the selected Application Filters
- either the selected individual Available Applications, or **All apps matching the filter**

You can add up to 50 applications and filters to the filter. To delete an application or filter from the selected applications, click the appropriate delete icon (🗑️). You can also select one or more applications and filters, or right-click to **Select All**, then right-click to **Delete Selected**.

8. Click **Save**.
The application filter is saved.

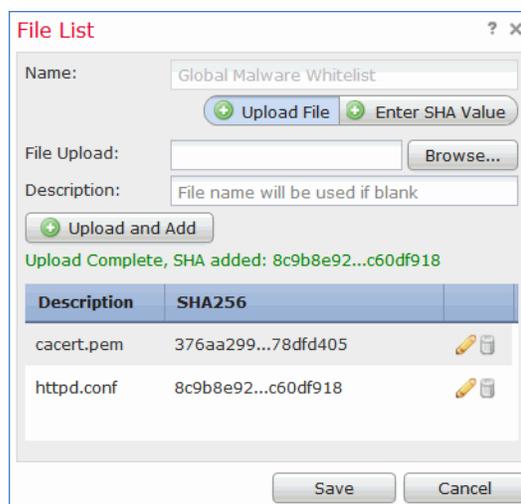

Working with the Global Malware Whitelist

LICENSE: Malware

SUPPORTED DEVICES: Series 3, virtual

SUPPORTED DEFENSE CENTERS: Any except DC500

If you use network-based advanced malware protection (AMP), and the Sourcefire cloud incorrectly identifies a file's disposition, you can add the file to the *global malware whitelist*. The system does not perform malware cloud lookups or block malware for files on the list, even files identified as malware by the cloud. Note, however, that the system may still detect and block files on the whitelist using file rules with the Detect and Block Files actions, respectively.

The system's global malware whitelist is included by default in every file policy. You can opt not to use this global list on a per-policy basis.

WARNING! If you enable the global malware whitelist in a file policy, the system ignores files on the list and does not block them as malware, even if the file policy includes Block Malware rules targeting the traffic containing the files. Do **not** include files on this list that are actually malware.

The whitelist is composed of SHA-256 values. You can upload a file and the system calculates the file's SHA-256 value then adds it to the whitelist. You can also calculate a file's SHA-256 value manually and enter it directly. From the event view, you can add a file's SHA-256 value to the whitelist using the context menu.

When you add a file to the global list, you must reapply any access control policies with file policies that use the list for the changes to take effect. Similarly, after you delete or edit file SHA-256 values on the global whitelist, you must reapply your access control policies for your changes to take effect.

Because adding a file to the global malware whitelist affects access control, you must have one of the following to manage all aspects of the global malware whitelist:

- Administrator access
- a combination of Network Admin or Access Admin (to edit the whitelist), Security Approver (to reapply access control policies), and Security Analyst or Security Analyst (RO) (to add a file using the SHA-256 value from the event view) access
- a custom role with Modify Access Control Policy and Object Manager (to edit the whitelist), Apply Access Control Policy (to reapply access control policies), and Modify File Events (to add a file using the SHA-256 value from the event view) permissions; see [Using Custom User Roles with Access Control Policies](#) on page 433

For more information using file lists, see the following topics:

- [Adding a File to the Whitelist from the Event View](#) on page 181
- [Adding a File to the Whitelist by Uploading the File](#) on page 182
- [Adding a File to the Whitelist Using the SHA-256 Value](#) on page 184
- [Modifying Files on the Global Malware List](#) on page 185

Adding a File to the Whitelist from the Event View

LICENSE: Malware

SUPPORTED DEVICES: Series 3, virtual

SUPPORTED DEFENSE CENTERS: Any except DC500

You can add a file to the global malware whitelist from the file or malware event view, using the context menu on the file's SHA-256 value. If you add a file using the context menu, the system adds the filename as the description.

To add a file to the global whitelist using the context menu:

ACCESS: Admin/Any Security Analyst

1. In the Files or Malware event views, hover your pointer over a SHA-256 hotspot.
2. Right-click and select **Whitelist SHA** from the context menu.
For information on the other options in the context menu, see [Using the Context Menu](#) on page 63.
3. Confirm that you want to add the SHA-256 value representing the file to the whitelist.
A confirmation dialog appears, noting that you must reapply any access control policies with file policies that use the whitelist.
4. Click **Close**.
5. Reapply all access control policies with file policies that use the global malware whitelist.
After the policies apply, the system no longer performs malware cloud lookups on the file or blocks the file as malware.

Adding a File to the Whitelist by Uploading the File

LICENSE: Malware

SUPPORTED DEVICES: Series 3, virtual

SUPPORTED DEFENSE CENTERS: Any except DC500

If you have a copy of the file you want to add to the global malware whitelist, you can upload it and the system calculates the file's SHA-256 value and adds the file to the whitelist. The system does not enforce a limit on the size of files for SHA-256 calculation. You cannot upload files that duplicate SHA-256 values already on the list.

To add a file by uploading a file to calculate its SHA-256 value:

ACCESS: Admin/Network Admin

1. Select **Objects > Object Management**, then click **File List**.
2. Next to the global malware whitelist, click the edit icon (✎).
The File List pop-up window appears.

Description	SHA256
-------------	--------

3. Click **Upload File**.
The pop-up window updates to include new fields.

Description	SHA256
-------------	--------

4. Browse to and select the file you want to add to the whitelist.
5. Optionally, type a **Description** for the file. If you leave the description blank, the system uses the file name as the description.
6. Click **Upload and Add**.
The system calculates the SHA-256 value for the file and adds the file and the value to the list.
7. Click **Save**.

8. Reapply all access control policies with file policies that use the global malware whitelist.

After the policies apply, the system no longer performs malware cloud lookups on the file or blocks the file as malware.

Adding a File to the Whitelist Using the SHA-256 Value

LICENSE: Malware

SUPPORTED DEVICES: Series 3, virtual

SUPPORTED DEFENSE CENTERS: Any except DC500

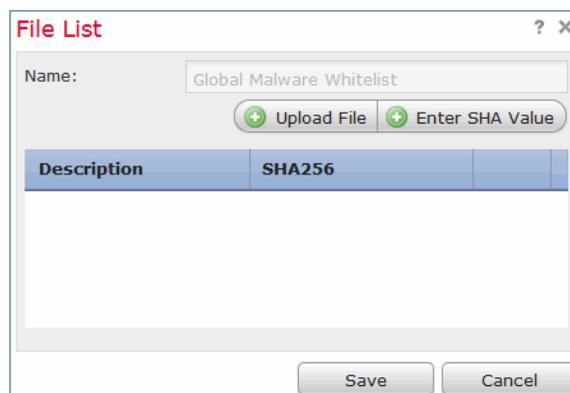

You can submit a file's SHA-256 value to add it to the global malware whitelist. You cannot add duplicate SHA-256 values.

TIP! Use **Show Full Text** in the context menu in the file or malware event views to view the full SHA-256 value for the file. You can copy the value from the full text view.

To add a file by manually entering the file's SHA-256 value:

ACCESS: Admin/Network Admin

1. Select **Objects > Object Management**, then click **File List**.
2. Next to the global malware whitelist, click the edit icon (✎).
The File List pop-up window appears.

3. Click **Enter SHA Value**.

The pop-up window updates to include new fields.

Description	SHA256
-------------	--------

4. Type (or paste) the file's **SHA256** value.
5. Optionally, type a description for the file.
The system leaves the description blank if you do not supply the description.
6. Click **Add**.
The system calculates the SHA-256 value for the file and adds the file and the value to the list.
7. Click **Save**.
8. Reapply all access control policies with file policies that use the global malware whitelist.
After the policies apply, the system no longer performs malware cloud lookups on the file or blocks the file as malware.

Modifying Files on the Global Malware List

LICENSE: Malware

SUPPORTED DEVICES: Series 3, virtual

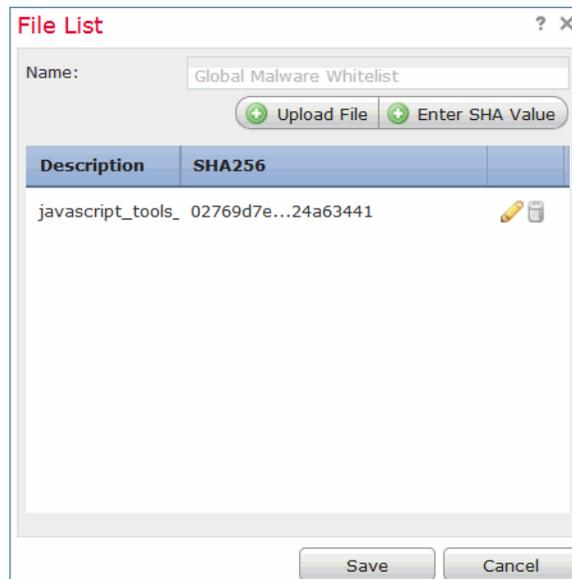

SUPPORTED DEFENSE CENTERS: Any except DC500

You can edit existing file entries on the global malware whitelist.

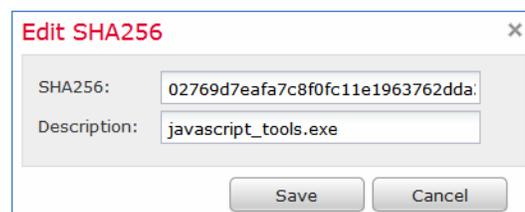

To edit a file on the global malware whitelist:

ACCESS: Admin/Network Admin

1. Select **Objects > Object Management**, then click **File List**.
2. Next to the global malware whitelist, click the edit icon (✎).
The File List pop-up window appears.

3. Next to the file you want to edit, click the edit icon (✎).
The Edit SHA pop-up window appears.

4. Update the **SHA256** value or **Description**.
5. Click **Save**.
The system updates the file entry in the list.

TIP! You can also delete files from the list. Next to the file you want to remove, click the delete icon (🗑).

6. Click **Save**.

7. Reapply all access control policies with file policies that use the global malware whitelist.

After the policies apply, the system no longer performs malware cloud lookups on or blocks as malware any files you add. It resumes malware protection against any files you deleted from the list.

Working with Security Zones

LICENSE: Any

SUPPORTED DEVICES: Any

A *security zone* is a grouping of one or more inline, passive, switched, or routed interfaces that you can use to manage and classify traffic flow in various policies and configurations. The interfaces in a single zone may span multiple devices; you can also configure multiple zones on a single device. This allows you to divide the network into segments where you can apply various policies. You must assign each interface you configure to a security zone before it can handle traffic, and each interface can belong to only one zone.

In addition to using security zones to group interfaces, you can use zones in various places in the system's web interface, including access control policies, network discovery rules, and event searches. For example, you could write an access control rule that applies only to a specific source or destination zone, or restrict network discovery to traffic to or from a specific zone.

When you update a security zone object, the system saves a new revision of the object. As a result, if you have managed devices in the same security zone that have different revisions of the security zone object, you may log what appear to be duplicate connections. If you notice duplicate connection reporting, you can update all managed devices to use the same revision of the object. In the object manager, edit the security zone, remove all managed devices, save the object, re-add the managed devices, and save the object again. Then, reapply all affected device policies. For more information on applying device policies, see [Applying Changes to Devices](#) on page 211.

You create security zones in one of the following ways:

- The system creates security zones upon device registration, depending on the detection mode you selected for the device during its initial configuration. For example, the system creates a Passive zone in passive deployments, while in inline deployments the system creates External and Internal zones.
- You can create security zones on the fly while configuring interfaces on a managed device.
- You can create security zones using the object manager (**Objects > Object Management**).

The Security Zones page of the object manager lists the zones configured on your managed devices. The page also displays the type of interfaces in each zone, and

you can expand each zone to view which interfaces on which devices belong to each zone.

Name	Type
External	Inline
tamarix	
s1p2	
xiramati	
Internal	Inline

IMPORTANT! All interfaces in a security zone must be of the same type, that is, all inline, passive, switched, or routed. Further, after you create a security zone, you cannot change the type of interfaces it contains.

You cannot delete a security zone that is in use. After you add or remove interfaces from a zone, you must reapply the device configuration to the devices where the interfaces reside. You must also reapply the access control and network discovery policies that use the zone.

To add a security zone:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Objects > Object Management**.
The Object Management page appears.
2. Select **Security Zones**.

3. Click **Add Security Zone**.

The Security Zones pop-up window appears.

The screenshot shows a window titled "Security Zones" with a question mark icon in the top right corner. The window contains the following elements:

- Name:** A text input field.
- Type:** A dropdown menu with the text "Select Security Zone Type".
- Device > Interfaces:** A dropdown menu with the text "Select Device".
- Selected Interfaces:** An empty rectangular box for listing interfaces.
- Add:** A button located between the "Selected Interfaces" box and the "Device > Interfaces" dropdown.
- Save:** A button at the bottom right.
- Cancel:** A button at the bottom right, to the right of the "Save" button.

4. Type a **Name** for the zone. You can use any printable standard ASCII characters except curly braces ({}).
5. Select an interface **Type** for the zone.
After you create a security zone, you cannot change its type.
6. From the **Device > Interfaces** drop-down list, select a device that contains interfaces you want to add to the zone.
7. Select one or more interfaces.
Use the Shift and Ctrl keys to select multiple objects. If you have not yet configured interfaces on your managed devices, you can create an empty zone and add interfaces to it later; skip to step 10.
8. Click **Add**.
The interfaces you selected are added to the zone, grouped by device.
9. Repeat steps 6 through 8 to add interfaces on other devices to the zone.
10. Click **Save**.
The security zone is added.

CHAPTER 5

MANAGING DEVICES

The Sourcefire Defense Center is a key component in the Sourcefire 3D System. You can use the Defense Center to manage the full range of devices that comprise the Sourcefire 3D System, and to aggregate, analyze, and respond to the threats they detect on your network.

By using the Defense Center to manage devices, you can:

- configure policies for all your devices from a single location, making it easier to change configurations
- install various types of software updates on devices
- push health policies to your managed devices and monitor their health status from the Defense Center

The Defense Center aggregates and correlates intrusion events, network discovery information, and device performance data, allowing you to monitor the information that your devices are reporting in relation to one another, and to assess the overall activity occurring on your network.

For more information, see the following sections:

- [Management Concepts](#) on page 191 describes some of the features and limitations involved with managing your devices with a Defense Center.
- [Working in NAT Environments](#) on page 193 describes the principles of setting up the management of your devices in Network Address Translation environments.
- [Configuring High Availability](#) on page 194 describes how to set up two Defense Centers as a high availability pair to help ensure continuity of operations.

- [Working with Devices](#) on page 206 describes how to establish and disable connections between devices and your Defense Center. It also explains how to add, delete, and change the state of managed devices.
- [Configuring Remote Management](#) on page 213 describes how to establish and disable remote management of a managed device.
- [Managing Device Groups](#) on page 217 describes how to create device groups as well as how to add and remove devices from groups.
- [Clustering Devices](#) on page 220 describes how to establish and manage high availability between two managed devices.
- [Editing Device Configuration](#) on page 244 describes the device attributes you can edit and explains how to edit them.
- [Managing Stacked Devices](#) on page 237 describes how to create a stack of managed devices and how to remove devices from a stack.
- [Configuring Interfaces](#) on page 258 explains how to configure interfaces on your managed devices.

Management Concepts

You can use a Defense Center to manage nearly every aspect of a device's behavior. You need only one Defense Center to manage a device, though you can also use a second Defense Center as part of a high availability pair. The sections that follow explain some of the concepts you need to know as you plan your Sourcefire 3D System deployment:

- [What Can Be Managed by a Defense Center?](#) on page 191
- [Beyond Policies and Events](#) on page 192
- [Using Redundant Defense Centers](#) on page 193

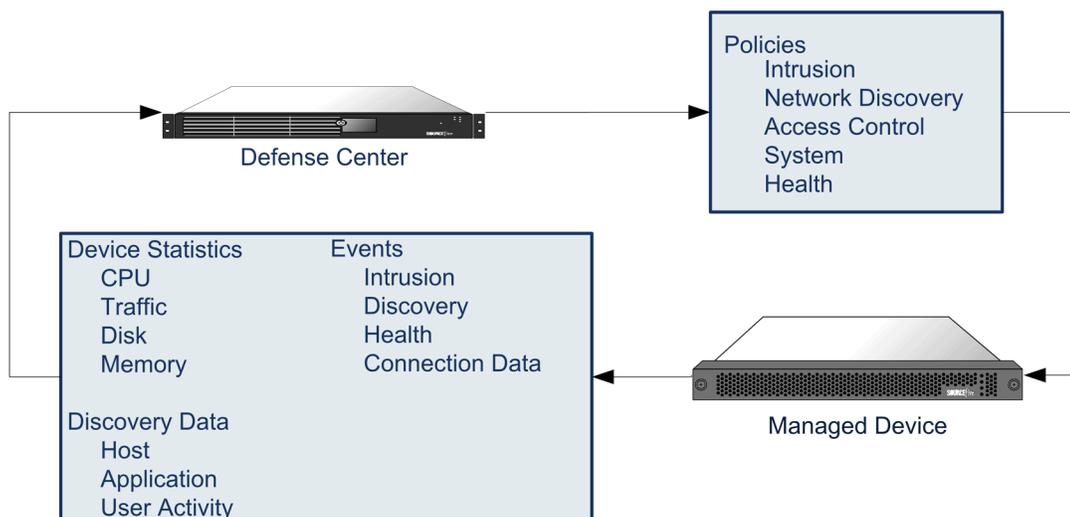

What Can Be Managed by a Defense Center?

You can use your Defense Center as a central management point in a Sourcefire 3D System deployment to manage Sourcefire-branded managed devices, including virtual devices.

IMPORTANT! Sourcefire recommends that you manage no more than three devices with the DC500 model Defense Center. For details on DC500 database limitations see the [Database Event Limits table](#) on page 1979.

When you manage a device, information is transmitted between the Defense Center and the device over a secure, SSL-encrypted TCP tunnel.

The following illustration lists what is transmitted between a Sourcefire Defense Center and its managed devices. Note that the types of events and policies that are sent between the appliances are based on the device type.

Beyond Policies and Events

LICENSE: Any

In addition to applying policies to devices and receiving events from them, you can also perform other device-related tasks on the Defense Center.

Backing Up a Device

If you are storing event data on your device in addition to sending it to the Defense Center, you can use the Defense Center's web interface to back up those events from the device. See [Backing up Your Managed Devices with a Defense Center](#) on page 2209 for more information.

Updating Devices

From time to time, Sourcefire releases updates to the Sourcefire 3D System, including:

- Sourcefire rule updates, which may contain new and updated intrusion rules
- vulnerability database updates
- geolocation updates
- software patches and updates

You can use the Defense Center to install an update on the devices it manages.

Using Redundant Defense Centers

LICENSE: Any

SUPPORTED DEFENSE CENTERS: DC1000, DC1500, DC3000, DC3500

You can set up two Defense Centers as a high availability pair. This ensures redundant functionality in case one of the Defense Centers fails. Policies, user accounts, and more are shared between the two Defense Centers. Events are automatically sent to both Defense Centers. See [Configuring High Availability](#) on page 194 for more information.

Working in NAT Environments

LICENSE: Control

Network address translation (NAT) is a method of transmitting and receiving network traffic through a router that involves reassigning the source or destination IP address as the traffic passes through the router. Typical applications using NAT enable multiple hosts on a private network to use a single public IP address to access the public network.

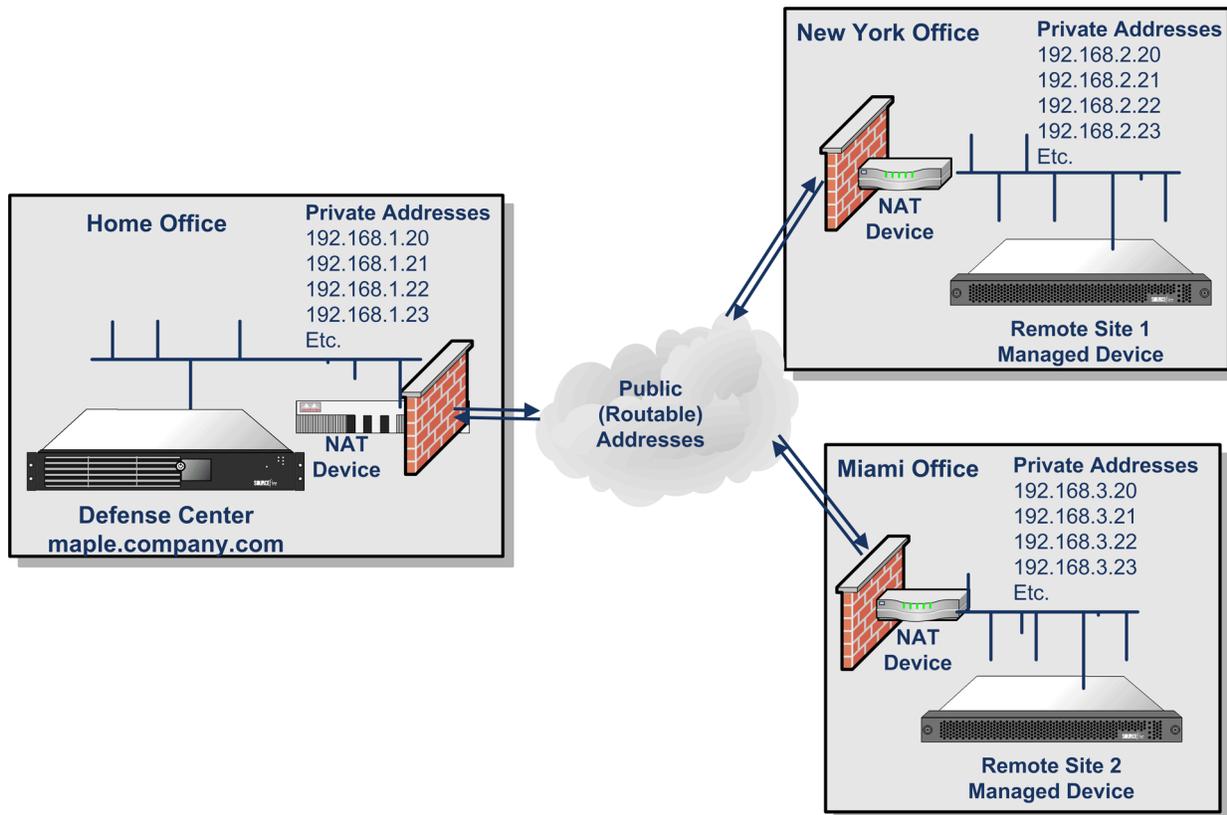

When you add a device to a Defense Center, you establish communications between the appliances. The information you need to establish communications depends on whether the environment uses NAT:

- In an environment without NAT, you need a registration key and the IP addresses or fully qualified domain names of both appliances.
- In an environment with NAT, you need a registration key and a unique NAT ID.

IMPORTANT! The NAT ID **must** be unique among all NAT IDs used to register devices to a Defense Center.

The following diagram shows a Defense Center managing two devices in a NAT environment. You can use the same registration key when adding both devices,

because registration keys do not have to be unique. However, you must use **unique** NAT IDs when adding the devices to the Defense Center.

Configuring High Availability

LICENSE: Any

SUPPORTED DEFENSE CENTERS: DC1000, DC1500, DC3000, DC3500

To ensure the continuity of operations, the high availability feature allows you to designate redundant Defense Centers to manage devices. Event data streams from managed devices to both Defense Centers and certain configuration elements are maintained on both Defense Centers. If one Defense Center fails, you can monitor your network without interruption using the other Defense Center.

WARNING! Because the system restricts some functionality to the primary Defense Center, if that appliance fails, you must switch the role of the secondary Defense Center to **Active & Primary**. See [Monitoring and Changing High Availability Status](#) on page 202.

See the following sections for more information about setting up high availability:

- [Using High Availability](#) on page 195 lists the configurations that are and are not shared when you implement high availability.
- [Guidelines for Implementing High Availability](#) on page 199 outlines guidelines you must follow if you want to implement high availability.
- [Setting Up High Availability](#) on page 200 explains how to specify primary and secondary Defense Centers.
- [Monitoring and Changing High Availability Status](#) on page 202 explains how to check the status of your linked Defense Centers and how to change the roles of the Defense Center if the primary Defense Center fails.
- [Disabling High Availability and Unregistering Devices](#) on page 204 explains how to permanently remove the link between linked Defense Centers.
- [Pausing Communication Between Paired Defense Centers](#) on page 205 explains how to pause communications between linked Defense Centers.
- [Restarting Communication Between Paired Defense Centers](#) on page 205 explains how to restart communications between linked Defense Centers.

Using High Availability

LICENSE: Any

SUPPORTED DEFENSE CENTERS: DC1000, DC1500, DC3000, DC3500

DC1500s and DC3500s support high availability configurations; DC750s and the virtual Defense Centers do not. Sourcefire **strongly** recommends that both Defense Centers in a high availability pair be the same model. Do **not** attempt to set up high availability between a Defense Center 1500 and a Defense Center 3500.

Although Defense Centers in high availability mode are designated *primary* and *secondary*, you can make policy or other changes to either Defense Center. However, Sourcefire recommends that you change configurations **only** on the primary Defense Center and that you keep your secondary Defense Center as a backup.

Defense Centers periodically update each other on changes to their configurations, and any change you make to one Defense Center should be applied on the other Defense Center within ten minutes. (Each Defense Center has a five-minute synchronization cycle, but the cycles themselves could be out of synchronization by as much as five minutes, so changes appear within two five-minute cycles.) During this ten-minute window, configurations may appear differently on the Defense Centers.

For example, if you create a policy on your primary Defense Center and apply it to a device that is also managed by your secondary Defense Center, the device could contact the secondary Defense Center before the Defense Centers contact each other. Because the device has a policy applied to it that the secondary Defense Center does not recognize, the secondary Defense Center displays a new policy with the name “unknown” until the Defense Centers synchronize.

Also, if you make conflicting policy or other changes to both Defense Centers within the same window between Defense Centers syncs, the last change you make takes precedence, regardless of the designations of the Defense Center as primary and secondary.

Before you establish a high availability pair, note the following prerequisites:

- Make sure both Defense Centers have a user account named `admin` with Administrator privileges. These accounts must use the same password.
- Make sure that other than the `admin` account, the two Defense Centers do not have user accounts with identical user names. Remove or rename one of the duplicate user accounts before you establish high availability.

Note that Defense Centers configured as a high availability pair do not need to be on the same trusted management network, nor do they have to be in the same geographic location.

For more information on which configurations are shared or not shared between members of a high availability pair, see:

- [Shared Configurations](#) on page 196
- [Health and System Policies](#) on page 197
- [Correlation Responses](#) on page 198
- [Licenses](#) on page 198
- [URL Filtering and Security Intelligence](#) on page 198
- [Sourcefire Cloud Connections and Malware Information](#) on page 199
- [User Agents](#) on page 199

Shared Configurations

LICENSE: Any

SUPPORTED DEFENSE CENTERS: DC1000, DC1500, DC3000, DC3500

Defense Centers in a high availability pair share the following information:

- user account attributes, authentication configurations, and custom user roles
- authentication objects for user accounts and user awareness, as well as the users and groups that are available to user conditions in access control rules
- custom dashboards
- custom workflows and tables
- device attributes, such as the device's host name, where events generated by the device are stored, and the group in which the device resides
- intrusion policies and their associated rule states
- file policies
- access control policies and their associated rules
- local rules

- custom intrusion rule classifications
- variable values and user-defined variables
- network discovery policies
- user-defined application protocol detectors and the applications they detect
- activated custom fingerprints
- host attributes
- network discovery user feedback, including notes and host criticality; the deletion of hosts, applications, and networks from the network map; and the deactivation or modification of vulnerabilities
- correlation policies and rules, compliance white lists, and traffic profiles
- change reconciliation snapshots and report settings
- intrusion rule updates
- geolocation updates
- vulnerability database updates

Health and System Policies

LICENSE: Any

SUPPORTED DEFENSE CENTERS: DC1000, DC1500, DC3000, DC3500

Health and system policies for Defense Centers and managed devices are shared in high availability pairs. Allow enough time to ensure that information about health policies, modules, blacklists, is synchronized on a newly activated Defense Center.

IMPORTANT! Although system policies are shared by Defense Centers in a high availability pair, they are not automatically applied. If you want identical system policies on both Defense Centers, apply the policy after it synchronizes.

Defense Centers in a high availability pair share the following system and health policy information:

- system policies
- system policy configurations (what policy is applied where)
- health policies
- health monitoring configurations (what policy is applied where)
- which appliances are blacklisted from health monitoring
- which appliances have individual health monitoring policies blacklisted

Correlation Responses

LICENSE: Any

SUPPORTED DEFENSE CENTERS: DC1000, DC1500, DC3000, DC3500

Although Defense Centers share correlation policies, rules, and responses, Defense Centers do not share the *associations* between correlation rules and their responses. This is to avoid launching duplicate responses when correlation policies are violated.

You must upload and install any custom remediation modules and configure remediation instances on your secondary Defense Center before remediations are available to associate with correlation policies. If the primary Defense Center fails, not only should you quickly associate your correlation policies with the appropriate responses and remediations on the secondary Defense Center, but you must also use the web interface on the secondary Defense Center to switch its role to **Active & Primary** to maintain continuity of operations. For more information on switching roles, see [Monitoring and Changing High Availability Status](#) on page 202. For more information about correlation responses, see [Creating Correlation Policies](#) on page 1513 and [Creating Remediations](#) on page 1607.

When you restore your primary Defense Center after a failure, if you created associations between rules or white lists and their responses and remediations on the secondary Defense Center, make sure you remove the associations so responses and remediations will only be generated by the primary Defense Center.

Licenses

LICENSE: Any

SUPPORTED DEFENSE CENTERS: DC1000, DC1500, DC3000, DC3500

Defense Centers in a high availability pair do **not** share licenses. You must add equivalent licenses to each member of the pair. For more information, see [Understanding Licensing](#) on page 2036.

URL Filtering and Security Intelligence

LICENSE: URL Filtering or Protection

SUPPORTED DEVICES: Series 3, virtual

SUPPORTED DEFENSE CENTERS: DC1000, DC1500, DC3000, DC3500

URL filtering and Security Intelligence configurations and information are synchronized between Defense Centers in a high availability deployment. However, only the primary Defense Center downloads URL category and reputation data and for updates to Security Intelligence feeds.

If the primary Defense Center fails, not only must you make sure that the secondary Defense Center can access the URL filtering cloud and any configured feed sites, but you must also use the web interface on the secondary Defense Center to switch its role to **Active & Primary**. For information on switching roles, see [Monitoring and Changing High Availability Status](#) on page 202.

Sourcefire Cloud Connections and Malware Information

LICENSE: Any or Malware

SUPPORTED DEVICES: Series 3, virtual

SUPPORTED DEFENSE CENTERS: DC1000, DC1500, DC3000, DC3500

Although they share file policies and related configurations, Defense Centers in a high availability pair share neither Sourcefire cloud connections nor malware dispositions. To ensure continuity of operations, and to ensure that detected files' malware dispositions are the same on both Defense Centers, both primary and secondary Defense Centers must have access to the cloud. For more information, see [Working with Malware Protection and File Control](#) on page 1197.

User Agents

LICENSE: FireSIGHT

SUPPORTED DEFENSE CENTERS: DC1000, DC1500, DC3000, DC3500

User Agents can connect to up to five Defense Centers at a time. You should connect agents to the primary Defense Center. If the primary Defense Center fails, you must make sure that any agents can communicate with the secondary Defense Center. See [Introduction to Network Discovery](#) on page 1250 for more information.

Guidelines for Implementing High Availability

LICENSE: Any

SUPPORTED DEFENSE CENTERS: DC1000, DC1500, DC3000, DC3500

To take advantage of high availability, you must follow the guidelines in the following sections.

Primary and Secondary Defense Center Requirements

You must designate one Defense Center as the primary Defense Center and one as the secondary.

Regardless of their designations as primary and secondary, both Defense Centers can be configured with policies, rules, managed devices, and so on before you set up high availability.

To avoid confusion, start with the secondary Defense Center in its original state. That is, you have not created or modified any policies, nor created any new rules, nor have you previously managed any devices with it. To make sure the secondary Defense Center is in its original state, restore it to factory defaults. Note that this also deletes event and configuration data from the Defense Center. For more information, see the *Sourcefire 3D System Installation Guide*.

IMPORTANT! You cannot configure a recurring task schedule on the inactive Defense Center. You must recreate the recurring task schedule on a newly activated Defense Center when it changes from inactive to active.

Version Requirements

Both Defense Centers must be running the same software and rule update version. Additionally, this software version must be the same or newer than the software version of managed devices.

Communication Requirements

By default, paired Defense Centers use port 8305/tcp for communications. You can change the port as described in [Changing the Management Port](#) on page 217.

The two Defense Centers do not need to be on the same network segment, but each of the Defense Centers must be able to communicate with the other and with the devices they share. That is, the primary Defense Center must be able to contact the secondary Defense Center at the IP address on the secondary Defense Center's own management interface, and vice versa. In addition, each Defense Center must be able to contact the devices it manages or the devices must be able to contact the Defense Center.

Setting Up High Availability

LICENSE: Any

SUPPORTED DEFENSE CENTERS: DC1000, DC1500, DC3000, DC3500

To use high availability, you must designate one Defense Center as the primary and another Defense Center of the same model as the secondary. For information about editing the remote management communications between the two appliances, see [Editing Remote Management](#) on page 216.

WARNING! Sourcefire recommends that you change configurations **only** on the primary Defense Center and that you use your secondary Defense Center as a backup.

Before you configure high availability, make sure you synchronize time settings between the Defense Centers you want to link. For details on setting time, see [Synchronizing Time](#) on page 1991.

Depending upon the number of policies and custom standard text rules they have, it may take up to 10 minutes before all the rules and policies appear on both Defense Centers. You can view the High Availability page to check the status of the link between the two Defense Centers. You can also monitor the Task Status to see when the process completes. See [Monitoring and Changing High Availability Status](#) on page 202.

If one of the Defense Centers in the high availability pair must be reimaged, disable the high availability link first. After you reimage the Defense Center, re-establish the high availability pair and the data will synchronize from the existing Defense Center to the newly added Defense Center. If a Defense Center cannot be reimaged (for example, the appliance has failed), contact Sourcefire Support.

To set up high availability for two Defense Centers:

ACCESS: Admin

1. Log into the Defense Center that you want to designate as the secondary Defense Center.
2. Select **System > Local > Registration**.
The Registration page appears.
3. Click **High Availability**.
The High Availability page appears.
4. Click the **secondary Defense Center** option.
The Secondary Defense Center Setup page appears.

The screenshot shows a form with three text input fields. The first field is labeled 'Primary DC Host *', the second is 'Registration Key *', and the third is 'Unique NAT ID'. Below the fields is a button labeled 'Register'.

5. Type the hostname or IP address of the primary Defense Center in the **Primary DC Host** text box.

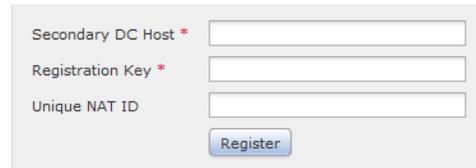

WARNING! Make sure you use hostnames rather than IP addresses if your network uses DHCP to assign IP addresses.

Note that you can leave the **Primary DC Host** field empty if the management host does not have a routable address. In that case, use both the **Registration Key** and the **Unique NAT ID** fields.

6. Type a one-time-use registration key in the **Registration Key** text box
7. Optionally, in the **Unique NAT ID** field, type a unique alphanumeric registration ID that you want to use to identify the primary Defense Center. See [Working in NAT Environments](#) on page 193 for more information.
8. Click **Register**.
A success message appears, and the Peer Manager page appears, showing the current state of the secondary Defense Center.
9. Using an account with Admin access, log into the Defense Center that you want to designate as the primary.
10. Select **System > Local > Registration**.
The Registration page appears.
11. Click **High Availability**.
The High Availability page appears.

12. Click the **primary Defense Center** option.

The Primary Defense Center Setup page appears.

13. Type the hostname or IP address of the secondary Defense Center in the **Secondary DC Host** text box.

WARNING! Make sure you use hostnames rather than IP addresses if your network uses DHCP to assign IP addresses.

14. Type the same one-time-use registration key in the **Registration Key** text box you used in step 6.
15. If you used a unique NAT ID on the secondary Defense Center, type the same registration ID that you used in step 7 in the **Unique NAT ID** text box.
16. Click **Register**.

A success message appears, and the Peer Manager page appears, showing the current state of the primary Defense Center.

Monitoring and Changing High Availability Status

LICENSE: Any

SUPPORTED DEFENSE CENTERS: DC1000, DC1500, DC3000, DC3500

After you have identified your primary and secondary Defense Centers, you can use one of them to view status information about the other, including:

- IP address
- product model
- operating system
- operation system version
- the local role (Active & Primary or Inactive & Secondary)
- time the Defense Centers last synchronized

You can also use the High Availability page to change the roles of the Defense Centers if the primary Defense Center fails. Because the system restricts the

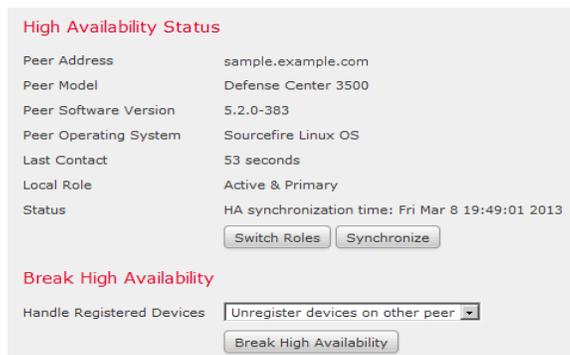

following functionality to the primary Defense Center, if that appliance fails, you must switch the role of the secondary Defense Center to **Active & Primary**:

- Updates to URL category and reputation data; see [URL Filtering and Security Intelligence](#) for more information.
- Updates to Security Intelligence feeds; see [URL Filtering and Security Intelligence](#) for more information.
- Associations between correlation rules and responses; see [Correlation Responses](#) for more information.

To check high availability status:

ACCESS: Admin

1. Log into one of the Defense Centers that you linked using high availability.
2. Select **System > Local > Registration**.
The Registration page appears.
3. Click **High Availability**.
The High Availability page appears.

The screenshot shows the 'High Availability Status' page. It contains a table of system information for the peer device, followed by control buttons and a section for breaking high availability.

High Availability Status	
Peer Address	sample.example.com
Peer Model	Defense Center 3500
Peer Software Version	5.2.0-383
Peer Operating System	Sourcefire Linux OS
Last Contact	53 seconds
Local Role	Active & Primary
Status	HA synchronization time: Fri Mar 8 19:49:01 2013

Below the table are two buttons: **Switch Roles** and **Synchronize**.

Under the heading **Break High Availability**, there is a dropdown menu for 'Handle Registered Devices' with the selected option 'Unregister devices on other peer', and a **Break High Availability** button.

4. Under **High Availability Status**, you can view the following information about the other Defense Center in the high availability pair:
 - the IP address
 - the model name
 - the software version
 - the operating system
 - the length of time since the last contact between the two Defense Centers
 - the local role (Active & Primary or Inactive & Secondary)
 - the time the Defense Centers last synchronized
 - the option to switch roles between the two Defense Centers

5. The two Defense Centers automatically synchronize within ten minutes (five minutes for each Defense Center) after any action that affects a shared feature. For example, if you create a new policy on one Defense Center, it is automatically shared with the other Defense Center within 5 minutes. However, if you want to synchronize the policy immediately, click **Synchronize**.

IMPORTANT! If you delete a device from a Defense Center configured in a high availability pair and intend to re-add it, Sourcefire recommends that you wait at least five minutes before adding the device back. This interval ensures that the high availability pair resynchronizes first. If you do not wait five minutes, it may take more than one synchronization cycle to add the device to both Defense Centers.

6. Click **Switch Roles** to change the local role from Active & Primary to Inactive & Secondary, or from Inactive & Secondary to Active & Primary.
The roles are switched between the two peers.
7. Click **Peer Manager** in the toolbar.
The Peer Manager page appears.

Host	Last Modified	Status	State	
10.10.10.10	2011-11-29 12:56:58	Registered	<input checked="" type="checkbox"/>	

You can view the following information:

- the IP address of the other Defense Center in the high availability pair
- the status, registered or unregistered, of the communications link
- the state, enabled or disabled, of the high availability pair

For information about editing the remote management communications between the two appliances, see [Editing Remote Management](#) on page 216.

Disabling High Availability and Unregistering Devices

LICENSE: Any

SUPPORTED DEFENSE CENTERS: DC1000, DC1500, DC3000, DC3500

If you want to remove one of the Defense Centers from a high availability pair, you must first disable the high availability link between them.

To disable a high availability pair:

ACCESS: Admin

1. Log into one of the Defense Centers in the high availability pair.
2. Select **System > Local > Registration**.
The Registration page appears.
3. Click **High Availability**.
The High Availability page appears.

4. Select one of the following options from the **Handle Registered Devices** drop-down list:
 - To control all the managed devices with the Defense Center where you are accessing this page, select **Unregister devices on the other peer**.
 - To control all the managed devices with the other Defense Center, select **Unregister devices on this peer**.
 - To stop managing the devices altogether, select **Unregister devices on both peers**.
5. Click **Break High Availability**.

After you answer the prompt **Do you really want to Break High Availability?** by selecting **OK**, high availability is disabled and any managed devices are deleted from the Defense Centers according to your selection.

You can enable high availability with a different Defense Center as described in [Setting Up High Availability](#) on page 200.

Pausing Communication Between Paired Defense Centers

LICENSE: Any

SUPPORTED DEFENSE CENTERS: DC1000, DC1500, DC3000, DC3500

If you want to temporarily disable high availability, you can disable the communications channel between the Defense Centers.

To disable the communications channel for a high availability pair:

ACCESS: Admin

1. Click **Peer Manager**.

The Peer Manager page appears.

Host	Last Modified	Status	State
10.10.10.10	2011-11-29 12:56:58	Registered	<input checked="" type="checkbox"/>

2. Click the slider to disable the communications channel between the two Defense Centers.

For information about editing the remote management communications between the two appliances, see [Editing Remote Management](#) on page 216.

Restarting Communication Between Paired Defense Centers

LICENSE: Any

SUPPORTED DEFENSE CENTERS: DC1000, DC1500, DC3000, DC3500

If you temporarily disabled high availability, you can enable the communications channel between the Defense Centers to restart high availability.

To enable the communications channel for a high availability pair:

ACCESS: Admin

1. Click **Peer Manager**.

The Peer Manager page appears.

Host	Last Modified	Status	State
10.10.10.10	2011-11-29 15:06:44	Registered	<input type="checkbox"/> 

2. Click the slider to enable the communications channel between the two Defense Centers.

For information about editing the remote management communications between the two appliances, see [Editing Remote Management](#) on page 216.

Working with Devices

LICENSE: Any

You can use the Defense Center to manage the full range of devices that are a part of the Sourcefire 3D System. When you manage a device, you set up a two-way, SSL-encrypted communication channel between the Defense Center and the device. The Defense Center uses this channel to send information to the device about how you want to analyze and manage your network traffic.

As the device evaluates the traffic, it generates events and sends them to the Defense Center using the same channel.

See the following sections for more information about managing devices:

- [Understanding the Device Management Page](#) on page 206
- [Adding Devices to the Defense Center](#) on page 208
- [Configuring Remote Management](#) on page 213
- [Managing Device Groups](#) on page 217
- [Clustering Devices](#) on page 220
- [Editing Device Configuration](#) on page 244
- [Configuring Interfaces](#) on page 258

Understanding the Device Management Page

LICENSE: Any

The Device Management page provides you with a range of information and options that you can use to manage your registered devices, device clusters, and

device groups. The page displays a list of all the devices currently registered on the Defense Center.

Name	License Type	Health Policy	System Policy	Access Control Policy
By Group [v] Add... [v]				
Ungrouped (4)				
birch 10.10.10.10 - 3D Sensor 3500 - v5.2.0	Protection, Control	katsura_health_policy	katsura_system_policy	Default Access Control

You can use the **sort-by** drop-down list to sort the appliance list according to your needs. Devices are displayed in the appliance list grouped by the category you select. You can sort by:

- Group (that is, device group); see [Managing Device Groups](#) on page 217 for more information
- Type (that is, the type of licenses applied to the device); see [Licensing the Sourcefire 3D System](#) on page 2036 for more information
- Model (that is, the model of the device being managed by the Defense Center)
- Health Policy; see [Using Health Monitoring](#) on page 2109 for more information
- System Policy; see [Managing System Policies](#) on page 1961 for more information
- Access Control Policy; see [Managing Access Control Policies](#) on page 456 for more information

For device groups, you can expand and collapse the list of devices in the group. The list appears collapsed by default.

See the Appliance List Fields table for more information about the appliance list.

Appliance List Fields

FIELD	DESCRIPTION
Name	A list of the hostname, IP address, device model, and software version for each device. The status icon to the left of the appliance indicates its current health status.
License Type	The licenses that are enabled on the managed device.
Health Policy	The currently applied health policy for the device. You can click the name of the health policy to view a read-only version of the policy. See Editing Health Policies on page 2147 for information about modifying an existing health policy.

Appliance List Fields (Continued)

FIELD	DESCRIPTION
System Policy	The currently applied system policy for the device. You can click the name of the system policy to view a read-only version of the policy. See Managing System Policies on page 1961 for more information.
Access Control Policy	A link to the currently applied access control policy. See Managing Access Control Policies on page 456.

See the following sections for more features accessible from the Device Management page:

- [Adding Devices to the Defense Center](#) on page 208
- [Managing Device Groups](#) on page 217
- [Clustering Devices](#) on page 220

Adding Devices to the Defense Center

LICENSE: Any

When you manage a device, you set up a two-way, SSL-encrypted communication channel between the Defense Center and the device. The Defense Center uses this channel to send information about how you want to analyze your network traffic to the device. As the device evaluates the traffic, it generates events and sends them to the Defense Center using the same channel.

Before you manage a device with a Defense Center, you must make sure that the network settings are configured correctly on the device. This is usually completed as part of the installation process. See [Configuring Network Settings](#) on page 2009 for more information.

Note that if you registered a Defense Center and a device using IPv4 and want to convert them to IPv6, you must delete and re-register the device.

You can select an access control policy to apply to a device as you register it to the Defense Center. If you attempt to apply a policy that requires a license that is not enabled on the device, the policy apply fails. Also, if the access control policy is associated with a network discovery policy, that policy also fails to apply as network discovery requires access control to properly apply to a managed device.

When you register a device cluster or device stack, although you can select licenses, these licenses cannot be applied upon device registration. This ensures that the cluster or stack is running the proper licenses to prevent it from entering a degraded state with mismatched licenses. After registration, you can evaluate the licenses in either the general properties (cluster) or stack properties (stack) of the Device Management page. For more information, see [Establishing Device Clusters](#) on page 223 or [Establishing Device Stacks](#) on page 239.

When you register a Series 2 device, although you can select licenses, any licenses you select are not applied upon device registration. Series 2 devices automatically have Protection capabilities, with the exception of Security Intelligence filtering. You cannot disable these capabilities, nor can you apply other licenses to a Series 2 device.

TIP! To modify the detailed configuration of a device, click the edit icon (✎) next to the device. See [Editing Device Configuration](#) on page 244 and [Configuring Interfaces](#) on page 258 for more information.

To add a device to a Defense Center:

ACCESS: Admin/Network Admin

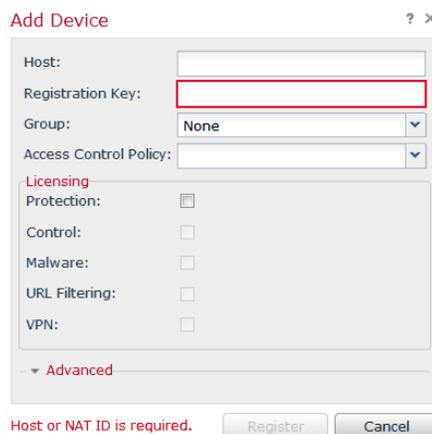

1. Configure the device to be managed by the Defense Center.

Use the procedure in [Configuring Remote Management](#) on page 213. After the device confirms communication with the Defense Center, the Pending Registration status appears.

Host	Last Modified	Status	State	
katsura	2011-12-06 16:51:05	Pending Registration	<input checked="" type="checkbox"/>	 

IMPORTANT! In some high availability deployments where network address translation (NAT) is used, you may also need to add the secondary Defense Center as a manager. For more information, contact Sourcefire Support.

2. Select **Devices > Device Management**.
The Device Management page appears.
3. From the **Add** drop-down menu, select **Add Device**.
The Add Device pop-up window appears.

4. In the **Host** field, type the IP address or the hostname of the device you want to add.

The hostname of the device is the fully qualified domain name or the name that resolves through the local DNS to a valid IP address.

Note that in a NAT environment, you may not need to specify the IP address or host name of the device, if you already specified the IP address or host name of the Defense Center when you configured the device to be managed by the Defense Center. For more information, see [Working in NAT Environments](#) on page 193.

WARNING! Use a hostname rather than an IP address if your network uses DHCP to assign IP addresses.

5. In the **Registration Key** field, type the same registration key that you used when you configured the device to be managed by the Defense Center.
6. Optionally, add the device to a device group by selecting the group from the **Group** drop-down list.

For more information about device groups, see [Managing Device Groups](#) on page 217.

7. From the **Access Control Policy** drop-down list, select an initial policy to apply to the device:
 - The **Default Access Control** policy blocks all traffic from entering your network.
 - The **Default Intrusion Prevention** policy allows all traffic that is also passed by the Balanced Security and Connectivity intrusion policy.
 - The **Default Network Discovery** policy allows all traffic, which is inspected by network discovery only.
 - You can select any existing user-defined access control policy.

For more information, see [Using Access Control Policies](#) on page 424.

8. Select licenses to apply to the device. Note that:
 - Control and Malware licenses require a Protection license; a URL Filtering license requires both Protection and Control licenses.
 - You cannot enable a Malware license on a pre-Version 5.1.1 device.
 - Although you can enable a Control license on a virtual device, virtual devices do **not** support fast-path rules, switching, routing, or clustering.
 - You cannot change the license settings on clustered devices.
 - For stacked devices, you enable or disable the licenses for the stack on the Stack page of the appliance editor.

- When you register a Series 2 device, any licenses you select are not applied upon device registration. Series 2 devices automatically have Protection capabilities, with the exception of Security Intelligence filtering. You cannot disable these capabilities, nor can you apply other licenses to a Series 2 device.

For more information, see [Licensing the Sourcefire 3D System](#) on page 2036.

9. If you used a NAT ID to identify the device when you configured it to be managed by the Defense Center, expand the **Advanced** section and enter the same NAT ID in the **Unique NAT ID** field.

10. To allow the device to transfer packets to the Defense Center, select the **Transfer Packets** check box.

This option is enabled by default. If you disable it, you completely prohibit packet transfer to the Defense Center.

11. Click **Register**.

The device is added to the Defense Center. Note that it may take up to two minutes for the Defense Center to verify the device's heartbeat and establish communication.

Applying Changes to Devices

LICENSE: Any

After you make changes to the configuration of a device, a device cluster, or a device stack, you must apply the changes before they take effect throughout the system. Note that the device must have unapplied changes or this option remains disabled.

TIP! You can apply device changes from the Device Management page or from the Interfaces tab of the appliance editor.

To apply changes to the device:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to apply changes, click the apply icon (👍).

3. When prompted, click **Apply**.
The device changes are applied.

TIP! Optionally, from the Apply Device Changes dialog box, click **View Changes**. The Device Management Revision Comparison Report page appears in a new browser window. For more information, see [Using the Device Management Revision Comparison Report](#) on page 212.

4. Click **OK**.
You are returned to the Device Management page.

Using the Device Management Revision Comparison Report

LICENSE: Any

A device management comparison report allows you to view the changes you have made to an appliance before you apply them. The report displays all differences between the current appliance configuration and the proposed appliance configuration. This gives you an opportunity to discover any potential configuration errors.

To compare appliance changes before applying them:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the appliance where you want to apply changes, click the apply icon (✓).
The Apply Device Changes pop-up window appears. Note that the appliance must have unapplied changes or the apply icon remains disabled.
3. Click **View Changes**.
The Device Management Revision Comparison Report page appears in a new window.
4. Click **Previous** and **Next** to scroll through the differences between the current appliance configuration and the proposed appliance configuration.
5. Optionally, click **Comparison Report** to produce a PDF version of the report.

Deleting Devices

LICENSE: Any

If you no longer want to manage a device, you can delete it from the Defense Center. Deleting a device severs all communication between the Defense Center

and the device. To manage the device again at a later date, you must re-add it to the Defense Center.

IMPORTANT! If you delete a device from a Defense Center configured in a high availability pair and want to re-add it, Sourcefire recommends that you wait at least five minutes before re-adding it. This interval ensures that the high availability pair resynchronizes so that both Defense Centers recognize the deletion. If you do not wait five minutes, it may take more than one synchronization cycle to add the device to both Defense Centers.

To delete a device from the Defense Center:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management.**

The Device Management page appears.

2. Next to the device you want to delete, click the delete icon ().

When prompted, confirm that you want to delete the device. Communication between the device and the Defense Center is discontinued and the device is deleted from the Device Management page. If the device has a system policy that causes it to receive time from the Defense Center via NTP, the device reverts to local time management.

Configuring Remote Management

LICENSE: Any

Before you can manage one Sourcefire 3D System appliance with another, you must set up a two-way, SSL-encrypted communication channel between the two appliances. The appliances use the channel to share configuration and event information. High availability peers also use the channel, which is by default on port 8305/tcp.

You must configure remote management on the appliance that will be managed, that is, on the device that you want to manage with a Defense Center. After you configure remote management, you can use the managing appliance's web interface to add the managed appliance to your deployment.

To enable communications between two appliances, you must provide a way for the appliances to recognize each other. There are three criteria the Sourcefire 3D System uses when allowing communications:

- the hostname or IP address of the appliance with which you are trying to establish communication

In NAT environments, even if the other appliance does not have a routable address, you must provide a hostname or an IP address either when you are configuring remote management, or when you are adding the managed appliance.

- a required registration key that identifies the connection
- an optional unique alphanumeric NAT ID that can help the Sourcefire 3D System establish communications in a NAT environment

The NAT ID **must** be unique among all NAT IDs used to register managed appliances. For more information, see [Working in NAT Environments](#) on page 193.

When you register a managed device to a Defense Center, the access control policy you select applies to the device. In addition, the network discovery policy on the Defense Center automatically applies to the device. However, if you do not enable licenses for the device required by features used in the access control policy you select, the access control policy apply fails, causing the network discovery policy apply to fail as well. If, for example, you select an access control policy with an intrusion policy as the default action, and do not enable the Protection license, both the access control policy and the network discovery policy apply fail.

To configure remote management of the local appliance:

ACCESS: Admin

1. On the web interface for the appliance you want to manage, select **System > Local > Registration**.

The Remote Management page appears.

WARNING! Sourcefire **strongly** recommends that you not change the value for the management port. If you change it, you must also change it for all appliances in your deployment that need to communicate with each other. For more information, see [Changing the Management Port](#) on page 217.

2. Click **Add Manager**.

The Add Remote Management page appears.

Host	Last Modified	Status	State
oak.example.com	2011-10-07 10:10:45	Registered	Enabled (Disable)

3. In the **Management Host** field, type the IP address or the hostname of the appliance that you want to use to manage this appliance.

The hostname is the fully qualified domain name or the name that resolves through the local DNS to a valid IP address.

In a NAT environment, you do not need to specify an IP address or hostname here if you plan to specify it when you add the managed appliance. In this case, the Sourcefire 3D System uses the NAT ID you will provide later to identify the remote manager on the managed appliance's web interface.

WARNING! Use a hostname rather than an IP address if your network uses DHCP to assign IP addresses.

4. In the **Registration Key** field, type the registration key that you want to use to set up communications between appliances.
5. For NAT environments, in the **Unique NAT ID** field, type a **unique** alphanumeric NAT ID that you want to use to set up communications between appliances.
6. Click **Save**.
After the appliances confirm that they can communicate with each other, the Pending Registration status appears.
7. Use the managing appliance's web interface to add this appliance to your deployment.

For more information, see [Adding Devices to the Defense Center](#) on page 208.

IMPORTANT! When enabling remote management of a device, in some high availability deployments that use NAT, you may also need to add the secondary Defense Center as a manager. For more information, contact Sourcefire Support.

Editing Remote Management

LICENSE: Any

Use the following procedure to edit the hostname or IP address of the managing appliance. You can also change the display name of the managing appliance, which is a name only used within the context of the Sourcefire 3D System. Although you can use the hostname as the display name of the appliance, entering a different display name does not change the hostname.

TIP! You can click the slider to block the communication channel between the managed device and the Defense Center. Click the slider to enable the communication channel.

To edit remote management:

ACCESS: Admin

1. Select **System > Local > Registration**.

The Remote Management page appears.

Host	Last Modified	Status	State
oak.example.com	2011-10-07 10:10:45	Registered	Enabled (Disable)

2. Click the edit icon (✎) next to the manager for which you want to edit remote management settings.

The Edit Remote Management page appears.

Name * oak.example.com
Host * oak
Save Cancel

3. In the **Name** field, change the display name of the managing appliance.
4. In the **Host** field, change the IP address or the hostname of the managing appliance.
The hostname is the fully qualified domain name or the name that resolves through the local DNS to a valid IP address.

5. Click **Save**.
Your changes are saved.

Changing the Management Port

LICENSE: Any

Sourcefire 3D System appliances communicate using a two-way, SSL-encrypted communication channel, which by default is on port 8305.

Although Sourcefire **strongly** recommends that you keep the default setting, if the management port conflicts with other communications on your network, you can choose a different port. Usually, changes to the management port are made during installation of the Sourcefire 3D System.

WARNING! If you change the management port, you must change it for all appliances in your deployment that need to communicate with each other.

To change the management port:

ACCESS: Admin

1. Select **System > Local > Configuration**.
The Information page appears.
2. Click **Network**.
The Network Settings page appears.
3. In the **Remote Management Port** field, enter the port number that you want to use.
4. Click **Save**.
The management port is changed.
5. Repeat this procedure for every appliance in your deployment that must communicate with this appliance.

Managing Device Groups

LICENSE: Any

The Defense Center allows you to group devices so you can easily apply policies and install updates on multiple devices. You can expand and collapse the list of devices in the group. The list appears collapsed by default.

See the following sections for more information:

- [Adding Device Groups](#) on page 218
- [Editing Device Groups](#) on page 218
- [Deleting Device Groups](#) on page 219

Adding Device Groups

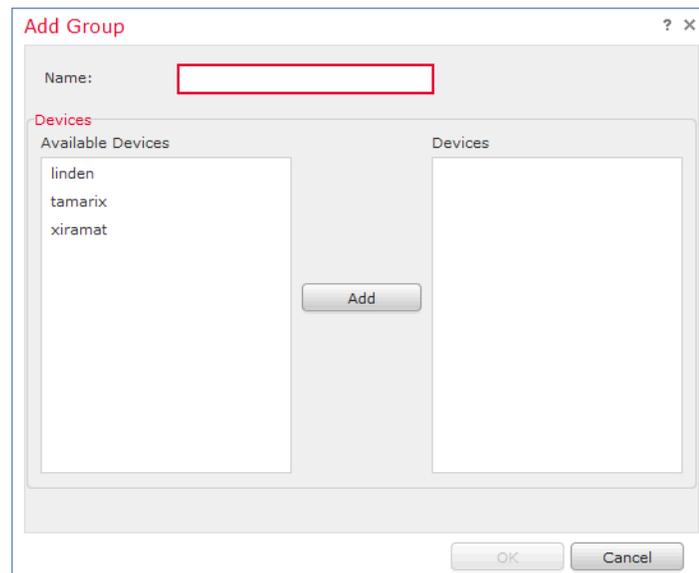

LICENSE: Any

The following procedure explains how to add a device group so you can easily apply policies and install updates on multiple devices.

To create a device group and add devices to it:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. From the **Add** drop-down menu, select **Add Group**.
The Add Group pop-up window appears.

3. In the **Name** field, type the name of the group.
4. Under **Available Devices**, select one or more appliances to add to the device group. Use Ctrl or Shift while clicking to select multiple appliances.
5. Click **Add** to include the selected appliances in the device group.
6. Click **OK**.
The device group is added.

Editing Device Groups

LICENSE: Any

You can change the set of devices that reside in any device group. You must remove an appliance from its current group before you can add it to a new group.

Moving an appliance to a new group does not change its policy to the policy previously applied to the group. To change the device's policy, you must apply a new policy to the device or device group.

To edit a device group:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device group you want to edit, click the edit icon ().
The Edit Group pop-up window appears.
3. Optionally, in the **Name** field, type a new name for the group
4. Under **Available Devices**, select one or more appliances to add to the device group. Use Ctrl or Shift while clicking to select multiple appliances.
5. Click **Add** to include the selected appliances in the device group.
6. To remove selected appliances from the device group, click the delete icon ().
7. Click **OK**.
The changes to the device group are saved.

Deleting Device Groups

LICENSE: Any

If you delete a device group that contains devices, the devices are moved to the Ungrouped category on the Device Management page. They are not deleted from the Defense Center.

To delete a device group:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device group you want to delete, click the delete icon ().
3. When prompted, confirm that you want to delete the device group.
The device group is deleted.

Clustering Devices

LICENSE: Control

SUPPORTED DEVICES: Series 3

With device clustering (also called device high availability), you can establish redundancy of networking functionality and configuration data between two peer devices or two peer device stacks. See [Managing Stacked Devices](#) on page 237 for more information about stacking devices.

You achieve configuration redundancy by clustering two peer devices or two peer device stacks as a single logical system for policy applies, system updates, and registration. The system automatically synchronizes other configuration data.

Clustering Requirements

Before you can configure a device cluster, both devices or device stack primary members must be the same model and have identical copper or fiber interfaces. Both devices or device stacks must also be running the same software and have the same licenses. Device stacks must have identical hardware configurations; for example, you can cluster a 3D8290 with a 3D8290. If the devices are targeted by NAT policies, both peers must have the same NAT policy. After you cluster the devices, you cannot change the license options for individual clustered devices, but you can change the license for the entire cluster. See [Establishing Device Clusters](#) on page 223 for more information.

Clustering Failover and Maintenance Mode

With a device cluster, the system fails over either manually or automatically. You manually trigger failover by placing one of the clustered devices or stacks in maintenance mode. For more information about maintenance mode, see [Placing a Clustered Device into Maintenance Mode](#) on page 229.

Automatic failover occurs when the health of the active device or stack becomes compromised or during a system update. If the health of the backup device or stack becomes similarly compromised, the system does not fail over and enters a degraded state. The system also does not fail over when one of the devices or device stacks is in maintenance mode. Note that disconnecting the stacking cable from an active stack sends that stack into maintenance mode. Shutting down the secondary device in an active stack also sends that stack into maintenance mode.

Applying Policies and Updates

When you apply policies, you apply them to the device cluster instead of the individual devices or stacks. If the policy fails, the system does not apply it to either device or stack. The policy first applies to the active device or stack and then the backup, so that the cluster always has one peer handling network traffic.

Clustered devices receive updates as a single entity rather than individual devices or stacks. When the update is started, the system first applies it to the backup device or stack, which goes into maintenance mode until any necessary

processes restart and the device begins processing traffic again. The system then applies the update to the active device or stack, which follows the same process.

Achieving Redundancy Without Clustering Devices

In most cases, you can achieve Layer 3 redundancy without clustering devices by using the Sourcefire Redundancy Protocol (SFRP). SFRP allows devices to act as redundant gateways for specified IP addresses. With network redundancy, you configure two devices or stacks to provide identical network connections, ensuring connectivity for other hosts on the network. For more information about SFRP, see [Configuring SFRP](#) on page 304.

You determine how to configure device high availability depending on your Sourcefire 3D System deployment: passive, inline, routed, or switched. You can also deploy your system in multiple roles at once. Of the four deployment types, only passive deployments require that you cluster devices or stacks to provide redundancy. You can establish network redundancy for the other deployment types with or without device clusters. The following sections provide a brief overview of high availability in each deployment type.

Passive Deployment Redundancy

Passive interfaces are generally connected to tap ports on central switches, which allows them to analyze all of the traffic flowing across the switch. If multiple devices are connected to the same tap feed, the system generates events from each of the devices. When clustered, devices act as either active or backup, which allows the system to analyze traffic even in the event of a system failure while also preventing duplicate events.

Inline Deployment Redundancy

Because an inline set has no control over the routing of the packets being passed through it, it must always be active in a deployment. Therefore, redundancy relies on external systems to route traffic correctly. You can configure redundant inline sets with or without device clusters.

To deploy redundant inline sets, you configure the network topology so that it allows traffic to pass through only one of the inline sets while preventing circular routing. If one of the inline sets fails, the surrounding network infrastructure detects the loss of connectivity to the gateway address and adjusts the routes to send traffic through the redundant set.

Routed Deployment Redundancy

Hosts in an IP network must use a well-known gateway address to send traffic to different networks. Establishing redundancy in a routed deployment requires that routed interfaces share the gateway addresses so that only one interface handles traffic for that address at any given time. To accomplish this, you must maintain an equal number of IP addresses on a virtual router. One interface advertises the address. If that interface goes down, the backup interface begins advertising the address.

In non-clustered devices, you use SFRP to establish redundancy by configuring gateway IP addresses shared between multiple routed interfaces. You can configure SFRP with or without device clusters. You can also establish redundancy using dynamic routing such as OSPF or RIP.

Switched Deployment Redundancy

You establish redundancy in a switched deployment using the Spanning Tree Protocol (STP). STP is a protocol that manages the topology of bridged networks. It is specifically designed to allow redundant links to provide automatic backup for switched interfaces without configuring backup links. Devices in a switched deployment rely on STP to manage traffic between redundant interfaces. Two devices connected to the same broadcast network receive traffic based on the topology calculated by STP. See [Configuring Advanced Virtual Switch Settings](#) on page 291 for more information about enabling STP.

IMPORTANT! Sourcefire strongly recommends that you enable STP when configuring a virtual switch that you plan to deploy in a device cluster.

See the following sections for more information about clustering devices and stacks:

- [Establishing Device Clusters](#) on page 223
- [Editing Device Clusters](#) on page 224
- [Configuring Individual Devices in a Cluster](#) on page 225
- [Configuring Individual Device Stacks in a Cluster](#) on page 226
- [Configuring Interfaces on a Clustered Device](#) on page 227
- [Switching the Active Peer in a Cluster](#) on page 228
- [Placing a Clustered Device into Maintenance Mode](#) on page 229
- [Replacing a Device in a Clustered Stack](#) on page 229
- [Establishing Clustered State Sharing](#) on page 230
- [Troubleshooting Clustered State Sharing](#) on page 233
- [Separating Clustered Devices](#) on page 236
- [Configuring SFRP](#) on page 304
- [Configuring HA Link Interfaces](#) on page 262

Establishing Device Clusters

LICENSE: Control

SUPPORTED DEVICES: Series 3

Before you establish a device cluster, you must meet the following prerequisites:

- Configure interfaces on each device or each primary device in a stack.
- Each device or device stack primary member that you include in the cluster must be the same model and have identical copper or fiber interfaces.
- Both devices or device stacks must have normal health status, run the same software, and have the same licenses. See [Using the Health Monitor](#) on page 2163 for more information. In particular, the devices cannot have hardware failures that would cause them to enter maintenance mode and trigger a failover.
- You cannot mismatch devices and stacks in a cluster. You must cluster single devices with single devices or device stacks with device stacks that have identical hardware configurations. For example, you can cluster a 3D8290 with a 3D8290.
- If the devices are targeted by NAT policies, both peers must have the same NAT policy.

When establishing a device cluster, you designate one of the devices or stacks as active and the other as backup. The system applies a merged configuration to the clustered devices. If there is a conflict, the system applies the configuration from the device or stack you designated as active.

After you cluster the devices, you cannot change the license options for individual clustered devices, but you can change the license for the entire cluster. See [Editing Device Clusters](#) on page 224 for more information. If there are interface attributes that need to be set on switched interfaces or routed interfaces, the system establishes the cluster, but sets it to a pending status. After you configure the necessary attributes, the system completes the device cluster and sets it to a normal status.

After you establish clustered pair, the system treats the peer devices or stacks as a single device on the Device Management page. Device clusters display the cluster icon () in the appliance list. Any configuration changes you make are synchronized between the clustered devices. The Device Management page displays which device or stack in the cluster is active, which changes after manual or automatic failover. See [Placing a Clustered Device into Maintenance Mode](#) on page 229 for more information about manual failover.

Removing registration of a device cluster from a Defense Center removes registration from both devices or stacks. You remove a device cluster from the Defense Center as you would an individual managed device. See [Deleting Devices](#) on page 212 for more information.

You can then register the cluster on another Defense Center. To register clustered single devices, you add remote management to the active device in the cluster

and then add that device to the Defense Center, which adds the entire cluster. To register clustered stacked devices, you add remote management to the primary device of the either stack and then add that device to the Defense Center, which adds the entire cluster. See [Adding Devices to the Defense Center](#) on page 208 for more information.

After you establish a device cluster, you can configure a high availability link interface, as explained in [Configuring HA Link Interfaces](#) on page 262.

To cluster devices or device stacks:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.

The Device Management page appears.

2. From the **Add** drop-down menu, select **Add Cluster**.

The Add Cluster pop-up window appears.

3. In the **Name** field, type the name of the cluster.

You may enter alphanumeric characters and special characters, with the exception of the following characters, which are invalid: +, (,), {, }, #, &, \, <, >, ?, ', and "

4. Select the **Active** device or stack for the cluster.
5. Select the **Backup** device or stack for the cluster.
6. Click **Cluster**.

The device cluster is added. This process takes a few minutes as the process synchronizes system data.

Editing Device Clusters

LICENSE: Control

SUPPORTED DEVICES: Series 3

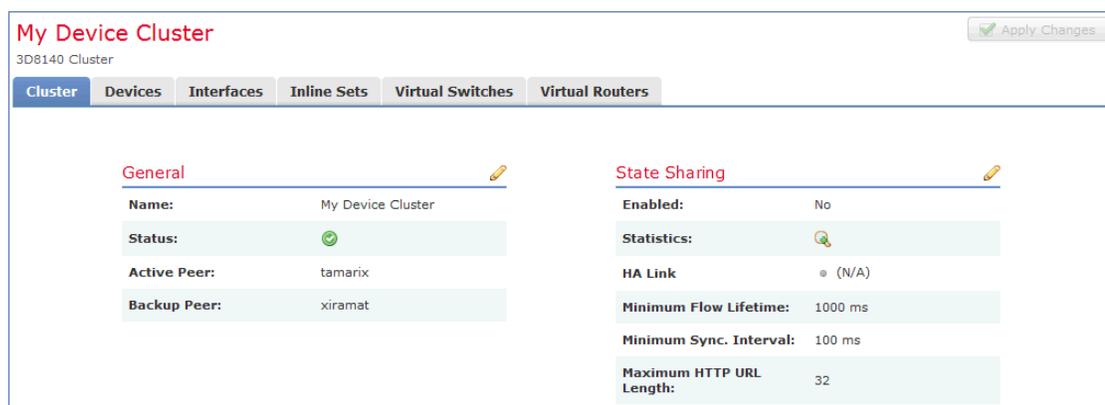

After you establish a device cluster, most changes you make to the device configuration also change the configuration of the entire cluster.

You can view the status of the cluster by hovering your pointer over the status icon in the General section. You can also view which device or stack is the active peer and backup peer in the cluster.

To edit a device cluster:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device cluster where you want to edit the configuration, click the edit icon (✎).
The Cluster page appears.

3. Use the sections on the Cluster page to make changes to the clustered configuration as you would a single device configuration.

See the following sections for more information:

- [Editing Assigned Device Names](#) on page 244
- [Enabling and Disabling Device Licenses](#) on page 246
- [Establishing Clustered State Sharing](#) on page 230
- [Editing Advanced Device Settings](#) on page 251

Configuring Individual Devices in a Cluster

LICENSE: Control

SUPPORTED DEVICES: Series 3

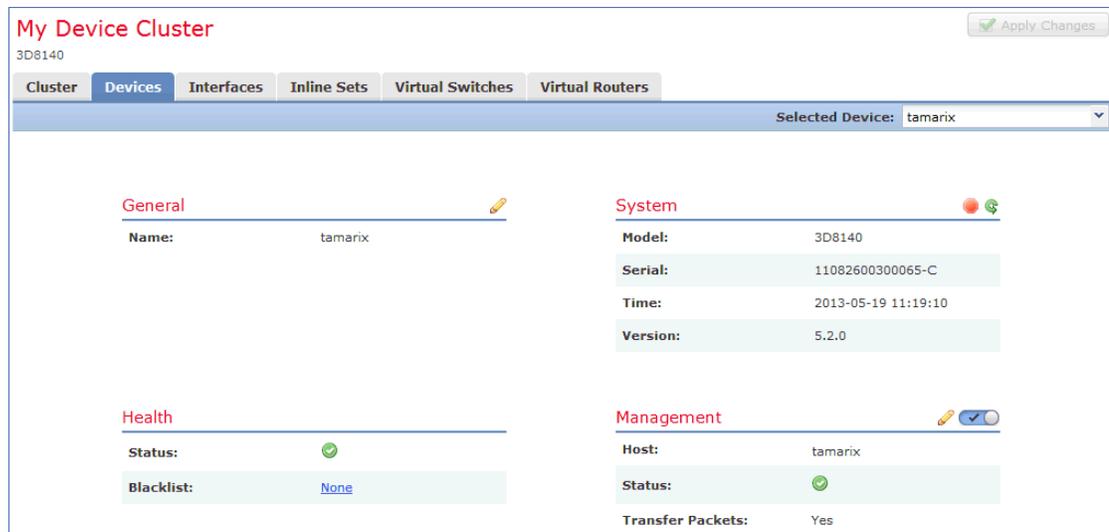

After you establish a device cluster, you can still configure some attributes for each device within the cluster. You can make changes to a clustered device just as you would to a single device.

To configure an individual device in a cluster:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.

2. Next to the device cluster where you want to edit the configuration, click the edit icon (✎).
The Cluster page appears.
3. Click **Devices**.
The Devices page appears.

4. From the **Selected Device** drop-down list, select the device you want to modify.
5. Use the sections on the Devices page to make changes to the individual clustered device as you would a single device.
See the following sections for more information:
 - [Editing Assigned Device Names](#) on page 244
 - [Editing Device System Settings](#) on page 247
 - [Viewing the Health of a Device](#) on page 248
 - [Editing Device Management Settings](#) on page 249

Configuring Individual Device Stacks in a Cluster

LICENSE: Control

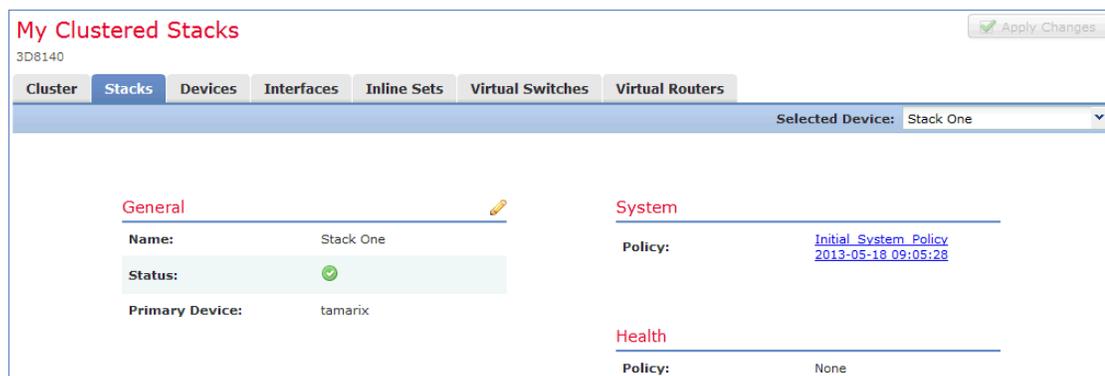

SUPPORTED DEVICES: Series 3

After you cluster a pair of stacked devices, the system limits the stack attributes that you can edit. You can edit the name of a stack in a clustered stack. In addition, you can edit the network configuration of the stack, as described in [Configuring Interfaces on a Clustered Device](#) on page 227.

To edit the name of a stack in a cluster:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device cluster where you want to edit the configuration, click the edit icon (✎).
The Cluster page appears.
3. Click **Stacks**.
The Stacks page appears.
From the **Selected Device** drop-down list, select the stack you want to modify.

4. Next to the General section, click the edit icon (✎).
The General pop-up window appears.
5. In the **Name** field, type a new assigned name for the stack.
You may enter alphanumeric characters and special characters, with the exception of the following characters, which are invalid: +, (,), {, }, #, &, \, <, >, ?, ', and ".
?
6. Click **Save**.
The new name is saved. Note that your changes do not take effect until you apply the stack configuration; see [Applying Changes to Devices](#) on page 211 for more information.

Configuring Interfaces on a Clustered Device

LICENSE: Control

SUPPORTED DEVICES: Series 3

You can configure interfaces on individual devices in a cluster. However, you must also configure an equivalent interface on the peer device in the cluster. For clustered stacks, you configure identical interfaces on the primary devices of the

stacks. When you configure virtual routers, you select the stack where you want to configure the routers. See [Configuring Virtual Routers](#) on page 306 for more information.

The Interfaces page of a clustered device includes the hardware and interfaces views that you find on an individual device. See [Configuring Interfaces](#) on page 258 for more information.

To configure interfaces on a clustered device:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device cluster where you want to configure interfaces, click the edit icon (✎).
The Cluster page appears.
3. Click **Interfaces**.
The Interfaces page appears.

4. From the **Selected Device** drop-down list, select the device you want to modify.
5. Configure interfaces as you would on an individual device. See [Configuring Interfaces](#) on page 258 for more information.

Switching the Active Peer in a Cluster

LICENSE: Control

SUPPORTED DEVICES: Series 3

After you establish a device cluster, you can manually switch the active and backup peer devices or stacks.

To switch the active peer in a cluster:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.

2. Next to the device cluster that you want to change the active peer, click the switch active peer icon ()
The Switch Active Peer pop-up window appears.
3. Click **Yes** to immediately make the backup device the active device in the cluster. Click **No** to cancel and return to the Device Management page.

Placing a Clustered Device into Maintenance Mode

LICENSE: Control

SUPPORTED DEVICES: Series 3

After you establish a cluster, you can manually trigger failover by placing one of the clustered devices or stacks into maintenance mode to perform maintenance on the devices. In maintenance mode, the system administratively takes down all interfaces except for the management interface. After maintenance is completed, you can re-enable the device to resume normal operation.

IMPORTANT! You cannot place both members of a cluster into maintenance mode at the same time.

To place a clustered device into maintenance mode:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the clustered device you want to place in maintenance mode, click the toggle maintenance mode icon ()
The Confirm Maintenance Mode pop-up window appears.
3. Click **Yes** to confirm maintenance mode or click **No** to cancel.
4. Click the toggle maintenance mode icon () again to bring the device out of maintenance mode.

Replacing a Device in a Clustered Stack

LICENSE: Control

SUPPORTED DEVICES: Series 3

After you place a stack that is a cluster member into maintenance mode, you can replace a secondary device in the stack for another device. You can only select devices that are not currently stacked or clustered. The new device must follow the same guidelines for establishing a device stack. See [Establishing Device Stacks](#) on page 239.

To replace a device in a clustered stack:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the stack member you want to place into maintenance mode, click the toggle maintenance mode icon ()
The Confirm Maintenance Mode pop-up window appears.
3. Click **Yes** to confirm maintenance mode or click **No** to cancel.
4. Click the replace device icon ()
The Replace Device pop-up window appears.
5. Select the **Replacement Device** from the drop-down list.
6. Click **Replace** to replace the device or click **Cancel** to keep the current device and return to the Device Management page.
7. Click the toggle maintenance mode icon () again to bring the stack immediately out of maintenance mode.
You do not need to reapply the device configuration.

Establishing Clustered State Sharing

LICENSE: Control

SUPPORTED DEVICES: Series 3

Clustered state sharing allows clustered devices or clustered stacks to synchronize as much state as necessary, so that if either device or stack fails, the other peer can take over with no interruption to traffic flow. Without state sharing, the following features may not fail over properly:

- Strict TCP enforcement
- Unidirectional access control rules
- Blocking persistence

Note, however, that enabling state sharing slows system performance.

You must configure and enable HA link interfaces on both devices or the primary stacked devices in the cluster before you can configure clustered state sharing. 3D8250 devices require a 10G HA link, while other model devices require a 1G HA link. See [Configuring HA Link Interfaces](#) on page 262 for more information.

Strict TCP Enforcement

SUPPORTED DEVICES: Series 3

When you enable strict TCP enforcement for a domain, the system drops any packets that are out of order on TCP sessions. For example, the system drops

non-SYN packets received on an un-established connection. With state sharing, devices in the cluster allow TCP sessions to continue after failover without having to reestablish the connection, even if strict TCP enforcement is enabled. You can enable strict TCP enforcement on inline sets, virtual routers, and virtual switches.

Unidirectional Access Control Rules

If you have configured unidirectional access control rules, network traffic may match a different access control rule than intended when the system reevaluates a connection midstream after failover. For example, consider if you have a policy containing the following two access control rules:

Rule 1: Allow from 192.168.1.0/24 to 192.168.2.0/24

Rule 2: Block all

Without state sharing, if an allowed connection from 192.168.1.1 to 192.168.2.1 is still active following a failover and the next packet is seen as a response packet, the system denies the connection. With state sharing, a midstream pickup would match the existing connection and continue to be allowed.

Blocking Persistence

While many connections are blocked on the first packet based on access control rules or other factors, there are cases where the system allows some number of packets through before determining that the connection should be blocked. With state sharing, the system immediately blocks the connection on the peer device or stack as well.

When establishing clustered state sharing, you can configure the following options:

Enabled

Click the check box to enable state sharing. Clear the check box to disable state sharing.

Minimum Flow Lifetime

Specify the minimum time (in milliseconds) for a session before the system sends any synchronization messages for it. You can use any integer from 0 to 65535. The system does not synchronize any sessions that have not met the minimum flow lifetime, and the system synchronizes only when a packet is received for the connection.

Minimum Sync. Interval

Specify the minimum time (in milliseconds) between update messages for a session. You can use any integer from 0 to 65535. The minimum synchronization interval prevents synchronization messages for a given connection from being sent more frequently than the configured value after the connection reaches the minimum lifetime.

Maximum HTTP URL Length

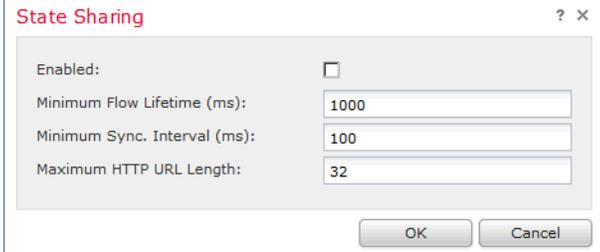

Specify the maximum characters for the URL the system synchronizes between the clustered devices. You may use any integer from 0 to 225.

IMPORTANT! Sourcefire recommends that you use the default values, unless your deployment presents a good reason to change them. Decreasing the values allows increased clustered peer readiness, while increasing the values allows better performance.

To establish clustered state sharing:

ACCESS: Admin/Network Admin

1. Configure HA link interfaces for each device in the cluster.
See [Configuring HA Link Interfaces](#) on page 262 for more information.
2. Select **Devices > Device Management**.
The Device Management page appears.
3. Next to the device cluster you want to edit, click the edit icon (✎).
The Cluster page appears.
4. Next to the State Sharing section, click the edit icon (✎).
The State Sharing pop-up window appears.

Enabled:	<input type="checkbox"/>
Minimum Flow Lifetime (ms):	1000
Minimum Sync. Interval (ms):	100
Maximum HTTP URL Length:	32

5. Configure the state sharing, as described earlier in this section.
6. Click **OK**.
Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211 for more information.

Troubleshooting Clustered State Sharing

LICENSE: Control

SUPPORTED DEVICES: Series 3

After you enable state sharing, you can view the following information about the configuration in the State Sharing section of the Cluster page:

- The HA link interface that is being used and its current link state
- Detailed synchronization statistics for troubleshooting issues

The state sharing statistics are primarily counters for different aspects of the clustered synchronization traffic sent and received, along with some other error counters. In addition, you can view the latest system logs for each device in the cluster.

See the following sections for more information about the statistics you can view for each device and how you can use them to troubleshoot your clustered state sharing configuration.

Messages Received (Unicast)

Messages received are the number of cluster synchronization messages received from the clustered peer.

The value should be close to the number of messages sent by the peer. During active use, the values may not match, but should be close. If traffic stops, the values should become stable and the messages received will match the messages sent.

For troubleshooting, you should view both the messages received and the messages sent, compare the rate of increase, and make sure the values are close. The sent value on each peer should be incrementing at approximately the same rate as the received value on the opposite peer.

Contact Support if the received messages stop incrementing or increment slower than the messages sent by the peer.

Packets Received

The system batches multiple messages into single packets in order to decrease overhead. The Packets Received counter displays the total number of these data packets, as well as other control packets that have been received by a device.

The value should be close to the number of packets sent by the peer device. During active use, the values may not match, but should be close. Because the number of messages received should be close and incrementing at the same rate as the number of messages sent by the peer, the number of packets received should have the same behavior.

For troubleshooting, you should view both the packets received and the messages sent, compare the rate of increase, and make sure the values are increasing at the same rate. If the sent value on the clustered peer is incrementing, the received value on the device should also increase at the same rate.

Contact Support if the received packets stop incrementing or increment slower than the messages sent by the peer.

Total Bytes Received

Total bytes received are the number of bytes that make up the packets received by the peer.

The value should be close to the number of bytes sent by the other peer. During active use, the values may not match, but should be close.

For troubleshooting, you should view both the total bytes received and the messages sent, compare the rate of increase, and make sure the values are increasing at the same rate. If the sent value on the clustered peer is incrementing, the received value on the device should also increase at the same rate.

Contact Support if the received bytes stop incrementing or increment slower than the messages sent by the peer.

Protocol Bytes Received

Protocol bytes received are the number of bytes of protocol overhead received, which includes everything but the payload of session state synchronization messages.

The value should be close to the number of bytes sent by the peer. During active use, the values may not match, but should be close.

For troubleshooting, you should view the total bytes received to discover how much actual state data is being shared in comparison to protocol data. If the protocol data is a large percentage of the data being sent, you can adjust the minimum sync interval.

Contact Support if the protocol bytes received increment at a similar rate to the total bytes received. Protocol bytes received should be minimal in relation to the total bytes received.

Messages Sent

Messages sent are the number of cluster synchronization messages sent to the clustered peer.

This data is useful in comparison to the number of messages received. During active use, the values may not match, but should be close.

For troubleshooting, you should view both the messages received and the messages sent, compare the rate of increase, and make sure the values are close.

Contact Support if the messages sent increment at a similar rate to the total bytes received.

Bytes Sent

Bytes sent are the total number of bytes sent that make up the cluster synchronization messages sent to the peer.

This data are useful in comparison to the number of messages received. During active use, the values may not match, but should be close. The number of bytes received on the peer should be close to, but not more than this value.

Contact Support if the total bytes received is not incrementing at about the same rate as the bytes sent.

Tx Errors

Tx errors are the number of memory allocation failures the system encounters when trying to allocate space for messages to be sent to the clustered peer.

This value should be zero at all times on both peers. Contact Support if this number is not zero or if the number steadily increases, which indicates the system has encountered an error where it cannot allocate memory.

Tx Overruns

Tx overruns are the number of times the system attempts and fails to place a message into the transit queue.

This value should be zero at all times on both peers. When the value is not zero or is steadily increasing, it indicates that the system is sharing too much data across the HA link that cannot be sent quickly enough.

You should increase the HA link MTU if it was previously set below the default value of 9918. You can change the minimum flow lifetime and minimum synchronization interval settings to reduce the amount of data shared across the HA link to prevent the number from incrementing.

Contact Support if this value persists or continues to increase.

Recent Logs

The system log displays the most recent clustered synchronization messages. The log should not display any ERROR or WARN messages. It should remain comparable between the peers, such as the same number of sockets being connected.

However, the data displayed may be opposite in some instances, for example, one peer reports that it received a connection from the other peer and references different IP addresses. The log provides a comprehensive view of the clustered state sharing connection, and any errors within the connection.

Contact Support if the log displays an ERROR or WARN message, or any message that does not appear to be purely informational.

To view clustered state sharing statistics:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device cluster you want to edit, click the edit icon (✎).
The Cluster page for the device cluster appears.
3. In the State Sharing section, click the view statistics icon (📊).
The State Sharing Statistics pop-up window appears.

	Active Peer	Backup Peer
Device	xiramat	tamarix
Messages Received (Unicast)	0	0
Packets Received	1307	1308
Total Bytes Received	10456	10464
Protocol Bytes Received	10456	10464
Messages Sent	0	0
Packets Sent	1442	1307
Bytes Sent	11536	10456
TX Errors	0	0
TX Overruns	0	0
Recent Logs	View	View

4. Optionally, select a **Device** to view if your cluster is composed of device stacks.
5. Optionally, click **Refresh** to update the statistics.
6. Optionally, click **View** to view the latest data log for each clustered device.

Separating Clustered Devices

LICENSE: Control

SUPPORTED DEVICES: Series 3

When you break device clustering, the active device or stack retains full deployment functionality. The backup device or stack loses its interface

configurations and fails over to the active device or stack, unless you choose to leave the interface configurations active, in which case the backup device or stack resumes normal operation. Breaking a cluster always removes the configuration of passive interfaces on the backup devices. Any devices in maintenance mode resume normal operation upon breaking the cluster.

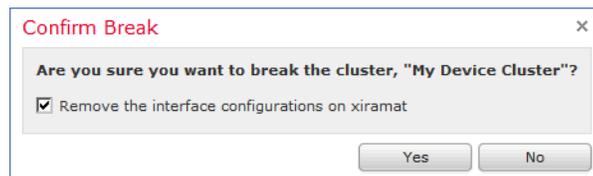

To separate a clustered device:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.

The Device Management page appears.

2. Next to the device cluster you want to break, click the break cluster icon (). The Confirm Break pop-up window appears.

3. Optionally, select the check box to remove the interface configurations on the backup device or stack, which means all interfaces except for the management interface are administratively taken down.
4. Click **Yes**.
The device cluster is separated.

Managing Stacked Devices

LICENSE: Any

SUPPORTED DEVICES: 3D8140, 3D8200 family, 3D9900

You can increase the amount of traffic inspected on a network segment by using devices in the following stacked configurations:

- two 3D8140s
- two 3D9900s
- up to four 3D8250s
- a 3D8260 (a primary device and a secondary device)
- a 3D8270 (a primary device with 40G capacity and two secondary devices)
- a 3D8290 (a primary device with 40G capacity and three secondary devices)

For more information about stacked configurations, see the *Sourcefire 3D System Installation Guide*.

When you establish a stacked configuration, you combine the resources of each stacked device into a single, shared configuration.

You designate one device as the *primary* device, where you configure the interfaces for the entire stack. You designate the other devices as *secondary*. Secondary devices must not be currently sensing any traffic and must not have link on any interface.

Connect the primary device to the network segment you want to analyze in the same way you would configure a single device. See [Configuring Interfaces](#) on page 258 for more information. Connect the secondary devices to the primary device using the stacked device cabling instructions found in the *Sourcefire 3D System Installation Guide*.

All devices in the stacked configuration must have the same hardware, run the same software version, and have the same licenses. If the devices are targeted by NAT policies, both the primary and secondary device must have the same NAT policy. See [Managing NAT Policies](#) on page 391 for more information. You must apply updates to the entire stack from the Defense Center. If an update fails on one or more devices in the stack, the stack enters a mixed-version state. You cannot apply policies to or update a stack in a mixed-version state. To correct this state, you can break the stack or remove individual devices with different versions, update the individual devices, then reestablish the stacked configuration. After you stack the devices, you can change the licenses only for the entire stack at once.

After you establish the stacked configuration, the devices act like a single, shared configuration. If the primary device fails, no traffic is passed to the secondary devices. Health alerts are generated indicating that the stacking heartbeat has failed on the secondary devices. See [Using Health Monitoring](#) on page 2109 for more information.

If a secondary device fails, the primary device continues to sense traffic, generate alerts, and send traffic to all secondary devices. On failed secondary devices, traffic is dropped. A health alert is generated indicating loss of link.

You can use a device stack as you would a single device in your deployment, with a few exceptions. If you have clustered devices, you cannot stack a device cluster or a device in a clustered pair. See [Clustering Devices](#) on page 220 for more information. You also cannot configure NAT on a device stack.

IMPORTANT! If you use eStreamer to stream event data from stacked devices to an external client application, collect the data from each device and ensure that you configure each device identically. The eStreamer settings are not automatically synchronized between stacked devices.

See the following sections for more information:

- [Establishing Device Stacks](#) on page 239
- [Editing Device Stacks](#) on page 241
- [Configuring Individual Devices in a Stack](#) on page 242
- [Separating Stacked Devices](#) on page 243

Establishing Device Stacks

LICENSE: Any

SUPPORTED DEVICES: 3D8140, 3D8200 family, 3D9900

You can increase the amount of traffic inspected on a network segment by stacking two fiber-based 3D9900s, two 3D8140 devices, up to four 3D8250s, a 3D8260, a 3D8270, or a 3D8290, and using their combined resources in a single, shared, configuration. Before you begin, you must:

- decide which unit will be the primary device.
- cable the units properly before designating the primary/secondary relationship. For information about cabling, see the *Sourcefire 3D System Installation Guide*.

IMPORTANT! If you have clustered devices, you cannot stack a device cluster or a device in a clustered pair. However, you can cluster a device stack. See [Clustering Devices](#) on page 220 for more information.

After you establish a device stack, the system treats the devices as a single device on the Device Management page. Device stacks display the stack icon

() in the appliance list.

Removing registration of a device stack from a Defense Center also removes registration from both devices. You delete stacked devices from the Defense Center as you would a single managed device; you can then register the stack on another Defense Center. You only need to register one of the stacked devices on the new Defense Center for the entire stack to appear. See [Deleting Devices](#) on page 212 and [Adding Devices to the Defense Center](#) on page 208 for more information.

After you establish the device stack, you cannot change which devices are primary or secondary unless you break and reestablish the stack. However, you can add secondary devices to an existing stack of two or three 3D8250s, a 3D8260, or a 3D8270 up to the limit of four 3D8250s in a stack. For additional devices, the primary device in the stack must have the necessary stacking NetMods for additional cabled devices. For example, if you have a 3D8260 where the primary only has a single stacking NetMod, you cannot add another secondary device to this stack. You add secondary devices to an existing stack in the same manner that you initially establish a stacked device configuration.

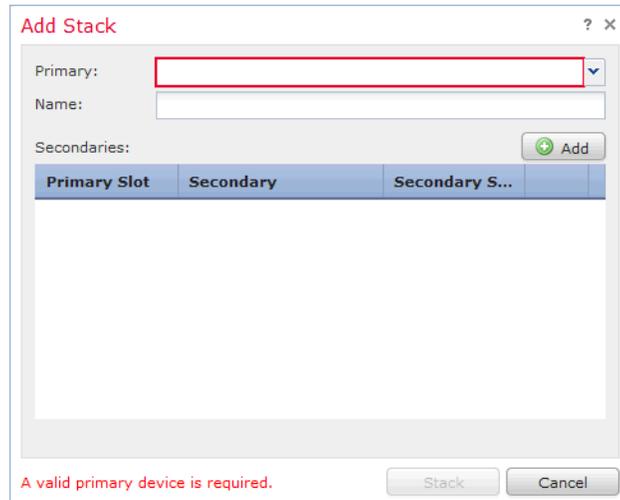

To establish a stacked device configuration:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.

The Device Management page appears.

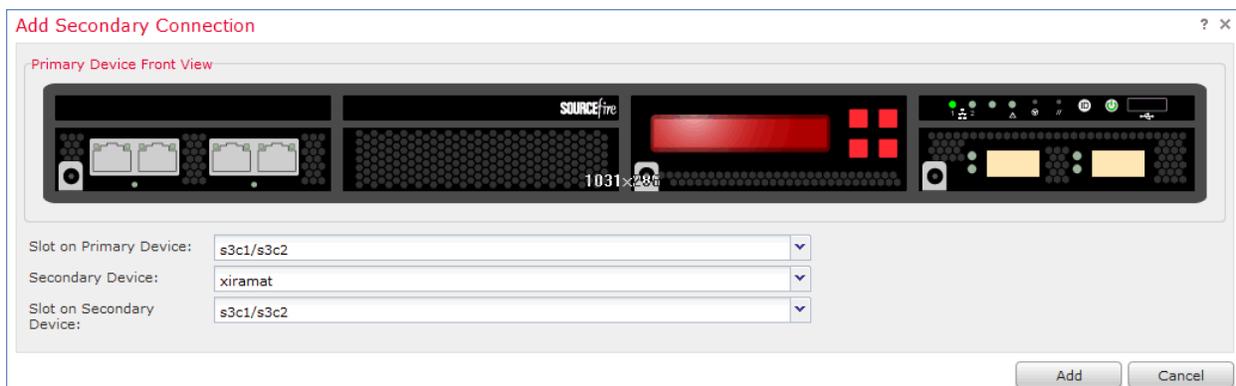

2. From the **Add** drop-down menu, select **Add Stack**.
The Add Stack pop-up window appears.

3. From the **Primary** drop-down list, select the device that you cabled for primary operation.

IMPORTANT! If you edit a device that is not cabled as the primary device, you cannot perform the next series of steps.

4. In the **Name** field, type the name of the stack. You may enter alphanumeric characters and special characters, with the exception of the following characters, which are invalid: +, (,), {, }, #, &, \, <, >, ?, ', and ".
5. Click **Add** to select the devices you want to form a stack with.
The Add Secondary Connection pop-up window appears. The following graphic displays the primary device front view for a 3D8140.

6. From the **Slot on Primary Device** drop-down list, select the stacking network module that connects the primary device to the secondary device.

7. From the **Secondary Device** drop-down list, select the device you cabled for secondary operation.

IMPORTANT! All devices in a stack must be of the same hardware model: 3D9900 with 3D9900, 3D8140 with 3D8140, or 3D8250 with 3D8250. You can add secondary 3D8250s to a properly configured and cabled 3D8260 or 3D8270.

8. From the **Slot on Secondary Device** drop-down list, select the stacking network module that connects the secondary device to the primary device.
9. Click **Add**.
The Add Stack window reappears with the new secondary device included.
10. Optionally, repeat steps 5 through 9 if you are adding secondary devices to an existing stack of 3D8250s, a 3D8260, or a 3D8270.
11. Click **Stack**.
The device stack is established or the additional secondary devices are added. Note that this process takes a few minutes as the process synchronizes system data.

Editing Device Stacks

LICENSE: Any

SUPPORTED DEVICES: 3D8140, 3D8200 family, 3D9900

After you establish a device stack, most changes you make to the device configuration also change the configuration of the entire stack. On the Stack page of the appliance editor, you can make changes to the stack configuration as on the Device page of a single device.

You can change the display name of the stack, enable and disable licenses, view system and health policies, configure automatic application bypass, and set up fast-path rules.

See the following sections for more information:

- [Editing Assigned Device Names](#) on page 244
- [Enabling and Disabling Device Licenses](#) on page 246
- [Editing Advanced Device Settings](#) on page 251

To edit a stacked configuration:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.

2. Next to the stacked device where you want to edit the configuration, click the edit icon (✎).
The Stack page for that device appears.
3. Use the sections on the Stack page to make changes to the stacked configuration as you would a single device configuration.
See the following sections for more information:
 - [Editing Assigned Device Names](#) on page 244
 - [Enabling and Disabling Device Licenses](#) on page 246
 - [Editing Advanced Device Settings](#) on page 251

Configuring Individual Devices in a Stack

LICENSE: Any

SUPPORTED DEVICES: 3D8140, 3D8200 family, 3D9900

After you establish a device stack, you can still configure some attributes for only one device within the stack. On the Devices page of the appliance editor, you can make changes to a device configured in a stack as on the Device page of a single device.

You can change the display name of a device, view system settings, shut down or restart a device, view health information, and edit device management settings.

See the following sections for more information:

- [Editing Assigned Device Names](#) on page 244
- [Editing Device System Settings](#) on page 247
- [Viewing the Health of a Device](#) on page 248
- [Editing Device Management Settings](#) on page 249

To configure an individual device in a stack:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the stacked device where you want to edit the configuration, click the edit icon (✎).
The Stack page for that device appears.
3. Click **Devices**.
The Devices page appears.
4. From the **Selected Device** drop-down list, select the device you want to modify.

5. Use the sections on the Devices page to make changes to the individual stacked device as you would a single device.

See the following sections for more information:

- [Editing Assigned Device Names](#) on page 244
- [Editing Device System Settings](#) on page 247
- [Viewing the Health of a Device](#) on page 248
- [Editing Device Management Settings](#) on page 249

Configuring Interfaces on a Stacked Device

LICENSE: Any

SUPPORTED DEVICES: 3D8140, 3D8200 family, 3D9900

Except for the management interface, you configure stacked device interfaces on the Interfaces page of the primary device in the stack. You can select any device in the stack to configure the management interface. See [Configuring the Management Interface](#) on page 260 for more information.

The Interfaces page of a Series 3 stacked device includes the hardware and interfaces views that you find on an individual device. The interfaces page of a 3D9900 does not include these views. See [Configuring Interfaces](#) on page 258 for more information.

To configure interfaces on a stacked device:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the stacked device where you want to configure interfaces, click the edit icon (✎).
The Stack page for that device appears.
3. Click **Interfaces**.
The Interfaces page appears.
4. From the **Selected Device** drop-down list, select the device you want to modify.
5. Configure interfaces as you would on an individual device. See [Configuring Interfaces](#) on page 258 for more information.

Separating Stacked Devices

LICENSE: Any

SUPPORTED DEVICES: 3D8140, 3D8200 family, 3D9900

If you no longer need to use a stacked configuration for your devices, you can break the stack and separate the devices.

To separate stacked devices:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device stack you want to break, click the break stack icon ().
The Confirm Break pop-up window appears.

TIP! To remove a secondary device from a stack of three or more 3D8250 devices without breaking the stack, click the remove from stack icon (). Removing the secondary device causes a brief disruption of traffic inspection, traffic flow, or link state as the system reconfigures the stack for operation without the extra device.

3. Click **Yes**.
The device stack is separated.

Editing Device Configuration

LICENSE: Any

The Device page of the appliance editor displays detailed device configuration and information. It also allows you to make changes to some parts of device configuration, such as enabling and disabling licenses, shutting down and restarting a device, modifying management, and setting up fast-path rules.

See the following sections for more information:

- [Editing Assigned Device Names](#) on page 244
- [Enabling and Disabling Device Licenses](#) on page 246
- [Editing Device System Settings](#) on page 247
- [Viewing the Health of a Device](#) on page 248
- [Editing Device Management Settings](#) on page 249
- [Understanding Advanced Device Settings](#) on page 250

Editing Assigned Device Names

LICENSE: Any

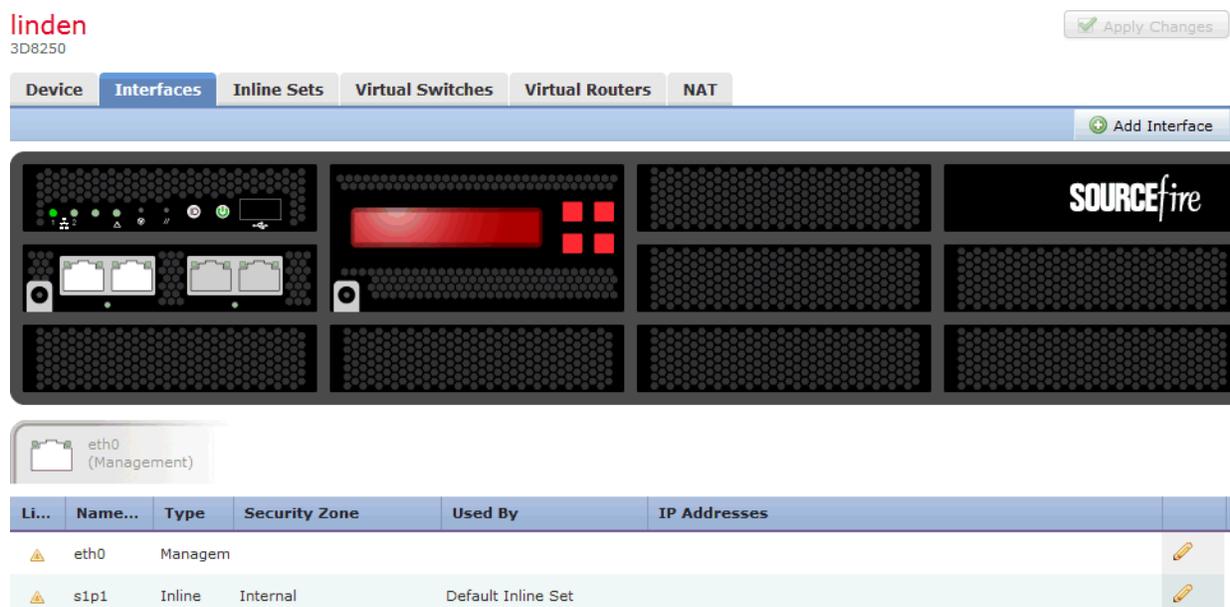

The General section of the Device tab shows the device name, which you can change.

To edit the assigned name of a device:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to edit the assigned name, click the edit icon (✎).

The Interfaces page for that device appears. The following graphic shows the Interfaces page for a Series 3 device.

3. Click **Device**.
The Device page appears.

TIP! For stacked devices, you edit the assigned device name for the stack on the Stack page of the appliance editor. You can edit the assigned device name for an individual device on the Devices page of the appliance editor.

4. Next to the General section, click the edit icon (✎).
The General pop-up window appears.

5. In the **Name** field, type a new assigned name for the device. You may enter alphanumeric characters and special characters, with the exception of the following characters, which are invalid: +, (,), {, }, #, &, \, <, >, ?, ', and ".
6. Click **Save**.
The new name is saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211 for more information.

Enabling and Disabling Device Licenses

LICENSE: Any

SUPPORTED DEVICES: Series 3, virtual

You can enable licenses on your device if you have available licenses on your Defense Center. Note that:

- Control and Malware licenses require a Protection license; URL Filtering VPN licenses require both Protection and Control licenses.
- You cannot enable a Malware license on a pre-Version 5.1.1 device.
- You cannot enable a VPN license on a virtual device.
- Although you can enable a Control license on a virtual device, virtual devices do **not** support fast-path rules, switching, routing, or clustering.
- You cannot change the license settings on clustered devices.
- Because Series 2 devices automatically have Protection capabilities, with the exception of Security Intelligence filtering, you cannot disable these capabilities, nor can you apply other licenses to a Series 2 device.

For more information, see [Licensing the Sourcefire 3D System](#) on page 2036.

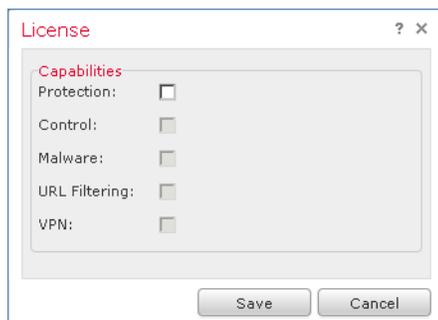

To enable or disable device licenses:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to enable or disable licenses, click the edit icon (✎).
The Interfaces tab for that device appears.
3. Click **Device**.
The Devices tab appears.

TIP! For stacked devices, you enable or disable the licenses for the stack on the Stack page of the appliance editor.

- Next to the **License** section, click the edit icon (✎).
The License pop-up window appears.

- You have the following options:
 - To enable a license, select the check box next to the license name.
 - To disable a license, clear the check box next to the license name.
- Click **Save**.
The changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211 for more information.

Editing Device System Settings

LICENSE: Any

The System section of the Device tab displays a read-only table of system information, as described in the following table.

System Section Table Fields

FIELD	DESCRIPTION
Model	The model name and number for the managed device.
Serial	The serial number of the chassis of the managed device.
Time	The current system time of the device.
Version	The version of the software currently installed on the managed device.
Policy	A link to the system policy currently applied to the managed device.

You can also shut down or restart the device.

To shut down and restart a managed device:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device that you want to restart, click the edit icon (✎).
The Interfaces tab for that device appears.
3. Click **Device**.
The Devices tab appears.

TIP! For stacked devices, you shut down or restart an individual device on the Devices page of the appliance editor.

4. To shut down the device, click the shut down device icon (🔴).
5. When prompted, confirm that you want to shut down the device.
You are returned to the Device Management page.
6. To restart the device, click the restart device icon (🔄).
7. When prompted, confirm that you want to restart the device.
The device is restarted.

Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211 for more information.

Viewing the Health of a Device

LICENSE: Any

The Health section of the Device tab displays health-related information. You can view an icon showing the current health status of the managed device. You can also click the icon to navigate to the Health Monitor page for that device. See [Interpreting Health Monitor Status](#) on page 2165 for more information.

You can click the **Policy** link to view a read-only version of the currently applied health policy. See [Editing Health Policies](#) on page 2147 for more information.

You can also click the **Blacklist** link to go to the Health Blacklist page, where you can enable and disable health blacklist modules. See [Blacklisting a Health Policy Module](#) on page 2158 for more information.

Editing Device Management Settings

LICENSE: Any

The Management section of the Device tab displays a list of remote management information, as described in the following table:

Management Section Table Fields

FIELD	DESCRIPTION
Host	The current management hostname or IP address of the device.
Status	Whether local event storage is enabled for the device.
Transfer Packets	Whether packet data is transferred to the Defense Center.

You can use the Management section to specify the management host and regenerate the virtual IP. You can also specify management options regarding local event storage and whether packet data should be transferred to the Defense Center.

TIP! You can click the slider to block the communication channel between the Defense Center and the managed device. Click the slider to enable the communication channel.

To modify management options on a device:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to modify management options, click the edit icon (✎).
The Interfaces tab for that device appears.
3. Click **Device**.
The Devices tab appears.

TIP! For stacked devices, you modify management options on an individual device on the Devices page of the appliance editor.

- Next to the **Management** section, click the edit icon (✎).
The Management pop-up window appears.

- In the **Host** field, enter the name or IP address of the management host.
- Clear the **Enabled** check box to disable management of the device. Select the check box to enable management.
- Select the **Transfer Packets** check box to allow packet data to be stored on the Defense Center with events. Clear the check box to prevent the managed device from sending packet data with the events.
- Click **Save**.

Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211 for more information.

Understanding Advanced Device Settings

LICENSE: Any

SUPPORTED DEVICES: feature dependent

The Advanced section of the Device tab displays a table of advanced configuration settings, as described in the Advanced Section Table Fields table.

Advanced Section Table Fields

FIELD	DESCRIPTION	SUPPORTED DEVICES
Application Bypass	The state of Automatic Application Bypass on the device.	Any
Bypass Threshold	The Automatic Application Bypass threshold, in milliseconds.	Any
Inspect Local Router Traffic	Whether the device inspects traffic received on routed interfaces that is destined for itself, such as ICMP, DHCP, and OSPF traffic.	Series 3
Fast-Path Rules	The number of fast-path rules that have been created on the device.	8000 Series, 3D9900

You can use the Advanced section to edit any of these settings. See the following sections for more information:

- [Automatic Application Bypass](#) on page 251
- [Editing Advanced Device Settings](#) on page 251
- [Configuring Fast-Path Rules](#) on page 253

Automatic Application Bypass

LICENSE: Any

The Automatic Application Bypass (AAB) feature limits the time allowed to process packets through an interface and allows packets to bypass detection if the time is exceeded. The feature functions with any deployment; however, it is most valuable in inline deployments.

You balance packet processing delays with your network's tolerance for packet latency. When a malfunction within Snort or a device misconfiguration causes traffic processing time to exceed a specified threshold, AAB causes Snort to restart within ten minutes of the failure, and generates troubleshoot data that can be analyzed to investigate the cause of the excessive processing time.

The AAB option is off by default. You can change the bypass threshold if the option is selected. The default setting is 3000 milliseconds (ms). The valid range is from 250 ms to 60,000 ms.

Typically, you use Rule Latency Thresholding in the intrusion policy to fast-path packets after the latency threshold value is exceeded. Rule Latency Thresholding does not shut down the engine or generate troubleshoot data. For more information, see [Understanding Rule Latency Thresholding](#) on page 1021.

IMPORTANT! AAB is activated only when an excessive amount of time is spent processing a single packet. If AAB engages, the system kills all Snort processes.

If detection is bypassed, the device generates a health monitoring alert. For more information on that health monitoring alert, see [Using the Health Monitor](#) on page 2163.

For more information about enabling Automatic Application Bypass and setting the bypass threshold, see [Editing Advanced Device Settings](#) on page 251.

Editing Advanced Device Settings

LICENSE: Any

SUPPORTED DEVICES: feature dependent

You can use the Advanced section of the Devices tab to modify the Automatic Application Bypass and Inspect Local Router Traffic settings. You can also configure fast-path rules, as explained in [Configuring Fast-Path Rules](#) on page 253.

Note the following:

- you can configure fast-path rules only on 8000 Series and 3D9900 devices.
- you can configure **Inspect Local Router Traffic** only on Series 3 devices

To modify advanced device settings:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.

The Device Management page appears.

2. Next to the device where you want to edit advanced device settings, click the edit icon (✎).

The Interfaces tab for that device appears.

3. Click **Device**.

The Devices tab appears.

TIP! For stacked devices, you edit the advanced device settings for the stack on the Stack page of the appliance editor.

4. Next to the **Advanced** section, click the edit icon (✎).

The Advanced pop-up window appears.

The screenshot shows a window titled "Advanced" with a search icon and a close icon in the top right corner. The window contains the following elements:

- Automatic Application Bypass:
- Bypass Threshold (ms):
- Inspect Local Router Traffic:
- Fast-Path Rules: A table with columns: #, Domain, Initiator, Initiator P..., Responder, Responder P..., Protocol, VLAN, Bidirectio... There are two buttons: "New IPv4 Rule" and "New IPv6 Rule".
- Save and Cancel buttons at the bottom right.

5. Optionally, select **Automatic Application Bypass** if your network is sensitive to latency. Automatic Application Bypass is most useful in inline deployments. For more information, see [Automatic Application Bypass](#) on page 251.
6. When you select the Automatic Application Bypass option, you can type a **Bypass Threshold** in milliseconds (ms). The default setting is 3000 ms and the valid range is from 250 ms to 60,000 ms.

7. Optionally, select the **Inspect Local Router Traffic** check box to inspect exception traffic when deployed as a router.
8. Optionally, configure fast-path rules. For more information, see [Configuring Fast-Path Rules](#) on page 253.
9. Click **Save**.
Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211 for more information.

Configuring Fast-Path Rules

LICENSE: Any

SUPPORTED DEVICES: 8000 Series, 3D9900

You can create fast-path rules to send traffic directly through a device with no further inspection. Fast-path rules divert traffic that does not need to be analyzed to bypass the device. Fast-path rules either send traffic to the fast-path (out of the interface) or allow it to continue into the device for further analysis. Their advantage is the speed at which they determine the correct path for the traffic. Because the fast-path rules function at the hardware level, they only determine limited information about the packet.

See the following sections for more information:

- [Adding IPv4 Fast-Path Rules](#) on page 253
- [Adding IPv6 Fast-Path Rules](#) on page 255
- [Deleting Fast-Path Rules](#) on page 257

Adding IPv4 Fast-Path Rules

LICENSE: Any

SUPPORTED DEVICES: 8000 Series, 3D9900

Fast-path rules send traffic to the fast-path (out of the interface) or into the device for further analysis. You can use the following criteria to select the IPv4 traffic you want to divert to the fast-path and not inspect:

- initiator or responder IP address or CIDR block
- protocol
- initiator or responder port, for TCP or UDP protocols
- VLAN ID
- bidirectional option

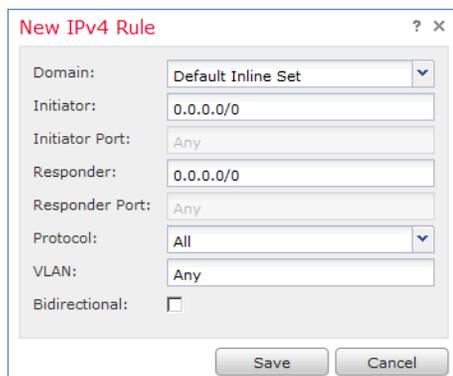

Note that the outermost ID is used for fast-path rules.

TIP! To edit an existing fast-path rule, click the edit icon () next to the rule.

To build or edit IPv4 fast-path rules:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to add a fast-path rule, click the edit icon (✎).
The Interfaces tab for that device appears.
3. Click **Device**.
The Devices tab appears.
4. Next to the **Advanced** section, click the edit icon (✎).
The Advanced pop-up window appears.
5. Click **New IPv4 Rule** to add a fast-path rule.
The New IPv4 Rule pop-up window appears.

6. From the **Domain** drop-down list, select an inline set or passive security zone. See [Setting Up an IPS Device](#) on page 266 for more information.
7. Use CIDR notation in the **Initiator** and the **Responder** fields to designate the IP address ranges of initiators or responders whose packets should bypass further analysis.
Your rule matches packets from the designated initiators or packets to the designated responders. For information on using CIDR notation in the Sourcefire 3D System, see [IP Address Conventions](#) on page 57.
8. Optionally, from the **Protocol** drop-down list, select the protocol on which you want the rule to act or select **All** to match traffic from any protocol on the list.

9. Optionally, if you chose the TCP or UDP protocol in step 8, enter initiator and responder ports in the **Initiator Port** and the **Responder Port** fields to designate ports.

TIP! You can enter a comma-separated list of port numbers in each rule. You cannot use port ranges in IPv4 fast-path rules.

If you also select the **Bidirectional** option, your filter criteria are narrowed to packets from those initiator ports or packets to those responder ports.

10. Optionally, enter a VLAN ID in the **VLAN** field.
Your rule matches only traffic for that VLAN.
11. Optionally, select the **Bidirectional** option to filter all traffic traveling between the specified initiator and responder IP addresses. Clear the option to filter only traffic from the specified initiator IP address to the specified responder IP address.
12. Click **Save**.

The rule is added under Fast-Path Rules in the Advanced pop-up window. Although the rule is added, you must click **Save** again to save the rule. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211 for more information.

Adding IPv6 Fast-Path Rules

LICENSE: Any

SUPPORTED DEVICES: 8000 Series, 3D9900

Fast-path rules send traffic to the fast-path (out of the interface) or into the device for further analysis. You can use the following criteria to select the IPv6 traffic you want to divert to the fast-path and not inspect:

- protocol
- initiator or responder port, for TCP or UDP protocols
- VLAN ID
- bidirectional option

Note that the outermost VLAN ID is used for fast-path rules.

TIP! To edit an existing fast-path rule, click the edit icon () next to the rule.

To add an IPv6 fast-path rule:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.

2. Next to the device where you want to add a fast-path rule, click the edit icon (✎).

The Interfaces tab for that device appears.

3. Click **Device**.

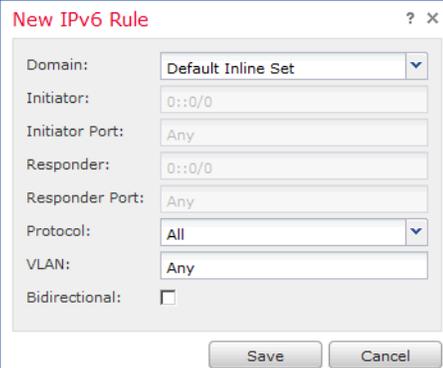

The Devices tab appears.

4. Next to the **Advanced** section, click the edit icon.

The Advanced pop-up window appears.

5. Click **New IPv6 Rule** to add a fast-path rule.

The New IPv6 Rule pop-up window appears. Note that the initiator and responder fields are fixed and indicate that the filter applies to IPv6 packets from any initiator or responder.

6. From the **Domain** drop-down list, select an inline set or passive security zone. See [Setting Up an IPS Device](#) on page 266 for more information.
7. Optionally, from the **Protocol** drop-down list, select the protocol on which you want the rule to act or select **All** to match traffic from any protocol on the list. Your fast-path rule matches only the selected protocol's packets.
8. Optionally, if you chose the TCP or UDP protocol in step 7, enter initiator and responder ports in the **Initiator Port** and the **Responder Port** fields to designate ports.

TIP! You can enter a comma-separated list of port numbers in each rule. You cannot use port ranges in IPv6 fast-path rules.

9. Optionally, enter a VLAN ID in the **VLAN** field. Your rule matches only traffic for that VLAN.

10. Optionally, select **Bidirectional** to filter all traffic traveling between the specified initiator and responder ports. Clear the option to specify that your rule matches only packets from those initiator ports or packets to those responder ports.

IMPORTANT! Because IPv6 fast-path rules do not specify initiator and responder IP addresses, the bidirectional option only functions with initiator and responder ports.

11. Click **Save**.
The rule is added under Fast-Path Rules in the Advanced pop-up window.
12. In the Advanced pop-up window, click **Save**.
The rule is saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211 for more information.

Deleting Fast-Path Rules

LICENSE: Any
SUPPORTED DEVICES: 8000 Series, 3D9900

The following procedure explains how to delete any IPv4 or IPv6 fast-path rule.

To delete any fast-path rule:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to delete a fast-path rule, click the edit icon (✎).
The Interfaces tab for that device appears.
3. Click **Device**.
The Devices tab appears.
4. Next to the **Advanced** section, click the edit icon (✎).
The Advanced pop-up window appears.
5. Next to the fast-path rule you want to delete, click the delete icon (🗑️).
6. When prompted, confirm that you want to delete the rule.
The rule is removed from the Advanced pop-up window.

7. Click **Save**.

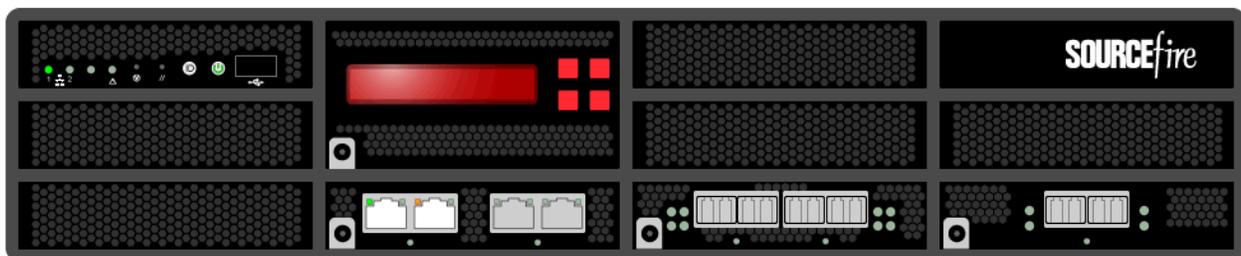

Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211 for more information.

Configuring Interfaces

LICENSE: Any

You can configure the interfaces of a managed device, according to your Sourcefire 3D System deployment, from the Interfaces page of the appliance editor.

The top of the Interfaces page displays a physical hardware view of a managed Series 3 device. Series 2 and virtual devices do not have physical hardware views. The following graphic shows the hardware view for a 3D8250.

The Using the Hardware View table explains how to use the physical hardware view.

Using the Hardware View

To...	YOU CAN...
view a network module's type, part number, and serial number	hover your cursor over the dark circle in the lower left corner of the network module.
select an interface in the interfaces table view	click the interface.
open an interface editor	double-click the interface.

Using the Hardware View (Continued)

To...	YOU CAN...
view the name of the interface, the type of interface, whether the interface has link, the interface's speed setting, and whether the interface is currently in bypass mode	hover your cursor over the interface.
view the details about an error or warning	hover your cursor over the affected port on the network module.

The interfaces table view, which is below the Series 3 hardware view, lists all the interfaces you have configured on a device. The table includes summarized information about each interface, as described in the following table. Note that only 8000 Series devices display the MAC Address and IP Address columns. See the Interfaces Table View Fields table for more information.

Interfaces Table View Fields

FIELD	DESCRIPTION
Link	The current link state of the interface. Logical interfaces have the same link state as their parent physical interface.
Name	The name of the interface. Interface names are auto-generated with the exception of hybrid interfaces, which are user-defined. Physical interfaces display the name of the physical interface. Logical interfaces display the name of the physical interface and the assigned VLAN tag.
Type	The configuration of the interface: <ul style="list-style-type: none"> • None • Management • Passive • Inline • Switched • Routed • Hybrid • HA link
Security Zone	The security zone where the interface is assigned.
Used by	The inline set, virtual switch, or virtual router where the interface is assigned.

Interfaces Table View Fields (Continued)

FIELD	DESCRIPTION
MAC Address	The MAC address displayed for the interface when it is enabled for switched and routed features. For virtual devices, the MAC address is displayed so that you can match the network adapters configured on your device to the interfaces that appear on the Interfaces page.
IP Addresses	IP addresses assigned to the interface. Hover your pointer over an IP address to view whether it is active or inactive. Inactive IP addresses are grayed out.

Note that you can only configure a total of 1024 interfaces on a managed device. See the following sections for details on the different ways you can configure interfaces on a device:

- [Configuring the Management Interface](#) on page 260
- [Configuring HA Link Interfaces](#) on page 262
- [Configuring the Interface MTU](#) on page 263
- [Disabling Interfaces](#) on page 264
- [Preventing Duplicate Connection Logging](#) on page 265
- [Setting Up an IPS Device](#) on page 266
- [Setting Up Virtual Switches](#) on page 281
- [Setting Up Virtual Routers](#) on page 295
- [Setting Up Hybrid Interfaces](#) on page 352

Configuring the Management Interface

LICENSE: Any

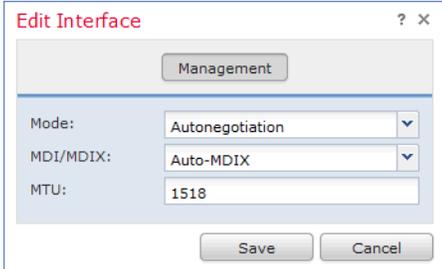

You can configure the link mode and MDI/MDIX settings for the management interface from the appliance editor. You must configure all other management interface settings, such as IPv4 address, IPv6 address, and DNS settings locally on the device.

WARNING! Changing the maximum transmission unit (MTU) interrupts traffic on the device. The range within which you can set the MTU can vary depending on the Sourcefire 3D System software version, device model, and interface type. See [Configuring the Interface MTU](#) on page 263 for more information.

To configure the management interface:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to configure the management interface, click the edit icon (✎).
The Interfaces tab for that device appears.
3. Next to the management interface, click the edit icon (✎).
The Edit Interface pop-up window appears.

The screenshot shows a dialog box titled "Edit Interface" with a "Management" tab. It contains three configuration fields: "Mode" set to "Autonegotiation", "MDI/MDIX" set to "Auto-MDIX", and "MTU" set to "1518". At the bottom, there are "Save" and "Cancel" buttons.

4. From the **Mode** drop-down list, select an option to designate the link mode or select **Autonegotiation** to specify that the interface is configured to autonegotiate speed and duplex settings.
5. From the **MDI/MDIX** drop-down list, select an option to designate whether the interface is configured for MDI (medium dependent interface), MDIX (medium dependent interface crossover), or Auto-MDIX.
Normally, MDI/MDIX is set to **Auto-MDIX**, which automatically handles switching between MDI and MDIX to attain link.
6. In the **MTU** field, type a maximum transmission unit (MTU), which designates the largest size packet allowed.
The range within which you can set the MTU can vary depending on the Sourcefire 3D System software version, device model, and interface type. See [Configuring the Interface MTU](#) on page 263 for more information.
7. Click **Save**.
Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211 for more information.

Configuring HA Link Interfaces

LICENSE: Any

SUPPORTED DEVICES: Series 3

After you establish a device cluster, you can configure a physical interface as a high availability (HA) link interface. This link acts as a redundant communications channel for sharing health information between the clustered devices. When you configure an HA link interface on one device, you automatically configure an interface on the second device. You must configure both HA links on the same broadcast domain. See [Clustering Devices](#) on page 220 for more information.

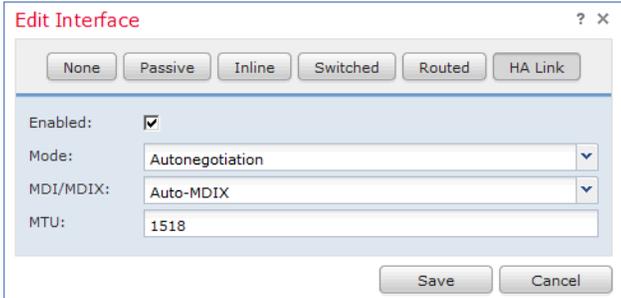

Dynamic NAT relies on dynamically allocating IP addresses and ports to map to other IP addresses and ports. Without an HA link, these mappings are lost in a failover, causing all translated connections to fail as they are routed through the now active device in the cluster.

WARNING! Changing the maximum transmission unit (MTU) interrupts traffic on the device. The range within which you can set the MTU can vary depending on the Sourcefire 3D System software version, the device model, and the interface type. See [Configuring the Interface MTU](#) on page 263 for more information.

To configure an HA link interface:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the clustered device where you want to configure the HA link interface, click the edit icon (✎).
The Interfaces tab for that device appears.
3. Next to the interface you want to configure as a HA link interface, click the edit icon (✎).
The Edit Interface pop-up window appears.
4. Click **HA Link** to display the HA link options.

The screenshot shows the 'Edit Interface' dialog box with the following configuration:

- Mode: HA Link (selected)
- Enabled:
- Mode: Autonegotiation
- MDI/MDIX: Auto-MDIX
- MTU: 1518

Buttons: Save, Cancel

5. Select the **Enabled** check box to allow the HA link interface to provide link.
If you clear the check box, the interface becomes disabled and administratively taken down.
6. From the **Mode** drop-down list, select an option to designate the link mode or select **Autonegotiation** to specify that the interface is configured to autonegotiate speed and duplex settings.
7. From the **MDI/MDIX** drop-down list, select an option to designate whether the interface is configured for MDI (medium dependent interface), MDIX (medium dependent interface crossover), or Auto-MDIX.
Normally, MDI/MDIX is set to **Auto-MDIX**, which automatically handles switching between MDI and MDIX to attain link.
8. In the **MTU** field, type a maximum transmission unit (MTU), which designates the largest size packet allowed.
The range within which you can set the MTU can vary depending on the Sourcefire 3D System software version, the device model, and the interface type. See [Configuring the Interface MTU](#) on page 263 for more information.
9. Click **Save**.
Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211 for more information.

Configuring the Interface MTU

LICENSE: Any

When you change the maximum transmission unit (MTU) on an interface, the following capabilities may be affected:

- traffic inspection, including application awareness and control, URL filtering, intrusion detection and prevention, and connection logging
- traffic flow, including switching, routing, and related functionality
- link state

The manner and duration of network traffic interruption depends on the interface type and how your devices are configured and deployed.

Consider the following when setting the interface MTU:

- Sourcefire 3D System software versions prior to 5.2 do not support Series 2 devices.
- The minimum IPv6 MTU setting is 1280.

The following table lists MTU configuration ranges for managed devices running different software versions.

MTU Range by Software Version and Device

FOR THIS SOFTWARE VERSION...	ON THIS MODEL DEVICE...	THE MTU RANGE (INTERFACE) IS...
5.1 to 5.1.1	Series 3, virtual	1518-10228 (hybrid) 1518-9018 (all others)
5.1.1 to pre-5.2	Series 3, virtual	1518-9234 (management) 1518-10228 (hybrid) 1518-10172 (all others)
5.2 or greater	Series 2 except 3D6500, 3D9900	594-1518 (all interfaces)
5.2 or greater	3D6500, 3D9900, virtual	594-9018 (all interfaces)
5.2 or greater	Series 3	594-9234 (management) 594-10172 (inline, passive) 594-9922 (all others)

Disabling Interfaces

You can disable an interface by setting the interface type to **None**. Disabled interfaces appear grayed out in the interface list.

LICENSE: Any

To disable an interface:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to disable the interface, click the edit icon (✎).
The Interfaces tab for that device appears.
3. Next to the interface you want to disable, click the edit icon (✎).
The Edit Interface pop-up window appears.
4. Click **None**.

5. Click **Save**.

Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211 for more information.

Preventing Duplicate Connection Logging

When you update a security zone object, the system saves a new revision of the object. As a result, if you have managed devices in the same security zone that have different revisions of the security zone object configured in the interfaces, you may log what appear to be duplicate connections.

If you notice duplicate connection reporting, you can update all managed devices to use the same revision of the object.

To synchronize security zone object revisions across devices:

1. Select **Devices > Device Management**.

The Device Management page appears.

WARNING! You must not reapply managed device changes to any device until you have edited the zone setting for interfaces on all devices you want to sync.

2. Next to the device where you want to update the security zone selection, click the edit icon ().
- The Interfaces tab for that device appears.
3. For each interface logging duplicate connection events, change the **Security Zone** to another zone, click **Save**, then change it back to the desired zone, and click **Save** again.
4. Repeat steps 2 through 3 for each device logging duplicate events.
5. After all interfaces on all devices have been edited, apply device changes to all managed devices at once.

CHAPTER 6

SETTING UP AN IPS DEVICE

You can configure your device in either a passive or inline IPS deployment. In a passive deployment, you deploy the system out of band from the flow of network traffic. In an inline deployment, you configure the system transparently on a network segment by binding two ports together.

The following sections describe configuring your device for passive and inline deployments of the Sourcefire 3D System:

- [Understanding Passive IPS Deployments](#) on page 266
- [Configuring Passive Interfaces](#) on page 267
- [Understanding Inline IPS Deployments](#) on page 269
- [Configuring Inline Interfaces](#) on page 269
- [Configuring Inline Sets](#) on page 271

Understanding Passive IPS Deployments

LICENSE: Protection

In a passive IPS deployment, the Sourcefire 3D System monitors traffic flowing across a network using a switch SPAN or mirror port. The SPAN or mirror port allows for traffic to be copied from other ports on the switch. This provides the system visibility within the network without being in the flow of network traffic. When configured in a passive deployment, the system cannot take certain actions such as blocking or shaping traffic. Passive interfaces receive all traffic unconditionally and no traffic received on these interfaces is retransmitted.

Configuring Passive Interfaces

LICENSE: Protection

You can configure one or more physical ports on a managed device as passive interfaces.

WARNING! Changing the maximum transmission unit (MTU) interrupts traffic on the device. The range within which you can set the MTU can vary depending on the Sourcefire 3D System software version, device model, and interface type. See [Configuring the Interface MTU](#) on page 263 for more information.

To configure a passive interface:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.

The Device Management page appears.

Name	License Type	Health Policy	System Policy	Access Control Pol...
Ungrouped (1)				
linden 10.10.10.10 - 3D8250	Protect & Control w/URL Filtering	Blacklisted Power Supply	katsura system policy	My Access Control Policy

2. Next to the device where you want to configure the passive interface, click the edit icon (✎).

The Interfaces tab appears.

linden
3D8250

Apply Changes

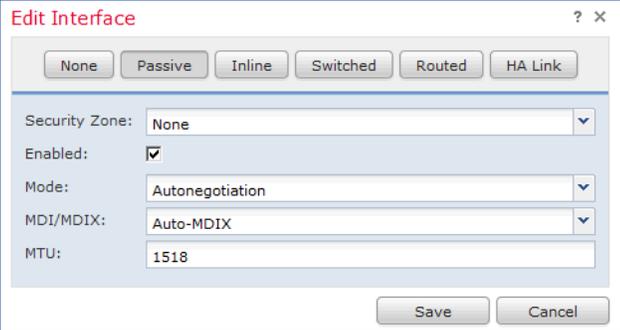

Device | **Interfaces** | Inline Sets | Virtual Switches | Virtual Routers | NAT

Add Interface

Li...	Name...	Type	Security Zone	Used By	IP Addresses
eth0	eth0	Managem			
s1p1	s1p1	Inline	Internal	Default Inline Set	

3. Next to the interface you want to configure as a passive interface, click the edit icon (✎).

The Edit Interface pop-up window appears.

4. Click **Passive** to display the passive interface options.
5. Optionally, from the **Security Zone** drop-down list, select an existing security zone or select **New** to add a new security zone.
6. Select the **Enabled** check box to allow the passive interface to monitor traffic. If you clear the check box, the interface becomes disabled so that users cannot access it for security purposes.
7. From the **Mode** drop-down list, select an option to designate the link mode or select **Autonegotiation** to specify that the interface is configured to automatically negotiate speed and duplex settings. Note that mode settings are available only for copper interfaces.
8. From the **MDI/MDIX** drop-down list, select an option to designate whether the interface is configured for MDI (medium dependent interface), MDIX (medium dependent interface crossover), or Auto-MDIX. Note that MDI/MDIX settings are available only for copper interfaces.
By default, MDI/MDIX is set to **Auto-MDIX**, which automatically handles switching between MDI and MDIX to attain link.
9. In the **MTU** field, type a maximum transmission unit (MTU), which designates the largest size packet allowed.
The range within which you can set the MTU can vary depending on the Sourcefire 3D System software version, device model, and interface type. See [Configuring the Interface MTU](#) on page 263 for more information.
10. Click **Save**.

The passive interface is configured. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211 for more information.

Understanding Inline IPS Deployments

LICENSE: Protection

In an inline IPS deployment, you configure the Sourcefire 3D System transparently on a network segment by binding two ports together. This allows the system to be installed in any network environment without the configuration of adjacent network devices. Inline interfaces receive all traffic unconditionally, but all traffic received on these interfaces is retransmitted out of an inline set unless explicitly dropped.

Configuring Inline Interfaces

LICENSE: Protection

You can configure one or more physical ports on a managed device as inline interfaces. You must assign a pair of inline interfaces to an inline set before they can handle traffic in an inline deployment.

IMPORTANT! If you configure an interface as an inline interface, the adjacent port on its NetMod automatically becomes an inline interface as well to complete the pair.

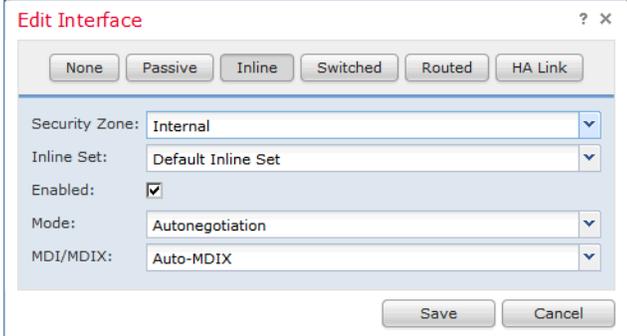

To configure inline interfaces on a virtual device, you must create the inline pair using adjacent interfaces.

To configure an inline interface:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to configure the inline interface, click the edit icon (✎).
The Interfaces tab appears.
3. Next to the interface you want to configure as an inline interface, click the edit icon (✎).
The Edit Interface pop-up window appears.

4. Click **Inline** to display the inline interface options.

The screenshot shows a dialog box titled "Edit Interface" with a close button (X) and a help button (?). At the top, there are six tabs: "None", "Passive", "Inline", "Switched", "Routed", and "HA Link". The "Inline" tab is selected. Below the tabs, there are several configuration fields: "Security Zone" with a dropdown menu showing "Internal"; "Inline Set" with a dropdown menu showing "Default Inline Set"; "Enabled" with a checked checkbox; "Mode" with a dropdown menu showing "Autonegotiation"; and "MDI/MDIX" with a dropdown menu showing "Auto-MDIX". At the bottom of the dialog, there are "Save" and "Cancel" buttons.

5. Optionally, from the **Security Zone** drop-down list, select an existing security zone or select **New** to add a new security zone.
6. From the **Inline Set** drop-down list, select an existing inline set or select **New** to add a new inline set.

Note that if you add a new inline set, you must configure it on the Device Management page (**Devices > Device Management > Inline Sets**) after you set up the inline interface. For more information, see [Adding Inline Sets](#) on page 271.
7. Select the **Enabled** check box to allow the inline interface to handle traffic.

If you clear the check box, the interface becomes disabled so that users cannot access it for security purposes.
8. From the **Mode** drop-down list, select an option to designate the link mode or select **Autonegotiation** to specify that the interface is configured to automatically negotiate speed and duplex settings. Note that Mode settings are available only for copper interfaces.
9. From the **MDI/MDIX** drop-down list, select an option to designate whether the interface is configured for MDI (medium dependent interface), MDIX (medium dependent interface crossover), or Auto-MDIX. Note that MDI/MDIX settings are available only for copper interfaces.

By default, MDI/MDIX is set to **Auto-MDIX**, which automatically handles switching between MDI and MDIX to attain link.
10. Click **Save**.

The inline interface is configured. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211 for more information.

Configuring Inline Sets

LICENSE: Protection

Before you can use inline interfaces in an inline deployment, you must configure inline sets and assign inline interface pairs to them. An inline set is a grouping of one or more inline interface pairs on a device; an inline interface pair can belong to only one inline set at a time.

See the following sections for more information:

- [Viewing Inline Sets](#) on page 271
- [Adding Inline Sets](#) on page 271
- [Configuring Advanced Inline Set Options](#) on page 275
- [Deleting Inline Sets](#) on page 279

Viewing Inline Sets

LICENSE: Protection

The Inline Sets tab of the Device Management page displays a list of all inline sets you have configured on a device. Note that you cannot configure inline sets to go into bypass mode on a virtual device. The Inline Sets Table View Fields table includes summary information about each set.

Inline Sets Table View Fields

FIELD	DESCRIPTION
Name	The name of the inline set.
Interface Pairs	A list of all pairs of inline interfaces assigned to the inline set. A pair is not available when you disable either interface in the pair from the Interfaces tab.
Bypass	The configured bypass mode of the inline set.

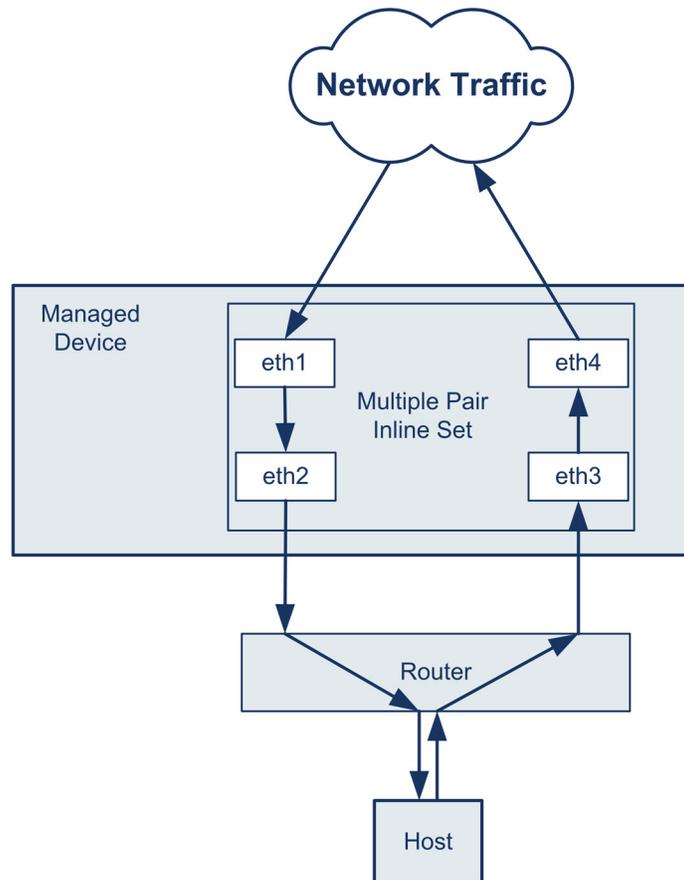

Adding Inline Sets

LICENSE: Protection

You can add inline sets from the Inline Sets tab of the Device Management page. You can also add inline sets as you configure inline interfaces.

You can assign only inline interface pairs to an inline set. If you want to create an inline set before you configure the inline interfaces on your managed devices, you can create an empty inline set and add interfaces to it later.

You can also add multiple interface pairs when your network uses asynchronous routing, as shown in the following diagram.

Your network may be set up to route traffic between a host on your network and external hosts through different inline interface pairs, depending on whether the traffic is inbound or outbound. If you include only one interface pair in an inline set, the device may not correctly analyze your network traffic because it might see only half of the traffic.

For devices with inline sets, a software bridge is automatically set up to transport packets after the device restarts. If the device is restarting, there is no software bridge running anywhere. If you enable bypass mode on the inline set, it goes into hardware bypass while the device is restarting. In that case, you may lose a few seconds of packets as the system goes down and comes back up, due to

renegotiation of link with the device. However, the system will pass traffic while Snort is restarting.

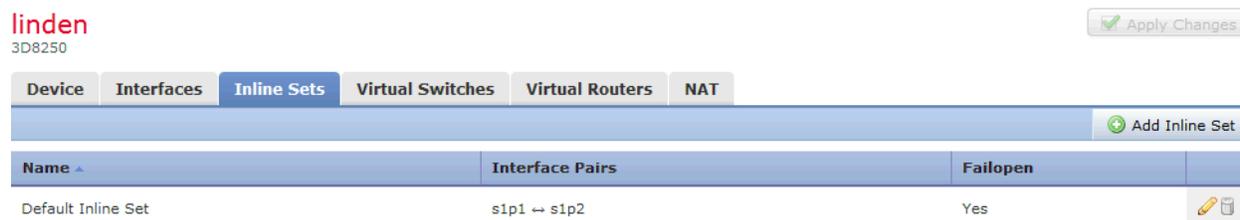

WARNING! Changes you make to an existing inline set may interrupt traffic on the device. Changing the maximum transmission unit (MTU) interrupts traffic on the device; some packets are transmitted without inspection and dropped. The range within which you can set the MTU can vary depending on the Sourcefire 3D System software version, device model, and interface type. See [Configuring the Interface MTU](#) on page 263 for more information.

To edit an existing inline set, click the edit icon (✎) next to the set.

To add an inline set:

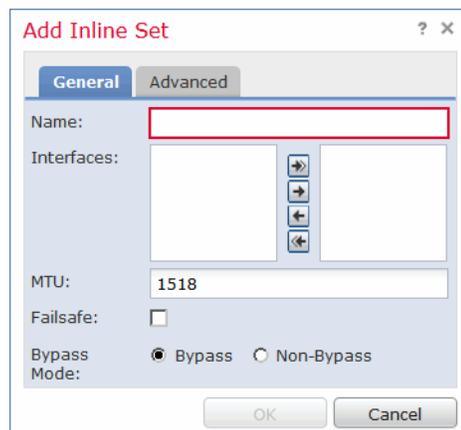

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to add the inline set, click the edit icon (✎).
The Interfaces tab appears.
3. Click **Inline Sets**.
The Inline Sets tab appears.

4. Click **Add Inline Set**.

The Add Inline Set pop-up window appears.

5. In the **Name** field, type a name for the inline set. You can use alphanumeric characters and spaces.

6. You have two options for selecting inline interface pairs to add to the inline set:

- Next to **Interfaces**, select one or more inline interface pairs, then click the add selected icon (➔). Use Ctrl or Shift to select multiple inline interface pairs.
- To add all interface pairs to the inline set, click the add all icon (➔➔).

TIP! To remove inline interfaces from the inline set, select one or more inline interface pairs and click the remove selected icon (⬅). To remove all interface pairs from the inline set, click the remove all icon (⬅➔). Disabling either interface in a pair from the Interfaces tab also removes the pair.

7. In the **MTU** field, type a maximum transmission unit (MTU), which designates the largest size packet allowed.

The range within which you can set the MTU can vary depending on the Sourcefire 3D System software version, device model, and interface type. See [Configuring the Interface MTU](#) on page 263 for more information.

8. Optionally, select **Failsafe** to specify that traffic is allowed to bypass detection and continue through the device. Managed devices monitor internal traffic buffers and bypass detection if those buffers are full.

Note that only Series 3 and 3D9900 devices support this option.

9. Select the bypass mode to configure how the relays in the inline interfaces respond when an interface fails:
 - Select **Bypass** to allow traffic to continue to pass through the interfaces.
 - Select **Non-Bypass** to block traffic.

IMPORTANT! In bypass mode, you may lose a few packets when you reboot the appliance. Also note that you cannot configure bypass mode for inline sets on a virtual device, for non-bypass NetMods on 8000 Series devices, or for SFP modules on 3D7115 or 3D7125 devices.

10. Click **OK**.

The inline set is added. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211 for more information.

TIP! To configure advanced settings for the inline set, such as tap mode, link state propagation, and transparent inline mode, see [Configuring Advanced Inline Set Options](#) on page 275.

Configuring Advanced Inline Set Options

LICENSE: Protection

SUPPORTED DEVICES: feature dependent

There are a number of options you may consider as you configure inline sets. See the sections below for more information about each option.

Tap Mode

SUPPORTED DEVICES: Series 3, 3D9900

Tap mode is available on 3D9900 and Series 3 devices when you create an inline or inline with fail-open interface set.

With tap mode, the device is deployed inline, but instead of the packet flow passing through the device, a copy of each packet is sent to the device and the network traffic flow is undisturbed. Because you are working with copies of packets rather than the packets themselves, rules that you set to drop and rules that use the replace keyword do not affect the packet stream. However, rules of these types do generate intrusion events when they are triggered, and the table view of intrusion events indicates that the triggering packets would have dropped in an inline deployment.

There are benefits to using tap mode with devices that are deployed inline. For example, you can set up the cabling between the device and the network as if the device were inline and analyze the kinds of intrusion events the device generates. Based on the results, you can modify your intrusion policy and add the drop rules

that best protect your network without impacting its efficiency. When you are ready to deploy the device inline, you can disable tap mode and begin dropping suspicious traffic without having to reconfigure the cabling between the device and the network.

Note that you cannot enable this option and strict TCP enforcement on the same inline set.

Propagate Link State

SUPPORTED DEVICES: Series 2, Series 3

Link state propagation is a feature for inline sets configured in bypass mode so both pairs of an inline set track state.

Link state propagation automatically brings down the second interface in the inline interface pair when one of the interfaces in an inline set goes down. When the downed interface comes back up, the second interface automatically comes back up, also. In other words, if the link state of one interface changes, the link state of the other interface changes automatically to match it. Link state propagation is available for both copper and fiber configurable bypass interfaces.

IMPORTANT! When link state propagation triggers, fiber inline sets configured as fail-open on Series 2 devices (except those on 3D9900s) activate hardware bypass mode. In this case, the interface cards involved do not come out of bypass automatically; you must bring them out of bypass mode manually. For more information about fiber interfaces in inline sets and hardware bypass, see [Removing Bypass Mode on Fiber Inline Sets Configured to Fail Open](#) on page 279.

Link state propagation is especially useful in resilient network environments where routers are configured to reroute traffic automatically around network devices that are in a failure state.

You cannot disable link state propagation for inline sets configured on clustered devices.

Note that virtual devices do not support this option.

Transparent Inline Mode

Transparent Inline Mode option allows the device to act as a “bump in the wire” and means that the device forwards all the network traffic it sees, regardless of its source and destination. Note that you cannot disable this option on Series 3 or 3D9900 devices.

Strict TCP Enforcement

SUPPORTED DEVICES: Series 3

To maximize TCP security, you can enable strict enforcement, which blocks connections where the three-way handshake was not completed. Strict enforcement also blocks:

- non-SYN TCP packets for connections where the three-way handshake was not completed
- non-SYN/RST packets from the initiator on a TCP connection before the responder sends the SYN-ACK
- non-SYN-ACK/RST packets from the responder on a TCP connection after the SYN but before the session is established
- SYN packets on an established TCP connection from either the initiator or the responder

Note that Series 2 and virtual devices do not support this option. In addition, you cannot enable this option and tap mode on the same inline set.

WARNING! Managed devices must be running at least Version 5.1 of the Sourcefire 3D System before you can enable strict TCP enforcement. Although you can apply a device configuration with strict TCP enforcement to pre-5.1 devices, those devices do not perform strict enforcement.

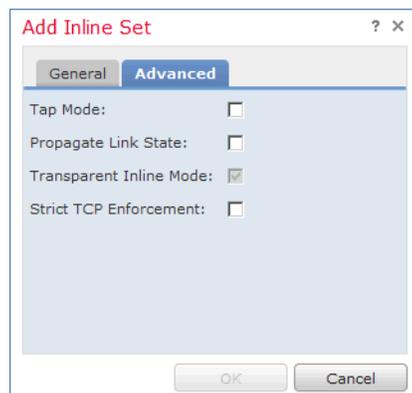

To configure advanced inline set options:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to edit the inline set, click the edit icon (✎).
The Interfaces tab appears.
3. Click **Inline Sets**.
The Inline Sets tab appears.
4. Next to the inline set you want to edit, click the edit icon (✎).
The Edit Inline Set pop-up window appears.

5. Click **Advanced**.

The Advanced tab appears.

6. Optionally, select **Tap Mode** to enable tap mode on the inline interfaces of Series 3 and 3D9900 devices.
Note that virtual devices and Series 2 devices other than 3D9900 do not support this option. In addition, you cannot enable Tap Mode and Strict TCP Enforcement on the same inline set.
7. Optionally, select **Propagate Link State** on Series 2 or Series 3 devices. This option is especially useful if the routers on your network are able to reroute traffic around a network device that is down.
You cannot disable link state propagation for inline sets configured on clustered devices.
Note that virtual devices do not support this option.
8. Optionally, select **Strict TCP Enforcement** to enable strict TCP enforcement on Series 3 devices.
Note that Series 2 and virtual devices do not support this option. In addition, you cannot enable Strict TCP Enforcement and Tap Mode on the same inline set.
9. Optionally, select **Transparent Inline Mode**.
Note that you cannot disable this option on Series 3 or 3D9900 devices.
10. Click **OK**.
Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211 for more information.

Removing Bypass Mode on Fiber Inline Sets Configured to Fail Open

LICENSE: Protection

SUPPORTED DEVICES: Series 2 except 3D9900

When link state propagation is enabled on a Series 2 device with a fiber inline set configured to fail open and the device goes into bypass mode, all network traffic passes through the inline set without being analyzed. When the links restore, most fiber inline sets configured to fail open do not return from bypass automatically. You can use a command line tool to force the inline set out of bypass mode.

This tool works on inline sets with fiber inline interfaces configured to fail open. It is not necessary to use this tool on inline sets with copper inline interfaces set to fail open.

IMPORTANT! Contact Technical Support if you are having issues with inline sets configured to fail open on your device.

To force a fiber inline set configured to fail open out of bypass mode on a device:

ACCESS: Admin/Network Admin

1. Open a terminal window on your device and sign in as the admin user.
2. Enter the following at the command line:

```
sudo /var/sf/bin/unbypass_cards.sh
```

You are prompted for your password.
3. When the interfaces switch out of bypass mode, a message in syslog indicates the device is analyzing traffic. For example:

```
Fiber pair has been reset by un_bypass
```

Deleting Inline Sets

LICENSE: Protection

When you delete an inline set, any inline interfaces assigned to the set become available for inclusion in another set. The interfaces are not deleted.

To delete an inline set:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to delete the inline set, click the edit icon ().
The Interfaces tab appears.

3. Click **Inline Sets**.
The Inline Sets tab appears.
4. Next to the inline set you want to delete, click the delete icon ().
5. When prompted, confirm that you want to delete the inline set.
The inline set is deleted. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211 for more information.

CHAPTER 7

SETTING UP VIRTUAL SWITCHES

You can configure a managed device in a Layer 2 deployment so that it provides packet switching between two or more networks. In a Layer 2 deployment, you can configure virtual switches on managed devices to operate as standalone broadcast domains, dividing your network into logical segments. A virtual switch uses the media access control (MAC) address from a host to determine where to send packets.

When you configure a virtual switch, the switch initially broadcasts packets through every available port on the switch. Over time, the switch uses tagged return traffic to learn which hosts reside on the networks connected to each port.

IMPORTANT! In a Layer 2 deployment, you cannot block egress traffic based on destination network or destination security zone. You must instead write access control rules that block ingress traffic based on blocking source network or source security zone. For more information on adding zones and networks to access control rules, see [Adding Zone Conditions](#) on page 492 and [Adding Network Conditions](#) on page 493.

A virtual switch must contain two or more switched interfaces to handle traffic. For each virtual switch, traffic becomes limited to the set of ports configured as switched interfaces. For example, if you configure a virtual switch with four switched interfaces, packets sent in through one port for broadcast can only be sent out of the remaining three ports on the switch.

When you configure a physical switched interface, you must assign it to a virtual switch. You can also define additional logical switched interfaces on a physical port as needed.

Note that you cannot configure virtual switches, physical switched interfaces, or logical switched interfaces on a virtual device.

WARNING! If a Layer 2 deployment fails for any reason, the device no longer passes traffic.

See the following sections for more information about configuring a Layer 2 deployment:

- [Configuring Switched Interfaces](#) on page 282
- [Configuring Virtual Switches](#) on page 288

Configuring Switched Interfaces

LICENSE: Control

SUPPORTED DEVICES: Series 3

You can set up switched interfaces to have either physical or logical configurations. You can configure physical switched interfaces for handling untagged VLAN traffic. You can also create logical switched interfaces for handling traffic with designated VLAN tags.

In a Layer 2 deployment, the system drops any traffic received on an external physical interface that does not have a switched interface waiting for it. If the system receives a packet with no VLAN tag and you have not configured a physical switched interface for that port, it drops the packet. If the system receives a VLAN-tagged packet and you have not configured a logical switched interface, it also drops the packet.

The system handles traffic that has been received with VLAN tags on switched interfaces by stripping the outermost VLAN tag on ingress before any rules evaluation or forwarding decisions. Packets leaving the device through a VLAN-tagged logical switched interface are encapsulated with the associated VLAN tag on egress.

Note that if you change the parent physical interface to inline or passive, the system deletes all the associated logical interfaces.

See the following sections for more information:

- [Configuring Physical Switched Interfaces](#) on page 283
- [Adding Logical Switched Interfaces](#) on page 285
- [Deleting Logical Switched Interfaces](#) on page 287

Configuring Physical Switched Interfaces

LICENSE: Control

SUPPORTED DEVICES: Series 3

You can configure one or more physical ports on a managed device as switched interfaces. You must assign a physical switched interface to a virtual switch before it can handle traffic.

WARNING! Changing the maximum transmission unit (MTU) interrupts traffic on the device and packets are dropped. The range within which you can set the MTU can vary depending on the Sourcefire 3D System software version, device model, and interface type. See [Configuring the Interface MTU](#) on page 263 for more information.

To configure a physical switched interface:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.

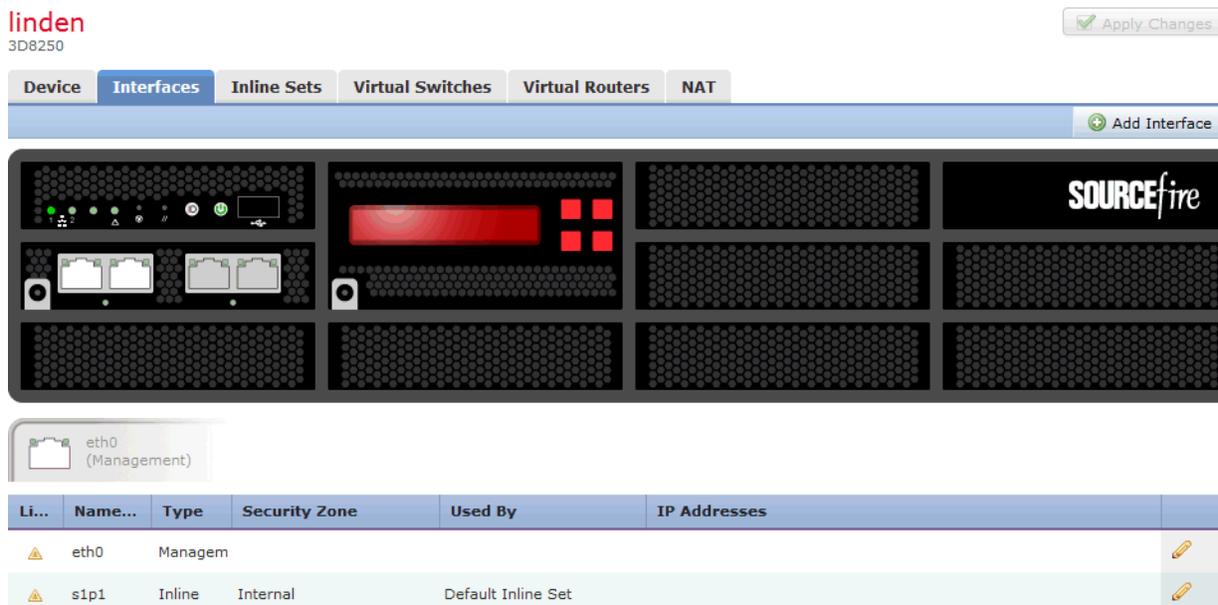

The Device Management page appears.

Name	License Type	Health Policy	System Policy	Access Control Policy
📁 Ungrouped (4)				

- Next to the device where you want to configure the switched interface, click the edit icon (✎).

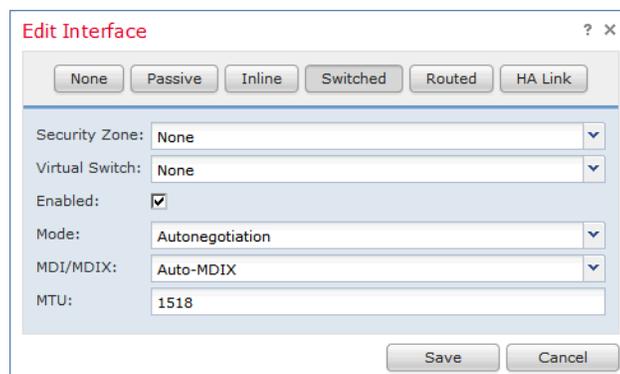

The Interfaces tab appears.

- Next to the interface you want to configure as a switched interface, click the edit icon (✎).

The Edit Interface pop-up window appears.

- Click **Switched** to display the switched interface options.

- Optionally, from the **Security Zone** drop-down list, select an existing security zone or select **New** to add a new security zone.

6. Optionally, from the **Virtual Switch** drop-down list, select an existing virtual switch or select **New** to add a new virtual switch.

Note that if you add a new virtual switch, you must configure it on the Virtual Switches tab of the Device Management page (**Devices > Device Management > Virtual Switches**) after you set up the switched interface. See [Adding Virtual Switches](#) on page 289.

7. Select the **Enabled** check box to allow the switched interface to handle traffic. If you clear the check box, the interface becomes disabled so that users cannot access it for security purposes.

8. From the **Mode** drop-down list, select an option to designate the link mode or select **Autonegotiation** to specify that the interface is configured to auto negotiate speed and duplex settings. Note that mode settings are available only for copper interfaces.

9. From the **MDI/MDIX** drop-down list, select an option to designate whether the interface is configured for MDI (medium dependent interface), MDIX (medium dependent interface crossover), or Auto-MDIX. Note that MDI/MDIX settings are available only for copper interfaces.

By default, MDI/MDIX is set to Auto-MDIX, which automatically handles switching between MDI and MDIX to attain link.

10. In the **MTU** field, type a maximum transmission unit (MTU), which designates the largest size packet allowed.

The range within which you can set the MTU can vary depending on the Sourcefire 3D System software version, device model, and interface type. See [Configuring the Interface MTU](#) on page 263 for more information.

11. Click **Save**.

The physical switched interface is configured. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211 for more information.

Adding Logical Switched Interfaces

LICENSE: Control

SUPPORTED DEVICES: Series 3

For each physical switched interface, you can add multiple logical switched interfaces. You must associate each logical interface with a VLAN tag to handle

traffic received by the physical interface with that specific tag. You must assign a logical switched interface to a virtual switch to handle traffic.

WARNING! Any changes you make to the maximum transmission unit (MTU) interrupts switched traffic on the device and packets are dropped. Managed devices must be running at least Version 5.1.1 of the Sourcefire 3D System before you can set their MTU to an upper limit of 10172. Pre-5.1.1 devices have an MTU limit of 9018; these devices will drop packets that exceed this limit.

To edit an existing logical switched interface, click the edit icon (✎) next to the interface.

To add a logical switched interface:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to add the switched interface, click the edit icon (✎).
The Interfaces tab appears.
3. Click **Add Interface**.
The Add Interface pop-up window appears.
4. Click **Switched** to display the switched interface options.

The screenshot shows the 'Add Interface' dialog box with the 'Switched' tab selected. The 'Interface' dropdown is set to 's1p3', 'VLAN Tag' is '1', 'Security Zone' is 'None', 'Virtual Switch' is 'None', 'Enabled' is checked, and 'MTU' is '1518'. The 'Save' and 'Cancel' buttons are at the bottom right.

5. From the **Interface** drop-down list, select the physical interface that will receive the VLAN-tagged traffic.
6. In the **VLAN Tag** field, type a tag value that gets assigned to inbound and outbound traffic on this interface. The value can be any integer from 1 to 4094.
7. Optionally, from the **Security Zone** drop-down list, select an existing security zone or select **New** to add a new security zone.

8. Optionally, from the Virtual Switch drop-down list, select an existing virtual switch or select **New** to add a new virtual switch.
Note that if you add a new virtual switch, you must configure it on the Device Management page (**Devices > Device Management > Virtual Switches**) after you set up the switched interface. See [Adding Virtual Switches](#) on page 289.
9. Select the **Enabled** check box to allow the switched interface to handle traffic.
If you clear the check box, the interface becomes disabled and administratively taken down. If you disable a physical interface, you also disable all of the logical interfaces associated with it.
10. In the **MTU** field, type a maximum transmission unit (MTU), which designates the largest size packet allowed.
In Version 5.1.1 or greater, the value can be any integer from 1518 to 10172. In pre-5.1.1 devices, the value can be 1518 to 9018.
11. Click **Save**.
The logical switched interface is added. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211 for more information.

Deleting Logical Switched Interfaces

LICENSE: Control

SUPPORTED DEVICES: Series 3

When you delete a logical switched interface, you remove it from the physical interface where it resides, as well as the virtual switch and security zone it is associated with.

To delete a switched interface:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Select the managed device that contains the switched interface you want to delete and click the edit icon (✎) for that device.
The Interfaces tab for that device appears.
3. Next to the logical switched interface you want to delete, click the delete icon (🗑).
4. When prompted, confirm that you want to delete the interface.
The interface is deleted. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211 for more information.

Configuring Virtual Switches

LICENSE: Control

SUPPORTED DEVICES: Series 3

Before you can use switched interfaces in a Layer 2 deployment, you must configure virtual switches and assign switched interfaces to them. A virtual switch is a group of switched interfaces that process inbound and outbound traffic through your network.

See the following sections for more information about configuring virtual switches:

- [Viewing Virtual Switches](#) on page 288
- [Adding Virtual Switches](#) on page 289
- [Configuring Advanced Virtual Switch Settings](#) on page 291
- [Deleting Virtual Switches](#) on page 294

Viewing Virtual Switches

LICENSE: Control

SUPPORTED DEVICES: Series 3

The Virtual Switches tab of the Device Management page displays a list of all the virtual switches you have configured on a device. The page includes summary information about each switch, as described in the following table.

Virtual Switches Table View Fields

FIELD	DESCRIPTION
Name	The name of the virtual switch.
Interfaces	All switched interfaces that are assigned to the virtual switch. Interfaces that you have disabled from the Interfaces tab are not available.
Hybrid Interface	The optionally configured hybrid interface that ties the virtual switch to a virtual router.

Virtual Switches Table View Fields (Continued)

FIELD	DESCRIPTION
Unicast Packets	Unicast packet statistics for the virtual switch, including: <ul style="list-style-type: none">• Unicast packets received• Unicast packets forwarded (excludes drops by host)• Unicast packets unintentionally dropped
Broadcast Packets	Broadcast packet statistics for the virtual switch, including: <ul style="list-style-type: none">• Broadcast packets received• Broadcast packets forwarded• Broadcast packets unintentionally dropped

Adding Virtual Switches

LICENSE: Control

SUPPORTED DEVICES: Series 3

You can add virtual switches from the Virtual Switches tab of the Device Management page. You can also add switches as you configure switched interfaces.

You can assign only switched interfaces to a virtual switch. If you want to create a virtual switch before you configure the switched interfaces on your managed devices, you can create an empty virtual switch and add interfaces to it later.

TIP! To edit an existing virtual switch, click the edit icon () next to the switch.

Note that any changes you make to an existing virtual switch may interrupt traffic on the device.

To add a virtual switch:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to add the virtual switch, click the edit icon ().
The Interfaces tab appears.

3. Click **Virtual Switches**.

The Virtual Switches tab appears.

Name	Interface	Hybrid Interface	Unicast Packets	Broadcast Packets	
Test Virtual Switch	s1p3		Received: 0 Forwarded: 0 Dropped: 0	Received: 0 Forwarded: 0 Dropped: 0	

4. Click **Add Virtual Switch**.

The Add Virtual Switch pop-up window appears.

Add Virtual Switch ? X

General Advanced

Name:

Available Selected

s1p3

Add

Hybrid Interface: None

Save Cancel

5. In the **Name** field, type a name for the virtual switch. You can use alphanumeric characters and spaces.
6. Under **Available**, select one or more switched interfaces to add to the virtual switch.

TIP! Interfaces that you have disabled from the Interfaces tab are not available; disabling an interface after you add it removes it from the configuration.

7. Click **Add**.
8. Optionally, from the **Hybrid Interface** drop-down list, select a hybrid interface that ties the virtual switch to a virtual router. For more information, see [Setting Up Hybrid Interfaces](#) on page 352.

9. Click **Save**.

The virtual switch is added. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211 for more information.

TIP! To configure advanced settings for the switch, such as static MAC entries and spanning tree protocol, see [Configuring Advanced Virtual Switch Settings](#) on page 291.

Configuring Advanced Virtual Switch Settings

LICENSE: Control

SUPPORTED DEVICES: Series 3

When adding or editing a virtual switch, you can add static MAC entries, enable Spanning Tree Protocol (STP), drop Bridge Protocol Data Units (BPDU), and enable strict TCP enforcement.

Over time, a virtual switch learns MAC addresses by tagging return traffic from the network. Optionally, you can manually add a static MAC entry, which designates that a MAC address resides on a specific port. Regardless of whether you ever receive traffic from that port, the MAC address remains static in the table. You can specify one or more static MAC addresses for each virtual switch.

STP is a network protocol used to prevent network loops. BPDUs are exchanged through the network, carrying information about network bridges. The protocol uses BPDUs to identify and select the fastest network links, if there are redundant links in the network. If a network link fails, Spanning Tree fails over to an existing alternate link.

If your virtual switch routes traffic between VLANs, similar to a router on a stick, BPDUs enter and exit the device through different logical switched interfaces, but the same physical switched interface. As a result, STP identifies the device as a redundant network loop, which can cause issues in certain Layer 2 deployments. To prevent this, you can configure the virtual switch at the domain level to have the device drop BPDUs when monitoring traffic.

IMPORTANT! Sourcefire strongly recommends that you enable STP when configuring a virtual switch that you plan to deploy in a device cluster.

To maximize TCP security, you can enable strict enforcement, which blocks connections where the three-way handshake was not completed. Strict enforcement also blocks:

- non-SYN TCP packets for connections where the three-way handshake was not completed
- non-SYN/RST packets from the initiator on a TCP connection before the responder sends the SYN-ACK

- non-SYN-ACK/RST packets from the responder on a TCP connection after the SYN but before the session is established
- SYN packets on an established TCP connection from either the initiator or the responder

Note that if you associate the virtual switch with a logical hybrid interface, the switch uses the same strict TCP enforcement setting as the virtual router associated with the logical hybrid interface. You cannot specify strict TCP enforcement on the switch in this case.

WARNING! Managed devices must be running at least Version 5.1 of the Sourcefire 3D System before you can enable strict TCP enforcement. Although you can apply a device configuration with strict TCP enforcement to pre-5.1 devices, those devices do not perform strict enforcement.

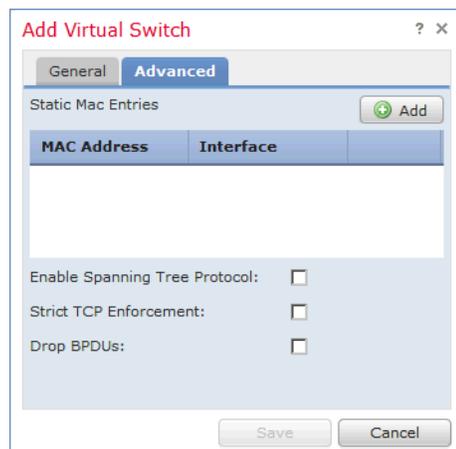

To configure advanced virtual switch settings:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device that contains the virtual switch you want to edit, click the edit icon (✎).
The Interfaces tab appears.
3. Click **Virtual Switches**.
The Virtual Switches tab appears.
4. Next to the virtual switch that you want to edit, click the edit icon (✎).
The Edit Virtual Switch pop-up window appears.

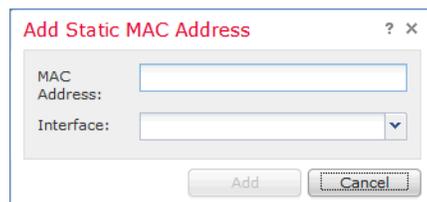

5. Click **Advanced**.

The Advanced tab appears.

6. To add a static MAC entry, click **Add**.

The Add Static MAC Address pop-up window appears.

7. In the **MAC Address** field, type the address using the standard format of six groups of two hexadecimal digits separated by colons (for example, 01:23:45:67:89:AB).
8. From the **Interface** drop-down list, select the interface where you want to assign the MAC address.
9. Click **Add**.

The MAC address is added to the Static MAC Entries table.

To edit a MAC address, click the edit icon (✎). To delete a MAC address, click the delete icon (🗑).

10. Optionally, to enable the Spanning Tree Protocol, select **Enable Spanning Tree Protocol**. Select **Enable Spanning Tree Protocol** only if your virtual switch switches traffic between multiple network interfaces.
You cannot select **Drop BPDUs** unless you clear **Enable Spanning Tree Protocol**.
11. Optionally, select **Strict TCP Enforcement** to enable strict TCP enforcement.

If you associate the virtual switch with a logical hybrid interface, this option does not appear and the switch uses the same setting as the virtual router associated with the logical hybrid interface.

12. Optionally, select **Drop BPDUs** to drop BPDUs at the domain level. Select **Drop BPDUs** only if your virtual switch routes traffic between VLANs on a single physical interface.
You cannot select **Enable Spanning Tree Protocol** unless you clear **Drop BPDUs**.
13. Click **Save**.
Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211 for more information.

Deleting Virtual Switches

LICENSE: Control

SUPPORTED DEVICES: Series 3

When you delete a virtual switch, any switched interfaces assigned to the switch become available for inclusion in another switch.

To delete a virtual switch:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Select the managed device that contains the virtual switch you want to delete and click the edit icon () for that device.
The Interfaces tab for that device appears.
3. Click **Virtual Switches**.
The Virtual Switches tab appears.
4. Next to the virtual switch that you want to delete, click the delete icon ().
5. When prompted, confirm that you want to delete the virtual switch.
The virtual switch is deleted. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211 for more information.

CHAPTER 8

SETTING UP VIRTUAL ROUTERS

You can configure a managed device in a Layer 3 deployment so that it routes traffic between two or more interfaces. You must assign an IP address to each interface and assign the interfaces to a virtual router to route traffic.

You can configure the system to route packets by making packet forwarding decisions according to the destination address. Interfaces configured as routed interfaces receive and forward the Layer 3 traffic. Routers obtain the destination from the outgoing interface based on the forwarding criteria, and access control rules designate the security policies to be applied.

In Layer 3 deployments, you can define static routes. In addition, you can configure Routing Information Protocol (RIP) and Open Shortest Path First (OSPF) dynamic routing protocols. You can also configure a combination of static routes and RIP or static routes and OSPF.

Note that you cannot configure virtual routers, physical routed interfaces, or logical routed interfaces on a virtual device.

WARNING! If a Layer 3 deployment fails for any reason, the device no longer passes traffic.

See the following sections for more information about configuring a Layer 3 deployment:

- [Configuring Routed Interfaces](#) on page 296
- [Configuring Virtual Routers](#) on page 306
- [Configuring NAT on a Virtual Router](#) on page 341

Configuring Routed Interfaces

LICENSE: Control

SUPPORTED DEVICES: Series 3

You can set up routed interfaces with either physical or logical configurations. You can configure physical routed interfaces for handling untagged VLAN traffic. You can also create logical routed interfaces for handling traffic with designated VLAN tags.

In a Layer 3 deployment, the system drops any traffic received on an external physical interface that does not have a routed interface waiting for it. If the system receives a packet with no VLAN tag and you have not configured a physical routed interface for that port, it drops the packet. If the system receives a VLAN-tagged packet and you have not configured a logical routed interface, it also drops the packet.

The system handles traffic that has been received with VLAN tags on switched interfaces by stripping the outermost VLAN tag on ingress prior to any rules evaluation or forwarding decisions. Packets leaving the device through a VLAN-tagged logical routed interface are encapsulated with the associated VLAN tag on egress. The system drops any traffic received with a VLAN tag after the stripping process completes.

Note that if you change the parent physical interface to inline or passive, the system deletes all the associated logical interfaces.

See the following sections for more information:

- [Configuring Physical Routed Interfaces](#) on page 296
- [Adding Logical Routed Interfaces](#) on page 300
- [Deleting Logical Routed Interfaces](#) on page 304

Configuring Physical Routed Interfaces

LICENSE: Control

SUPPORTED DEVICES: Series 3

You can configure one or more physical ports on a managed device as routed interfaces. You must assign a physical routed interface to a virtual router before it can route traffic.

You can add static Address Resolution Protocol (ARP) entries to a routed interface. If an external host needs to know the MAC address of the destination IP address it needs to send traffic to on your local network, it sends an ARP request. When you configure static ARP entries, the virtual router responds with an IP address and associated MAC address.

Note that disabling the **ICMP Enable Responses** option for routed interfaces does not prevent ICMP responses in all scenarios. You can add rules to an access control policy to drop packets where the destination IP is the routed interface's IP and the protocol is ICMP. For more information about creating access control

rules, see [Understanding and Writing Access Control Rules](#) on page 472. If you have enabled the **Inspect Local Router Traffic** option on the managed device, it drops the packets before they reach the host, thereby preventing any response. For more information about inspecting local router traffic, see [Understanding Advanced Device Settings](#) on page 250.

WARNING! Changing the maximum transmission unit (MTU) interrupts traffic on the device and packets are dropped. The range within which you can set the MTU can vary depending on the Sourcefire 3D System software version, device model, and interface type. See [Configuring the Interface MTU](#) on page 263 for more information.

To configure a physical routed interface:

ACCESS: Admin/Network Admin

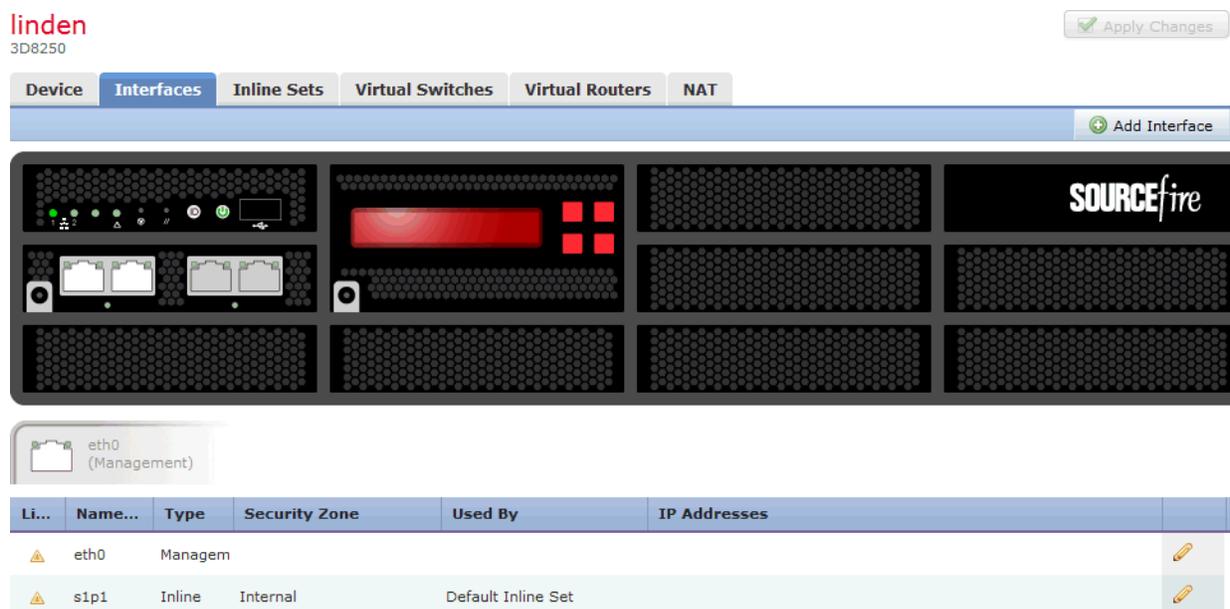

1. Select **Devices > Device Management**.

The Device Management page appears.

2. Next to the device where you want to configure the routed interface, click the edit icon (✎).

The Interfaces tab for that device appears.

3. Next to the interface you want to configure as a routed interface, click the edit icon (✎).

The Edit Interface pop-up window appears.

4. Click **Routed** to display the routed interface options.

Edit Interface ? x

None Passive Inline Switched **Routed** HA Link

Security Zone: None

Virtual Router: None

Enabled:

Mode: Autonegotiation

MDI/MDIX: Auto-MDIX

MTU: 1518

ICMP: Enable Responses

IPv6 NDP: Enable Router Advertisement

IP Addresses:

Address	Type
---------	------

Static ARP Entries:

IP Address	MAC Address
------------	-------------

Save Cancel

5. Optionally, from the **Security Zone** drop-down list, select an existing security zone or select **New** to add a new security zone.
6. Optionally, from the **Virtual Router** drop-down list, select an existing virtual router or select **New** to add a new virtual router.

Note that if you add a new virtual router, you must configure it on the Virtual Routers tab of the Device Management page (**Devices > Device Management > Virtual Routers**) after you set up the routed interface. See [Adding Virtual Routers](#) on page 307.

7. Select the **Enabled** check box to allow the routed interface to handle traffic. If you clear the check box, the interface becomes disabled so that users cannot access it for security purposes.
8. From the **Mode** drop-down list, select an option to designate the link mode or select **Autonegotiation** to specify that the interface is configured to auto negotiate speed and duplex settings. Note that mode settings are available only for copper interfaces.

9. From the **MDI/MDIX** drop-down list, select an option to designate whether the interface is configured for MDI (medium dependent interface), MDIX (medium dependent interface crossover), or Auto-MDIX. Note that MDI/MDIX settings are available only for copper interfaces.

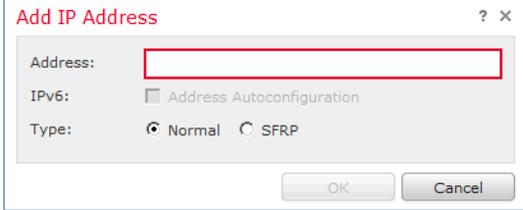

Normally, MDI/MDIX is set to Auto-MDIX, which automatically handles switching between MDI and MDIX to attain link.

10. In the **MTU** field, type a maximum transmission unit (MTU), which designates the largest size packet allowed. Note that the MTU is the Layer 2 MTU/MRU and not the Layer 3 MTU.

The range within which you can set the MTU can vary depending on the Sourcefire 3D System software version, device model, and interface type. See [Configuring the Interface MTU](#) on page 263 for more information.

11. Next to **ICMP**, select the **Enable Responses** check box to allow the interface to respond to ICMP traffic such as pings and traceroute.
12. Next to **IPv6 NDP**, select the **Enable Router Advertisement** check box to enable the interface to broadcast router advertisements.
13. To add an IP address, click **Add**.

The Add IP Address pop-up window appears.

14. In the **Address** field, type the routed interface's IP address and subnet mask using CIDR notation.
15. Optionally, if your organization uses IPv6 addresses, next to the **IPv6** field, select the **Address Autoconfiguration** check box to set the IP address of the interface automatically.
16. For **Type**, select either Normal or SFRP.
For SFRP options, see [Configuring SFRP](#) on page 304 for more information.

17. Click **OK**.

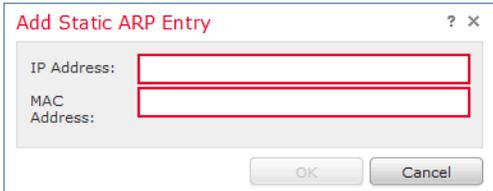

The IP address is added.

To edit an IP address, click the edit icon (✎). To delete an IP address, click the delete icon (🗑).

IMPORTANT! When adding an IP address to a routed interface of a clustered device, you must add a corresponding IP address to the routed interface on the cluster peer.

18. To add a static ARP entry, click **Add**.

The Add Static ARP Entry pop-up window appears.

19. In the **IP Address** field, type an IP address for the static ARP entry.
20. In the **MAC Address** field, type a MAC address to associate with the IP address. Enter the address using the standard format of six groups of two hexadecimal digits separated by colons (for example, 01:23:45:67:89:AB).
21. Click **OK**.
- The static ARP entry is added.

TIP! To edit a static ARP entry, click the edit icon (✎). To delete a static ARP entry, click the delete icon (🗑).

22. Click **Save**.

The physical routed interface is configured. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

Adding Logical Routed Interfaces

LICENSE: Control

SUPPORTED DEVICES: Series 3

For each physical routed interface, you can add multiple logical routed interfaces. You must associate each logical interface with a VLAN tag to handle traffic received by the physical interface with that specific tag. You must assign a logical routed interface to a virtual router to route traffic.

Note that disabling the **ICMP Enable Responses** option for routed interfaces does not prevent ICMP responses in all scenarios. You can add rules to an access control policy to drop packets where the destination IP is the routed interface's IP and the protocol is ICMP. For more information about creating access control rules, see [Understanding and Writing Access Control Rules](#) on page 472. If you have enabled the **Inspect Local Router Traffic** option on the managed device, it drops the packets before they reach the host, thereby preventing any response. For more information about inspecting local router traffic, see [Understanding Advanced Device Settings](#) on page 250.

WARNING! Changing the maximum transmission unit (MTU) interrupts traffic on the device and packets are dropped. The range within which you can set the MTU can vary depending on the Sourcefire 3D System software version, device model, and interface type. See [Configuring the Interface MTU](#) on page 263 for more information.

To edit an existing routed interface, click the edit icon () next to the interface.

To add a logical routed interface:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to add the routed interface, click the edit icon ().
The Interfaces tab for that device appears.
3. Click **Add Interface**.
The Add Interface pop-up window appears.

4. Click **Routed** to display the routed interface options.

The screenshot shows the 'Add Interface' configuration window with the 'Routed' tab selected. The configuration fields are as follows:

- Interface: s1p3
- VLAN Tag: 1
- Security Zone: None
- Virtual Router: None
- Enabled:
- MTU: 1518
- ICMP: Enable Responses
- IPv6 NDP: Enable Router Advertisement

Below these fields are two empty tables for configuration:

Address	Type
---------	------

IP Address	MAC Address
------------	-------------

Buttons for 'Add', 'Save', and 'Cancel' are visible at the bottom of the window.

5. From the **Interface** drop-down list, select the physical interface where you want to add the logical interface.
6. In the **VLAN Tag** field, type a tag value that gets assigned to inbound and outbound traffic on this interface. The value can be any integer from 1 to 4094.
7. Optionally, from the **Security Zone** drop-down list, select an existing security zone or select **New** to add a new security zone.
8. Optionally, from the **Virtual Router** drop-down list, select an existing virtual router or select **New** to add a new virtual router.

Note that if you add a new virtual router, you must configure it on the Device Management page (**Devices > Device Management > Virtual Routers**) after you finish setting up the routed interface. See [Adding Virtual Routers](#) on page 307.

9. Select the **Enabled** check box to allow the routed interface to handle traffic. If you clear the check box, the interface becomes disabled and administratively taken down. If you disable a physical interface, you also disable all of the logical interfaces associated with it.

10. In the **MTU** field, type a maximum transmission unit (MTU), which designates the largest size packet allowed. Note that the MTU is the Layer 2 MTU/MRU and not the Layer 3 MTU.

The range within which you can set the MTU can vary depending on the Sourcefire 3D System software version, device model, and interface type. See [Configuring the Interface MTU](#) on page 263 for more information.

11. Next to **ICMP**, select the **Enable Responses** check box to communicate updates or error information to other routers, intermediary devices, or hosts.
12. Next to **IPv6 NDP**, select the **Enable Router Advertisement** check box to enable the interface to broadcast router advertisements.
13. To add an IP address, click **Add**.
The Add IP Address pop-up window appears.
14. In the **Address** field, type the IP address in CIDR notation.
15. Optionally, if your organization uses IPv6 addresses, next to the **IPv6** field, select the **Address Autoconfiguration** check box to set the IP address of the interface automatically.
16. For **Type**, select either Normal or SFRP.
For SFRP options, see [Configuring SFRP](#) on page 304 for more information.
17. Click **OK**.

The IP address is added.

To edit an IP address, click the edit icon (✎). To delete an IP address, click the delete icon (🗑).

IMPORTANT! When you add an IP address to a routed interface of a clustered device, you must add a corresponding IP address to the routed interface on the cluster peer.

18. To add a static ARP entry, click **Add**.
The Add Static ARP Entry pop-up window appears.
19. In the **IP Address** field, type an IP address for the static ARP entry.
20. In the **MAC Address** field, type a MAC address to associate with the IP address. Enter the address using the standard format of six groups of two hexadecimal digits separated by colons (for example, 01:23:45:67:89:AB).

21. Click **OK**.
The static ARP entry is added.

TIP! To edit a static ARP entry, click the edit icon (). To delete a static ARP entry, click the delete icon ().

22. Click **Save**.
The logical routed interface is added. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

Deleting Logical Routed Interfaces

LICENSE: Control

SUPPORTED DEVICES: Series 3

When you delete a logical routed interface, you remove it from the physical interface where it resides, as well as its assigned virtual router and security zone.

To delete a routed interface:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to delete the routed interface, click the edit icon ().
The Interfaces tab for that device appears.
3. Next to the logical routed interface you want to delete, click the delete icon ().
4. When prompted, confirm that you want to delete the interface.
The interface is deleted. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

Configuring SFRP

LICENSE: Control

SUPPORTED DEVICES: Series 3

You can configure Sourcefire Redundancy Protocol (SFRP) to achieve network redundancy for high availability on either a device cluster or individual devices. SFRP provides gateway redundancy for both IPv4 and IPv6 addresses. You can configure SFRP on routed and hybrid interfaces.

If the interfaces are configured on individual devices, they must be in the same broadcast domain. You must designate at least one of the interfaces as master and an equal number as backup. The system supports only one master and one backup per IP address. If network connectivity is lost, the system automatically promotes the backup to master to maintain connectivity.

The options you set for SFRP must be the same on all interfaces in a group of SFRP interfaces. Multiple IP addresses in a group must be in the same master/backup state. Therefore, when you add or edit an IP address, the state you set for that address propagates to all the addresses in the group. For security purposes, you must enter values for **Group ID** and **Shared Secret** that are shared among the interfaces in the group.

To enable SFRP IP addresses on a virtual router, you must also configure at least one non-SFRP IP address.

For clustered devices, you designate the shared secret and the system copies it to the cluster peer along with the SFRP IP configuration. The shared secret authenticates peer data.

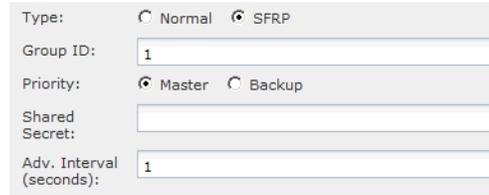

For more information about clustering devices, see [Clustering Devices](#) on page 220.

To configure SFRP:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to configure SFRP, click the edit icon (✎).
The Interfaces tab for that device appears.
3. Next to the interface where you want to configure SFRP, click the edit icon (✎).
The Edit Interface pop-up window appears.
4. Select the type of interface where you want to configure SFRP:
 - Click **Routed** to display the routed interface options.
 - Click **Hybrid** to display the hybrid interface options.
5. You can configure SFRP while adding or editing an IP address:
 - To add an IP address, click **Add**.
 - To edit an IP address, click the edit icon (✎).The Add IP Address or Edit IP Address pop-up window appears.

6. For **Type**, select **SFRP** to display the SFRP options.

Type: Normal SFRP
Group ID:
Priority: Master Backup
Shared Secret:
Adv. Interval (seconds):

7. In the **Group ID** field, enter a value that designates a group of master or backup interfaces configured for SFRP.
8. For **Priority**, select either **Master** or **Backup** to designate the preferred interface:
- For individual devices, you must set one interface to master on one device and the other to backup on a second device.
 - For device clusters, when you set one interface as master, the other automatically becomes the backup.
9. In the **Shared Secret** field, type a shared secret.
The Shared Secret field populates automatically for a group in a device cluster.
10. In the **Adv. Interval (seconds)** field, enter an interval for route advertisements for Layer 3 traffic.
11. Click **OK**.
The IP address is added or edited.
12. Click **Save**.
Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

Configuring Virtual Routers

LICENSE: Control

SUPPORTED DEVICES: Series 3

Before you can use routed interfaces in a Layer 3 deployment, you must configure virtual routers and assign routed interfaces to them. A virtual router is a group of routed interfaces that route Layer 3 traffic.

See the following sections for more information about configuring virtual routers:

- [Viewing Virtual Routers](#) on page 307
- [Adding Virtual Routers](#) on page 307
- [Viewing Virtual Router Statistics](#) on page 340
- [Deleting Virtual Routers](#) on page 341

Viewing Virtual Routers

LICENSE: Control

SUPPORTED DEVICES: Series 3

The Virtual Routers tab of the Device Management page (**Devices > Device Management > Virtual Routers**) displays a list of all the virtual routers you have configured on a device. The table includes summary information about each router, as described in the following table.

Virtual Routers Table View Fields

FIELD	DESCRIPTION
Name	The name of the virtual router.
Interfaces	A list of all routed interfaces that are assigned to the virtual router. Disabling an interface from the Interfaces tab removes it.
Protocols	The protocols currently in use by the virtual router, which is one of the following: <ul style="list-style-type: none">• Static• Static, RIP• Static, OSPF

Adding Virtual Routers

LICENSE: Control

SUPPORTED DEVICES: Series 3

You can add virtual routers from the Virtual Routers tab of the Device Management page. You can also add routers as you configure routed interfaces.

You can assign only routed and hybrid interfaces to a virtual router. If you want to create a virtual router before you configure the interfaces on your managed devices, you can create an empty virtual router and add interfaces to it later.

To maximize TCP security, you can enable strict enforcement, which blocks connections where the three-way handshake was not completed. Strict enforcement also blocks:

- non-SYN TCP packets for connections where the three-way handshake was not completed
- non-SYN/RST packets from the initiator on a TCP connection before the responder sends the SYN-ACK

- non-SYN-ACK/RST packets from the responder on a TCP connection after the SYN but before the session is established
- SYN packets on an established TCP connection from either the initiator or the responder

WARNING! Managed devices must be running at least Version 5.1 of the Sourcefire 3D System before you can enable strict TCP enforcement. Although you can apply a device configuration with strict TCP enforcement to pre-5.1 devices, those devices do not perform strict enforcement.

Note that if you change the configuration of a Layer 3 interface to a non-Layer 3 interface or remove a Layer 3 interface from the virtual router, the router may fall into an invalid state. For example, if it is used in DHCPv6, it may cause an upstream and downstream mismatch. Any changes you make to an existing virtual router may interrupt traffic on the device.

TIP! To edit an existing virtual router, click the edit icon () next to the router.

You can configure virtual routers in several different ways beyond the general options. See the following sections for more information about these configurations:

- [Setting up DHCP Relay](#) on page 310
- [Setting up Static Routes](#) on page 313
- [Setting up Dynamic Routing](#) on page 316
- [Setting up RIP Configuration](#) on page 316
- [Setting Up OSPF Configuration](#) on page 323
- [Setting up Virtual Router Filters](#) on page 335
- [Adding Virtual Router Authentication Profiles](#) on page 339

To add a virtual router:

ACCESS: Admin/Network Admin

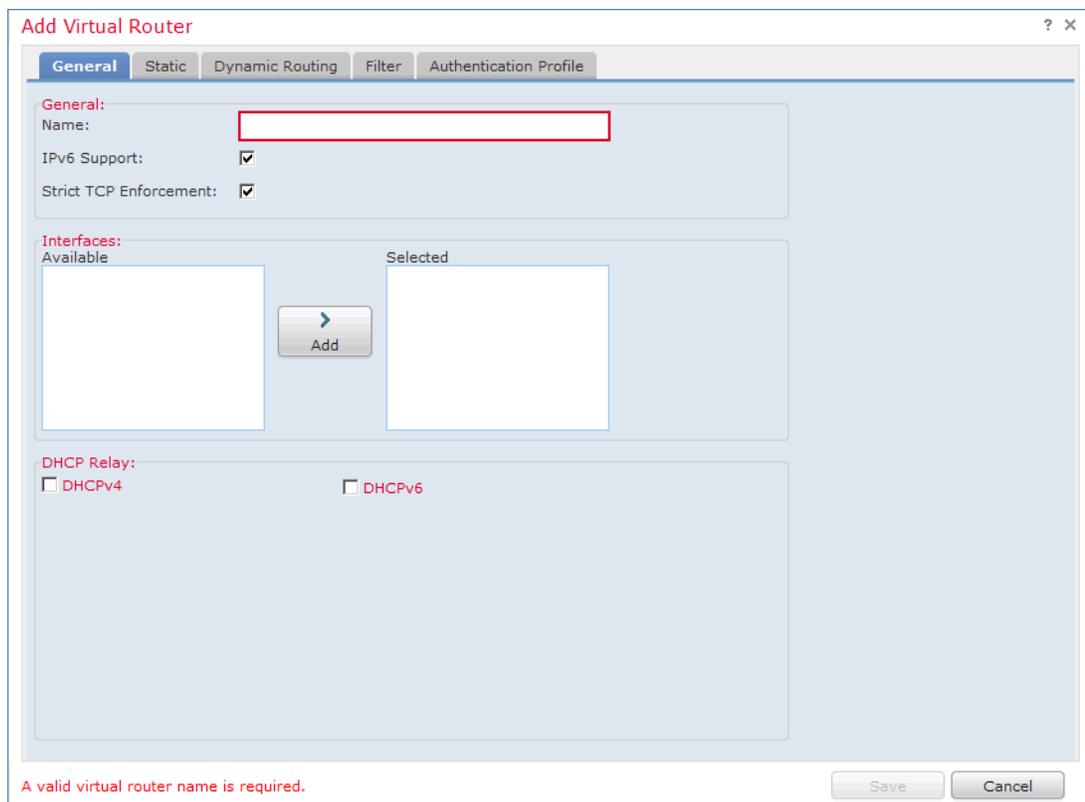

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to add the virtual router, click the edit icon ().
The Interfaces tab for that device appears.

3. Click **Virtual Routers**.
The Virtual Routers tab appears.

TIP! If your devices are in a clustered stack deployment, select the stack you want to modify from the **Selected Device** drop-down list.

4. Click **Add Virtual Router**.
The Add Virtual Router pop-up window appears.

5. In the **Name** field, type a name for the virtual router. You can use alphanumeric characters and spaces.

6. To enable IPv6 static routing, OSPFv3, and RIPng on your virtual router, select the **IPv6 Support** check box. To disable these features, deselect the check box.
7. Optionally, clear **Strict TCP Enforcement** if you do not want to enable strict TCP enforcement.
This option is enabled by default.
8. Under **Interfaces**, the **Available** list contains all enabled Layer 3 interfaces, routed and hybrid, on the device that you can assign to the virtual router. Select one or more interfaces to assign to the virtual router and click **Add**.

TIP! To remove a routed or hybrid interface from the virtual router, click the delete icon (). Disabling a configured interface from the Interfaces tab also removes it.

9. Click **Save**.
The virtual router is added. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

Setting up DHCP Relay

LICENSE: Control

SUPPORTED DEVICES: Series 3

DHCP provides configuration parameters to Internet hosts. A DHCP client that has not yet acquired an IP address cannot communicate directly with a DHCP server outside its broadcast domain. To allow DHCP clients to communicate with DHCP servers, you can configure DHCP relay instances to handle cases where the client is not on the same broadcast domain as the server.

You can set up DHCP relay for each virtual router you configure. By default, this feature is disabled. You can enable either DHCPv4 relay or DHCPv6 relay.

See the following sections for more information:

- [Setting up DHCPv4 Relay](#) on page 310
- [Setting up DHCPv6 Relay](#) on page 312

Setting up DHCPv4 Relay

LICENSE: Control

SUPPORTED DEVICES: Series 3

The following procedure explains how to set up DHCPv4 relay on a virtual router.

To set up DHCPv4 relay:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to set up DHCP relay, click the edit icon (✎).
The Interfaces tab for that device appears.
3. Click **Virtual Routers**.
The Virtual Routers tab appears.
4. Next to the virtual router where you want to set up DHCP relay, click the edit icon (✎).
The Edit Virtual Router pop-up window appears.
5. To set up DHCP relay for DHCPv4, select the **DHCPv4** check box.

6. Under the **Servers** field, type a server IP address.
7. Click **Add**.
The IP address is added to the **Servers** field. You can add up to four DHCP servers.

TIP! To delete a DHCP server, click the delete icon (🗑) next to the server IP address.

8. In the **Max Hops** field, type the maximum number of hops from 1 to 255.
9. Click **Save**.
Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

Setting up DHCPv6 Relay

LICENSE: Control

SUPPORTED DEVICES: Series 3

The following procedure explains how to set up DHCPv6 relay on a virtual router.

IMPORTANT! You cannot run a DHCPv6 Relay chain through two or more virtual routers running on the same device.

To set up DHCPv6 relay:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.

The Device Management page appears.

2. Next to the device where you want to set up DHCP relay, click the edit icon (✎).

The Interfaces tab for that device appears.

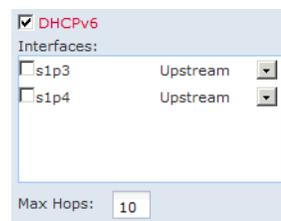

3. Click **Virtual Routers**.

The Virtual Routers tab appears.

4. Next to the virtual router where you want to set up DHCP relay, click the edit icon (✎).

The Edit Virtual Router pop-up window appears.

5. To set up DHCP relay for DHCPv6, select the **DHCPv6** check box.

✓ DHCPv6

Interfaces:

<input type="checkbox"/> s1p3	Upstream	▼
<input type="checkbox"/> s1p4	Upstream	▼

Max Hops: 10

6. In the **Interfaces** field, select the check boxes next to one or more interfaces that have been assigned to the virtual router.

TIP! You cannot disable an interface from the Interfaces tab while it is configured for DHCPv6 Relay. You must first clear the DHCPv6 Relay interfaces check box and save the configuration.

7. Next to a selected interface, click the drop-down icon and select whether the interface relays DHCP requests **Upstream**, **Downstream**, or **Both**.

Note that you must include at least one downstream interface and one upstream interface. Selecting both means that the interface is both downstream and upstream.

8. In the **Max Hops** field, type the maximum number of hops from 1 to 255
9. Click **Save**.

Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

Setting up Static Routes

LICENSE: Control

SUPPORTED DEVICES: Series 3

Static routing allows you to write rules about the IP addresses of traffic passing through a router. It is the simplest way of configuring path selection of a virtual router because there is no communication with other routers regarding the current topology of the network.

See the following sections for more information:

- [Understanding the Static Routes Table View](#) on page 313
- [Adding Static Routes](#) on page 314

Understanding the Static Routes Table View

LICENSE: Control

SUPPORTED DEVICES: Series 3

The Static Routes tab of the Virtual Router editor displays a list of all the static routes you have configured on a virtual router. The table includes summary information about each route, as described in the following table.

Static Routes Table View Fields

FIELD	DESCRIPTION
Enabled	Specifies whether this route is currently enabled or disabled.
Name	The name of the static route.
Destination	The destination network where traffic is routed.

Static Routes Table View Fields (Continued)

FIELD	DESCRIPTION
Type	Specifies the action that is taken for this route, which will be one of the following: <ul style="list-style-type: none"> IP — designates that the route forwards packets to the address of a neighboring router. Interface — designates that the route forwards packets to an interface through which traffic is routed to hosts on a directly connected network. Discard — designates that the static route drops packets.
Gateway	The target IP address if you selected IP as the static route type or the interface if you selected Interface as the static route type.
Preference	Determines the route selection. If you have multiple routes to the same destination, the system selects the route with the higher preference.

Adding Static Routes

LICENSE: Control

SUPPORTED DEVICES: Series 3

The following procedure explains how to add a static route.

To edit a static route, click the edit icon (✎). To delete a static route, click the delete icon (🗑).

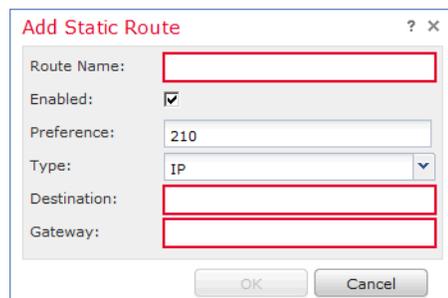

To add a static route:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to add the static route, click the edit icon (✎).
The Interfaces tab for that device appears.
3. Click **Virtual Routers**.
The Virtual Routers tab appears.
4. Next to the virtual router where you want to add the static route, click the edit icon (✎).
The Edit Virtual Router pop-up window appears.
5. Click **Static** to display the static route options.

6. Click **Add Static Route**.

The Add Static Route pop-up window appears.

7. In the **Route Name** field, type a name for the static route. You can use alphanumeric characters and spaces.
8. For **Enabled**, select the check box to specify that the route is currently enabled.
9. In the **Preference** field, type a numerical value between 1 and 65535 to determine the route selection.
If you have multiple routes to the same destination, the system selects the route with the higher preference.
10. From the **Type** drop-down list, select the type of static route you are configuring.
11. In the **Destination** field, type the IP address for the destination network where traffic should be routed.
12. In the **Gateway** field, you have two options:
 - If you selected **IP** as the selected static route type, type an IP address.
 - If you selected **Interface** as the selected static route type, select an enabled interface from the drop-down list.

TIP! Interfaces you have disabled from the Interfaces tab are not available; disabling an interface you have added removes it from the configuration.

13. Click **OK**.

The static route is added.

14. Click **Save**.

Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

Setting up Dynamic Routing

LICENSE: Control

SUPPORTED DEVICES: Series 3

Dynamic, or adaptive, routing uses a routing protocol to alter the path that a route takes in response to a change in network conditions. The adaptation is intended to allow as many routes as possible to remain valid, that is, have destinations that can be reached in response to the change. This allows the network to “route around” damage, such as loss of a node or a connection between nodes, so long as other path choices are available. You can configure a router with no dynamic routing, or you can configure the Routing Information Protocol (RIP) or the Open Shortest Path First (OSPF) routing protocol.

See the following sections for more information:

- [Setting up RIP Configuration](#) on page 316
- [Setting Up OSPF Configuration](#) on page 323

Setting up RIP Configuration

LICENSE: Control

SUPPORTED DEVICES: Series 3

Routing Information Protocol (RIP) is a dynamic routing protocol, designed for small IP networks, that relies on hop count to determine routes. The best routes use the fewest number of hops. The maximum number of hops allowed for RIP is 15. This hop limit also limits the size of the network that RIP can support.

See the following sections for more information on configuring RIP:

- [Adding Interfaces for RIP Configuration](#) on page 316
- [Configuring Authentication Settings for RIP Configuration](#) on page 318
- [Configuring Advanced Settings for RIP Configuration](#) on page 319
- [Adding Import Filters for RIP Configuration](#) on page 320
- [Adding Export Filters for RIP Configuration](#) on page 322

Adding Interfaces for RIP Configuration

LICENSE: Control

SUPPORTED DEVICES: Series 3

While configuring RIP, you must select interfaces from those already included in the virtual router, where you want to configure RIP. Disabled interfaces are not available.

To edit a RIP interface, click the edit icon (✎). To delete a RIP interface, click the delete icon (🗑).

To add an interface for RIP configuration:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to add the RIP interface, click the edit icon (✎).
The Interfaces tab for that device appears.
3. Click **Virtual Routers**.
The Virtual Routers tab appears.
4. Next to the virtual router where you want to add the RIP interface, click the edit icon (✎).
The Edit Virtual Router pop-up window appears.
5. Click **Dynamic Routing** to display the dynamic routing options.
6. Click **RIP** to display the RIP options.

The screenshot shows the 'Edit Virtual Router, "My Virtual Router"' window with the 'Dynamic Routing' tab selected. The 'Routing Type' is set to 'RIP'. The 'Interfaces' table is empty. The 'Authentication' section is expanded, showing a 'Profile' dropdown set to 'Select a Profile...'. The 'Advanced' section includes fields for 'Preference' (120), 'Infinity' (16), 'Period' (30), 'Honor' (Never), 'Timeout Time' (120), and 'Garbage Time' (300). The 'Import Filters' and 'Export Filters' sections are also empty. 'Save' and 'Cancel' buttons are at the bottom right.

Name	Metric	Mode
------	--------	------

Routing Type: OFF RIP OSPF

Authentication Profile: Select a Profile...

Advanced Preference: 120 Infinity: 16
Period: 30 Honor: Never
Timeout Time: 120
Garbage Time: 300

Name	Action
------	--------

Name	Action
------	--------

Save Cancel

7. Under **Interfaces**, click the add icon ().
The Add an Interface pop-up window appears.
8. From the **Name** drop-down list, select the interface where you want to configure RIP.

TIP! Interfaces you have disabled from the Interfaces tab are not available; disabling an interface you have added removes it from the configuration.

9. In the **Metric** field, type a metric for the interface. When routes from different RIP instances are available and all of them have the same preference, the route with the lowest metric becomes the preferred route.
10. From the **Mode** drop-down list, select one of the following options:
 - **Multicast** — default mode where RIP multicasts the entire routing table to all adjacent routers at a specified address.
 - **Broadcast** — forces RIP to use broadcast (for example, RIPv1) even though multicast mode is possible.
 - **Quiet** — RIP will not transmit any periodic messages to this interface.
 - **No Listen** — RIP will send to this interface but not listen to it.
11. Click **Save**.
Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

Configuring Authentication Settings for RIP Configuration

LICENSE: Control

SUPPORTED DEVICES: Series 3

RIP authentication uses one of the authentication profiles you configured on the virtual router. For more information about configuring authentication profiles, see [Adding Virtual Router Authentication Profiles](#) on page 339.

To configure authentication settings for RIP configuration:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to add the RIP authentication profile, click the edit icon ().
The Interfaces tab for that device appears.
3. Click **Virtual Routers**.
The Virtual Routers tab appears.

4. Next to the virtual router where you want to add the RIP authentication profile, click the edit icon (✎).
The Edit Virtual Router pop-up window appears.
5. Click **Dynamic Routing** to display the dynamic routing options.
6. Click **RIP** to display the RIP options.
7. Under **Authentication**, use the Profile drop-down list to select an existing virtual router authentication profile or select **None**.
8. Click **Save**.
Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

Configuring Advanced Settings for RIP Configuration

LICENSE: Control

SUPPORTED DEVICES: Series 3

You can configure several advanced RIP settings pertaining to various timeout values and other features that affect the behavior of the protocol.

WARNING! Changing any of the advanced RIP settings to incorrect values can prevent the router from communicating successfully with other RIP routers.

To configure advanced settings for RIP configuration:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to edit the RIP advanced settings, click the edit icon (✎).
The Interfaces tab for that device appears.
3. Click **Virtual Routers**.
The Virtual Routers tab appears.
4. Next to the virtual router where you want to edit the RIP advanced settings, click the edit icon (✎).
The Edit Virtual Router pop-up window appears.
5. Click **Dynamic Routing** to display the dynamic routing options.
6. Click **RIP** to display the RIP options.

7. In the **Preference** field, type a numerical value (higher is better) for the preference of the routing protocol. The system prefers routes learned through RIP over static routes.
8. In the **Period** field, type the interval, in seconds, between periodic updates. A lower number determines faster convergence, but larger network load.
9. In the **Timeout Time** field, type a numerical value that specifies how old routes must be, in seconds, before being considered unreachable.
10. In the **Garbage Time** field, type a numerical value that specifies how old routes must be, in seconds, before being discarded.
11. In the **Infinity** field, type a numerical value that specifies a value for infinity distance in convergence calculations. Larger values will make protocol convergence slower.
12. From the **Honor** drop-down list, select one of the following options to designate when requests for dumping routing tables should be honored:
 - **Always** — always honor requests
 - **Neighbor** — only honor requests sent from a host on a directly connected network
 - **Never** — never honor requests
13. Click **Save**.

Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

Adding Import Filters for RIP Configuration

LICENSE: Control

SUPPORTED DEVICES: Series 3

You can add an import filter to designate which routes are accepted or rejected from RIP into the route table. Import filters are applied in the order they appear in the table.

When adding an import filter, you use one of the filters you configured on the virtual router. For more information about configuring filters, see [Setting up Virtual Router Filters](#) on page 335.

TIP! To edit a RIP import filter, click the edit icon (✎). To delete a RIP import filter, click the delete icon (🗑).

To add an import filter for RIP configuration:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to add the RIP virtual router filter, click the edit icon (✎).
The Interfaces tab for that device appears.
3. Click **Virtual Routers**.
The Virtual Routers tab appears.
4. Next to the virtual router where you want to add the RIP virtual router filter, click the edit icon (✎).
The Edit Virtual Router pop-up window appears.
5. Click **Dynamic Routing** to display the dynamic routing options.
6. Click **RIP** to display the RIP options.
7. Under **Import Filters**, click the add icon (⊕).
The Add an Import Filter pop-up window appears.
8. From the **Name** drop-down list, select the filter you want to add as an import filter.
9. Next to **Action**, select **Accept** or **Reject**.
10. Click **OK**.
The import filter is added.

TIP! To change the order of the import filters, click the move up (▲) and move down (▼) icons as needed. You can also drag the filters up or down in the list.

11. Click **Save**.
Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

Adding Export Filters for RIP Configuration

LICENSE: Control

SUPPORTED DEVICES: Series 3

You can add an export filter to define which routes will be accepted or rejected from the route table to RIP. Export filters are applied in the order they appear in the table.

When adding an export filter, you use one of the filters you configured on the virtual router. For more information about configuring filters, see [Setting up Virtual Router Filters](#) on page 335.

To add an export filter for RIP configuration:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to add the RIP virtual router filter, click the edit icon (✎).
The Interfaces tab for that device appears.
3. Click **Virtual Routers**.
The Virtual Routers tab appears.
4. Next to the virtual router where you want to add the RIP virtual router filter, click the edit icon (✎).
The Edit Virtual Router pop-up window appears.
5. Click **Dynamic Routing** to display the dynamic routing options.
6. Click **RIP** to display the RIP options.
7. Under **Export Filters**, click the add icon (+).
8. From the **Name** drop-down list, select the filter you want to add as an export filter.
9. Next to **Action**, select **Accept** or **Reject**.
10. Click **OK**.
The export filter is added.

TIP! To change the order of the export filters, click the move up (▲) and move down (▼) icons as needed. You can also drag the filters up or down in the list.

11. Click **Save**.

Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

Setting Up OSPF Configuration

LICENSE: Control

SUPPORTED DEVICES: Series 3

Open Shortest Path First (OSPF) is an adaptive routing protocol that defines routes dynamically by obtaining information from other routers and advertising routes to other routers using link state advertisements. The router keeps information about the links between it and the destination to make routing decisions. OSPF assigns a cost to each routed interface, and considers the best routes to have the lowest costs.

See the following sections for more information:

- [Setting Up OSPF Routing Areas](#) on page 323
- [Adding Import Filters for OSPF Configuration](#) on page 333
- [Adding Export Filters for OSPF Configuration](#) on page 334

Setting Up OSPF Routing Areas

LICENSE: Control

SUPPORTED DEVICES: Series 3

An OSPF network may be structured, or subdivided, into routing areas to simplify administration and optimize traffic and resource use. Areas are identified by 32-bit numbers, expressed either simply in decimal or often in octet-based dot-decimal notation.

By convention, area zero or 0.0.0.0 represents the core or backbone region of an OSPF network. You may choose to identify other areas. Often, administrators select the IP address of a main router in an area as the area's identification. Each additional area must have a direct or virtual connection to the backbone OSPF area. Such connections are maintained by an interconnecting router, known as the area border router (ABR). An ABR maintains separate link state databases for each area it serves and maintains summarized routes for all areas in the network.

See the following sections for more information on setting up OSPF areas:

- [Adding OSPF Areas](#) on page 324
- [Adding OSPF Area Interfaces](#) on page 327
- [Adding OSPF Area Vlinks](#) on page 331

Adding OSPF Areas

LICENSE: Control

SUPPORTED DEVICES: Series 3

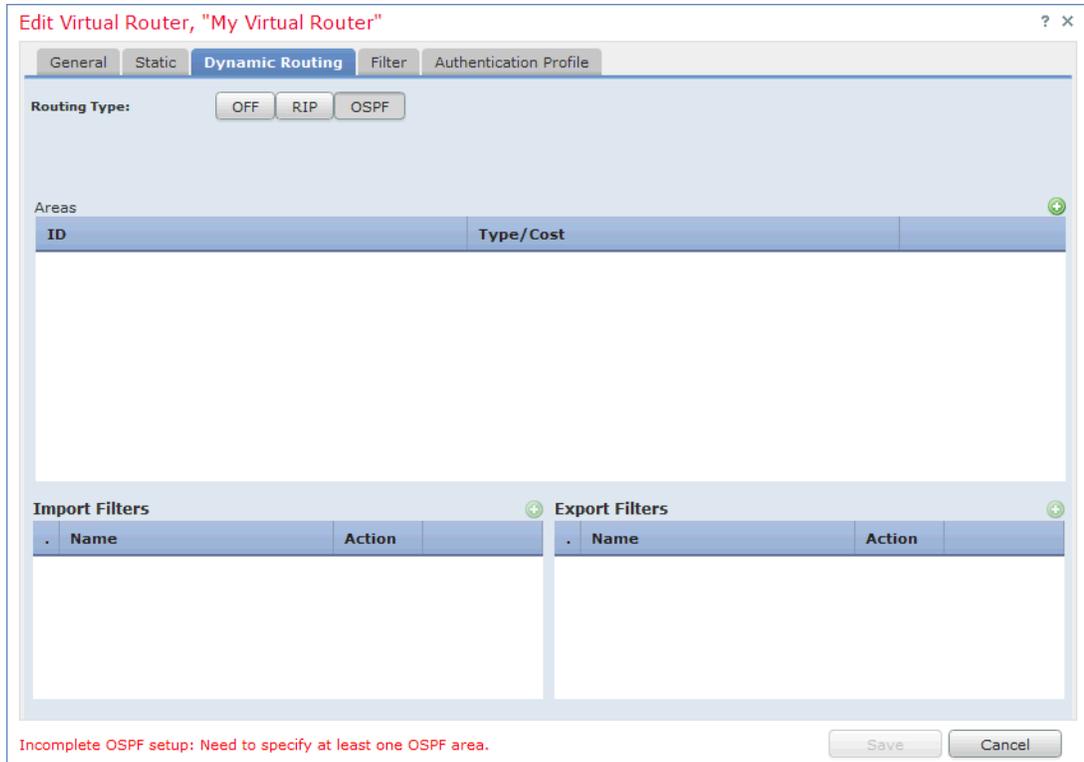

The following procedure explains how to add an OSPF area and configure general settings.

To add an OSPF area:

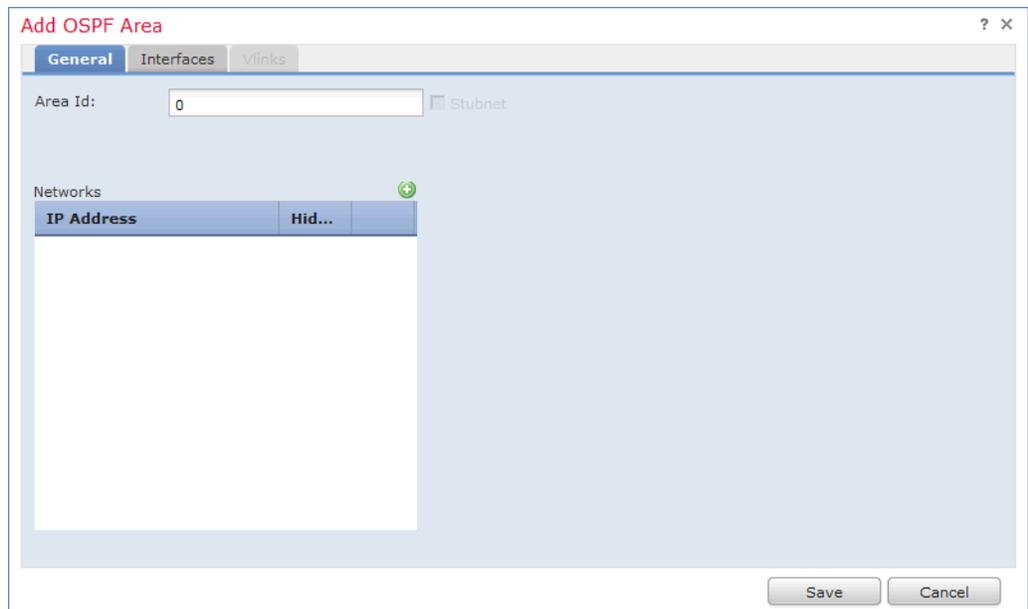

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to edit the OSPF general options, click the edit icon (✎).
The Interfaces tab for that device appears.
3. Click **Virtual Routers**.
The Virtual Routers tab appears.
4. Next to the virtual router where you want to edit the OSPF general options, click the edit icon (✎).
The Edit Virtual Router pop-up window appears.
5. Click **Dynamic Routing** to display the dynamic routing options.

6. Click **OSPF** to display the OSPF options.

7. Under **Areas**, click the add icon (+).
The Add OSPF Area pop-up window appears.

8. In the **Area Id** field, type a numerical value for the area. This value can be either an integer or an IPv4 address.
9. Optionally, select the **Stubnet** check box to designate that the area does not receive router advertisements external to the autonomous system and routing from within the area is based entirely on a default route. If you clear the check box, the area becomes a backbone area or otherwise non-stub area.

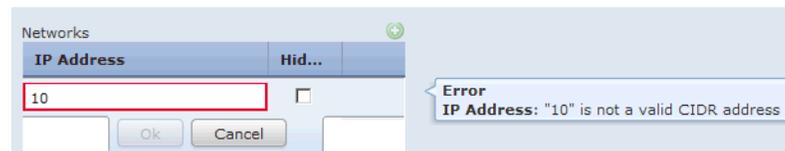

The Default cost field and Stubnet field appear.

10. In the **Default cost** field, type a cost associated with the default route for the area.
11. Under **Stubnets**, click the add icon ().
12. In the **IP Address** field, type an IP address in CIDR notation.
13. Select the **Hidden** check box to indicate that the stubnet is hidden. Hidden stubnets are not propagated into other areas.
14. Select the **Summary** check box to designate that default stubnets that are subnetworks of this stubnet are suppressed.
15. In the **Stub cost** field, type a value that defines the cost associated with routing to this stub network.
16. Click **OK**.

The stubnet is added.

TIP! To edit a stubnet, click the edit icon (). To delete a stubnet, click the delete icon ().

17. Optionally, under **Networks**, click the add icon ().

18. In the **IP Address** field, type an IP address in CIDR notation for the network.
19. Select the **Hidden** check box to indicate that the network is hidden. Hidden networks are not propagated into other areas.

20. Click **OK**.

The network is added.

TIP! To edit a network, click the edit icon (). To delete a network, click the delete icon ().

21. Click **Save**.

Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

Adding OSPF Area Interfaces

LICENSE: Control

SUPPORTED DEVICES: Series 3

You can configure a subset of the interfaces assigned to the virtual router for OSPF. The following list describes the options you can specify on each interface.

Interfaces

Select the interface where you want to configure OSPF. Interfaces you have disabled from the Interfaces tab are not available.

Type

Select the type of OSPF interface from the following choices:

- **Broadcast** — On broadcast networks, flooding and hello messages are sent using multicasts, a single packet for all the neighbors. The option designates a router to be responsible for synchronizing the link state databases and originating network link state advertisements. This network type cannot be used on physically non-broadcast multiple-access (NBMP) networks and on unnumbered networks without proper IP prefixes.
- **Point-to-Point (PtP)** — Point-to-point networks connect just two routers together. No election is performed and no network link state advertisement is originated, which makes it simpler and faster to establish. This network type is useful not only for physically PtP interfaces, but also for broadcast networks used as PtP links. This network type cannot be used on physically NBMP networks.

- Non-Broadcast — On NBMP networks, the packets are sent to each neighbor separately because of the lack of multicast capabilities. Similar to broadcast networks, the option designates a router, which plays a central role in the propagation of link state advertisements. This network type cannot be used on unnumbered networks.
- Autodetect — The system determines the correct type based on the specified interface.

Cost

Specify the output cost of the interface.

Stub

Specify whether the interface should listen for OSPF traffic and transmit its own traffic.

Priority

Enter a numerical value that specifies the priority value used in designated router election. On every multiple access network, the system designates a router and backup router. These routers have some special functions in the flooding process. Higher priority increases preferences in this election. You cannot configure a router with a priority of 0.

Nonbroadcast

Specify whether hello packets are sent to any undefined neighbors. This switch is ignored on any NBMA network.

Authentication

Select the OSPF authentication profile that this interface uses from one of the authentication profiles you configured on the virtual router or select **None**. For more information about configuring authentication profiles, see [Adding Virtual Router Authentication Profiles](#) on page 339.

Hello Interval

Type the interval, in seconds, between the sending of hello messages.

Poll

Type the interval, in seconds, between the sending of hello messages for some neighbors on NBMA networks.

Retrans Interval

Type the interval, in seconds, between retransmissions of unacknowledged updates.

Retrans Delay

Type the estimated number of seconds it takes to transmit a link state update packet over the interface.

Wait Time

Type the number of seconds that the router waits between starting election and building adjacency.

Dead Interval

Type the number of seconds that the router waits before declaring a neighbor down when not receiving messages from it. If this value is defined, it overrides the value calculated from dead count.

Dead Count

Type a numerical value that when multiplied by the hello interval specifies the number of seconds that the router waits before declaring a neighbor down when not receiving messages from it.

To edit an OSPF area interface, click the edit icon (✎). To delete an OSPF area interface, click the delete icon (🗑). Disabling a configured interface from the Interfaces tab also deletes it.

IMPORTANT! You can select only one interface for use in an OSPF area.

To add an OSPF area interface:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to add the OSPF interface, click the edit icon (✎).
The Interfaces tab for that device appears.
3. Click **Virtual Routers**.
The Virtual Routers tab appears.
4. Next to the virtual router where you want to add the OSPF interface, click the edit icon (✎).
The Edit Virtual Router pop-up window appears.
5. Click **Dynamic Routing** to display the dynamic routing options.
6. Click **OSPF** to display the OSPF options.

7. Under **Areas**, click the add icon (+).
The Add OSPF Area pop-up window appears.
8. Click **Interfaces**.
The Interfaces tab appears.
9. Click the add icon (+).
The Add OSPF Area Interface pop-up window appears.

10. Take any of the actions as described in [Adding OSPF Area Interfaces](#) on page 327.
11. Optionally under **Neighbors**, click the add icon (+).

12. In the **IP address** field, type an IP address for the neighbor receiving hello messages on non-broadcast networks from this interface.

13. Select the **Eligible** check box to indicate that the neighbor is eligible to receive messages.
14. Click **OK**.
The neighbor is added.

TIP! To edit a neighbor, click the edit icon (✎). To delete a neighbor, click the delete icon (🗑).

15. Click **OK**.
The OSPF area interface is added.
16. Click **Save**.
The OSPF area is saved.
17. Click **Save**.
Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

Adding OSPF Area Vlinks

LICENSE: Control

SUPPORTED DEVICES: Series 3

All areas in an OSPF autonomous system must be physically connected to the backbone area. In some cases where this physical connection is not possible, you can use a vlink to connect to the backbone through a non-backbone area. Vlinks can also be used to connect two parts of a partitioned backbone through a non-backbone area.

You must add a minimum of two OSPF areas before you can add a vlink.

To add an OSPF area vlink:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to add the OSPF vlink, click the edit icon (✎).
The Interfaces tab for that device appears.
3. Click **Virtual Routers**.
The Virtual Routers tab appears.

4. Next to the virtual router where you want to add the OSPF interface, click the edit icon (✎).
The Edit Virtual Router pop-up window appears.
5. Click **Dynamic Routing** to display the dynamic routing options.
6. Click **OSPF** to display the OSPF options.
7. Under **Areas**, click the add icon (+).
8. Click **Vlinks**.
The Vlinks tab appears.
9. Click the add icon (+).
The Add OSPF Area Vlink pop-up window appears.

The screenshot shows a dialog box titled "Add OSPF Area Vlink". It contains the following fields and values:

Router ID:	<input type="text"/>
Authentication:	none
Timing	
Hello Interval:	10
Retrans Interval:	5
Wait Time:	40
Dead Interval:	40
Dead Count:	4

Buttons: OK, Cancel

10. In the **Router ID** field, type an IP address for the router.
11. From the **Authentication** drop-down list, select the authentication profile the vlink will use.
12. In the **Hello Interval** field, type the interval, in seconds, between sending of hello messages.
13. In the **Retrans Interval** field, type the interval, in seconds, between retransmissions of unacknowledged updates.
14. In the **Wait Time** field, type the number of seconds that the router waits between starting election and building adjacency.
15. In the **Dead Interval** field, type the number of seconds that the router waits before declaring a neighbor down when not receiving messages from it. If this value is defined, it overrides the value calculated from dead count.
16. In the **Dead Count** field, type a numerical value that when multiplied by the hello interval, specifies the number of seconds that the router waits before declaring a neighbor down when not receiving messages from it.

17. Click **OK**.
The OSPF area vlink is added.
18. Click **Save**.
The OSPF area is saved.
19. Click **Save**.
Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

Adding Import Filters for OSPF Configuration

LICENSE: Control

SUPPORTED DEVICES: Series 3

You can add an import filter to define which routes are accepted or rejected from OSPF into the route table. Import filters are applied in the order they appear in the table.

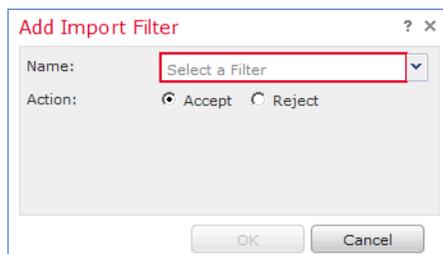

When adding an import filter, you use one of the filters you configured on the virtual router. For more information about configuring filters, see [Setting up Virtual Router Filters](#) on page 335.

To add an import filter for OSPF configuration:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to add the OSPF virtual router filter, click the edit icon (✎).
The Interfaces tab for that device appears.
3. Click **Virtual Routers**.
The Virtual Routers tab appears.
4. Next to the virtual router where you want to add the OSPF virtual router filter, click the edit icon (✎).
The Edit Virtual Router pop-up window appears.
5. Click **Dynamic Routing** to display the dynamic routing options.
6. Click **OSPF** to display the OSPF options.

7. Under **Import Filters**, click the add icon ().
The Add Import Filter pop-up window appears.

8. From the **Name** drop-down list, select the filter you want to add as an import filter.
9. Next to **Action**, select **Accept** or **Reject**.
10. Click **OK**.
The import filter is added.

TIP! To change the order of the import filters, click the move up () and move down () icons as needed. You can also drag the filters up or down in the list.

11. Click **Save**.
Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

Adding Export Filters for OSPF Configuration

LICENSE: Control

SUPPORTED DEVICES: Series 3

You can add an export filter to define which routes will be accepted or rejected from the route table to OSPF. Export filters are applied in the order they appear in the table.

When adding an export filter, you use one of the filters you configured on the virtual router. For more information about configuring filters, see [Setting up Virtual Router Filters](#) on page 335.

To add an export filter for OSPF configuration:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.

2. Next to the device where you want to add the OSPF virtual router filter, click the edit icon (✎).
The Interfaces tab for that device appears.
3. Click **Virtual Routers**.
The Virtual Routers tab appears.
4. Next to the virtual router where you want to add the OSPF virtual router filter, click the edit icon (✎).
The Edit Virtual Router pop-up window appears.
5. Click **Dynamic Routing** to display the dynamic routing options.
6. Click **OSPF** to display the OSPF options.
7. Under **Export Filters**, click the add icon (⊕).
The Add an Export Filter pop-up window appears.
8. From the **Name** drop-down list, select the filter you want to add as an export filter.
9. Next to **Action**, select **Accept** or **Reject**.
10. Click **OK**.
The export filter is added.

TIP! To change the order of the export filters, click the move up (▲) and move down (▼) icons as needed. You can also drag the filters up or down in the list.

11. Click **Save**.
Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

Setting up Virtual Router Filters

LICENSE: Control

SUPPORTED DEVICES: Series 3

Filters provide a way to match routes for importing into the virtual router's route table and for exporting routes to dynamic protocols. You can create and manage a

list of filters. Each filter defines specific criteria to look for in routes that are defined statically or received from a dynamic protocol.

TIP! To edit a virtual router filter, click the edit icon (). To delete a virtual router filter, click the delete icon ().

The Filter tab of the Virtual Router editor displays a table listing of all the filters you have configured on a virtual router. The table includes summary information about each filter, as described in the following table.

Virtual Router Filters Table View Fields

FIELD	DESCRIPTION
Name	The name of the filter.
Protocol	The protocol that the route originates from: <ul style="list-style-type: none"> • Static — The route originates as a local static route. • RIP — The route originates from a dynamic RIP configuration. • OSPF — The route originates from a dynamic OSPF configuration.
From Router	The router IP addresses that this filter attempts to match in a router. You must enter this value for static and RIP filters.
Next Hop	The next hop where packets using this route are forwarded. You must enter this value for static and RIP filters.
Destination Type	The type of destination where packets are sent: <ul style="list-style-type: none"> • Router • Device • Discard
Destination Network	The networks that this filter attempts to match in a route.
OSPF Path Type	Applies only to OSPF protocol. The path type can be one of the following: <ul style="list-style-type: none"> • Ext-1 • Ext-2 • Inter Area • Intra Area
OSPF Router ID	Applies only to OSPF protocol. The router ID of the router advertising that route/network.

To add a virtual router filter:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to add the virtual filter router, click the edit icon (✎).
The Interfaces tab for that device appears.
3. Click **Virtual Routers**.
The Virtual Routers tab appears.
4. Next to the virtual router where you want to add the virtual filter router, click the edit icon (✎).
The Edit Virtual Router pop-up window appears.
5. Click **Filter** to display the Filter options.
6. Click **Add Filter**.
The Create Filter pop-up window appears.

The screenshot shows the 'Create Filter' dialog box. It has a title bar with 'Create Filter' and a close button. The main area is divided into sections. At the top is a 'Name:' field. Below that is the 'General' section, which includes a 'Protocol:' section with radio buttons for 'All', 'Static', 'RIP', and 'OSPF'. There are also 'Destination Type:' checkboxes for 'Router', 'Device', and 'Discard'. To the right of these are 'From Router:' and 'Next Hop:' fields, each with an 'Add' button. Below these is a 'Destination Network:' field with an 'Add' button. The 'OSPF' section includes a 'Path Type:' section with checkboxes for 'Ext-1', 'Ext-2', 'Inter-Area', and 'Intra-Area', and a 'Router ID:' field with an 'Add' button. At the bottom of the dialog, there is a red message that says 'Incomplete filter setup.' and two buttons: 'OK' and 'Cancel'.

7. In the **Name** field, type a name for the filter. You can use alphanumeric characters only.

8. Under **Protocol**, select **All** or select the protocol that applies to the filter.
9. If you selected All, Static, or RIP as the Protocol, under **From Router**, type the router IP addresses that this filter will attempt to match in a route.

Note that you can also enter a /32 CIDR block for IPv4 addresses and a /128 prefix length for IPv6 addresses. All other address blocks are invalid for this field.
10. Click **Add**.

The **From Router** field is populated.
11. If you selected All, Static, or RIP as the Protocol, under **Next Hop**, type the IP addresses for the gateways that this filter will attempt to match in a route.

Note that you can also enter a /32 CIDR block for IPv4 addresses and a /128 prefix length for IPv6 addresses. All other address blocks are invalid for this field.
12. Click **Add**.

The **Next Hop** field is populated.
13. Under **Destination Type**, select the options that apply to the filter.
14. Under **Destination Network**, type the IP address of the network that this filter will attempt to match in a route.
15. Click **Add**.

The **Destination Network** field is populated.
16. If you selected All or OSPF as the Protocol, under **Path Type**, select the options that apply to the filter.

You must select at least one path type.
17. If you selected OSPF as the Protocol, under **Router ID**, type the IP address that serves as the router ID of the router advertising the route/network.
18. Click **Add**.

The **Router ID** field is populated.
19. Click **OK**.

The filter is added.
20. Click **Save**.

Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

Adding Virtual Router Authentication Profiles

LICENSE: Control

SUPPORTED DEVICES: Series 3

You can set up Authentication Profiles for use in RIP and OSPF configurations. You can configure a simple password or specify a shared cryptographic key. Simple passwords allow for every packet to carry eight bytes of the password. The system ignores received packets lacking this password. Cryptographic keys allow for validation, a 16-byte long digest generated from a password to be appended to every packet.

Note that for OSPF, each area can have a different authentication method. Therefore, you create authentication profiles that can be shared among many areas. You cannot add authentication for OSPFv3.

TIP! To edit an authentication profile, click the edit icon (). To delete an authentication profile, click the delete icon ().

To add a virtual router authentication profile:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to add the virtual router authentication profile, click the edit icon ().
The Interfaces tab for that device appears.
3. Click **Virtual Routers**.
The Virtual Routers tab appears.
4. Next to the virtual router where you want to add the virtual router authentication profile, click the edit icon ().
The Edit Virtual Router pop-up window appears.
5. Click **Authentication Profile**.
The Authentication Profile tab appears.

6. Click **Add Authentication Profile**.

The Add Authentication Profile pop-up window appears.

7. In the **Authentication Profile Name** field, type a name for the authentication profile.
8. From the **Authentication Type** drop down list, select **simple** or **cryptographic**.
9. In the **Password** field, type a secure password.
10. In the **Confirm Password** field, type the password again to confirm it.
11. Click **OK**.

The authentication profile is added.

12. Click **Save**.

Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

Viewing Virtual Router Statistics

LICENSE: Control

SUPPORTED DEVICES: Series 3

You can view runtime statistics for each virtual router. The statistics display unicast packets, packets dropped, and separate routing tables for IPv4 and IPv6 addresses.

To view virtual router statistics:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.

The Device Management page appears.

2. Next to the device where you want to view the virtual router statistics, click the edit icon (✎).

The Interfaces tab for that device appears.

3. Click **Virtual Routers**.

The Virtual Routers tab appears.

4. Next to the virtual router where you want to view the router statistics, click the view icon ().
The Statistics pop-up window appears.
5. Click **OK** to close the window.

Deleting Virtual Routers

LICENSE: Control

SUPPORTED DEVICES: Series 3

When you delete a virtual router, any routed interfaces assigned to the router become available for inclusion in another router.

To delete a virtual router:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to delete the virtual router, click the edit icon ().
The Interfaces tab for that device appears.
3. Click **Virtual Routers**.
The Virtual Routers tab appears.
4. Next to the virtual router that you want to delete, click the delete icon ().
5. When prompted, confirm that you want to delete the virtual router.
The virtual router is deleted. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

Configuring NAT on a Virtual Router

LICENSE: Control

SUPPORTED DEVICES: Series 3

In a Layer 3 deployment, you can configure routing with network address translation (NAT). You can configure NAT in different ways to manage specific network needs.

IMPORTANT! For managed devices running at least Version 5.2 of the Sourcefire 3D System, you configure NAT policies and apply them to the devices. See [Using NAT Policies](#) on page 383. This section refers to the NAT you must configure for pre-5.2 devices from the NAT tab on the Device Management page.

You can configure NAT to expose an internal server to an external network. In this configuration, you define a static translation from an external IP address to an internal IP address so that the system can access an internal server from outside the network. Traffic sent to the server targets the external IP address or IP address and port, and is translated into the internal IP address or IP address and port. Return traffic from the server is translated back to the external address.

You can configure NAT to allow an internal host or server to connect to an external application. In this configuration, you define a static translation from an internal address to an external address. This definition allows the internal host or server to initiate a connection to an external application that is expecting the internal host or server to have a specific IP address and port. Therefore, the system cannot dynamically allocate the address of the internal host or server.

You can configure NAT to hide private network addresses from an external network by using a block of IP addresses. This becomes useful if you want to obscure your internal network addresses and have sufficient external IP addresses to satisfy your internal network needs. In this configuration, you create a dynamic translation that automatically converts the source IP address of any outgoing traffic to an unused IP address from your externally facing IP addresses.

You can configure NAT to hide private network addresses from an external network using a limited block of IP addresses and port translation. This becomes useful if you want to obscure your internal network addresses, but have an insufficient number of external IP addresses to satisfy your internal network needs. In this configuration, you create a dynamic translation that automatically converts the source IP address and port of outgoing traffic to an unused IP address and port from your externally facing IP addresses.

WARNING! Sourcefire strongly recommends that if you configure dynamic NAT on an interface, you should also add an access control rule to block all inbound connections through that interface. In addition, if you configure static NAT on the same port, you must configure an access control rule with a lower rule number to allow inbound connections for the targeted internal host or server. For more information, see [Creating and Editing Access Control Rules](#) on page 474.

See the following sections for more information:

- [Understanding the NAT Entry List](#) on page 343
- [Adding NAT Entries](#) on page 344
- [Deleting NAT Entries](#) on page 350

Understanding the NAT Entry List

LICENSE: Control

SUPPORTED DEVICES: Series 3

The NAT entry list displays a table listing of all the NAT entries you have configured on a device. The table includes summary information about each NAT entry, as described in the NAT Entry Table View Fields table.

IMPORTANT! For managed devices running at least Version 5.2 of the Sourcefire 3D System, you configure NAT policies and apply them to the devices. See [Using NAT Policies](#) on page 383. This section refers to the NAT you must configure for pre-5.2 devices while configuring virtual routers.

NAT Entry Table View Fields

FIELD	DESCRIPTION
Name	The name of the NAT entry.
Interface	The hybrid or routed interface where packets are translated. The type of NAT entry you configure determines how the packets are translated. If you specify an external interface, the system translates all traffic matching the NAT entry type. If you specify an internal interface, then the system only translates traffic passing through that interface.
Type	The type of NAT entry configured, which is one of the following: <ul style="list-style-type: none">• Dynamic IP Only — indicates a dynamic translation of all outbound packets using a range of IP addresses.• Dynamic IP + Port — indicates a dynamic translation of all outbound packets using a reduced range of IP addresses and port translation.• Static — indicates a one-to-one translation. The direction of the original packet informs the translation. An inbound packet will have the destination IP address and optionally the port translated, while an outbound packet will have the source IP address and optionally the port translated. Both inbound and outbound packets will also have the return packets translated in reverse so that the traffic routes properly.
Original IP Address	The IP address to be translated.
Original Service	The service protocol and port number that are being translated.
Translated IP Address	The translated address applied to the original IP address. This is a single address for static NAT entries, and a range or CIDR block for dynamic NAT entries.
Translated Service	The translated port number applied to the original port number, if applicable.

If the list of NAT entries becomes too long, you can find a specific entry by either searching or filtering the table. You can also combine filters with a search.

You can search for an existing NAT entry in the table by any of the columns in the NAT entry table. If a match is found, the matching entry becomes highlighted in the table. You can move up and down between searched values using the arrows next to the search box.

To filter the NAT entry table:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to find the NAT entry, click the edit icon ().
The Interfaces tab for that device appears.
3. Click **NAT**.
The NAT tab appears.
4. Hover your pointer over the **Interface** or **Type** column header.
An arrow appears.
5. Click the arrow.
The **Filters** option appears.
6. Hover your pointer over the **Filters** option.
The **Filters** criteria appear.
7. Select one or more options from the list.
The NAT entry table displays only the entries that matched the selected filters.

TIP! To delete the filters, hover your pointer over the column header and clear the **Filters** check box or an individual filter's check box.

Adding NAT Entries

LICENSE: Control

SUPPORTED DEVICES: Series 3

Sourcefire strongly recommends that if you configure dynamic NAT on an interface, you should also add an access control rule to block all inbound connections through that interface. In addition, if you configure static NAT on the same port, you must configure an access control rule with a lower rule number to allow inbound connections for the targeted internal host or server. For more

information, see [Creating and Editing Access Control Rules](#) on page 474.

IMPORTANT! For managed devices running at least Version 5.2 of the Sourcefire 3D System, you configure NAT policies and apply them to the devices. See [Using NAT Policies](#) on page 383. This section refers to the NAT you must configure for pre-5.2 devices while configuring virtual routers.

See the following sections for more information about adding NAT entries:

- [Adding Static NAT Entries](#) on page 345
- [Adding Dynamic IP Only NAT Entries](#) on page 347
- [Adding Dynamic IP and Port NAT Entries](#) on page 348

Adding Static NAT Entries

LICENSE: Control

SUPPORTED DEVICES: Series 3

The following procedure explains how to add a static NAT entry. To edit an existing NAT entry, click the edit icon () next to the entry. You can also right-click the entry and select **Edit**.

IMPORTANT! For managed devices running at least Version 5.2 of the Sourcefire 3D System, you configure NAT policies and apply them to the devices. See [Using NAT Policies](#) on page 383. This section refers to the NAT you must configure for pre-5.2 devices while configuring virtual routers.

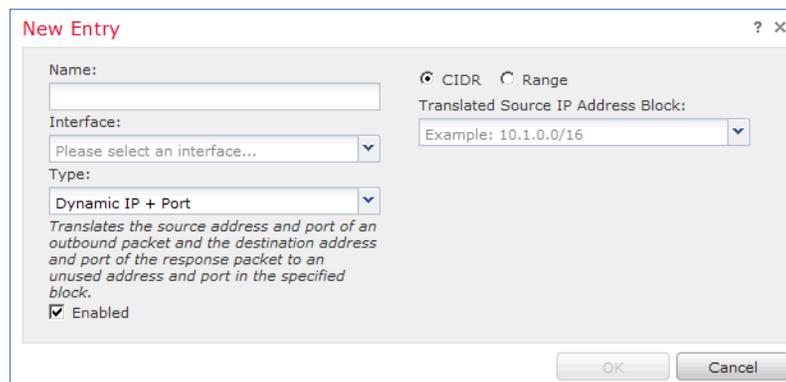

To add a NAT entry:

ACCESS: Admin/Network Admin

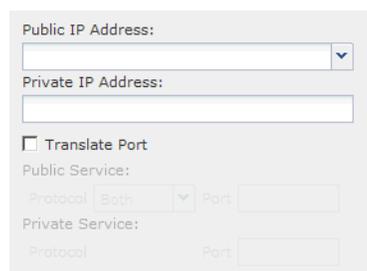

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to add the NAT entry, click the edit icon ().
The Interfaces tab for that device appears.
3. Click **NAT**.
The NAT tab appears.

4. Click **New Entry**.

The New Entry pop-up window appears.

5. In the **Name** field, type a name for the NAT entry.
6. From the **Interface** drop-down list, select a routed or hybrid interface.
7. From the **Type** drop-down list, select **Static** to display the static NAT options.

8. Optionally, you can clear the **Enabled** check box, which means the entry does not affect traffic while disabled.

TIP! You can also enable or disable a NAT entry from the entry list by right-clicking the entry, selecting **State**, and the appropriate option.

9. In the **Public IP Address** field, you can do one of the following:
 - Select the IP address to be translated from the drop-down list.
 - Type the IP address to be translated.
10. In the **Private IP Address** field, type the translated IP address that will be applied to the public IP address.
11. Optionally, select the **Translate Port** check box if you also want to translate port numbers statically.
 - Under **Public Service**, select a **Protocol** and type a **Port** to be translated.
 - Under **Private Service**, type the translated **Port** that will be applied to the original port number.

12. Click **OK**.

Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

Adding Dynamic IP Only NAT Entries

LICENSE: Control

SUPPORTED DEVICES: Series 3

Sourcefire strongly recommends that if you configure dynamic NAT on an interface, you should also add an access control rule to block all inbound connections through that interface. In addition, if you configure static NAT on the same port, you must configure an access control rule with a lower rule number to allow inbound connections for the targeted internal host or server. For more information, see [Creating and Editing Access Control Rules](#) on page 474.

The following procedure explains how to add a dynamic IP only NAT entry. To edit an existing NAT entry, click the edit icon () next to the entry. You can also right-click the entry and select **Edit**.

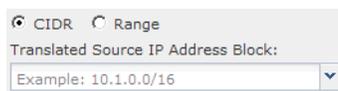

IMPORTANT! For managed devices running at least Version 5.2 of the Sourcefire 3D System, you configure NAT policies and apply them to the devices. See [Using NAT Policies](#) on page 383. This section refers to the NAT you must configure for pre-5.2 devices while configuring virtual routers.

To add a dynamic IP only NAT entry:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to add the NAT entry, click the edit icon ()
The Interfaces tab for that device appears.
3. Click **NAT**.
The NAT tab appears.
4. Click **New Entry**.
The New Entry pop-up window appears.
5. In the **Name** field, type a name for the NAT entry.
6. From the **Interface** drop-down list, select a routed or hybrid interface.

7. From the **Type** drop-down list, select **Dynamic IP Only** to display the dynamic IP only NAT options.

The screenshot shows a configuration interface with two radio buttons: 'CIDR' (selected) and 'Range'. Below them is a text field labeled 'Translated Source IP Address Block:' containing the text 'Example: 10.1.0.0/16' and a downward-pointing arrow indicating a dropdown menu.

8. Optionally, you can clear the **Enabled** check box, which means the entry does not affect traffic while disabled.

TIP! You can also enable or disable a NAT entry from the entry list by right-clicking the entry, selecting **State**, and the appropriate option.

9. Select either **CIDR** or **Range**:
 - If you selected **CIDR**, in the **Translated Source IP Address Block** field, either select an IP address from the drop-down list or type an IP address in CIDR notation. See [IP Address Conventions](#) on page 57.
 - If you selected **Range**, type a **First Translated Source IP Address** for the beginning of the range and a **Last Translated Source IP Address** for the end of the range.

IMPORTANT! On a 3D8250, you must have at least two IP addresses.

10. Click **OK**.

Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

Adding Dynamic IP and Port NAT Entries

LICENSE: Control

SUPPORTED DEVICES: Series 3

Sourcefire strongly recommends that if you configure dynamic NAT on an interface, you should also add an access control rule to block all inbound connections through that interface. In addition, if you configure static NAT on the same port, you must configure an access control rule with a lower rule number to allow inbound connections for the targeted internal host or server. For more information, see [Creating and Editing Access Control Rules](#) on page 474.

The following procedure explains how to add a dynamic IP and port NAT entry. To edit an existing NAT entry, click the edit icon () next to the entry. You can also right-click the entry and select **Edit**.

IMPORTANT! For managed devices running at least Version 5.2 of the Sourcefire 3D System, you configure NAT policies and apply them to the devices. See [Using NAT Policies](#) on page 383. This section refers to the NAT you must configure for pre-5.2 devices while configuring virtual routers.

To add a NAT entry:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.
2. Next to the device where you want to add the NAT entry, click the edit icon ().
The Interfaces tab for that device appears.
3. Click **NAT**.
The NAT tab appears.
4. Click **New Entry**.
The New Entry pop-up window appears.
5. In the **Name** field, type a name for the NAT entry.
6. From the **Interface** drop-down list, select a routed or hybrid interface.
7. From the **Type** drop-down list, select **Dynamic IP + Port** to display the dynamic IP and port NAT options.
8. Optionally, clear the **Enabled** check box, which means the entry does not affect traffic while disabled.

TIP! You can also enable or disable a NAT entry from the entry list by right-clicking the entry, selecting **State**, and the appropriate option.

9. Select either **CIDR** or **Range**:
 - If you selected **CIDR**, in the **Translated Source IP Address Block** field, either select an IP address from the drop-down list or type an IP address in CIDR notation. See [IP Address Conventions](#) on page 57.
 - If you selected **Range**, type a **First Translated Source IP Address** for the beginning of the range and a **Last Translated Source IP Address** for the end of the range.

IMPORTANT! On a 3D8250, you must have at least two IP addresses.

10. Click **OK**.

Your changes are saved. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

Deleting NAT Entries

LICENSE: Control

SUPPORTED DEVICES: Series 3

The following procedure explains how to delete a NAT entry.

IMPORTANT! For managed devices running at least Version 5.2 of the Sourcefire 3D System, you configure NAT policies and apply them to the devices. See [Using NAT Policies](#) on page 383. This section refers to the NAT you must configure for pre-5.2 devices while configuring virtual routers.

To delete a NAT entry:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.

The Device Management page appears.
2. Next to the device where you want to delete the NAT entry, click the edit icon ().

The Interfaces tab for that device appears.
3. Click **NAT**.

The NAT tab appears.
4. Next to the NAT entry you want to delete, click the delete icon (). You can also right-click the entry and select **Delete**.

5. When prompted, confirm that you want to delete the entry.
The entry is deleted. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

CHAPTER 9

SETTING UP HYBRID INTERFACES

You can configure logical hybrid interfaces on managed devices that allow the Sourcefire 3D System to bridge traffic between virtual routers and virtual switches. If IP traffic received on interfaces in a virtual switch is addressed to the MAC address of an associated hybrid logical interface, the system handles it as Layer 3 traffic and either routes or responds to the traffic depending on the destination IP address. If the system receives any other traffic, it handles it as Layer 2 traffic and switches it appropriately. You cannot configure logical hybrid interfaces on a virtual managed device.

Note that hybrid interfaces that are not associated with both a virtual switch and a virtual router are not available for routing, and do not generate or respond to traffic.

For more information about setting up hybrid interfaces, see [Adding Logical Hybrid Interfaces](#) on page 352.

Adding Logical Hybrid Interfaces

LICENSE: Control

SUPPORTED DEVICES: Series 3

You must associate a logical hybrid interface with a virtual router and virtual switch to bridge traffic between Layer 2 and Layer 3. You can only associate a single hybrid interface with a virtual switch. However, you can associate multiple hybrid interfaces with a virtual router.

You can also configure Sourcefire Redundancy Protocol (SFRP) on a logical hybrid interface. See [Configuring SFRP](#) on page 304 for more information.

Note that disabling the **ICMP Enable Responses** option for hybrid interfaces does not prevent ICMP responses in all scenarios. You can add rules to an access control policy to drop packets where the destination IP is the hybrid interface's IP and the protocol is ICMP. For more information about creating access control rules, see [Understanding and Writing Access Control Rules](#) on page 472. If you have enabled the **Inspect Local Router Traffic** option on the managed device, it drops the packets before they reach the host, thereby preventing any response. For more information about inspecting local router traffic, see [Understanding Advanced Device Settings](#) on page 250.

WARNING! Changing the maximum transmission unit (MTU) interrupts routed or switched traffic on the device and packets are dropped. The range within which you can set the MTU can vary depending on the Sourcefire 3D System software version, device model, and interface type. See [Configuring the Interface MTU](#) on page 263 for more information.

To edit an existing hybrid interface, click the edit icon (✎) next to the interface.

To add a logical hybrid interface:

ACCESS: Admin/Network Admin

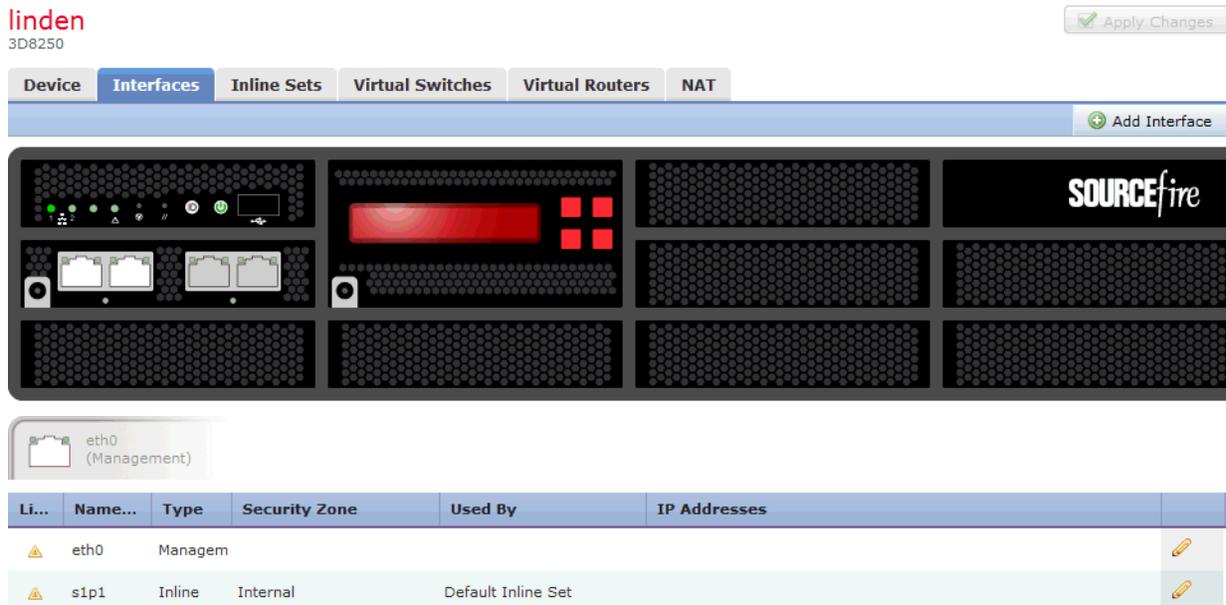

1. Select **Devices > Device Management**.

The Device Management page appears.

Name	License Type	Health Policy	System Policy	Access Control Pol...
4 📁 Ungrouped (1)				
linden 10.10.10.10 - 3D8250	Protect & Control w/URL Filtering	Blacklisted Power Supply	katsura system policy	My Access Control Policy

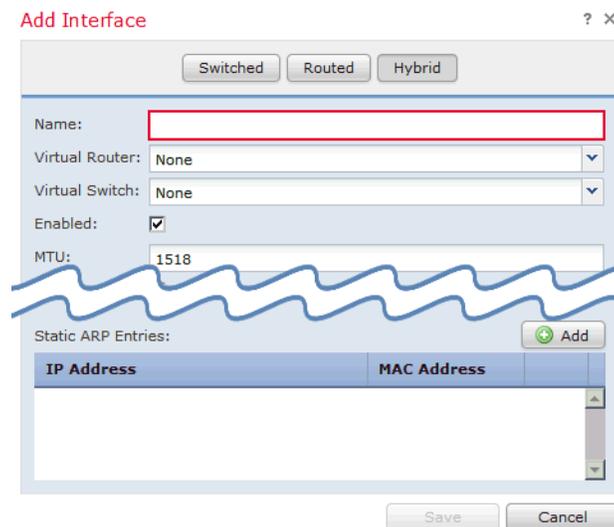

- Next to the device where you want to add the hybrid interface, click the edit icon (✎).

The Interfaces tab appears.

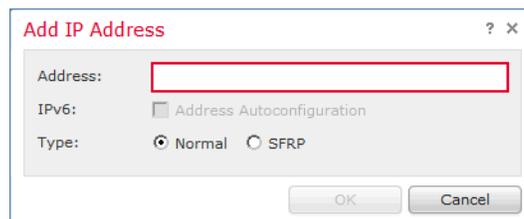

- Click **Add Interface**.

The Add Interface pop-up window appears.

- Click **Hybrid** to display the hybrid interface options.
- In the **Name** field, type a name for the interface. You can use alphanumeric characters and spaces.

6. From the **Virtual Router** drop-down list, select an existing virtual router, select **None**, or select **New** to add a new virtual router.
Note that if you add a new virtual router, you must configure it on the Device Management page (**Devices > Device Management > Virtual Routers**) after you finish setting up the hybrid interface. See [Adding Virtual Routers](#) on page 307.
7. From the **Virtual Switch** drop-down list, select an existing virtual switch, select **None**, or select **New** to add a new virtual switch.
Note that if you add a new virtual switch, you must configure it on the Device Management page (**Devices > Device Management > Virtual Switches**) after you finish setting up the hybrid interface. See [Adding Virtual Switches](#) on page 289.
8. Select the **Enabled** check box to allow the hybrid interface to handle traffic.
If you clear the check box, the interface becomes disabled and administratively taken down.
9. In the **MTU** field, type a maximum transmission unit (MTU), which designates the largest size packet allowed.
The range within which you can set the MTU can vary depending on the Sourcefire 3D System software version, device model, and interface type. See [Configuring the Interface MTU](#) on page 263 for more information.
10. Next to **ICMP**, select the **Enable Responses** check box to allow the interface to respond to ICMP traffic such as pings and traceroute.
11. Next to **IPv6 NDP**, select the **Enable Router Advertisement** check box to enable the interface to broadcast router advertisements.
You can only select this option if you added IPv6 addresses.
12. To add an IP address, click **Add**.
The Add IP Address pop-up window appears.

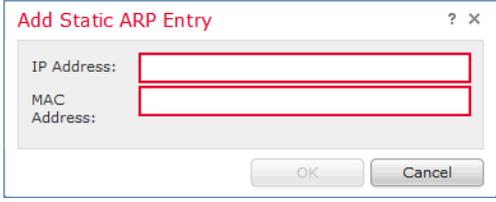

13. In the **Address** field, type the IP address and subnet mask.
14. Optionally if you have IPv6 addresses, next to the **IPv6** field, select the **Address Autoconfiguration** check box to set the IP address of the interface automatically.
15. For **Type**, select either Normal or SFRP.
For SFRP options, see [Configuring SFRP](#) on page 304 for more information.

16. Click **OK**.
The IP address is added.

TIP! To edit an IP address, click the edit icon (✎). To delete an IP address, click the delete icon (🗑).

17. To add a static ARP entry, click **Add**.
The Add Static ARP Entry pop-up window appears.

18. In the **IP Address** field, type an IP address for the static ARP entry.
19. In the **MAC Address** field, type a MAC address to associate with the IP address. Enter the address using the standard format of six groups of two hexadecimal digits separated by colons (for example, 01:23:45:67:89:AB).
20. Click **OK**.
The static ARP entry is added.

TIP! To edit a static ARP entry, click the edit icon (✎). To delete a static ARP entry, click the delete icon (🗑).

21. Click **Save**.
The logical hybrid interface is added. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

Deleting Logical Hybrid Interfaces

LICENSE: Control

SUPPORTED DEVICES: Series 3

The following procedure explains how to delete a logical hybrid interface.

To delete a hybrid interface:

ACCESS: Admin/Network Admin

1. Select **Devices > Device Management**.
The Device Management page appears.

2. Next to the device where you want to delete the logical hybrid interface, click the edit icon (✎).
The Interfaces tab for that device appears.
3. Next to the logical hybrid interface you want to delete, click the delete icon (🗑️).
4. When prompted, confirm that you want to delete the interface.
The interface is deleted. Note that your changes do not take effect until you apply the device configuration; see [Applying Changes to Devices](#) on page 211.

CHAPTER 10

USING GATEWAY VPN

A virtual private network (VPN) is a network connection that establishes a secure tunnel between endpoints via a public source, such as the Internet or other network. You can configure the Sourcefire 3D System to build secure VPN tunnels from the virtual routers of Sourcefire managed devices to remote devices or other third-party VPN endpoints. The system builds tunnels using the Internet Protocol Security (IPSec) protocol suite.

After the VPN connection is established, the hosts behind the local gateway can connect to the hosts behind the remote gateway through the secure VPN tunnel. A connection consists of the IP addresses and host names of the two gateways, the subnets behind them, and the shared secrets for the two gateways to authenticate to each other.

The VPN endpoints authenticate to each other with either the Internet Key Exchange (IKE) version 1 or version 2 protocol to create a security association for the tunnel. The system uses either the IPSec authentication header (AH) protocol or the IPSec encapsulating security payload (ESP) protocol to authenticate the data entering the tunnel. The ESP protocol encrypts the data as well as providing the same functionality as AH.

If you have access control policies in your deployment, the system does not send VPN traffic until it has passed through access control. In addition, the system does not send tunnel traffic to the public source when the tunnel is down.

To configure and apply VPN deployments, you must have a VPN license enabled on each of your target managed devices. Additionally, VPN features are only available on Series 3 devices.

See the following sections for more information on creating and managing VPN deployments:

- [Understanding IPSec](#) on page 359
- [Understanding VPN Deployments](#) on page 360
- [Managing VPN Deployments](#) on page 362

Understanding IPSec

The IPSec protocol suite defines how IP packets across a VPN tunnel are hashed, encrypted, and encapsulated in the ESP or AH security protocol. The Sourcefire 3D System uses the hash algorithm and encryption key of the Security Association (SA), which becomes established between the two gateways by the Internet Key Exchange (IKE) protocol.

Security associations (SA) establish shared security attributes between two devices and allow VPN endpoints to support secure communication. An SA allows two VPN endpoints to handle the parameters for how the VPN tunnel is secured between them.

The system uses the Internet Security Association and Key Management Protocol (ISAKMP) during the initial phase of negotiating the IPSec connection to establish the VPN between endpoints and the authenticated key exchange. The IKE protocol resides within ISAKMP. See [Understanding IKE](#) on page 359 for more information about the IKE protocol.

The AH security protocol provides protection for packet headers and data, but it cannot encrypt them. ESP provides encryption and protection for packets, but it cannot secure the outermost IP header. In many cases, this protection is not required, and most VPN deployments use ESP more frequently than AH because of its encryption capabilities. Since VPN only operates in tunnel mode, the system encrypts and authenticates the entire packet from Layer 3 and up in the ESP protocol. ESP in tunnel mode encrypts the data as well as providing the latter's encryption capabilities.

Understanding IKE

The Sourcefire 3D System uses the IKE protocol to mutually authenticate the two gateways against each other as well as to negotiate the SA for the tunnel. The process consists of two phases.

IKE phase 1 establishes a secure authenticated communication channel by using the Diffie-Hellman key exchange to generate a pre-shared key to encrypt further IKE communications. This negotiation results in a bidirectional ISAKMP security association. The system allows you to perform the authentication using a pre-shared key. Phase 1 operates in main mode, which seeks to protect all data during the negotiation, while also protecting the identity of the peers.

During IKE phase 2, the IKE peers use the secure channel established in phase 1 to negotiate security associations on behalf of IPSec. The negotiation results in a minimum of two unidirectional security associations, one inbound and one outbound.

Understanding VPN Deployments

A VPN deployment specifies the endpoints and networks that are included in a VPN and how they connect to each other. After you configure a VPN deployment, you can then apply it to your managed devices, as well as remote devices or other third-party VPN endpoints.

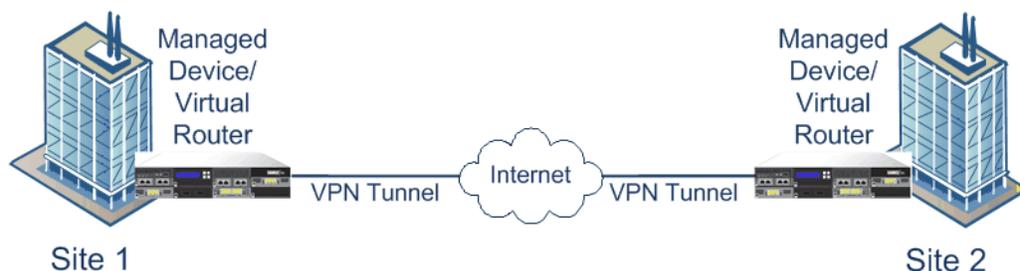

The system supports three types of VPN deployments: point-to-point, star, and mesh. See the following sections for more information about these VPN deployments:

- [Understanding Point-to-Point VPN Deployments](#) on page 360
- [Understanding Star VPN Deployments](#) on page 360
- [Understanding Mesh VPN Deployments](#) on page 361

Understanding Point-to-Point VPN Deployments

In a point-to-point VPN deployment, two endpoints communicate directly with each other. You configure the two endpoints as peer devices, and either device can initiate the secured connection. At least one of the devices in this configuration must be a VPN-enabled managed device.

The following diagram displays a typical point-to-point VPN deployment.

See [Configuring Point-to-Point VPN Deployments](#) on page 364 for more information.

Understanding Star VPN Deployments

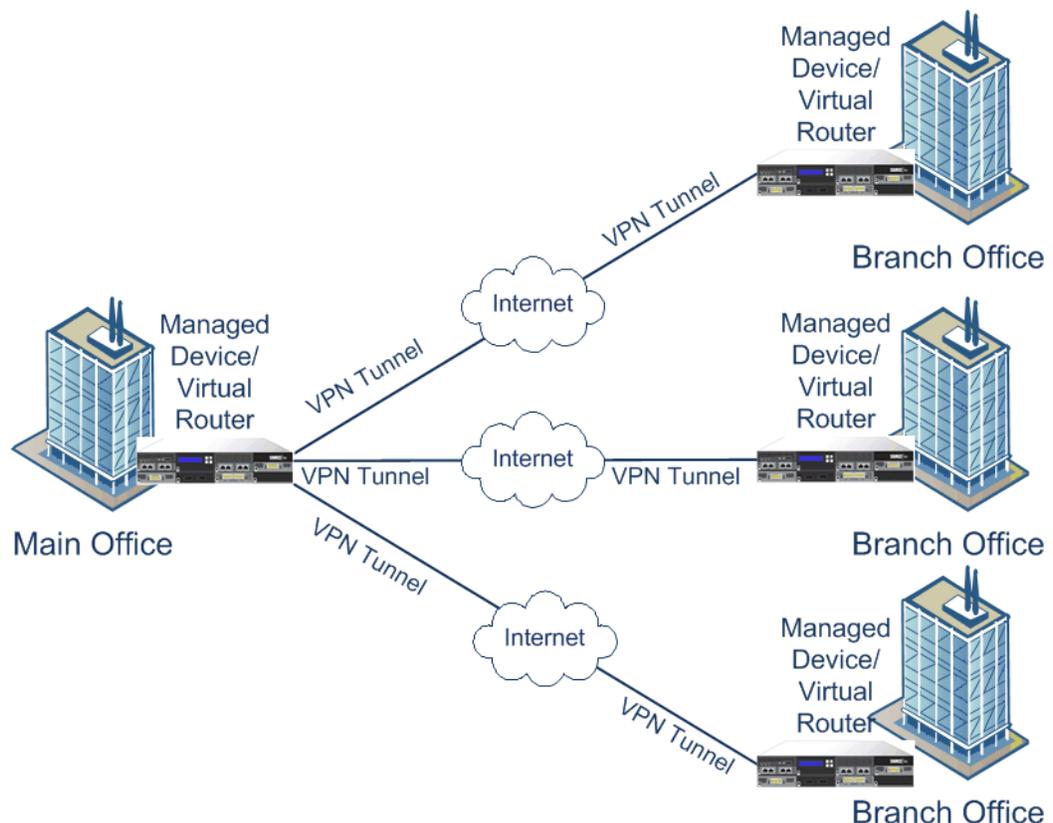

In a star VPN deployment, a central endpoint (hub node) establishes a secure connection with multiple remote endpoints (leaf nodes). Each connection between the hub node and an individual leaf node is a separate VPN tunnel. The

hosts behind any of the leaf nodes can communicate with each other through the hub node.

Star deployments commonly represent a VPN that connects an organization's main and branch office locations using secure connections over the Internet or other third-party network. Star VPN deployments provide all employees with controlled access to the organization's network.

In a typical star deployment, the hub node is a VPN-enabled managed device, located at the main office. Leaf nodes are located at branch offices and initiate most of the traffic. Star deployments only support IKE version 2.

The following diagram displays a typical star VPN deployment.

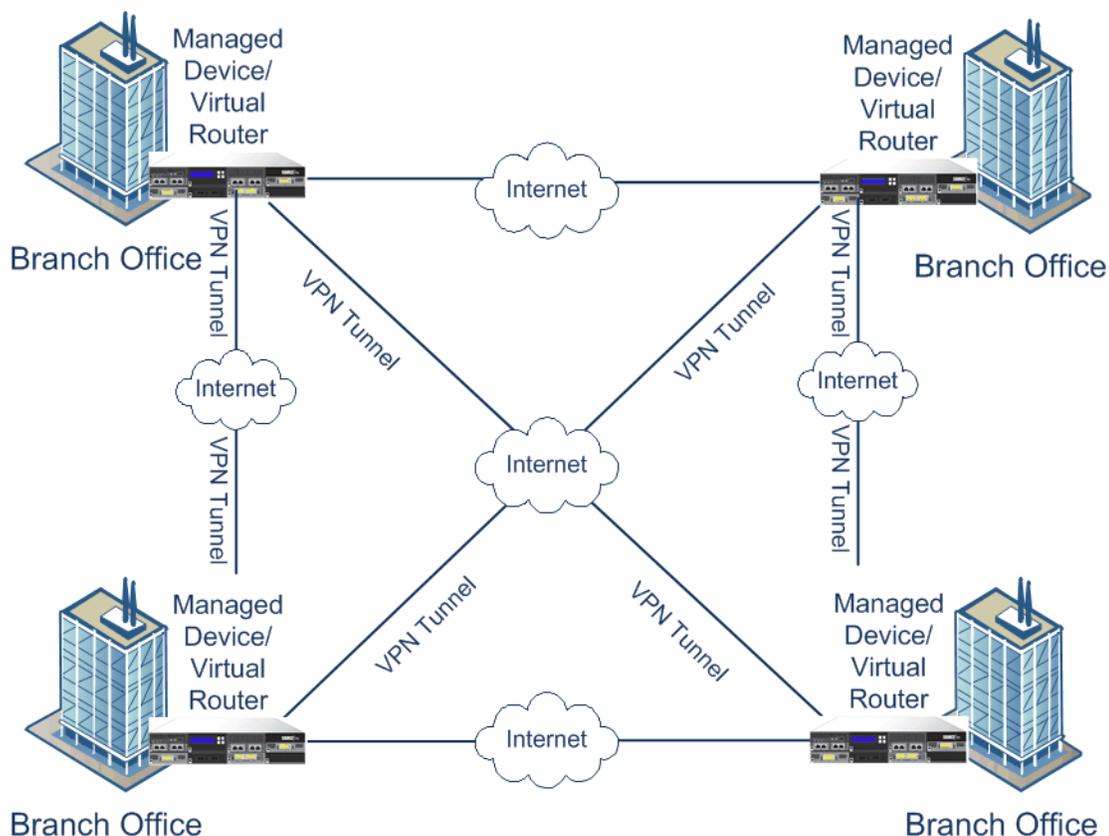

See [Configuring Star VPN Deployments](#) on page 368 for more information.

Understanding Mesh VPN Deployments

In a mesh VPN deployment, all endpoints can communicate with every other endpoint by means of an individual VPN tunnel. The mesh deployment offers redundancy so that when one endpoint fails, the remaining endpoints can still communicate with each other. This type of deployment commonly represents a VPN that connects a group of decentralized branch office locations. The number

of VPN-enabled managed devices you deploy in this configuration depends on the level of redundancy you require.

The following diagram displays a typical mesh VPN deployment.

See [Configuring Mesh VPN Deployments](#) on page 371 for more information.

Managing VPN Deployments

LICENSE: VPN

SUPPORTED DEVICES: Series 3

On the VPN page (**Devices > VPN**) you can view all of your current VPN deployments by name and the endpoints contained in the deployment. Options on this page allow you to view the status of a VPN deployment, create a new deployment, apply a deployment, and edit or delete a deployment.

WARNING! If you select the default access control policy when registering a device to your Defense Center, the default access control rule blocks all traffic. If you configure a VPN deployment on the device, the deployment fails.

The following table describes the actions you can take to manage your deployments on the VPN page.

VPN Deployment Management Actions

To...	You CAN...
create a new VPN deployment	click Add . See Configuring VPN Deployments on page 363 for more information.
modify the settings in an existing VPN deployment	click the edit icon (✎). See Configuring VPN Deployments on page 363 for more information.
view the status of an existing VPN deployment	click the status icon. See Viewing VPN Deployment Status on page 377 for more information.
apply a VPN deployment to all devices targeted in the deployment	click the apply icon (✔). See Applying a VPN Deployment on page 377 for more information.
delete a VPN deployment	click the delete icon (🗑), then click Yes , or click No if you decide not to delete the deployment.

Configuring VPN Deployments

LICENSE: VPN

SUPPORTED DEVICES: Series 3

When you create a new VPN deployment you must, at minimum, give it a unique name, specify a deployment type, and designate a pre-shared key. You can select from three types of deployment, each containing a group of VPN tunnels:

- Point-to-point (PTP) deployments establish a VPN tunnel between two endpoints.
- Star deployments establish a group of VPN tunnels connecting a hub endpoint to a group of leaf endpoints.
- Mesh deployments establish a group of VPN tunnels among a set of endpoints.

You must define a pre-shared key for VPN authentication. You can specify a default key to use in all of the VPN connections you generate in a deployment. For point-to-point deployments, you can specify a pre-shared key for each endpoint pair.

See the following sections for more information on creating each type of VPN deployment:

- [Configuring Point-to-Point VPN Deployments](#) on page 364
- [Configuring Star VPN Deployments](#) on page 368
- [Configuring Mesh VPN Deployments](#) on page 371

Configuring Point-to-Point VPN Deployments

LICENSE: VPN

SUPPORTED DEVICES: Series 3

When configuring a point-to-point VPN deployment, you define a group of endpoint pairs and then create a VPN between the two nodes in each pair. For more information, see [Understanding Point-to-Point VPN Deployments](#) on page 360.

The following list describes the options you can specify in your deployment.

Name

Give the deployment a unique name.

Type

Click **PTP** to specify that you are configuring a point-to-point deployment.

Pre-shared Key

Define a unique pre-shared key for authentication. The system uses this key for all the VPNs in your deployment, unless you specify a pre-shared key for each endpoint pair.

Device

You can select a managed device, including a device stack or cluster, as an endpoint for your deployment. For endpoints not managed by your Defense Center, select **Other** and then specify an IP address for the endpoint.

Virtual Router

If you selected a managed device as your endpoint, select a virtual router that is currently applied to the selected device. You cannot select the same virtual router for more than one endpoint.

Interface

If you selected a managed device as your endpoint, select a routed interface that is assigned to the selected virtual router.

IP Address

- If you selected a managed device as an endpoint, select an IP address that is assigned to the selected routed interface.
- If the managed device is a device cluster, you can only select from a list SFRP IP addresses.
- If you selected an endpoint **not** managed by the Defense Center, specify an IP address for the endpoint.

Protected Networks

Specify the networks in your deployment that are encrypted. Enter a subnet with CIDR block for each network. IKE version 1 only supports a single protected network.

Internal IP

Select the check box if the endpoint resides behind a firewall with network address translation.

Public IP

If you selected **Internal IP**, specify a public IP address for the firewall. If the endpoint is a responder, you must specify this value.

Public IKE Port

If you selected **Internal IP**, specify a numerical value for the UDP port on the firewall that is being port-forwarded to the internal endpoint. If the endpoint is a responder and the port on the firewall being forwarded is not 500 or 4500, you must specify this value.

Use Deployment Key

Select the check box to use the pre-shared key defined for the deployment. Clear the check box to specify a pre-shared key for VPN authentication for this endpoint pair.

Pre-shared Key

If you cleared the **Use Deployment Key** check box, specify a pre-shared key in this field.

TIP! To edit an existing point-to-point deployment, click the edit icon (✎) next to the deployment. You cannot edit the deployment type after you initially save the deployment.

To configure a point-to-point VPN deployment:

ACCESS: Admin/Network Admin

1. Select **Devices > VPN**.
The VPN page appears.

2. Click **Add**.

The Create New VPN Deployment pop-up window appears.

The screenshot shows a dialog box titled "Create New VPN Deployment" with a close button (X) and a help button (?). It has two tabs: "General" (active) and "Advanced".

Fields and controls include:

- Name:** A text input field.
- Type:** Three buttons: "PTP" (selected), "Star", and "Mesh".
- Pre-shared Key:** A text input field.
- Node Pairs:** A section with a table for defining node pairs. The table has two columns: "Node A" and "Node B". A green plus icon is in the top right corner of this section.

At the bottom, there is a red error message: "Please enter a deployment name." and two buttons: "Save" and "Cancel".

3. Give the deployment a unique **Name**.
You can use all printable characters, including spaces and special characters.
4. Ensure that **PTP** is selected as the **Type**.
5. Give the deployment a unique **Pre-shared Key**.

- Next to **Node Pairs**, click the add icon (+).
- The Add New Endpoint Pair pop-up window appears.

The screenshot shows the 'Add New Endpoint Pair' dialog box. It is divided into two main sections for 'Node A' and 'Node B'. Each section contains the following fields: 'Device', 'Virtual Router', 'Interface', and 'IP Address', all with dropdown menus. Below these is a 'Protected Networks' section with a table header 'Network' and an empty table body. At the bottom of each section are 'Advanced' settings: 'Internal IP' (checkbox), 'Public IP' (text field), and 'public IKE Port' (text field with '500'). A 'Use Deployment Key' checkbox is checked at the bottom left. A red error message 'Incomplete endpoint.' is visible at the bottom left, and 'Save' and 'Cancel' buttons are at the bottom right.

- Configure the VPN deployment, as described earlier in this section.
- Under **Node A**, next to **Protected Networks**, click the add icon (+).
The Add Network pop-up window appears.
- Type a CIDR block for the protected network.
- Click **OK**.
The protected network is added.
- Repeat step 8 through step 10 for **Node B**.
- Click **Save**.
The endpoint pair is added to your deployment and the Create New VPN Deployment pop-up window appears again.
- Click **Save** to finish configuring your deployment and the VPN page appears again.
Note that you must apply the deployment for it to take effect; see [Applying a VPN Deployment](#) on page 377.

Configuring Star VPN Deployments

LICENSE: VPN

SUPPORTED DEVICES: Series 3

When configuring a star VPN deployment, you define a single hub node endpoint and a group of leaf node endpoints. You must define the hub node endpoint and at least one leaf node endpoint to configure the deployment. For more information, see [Understanding Star VPN Deployments](#) on page 360.

The following list describes the options you can specify in your deployment.

Name

Give the deployment a unique name.

Type

Click **Star** to specify that you are configuring a star deployment.

Pre-shared Key

Define a unique pre-shared key for authentication.

Device

You can select a managed device, including a device stack or cluster, as an endpoint for your deployment. For endpoints not managed by your Defense Center, select **Other** and then specify an IP address for the endpoint.

Virtual Router

If you selected a managed device as your endpoint, select a virtual router that is currently applied to the selected device. You cannot select the same virtual router for more than one endpoint.

Interface

If you selected a managed device as your endpoint, select a routed interface that is assigned to the selected virtual router.

IP Address

- If you selected a managed device as an endpoint, select an IP address that is assigned to the selected routed interface.
- If the managed device is a device cluster, you can only select from a list SFRP IP addresses.
- If you selected an endpoint **not** managed by the Defense Center, specify an IP address for the endpoint.

Protected Networks

Specify the networks in your deployment that are encrypted. Enter a subnet with CIDR block for each network.

Internal IP

Select the check box if the endpoint resides behind a firewall with network address translation.

Public IP

If you selected **Internal IP**, specify a public IP address for the firewall. If the endpoint is a responder, you must specify this value.

Public IKE Port

If you selected **Internal IP**, specify a numerical value for the UDP port on the firewall that is being port-forwarded to the internal endpoint. If the endpoint is a responder and the port on the firewall being forwarded is not 500 or 4500, you must specify this value.

TIP! To edit an existing star deployment, click the edit icon (✎) next to the deployment. You cannot edit the deployment type after you initially save the deployment. To change the deployment type, you must delete the deployment and create a new one.

To configure a star deployment:

ACCESS: Admin/Network Admin

1. Select **Devices > VPN**.
The VPN page appears
2. Click **Add**.
The Create New VPN Deployment pop-up window appears.
3. Give the deployment a unique **Name**.
You can use all printable characters, including spaces and special characters.
4. Click **Star** to specify the **Type**.
5. Give the deployment a unique **Pre-shared Key**.

- Next to **Hub Node**, click the add icon (+).
- The Add Hub Node pop-up window appears.

The screenshot shows the 'Add Hub Node' dialog box. It includes fields for 'Device', 'Virtual Router', 'Interface', and 'IP Address', each with a dropdown arrow. Below these is a 'Protected Networks' section with a table header 'Network' and a plus icon. The 'Advanced' section is collapsed. The 'Internal IP' checkbox is unchecked. The 'Public IP' field is empty. The 'public IKE Port' field contains the value '500'. At the bottom, there is a red error message 'Incomplete endpoint.' and 'Save' and 'Cancel' buttons.

- Configure the VPN deployment, as described earlier in this section.
 - Next to **Protected Networks**, click the add icon (+).
- The Add Network pop-up window appears.
- Type an IP address for the protected network.
 - Click **OK**.
- The protected network is added.
- Click **Save**.
- The hub node is added to your deployment and the Create New VPN Deployment pop-up window appears again.

- Next to **Leaf Nodes**, click the add icon (+).
- The Add Leaf Node pop-up window appears.

The screenshot shows the 'Add Leaf Node' dialog box. It features a title bar with a question mark and a close button. The main area is divided into several sections: 'Device:', 'Virtual Router:', 'Interface:', and 'IP Address:', each with a dropdown menu. Below these is a 'Protected Networks' section with a table header 'Network' and a green plus icon. The 'Advanced:' section includes 'Internal IP:' with a checkbox, 'Public IP:' with a text field, and 'public IKE Port:' with a text field containing '500'. At the bottom, there is a red error message 'Incomplete endpoint.', a 'Save' button, and a 'Cancel' button.

- Repeat step 7 through step 10 to complete the leaf node, which has the same options as the hub node.
- Click **Save**.
The leaf node is added to your deployment and the Create New VPN Deployment pop-up window appears again.
- Click **Save** to finish configuring your deployment and the VPN page appears again.
Note that you must apply the deployment for it to take effect; see [Applying a VPN Deployment](#) on page 377.

Configuring Mesh VPN Deployments

LICENSE: VPN

SUPPORTED DEVICES: Series 3

When configuring a mesh VPN deployment, you define a group of VPNs to link any two points for a given set of endpoints. For more information, see [Configuring Mesh VPN Deployments](#) on page 371.

The following list describes the options you can specify in your deployment.

Name

Give the deployment a unique name.

Type

Click **Mesh** to specify that you are configuring a mesh deployment.

Pre-shared Key

Define a unique pre-shared key for authentication.

Device

You can select a managed device, including a device stack or cluster, as an endpoint for your deployment. For endpoints not managed by your Defense Center, select **Other** and then specify an IP address for the endpoint.

Virtual Router

If you selected a managed device as your endpoint, select a virtual router that is currently applied to the selected device. You cannot select the same virtual router for more than one endpoint.

Interface

If you selected a managed device as your endpoint, select a routed interface that is assigned to the selected virtual router.

IP Address

- If you selected a managed device as an endpoint, select an IP address that is assigned to the selected routed interface.
- If the managed device is a device cluster, you can only select from a list SFRP IP addresses.
- If you selected an endpoint **not** managed by the Defense Center, specify an IP address for the endpoint.

Protected Networks

Specify the networks in your deployment that are encrypted. Enter a subnet with CIDR block for each network. IKE version 1 only supports a single protected network.

Internal IP

Select the check box if the endpoint resides behind a firewall with network address translation.

Public IP

If you selected **Internal IP**, specify a public IP address for the firewall. If the endpoint is a responder, you must specify this value.

Public IKE Port

If you selected **Internal IP**, specify a numerical value for the UDP port on the firewall that is being port-forwarded to the internal endpoint. If the endpoint is a responder and the port on the firewall being forwarded is not 500 or 4500, you must specify this value.

TIP! To edit an existing mesh deployment, click the edit icon (✎) next to the deployment. You cannot edit the deployment type after you initially save the deployment. To change the deployment type, you must delete the deployment and create a new one.

To configure a mesh VPN deployment:

ACCESS: Admin/Network Admin

1. Select **Devices > VPN**.

The VPN page appears

2. Click **Add**.

The Create New VPN Deployment pop-up window appears.

3. Give the deployment a unique **Name**.

You can use all printable characters, including spaces and special characters.

4. Click **Mesh** to specify the **Type**.

5. Give the deployment a unique **Pre-shared Key**.

- Next to **Nodes**, click the add icon (+).
The Add Endpoint pop-up window appears.

The screenshot shows the 'Add Endpoint' dialog box. It includes fields for Device, Virtual Router, Interface, IP Address, and IKE port (set to 500). There is a section for Protected Networks with a table header 'Network' and a plus icon. Below that is an Advanced section with Internal IP (checkbox), Public IP, and Public IKE Port (set to 500). At the bottom, there is a red error message 'Incomplete endpoint.' and 'Save' and 'Cancel' buttons.

- Configure the VPN deployment, as described earlier in this section.
- Next to **Protected Networks**, click the add icon (+).
The Add Network pop-up window appears.
- Type a CIDR block for the protected network.
- Click **OK**.
The protected network is added.
- Click **Save**.
The endpoint is added to your deployment and the Create New VPN Deployment pop-up window appears again.
- Repeat step 6 through step 11 to add more endpoints.
- Click **Save** to complete your deployment and the VPN page appears again.
Note that you must apply the deployment for it to take effect; see [Applying a VPN Deployment](#) on page 377.

Configuring Advanced VPN Deployment Settings

LICENSE: VPN

SUPPORTED DEVICES: Series 3

VPN deployments contain some common settings that can be shared among the VPNs in a deployment. Each VPN can use the default settings or you can override

the default settings. Advanced settings typically require little or no modification and are not common to every deployment.

The following list describes the advanced options you can specify in your deployment.

Other Algorithm Allowed

Select the check box to enable auto negotiation to an algorithm not listed in the Algorithm list, but proposed by the remote peer when the remote peer is a third party device.

Algorithm

Specify the phase one and phase two algorithm proposals to secure data in your deployment. Select **Cipher, Hash**, and Diffie-Hellman (**DH**) group authentication messages for both phases.

IKE Life Time

Specify a numerical value and select a time unit for the maximum IKE SA renegotiation interval. You can specify a minimum of 15 minutes and a maximum of 30 days.

IKE v2

Select the check box to specify that the system uses IKE version 2. This version supports the star deployment and multiple protected networks.

Life Time

Specify a numerical value and select a time unit for the maximum SA renegotiation interval. You can specify a minimum of 5 minutes and a maximum of 24 hours.

Life Packets

Specify the number of packets that can be transmitted over an IPsec SA before it expires. You can use any integer between 0 and 18446744073709551615.

Life Bytes

Specify the number of bytes that can be transmitted over an IPsec SA before it expires. You can use any integer between 0 and 18446744073709551615.

AH

Select the check box to specify that the system uses the authentication header security protocol for the data to be protected. Clear the check box to use encryption service payload (ESP) protocol. See [Understanding IPSec](#) on page 359 for guidance on when to use each protocol.

To configure advanced VPN deployment settings:

ACCESS: Admin/Network Admin

1. Select **Devices > VPN**.
The VPN page appears.
2. Click **Add**.
The Create New VPN Deployment pop-up window appears.
3. Click the **Advanced** tab.

The screenshot shows the 'Create New VPN Deployment' dialog box with the 'Advanced' tab selected. It is divided into two main sections: IKE Algorithm Proposal and IPSec Algorithm Proposal. Each section has a table of algorithms and a set of settings below it.

IKE Algorithm Proposal:

Cipher	Hash	DH	
aes128	sha1	modp2048	
3des	sha1	modp1536	

IPSec Algorithm Proposal:

Cipher	Hash	DH	
aes128	sha1		
3des	sha1		

IKE Settings:

IKE Life Time: 3 hours

IKE v2:

IPSec Settings:

Life Time: 1 hours

Life Packets: 0

Life Bytes: 0

AH:

Please enter a deployment name.

Save Cancel

4. Configure the advanced settings, as described earlier in this section.
5. Next to **Algorithms**, click the add icon ().
The Add IKE Algorithm Proposal pop-up window appears.
6. Select **Cipher**, **Hash**, and Diffie-Hellman (**DH**) group authentication messages for both phases.
7. Click **OK**.
The IKE algorithm proposal is added.

8. Click **Save**.

Your changes are saved and the VPN page appears.

Note that you must apply the deployment for it to take effect; see [Applying a VPN Deployment](#) on page 377.

Applying a VPN Deployment

LICENSE: VPN

SUPPORTED DEVICES: Series 3

After configuring or making any changes to a VPN deployment, you must apply the deployment to one or more devices to implement the settings you designated for the deployment.

To apply a VPN deployment:

ACCESS: Admin/Network Admin

1. Select **Devices > VPN**.

The VPN page appears.

2. Click the apply icon (✓) next to the VPN deployment that you want to apply.

3. When prompted, click **Yes**.

The VPN deployment is applied.

TIP! Optionally, from the Apply VPN deployment dialog box, click **View Changes**. The VPN Comparison View page appears in a new browser window. For more information, see [Using the VPN Deployment Comparison View](#) on page 381.

4. Click **OK**.

You are returned to the VPN page.

Viewing VPN Deployment Status

LICENSE: VPN

SUPPORTED DEVICES: Series 3

After you configure a VPN deployment, you can view the status of your configured VPN tunnels. The VPN page displays a status icon for each applied VPN deployment:

- The (✓) icon designates that all VPN endpoints are up.
- The (ⓘ) icon designates that all VPN endpoints are down.
- The (⚠) icon designates that some endpoints are up, while others are down.

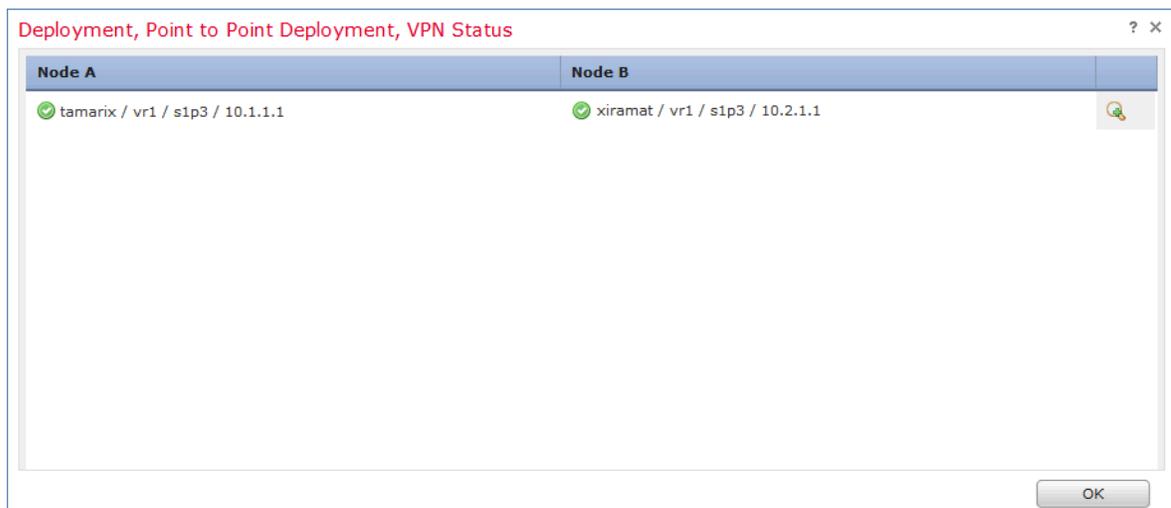

You can click a status icon to view the deployment status along with basic information about the endpoints in the deployment, such as endpoint name and IP address. The VPN status updates every minute or when a status change occurs, such as an endpoint going down or coming up.

To view VPN status:

ACCESS: Admin/Network Admin

1. Select **Devices > VPN**.
The VPN page appears.
2. Click the VPN status icon next to the deployment where you want to view the status.

The VPN Status pop-up window appears.

3. Click **OK** to return to the VPN page.

Viewing VPN Statistics and Logs

LICENSE: VPN

SUPPORTED DEVICES: Series 3

After you configure a VPN deployment, you can view statistics about the data traversing your configured VPN tunnels. In addition, you can view the latest VPN system and IKE logs for each endpoint.

The system displays the following statistics.

Endpoint

The device path to the routed interface and IP address designated as the VPN endpoint.

Status

Whether the VPN connection is up or down.

Protocol

The protocol used for encryption, either ESP or AH.

Packets Received

The number of packets per interface the VPN tunnel receives during an IPsec SA negotiation.

Packets Forwarded

The number of packets per interface the VPN tunnel transmits during an IPsec SA negotiation.

Bytes Received

The number of bytes per interface the VPN tunnel receives during an IPsec SA negotiation.

Bytes Forwarded

The number of bytes per interface the VPN tunnel transmits during an IPsec SA negotiation.

Time Created

The date and time the VPN connection was created.

Time Last Used

The last time a user initiated a VPN connection.

NAT Traversal

If Yes is displayed, at least one of the VPN endpoints resides behind a device with network address translation.

IKE State

The state of the IKE SA: connecting, established, deleting, or destroying.

IKE Event

The IKE SA event: reauthentication or rekeying.

IKE Event Time

The time in seconds the next event should occur.

IKE Algorithm

The IKE algorithm being used by the VPN deployment.

IPSec State

The state of the IPSec SA: installing, installed, updating, rekeying, deleting, and destroying.

IPSec Event

Notification of when the IPSec SA event is rekeying.

IPSec Event Time

The time in seconds until the next event should occur.

IPSec Algorithm

IPSec algorithm being used by the VPN deployment.

To view VPN statistics:

ACCESS: Admin/Network Admin

1. Select **Devices > VPN**.

The VPN page appears.

2. Click the VPN status icon next to the deployment where you want to view the VPN statistics.

The VPN Status pop-up window appears.

- Click the view statistics icon (📊).
The VPN Statistics pop-up window appears.

	Node A	Node B

[View Recent Log](#)

- Optionally, click **Refresh** to update the VPN statistics.
- Optionally, click **View Recent Log** to view the latest data log for each endpoint.
To view the log for clustered devices and stacked devices, you can select the link for either the active/primary or backup/secondary device.

Using the VPN Deployment Comparison View

LICENSE: VPN

SUPPORTED DEVICES: Series 3

The VPN deployment comparison view allows you to view the changes you have made to a deployment before you apply them. The report displays all differences between the current deployment and the proposed deployment. This gives you an opportunity to discover any potential configuration errors.

The comparison view displays both deployments in a side-by-side format, with each deployment identified by name in the title bar on the left and right sides of the comparison view. The time of last modification and the last user to modify are displayed with the deployment name.

Differences between the two deployments are highlighted:

- Blue indicates that the highlighted setting is different in the two deployments, and the difference is noted in red text.
- Green indicates that the highlighted setting appears in one deployment but not the other.

You can perform any of the actions in the following table.

VPN Deployment Comparison View Actions

To...	You CAN...
navigate individually through changes	click Previous or Next above the title bar. The double-arrow icon (↔) centered between the left and right sides moves, and the Difference number adjusts to identify which difference you are viewing.
generate a deployment comparison report	click Comparison Report . The deployment comparison report creates a PDF document that lists only the differences between the two policies.

CHAPTER 11

USING NAT POLICIES

A network address translation (NAT) policy determines how the system achieves routing with network address translation. You can configure one or more NAT policies, which you can then apply to one or more managed devices. Each device can have one currently applied policy.

You add NAT rules to a policy to control how the system handles network address translations. Each rule contains a set of conditions that identify the specific traffic you want to translate. You can create the following types of rules:

- static, which provide one-to-one translations on destination networks and optionally port and protocol
- dynamic IP, which translate many-to-many source networks, but maintain port and protocol
- dynamic IP and port, which translate many-to-one or many-to-many source networks and port and protocol

The system matches traffic to static translations before dynamic translations are inspected. The system then matches traffic to dynamic NAT rules in order; the first-matched rules handle the traffic. See [Organizing Rules in a NAT Policy](#) on page 389 for more information.

If you have access control policies in your deployment, the system does not translate traffic until it has passed through access control.

To configure and apply NAT policies on your appliances, you must have a Control license enabled on each of your target managed devices. Additionally, you can

only apply NAT policies to Series 3 devices with configured virtual routers or hybrid interfaces.

IMPORTANT! Managed devices must be running at least Version 5.2 of the Sourcefire 3D System before you can apply NAT policies to them. You must configure NAT for pre-5.2 devices from the NAT tab on the Device Management page. See [Configuring NAT on a Virtual Router](#) on page 341.

After you have configured and deployed NAT policies, you can use the command line interface (CLI) for managed device targets to troubleshoot the deployment. The CLI displays three types of NAT information: configuration, rule definitions, and active translations. See [Command Line Reference](#) on page 2242 for more information.

See the following sections for more information on creating and managing NAT policies:

- [Planning and Implementing a NAT Policy](#) on page 384
- [Configuring NAT Policies](#) on page 385
- [Organizing Rules in a NAT Policy](#) on page 389
- [Managing NAT Policies](#) on page 391
- [Creating and Editing NAT Rules](#) on page 404
- [Understanding NAT Rule Types](#) on page 406
- [Understanding NAT Rule Conditions and Condition Mechanics](#) on page 409
- [Working with Different Types of Conditions in NAT Rules](#) on page 415

Planning and Implementing a NAT Policy

LICENSE: Any

You can configure NAT policies in different ways to manage specific network needs. This section provides information for some of the ways you can deploy NAT policies.

WARNING! In clustered configurations, only select an individual peer interface for a static NAT rule on a clustered device if all networks affected by the NAT translations are private. Do **not** use this configuration for static NAT rules affecting traffic between public and private networks.

You can configure NAT to expose an internal server to an external network. In this configuration, you define a static translation from an external IP address to an internal IP address so the system can access an internal server from outside the network. Traffic sent to the server targets the external IP address or IP address and port, and is translated into the internal IP address or IP address and port. Return traffic from the server is translated back to the external address.

You can configure NAT to allow an internal host or server to connect to an external application. In this configuration, you define a static translation from an internal address to an external address. This definition allows the internal host or server to initiate a connection to an external application that is expecting the internal host or server to have a specific IP address and port. Therefore, the system cannot dynamically allocate the address of the internal host or server.

You can configure NAT to hide private network addresses from an external network by using a block of IP addresses. This becomes useful if you want to obscure your internal network addresses and have sufficient external IP addresses to satisfy your internal network needs. In this configuration, you create a dynamic translation that automatically converts the source IP address of any outgoing traffic to an unused IP address from your externally facing IP addresses.

You can configure NAT to hide private network addresses from an external network using a limited block of IP addresses and port translation. This becomes useful if you want to obscure your internal network addresses, but have an insufficient number of external IP addresses to satisfy your internal network needs. In this configuration, you create a dynamic translation that automatically converts the source IP address and port of outgoing traffic to an unused IP address and port from your externally facing IP addresses.

Configuring NAT Policies

LICENSE: Control

SUPPORTED DEVICES: Series 3

To configure a NAT policy, you must give the policy a unique name and identify the devices, or *targets*, where you want to apply the policy. You can also add, edit, delete, enable, and disable NAT rules. After you create or modify a NAT policy, you can apply the policy to all or some targeted devices.

You can apply NAT policies to a device cluster, including clustered stacks, as you would a standalone device. However, you can define static NAT rules for interfaces on individual clustered devices or the entire cluster and use the interfaces in source zones. For dynamic rules, you can use only the interfaces on the entire cluster in source or destination zones.

WARNING! In clustered configurations, only select an individual peer interface for a static NAT rule on a clustered device if all networks affected by the NAT translations are private. Do **not** use this configuration for static NAT rules affecting traffic between public and private networks.

If you configure dynamic NAT on a device cluster without HA link interfaces established, both clustered devices independently allocate dynamic NAT entries, and the system cannot synchronize the entries between devices. See [Configuring HA Link Interfaces](#) on page 262 for more information.

You can apply NAT policies to a device stack as you would a standalone device. If you establish a device stack from devices that were included in a NAT policy and had rules associated with interfaces from the secondary device that was a member of the stack, the interfaces from the secondary device remain in the NAT policy. You can save and apply policies with the interfaces, but the rules do not provide any translation. See [Managing Stacked Devices](#) on page 237 for more information.

The following table summarizes the configuration actions you can take on the NAT policy Edit page.

NAT Policy Configuration Actions

To...	You CAN...
modify the policy name or description	click the Name or Description field, delete any characters as needed, then type the new name or description.
manage policy targets	find more information at Managing NAT Policy Targets on page 387.
save your policy changes	click Save .
save and apply your policy	click Save and Apply . See Applying a NAT Policy on page 401 for more information.
cancel your policy changes	click Cancel , then, if you have made changes, click OK .
add a rule to a policy	click Add Rule . See Creating and Editing NAT Rules on page 404 for more information. TIP! You can also right-click an existing rule and select Insert new rule .
edit an existing rule	click the edit icon () next to the rule. See Creating and Editing NAT Rules on page 404 for more information. TIP! You can also right-click the rule and select Edit .
delete a rule	click the delete icon () next to the rule, then click OK . TIP! To delete one or more selected rules, you can right-click a blank area in the row for a selected rule, select Delete , then click OK .
enable or disable an existing rule	right-click a selected rule, select State , then select Disable or Enable . Disabled rules are grayed and marked (disabled) beneath the rule name.
display the configuration page for a specific rule attribute	click the name, value, or icon in the column for the condition on the row for the rule. For example, click the name or value in the Source Networks column to display the Source Network page for the selected rule. See Working with Different Types of Conditions in NAT Rules on page 415 for more information.

Managing NAT Policy Targets

LICENSE: Control

SUPPORTED DEVICES: Series 3

Before you can apply a NAT policy, you must identify the managed devices, including device stacks, clusters, or groups, where you want to apply the policy. You can identify the managed devices you want to target with your policy while creating or editing a policy. You can search a list of available devices, stacks, and clusters, and add them to a list of selected devices. You can also drag and drop selected devices, or add devices using the button between the two lists.

Note that you cannot target stacked devices running different versions of the Sourcefire 3D System (for example, if an upgrade on one of the devices fails). See [Managing Stacked Devices](#) on page 237 for more information.

The following table summarizes the actions you can take when managing targeted devices.

Targeted Device Management Actions

To...	You CAN...
search a list of available devices, stacks, and clusters	click inside the search field, then type a search string. The list of devices updates as you type to display matching device names.
clear a search for available devices	click the clear icon (✕) in the search field.
select available devices, stacks, or clusters to add to the list of selected targets	click the device name; use the Ctrl and Shift keys to select multiple devices. TIP! You can also right-click an available device, then click Select All .
add selected devices, stacks, or clusters	click Add to Policy . TIP! You can also drag and drop into the list of selected devices.
delete a single device, stack, or cluster from the Selected Devices list	click the delete icon (🗑) next to the device. TIP! You can also right-click the device and select Delete .
delete multiple devices from the Selected Devices list	use the Ctrl and Shift keys to select multiple devices, right-click to highlight the row for a selected device, then click Delete Selected .

Targeted Device Management Actions (Continued)

To...	You CAN...
save your configuration	click Save .
discard your configuration without saving your changes	click Cancel .

The following procedure explains how to configure a NAT policy to manage targeted devices. See [Editing a NAT Policy](#) on page 394 for the complete procedure for editing a NAT policy.

To manage targeted devices in a NAT policy:

ACCESS: Admin/Network Admin

1. Select **Devices > NAT**.
The NAT page appears.
2. Click the edit icon () next to the NAT policy you want to configure.
The NAT Policy Editor page appears.
3. Click the **Targets** tab.
The Targets page appears.
4. Optionally, click the **Search** prompt above the Available Devices list, then type a name.
The list updates as you type to display matching devices. You can click the clear icon () to clear the list.
5. Click the device, stack, cluster, or device group you want to add. Use Ctrl and Shift to select multiple devices.

TIP! You can also right-click an available device, then click **Select All**.

6. Click **Add to Policy**.
Selected devices are added.

TIP! You can also drag and drop to add devices.

7. Optionally, click the delete icon () to delete a device from the list of selected devices; or, use the Ctrl and Shift keys to select multiple devices, right-click, then select **Delete Selected**.
8. Click **Save** to save your configuration, or click **Cancel** to discard it.

Organizing Rules in a NAT Policy

LICENSE: Any

The Edit page for the NAT policy lists static NAT rules and dynamic NAT rules separately. The system sorts static rules alphabetically by name, and you cannot change the display order. You cannot create static rules with identical matching values. The system inspects static translations for a match before it inspects any dynamic translations.

Dynamic rules are processed in numerical order. The numeric position of each dynamic rule appears on the left side of the page next to the rule. You can move or insert dynamic rules and otherwise change the rule order. For example, if you move dynamic rule 10 under dynamic rule 3, rule 10 becomes rule 4 and all subsequent numbers increment accordingly.

A dynamic rule's position is important because the system compares packets to dynamic rules in the rules' numeric order on the policy Edit page. When a packet meets all the conditions of a dynamic rule, the system applies the conditions of that rule to the packet and ignores all subsequent rules for that packet.

Optionally, you can specify a dynamic rule's numeric position when you add or edit a dynamic rule. You can also highlight a dynamic rule before adding a new dynamic rule to insert the new rule below the rule you highlighted. See [Creating and Editing NAT Rules](#) on page 404.

You can select one or more dynamic rules by clicking a blank space in the row for the rule. You can drag and drop selected dynamic rules into a new location, thereby changing the position of the rules you moved and all subsequent rules.

You can cut or copy selected rules and paste them above or below an existing rule. You can only paste static rules in the Static Translations list and only dynamic rules in the Dynamic Translations list. You can also delete selected rules and insert new rules into any location in the list of existing rules.

IMPORTANT! You can copy, but not cut static rules.

You can display explanatory warnings to identify rules that will never match because they are preempted by preceding rules.

If you have access control policies in your deployment, the system does not translate traffic until it has passed through access control.

The following table summarizes the actions you can take to organize your rules.

NAT Rule Organization Actions

To...	You CAN...
select a rule	click a blank area in the row for a rule. Use the Ctrl or Shift key to select multiple rules. Rules you select are highlighted.
clear rule selections	click the reload icon () on the lower right side of the page. To clear individual rules, click a blank area in a rule's row while holding the Ctrl key.
cut or copy selected rules	right-click a blank area in the row for a selected rule, then select Cut or Copy . TIP! You can copy, but not cut static rules.
paste rules you have cut or copied into the rule list	right-click a blank area in the row for a rule where you want to paste selected rules, then select Paste above or Paste below . TIP! You can only paste static rules in the Static Translations list and only dynamic rules in the Dynamic Translations list.
move selected rules	drag and drop selected rules beneath a new location, indicated by a horizontal blue line that appears above your pointer as you drag.
delete a rule	click the delete icon () next to the rule, then click OK . TIP! You can also right-click a blank area in the row for a selected rule, select Delete , then click OK to delete one or more selected rules.
show warnings	click Show Warnings ; see Working with NAT Rule Warnings and Errors on page 390.

Working with NAT Rule Warnings and Errors

LICENSE: Any

The conditions of a NAT rule may preempt a subsequent rule from matching traffic. Any type of rule condition can preempt a subsequent rule.

A rule also preempts an identical subsequent rule where all configured conditions are the same. A subsequent rule would not be preempted if any condition were different.

The following table summarizes the actions you can take to show and clear warnings.

Preempted Rule Warning Actions

To...	YOU CAN...
show warnings	click Show Warnings . The page updates with an warning icon (⚠) next to each preempted rule.
display the warning for a rule	hover your pointer over the warning icon (⚠) next to a rule. A message indicates which rule preempts the rule.
clear warnings	click Hide Warnings . The page refreshes and the warnings disappear. TIP! Any action that refreshes the page, such as adding or editing a rule, or clicking the reload icon (🔄), also clears warnings.

If you create a rule that causes the NAT policy to fail upon apply, an error icon (❗) appears next to the rule. An error occurs if there is a conflict in the static rules, or if you edit a network object used in the policy that now makes the policy invalid. For example, an error occurs if you change a network object to use only IPv6 addresses and the rule that uses that object no longer has any valid networks where at least one network is required. Error icons appear automatically; you do not have to click **Show Warnings**.

Managing NAT Policies

LICENSE: Control

SUPPORTED DEVICES: Series 3

On the NAT policy page (**Devices > NAT**), you can view all your current NAT policies by name with optional description and the following status information:

- when a policy is up to date on targeted devices, in green text
- when a policy is out of date on targeted devices, in red text

Options on this page allow you to compare policies, create a new policy, apply a policy to targeted devices, copy a policy, view a report that lists all of the most recently saved settings in each policy, and edit a policy.

IMPORTANT! After you have applied a NAT policy to a managed device, you cannot delete the policy, even if it is out of date. Instead, you must apply a NAT policy with no rules to remove the applied NAT rules from the managed device.

The following table describes the actions you can take to manage your policies on the NAT policy page.

NAT Policy Management Actions

To...	You CAN...
create a new NAT policy	click New Policy . See Creating a NAT Policy on page 392 for more information.
modify the settings in an existing NAT policy	click the edit icon (). See Editing a NAT Policy on page 394 for more information.
apply a NAT policy to all devices targeted for the policy	click the policy apply icon (). See Applying a NAT Policy on page 401 for more information.
copy a NAT policy	click the copy icon (). See Copying a NAT Policy on page 395 for more information.
view a PDF report that lists the current configuration settings in a NAT policy	click the report icon (). See Viewing a NAT Policy Report on page 396 for more information.
compare NAT policies	click Compare Policies . See Comparing Two NAT Policies on page 397 for more information.
delete a NAT policy	click the delete icon () , then click OK , or click Cancel if you decide not to delete the policy. When prompted whether to continue, you are also informed if another user has unsaved changes in the policy. IMPORTANT! After you have applied a NAT policy to a managed device, you cannot delete the policy from the device. Instead, you must apply a NAT policy with no rules to remove the applied NAT rules from the managed device. You also cannot delete a policy that is the last applied policy on any of its target devices, even if it is out of date. Before you can delete the policy completely, you must apply a different policy to those targets.

Creating a NAT Policy

LICENSE: Control

SUPPORTED DEVICES: Series 3

When you create a new NAT policy you must, at minimum, give it a unique name. Although you are not required to identify policy targets at policy creation time, you must perform this step before you can apply the policy; see [Managing NAT Policy Targets](#) on page 387. If you apply a NAT policy with no rules to a device, the system removes all NAT rules from that device.

To create a NAT policy:

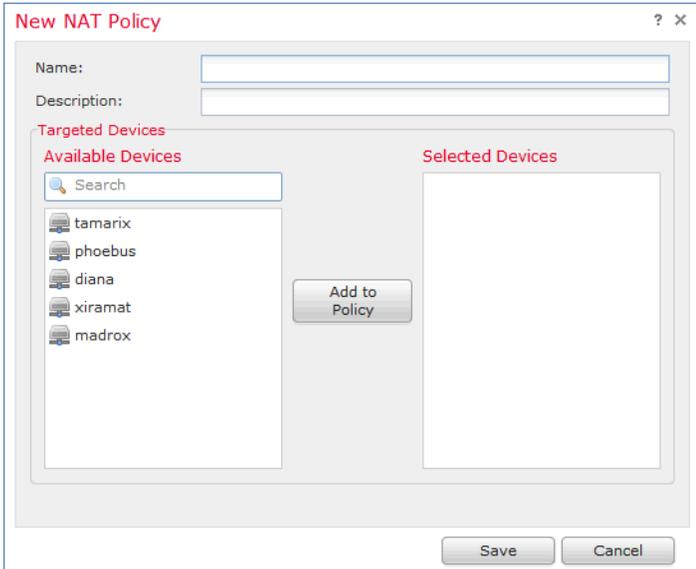

ACCESS: Admin/Network Admin

1. Select **Devices > NAT**.

The NAT page appears.

2. Click **New Policy**.

The New NAT Policy pop-up window appears.

3. Give the policy a unique **Name** and, optionally, a **Description**.

You can use all printable characters, including spaces and special characters.

4. Select the **Available Devices** where you want to apply the policy.

Use Ctrl and Shift to select multiple devices, or right-click to **Select All**. To narrow the devices that appear, type a search string in the **Search** field. To clear the search, click the clear icon (✕).

5. Add the **Selected Devices**. You can click and drag, or you can click **Add to Policy**.

6. Click **Save**.

The NAT policy Edit page appears. For information on configuring your new policy, including adding rules, see [Editing a NAT Policy](#) on page 394. Note that you must apply the policy for it to take effect; see [Applying a NAT Policy](#) on page 401.

Editing a NAT Policy

LICENSE: Control

SUPPORTED DEVICES: Series 3

On the NAT policy Edit page, you can configure your policy. See [Configuring NAT Policies](#) on page 385 and for more information.

When you change your configuration, a message indicates that you have unsaved changes. To retain your changes, you must save the policy before exiting the NAT policy Edit page. If you attempt to exit the policy Edit page without saving your changes, you are cautioned that you have unsaved changes; you can then discard your changes and exit the policy, or return to the policy Edit page.

To protect the privacy of your session, after 60 minutes of inactivity on the policy Edit page, changes to your policy are discarded and you are returned to the NAT page. After the first 30 minutes of inactivity, a message appears and updates periodically to provide the number of minutes remaining before changes are discarded. Any activity on the page resets the timer.

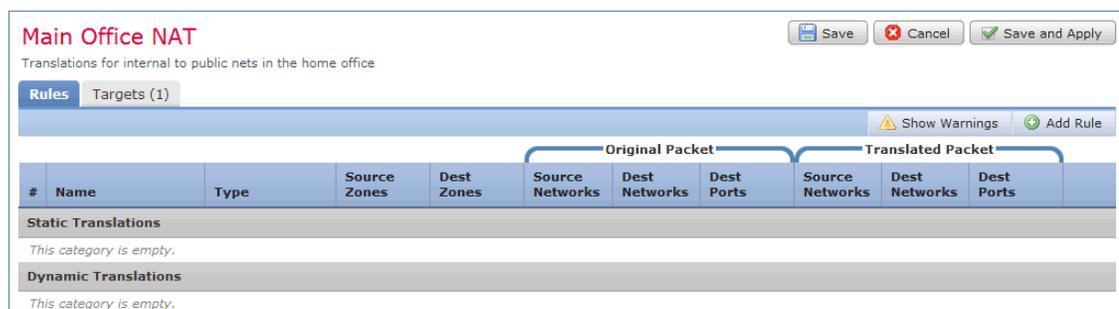

When you attempt to edit the same policy in two browser windows, you are prompted whether to resume your edit in the new window, discard your changes in the original window and continue editing in the new window, or cancel the second window and return to the policy Edit page.

When multiple users edit the same policy concurrently, a message for each user on the policy Edit page identifies other users who have unsaved changes. Any user who attempts to save changes is cautioned that saving changes will overwrite changes by other users. When multiple users save the same policy, the last saved changes are retained.

To edit a NAT policy:

ACCESS: Admin/Network Admin

1. Select **Devices > NAT**.
The NAT page appears.
2. Click the edit icon (✎) next to the NAT policy you want to configure.
The NAT policy Edit page appears.

3. To configure your policy, take any of the actions described in [Configuring NAT Policies](#) on page 385.
4. Save or discard your configuration. You have the following choices:
 - To save your changes and continue editing, click **Save**.
 - To save your changes and apply your policy, click **Save and Apply**. See [Applying a NAT Policy](#) on page 401.
You must apply your policy to put your changes into effect.
 - To discard your changes, click **Cancel** and, if prompted, click **OK**.
Your changes are discarded and the NAT page appears.

Copying a NAT Policy

LICENSE: Control

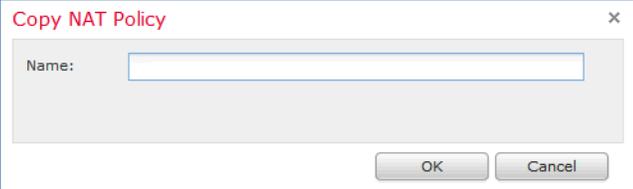

SUPPORTED DEVICES: Series 3

You can copy and rename a NAT policy. A policy you copy includes all policy rules and configurations.

To copy a NAT policy:

ACCESS: Admin/Network Admin

1. Select **Devices > NAT**.
The NAT page appears.
2. Click the copy icon (📄) next to the NAT policy you want to configure.
The Copy NAT Policy pop-up window appears.

3. Enter a unique policy **Name**.
You can use any printable characters, including spaces and special characters.
4. Click **OK**.
Your copy appears on the NAT page in alphabetical order by name.

Viewing a NAT Policy Report

LICENSE: Control

SUPPORTED DEVICES: Series 3

A NAT policy report is a record of the policy and rules configuration at a specific point in time. You can use the report for auditing purposes or to inspect the current configuration.

TIP! You can also generate a NAT comparison report that compares a policy with the currently applied policy or with another policy. For more information, see [Comparing Two NAT Policies](#) on page 397.

A NAT policy report contains the sections described in the following table.

NAT Policy Report Sections

SECTION	DESCRIPTION
Title Page	Identifies the name of the policy report, the date and time the policy was last modified, and the name of the user who last modified it.
Table of Contents	Describes the contents of the report.
Policy Information	Provides the name and description of the policy, the name of the user who last modified the policy, and the date and time the policy was last modified. See Editing a NAT Policy on page 394.
Device Targets	Lists the managed devices targeted by the policy. See Managing NAT Policy Targets on page 387.
Rules	Provides the rule type and conditions for each rule in the policy. See Creating and Editing NAT Rules on page 404.
Referenced Objects	Provides the name and configuration of all individual objects and group objects used in the policy, by type of condition (Zones, Networks, and Ports) where the object is configured.

To view a NAT policy report:

ACCESS: Admin/Network Admin

1. Select **Devices > NAT**.
The NAT page appears.

2. Click the report icon () next to the policy for which you want to generate a report. Remember to save any changes before you generate a NAT policy report; only saved changes appear in the report.

The system generates the report. Depending on your browser settings, the report may appear in a pop-up window, or you may be prompted to save the report to your computer.

Comparing Two NAT Policies

LICENSE: Control

SUPPORTED DEVICES: Series 3

To review policy changes, you can examine the differences between two NAT policies. You can compare any two policies or the currently applied policy with another policy. Optionally, after you compare, you can then generate a PDF report to record the differences between the two policies.

There are two tools you can use to compare policies:

- The comparison view displays only the differences between two policies in a side-by-side format. The name of each policy appears in the title bar on the left and right sides of the comparison view except when you select **Running Configuration**, in which case a blank bar represents the currently active policy.

You can use this to view and navigate both policies on the web interface, with their differences highlighted.

- The comparison report creates a record of only the differences between two policies in a format similar to the policy report, but in PDF format.

You can use this to save, copy, print, and share your policy comparisons for further examination.

For more information on understanding and using policy comparison tools, see the following sections:

- [Using the NAT Policy Comparison View](#) on page 397
- [Using the NAT Policy Comparison Report](#) on page 399

Using the NAT Policy Comparison View

LICENSE: Control

SUPPORTED DEVICES: Series 3

The comparison view displays both policies in a side-by-side format, with each policy identified by name in the title bar on the left and right sides of the comparison view. When comparing two policies other than the running

configuration, the time of last modification and the last user to modify are displayed with the policy name.

Main Office NAT (2013-05-23 09:22:27 by admin)	TX Sales Office (2013-05-23 09:24:18 by admin)

Differences between the two policies are highlighted:

- Blue indicates that the highlighted setting is different in the two policies, and the difference is noted in red text.
- Green indicates that the highlighted setting appears in one policy but not the other.

You can perform any of the actions in the following table.

NAT Policy Comparison View Actions

To...	YOU CAN...
navigate individually through changes	click Previous or Next above the title bar. The double-arrow icon (↔) centered between the left and right sides moves, and the Difference number adjusts to identify which difference you are viewing.

NAT Policy Comparison View Actions (Continued)

To...	YOU CAN...
generate a new policy comparison view	click New Comparison . The Select Comparison window appears. See Using the NAT Policy Comparison Report on page 399 for more information.
generate a policy comparison report	click Comparison Report . The policy comparison report creates a PDF document that lists only the differences between the two policies.

Using the NAT Policy Comparison Report

LICENSE: Control

SUPPORTED DEVICES: Series 3

A NAT policy comparison report is a record of all differences between two NAT policies or a policy and the currently applied policy identified by the policy comparison view, presented in PDF format. You can use this report to further examine the differences between two policy configurations and to save and disseminate your findings.

You can generate a NAT policy comparison report from the comparison view for any policies to which you have access. Remember to save any changes before you generate a policy report; only saved changes appear in the report.

The format of the policy comparison report is the same as the policy report, with one exception: the policy report contains all configurations in the policy, while the policy comparison report lists only those configurations that differ between the policies. A NAT policy comparison report contains the sections described in the [NAT Policy Report Sections table](#) on page 396.

To compare two NAT policies:

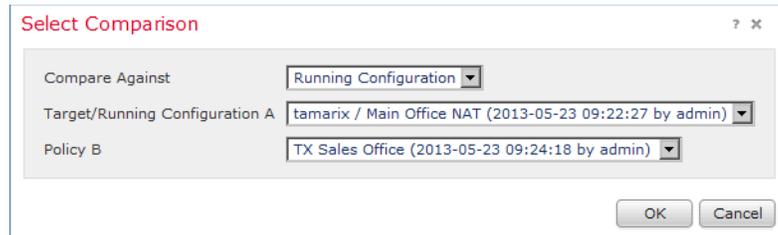

ACCESS: Admin/Network Admin

1. Select **Devices > NAT**.

The NAT page appears.

2. Click **Compare Policies**.

The Select Comparison window appears.

3. From the **Compare Against** drop-down list, select the type of comparison you want to make:

- To compare two different policies, select **Other Policy**.
The page refreshes and the Policy A and Policy B drop-down lists appear.
- To compare two different revisions, select **Other Revision**.
The page refreshes and the Policy, Revision A and Revision B drop-down lists appear.
- To compare another policy to the currently active policy, select **Running Configuration**.
The page refreshes and the Target/Running Configuration A and Policy B drop-down lists appear.

4. Depending on the comparison type you selected, you have the following choices:

- If you are comparing two different policies, select the policies you want to compare from the **Policy A** and **Policy B** drop-down lists.
- If you are comparing two different revisions, select the policy, then select the revisions you want to compare from the **Revision A** and **Revision B** drop-down lists.
- If you are comparing the running configuration to another policy, select the second policy from the **Policy B** drop-down list.

5. Click **OK** to display the policy comparison view.

The comparison view appears.

6. Optionally, click **Comparison Report** to generate the NAT policy comparison report.

The NAT policy comparison report appears. Depending on your browser settings, the report may appear in a pop-up window, or you may be prompted to save the report to your computer.

Applying a NAT Policy

LICENSE: Control

SUPPORTED DEVICES: Series 3

After making any changes to a NAT policy, you must apply the policy to one or more devices to implement the configuration changes on the networks monitored by the devices. You must target devices where you want to apply the policy before you can apply the policy. See [Managing NAT Policy Targets](#) on page 387.

Keep the following points in mind when applying NAT policies:

- You can configure and maintain multiple NAT policies on a Defense Center, but only one policy can be applied to a device at a time.
- You can apply two different NAT policies to different devices, even though they are both targets for multiple policies.
- You cannot apply a NAT policy to stacked devices running different versions of the Sourcefire 3D System (for example, if an upgrade on one of the devices fails). See [Managing Stacked Devices](#) on page 237 for more information.
- If you apply a device configuration that affects the interfaces in a NAT policy, the system reapplies the NAT policy on the device, including the interface changes. However, the policy remains unchanged on the DC and the interface displays an error icon ().

IMPORTANT! Applying an empty NAT policy removes all NAT rules from a device.

See the following sections for more information:

- [Applying a Complete NAT Policy](#) on page 401 explains how to use the quick-apply option to apply the NAT policy.
- [Applying Selected Policy Configurations](#) on page 402 explains how to select and apply configurations within the NAT policy.

Applying a Complete NAT Policy

LICENSE: Control

SUPPORTED DEVICES: Series 3

You can apply a NAT policy at any time. Applying a NAT policy also applies any associated rule configurations, objects, and policy changes to the devices targeted by the policy. A pop-up window allows you to apply all changes together as a single quick-apply action.

To quick-apply a complete NAT policy:

ACCESS: Admin/Network Admin

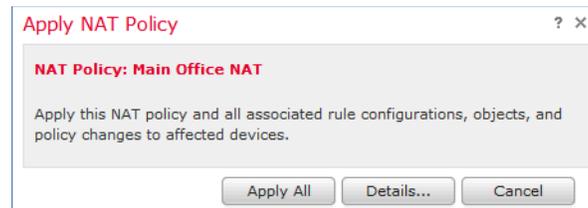

1. Select **Devices > NAT**.

The NAT page appears.

NAT Policy	Status	
APAC Regional Office	Targeting 1 devices Out-of-date on 1 targeted devices	✓ 📄 ✎ 🗑️
Main Office NAT Translations for internal to public nets in the home office	Targeting 1 devices Up-to-date on all targeted devices	✓ 📄 ✎ 🗑️
TX Sales Office	Targeting 1 devices Up-to-date on all targeted devices	✓ 📄 ✎ 🗑️

2. Click the apply icon (✓) next to the policy you want to apply.

The Apply NAT Rules pop-up window appears.

Alternatively, you can click **Save and Apply** on the policy Edit page; see [Editing a NAT Policy](#) on page 394.

3. Click **Apply All**.

Your policy apply task is queued. Click **OK** to return to the NAT page.

TIP! You can monitor the progress of the policy apply task on the Task Status page (**System > Monitoring > Task Status**).

Applying Selected Policy Configurations

LICENSE: Control

SUPPORTED DEVICES: Series 3

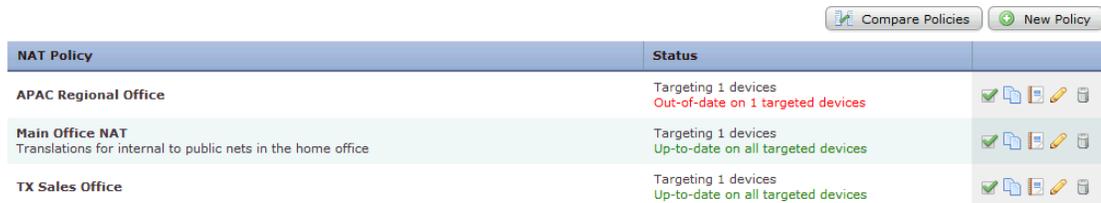

You can use the detailed policy apply page to apply changes to your NAT policy and to any designated targeted devices. The detailed page lists each device targeted by the policy and provides a column for the NAT policy by device. You can specify whether to apply changes to a NAT policy for each targeted device that is out of date.

To apply selected NAT policy configurations:

ACCESS: Admin/Network Admin

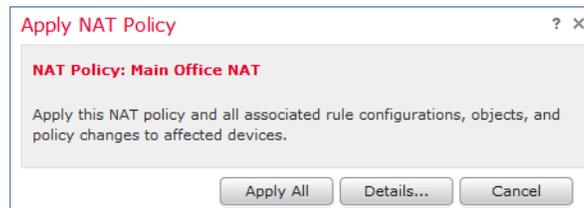

1. Select **Devices > NAT**.

The NAT page appears.

NAT Policy	Status	
APAC Regional Office	Targeting 1 devices Out-of-date on 1 targeted devices	<input checked="" type="checkbox"/>
Main Office NAT Translations for internal to public nets in the home office	Targeting 1 devices Up-to-date on all targeted devices	<input checked="" type="checkbox"/>
TX Sales Office	Targeting 1 devices Up-to-date on all targeted devices	<input checked="" type="checkbox"/>

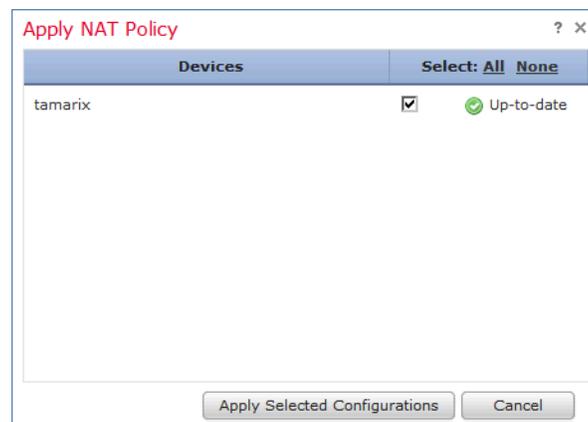

2. Click the apply icon () next to the policy you want to apply.
The Apply NAT Rules pop-up window appears.

Alternatively, you can click **Save and Apply** on the policy Edit page; see [Editing a NAT Policy](#) on page 394.

3. Click **Details**.

The detailed Apply NAT Rules pop-up window appears.

TIP! You can also open the pop-up window from the NAT page (**Devices > NAT**) by clicking on an out-of-date message in the **Status** column for the policy.

4. Select or clear the **NAT policy** check box next to the device name to specify whether to apply the NAT policy to a targeted device.

5. Click **Apply Selected Configurations**.

Your policy apply task is queued. Click **OK** to return to the NAT page.

TIP! You can monitor the progress of the policy apply task on the Task Status page (**System > Monitoring > Task Status**).

Creating and Editing NAT Rules

LICENSE: Control

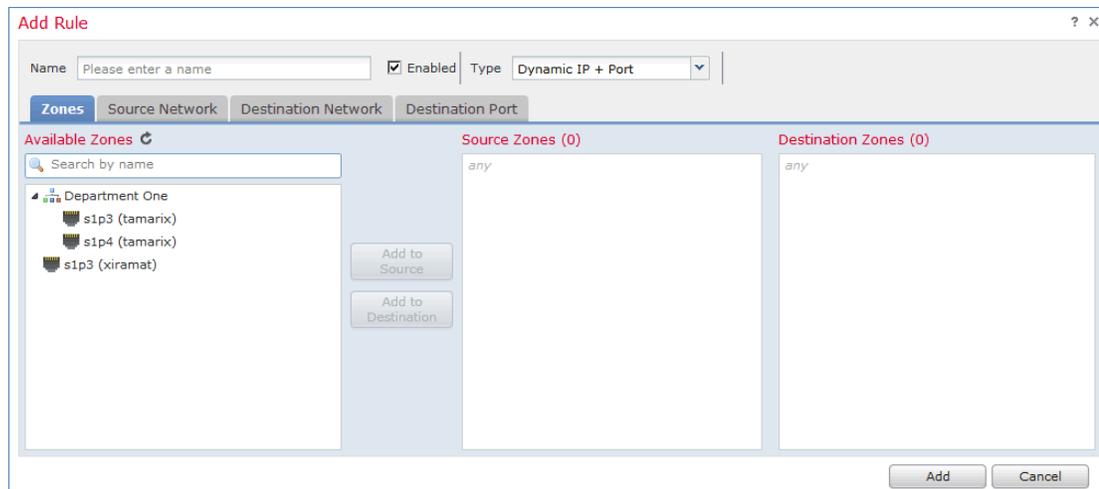

SUPPORTED DEVICES: Series 3

A NAT rule is simply a set of configurations and conditions that:

- qualifies network traffic
- specifies how the traffic that matches those qualifications is translated

You create and edit NAT rules from within an existing NAT policy. Each rule belongs to only one policy.

The web interface for adding or editing a rule is similar. You specify the rule name, state, type, and position (if dynamic) at the top of the page. You build conditions using the tabs on the left side of the page; each condition type has its own tab.

The following list summarizes the configurable components of a NAT rule.

Name

Give each rule a unique name. You can use up to thirty printable characters, including spaces and special characters, with the exception of the colon (:).

Rule State

By default, rules are enabled. If you disable a rule, the system does not use it to evaluate network traffic for translation. When viewing the list of rules in a NAT policy, disabled rules are grayed out, although you can still modify them.

Type

A rule's type determines how the system handles traffic that matches the rule's conditions. When you create and edit NAT rules, the configurable components vary according to rule type.

For detailed information on rule types and how they affect translation and traffic flow, see [Understanding NAT Rule Types](#) on page 406.

Position (Dynamic Rules Only)

Dynamic rules in a NAT policy are numbered, starting at 1. The system matches traffic to NAT rules in top-down order by ascending rule number.

When you add a rule to a policy, you specify its position by placing it **above** or **below** a specific rule, using rule numbers as a reference point. When editing an existing rule, you can **Move** the rule in a similar fashion. For more information, see [Organizing Rules in a NAT Policy](#) on page 389.

Conditions

Rule conditions identify the specific traffic you want to translate. Conditions can match traffic by any combination of multiple attributes, including security zone, network, and transport protocol port.

For detailed information on adding conditions, see [Understanding NAT Rule Conditions and Condition Mechanics](#) on page 409 and [Working with Different Types of Conditions in NAT Rules](#) on page 415.

To create or edit a NAT rule:

ACCESS: Admin/Network Admin

1. Select **Devices > NAT**.
The NAT page appears.
2. Click the edit icon () next to the NAT policy where you want to add a rule.
The NAT policy Edit page appears.

3. Add a new rule or edit an existing rule:
 - To add a new rule, click **Add Rule**.
 - To edit an existing rule, click the edit icon () next to the rule you want to edit.

Either the Add Rule or the Editing Rule page appears.

TIP! You can use the right-click context menu to perform many rule creation and management actions; see [Using the Context Menu](#) on page 63. You can also drag and drop rules to change their order.

4. Configure the rule components, as described earlier in this section. You can configure the following, or accept the defaults:
 - You must provide a unique rule **Name**.
 - Specify whether the rule is **Enabled**.
 - Select a rule **Type**.
 - Specify the rule position (dynamic rules only).
 - Configure the rule's conditions.
 - Static rules must include an original destination network.
 - Dynamic rules must include a translated source network.
5. Click **Add** or **Save**.

Your changes are saved. You must apply the NAT policy for your changes to take effect; see [Applying a NAT Policy](#) on page 401.

Understanding NAT Rule Types

LICENSE: Any

Every NAT rule has an associated type that:

- qualifies network traffic
- specifies how the traffic that matches those qualifications is translated

The following list summarizes the NAT rule types.

Static

Static rules provide one-to-one translations on destination networks and optionally port and protocol. When configuring static translations, you can configure source zones, destination networks, and destination ports. You cannot configure destination zones or source networks.

You **must** specify an original destination network. For destination networks, you can only select network objects and groups containing a single IP address or

enter literal IP addresses that represent a single IP address. You can only specify a single original destination network and a single translated destination network.

Optionally, you can specify a single original destination port and a single translated destination port. You must specify an original destination network before you can specify an original destination port. In addition, you cannot specify a translated destination port unless you also specify an original destination port, and the translated value must match the protocol of the original value.

WARNING! For static NAT rules on a clustered device, only select an individual peer interface if all networks affected by the NAT translations are private. Do **not** use this configuration for static NAT rules affecting traffic between public and private networks.

Dynamic IP Only

Dynamic IP Only rules translate many-to-many source networks, but maintain port and protocol. When configuring dynamic IP only translations, you can configure zones, source networks, original destination networks, and original destination ports. You cannot configure translated destination networks or translated destination ports.

You **must** specify at least one translated source network. If the number of translated source network values is less than the number of original source networks, the system displays a warning on the rule that it is possible to run out of translated addresses before all original addresses are matched.

If there are multiple rules with conditions that match the same packet, the low priority rules become dead, meaning they can never be triggered. The system also displays warnings for dead rules. You can view tooltips to determine which rule supersedes the dead rule.

IMPORTANT! You can save and apply policies with dead rules, but the rules cannot provide any translation.

In some instances, you may want to create rules with limited scope preceding rules with a broader scope. For example:

Rule 1: Match on address A and port A/Translate to address B
Rule 2: Match on address A/Translate to Address C

In this example, rule 1 matches some packets that also match rule 2. Therefore, rule 2 is not completely dead.

Optionally, you can specify only original destination ports. You cannot specify translated destination ports.

Dynamic IP + Port

Dynamic IP and port rules translate many-to-one or many-to-many source networks and port and protocol. When configuring dynamic IP and port translations, you can configure zones, source networks, original destination networks, and original destination ports. You cannot configure translated destination networks or translated destination ports.

You **must** specify at least one translated source network. If there are multiple rules with conditions that match the same packet, the low priority rules become dead, meaning they can never be triggered. The system also displays warnings for dead rules. You can view tool tips to determine which rule supersedes the dead rule.

IMPORTANT! You can save and apply policies with dead rules, but the rules cannot provide any translation.

Optionally, you can specify only original destination ports. You cannot specify translated destination ports.

IMPORTANT! If you create a dynamic IP and port rule, and the system passes traffic that does not use a port, no translation occurs for the traffic. For example, a ping (ICMP) from an IP address that matches the source network does not map, because ICMP does not use a port.

The following table summarizes the NAT rule condition types that can be configured based on the specified NAT rule type:

Available NAT Rule Condition Types per NAT Rule Type

CONDITION	STATIC	DYNAMIC (IP ONLY OR IP + PORT)
Source Zones	Optional	Optional
Destination Zones	Not allowed	Optional
Original Source Networks	Not allowed	Optional
Translated Source Networks	Not allowed	Required
Original Destination Networks	Required	Optional

Available NAT Rule Condition Types per NAT Rule Type (Continued)

CONDITION	STATIC	DYNAMIC (IP ONLY OR IP + PORT)
Translated Destination Networks	Optional; single address only	Not allowed
Original Destination Ports	Optional; single port only, and only allowed if you define the original destination network	Optional
Translated Destination Ports	Optional; single port only, and only allowed if you define the original destination port	Not allowed

Understanding NAT Rule Conditions and Condition Mechanics

LICENSE: Any

You can add conditions to NAT rules to identify the type of traffic that matches the rule. For each condition type, you select conditions you want to add to a rule from a list of available conditions. When applicable, condition filters allow you to constrain available conditions. Lists of available and selected conditions may be as short as a single condition or many pages long. You can search available conditions and display only those matching a typed name or value in a list that updates as you type.

Depending on the type of condition, lists of available conditions may be comprised of a combination of conditions provided directly by Sourcefire or configured using other Sourcefire 3D System features, including objects created using the object manager (**Objects > Object Management**), objects created directly from individual conditions pages, and literal conditions.

See the following sections for information on specifying rule conditions:

- [Understanding NAT Rule Conditions](#) on page 410 defines the different types of rule conditions.
- [Adding Conditions to NAT Rules](#) on page 411 describes the controls used to select and add rule conditions.
- [Searching NAT Rule Condition Lists](#) on page 413 explains how to search available conditions and display only those matching a typed name or value in a list that updates as you type.
- [Adding Literal Conditions to NAT Rules](#) on page 414 explains how to add literal conditions to a rule.
- [Using Objects in NAT Rule Conditions](#) on page 415 explains how to add individual objects to the system from the configuration pages for relevant condition types.

Understanding NAT Rule Conditions

LICENSE: Any

You can set a NAT rule to match traffic meeting any of the conditions described in the following table:

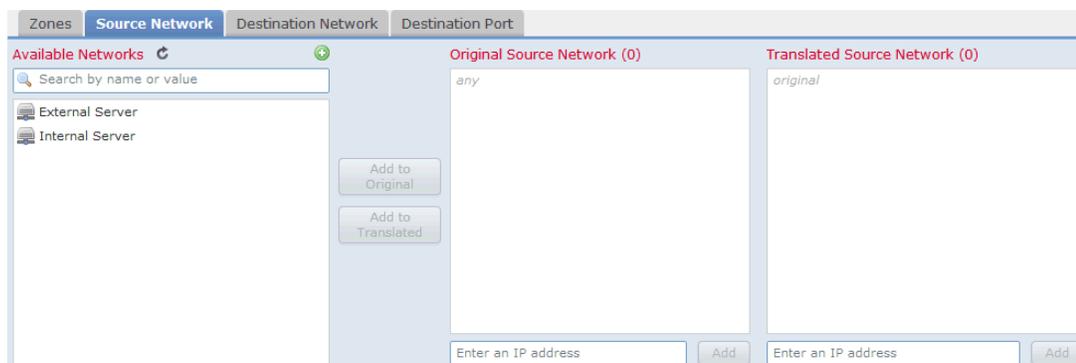

NAT Rule Condition Types

CONDITION	DESCRIPTION	SUPPORTED DEFENSE CENTERS	SUPPORTED DEVICES
Zones	A configuration of one or more routed interfaces where you can apply NAT policies. Zones provide a mechanism for classifying traffic on source and destination interfaces, and you can add source and destination zone conditions to rules. See Working with Security Zones on page 187 for information on creating zones using the object manager.	Any	Series 3
Networks	Any combination of individual IP addresses, CIDR blocks, and prefix lengths, either specified explicitly or using network objects and groups (see Working with Network Objects on page 161). You can add source and destination network conditions to NAT rules.	Any	Series 3
Destination Ports	Transport protocol ports, including individual and group port objects you create based on transport protocols. See Working with Port Objects on page 173 for information on creating individual and group transport protocol objects using the object manager.	Any	Series 3

Adding Conditions to NAT Rules

LICENSE: Any

Adding conditions to NAT rules is essentially the same for each type of condition. You select from a list of available conditions on the left, and add the selected conditions to one or two lists of selected conditions on the right.

For all condition types, you select one or more individual available conditions by clicking on them to highlight them. You can either click a button between the two types of lists to add available conditions that you select to your lists of selected conditions, or drag and drop available conditions that you select into the list of selected conditions.

You can add up to 50 conditions of each type to a list of selected conditions. For example, you can add up to 50 source zone conditions, up to 50 destination zone conditions, up to 50 source network conditions, and so on, until you reach the upper limit for the appliance.

The following table describes the actions you can take to select and add conditions to a rule.

Adding Conditions to a NAT Rule

To...	You CAN...
select available conditions to add to a list of selected conditions	click the available condition; use the Ctrl and Shift keys to select multiple conditions.
select all listed available conditions	right-click the row for any available condition, then click Select All .
search a list of available conditions or filters	click inside the Search field and type a search string. See Searching NAT Rule Condition Lists on page 413 for more information.

Adding Conditions to a NAT Rule (Continued)

To...	YOU CAN...
clear a search when searching available conditions or filters	click the reload icon () above the Search field or the clear icon () in the Search field.
add selected zone conditions from a list of available conditions to a list of selected source or destination conditions	click Add to Source or Add to Destination . See Adding Zone Conditions to NAT Rules on page 415 for more information.
add selected network and port conditions from a list of available conditions to a list of selected original or translated conditions	click Add to Original or Add to Translated . See Adding Source Network Conditions to Dynamic NAT Rules on page 418, Adding Destination Network Conditions to NAT Rules on page 419, or Adding Port Conditions to NAT Rules on page 421 for more information.
drag and drop selected available conditions into a list of selected conditions	click a selected condition, then drag and drop into the list of selected conditions.
add a literal condition to a list of selected conditions using a literal field	click to remove the prompt from the literal field, type the literal condition, then click Add . Network conditions provide a field for adding literal conditions.
add a literal condition to a list of selected conditions using a drop-down list	select a condition from the drop-down list, then click Add . Port conditions provide a drop-down list for adding literal conditions. See Adding Port Conditions to NAT Rules on page 421 for more information.
add an individual object or condition filter so you can then select it from the list of available conditions	click the add icon (). See Using Objects and Security Zones on page 158 for information on adding objects using the object manager.
delete a single condition from a list of selected conditions	click the delete icon () next to the condition
delete a condition from a list of selected conditions	right-click to highlight the row for a selected condition, then click Delete .
delete multiple conditions from a list of selected conditions	use the Shift and Ctrl keys to select multiple conditions, or right-click and Select All ; next, right-click to highlight the row for a selected condition, then click Delete Selected .

On the relevant condition page, and also on the policy Edit page, you can hover your pointer over an individual object to display the contents of the object, and over a group object to display the number of individual objects in the group.

The following basic procedure explains how to add conditions to a new rule. See [Creating and Editing NAT Rules](#) on page 404 for complete instructions on adding and modifying rules.

To add available conditions to a list of selected conditions:

ACCESS: Admin/Network Admin

1. Select **Devices > NAT**.
The NAT page appears.
2. Click the edit icon () next to the NAT policy you want to modify.
The policy Edit page appears.
3. Click **Add Rule**.
The Add Rule page appears.

4. Click the tab for the type of condition you want to add to the rule.
The conditions page appears for the type of condition you selected.
5. Take any of the available actions in the [Adding Conditions to a NAT Rule table](#) on page 411.
6. Click **Add** to save your configuration.
Your rule is added and the policy Edit page appears.

Searching NAT Rule Condition Lists

LICENSE: Any

You can filter a list of available NAT rule conditions to limit the number of items displayed in the list. The list updates as you type to display matching items.

Optionally, you can search on object names and on the values configured for objects. For example, if you have an individual network object named **Texas office** with the configured value **192.168.3.0/24**, and the object is included in the group object **US offices**, you can display both objects by typing a partial or complete search string such as **Tex**, or by typing a value such as **3**.

The following basic procedure explains how to filter a list in a new rule. See [Creating and Editing NAT Rules](#) on page 404 for complete instructions on adding and modifying rules.

To search a list of available conditions:

ACCESS: Admin/Network Admin

1. Select **Devices > NAT**.

The NAT page appears.

2. Click the edit icon (✎) next to the NAT policy you want to modify.

The policy Edit page appears.

3. Click **Add Rule**.

The Add Rule page appears. The following graphic shows the search field on the Source Network and Destination Network conditions page.

4. To search a list, click inside the search field to clear the prompt, then type a search string.

The list updates as you type to display matching items and a clear list icon (✕) appears in the search field. The list updates and no items are listed when none match the search string.

5. Optionally, click the reload icon (↻) above the **Search** field or click the clear icon (✕) in the **Search** field to clear the search string.

The complete list appears.

6. Click **Add** to save your configuration.

Your rule is added and the policy Edit page appears.

Adding Literal Conditions to NAT Rules

LICENSE: Any

You can add a literal value to the list of original and translated conditions for the following condition types:

- Networks
- Ports

For network conditions, you type the literal value in a configuration field below the list of original or translated conditions.

In the case of port conditions, you select a protocol from a drop-down list. When the protocol is **ATM** and, optionally, when the protocol is **TCP** or **UDP**, you type a port number in a configuration field.

Each relevant conditions page provides the controls needed to add literal values. Values you type in a configuration field appear as red text if the value is invalid, or until it is recognized as valid. Typed values change to blue text as you type when they are recognized as valid. A grayed **Add** button activates when a valid value is

recognized. Literal values you add appear immediately in the list of selected conditions.

See the following sections for specific details on adding each type of literal value:

- [Adding Source Network Conditions to Dynamic NAT Rules](#) on page 418
- [Adding Destination Network Conditions to NAT Rules](#) on page 419
- [Adding Port Conditions to NAT Rules](#) on page 421

Using Objects in NAT Rule Conditions

LICENSE: Any

Objects that you create in the object manager (**Objects > Object Management**) are immediately available for you to select from relevant lists of available NAT rule conditions. See [Using Objects and Security Zones](#) on page 158 for information.

You can also create objects on-the-fly from the NAT policy. A control on relevant conditions pages provides access to the same configuration controls that you use in the object manager.

Individual objects created on-the-fly appear immediately in the list of available objects. You can add them to the current rule, and to other existing and future rules. On the relevant conditions page, and also on the policy Edit page, you can hover your pointer over an individual object to display the contents of the object, and over a group object to display the number of individual objects in the group.

Working with Different Types of Conditions in NAT Rules

LICENSE: Any

You can match traffic with one or more rule conditions. See the following sections for more information:

- [Adding Zone Conditions to NAT Rules](#) on page 415 explains how to match traffic by security zones that you create using the object manager.
- [Adding Source Network Conditions to Dynamic NAT Rules](#) on page 418 and [Adding Destination Network Conditions to NAT Rules](#) on page 419 explain how to match traffic by IP address or address block.
- [Adding Port Conditions to NAT Rules](#) on page 421 explains how to match traffic by specified transport protocol ports.

Adding Zone Conditions to NAT Rules

LICENSE: Any

The security zones on your system are comprised of interfaces on your managed devices. Zones that you add to a NAT rule target the rule to devices on your network that have routed or hybrid interfaces in those zones. You can only add security zones with routed or hybrid interfaces as conditions for NAT rules. See

[Working with Security Zones](#) on page 187 for information on creating security zones using the object manager.

You can add either zones or standalone interfaces that are currently assigned to a virtual router to NAT rules. If there are devices with unapplied device configurations, the Zones page displays a warning icon (⚠) at the top of the available zones list, indicating that only applied zones and interfaces are displayed. You can click the arrow icon (▸) next to a zone to collapse or expand the zone to hide or view its interfaces.

If an interface is on a clustered device, the available zones list displays an additional branch from that interface with the other interfaces in the cluster as children of the primary interface on the active device in the cluster. You can also click the arrow icon (▸) to collapse or expand the clustered device interfaces to hide or view its interfaces.

IMPORTANT! You can save and apply policies with disabled interfaces, but the rules cannot provide any translation until the interfaces are enabled.

The two lists on the right are the source and destination zones used for matching purposes by the NAT rules. If the rule already has values configured, these lists display the existing values when you edit the rule. If the source zones list is empty, the rule matches traffic *from* any zone or interface. If the destination zones list is empty, the rule matches traffic *to* any zone or interface.

The system displays warnings for rules with zone combinations that never trigger on a targeted device.

IMPORTANT! You can save and apply policies with these zone combinations, but the rules will not provide any translation.

You can add individual interfaces by selecting an item in a zone or by selecting a standalone interface. You can only add interfaces in a zone if the zone it is assigned to has not already been added to a source zones or destination zones list. These individually selected interfaces are not affected by changes to zones, even if you remove them and add them to a different zone. If an interface is the primary member of a cluster and you are configuring a dynamic rule, you can add only the primary interface to the source zones or destination zones list. For static rules, you can add individual cluster member interfaces to the source zones list. You can only add a primary cluster interface to a list if none of its children have been added, and you can only add individual cluster interfaces if the primary has not been added.

If you add a zone, the rule uses all interfaces associated with the zone. If you add or remove an interface from the zone, the rule will not use the updated version of

the zone until the device configuration has been reapplied to the devices where the interfaces reside.

IMPORTANT! In a static NAT rule, you can add only source zones. In a dynamic NAT rule, you can add both source and destination zones.

The following procedure explains how to add source and destination zone conditions while adding or editing a NAT rule. See [Understanding NAT Rule Conditions and Condition Mechanics](#) on page 409 for more detailed information.

To add zone conditions to a NAT rule:

ACCESS: Admin/Network Admin

1. Select the **Zones** tab on the rule Edit page.

The Zones page appears.

2. Optionally, click the **Search by name** prompt above the **Available Zones** list, then type a name or value.

The list updates as you type to display matching conditions. See [Searching NAT Rule Condition Lists](#) on page 413 for more information.

3. Click a zone or interface in the **Available Zones** list. Use the Shift and Ctrl keys to select multiple conditions, or right-click and then click **Select All**.

Conditions you select are highlighted.

4. You have the following choices:

- To match traffic by source zone, click **Add to Source**.
- To match traffic by destination zone, click **Add to Destination**.

Optionally, you can drag and drop selected conditions into the **Source Zones** or **Destination Zones** lists.

Selected conditions are added. Note that while you can add disabled interfaces to a NAT rule, the rule does not provide any translation.

IMPORTANT! You can add only source zones to static NAT rules.

5. Save or continue editing the rule.

You must apply the NAT policy for your changes to take effect; see [Applying a NAT Policy](#) on page 401.

Adding Source Network Conditions to Dynamic NAT Rules

LICENSE: Any

You configure the matching values and translation values of the source IP address for packets. If the original source network is not configured, then any source IP address matches the dynamic NAT rule. Note that you cannot configure source networks for static NAT rules. If a packet matches the NAT rule, the system uses the values in the translated source network to assign the new value for the source IP address. For dynamic rules, you must configure a translated source network with at least one value.

WARNING! If a network object or object group is being used by a NAT rule, and you change or delete the object or group, it can cause the rule to become invalid.

You can add any of the following kinds of source network conditions to a dynamic NAT rule:

- individual and group network objects that you have created using the object manager
See [Working with Network Objects](#) on page 161 for information on creating individual and group network objects using the object manager.
- individual network objects that you add from the Source Network conditions page, and can then add to your rule and to other existing and future rules
See [Using Objects in NAT Rule Conditions](#) on page 415 for more information.
- literal, single IP addresses, ranges, or address blocks
See [Adding Literal Conditions to NAT Rules](#) on page 414 for more information.

The following procedure explains how to add source network conditions while adding or editing a dynamic NAT rule. See [Understanding NAT Rule Conditions and Condition Mechanics](#) on page 409 for more detailed information.

To add network conditions to a dynamic NAT rule:

ACCESS: Admin/Network Admin

1. Select the **Source Networks** tab on the rule Edit page.
The Source Network page appears.

2. Optionally, click the **Search by name or value** prompt above the **Available Networks** list, then type a name or value.
The list updates as you type to display matching conditions. See [Searching NAT Rule Condition Lists](#) on page 413 for more information.
3. Click a condition in the **Available Networks** list. Use the Shift and Ctrl keys to select multiple conditions, or right-click and then click **Select All**.
Conditions you select are highlighted.
4. You have the following choices:
 - To match traffic by original source network, click **Add to Original**.
 - To specify the translation value for traffic that matches the translated source network, click **Add to Translated**.Alternatively, you can drag and drop selected conditions into the **Original Source Network** or **Translated Source Network** lists.
Conditions you selected are added.
5. Optionally, click the add icon () above the **Available Networks** list to add an individual network object.
You can add multiple IP addresses, CIDR blocks, and prefix lengths to each network object.
Optionally, you can then select the object you added. See [Working with Network Objects](#) on page 161 and [Using Objects in NAT Rule Conditions](#) on page 415 for more information.
6. Optionally, click the **Enter an IP address** prompt below the **Original Source Network** or **Translated Source Network** list; then type an IP address, range, or address block and click **Add**.
You add ranges in the following format: lower IP address-upper IP address.
For example: 179.13.1.1-179.13.1.10.
The list updates to display your entry. See [Adding Literal Conditions to NAT Rules](#) on page 414 for more information.
7. Save or continue editing the rule.
You must apply the NAT policy for your changes to take effect; see [Applying a NAT Policy](#) on page 401.

Adding Destination Network Conditions to NAT Rules

LICENSE: Any

You configure the matching values and translation values of the destination IP address for packets. Note that you cannot configure translated destination networks for dynamic NAT rules.

Because static NAT rules are one-to-one translations, the **Available Networks** list contains only network objects and groups that contain only a single IP address.

For static translations, you can add only a single object or literal value to both the **Original Destination Network** or **Translated Destination Network** lists.

WARNING! If a network object or object group is being used by a NAT rule, and you change or delete the object or group, it can cause the rule to become invalid.

You can add any of the following kinds of destination network conditions to a NAT rule:

- individual and group network objects that you have created using the object manager
See [Working with Network Objects](#) on page 161 for information on creating individual and group network objects using the object manager.
- individual network objects that you add from the Destination Network conditions page, and can then add to your rule and to other existing and future rules
See [Using Objects in NAT Rule Conditions](#) on page 415 for more information.
- literal, single IP addresses, range, or address blocks
For static NAT rules, you can add only a CIDR with subnet mask /32, and only if there is not already a value in the list.
See [Adding Literal Conditions to NAT Rules](#) on page 414 for more information.

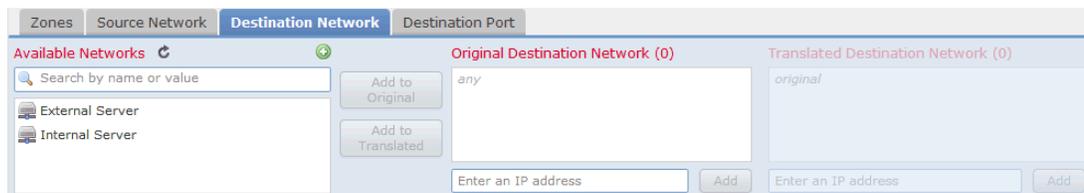

The following procedure explains how to add destination network conditions while adding or editing a NAT rule. See [Understanding NAT Rule Conditions and Condition Mechanics](#) on page 409 for more detailed information.

To add destination network conditions to a NAT rule:

ACCESS: Admin/Network Admin

1. Select the **Destination Network** tab on the rule Edit page.

The Destination Network page appears.

2. Optionally, click the **Search by name or value** prompt above the **Available Networks** list, then type a name or value.

The list updates as you type to display matching conditions. See [Searching NAT Rule Condition Lists](#) on page 413 for more information.

3. Click a condition in the **Available Networks** list. Use the Shift and Ctrl keys to select multiple conditions, or right-click and then click **Select All**.

Conditions you select are highlighted.

4. You have the following choices:
 - To match traffic by original destination network, click **Add to Original**.
 - To specify the translation value for traffic that matches the translated destination network, click **Add to Translated**.

Alternatively, you can drag and drop selected conditions into the **Original Destination Network** or **Translated Destination Network** lists.

Conditions you selected are added.

5. Optionally, click the add icon (+) above the **Available Networks** list to add an individual network object.

For dynamic rules, you can add multiple IP addresses, CIDR blocks, and prefix lengths to each network object. For static rules, you can add only a single IP address. Optionally, you can then select the object you added. See [Working with Network Objects](#) on page 161 and [Using Objects in NAT Rule Conditions](#) on page 415 for more information.

6. Optionally, click the **Enter an IP address** prompt below the **Original Destination Network** or **Translated Destination Network** list, then type an IP address or address block and click **Add**.

The list updates to display your entry. See [Adding Literal Conditions to NAT Rules](#) on page 414 for more information.

7. Save or continue editing the rule.

You must apply the NAT policy for your changes to take effect; see [Applying an Access Control Policy](#) on page 466.

Adding Port Conditions to NAT Rules

LICENSE: Any

You can add a port condition to a rule to match network traffic based on the original and translated destination port and transport protocol for translation. If the original port is not configured, any destination port matches the rule. If a packet matches the NAT rule and a translated destination port is configured, the system translates the port into that value. Note that for dynamic rules, you can specify only the original destination port. For static rules, you can define a translated destination port, but only with an object with the same protocol as the original destination port object or literal value.

The system matches the destination port against the value of the port object or literal port in the original destination port list for static rules, or multiple values for dynamic rules.

Because static NAT rules are one-to-one translations, the **Available Ports** list contains only port objects and groups that contain only a single port. For static translations, you can add only a single object or literal value to both the **Original Port** or **Translated Port** lists.

For dynamic rules, you can add a range of ports. For example, when specifying the original destination port, you can add **1000-1100** as a literal value.

WARNING! If a port object or object group is being used by a NAT rule, and you change or delete the object or group, it can cause the rule to become invalid.

You can add any of the following kinds of port conditions to a NAT rule:

- individual and group port objects that you have created using the object manager
See [Working with Port Objects](#) on page 173 for information on creating individual and group port objects using the object manager.
- individual port objects that you add from the Destination Ports conditions page, and can then add to your rule and to other existing and future rules
See [Using Objects in NAT Rule Conditions](#) on page 415 for more information.
- literal port values, consisting of a TCP, UDP, or All (TCP and UDP) transport protocol and a port
See [Adding Literal Conditions to NAT Rules](#) on page 414 for more information.

The following procedure explains how to add port conditions while adding or editing a NAT rule. See [Understanding NAT Rule Conditions and Condition Mechanics](#) on page 409 for more detailed information.

To add destination port conditions to a NAT rule:

ACCESS: Admin/Network Admin

1. Select the **Destination Port** tab on the rule Edit page.

The Destination Port page appears.

2. Optionally, click the **Search by name or value** prompt above the **Available Ports** list, then type a name or value.

The list updates as you type to display matching conditions. See [Searching NAT Rule Condition Lists](#) on page 413 for more information.

3. Click a condition in the **Available Ports** list. Use the Shift and Ctrl keys to select multiple conditions, or right-click to select all conditions. Note that you can add a maximum of 50 conditions.

Conditions you select are highlighted.

4. You have the following choices:
 - Click **Add to Original** to add the selected port to the Original Ports list.
 - Click **Add to Translated** to add the selected port to the Translated Ports list.
 - Drag and drop available ports into a list.

5. Optionally, to create and add an individual port object click the add icon () above the **Available Ports** list.

You can identify a single port or a port range in each port object that you add. You can then select objects you added as conditions for your rule. See [Using Objects in NAT Rule Conditions](#) on page 415 for more information.

For static rules, you can use only port objects with single ports.

6. Optionally, to add a literal port select an entry from the **Protocol** drop-down list beneath the **Original Port** or **Translated Port** lists.

Enter a port, then click **Add**. You can specify a port number from 0 through 65535. For dynamic rules, you can specify a single port or a range.

The list updates to display your selection. See [Adding Literal Conditions to NAT Rules](#) on page 414 for more information.

Conditions you selected are added

7. Save or continue editing the rule.

You must apply the NAT policy for your changes to take effect; see [Applying a NAT Policy](#) on page 401.

CHAPTER 12

USING ACCESS CONTROL POLICIES

An *access control policy* determines how the system handles non-fast-pathed traffic on your network. You can configure one or more access control policies, which you can then apply to one or more managed devices. Each device can have one currently applied policy.

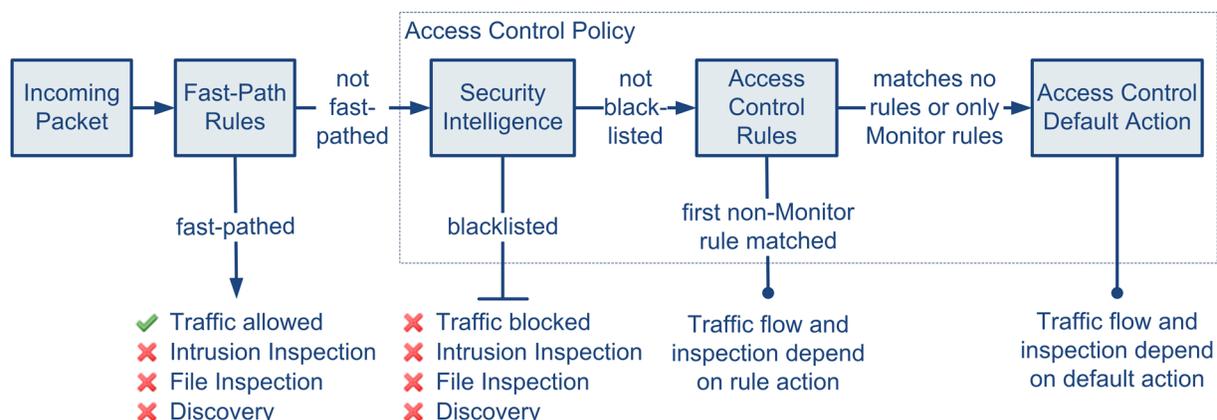

A simple access control policy can filter (blacklist or monitor) traffic based on Security Intelligence data, then use the policy's *default action* to handle non-blacklisted traffic in one of the following ways:

- block all traffic from entering your network
- trust all traffic to enter your network without further inspection
- allow all traffic to enter your network, and inspect the traffic with a network discovery policy only
- allow all traffic to enter your network, and inspect the traffic with intrusion and network discovery policies

Optionally, you can add *access control rules* to a policy, which provide granular control over how you handle and log network traffic. For each rule, you specify a rule *action*, that is, whether to trust, monitor, block, or inspect matching traffic with an intrusion or file policy. Each rule contains a set of conditions that identify the specific traffic you want to control. Rules can be simple or complex, matching traffic by any combination of security zone, network, VLAN, Active Directory LDAP user or group, application, transport protocol port, or URL.

The system matches traffic to access control rules in order; the first matched rule handles the traffic. (An exception occurs with Monitor rules, which allow traffic to continue to be evaluated.)

The diagram below illustrates traffic flow through the Sourcefire 3D System, and provides some details on the types of inspection performed on that traffic. Notice that the system does not inspect fast-pathed or blacklisted traffic. For traffic handled by an access control rule or default action, flow and inspection depend on the rule action. Although rule actions are not shown in the diagram for simplicity, the system does not perform any kind of inspection on trusted or blocked traffic. Additionally, file inspection is not supported with the default action.

This chapter contains information on creating a basic access control policy (including Security Intelligence filtering) and adding rules to that policy. For detailed information on associated components of the Sourcefire 3D System, see the following documentation:

- [Configuring Fast-Path Rules](#) on page 253
- [Understanding and Writing Access Control Rules](#) on page 472
- [Understanding and Creating File Policies](#) on page 1206
- [Configuring Intrusion Policies](#) on page 667
- [Introduction to Network Discovery](#) on page 1250

Although you can create access control policies regardless of the licenses on your Defense Center, certain aspects of access control require that you enable specific licensed capabilities on target devices before you can apply the policy. Additionally, some features are only available on certain appliance models. The Defense Center uses warning icons (⚠) and confirmation dialog boxes to designate unsupported features for your deployment. For details, hover your pointer over a warning icon.

The following table explains the license and appliance model requirements to apply access control policies. Note that Series 2 devices automatically have most

Protection capabilities; you do not have to explicitly enable Protection on those devices.

License and Appliance Requirements for Access Control

TO APPLY A POLICY THAT...	ADD THIS LICENSE...	TO ONE OF THESE DEFENSE CENTERS...	AND ENABLE IT ON ONE OF THESE DEVICES...
performs access control based on zone, network, VLAN, or port, or that performs URL filtering using literal URLs and URL objects	Any	Any	Any, except Series 2 devices cannot perform URL filtering using literal URLs and URL objects
performs intrusion detection and prevention, file control, or Security Intelligence filtering	Protection	Any	Any, except Series 2 devices cannot perform Security Intelligence filtering
performs advanced malware protection, that is, network-based malware detection and blocking	Malware	Any except DC500	Series 3, virtual
performs user or application control	Control	Any, except the DC500 cannot perform user control	Series 3, virtual
performs URL filtering using category and reputation data	URL Filtering	Any except DC500	Series 3, virtual

See the following sections for more information on creating and managing access control policies:

- [Configuring Policies](#) on page 426
- [Organizing Rules in a Policy](#) on page 449
- [Managing Access Control Policies](#) on page 456

Configuring Policies

LICENSE: Any

To configure an access control policy, you must give the policy a unique name, specify a default action, and identify the devices, or *targets*, where you want to apply the policy.

You can also:

- blacklist (deny without further inspection) traffic based on Security Intelligence data before that traffic can be inspected by any access control rules; optionally you can monitor traffic based on that same data
- add, edit, delete, enable, and disable access control rules
- configure an HTML page (called the *HTTP response page*) that users see when an access control rule blocks their HTTP request
- configure advanced settings, such as the number of URL characters to store in connection events, the depth or duration of file and malware inspection, and the duration of bypasses for interactively blocked sessions
- log traffic that is handled by the default action

After you create or modify an access control policy, you can apply the policy to all or some targeted devices. You can also create custom user roles that allow you to assign different permissions to different users for configuring, organizing, and applying policies.

The following table summarizes the configuration actions you can take on the policy Edit page.

Access Control Policy Configuration Actions

To...	You CAN...
modify the policy name or description	click the name or description field, delete any characters as needed, then type the new name or description.
set the default action	find more information at Setting the Default Action on page 428.
log connections for the default action	find more information at Logging Connections for the Default Action on page 431.
assign different rights to different users	find more information at Using Custom User Roles with Access Control Policies on page 433.
manage policy targets	find more information at Managing Policy Targets on page 434.
save your policy changes	click Save .
save and apply your policy	click Save and Apply . See Applying an Access Control Policy on page 466 for more information. TIP! You can also click the edit icon () next to your policy on the Access Control page.
cancel your policy changes	click Cancel , then, if you have made changes, click OK .

Access Control Policy Configuration Actions (Continued)

To...	You CAN...
add a rule to a policy	click Add Rule . See Understanding and Writing Access Control Rules on page 472 for more information. TIP! You can also right-click a blank area in the row for a rule and select Insert new rule .
edit an existing rule	click the edit icon () next to the rule. See Creating and Editing Access Control Rules on page 474 for more information. TIP! You can also right-click the rule and select Edit .
delete a rule	click the delete icon () next to the rule, then click OK . TIP! You can also right-click a blank area in the row for a selected rule, select Delete , then click OK to delete one or more selected rules.
enable or disable an existing rule	right-click a selected rule, select State , then select Disable or Enable . Disabled rules are grayed and marked (disabled) beneath the rule name.
display the configuration page for a specific rule attribute	click the name, value, or icon in the column for the condition on the row for the rule. For example, click the name or value in the Source Networks column to display the Networks page for the selected rule. See Working with Different Types of Conditions on page 491 for more information.
configure a response page to blocked HTTP requests	find more information at Adding an HTTP Response Page on page 436.
filter traffic based on Security Intelligence data	find more information in Filtering Traffic Based on Security Intelligence Data on page 438.
configure advanced settings	find more information in Configuring Advanced Access Control Policy Settings on page 447.

Setting the Default Action

LICENSE: Any

The default action for an access control policy determines how the system handles traffic that:

- is not blacklisted by Security Intelligence
- does not match any non-Monitor rule in the policy

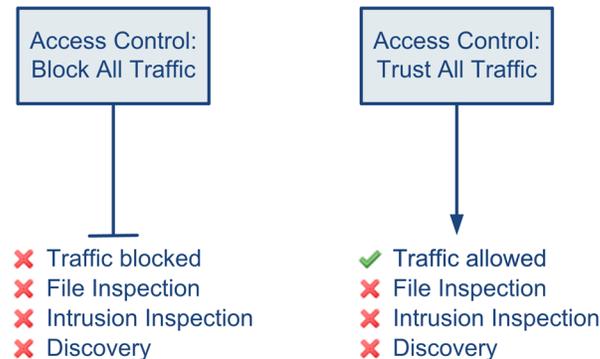

When you apply an access control policy that does not contain any access control rules or Security Intelligence configurations, the default action determines how all traffic on your network is handled.

The following table lists the default actions you can choose, as well as their effect on traffic and the types of inspection performed on traffic handled by each option.

Access Control Policy Default Actions

DEFAULT ACTION	EFFECT ON TRAFFIC	INSPECTION
Access Control: Block All Traffic	block without further inspection	none
Access Control: Trust All Traffic	trust (allow without further inspection)	none
Network Discovery Only	allow	network discovery
Intrusion Prevention	allow, as long as it is passed by the intrusion policy you specify	intrusion and network discovery

The diagram below illustrates the block and trust Access Control default actions. Notice that the system does not perform any kind of inspection on traffic blocked or trusted by the default action.

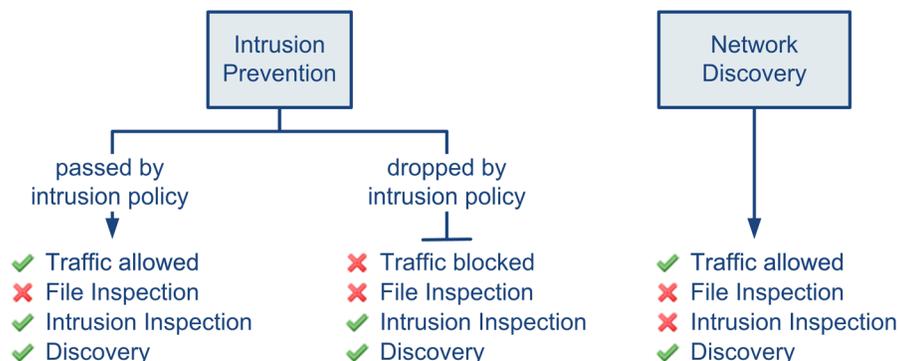

You can also set the default action so that it inspects default-action traffic with network discovery, an intrusion policy, or both. If you are performing neither intrusion detection nor access control, selecting a default action of **Network Discovery Only** can improve Defense Center performance. Note that to take advantage of this performance improvement, you must make sure your access

control rules do not contain: application, user, or URL conditions; or file and intrusion inspection options.

IMPORTANT! Selecting a default action of **Network Discovery Only** does not automatically guarantee discovery inspection. The system performs discovery only for connections involving IP addresses that are explicitly monitored by your network discovery policy. For more information, see [Introduction to Network Discovery](#) on page 1250.

If you inspect default-action traffic with an intrusion policy, the system can also inspect it using network discovery, depending on the settings in your network discovery policy. See [Intrusion Policies and Access Control Rules](#) on page 513 for a discussion on associating intrusion policies with access control rules.

The diagram below illustrates the **Intrusion Prevention** and **Network Discovery Only** default actions. Notice that although file inspection is supported in access control rules, you cannot perform file inspection on traffic handled by the default action.

The following procedure explains how to set the default action for an access control policy while editing the policy. See [Editing an Access Control Policy](#) on page 459 for the complete procedure for editing an access control policy.

To set the default action of an access control policy:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Policies > Access Control**.
The Access Control page appears.
2. Click the edit icon (🔧) next to the access control policy you want to configure.
The policy Edit page appears.
3. Select a **Default Action**.
 - To block all traffic, select **Access Control: Block All Traffic**.
 - To trust all traffic, select **Access Control: Trust All Traffic**.

- To allow all traffic and inspect it with network discovery, select **Network Discovery Only**.
- To inspect all traffic with both network discovery and intrusion policies, select an intrusion policy, all of which begin with the label **Intrusion Prevention**. Keep in mind that an intrusion policy can block traffic.

WARNING! Do **not** use **Experimental Policy 1** unless instructed to do so by a Sourcefire representative. Sourcefire uses this policy for testing.

4. Configure logging options for the default action as described in the next section, [Logging Connections for the Default Action](#).

Logging Connections for the Default Action

LICENSE: Any

You must decide whether you want to log connection data for the traffic that is handled by the default action. The options for logging connections handled by the policy default action largely parallel the options for logging connection handled by individual access control rules. However, there are some differences:

- The default action has no file logging options because you cannot perform file control or malware protection using the default action.
- When an intrusion policy associated with the access control default action generates an intrusion event, the system does **not** automatically log the end of the associated connection. This is useful for intrusion detection and prevention-only deployments, where you do not want to log any connection data.

An exception to this rule occurs if you enable beginning-of-connection logging for the default action. In that case, the system **does** log the end of the connection when an associated intrusion policy triggers, in addition to logging the beginning of the connection.

For a comprehensive discussion of connection logging, see [Logging Connection, File, and Malware Information](#) on page 515.

In general, if you want to perform any kind of detailed analysis on connection data, you should log the end of connections. If you want to view connection summaries in custom workflows, view connection data in graphical format, or create and use traffic profiles, you **must** log connection events at the end of connections. Note that for the **Block All Traffic** default action, you can log only beginning-of-connection events, because traffic is denied without further inspection.

Logging connection events to the Defense Center database allows you to take advantage of the analysis, reporting, and correlation features in the Sourcefire 3D System. Optionally, you can send most connection events to the syslog or an SNMP trap server.

The following procedure explains how to configure an access control policy to log connections. See [Editing an Access Control Policy](#) on page 459 for the complete procedure for editing an access control policy.

To log connections in traffic handled by the default action:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Policies > Access Control**.

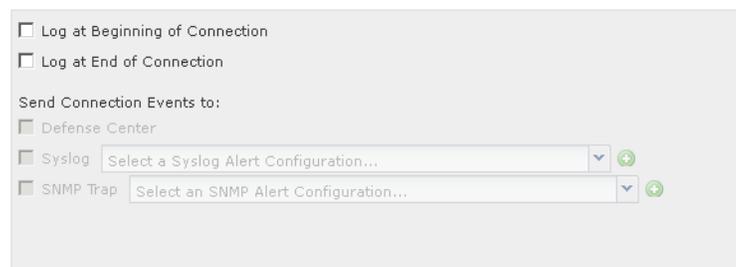

The Access Control page appears.

2. Click the edit icon (✎) next to the access control policy you want to configure.

The policy Edit page appears.

3. Click the logging icon (📄) next to the **Default Action** drop-down list.

The Logging pop-up window appears.

4. Specify whether you want to **Log at Beginning of Connection** or **Log at End of Connection**.

You cannot log end-of-connection events for blocked traffic.

5. Specify where to send connection events. You have the following choices:

- To send connection events to the Defense Center, select **Defense Center**.
- To send connection events to syslog, select **Syslog**, then select a syslog alert response from the drop-down list. Optionally, you can configure a syslog alert response by clicking the add icon (+); see [Creating a Syslog Alert Response](#) on page 530.
- To send connection events to an SNMP trap server, select **SNMP Trap**, then select an SNMP alert response from the drop-down list. Optionally, you can configure an SNMP alert response by clicking the add icon (+); see [Creating an SNMP Alert Response](#) on page 528.

6. Save your changes.

You must apply the access control policy for your changes to take effect; see [Applying an Access Control Policy](#) on page 466.

Using Custom User Roles with Access Control Policies

LICENSE: Any

As described in [Managing Custom User Roles](#) on page 1908, you can create custom user roles with specialized access privileges. Custom user roles can have any set of menu-based and system permissions, and may be completely original or based on a predefined user role. Custom roles for access control-related features determine whether users can view, modify, and apply access control, intrusion, and file policies, as well as insert or modify rules in the Administrator Rules or Root Rules categories.

The following table shows five example custom roles that determine how Sourcefire 3D System users interact with access control features. The table lists, in the order they appear when creating custom user roles, the privileges required for each custom role.

Example Access Control Custom Roles

CUSTOM ROLE PERMISSION	ACCESS CONTROL EDITOR	INTRUSION EDITOR	FILE POLICY EDITOR	POLICY APPLIER (ALL)	INTRUSION POLICY APPLIER
Access Control	X			X	X
Access Control List	X			X	X
Modify Access Control Policy	X				
Apply Intrusion Policies				X	X
Apply Access Control Policies				X	
Intrusion		X			
Intrusion Policy		X			
Modify Intrusion Policy		X			
File Policy			X		
Modify File Policy			X		

Note that the system can render the web interface differently depending on whether a user can apply both access control policies and intrusion policies, only intrusion policies, or neither. For example, the Intrusion Policies Applier in the

table above can view access control policies and apply intrusion policies, but cannot edit access control policies or intrusion policies, cannot apply access control policies, and cannot view file policies. In the web interface:

- the edit icon () does not appear on the Access Control page
- the delete icon () does not appear on the Access Control page
- the quick-apply pop-up window applies only the intrusion policy
- access control policy check boxes in the detailed apply pop-up window are disabled

Managing Policy Targets

LICENSE: Any

Before you can apply an access control policy, you must identify the managed devices, including device groups, where you want to apply the policy. You can identify the managed devices you want to target with your policy while creating or editing a policy. You can search a list of available devices and add devices to a list of selected devices. You can drag and drop selected devices, or add devices using the button between the two lists.

Note that you cannot target stacked devices running different versions of the Sourcefire 3D System (for example, if an upgrade on one of the devices fails). You can target a device stack, but not individual devices within the stack. See [Managing Stacked Devices](#) on page 237 for more information.

The following table summarizes the actions you can take when managing targeted devices.

Targeted Device Management Actions

To...	You CAN...
search a list of available devices	click inside the search field, then type a search string. The list of devices updates as you type to display matching device names.
clear a search for available devices	click the clear icon () in the search field.
select available devices to add to the list of selected targets	click the device name; use the Ctrl and Shift keys to select multiple devices. TIP! You can also right-click an available device, then click Select All .
add selected devices	click Add to Policy . TIP! You can also drag and drop into the list of selected devices.

Targeted Device Management Actions (Continued)

To...	You CAN...
delete a single device from the Selected Devices list	click the delete icon () next to the device. TIP! You can also right-click the device and select Delete .
delete multiple devices from the Selected Devices list	use the Ctrl and Shift keys to select multiple devices, right-click to highlight the row for a selected device, then click Delete Selected .
save your configuration	click OK .
discard your configuration without saving your changes	click Cancel .

The following procedure explains how to configure an access control policy to manage targeted devices. See [Editing an Access Control Policy](#) on page 459 for the complete procedure for editing an access control policy.

To manage targeted devices in an access control policy:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Policies > Access Control**.
The Access Control page appears.
2. Click the edit icon () next to the access control policy you want to configure.
The policy Edit page appears.
3. Click the device targets link, then click **Manage Targets**.
The Manage Device Targets pop-up window appears.
4. Optionally, click the **Search** prompt above the **Available Devices** list, then type a name.
The list updates as you type to display matching devices. You can click the clear icon () to clear the list.
5. Click the device or device group you want to add. Use Ctrl and Shift to select multiple devices.

TIP! You can also right-click an available device, then click **Select All**.

6. Click **Add to Policy**.
Selected devices are added.

TIP! You can also drag and drop.

7. Optionally, click the delete icon () to delete a device from the list of selected devices; or, use the Ctrl and Shift keys to select multiple devices, right-click, then select **Delete Selected**.
8. Click **OK** to save your configuration, or click **Cancel** to discard it.
If you click **OK**, your configuration is added to the policy and the policy Edit page appears.

Adding an HTTP Response Page

LICENSE: FireSIGHT

When an access control rule blocks a user's HTTP request, what the user sees in a web browser depends on how you block the session. When choosing a rule action, select:

- **Block** or **Block with reset** if you want to deny the connection. A blocked session times out; the system resets Block with reset connections. However, for both blocking actions, you can override the default browser or server page with a custom page that explains that the connection was denied. The system calls this custom page an *HTTP response page*.
- **Interactive Block** or **Interactive Block with reset** if you want to display an HTTP response page that warns users, but also allows them to click a button to continue or refresh the page to load the originally requested site. Note that users **must** enable JavaScript and third-party cookies in their browsers before they can dismiss these warnings and click to continue. Users may have to refresh after bypassing the response page to load page elements that did not load.

You can either display a generic Sourcefire-provided response page, or you can enter custom HTML. When you enter custom text, a counter shows how many characters you have used. For a blocked session custom page you can use up to 1353 characters; click-to-continue custom pages are limited to 1273 characters.

Note that HTTP response pages do not appear for traffic blocked because of a Security Intelligence blacklist or an application detected based on a Secure Sockets Layer (SSL) certificate.

TIP! To quickly disable interactive blocking for all rules in an access control policy, display neither the Sourcefire-provided page nor a custom page.

In each access control policy, you configure the response page for blocking and interactively blocking rules separately. The rule action determines the page displayed to your users. For example, you could display the Sourcefire-provided page to users whose sessions are blocked, but a custom page to users who can click to continue. For detailed information on rule actions, see [Understanding Rule Actions](#) on page 478.

Note that in rare cases, when a blocking rule is preceded by another rule that contains an application condition, an HTTP response page may not appear even though the system successfully blocks traffic.

To configure HTTP response pages:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Policies > Access Control**.

The Access Control page appears.

2. Click the edit icon (✎) next to the access control policy you want to configure.

The policy Edit page appears.

3. Select the **HTTP Responses** tab.

HTTP response page settings for the access control policy appear.

Block Response Page
This page will be displayed when HTTP traffic is blocked.
None

Interactive Block Response Page
This page will be displayed when HTTP traffic is blocked, but the user may choose to continue.
Sourcefire-provided 🔍

4. For the **Block Response Page** and the **Interactive Block Response Page**, select responses from the drop-down lists. For each page, you have the following choices:

- To use a generic response, select **Sourcefire-provided**. You can click the view icon (🔍) to view the HTML code for this page.
- To create a custom response, select **Custom**.
A pop-up window appears, pre-populated with Sourcefire-provided code that you can replace or modify. When you are done, save your changes. Note that you can edit a custom page by clicking the edit icon (✎).
- To prevent the system from displaying an HTTP response page, select **None**. Note that selecting this option for interactively blocked sessions prevents users from clicking to continue.

5. Click **Save** to save your configuration.

You must apply the access control policy for your changes to take effect. For more information, see [Applying an Access Control Policy](#) on page 466.

Filtering Traffic Based on Security Intelligence Data

LICENSE: Protection

SUPPORTED DEVICES: Series 3, virtual

SUPPORTED DEFENSE CENTERS: Any except DC500

The Security Intelligence feature allows you to specify the traffic that can traverse your network, per access control policy, based on the source or destination IP address. This is especially useful if you want to blacklist—deny traffic to and from—specific IP addresses, before the traffic is subjected to analysis by access control rules.

Note that you could create access control rules that perform a similar function to Security Intelligence filtering. However, access control rules are wider in scope, more complex to configure, and cannot automatically update using dynamic feeds. In contrast, Security Intelligence filtering can immediately blacklist connections based on the latest intelligence, removing the need for a more resource-intensive, in-depth analysis.

Optionally, and recommended in passive deployments, you can use a “monitor-only” setting for Security Intelligence filtering. This allows the system to analyze connections that would have been blacklisted, but also logs the match to the blacklist.

To help you build blacklists, Sourcefire provides the Sourcefire Intelligence Feed, which is comprised of several regularly updated collections of IP addresses determined by the VRT to have a poor reputation. To augment the intelligence feed, you can use third-party feeds and custom lists of IP addresses, including a global blacklist. You can also blacklist IP addresses using network objects and groups. These configurations are collectively called *Security Intelligence objects*.

IMPORTANT! Although feed updates and additions to the global blacklist (or global whitelist; see below) automatically implement changes throughout your deployment, any other change to a Security Intelligence object requires an access control policy reapply. For more information, see the [Security Intelligence Object Capabilities table](#) on page 165.

Choosing IP Addresses to Blacklist

The easiest way to construct a blacklist is to use the Sourcefire Intelligence Feed, which tracks IP addresses known to be open relays, known attackers, bogus IP addresses (bogon), and so on. Because the intelligence feed is regularly updated, using it ensures that the system uses up-to-date information to filter your network traffic. Malicious IP addresses that represent security threats such as malware, spam, botnets, and phishing may appear and disappear faster than you can update and apply new policies.

To augment the intelligence feed, you can perform Security Intelligence filtering using custom or third-party IP address lists and feeds:

- a *list* is a static list of IP addresses that you upload to the Defense Center
- a *feed* is a dynamic list of IP addresses that the Defense Center downloads from the internet on a regular basis; the Sourcefire Intelligence Feed is a special kind of feed

For detailed information on configuring Security Intelligence lists and feeds, including high availability and internet access requirements, see [Working with Security Intelligence Lists and Feeds](#) on page 162.

Also, in the course of your analysis, you can build a *global blacklist* by selecting any IP address in an event view, the Context Explorer, or a dashboard. For example, if you notice a set of routable IP addresses in intrusion events associated with exploit attempts, you can immediately blacklist those IP addresses. The Defense Center uses this global blacklist (and a related *global whitelist*) to perform Security Intelligence filtering in all access control policies. For information on managing these global lists, see [Working with the Global Whitelist and Blacklist](#) on page 166.

Finally, a simple way to construct a blacklist is to use *network objects* or *network object groups* that represent an IP address, IP address block, or collection of IP addresses. For information on creating and modifying network objects, see [Working with Network Objects](#) on page 161.

IMPORTANT! Although they have all other Protection capabilities by default, Series 2 devices cannot perform Security Intelligence filtering. You cannot apply an access control policy that uses a populated global whitelist or blacklist to Series 2 devices (or to unlicensed Series 3 devices). If you added IP addresses to either global list, you must remove the non-empty list from the policy's Security Intelligence configuration before you can apply the policy.

Security Intelligence Whitelists

In addition to a blacklist, each access control policy has an associated whitelist, which you can also populate with Security Intelligence objects. A policy's whitelist overrides its blacklist. That is, the system evaluates traffic with a whitelisted source or destination IP address using access control rules, even if the IP address is also blacklisted. In general, use the whitelist if a blacklist is still useful, but is too broad in scope and incorrectly blocks traffic that you want to inspect.

For example, if a reputable feed improperly blocks your access to vital resources but is overall useful to your organization, you can whitelist only the improperly classified IP addresses, rather than removing the whole feed from the blacklist.

Enforcing Security Intelligence Filtering by Security Zone

For added granularity, you can enforce Security Intelligence filtering based on whether the source or destination IP address in a connection resides in a particular security zone.

To extend the whitelist example above, you could whitelist the improperly classified IP addresses, but then restrict the whitelist object using a security zone used by those in your organization who need to access those IP addresses. That way, only those with a business need can access the whitelisted IP addresses. As another example, you might want to use a third-party spam feed to blacklist traffic on an email server security zone.

Monitoring — Rather than Blacklisting — Connections

If you are not sure whether you want to blacklist a particular IP address or set of addresses, you can use a “monitor-only” setting, which allows the system to pass the matching connection to access control rules, but also logs the match to the blacklist. Note that you cannot set the global blacklist to monitor-only.

Consider a scenario where you want to test a third-party feed before you implement blocking using that feed. When you set the feed to monitor-only, the system allows connections that would have been blocked to be further analyzed by the system, but also logs a record of each of those connections for your evaluation.

In passive deployments, to optimize performance, Sourcefire recommends that you always use monitor-only settings. This is because managed devices that are deployed passively cannot affect traffic flow; there is no advantage to configuring the system to block traffic.

Logging Blacklisted Connections

Logging blacklisted connections allows you to generate a connection event when the system detects network traffic to or from a blacklisted IP address. Events generated by Security Intelligence filtering represent the decision made by the system to either deny (blacklist) or inspect (blacklist set to monitor-only) the connection. This logging configuration is independent of the logging configurations for access control rules or the default action.

You must enable logging for Security Intelligence if you want to set blacklisted objects to monitor-only. Note that for those matching connections that go on to be inspected by access control rules, the system may generate additional connection events, depending on the logging settings in the access control rule or default action that later handles the connection.

Health Monitoring

The default health policy includes the Security Intelligence module (see [Configuring Security Intelligence Monitoring](#) on page 2139), which warns you if:

- the Defense Center cannot update a feed, or if feed data is corrupt or contains no recognizable IP addresses
- a managed device had a problem receiving updated Security Intelligence data from the Defense Center
- a managed device cannot load all of the Security Intelligence data provided to it by the Defense Center, due to memory issues

For detailed information on configuring your access control policy to perform Security Intelligence filtering, see the following sections:

- [Building the Security Intelligence Whitelist and Blacklist](#) on page 441
- [Searching for Objects to Whitelist or Blacklist](#) on page 444
- [Creating Objects to Whitelist or Blacklist](#) on page 444
- [Logging Blacklisted Connections](#) on page 445

Building the Security Intelligence Whitelist and Blacklist

LICENSE: Protection

SUPPORTED DEVICES: Series 3, virtual

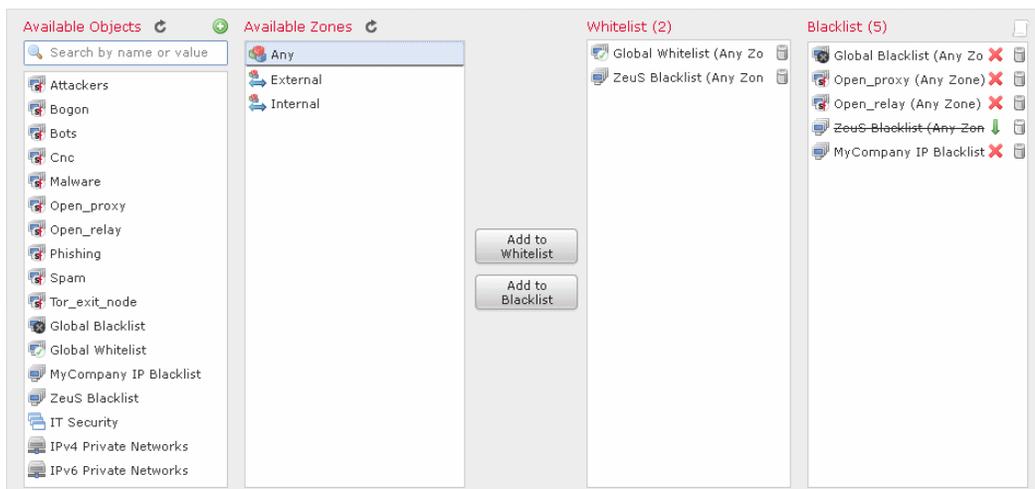

SUPPORTED DEFENSE CENTERS: Any except DC500

To build a whitelist and blacklist, populate them with any combination of network objects and groups, as well as Security Intelligence feeds and lists, all of which you can constrain by security zone.

By default, access control policies use the Defense Center's global whitelist and blacklist, which apply to any zone. These lists are populated by your analysts, who can quickly add individual IP addresses using the context menu. You can opt not to use these global lists on a per-policy basis. For more information, see [Working with the Global Whitelist and Blacklist](#) on page 166.

After you build your whitelist and blacklist, you can log blacklisted connections. You can also set individual blacklisted objects, including feeds and lists, to monitor-only. This allows the system to handle connections involving blacklisted IP addresses using access control, but also logs the connection's match to the blacklist.

Use the Security Intelligence tab in the access control policy to configure the whitelist, blacklist, and logging options.

The page lists the Available Objects you can use in either the whitelist or blacklist, as well as the Available Zones you can use to constrain whitelisted and blacklisted objects. Each type of object or zone is distinguished with an different icon. The objects marked with the Sourcefire icon () represent the different categories in the Sourcefire Intelligence Feed.

In the blacklist, objects set to block are marked with the block icon () while monitor-only objects are marked with the monitor icon (). Because the whitelist overrides the blacklist, if you add the same object to both lists, the system displays the blacklisted object with a strikethrough.

You can add up to a total of 255 objects to the whitelist and the blacklist. That is, the number of objects in the whitelist plus the number in the blacklist cannot exceed 255.

Note that although you can add network objects with a netmask of /0 to the whitelist or blacklist, address ranges using a /0 netmask in those objects will be ignored and whitelist and blacklist filtering will not occur based on those addresses. Address ranges with a /0 netmask from security intelligence feeds will also be ignored. If you want to monitor or block all traffic targeted by a policy, use an access control rule with the **Monitor** or **Block** rule action, respectively, and a default value of **any** for the **Source Networks** and **Destination Networks**, instead of security intelligence filtering.

TIP! The general mechanics of constructing Security Intelligence whitelists and blacklists are the same as those for constructing access control rules. For detailed information, see [Understanding Rule Conditions and Condition Mechanics](#) on page 482.

To build the Security Intelligence whitelist and blacklist for an access control policy:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Policies > Access Control**.
The Access Control page appears.
2. Click the edit icon () next to the access control policy you want to configure.
The policy Edit page appears.
3. Select the **Security Intelligence** tab.
Security Intelligence settings for the access control policy appear.
4. Optionally, click the logging icon () to log blacklisted connections.
You must enable logging before you can set blacklisted objects to monitor-only. For details, see [Logging Blacklisted Connections](#) on page 445.
5. Begin building your whitelist and blacklist by selecting one or more Available Objects.
Use Shift and Ctrl to select multiple objects, or right-click and **Select All**.

TIP! You can search for existing objects to include, or create objects on the fly if no existing objects meet the needs of your organization. For more information, see [Searching for Objects to Whitelist or Blacklist](#) on page 444 and [Creating Objects to Whitelist or Blacklist](#) on page 444.

6. Optionally, constrain the selected objects by zone by selecting an Available Zone.
By default, objects are not constrained, that is, they have a zone of **Any**. Note that other than using **Any**, you can constrain by only one zone. To enforce Security Intelligence filtering for an object on multiple zones, you must add the object to the whitelist or blacklist separately for each zone. Also, the global whitelist or blacklist cannot be constrained by zone.
7. Click **Add to Whitelist** or **Add to Blacklist**.
You can also click and drag the selected objects to either list.

TIP! To remove an object, click its delete icon (). Use Shift and Ctrl to select multiple objects, or right-click and **Select All**, then right-click and select **Delete Selected**. If you are deleting a global list, you must confirm your choice. Note that removing an object from a whitelist or blacklist does not delete the object from the Defense Center.

8. Repeat steps 5 through 7 until you are finished adding objects to your whitelist and blacklist.

9. Optionally, set blacklisted objects to monitor-only by right-clicking the object under Blacklist, then selecting **Monitor-only (do not block)**.

In passive deployments, Sourcefire recommends you set all blacklisted objects to monitor-only. Note, however, that you cannot set the global blacklist to monitor-only.

10. Click **Save**.

You must apply the access control policy for your changes to take effect. For more information, see [Applying an Access Control Policy](#) on page 466.

Searching for Objects to Whitelist or Blacklist

LICENSE: Protection

SUPPORTED DEVICES: Series 3, virtual

SUPPORTED DEFENSE CENTERS: Any except DC500

If you have multiple network objects, groups, feeds, and lists, use the search feature to narrow the objects you want to blacklist or whitelist.

To search for objects to whitelist or blacklist:

ACCESS: Admin/Access Admin/Network Admin

- ▶ Type in the **Search by name or value** field.

The Available Objects list updates as you type to display matching items. Click the reload icon () above the search field or click the clear icon () in the search field to clear the search string.

You can search on network object names and on the values configured for those objects. For example, if you have an individual network object named **Texas office** with the configured value **192.168.3.0/24**, and the object is included in the group object **US offices**, you can display both objects by typing a partial or complete search string such as **Tex**, or by typing a value such as **3**.

Creating Objects to Whitelist or Blacklist

LICENSE: Protection

SUPPORTED DEVICES: Series 3, virtual

SUPPORTED DEFENSE CENTERS: Any except DC500

While editing an access control policy, you can create an object on-the-fly to use in its whitelist and blacklist: either a network object or a Security Intelligence list or feed. Note that to group network objects or create network object groups, you must use the object manager.

To create objects to whitelist or blacklist:

ACCESS: Admin/Access Admin/Network Admin

- ▶ Click the add icon (), then select the type of object you want to create:
 - Select **Add IP List** to create a Security Intelligence list or feed; see [Working with Security Intelligence Lists and Feeds](#) on page 162.
 - Select **Add Network Object** to add a network object; see [Working with Network Objects](#) on page 161.

Logging Blacklisted Connections

LICENSE: Protection

SUPPORTED DEVICES: Series 3, virtual

SUPPORTED DEFENSE CENTERS: Any except DC500

Logging blacklisted connections allows you to generate a connection event when the system detects network traffic to or from a blacklisted IP address. You can save these connection events to the Defense Center database, and can also log the events to the syslog or to an SNMP trap server using alert responses. For information on setting up alert responses, see [Working with Alert Responses](#) on page 526.

IMPORTANT! You **must** send events to the Defense Center if you want to set blacklisted objects to monitor-only, or perform any other Defense Center-based analysis on connection events generated by Security Intelligence filtering.

Unlike the logging options for access control rules or the default action, you cannot choose whether to generate beginning- or end-of-connection events. Events generated by Security Intelligence filtering always represent the beginning of a connection and the decision made by the system to either:

- deny the traffic without further inspection (blacklist)
- perform further analysis on the connection (blacklist set to monitor-only)

This decision is logged as a connection event's reason: either **IP Block** or **IP Monitor**. The decision is also reflected in the connection event's action, which for a blacklisted connection is **Block**. Contrast with a monitored connection, where the action is that of the first non-Monitor access control rule triggered by the connection, or the default action.

The system also logs a Security Intelligence category, which qualifies the reason with the name of the blacklisted object — whether network object, feed, or list — that contains the blacklisted IP address.

In the event viewer, so that you can identify the blacklisted IP address in the connection, host icons next to blacklisted and monitored IP addresses look slightly different.

Because the decision to blacklist a connection occurs before the network traffic is evaluated by access control rules, connection events generated by Security

Intelligence filtering do not contain information that must be determined by examining traffic over the duration of the session, nor do they contain application data. For details on the information in connection events, see [Information Available in Connection Events](#) on page 550.

IP Block connection events have a threshold of 15 seconds per unique initiator-responder pair. That is, once the system generates an event when it blocks a connection, it does not generate another connection event for additional blocked connections between those two hosts for the next 15 seconds, regardless of port or protocol.

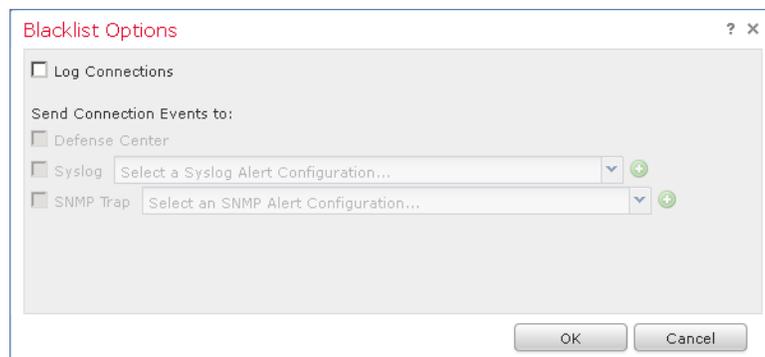

Note that the system may generate additional events for monitored connections, depending on the logging settings in the access control rule or default action that later handles the connection. For similar reasons, the system does not generate a special connection event when it detects a connection to or from a whitelisted IP address. That is, whitelisted connections generate events depending on how the system later handles the connection.

To log blacklisted connections:

ACCESS: Admin/Access Admin/Network Admin

1. On the Security Intelligence tab in an access control policy, click the logging icon ().

The Blacklist Options dialog box appears.

2. Select the **Log Connections** check box to log beginning-of-connection events when traffic meets Security Intelligence conditions.

3. Specify where to send connection events. You have the following choices:
 - To send connection events to the Defense Center, select **Defense Center**.
 - To send connection events to syslog, select **Syslog**, then select a syslog alert response from the drop-down list. Optionally, you can add a syslog alert response by clicking the add icon (+); see [Creating a Syslog Alert Response](#) on page 530.
 - To send connection events to an SNMP trap server, select **SNMP Trap**, then select an SNMP alert response from the drop-down list. Optionally, you can add an SNMP alert responses by clicking the add icon (+); see [Creating an SNMP Alert Response](#) on page 528.
4. Click **OK** to set your logging options.
The Security Intelligence tab appears again.
5. Click **Save**.
You must apply the access control policy for your changes to take effect. For more information, see [Applying an Access Control Policy](#) on page 466.

Configuring Advanced Access Control Policy Settings

LICENSE: Any

Advanced access control policy settings typically require little or no modification. The default settings are appropriate for most deployments.

URL Logging Advanced Options

When you log an end-of-connection event to the Defense Center database (see [Logging Connection, File, and Malware Information](#) on page 515) for HTTP traffic, the system records the URL requested by the monitored host during the session.

By default, the system stores the first 1024 characters of the URL in the connection log. Using **Maximum URL characters to store in connection events**, you can configure the system to store up to 4096 characters per URL to make sure you capture the full URLs requested by monitored hosts. Or, if you are uninterested in the individual URLs visited, you can disable URL storage entirely by storing zero characters. Depending on your network traffic, disabling or limiting the number of stored URL characters may improve system performance.

Disabling URL logging does not affect URL filtering. Access control rules properly filter traffic based on requested URLs, their categories, and reputations, even though the system does not record the individual URLs requested in the traffic handled by those rules. For more information, see [Adding URL Conditions](#) on page 506.

File and Malware Detection Options

If you use file policies to perform file control and malware detection or blocking, you can:

- using **Limit the number of bytes inspected when doing file type detection**, specify the number of bytes inspected when performing file type detection. By default, this option is set to 1460 bytes, or one packet. In most cases, the system can identify common file types using the first packet.
- using **Do not perform malware detection on files larger than (in bytes)**, prevent the system from performing malware detection on files larger than a certain size. By default, the option is set to 10485760 (10MB)
- using **Allow file if cloud lookup for Block Malware takes longer than (seconds)**, specify how long the system will hold the last byte of a file that matches a **Block Malware** rule and that does not have a cached disposition, while malware cloud lookup occurs. If the set duration elapses without the system obtaining a disposition, the system allows the file to pass through into traffic. By default, the option is set to 2 seconds.

Note that dispositions of Unavailable are not cached.

WARNING! Although this option will accept values of up to 30 seconds, Sourcefire recommends that you use the default value to avoid blocking traffic because of connection failures. Do **not** set a value of 0 for this option without first contacting Sourcefire Support.

You can set either of the first two options as high as 4294967295 (4GB). Setting the first two options to zero removes the restriction altogether. However, keep in mind that increasing the file sizes can affect the performance of the system.

Interactive Block Options

When traffic matches access control rules with **Interactive Block** or **Interactive Block with Reset** as the action, the user can click through a response page to bypass the block. Using **Allow an Interactive Block to bypass blocking for (seconds)**, you can set how long the system allows a user to resume a session using the same URL from the same IP address without clicking through the response page again. The default setting is 600 seconds (equivalent to 10 minutes). You can set the duration to as long as 31536000 seconds (equivalent to 365 days). Set this option to zero to make any user bypass of the response page for an interactive block a permanent bypass for sessions with the same URL and user's IP address.

To configure advanced access control policy options:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Policies > Access Control**.

The Access Control page appears.

2. Click the edit icon (✎) next to the access control policy you want to configure.

The policy Edit page appears.

3. Select the **Advanced** tab.

Advanced settings for the access control policy appear.

Maximum URL characters to store in connection events	1024
Limit the number of bytes inspected when doing file type detection	1460
Do not perform malware detection on files larger than (in bytes)	10485760
Allow file if cloud lookup for Block Malware takes longer than (seconds)	2
Allow an Interactive Block to bypass blocking for (seconds)	600

4. Configure the advanced options, as described above.

5. Click **Save**.

You must apply the access control policy for your changes to take effect. For more information, see [Applying an Access Control Policy](#) on page 466.

Organizing Rules in a Policy

LICENSE: Any

The Edit page for the access control policy lists access control rules in numerical order. The numeric position of each rule appears on the left side of the page next to the rule. You can move or insert rules and otherwise change the rule order. For example, if you move rule 10 under rule 3, rule 10 becomes rule 4 and all subsequent numbers increment accordingly.

A rule's position is important because the system compares packets to rules in the numeric order in which the rules are arranged on the policy Edit page. When a packet meets all the conditions of a rule, the system applies the conditions of that rule to the packet and ignores all subsequent rules for that packet.

Optionally, you can specify a rule's numeric position when you add or edit a rule. You can also highlight a rule before adding a new rule to predetermine the default position of the new rule to be below the rule you highlighted. See [Creating and Editing Access Control Rules](#) on page 474.

To locate specific rules, you can use partial or complete strings to search for rules by rule name or by a name or value in configured rule conditions. You can also filter rules to display only rules for selected devices targeted by your policy.

You can select one or more rules by clicking a blank space in the row for the rule. You can drag and drop selected rules into a new location, thereby changing the position of the rules you moved and all subsequent rules. You can cut or copy

selected rules and paste them above or below an existing rule. You can delete selected rules and insert new rules into any location in the list of existing rules.

You can further organize rules by adding custom categories between the administrative and root categories. You can delete or rename custom categories that you add.

You can display explanatory warnings to identify rules that will never match because they are preempted by preceding rules.

The following table summarizes the actions you can take to organize your rules.

Access Control Rule Organization Actions

To...	You CAN...
add a category to a policy	click Add Category . See Working with Rule Categories on page 451 for more information. TIP! You can also right-click a blank area in the row for a rule and select Insert new category .
search rule names and conditions for a string	click the Search Rules prompt, type a name or value, then press the Enter key. See Searching for Rules on page 453 for more information.
clear rule search	click the clear icon (✕) in the search field.
display rules for selected devices	find more information at Filtering Rules by Device on page 454.
select a rule	click a blank area in the row for a rule. Use the Ctrl or Shift key to select multiple rules. Rules you select are highlighted. Note that you can select rules in multiple categories.
clear rule selections	click the reload icon (↻) on the lower right side of the page.
cut or copy selected rules	right-click a blank area in the row for a selected rule, then select Cut or Copy .
paste rules you have cut or copied into the rule list	right-click a blank area in the row for a rule where you want to paste selected rules, then select Paste above or Paste below .
enable an inactive rule	right-click the rule and select State > Enable .
disable an active rule	right-click the rule and select State > Disable .
move selected rules	drag and drop selected rules beneath a new location indicated by a horizontal blue line that appears above your pointer as you drag.

Access Control Rule Organization Actions (Continued)

To...	You CAN...
delete a rule	click the delete icon () next to the rule, then click OK . TIP! You can also right-click a blank area in the row for a selected rule, select Delete , then click OK to delete one or more selected rules.
read warnings or errors	hover over the warning icon () or error icon () to read the warning or error text; see Working with Warnings and Errors on page 455 for more information.
determine if an intrusion policy or file policy is selected for a rule	view the intrusion policy icon () or the file policy icon (). If the icon for a policy is active (yellow) a policy is selected; if it is inactive (white), no policy of that type is selected for the rule.
view the intrusion policy or file policy selected for a rule	click the intrusion policy icon () or the file policy icon ().

Working with Rule Categories

LICENSE: Any

The following three predefined access control rule categories on the policy Edit page can help you organize your rules:

- Administrator Rules
- Standard Rules
- Root Rules

You cannot move, delete, or rename predefined categories. By default, any predefined user role that allows you to modify access control policies also allows you to move rules into and from, and modify rules in, any of these categories. You can create custom user roles that restrict users from moving and modifying rules in these predefined categories. See [Managing Custom User Roles](#) on page 1908 and [Policies Menu](#) on page 1920 for more information.

You can add new custom categories between the predefined standard and root categories. Adding custom categories allows you to further organize your rules without having to create additional policies. You can rename and delete categories that you add. You cannot move these categories, but you can move rules into, within, and out of them. Any user who is allowed to modify access control policies can also add rules to these categories and modify rules in them without restriction.

The following procedure explains how to add a new category to an access control policy. See [Editing an Access Control Policy](#) on page 459 for the complete procedure for editing an access control policy.

To add a new category:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Policies > Access Control**.

The Access Control page appears.

2. Click the edit icon () next to the access control policy you want to configure.

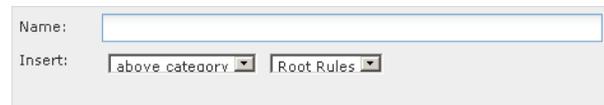

The policy Edit page appears.

3. Optionally, click a blank area in the row for an existing rule to set the default position of the new category.

4. Click **Add Category**.

Alternately, if you have added rules to your policy, you can right-click an existing rule and then click **Insert new category**.

The Add Category pop-up window appears.

5. Type a unique category **Name**.

You can enter an alphanumeric name, including spaces and special printable characters, with up to 30 characters.

6. You have the following choices:

- To position the new category immediately above an existing category, select **above Category** from the first Insert drop-down list, then select the category above which you want to position the rule from the second drop-down list.
- To position the new category rule below an existing rule, select **below rule** from the drop-down list, then enter an existing rule number.
Note that this option is valid only when at least one rule exists in the policy.
- To position the rule above an existing rule, select **above rule** from the drop-down list, then, enter an existing rule number.
Note that this option is valid only when at least one rule exists in the policy.

7. Click **OK** to add your category, or click **Cancel** to discard it.

If you click **OK**, your category is added to the policy.

Note that you can click the edit icon () next to a category you add to edit the category name, or click the delete icon () to delete the category. Rules in a category you delete are added to the category above.

Searching for Rules

LICENSE: Any

You can search the list of access control rules for matching values using an alphanumeric string, including spaces and printable, special characters. The search inspects the rule name and any rule condition you have added to the rule. For rule conditions, the search matches any name or value you can add for each condition type (zone, network, application, and so on). This includes individual object names or values, group object names, individual object names or values within a group, and literal values.

You can use complete or partial search strings. The column for matching values is highlighted for each matching rule. For example, if you search on all or part of the string **100Bao**, at a minimum, the Applications column is highlighted for each rule where you have added the 100Bao application. If you also have a rule named 100Bao, both the Name and Applications columns are highlighted.

You can navigate to each previous or next matching rule. A status message displays the current match and the total number of matches.

Matches may occur on any page of a multi-page rule list. When the first match is not on the first page, the page where the first match occurs is displayed. Selecting the next match when you are at the last match takes you to the first match, and selecting the previous match when you are at the first match takes you to the last match.

The following procedure explains how to search for rules in an access control policy. See [Editing an Access Control Policy](#) on page 459 for the complete procedure for editing an access control policy.

To search for rules:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Policies > Access Control**.
The Access Control page appears.
2. Click the edit icon () next to the access control policy you want to search.
The policy Edit page appears.
3. Click the **Search Rules** prompt, type a search string, then press Enter.
Columns for rules with matching values are highlighted, with differentiated highlighting for the indicated (first) match.

TIP! You can also use the Tab key or click a blank page area to initiate the search.

4. You have the following options:
 - To navigate between matching rules, click the next-match (▼) or previous-match (▲) icon.
 - To clear the search string, click the clear icon (✕).
The page refreshes and highlighting clears.

Filtering Rules by Device

LICENSE: Any

You can filter the access control rules listed in your access control policy to display only the rules for one or more specified devices or device groups. The system uses the zone conditions in access control rules to associate rules with devices on your network. See [Working with Security Zones](#) on page 187 and [Adding Zone Conditions](#) on page 492 for more information.

Rules are hidden for devices and groups that you do not specify. Rules where you do not add zones are targeted for any zone, and therefore are targeted for all devices, so they are never hidden.

The following procedure explains how to filter rules by device or device group. See [Editing an Access Control Policy](#) on page 459 for the complete procedure for editing an access control policy.

To filter rules by device or device group:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Policies > Access Control**.
The Access Control page appears.
2. Click the edit icon (✎) next to the access control policy you want to modify.
The policy Edit page appears.
3. Click **Filter by Device** above the list of rules.
The Filter by Device pop-up window appears. If you have added devices or device groups to your policy, a list of targeted devices and device groups appears.
4. Select one or more of the check boxes to display only the rules that apply to those devices or groups. Alternatively, select the **All** check box to reset and display all of the rules.
5. Click the **OK** button to update the list of rules.
The page updates to display rules for devices and device groups that you selected and hide rules for devices and device groups that you did not select.

TIP! Filters are cleared if you add a new rule, or if you edit and save an existing rule.

Working with Warnings and Errors

LICENSE: Any

Because of the number of configurable elements in an access control policy, policies can be very complex. Rules might be preempted by other rules. Functionality might be configured that depends on configuration outside of the access control policy. To help ensure that the policy you configure has the result you expect, the access control policy interface has a robust warning and error feedback system. If a rule or other element within a policy has a warning, the policy can be applied, but that piece of configuration will have no effect. If an element has an error, policy apply will fail unless the erroneous configuration is corrected.

To view the warning text for an object in the policy, hover your pointer over the warning icon (⚠) next to it. To view the error text for an object, hover your pointer over the error icon (❗) next to it.

If you disable a rule with a warning, the warning icon disappears. It reappears if you enable the rule without correcting the underlying issue. If you disable a rule with a warning, note that the error icon remains and the policy will still not apply even with the rule disabled.

Understanding Invalid Configurations

Because outside settings that the access control policy depends on may change, an access control policy setting that was valid may become invalid.

For example, if you have a URL condition in a rule, the rule might be valid until you choose to target a device that does not have a URL Filtering license. At that point, an error icon appears next to the rule, and you cannot apply the policy to that device until you edit or delete the rule, retarget the policy, or enable the appropriate license.

In another example, if you add a port group to the source ports in a rule, then change the port group to include an ICMP port, the rule becomes invalid and a warning icon appears next to it. You can still apply the policy, but the rule will not actually be applied to targeted devices.

Similarly, if you add a user to a rule, then change your LDAP user awareness settings to exclude that user, that rule will no longer apply because the user is no longer an access controlled user.

For all of these situations, warnings or errors appear in the access control policy or access control policy list to alert you to the issues.

Understanding Rule Pre-emption

The conditions of an access control rule may preempt a subsequent rule from matching traffic. For example:

```
Rule 1: allow Administrator users  
Rule 2: block Administrator users
```

The second rule above will never block traffic because the first rule will have already allowed the traffic.

Any type of rule condition can preempt a subsequent rule. For example, the VLAN range in the first rule below includes the VLAN in the second rule, so the first rule preempts the second rule:

```
Rule 1: allow VLAN 22-33
Rule 2: block VLAN 27
```

In the following example, Rule 1 matches any VLAN because no VLANs are configured, so Rule 1 preempts Rule 2, which attempts to match VLAN 2:

```
Rule 1: allow Source Network 10.4.0.0/16
Rule 2: allow Source Network 10.4.0.0/16, VLAN 2
```

A rule also preempts an identical subsequent rule where all configured conditions are the same. For example:

```
Rule 1: allow VLAN 1 URL www.example.com
Rule 2: allow VLAN 1 URL www.example.com
```

A subsequent rule would not be preempted if any condition is different. For example:

```
Rule 1: allow VLAN 1 URL www.example.com
Rule 2: allow VLAN 2 URL www.example.com
```

Managing Access Control Policies

LICENSE: Any

On the Access Control policy page (**Policies > Access Control**) you can view all your current access control policies by name with optional description and the following status information:

- when a policy is up to date on targeted devices, in green text
- when a policy is out of date on targeted devices, in red text

Options on this page allow you to compare policies, create a new policy, apply a policy to targeted devices, copy a policy, view a report that lists all of the most recently saved settings in each policy, and edit, or delete a policy.

TIP! You can export access control policies to, and import access control policies from, other Defense Centers in your deployment. See [Importing and Exporting Objects](#) on page 2225 for more information.

Depending on your choices when you add a device, either of two default access control policies might appear and already be applied to the device:

- The Default Access Control policy blocks all traffic from entering your network.
- The Default Intrusion Prevention policy allows all traffic and applies the Balanced Security and Connectivity intrusion policy to traffic on your network; see [Configuring Intrusion Policies](#) on page 667.

You can use either of these policies the same as you use policies you create.

The following table describes the actions you can take to manage your policies on the Access Control policy page:

Access Control Policy Management Actions

To...	You CAN...
create a new access control policy	click Create Policy . See Creating an Access Control Policy on page 458 for more information.
modify the settings in an existing access control policy	click the edit icon (). See Editing an Access Control Policy on page 459 for more information.
apply an access control policy to all devices targeted for the policy	click the policy apply icon (). See Applying an Access Control Policy on page 466 for more information.
determine what changed in policies to make them out of date on a device	click the red status message to see the detailed apply view, then click Out-of-date for the policy and device where you want to see what changed. See Applying Selected Policy Configurations on page 469 and Comparing Two Access Control Policies on page 462 for more information.
copy an access control policy	click the copy icon (). See Copying an Access Control Policy on page 460 for more information.
view a PDF report that lists the current configuration settings in an access control policy	click the report icon (). See Viewing an Access Control Policy Report on page 461 for more information.
compare access control policies	click Compare Policies . See Comparing Two Access Control Policies on page 462 for more information.
delete an access control policy	click the delete icon () , then click OK , or click Cancel if you decide not to delete the policy. When prompted whether to continue, you are also informed if another user has unsaved changes in the policy.

Creating an Access Control Policy

LICENSE: Any

When you create a new access control policy you must, at minimum, give it a unique name and specify a default action. Although you are not required to identify the policy targets at policy creation time, you must perform this step before you can apply the policy; see [Managing Policy Targets](#) on page 434.

You have the following options when selecting a default action for a new policy:

- **Block all traffic** creates a policy with the **Access Control: Block All Traffic** default action.
- **Intrusion Prevention** creates a policy with the **Intrusion Prevention: Balanced Security and Connectivity** default action.
- **Network Discovery** creates a policy with the **Network Discovery Only** default action.

After you create the access control policy, you can modify the default action. For guidance on choosing a default action, see [Setting the Default Action](#) on page 428.

To create an access control policy:

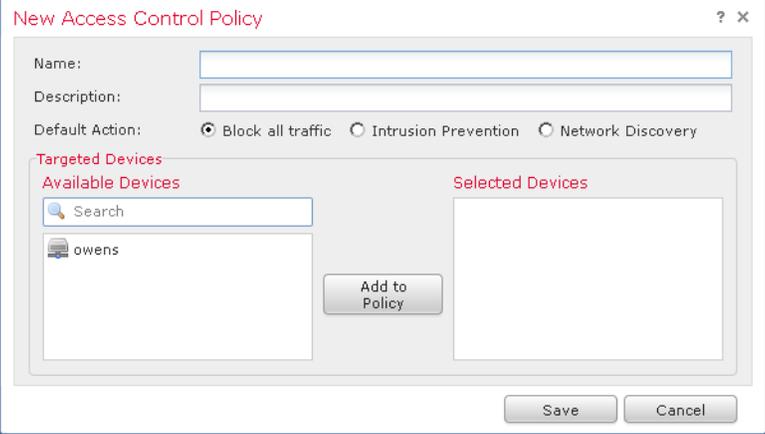

ACCESS: Admin/Access Admin/Network Admin

1. Select **Policies > Access Control**.

The Access Control page appears.

2. Click **New Policy**.

The New Access Control Policy pop-up window appears.

3. Give the policy a unique **Name** and, optionally, a **Description**.

You can use all printable characters, including spaces and special characters, except for the pound sign (#), a semi-colon (;), or either brace ({}). The name must include at least one non-space character.

4. Specify the **Default Action**.

5. Select the **Available Devices** where you want to apply the policy.
Use Ctrl and Shift to select multiple devices, or right-click to **Select All**. To narrow the devices that appear, type a search string in the **Search** field. To clear the search, click the clear icon (✕).
6. Add the **Selected Devices**. You can click and drag, or you can click **Add to Policy**.
7. Click **Save**.
The access control policy Edit page appears. For information on configuring your new policy, including adding rules, see [Editing an Access Control Policy](#) on page 459. Note that you must apply the policy for it to take effect; see [Applying an Access Control Policy](#) on page 466.

Editing an Access Control Policy

LICENSE: Any

On the policy Edit page, you can configure your policy and organize access control rules. See [Configuring Policies](#) on page 426 and [Organizing Rules in a Policy](#) on page 449 for more information.

When you change your configuration, a message indicates that you have unsaved changes. To retain your changes, you must save the policy before exiting the policy Edit page. If you attempt to exit the policy Edit page without saving your changes, you are cautioned that you have unsaved changes; you can then discard your changes and exit the policy, or return to the policy Edit page.

To protect the privacy of your session, after sixty minutes of inactivity on the policy Edit page, changes to your policy are discarded and you are returned to the Access Control page. After the first thirty minutes of inactivity, a message appears and updates periodically to provide the number of minutes remaining before changes are discarded. Any activity on the page cancels the timer.

When you attempt to edit the same policy in two browser windows, you are prompted whether to resume your edit in the new window, discard your changes in the original window and continue editing in the new window, or cancel the second window and return to the policy Edit page.

When multiple users edit the same policy concurrently, a message for each on the policy Edit page identifies other users who have unsaved changes. Any user who attempts to save their changes is cautioned that their changes will overwrite changes by other users. When the same policy is saved by multiple users, the last saved changes are retained.

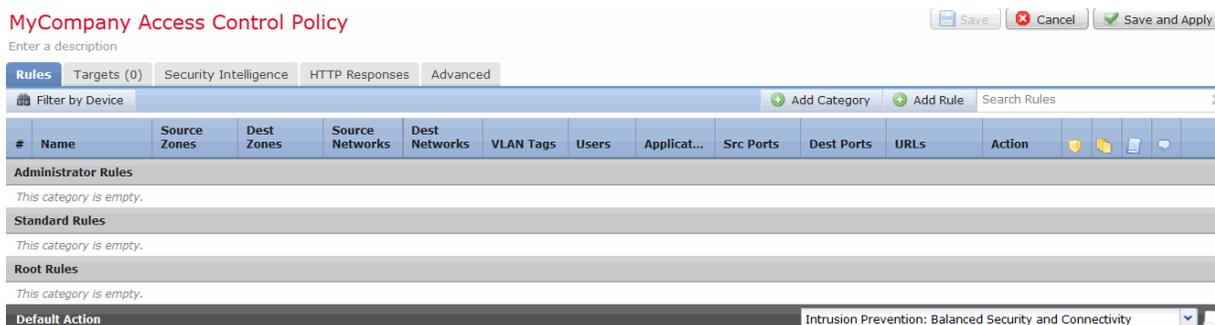

To edit an access control policy:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Policies > Access Control**.
The Access Control page appears.

2. Click the edit icon (✎) next to the access control policy you want to configure.

The policy Edit page appears.

3. You have the following choices:
 - To configure your policy, you can take any of the actions described in [Configuring Policies](#) on page 426 and summarized in the [Access Control Policy Configuration Actions](#) on page 427.
 - To organize rules in your policy, you can take any of the actions described in [Organizing Rules in a Policy](#) on page 449 and summarized in the [Access Control Rule Organization Actions](#) on page 450.
4. Save or discard your configuration. You have the following choices:
 - To save your changes and continue editing, click **Save**.
 - To save your changes and apply your policy, click **Save and Apply**. See [Applying an Access Control Policy](#) on page 466.
You must apply your policy to put your changes into effect.
 - To discard your changes, click **Cancel** and, if prompted, click **OK**.
Your changes are discarded and the Access Control page appears.

Copying an Access Control Policy

LICENSE: Any

You can copy and rename an access control policy. A policy you copy includes all policy rules and configurations.

To copy an access control policy:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Policies > Access Control**.
The Access Control page appears.

2. Click the copy icon (📄) next to the access control policy you want to configure.

The Copy Access Control Policy pop-up window appears.

3. Enter a unique policy **Name**.
You can use all printable characters, including spaces and special characters, except for the pound sign (#), a semi-colon (;), or either brace ({}). The name must include at least one non-space character.
4. Click **OK**.
Your copy appears on the Access Control page in alphabetical order by name.

Viewing an Access Control Policy Report

LICENSE: Any

An access control policy report is a record of the policy and rules configuration at a specific point in time. You can use the report for auditing purposes or to inspect the current configuration.

TIP! You can also generate an access control comparison report that compares a policy with the currently applied policy or with another policy. For more information, see [Comparing Two Access Control Policies](#) on page 462.

An access control policy report contains the sections described in the following table.

Access Control Policy Report Sections

SECTION	DESCRIPTION
Title Page	Identifies the name of the policy report, the date and time the policy was last modified, and the name of the user who made that modification.
Table of Contents	Describes the contents of the report.
Policy Information	Provides the name and description of the policy, the name of the user who last modified the policy, and the date and time the policy was last modified. See Editing an Access Control Policy on page 459.

Access Control Policy Report Sections (Continued)

SECTION	DESCRIPTION
Device Targets	Lists the managed devices targeted by the policy. See Managing Policy Targets on page 434.
HTTP Block Response HTTP Interactive Block Response	Provides details on the HTTP block response pages associated with the policy. See Adding an HTTP Response Page on page 436.
Security Intelligence	Provides details on the Security Intelligence whitelist and blacklist. See Filtering Traffic Based on Security Intelligence Data on page 438.
Default Action	Provides the default action. See Setting the Default Action on page 428.
Rules	Provides the rule action and conditions for each rule in the policy, by rule category. See Understanding and Writing Access Control Rules on page 472 and Working with Rule Categories on page 451.
Referenced Objects	Provides the name and configuration of all individual objects and group objects used in the policy, by type of condition (Networks, VLAN Tags, and so on) where the object is configured. See Understanding Rule Conditions on page 483 and Using Objects and Security Zones on page 158.

To view an access control policy report:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Policies > Access Control**.

The Access Control page appears.

2. Click the report icon () next to the policy for which you want to generate a report. Remember to save any changes before you generate an access control policy report; only saved changes appear in the report.

The system generates the report. Depending on your browser settings, the report may appear in a pop-up window, or you may be prompted to save the report to your computer.

Comparing Two Access Control Policies

LICENSE: Any

To review policy changes for compliance with your organization's standards or to optimize system performance, you can examine the differences between two

access control policies. You can compare any two policies or the currently applied policy with another policy. Optionally, after you compare, you can then generate a PDF report to record the differences between the two policies.

There are two tools you can use to compare policies:

- The comparison view displays only the differences between two policies in a side-by-side format. The name of each policy appears in the title bar on the left and right sides of the comparison view except when you select **Running Configuration**, in which case a blank bar represents the currently active policy.

You can use this to view and navigate both policies on the web interface, with their differences highlighted.

- The comparison report creates a record of only the differences between two policies in a format similar to the policy report, but in PDF format.

You can use this to save, copy, print, and share your policy comparisons for further examination.

For more information on understanding and using the policy comparison tools, see:

- [Using the Access Control Policy Comparison View](#) on page 463
- [Using the Access Control Policy Comparison Report](#) on page 465

Using the Access Control Policy Comparison View

LICENSE: Any

The comparison view displays both policies in a side-by-side format, with each policy identified by name in the title bar on the left and right sides of the comparison view. When comparing two policies other than the running

configuration, the time of last modification and the last user to modify are displayed with the policy name.

Default Intrusion Prevention (2012-05-17 10:36:37 by admin)	MyCompany's AC Policy (2012-05-24 16:26:06 by admin)
Policy Information	
Name	Default Intrusion Prevention
Description	
Modified	2012-05-17 10:36:37 by admin
HTTP Block Response	None
Advanced Settings	
Maximum URL Length	1024
Rules	
Category 1	
Name	Administrator Rules
Rule 1	
Name	monitor non-IE browsers
Action	monitor
Application Filters	
Chrome	
Firefox	
Konqueror	
Mobile Safari	

Differences between the two policies are highlighted:

- Blue indicates that the highlighted setting is different in the two policies, and the difference is noted in red text.
- Green indicates that the highlighted setting appears in one policy but not the other.

You can perform any of the actions in the following table.

Access Control Policy Comparison View Actions

To...	YOU CAN...
navigate individually through changes	click Previous or Next above the title bar. The double-arrow icon (↔) centered between the left and right sides moves, and the Difference number adjusts to identify which difference you are viewing.
generate a new policy comparison view	click New Comparison . The Select Comparison window appears. See Using the Access Control Policy Comparison Report on page 465 for more information.
generate a policy comparison report	click Comparison Report . The policy comparison report creates a PDF document that lists only the differences between the two policies.

Using the Access Control Policy Comparison Report

LICENSE: Any

An access control policy comparison report is a record of all differences between two access control policies or a policy and the currently applied policy identified by the policy comparison view, presented in PDF format. You can use this report to further examine the differences between two policy configurations and to save and disseminate your findings.

You can generate an access control policy comparison report from the comparison view for any policies to which you have access. Remember to save any changes before you generate a policy report; only saved changes appear in the report.

The format of the policy comparison report is the same as the policy report with one exception: the policy report contains all configurations in the policy, and the policy comparison report lists only those configurations that differ between the policies. An access control policy comparison report contains the sections described in the [Access Control Policy Report Sections table](#) on page 461.

TIP! You can use a similar procedure to compare intrusion, file, system, or health policies.

To compare two access control policies:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Policies > Access Control**.

The Access Control page appears.

2. Click **Compare Policies**.

The Select Comparison window appears.

The screenshot shows a window titled "Select Comparison" with three dropdown menus. The first menu, "Compare Against", is set to "Running Configuration". The second menu, "Target/Running Configuration A", is set to "linden". The third menu, "Policy B", is set to "Default Intru".

3. From the **Compare Against** drop-down list, select the type of comparison you want to make:

- To compare two different policies, select **Other Policy**.

The page refreshes and the Policy A and Policy B drop-down lists appear.

- To compare another policy to the currently active policy, select **Running Configuration**.

The page refreshes and the Target/Running Configuration A and Policy B drop-down lists appear.

4. Depending on the comparison type you selected, you have the following choices:
 - If you are comparing two different policies, select the policies you want to compare from the Policy A and Policy B drop-down lists.
 - If you are comparing the running configuration to another policy, select the second policy from the Policy B drop-down list.
5. Click **OK** to display the policy comparison view.
The comparison view appears.
6. Optionally, click **Comparison Report** to generate the access control policy comparison report.
The access control policy comparison report appears. Depending on your browser settings, the report may appear in a pop-up window, or you may be prompted to save the report to your computer.

Applying an Access Control Policy

LICENSE: Any

After making any changes to an access control policy, you must apply the policy to one or more devices to implement the configuration changes on the networks monitored by the devices. You must target devices where you want to apply the policy before you can apply the policy. See [Managing Policy Targets](#) on page 434.

Keep the following points in mind when applying access control policies:

- In special cases, applying an access control policy may cause a short pause in traffic flow and processing, and may also cause a few packets to pass uninspected. This occurs when the Snort® process restarts; for example, the process restarts when you apply an access control policy that pushes a new version of Snort to a managed device following a Defense Center upgrade, when you apply a policy for the first time after a rule import that includes shared object rules, and, in some cases, when you install a VDB update. See [Performing Software Updates](#) on page 2056, [Updating the Vulnerability Database](#) on page 2070, and [Importing Rule Updates and Local Rule Files](#) on page 2072.
- On 3D7010, 3D7020, and 3D7030 managed devices, applying an access control policy takes up to five minutes. To minimize inconvenience, apply access control policies during a change window.
- If an access control policy requires licenses enabled through recently applied device configurations, the system queues the access control policy apply until the device configurations finish applying.
- Intrusion rules that are set to Drop and Generate Events in an associated intrusion policy where **Drop when Inline** is selected will generate events but will **not** drop any packets or block any attacks when you apply the intrusion policy to a device that uses a passive interface set or an inline interface set in tap mode. See [Setting Drop Behavior in an Inline Deployment](#) on

page 689 and [Tap Mode](#) on page 275 for more information.

- You cannot apply an access control policy to stacked devices running different versions of the Sourcefire 3D System (for example, if an upgrade on one of the devices fails). See [Managing Stacked Devices](#) on page 237 for more information.
- Some features require minimum versions of the Sourcefire 3D System, or specific device models. Managed devices must be running at least Version 5.1.1 to detect malware and perform file control, and Version 5.2 to block malware. See [Supported Capabilities by Appliance Model](#) on page 42 for a summary of features not supported on Series 2 appliances.
- The label for the apply button on the quick-apply pop-up window can differ depending on whether you are permitted to apply an access control policy, intrusion policy, or both; see [Using Custom User Roles with Access Control Policies](#) on page 433.
- At least one detector must be enabled for each application rule condition in the policy. If no detector is enabled for an application, the system automatically enables all Sourcefire-provided detectors for the application; if none exist, the system enables the most recently modified user-defined detector for the application. See [Working with Application Conditions](#) on page 498 for more information.
- You can add an unlimited number of unique intrusion policies to an access control policy. However, when you apply the access control policy to a device, a pop-up window may warn that you have exceeded the maximum number of intrusion policies supported by the device. This maximum depends on a number of factors, including the physical memory and the number of processors on your device.

TIP! If you exceed the number of intrusion policies supported by your device, reevaluate your access control policy. You may want to consolidate intrusion policies so you can associate a single intrusion policy with multiple access control rules.

- Although you can apply any combination of an access control policy and its associated intrusion policies, applying an access control policy automatically applies all associated file policies. You cannot apply file policies independently.

See the following sections for more information:

- [Applying a Complete Policy](#) on page 468 explains how to use the quick-apply option to apply the access control policy along with any associated intrusion and file policies.
- [Applying Selected Policy Configurations](#) on page 469 explains how to select and apply any combination of the access control policy, any associated intrusion policies, or both.

Applying a Complete Policy

LICENSE: Any

You can apply an access control policy at any time. Applying an access control policy also applies any associated intrusion and file policies that are different from those currently running on devices targeted by the policy. A pop-up window allows you to apply all together as a single quick-apply action. Unchanged intrusion and file policies are not applied when you use the quick-apply option.

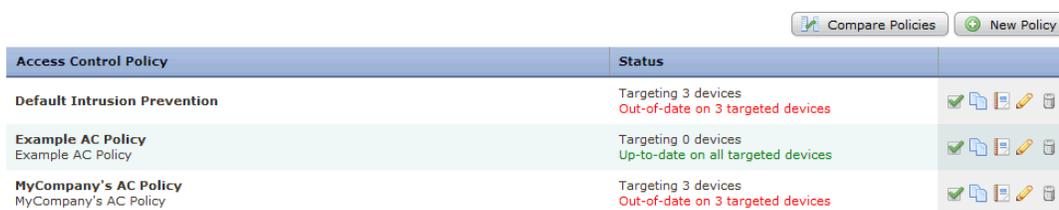

The label for the apply button on the quick-apply pop-up window can differ depending on whether you are permitted to apply an access control policy, intrusion policy, or both; see [Using Custom User Roles with Access Control Policies](#) on page 433.

To quick-apply a complete access control policy:

ACCESS: Admin/Security Approver

1. Select **Policies > Access Control**.

The Access Control page appears.

Access Control Policy	Status	
Default Intrusion Prevention	Targeting 3 devices Out-of-date on 3 targeted devices	   
Example AC Policy Example AC Policy	Targeting 0 devices Up-to-date on all targeted devices	   
MyCompany's AC Policy MyCompany's AC Policy	Targeting 3 devices Out-of-date on 3 targeted devices	   

2. Click the apply icon () next to the policy you want to apply.
The Apply Access Control Rules pop-up window appears.

Alternatively, you can click **Save and Apply** on the policy Edit page; see [Editing an Access Control Policy](#) on page 459.

3. Click **Apply All**.

Your policy apply task is queued. Click **OK** to return to the Access Control page.

TIP! You can monitor the progress of the policy apply task on the Task Status page (**System > Monitoring > Task Status**).

Applying Selected Policy Configurations

LICENSE: Any

You can use the detailed policy apply page to apply changes to your access control policy and to any associated intrusion policies. The detailed page lists each device targeted by the policy and provides a column for the access control policy by device, and a column for associated intrusion policies by device. You can specify whether to apply changes to an access control policy, to associated intrusion policies individually or in combination, or both for each targeted device.

You must apply both an access control policy and an associated intrusion policy in either of the following cases:

- when the access control policy is being applied to the device for the first time
- when an intrusion policy has been newly added to the access control policy

In both cases, the states of the access control policy and the intrusion policies are linked; that is, you must apply both or neither.

Note that regardless of the intrusion policies you apply, applying an access control policy automatically applies all associated file policies that are different from those currently running on devices targeted by the policy. You cannot apply file policies independently.

The Access Control Policy Column

The Access Control Policy column provides a check box for indicating whether to apply the access control policy.

TIP! Although you can reapply a policy while it is still in the task queue, that is, while the apply task has not yet completed, there is no benefit in doing this.

A status message indicates whether the policy is currently up to date or out of date. When the policy is out of date, you can conveniently display a comparison of the policy to the currently running policy in a new browser window. The comparison does not include differences in an intrusion policy associated with the access control policy.

The Intrusion Policies Column

The Intrusion Policies column provides one or more check boxes for indicating whether to apply intrusion policies associated with the access control policy to a device. A single grayed check box indicates that all associated intrusion policies are identical to currently running policies, in which case the check box is cleared and cannot be selected. You cannot apply an unchanged intrusion policy; only changed intrusion policies are listed, and can be selected individually. When the same intrusion policy is associated with multiple rules in a policy, the intrusion policy is listed only once for each device.

The check box for an intrusion policy is selected and the check box is grayed and cannot be changed when the access control policy and the intrusion policy must be applied together, as described above, in either of the following cases:

- when the access control policy is being applied to the device for the first time
- when an intrusion policy has been newly added to the access control policy

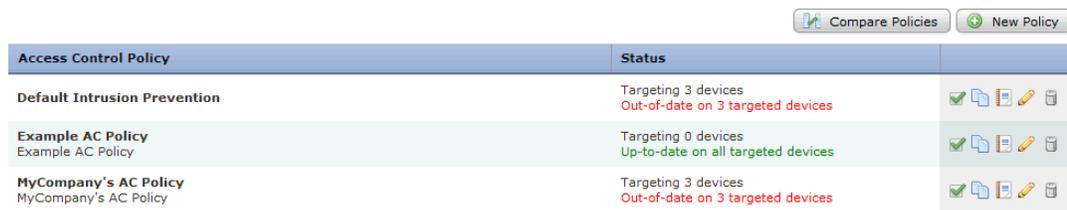

Status messages indicate whether intrusion policies are currently up to date or out of date. An intrusion policy is out of date when it is not identical to an intrusion policy currently running on the listed device. An identical intrusion policy on the device is up to date. When the policy is out of date, you can conveniently display a comparison of the policy to the currently running policy in a new browser window.

To apply selected access control policy configurations:

ACCESS: Admin/Security Approver

1. Select **Policies > Access Control**.

The Access Control page appears.

Access Control Policy	Status	
Default Intrusion Prevention	Targeting 3 devices Out-of-date on 3 targeted devices	   
Example AC Policy Example AC Policy	Targeting 0 devices Up-to-date on all targeted devices	   
MyCompany's AC Policy MyCompany's AC Policy	Targeting 3 devices Out-of-date on 3 targeted devices	   

2. Click the apply icon () next to the policy you want to apply.

The Apply Access Control Rules pop-up window appears.

Alternatively, you can click **Save and Apply** on the policy Edit page; see [Editing an Access Control Policy](#) on page 459.

3. Click **Details**.

The detailed Apply Access Control Rules pop-up window appears.

Devices	Access Control Policy		Intrusion Policies	
	Select: All None		Select: All None	
linden	<input checked="" type="checkbox"/>	<input type="checkbox"/> Out-of-date	<input checked="" type="checkbox"/> Balanced Security anc	<input type="checkbox"/> Out-of-date
xiramat	<input checked="" type="checkbox"/>	<input type="checkbox"/> Out-of-date	<input checked="" type="checkbox"/> Balanced Security anc	<input type="checkbox"/> Out-of-date
tamarix	<input checked="" type="checkbox"/>	<input type="checkbox"/> Out-of-date	<input checked="" type="checkbox"/> Balanced Security anc	<input type="checkbox"/> Out-of-date

TIP! You can also open the pop-up window from the Access Control page (**Policies > Access Control**) by clicking on an out-of-date message in the **Status** column for the policy.

4. Select or clear the access control policy check box next to the device name to specify whether to apply the access control policy to a targeted device.
5. Select or clear the intrusion policy check box next to the device name to specify whether to apply an intrusion policy to a targeted device.
6. Click **Apply Selected Configurations**.

Your policy apply task is queued. Click **OK** to return to the Access Control page.

TIP! You can monitor the progress of the policy apply task on the Task Status page (**System > Monitoring > Task Status**).

IMPORTANT! A pop-up window may warn that you have exceeded the maximum number of intrusion policies supported by the device. To successfully apply the access control policy, remove applied intrusion policies from it until the number of remaining intrusion policies (including the default action) falls within the maximum.

CHAPTER 13

UNDERSTANDING AND WRITING ACCESS CONTROL RULES

A set of *access control rules* is a key component of an access control policy. Although you can create basic access control policies without them, access control rules allow you to manage, in a granular fashion, which traffic can enter your network, exit it, or cross from within without leaving it. For example, you could block some or all social networking traffic, prevent your sales department from accessing accounting records, monitor which users access which sites or networks, and so on.

IMPORTANT! Hardware-based fast-path rules and Security Intelligence-based traffic filtering (blacklisting) occur **before** network traffic is evaluated by access control rules.

Within an access control policy, the system matches traffic to rules in top-down order by rule number. In addition to its rule order and some other basic attributes, each rule has the following major components:

- a set of rule *conditions* that identifies the specific traffic you want to control
- a rule *action*, which determines how the system handles traffic that meets the rule's conditions
- file, malware, and intrusion *inspection* options, which allow you to examine (and optionally block) matching traffic that you would otherwise allow
- *logging* options, which allow you to keep a record of the matching traffic and how it was handled by the rule

The access control policy's *default action* handles traffic that is not blacklisted by Security Intelligence and does not meet the conditions of any non-Monitor rule in the policy. For more information on access control policies and the default action,

see [Using Access Control Policies](#) on page 424.

TIP! If you want to use the Sourcefire 3D System to perform intrusion detection and prevention but do not need to take advantage of discovery data, you can optimize performance by disabling new discovery. First, make sure that your applied access control policies do not contain rules with user, application, or URL conditions. Then, remove all rules from your network discovery policy and apply it to your managed devices. For more information on configuring discovery, see [Introduction to Network Discovery](#) on page 1250.

Although you can create access control rules with any license, certain rule conditions and inspection options require that you enable specific licensed capabilities on the access control policy’s targeted devices. You cannot apply a policy that uses licensed capabilities to unlicensed devices. The Defense Center uses warning icons (⚠) and confirmation dialogs to designate unlicensed features. For details, hover your pointer over a warning icon.

The following table explains the licenses you must have to use access control rules.

License Requirements for Access Control Rules

TO APPLY AN ACCESS CONTROL POLICY THAT INCLUDES RULES...	ADD THIS LICENSE...	TO ONE OF THESE DEFENSE CENTERS...	AND ENABLE IT ON ONE OF THESE DEVICES...
with zone, network, VLAN, or port conditions, or URL conditions that use literal URLs and URL objects only	Any	Any	Any, except Series 2 devices cannot perform URL filtering using literal URLs and URL objects
associated with intrusion policies, or file policies that do not perform malware detection or blocking	Protection	Any	Any, except Series 2 devices cannot perform Security Intelligence filtering
associated with file policies that perform malware detection or blocking	Malware	Any except DC500	Series 3, virtual
with application or user conditions	Control	Any, except the DC500 cannot perform user control	Series 3, virtual
with URL conditions that use URL category and reputation data	URL Filtering	Any except DC500	Series 3, virtual

See the following sections for more information on access control rules:

- [Creating and Editing Access Control Rules](#) on page 474
- [Understanding Rule Actions](#) on page 478
- [Understanding Rule Conditions and Condition Mechanics](#) on page 482
- [Working with Different Types of Conditions](#) on page 491
- [Performing File and Intrusion Inspection on Allowed Traffic](#) on page 511
- [Logging Connection, File, and Malware Information](#) on page 515
- [Adding Comments to a Rule](#) on page 521

Creating and Editing Access Control Rules

LICENSE: Any

An access control rule is simply a set of configurations and conditions that:

- qualifies network traffic
- specifies how and whether you further inspect and log traffic that matches those qualifications
- determines the traffic's eventual flow

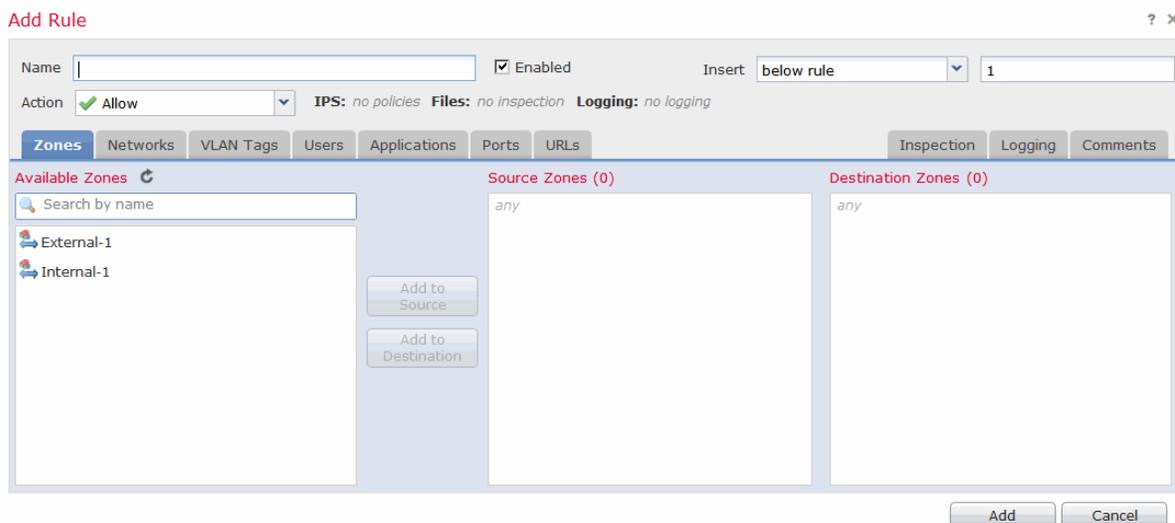

You create and edit access control rules from within an existing access control policy. Each rule belongs to only one policy.

When you apply an access control policy to a device, the Defense Center sends each rule defined in the policy to the device as a set of expanded rules, where each rule expresses one possible combination of conditions in the rule. For example, a rule with the Internal security zone as a source zone and LDAP and HTTPS source ports would be sent to the device as two rules: one to match traffic with a source zone of Internal over an LDAP source port, and one to match traffic with a source zone of Internal over an HTTPS source port.

Note that an access control policy with many complex rules may not apply to a managed device if the number of expanded rules exceeds the number allowed for that device. If this occurs, analyze the conditions in your rules to see if you can eliminate unnecessary settings.

The web interface for adding or editing a rule is similar. You specify the rule name, state, action, and position at the top of the page. You build conditions using the tabs on the left side of the page; each condition type has its own tab. You

configure inspection and logging options, as well as add comments to the rule, using the tabs on the right side of the page.

The following list summarizes the configurable components of an access control rule.

Name

Give each rule a unique name. You can use up to thirty printable characters, including spaces and special characters, with the exception of the colon (:).

Rule State

By default, rules are enabled. If you disable a rule, the system does not use it to evaluate network traffic. When viewing the list of rules in an access control policy, disabled rules are grayed out, although you can still modify them.

Action

A rule's action determines how the system handles traffic that matches the rule's conditions. You can trust, monitor, block, or allow (with or without further inspection) matching traffic. The access control policy's *default action* handles traffic that does not meet the conditions of any non-Monitor access control rule.

IMPORTANT! Access control rules actions, along with the policy's default action, determine the network traffic that you can examine using intrusion, file, or network discovery policies. The system does **not** perform inspection on trusted or blocked traffic.

For detailed information on rule actions and how they affect inspection and traffic flow, see [Understanding Rule Actions](#) on page 478.

Current Inspection and Logging Settings

The **IPS**, **Files**, and Logging options indicate the intrusion policy, file policy, and logging options currently selected in the rule. Click the **IPS** or **Files** setting to open the Inspection tab, or click the **Logging** setting to open the Logging tab.

Position (Order and Category)

Rules in an access control policy are numbered, starting at 1. The system matches traffic to access control rules in top-down order by ascending rule number. Optionally, you can group rules by category. By default the system provides three categories: Administrator, Standard, and Root. You can add your own custom categories anywhere you like, but you cannot delete the Sourcefire-provided categories or change their order.

When you add a rule to a policy, you specify its position in one of two ways. First, you can **Insert** it in a category, which places it last (numerically) in that category. Or, you can place it **above** or **below** a specific rule, using rule numbers as a reference point. When editing an existing rule, you can **Move** the rule in a similar fashion. For more information, see [Organizing Rules in a Policy](#) on page 449.

Conditions

Rule conditions identify the specific traffic you want to control. Conditions can match traffic by any combination of multiple attributes, including security zone, network, VLAN, Active Directory LDAP user or group, application, transport protocol port, or URL information. Conditions can be simple or complex, and in some cases require that you apply a license to the access control policy's target devices.

For detailed information on adding conditions, see [Understanding Rule Conditions and Condition Mechanics](#) on page 482 and [Working with Different Types of Conditions](#) on page 491.

File and Intrusion Inspection Options

A rule's inspection options apply to traffic that you would normally allow. You configure the system to perform further inspection by associating an intrusion or file policy (or both) with a rule.

File policies perform *file control*, that is, they can detect and block your users from uploading (sending) or downloading (receiving) files of specific types over specific application protocols. File policies can also use Sourcefire's advanced malware protection feature to determine if certain transmitted files represent a threat to your organization, then block them. Intrusion policies perform intrusion detection and prevention and can drop offending packets.

Both types of inspection require the Protection license. AMP requires a Malware license. For detailed information on associating an intrusion or file policy with a rule, see [Performing File and Intrusion Inspection on Allowed Traffic](#) on page 511.

Logging Options

An access control rule's logging options allow you to specify whether and how to keep a record of matching traffic, as well as log the detection of files or malware in that traffic.

In general, you can log a connection event at the beginning or end of a connection, or both. However, you can log only beginning-of-connection events for blocked traffic because matching traffic is denied without further inspection. Additionally, although the system automatically logs end-of-connection events for monitored traffic, beginning-of-connection logging for monitored traffic is determined by the first non-Monitor rule triggered by the traffic, or the default action.

If you choose to log at the end of connections, the system generates events when it detects the close of a connection, when it does not detect the end of a connection after a period of time, or when it can no longer track the session due to memory constraints.

You can log connections to the Defense Center database, as well as to the system log (syslog) or to an SNMP trap server. For detailed information, see [Logging Connection, File, and Malware Information](#) on page 515.

Comments

Each time you save changes to an access control rule, you can add a comment. For example, you might summarize the overall configuration for the benefit of other users, or note when you change a rule and the reason for the change. You can display a list of all comments for a rule along with the user who added each comment and the date the comment was added. For more information, see [Adding Comments to a Rule](#) on page 521.

To create or edit an access control rule:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Policies > Access Control**.

The Access Control page appears.

2. Click the edit icon (✎) next to the access control policy where you want to add a rule.

The policy Edit page appears.

3. Add a new rule or edit an existing rule:
 - To add a new rule, click **Add Rule**.
 - To edit an existing rule, click the edit icon () next to the rule you want to edit.

Either the Add Rule or the Editing Rule page appears.

TIP! You can use the right-click context menu to perform many rule creation and management actions; see [Using the Context Menu](#) on page 63. You can also drag and drop rules to change their order.

4. Configure the rule components, as described earlier in this section. You can configure the following, or accept the defaults:
 - You must provide a unique rule **Name**.
 - Specify whether the rule is **Enabled**.
 - Select a rule **Action**.
 - Specify the rule position.
 - Configure the rule's conditions.
 - Configure the rule's **Inspection** options.
 - Specify **Logging** options.
 - Add **Comments**.

5. Click **Add** or **Save**.

Your changes are saved. You must apply the access control policy for your changes to take effect; see [Applying an Access Control Policy](#) on page 466.

Understanding Rule Actions

LICENSE: Any

Every access control rule has an associated action that determines:

- whether the system will trust, monitor, block, or allow (with or without further inspection) traffic that matches the rule's conditions
- for certain rule actions, whether the system further inspects matching traffic with intrusion, file, and network discovery policies before allowing it to pass
- when and how you can log details about matching traffic

The access control policy's *default action* handles traffic that does not meet the conditions of any non-Monitor access control rule; see [Setting the Default Action](#) on page 428. For detailed information on rule actions and how they affect connection logging, see following sections, as well as [Logging Connection, File, and Malware Information](#) on page 515.

Allow

The **Allow** action allows matching traffic to pass. Optionally, you can associate an Allow rule with an intrusion or file policy, or both. These two types of policy further inspect and can block network traffic according to their own configurations:

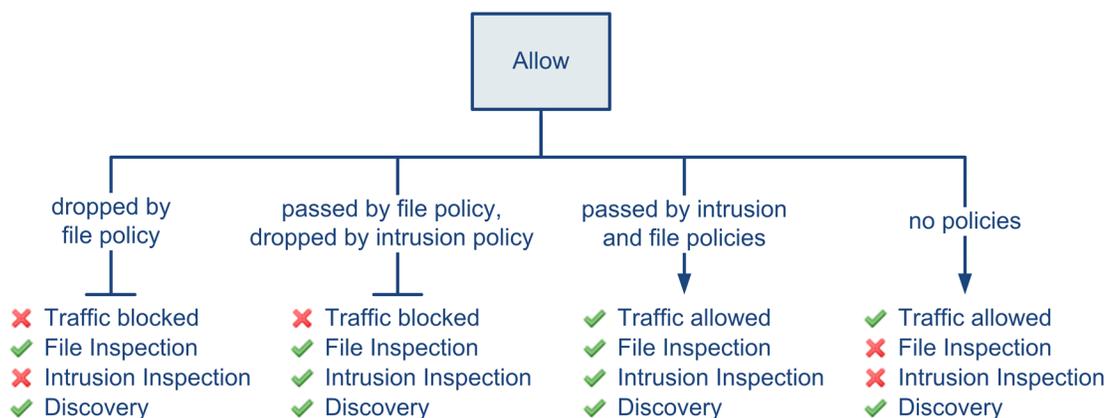

- Use an associated file policy to perform file control, that is, to detect and block your users from uploading (sending) or downloading (receiving) files of specific types over specific application protocols. File policies also allow you to inspect a restricted set of those files for malware, and optionally block detected malware.
- Use an associated intrusion policy to analyze network traffic according to intrusion detection and prevention configurations and, optionally, drop offending packets.

For instructions on how to associate an intrusion or file policy with an access control rule, see [Performing File and Intrusion Inspection on Allowed Traffic](#) on page 511.

The diagram below illustrates the types of inspection performed on traffic that meets the conditions of an Allow rule (or a user-bypassed Interactive Block rule; see [Interactive Block and Interactive Block with Reset](#) on page 481). Notice that file inspection occurs before intrusion inspection; blocked files are not inspected for intrusion-related exploits.

For simplicity, the diagram displays traffic flow for situations where both (or neither) an intrusion and a file policy are associated with an access control rule. You can, however, configure one without the other. Without a file policy, traffic flow is determined by the intrusion policy; without an intrusion policy, traffic flow is determined by the file policy.

Regardless of whether the traffic is inspected or dropped by an intrusion or file policy, the system can inspect it using network discovery.

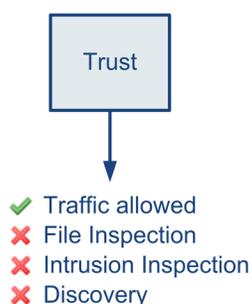

IMPORTANT! Selecting a rule action of **Allow** does not automatically guarantee discovery inspection. The system performs discovery only for connections involving IP addresses that are explicitly monitored by your network discovery policy. For more information, see [Introduction to Network Discovery](#) on page 1250.

You can log allowed network traffic at both the beginning and end of connections.

Trust

The Trust action allows traffic to pass without further inspection. You cannot inspect trusted traffic with a file, intrusion, or network discovery policy.

You can log trusted network traffic at both the beginning and end of connections. Note that TCP connections detected by a trust rule on the first packet will not generate a beginning-of-connection event. On virtual appliances, generated events will be reported one hour after the final session packet.

Monitor

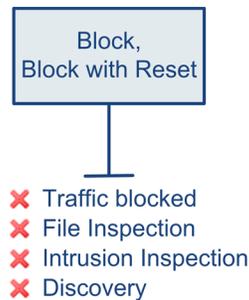

The **Monitor** action does not affect traffic flow; matching traffic is neither immediately permitted nor denied. Rather, traffic is matched against additional rules, if present, to determine whether to permit or deny it. The first non-Monitor rule matched determines traffic flow and any further inspection. If there are no additional matching rules, the system uses the default action.

Because the primary purpose of Monitor rules is to track network traffic, the system automatically logs end-of connection events for monitored traffic. That is, connections are logged even if the traffic matches no other rules and you do not enable logging on the default action. The action associated with a logged connection is either that of the first non-Monitor rule triggered by the connection, or the default action.

If locally-bound traffic matches a monitor rule in a Layer 3 deployment, that traffic may bypass inspection. To ensure inspection of the traffic, enable **Inspect Local Router Traffic** in the advanced device settings for the managed device routing the traffic.

Block and Block with Reset

The **Block** and **Block with reset** actions deny traffic without further inspection. Block with reset rules also reset the connection. You cannot inspect blocked traffic with a file, intrusion, or network discovery policy.

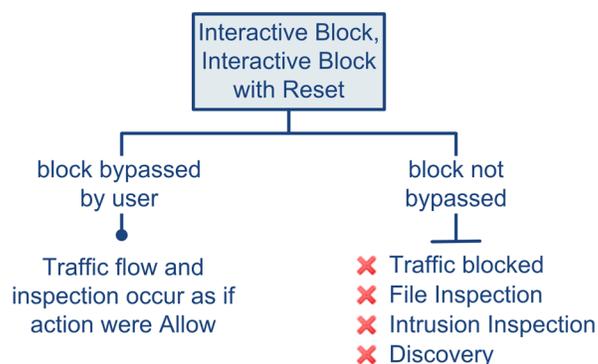

You can log blocked network traffic only at the beginning of connections.

Interactive Block and Interactive Block with Reset

For HTTP traffic, the **Interactive Block** and **Interactive Block with reset** actions give users a chance to bypass a website block, by clicking through a warning page. If a user does not bypass the block, matching traffic is denied without further inspection. Interactive Block with reset rules also reset the connection. For information on configuring the warning page, see [Adding an HTTP Response Page](#) on page 436.

On the other hand, if a user bypasses the block, matching network traffic is treated identically to allowed traffic; see [Allow](#) on page 479. When the system initially blocks a user's HTTP request using an Interactive Block rule, it marks the beginning-of-connection event with the Interactive Block or Interactive Block with

Reset action. If the user clicks through the warning page that the system displays, any additional connection events you log for the session have an action of Allow. Therefore, as with Allow rules, you can associate either type of Interactive Block rule with a file and intrusion policy. The system can also use network discovery to inspect this user-allowed traffic.

Logging options for interactively blocked traffic are identical to those in allowed traffic, but keep in mind that if a user does not bypass the interactive block, the system can log only beginning-of-connection events.

Understanding Rule Conditions and Condition Mechanics

LICENSE: Any

You can add conditions to access control rules to identify the type of traffic that matches the rule. You can add any of seven types of conditions to a rule, either alone or in any combination.

For each condition type, you select conditions you want to add to a rule from a list of available conditions. When applicable, condition filters allow you to constrain available conditions. Lists of available and selected conditions may be as short as a single condition or many pages long. You can search available conditions and display only those matching a typed name or value in a list that updates as you type.

Depending on the type of condition, lists of available conditions may be comprised of a combination of conditions provided directly by Sourcefire or configured using other Sourcefire 3D System features, including objects created using the object manager (**Objects > Object Management**), objects created directly from individual conditions pages, and literal conditions.

See the following sections for information on specifying rule conditions:

- [Understanding Rule Conditions](#) on page 483 defines the different types of rule conditions.
- [Adding Rule Conditions](#) on page 485 describes the controls used to select and add rule conditions.

- [Searching Condition Lists](#) on page 489 explains how to search available conditions and display only those matching a typed name or value in a list that updates as you type.
- [Adding Literal Conditions](#) on page 490 explains how to add literal conditions to a rule.
- [Using Objects in Conditions](#) on page 491 explains how to add individual objects to the system from the configuration pages for relevant condition types.

Understanding Rule Conditions

LICENSE: Any

You can set an access control rule to match traffic meeting any of the conditions described in the following table:

Access Control Rule Condition Types

CONDITION	DESCRIPTION	SUPPORTED DEFENSE CENTERS	SUPPORTED DEVICES
Zones	A configuration of one or more interfaces where you can apply policies. Zones provide a mechanism for classifying traffic on source and destination interfaces, and you can add source and destination zone conditions to rules. See Working with Security Zones on page 187 for information on creating zones using the object manager. See Adding Zone Conditions on page 492 for more information on adding these conditions.	Any	Any
Networks	Any combination of individual IP addresses, CIDR blocks, and prefix lengths, either specified explicitly or using network objects and groups (see Working with Network Objects on page 161). You can add source and destination network conditions to rules. See Adding Network Conditions on page 493 for more information on adding these conditions.	Any	Any
VLAN Tags	A number from 0 to 4094 that identifies traffic on your network by VLAN. See Working with VLAN Tag Objects on page 174 for information on creating individual and group VLAN Tag objects using the object manager. See Adding VLAN Tag Conditions on page 495 for more information on adding these conditions.	Any	Any

Access Control Rule Condition Types (Continued)

CONDITION	DESCRIPTION	SUPPORTED DEFENSE CENTERS	SUPPORTED DEVICES
Users	Individual LDAP users and user groups retrieved from a Microsoft Active Directory Server. See Understanding LDAP Authentication on page 1854 for information on specifying and retrieving the users and groups you want to use for user control. See Adding User Conditions on page 497 for more information on adding these conditions.	Any except DC500	Series 3, virtual
Applications	Applications provided by Sourcefire, user-defined applications, and application filters you create using the object manager. See Working with Application Detectors on page 1663 and Working with Application Filters on page 176 for more information. See Working with Application Conditions on page 498 for more information on adding these conditions.	Any	Series 3, virtual
Ports	Transport protocol ports, including individual and group port objects you create based on transport protocols. See Working with Port Objects on page 173 for information on creating individual and group transport protocol objects using the object manager. See Adding Port Conditions on page 504 for more information on adding these conditions.	Any	Any
URLs	Sourcefire-provided URLs grouped by category and reputation, literal URLs, and any individual and group URL objects you create using the object manager. See Enabling Sourcefire Cloud Communications on page 2032 and Working with URL Objects on page 175 for more information. See Adding URL Conditions on page 506 for more information on adding these conditions.	Any except DC500 (DC500 does support literal URLs, URL objects, and URL object groups)	Series 3, virtual

You can filter traffic that matches one or more types of access control rule conditions, in any combination. The system links multiple conditions of the same type with an OR operation, and links different condition types with an AND operation. For example, if your rule conditions are:

Destination Networks: 10.4.0.0/16, 10.5.0.0/16
VLAN Tags: 11

then, the rule would match traffic going to a host that is in either 10.4.0.0/16 or 10.5.0.0/16 on VLAN 11, such as:

10.1.1.1 to 10.4.12.1 on VLAN 11

or:

192.168.2.1 to 10.5.15.23 on VLAN 11

When you specify multiple conditions in a rule, traffic that matches all conditions of the rule matches the rule. When you do not add any conditions of a particular type to a rule, the system uses the default setting of **any** traffic of that type, which means that the system does not filter traffic based on that condition type.

Note that you can add source and destination zone conditions and source and destination network conditions. For other conditions, where you do not specify source or destination, all traffic is compared to the rule to identify matching traffic.

Adding Rule Conditions

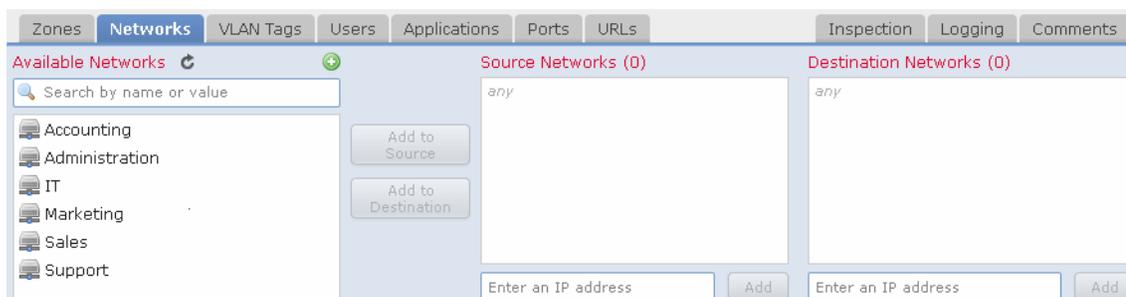

LICENSE: Any

Adding conditions to access control rules is essentially the same for each type of condition. You select from one or two lists of available conditions on the left, and add the selected conditions to one or two lists of selected conditions on the right.

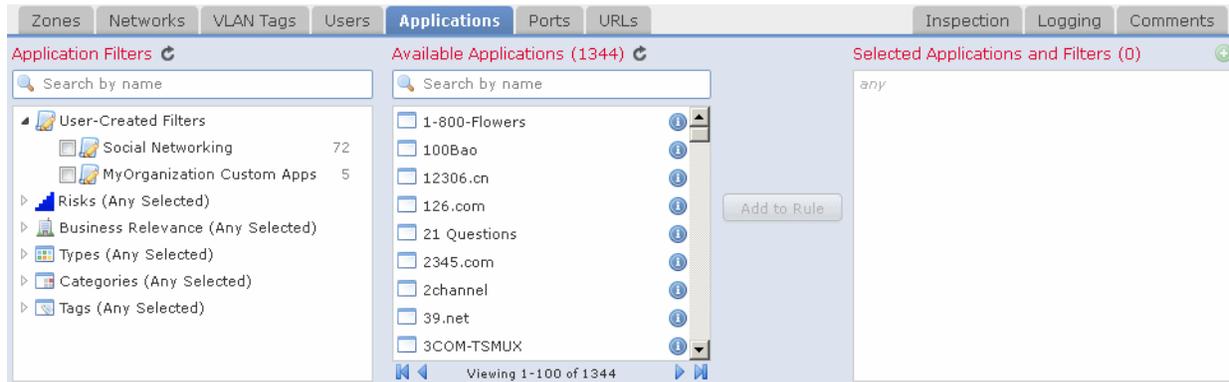

For all condition types, you select one or more individual available conditions by clicking on them to highlight them. For application conditions, you can also select or clear check boxes to constrain the list of available applications using Sourcefire-provided or user-defined filters.

In all cases, you can either click a button between the two types of lists to add available conditions that you select to your lists of selected conditions, or drag and drop available conditions that you select into the list of selected conditions.

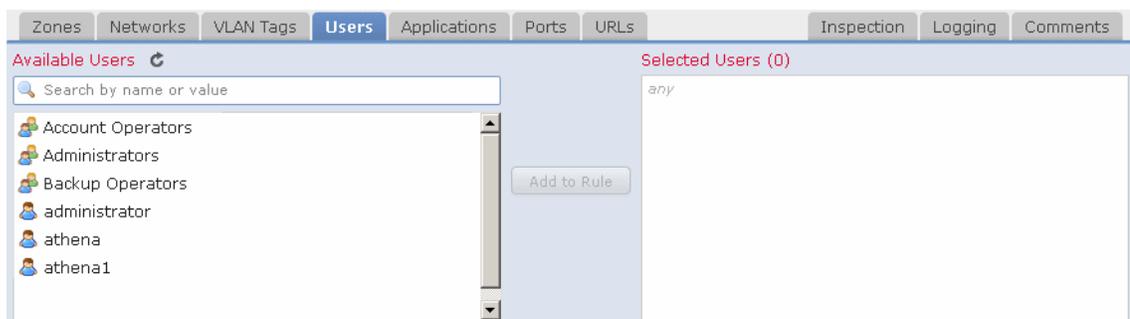

Some pages (Zones, Networks, and Ports) have one list of available conditions on the left, which can be added to either of two lists of selected conditions on the right.

Other pages (Applications and URLs) have two lists of available conditions on the left, which can be used together to select available conditions to add to a single list of selected conditions on the right.

Other pages (VLAN Tags and Users) have one list of available conditions on the left, which can be added to a single list of selected conditions on the right.

You can add up to 50 conditions of each type to a list of selected conditions. For example, you can add up to 50 source zone conditions, up to 50 destination zone filters, up to 50 user conditions, and so on, until you reach the upper limit for the appliance.

Note that when you apply an access control policy to a device, the Defense Center sends each rule defined in the policy to the device as a set of expanded rules, where each rule expresses one possible combination of conditions in the rule. For example, a rule with the Internal security zone as a source zone and LDAP and HTTPS source ports would be sent to the device as two rules: one to match traffic with a source zone of Internal over an LDAP source port, and one to match traffic with a source zone of Internal over an HTTPS source port.

An access control policy with many complex rules may not apply to a managed device if the number of expanded rules exceeds the number allowed for that device. If this occurs, analyze the conditions in your rules to see if you can eliminate unnecessary settings.

When a list of available conditions contains more conditions than can be displayed on a single page, you can use navigation links under the list to switch between pages.

The following table describes the actions you can take to select and add conditions to a rule.

Adding Conditions

To...	You CAN...
select available conditions to add to a list of selected conditions	click the available condition; use the Ctrl and Shift keys to select multiple conditions.
select all listed available conditions	right-click the row for any available condition, then click Select All .
search a list of available conditions or filters	click inside the search field and type a search string. See Searching Condition Lists on page 489 for more information.
clear a search when searching available conditions or filters	click the reload icon () above the search field or the clear icon () in the search field.
add selected conditions from a list of available conditions to a list of selected source or destination conditions	click Add to Source or Add to Destination . You can add zone and network conditions to lists of source and destination conditions. See Adding Zone Conditions on page 492, Adding Network Conditions on page 493, or Adding Port Conditions on page 504 for more information.
add selected conditions from a list of available conditions to a single list of selected conditions	click Add to Rule . VLAN tag, user, application, and URL conditions use single lists of selected conditions.
drag and drop selected available conditions into a list of selected conditions	right-click a selected condition, then drag and drop into the list of selected conditions.
add a literal condition to a list of selected conditions using a literal field	click to remove the prompt from the literal field, type the literal condition, then click Add . Network, VLAN tag, and URL conditions provide a field for adding literal conditions.

Adding Conditions (Continued)

To...	You CAN...
add a literal condition to a list of selected conditions using a drop-down list	select a condition from the drop-down list, then click Add . Port conditions provide a drop-down list for adding literal conditions. See Adding Port Conditions on page 504 for more information.
add an individual object or condition filter so you can then select it from the list of available conditions	click the add icon (). See Using Objects and Security Zones on page 158 for information on adding objects using the object manager.
delete a single condition from a list of selected conditions	click the delete icon () next to the condition
delete a condition from a list of selected conditions	right-click to highlight the row for a selected condition, then click Delete .
delete multiple conditions from a list of selected conditions	use the Shift and Ctrl keys to select multiple conditions, or right-click and Select All ; next, right-click to highlight the row for a selected condition, then click Delete Selected .

Conditions you select are grayed out and can no longer be added to the same list of selected conditions. When you select conditions you have added, the add button is also grayed out. When you select conditions you have not previously added, the add button activates and can be used. In the following example, the 100Bao and 2channel applications have been added and are currently selected. Both the selected applications and the **Add to Rule** button are grayed out.

Similarly, if conditions cannot be used in combination, such as mixed transport protocols for source and destination ports, conditions that are invalid based on previous selections are grayed out.

On the relevant condition page, and also on the policy Edit page, you can hover your pointer over an individual object to display the contents of the object, and over a group object to display the number of individual objects in the group.

The following basic procedure explains how to add conditions to a new rule. See [Creating and Editing Access Control Rules](#) on page 474 for complete instructions on adding and modifying rules.

To add available conditions to a list of selected conditions:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Policies > Access Control**.
The Access Control page appears.
2. Click the edit icon (✎) next to the access control policy you want to modify.
The policy Edit page appears.
3. Click **Add Rule**.
The Add Rule page appears.

4. Click the tab for the type of condition you want to add to the rule.
The conditions page appears for the type of condition you selected.
5. Take any of the available actions in the [Adding Conditions](#) on page 487.
6. Click **Add** to save your configuration.
Your rule is added and the policy Edit page appears.

Searching Condition Lists

LICENSE: Any

You can filter a list of available access control rule conditions and condition categories to limit the number of items displayed in the list. The list updates as you type to display matching items.

Optionally, you can search on object names and on the values configured for objects. For example, if you have an individual network object named *Texas Office* with the configured value *192.168.3.0/24*, and the object is included in the group object *US Offices*, you can display both objects by typing a partial or complete search string such as *Tex*, or by typing a value such as *3*.

The following basic procedure explains how to filter a list in a new rule. See [Creating and Editing Access Control Rules](#) on page 474 for complete instructions on adding and modifying rules.

To search a list of available conditions or condition categories:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Policies > Access Control**.
The Access Control page appears.

2. Click the edit icon (✎) next to the access control policy you want to modify. The policy Edit page appears.
3. Click **Add Rule**.
The Add Rule page appears. The following graphic shows the search field on the Networks conditions page.

4. To search a list, click inside the search field to clear the prompt, then type a search string.
The list updates as you type to display matching items and a clear list icon (✕) appears in the search field. The list updates and no items are listed when none match the search string.
5. Optionally, click the reload icon (↻) above the search field or click the clear icon (✕) in the search field to clear the search string.
The complete list appears.
6. Click **Add** to save your configuration.
Your rule is added and the policy Edit page appears.

Adding Literal Conditions

LICENSE: Any

You can add a literal value to the list of selected conditions for the following condition types:

- Networks
- VLAN Tags
- Ports
- URLs

For all but port conditions, you type the literal value in a configuration field below the list of selected conditions.

In the case of port conditions, you select a protocol from a drop-down list. When the protocol is **A11** (for destination ports) and, optionally, when the protocol is **TCP** or **UDP**, you type a port number in a configuration field. When the protocol is **ICMP** or **IPV6-ICMP**, you select a type and, if appropriate, a related code. When you add a source port, the protocol defaults to **TCP**. You must specify a protocol when setting a literal port.

Each relevant conditions page provides the controls needed to add literal values. Values you type in a configuration field appear as red text if the value is invalid, or until it is recognized as valid. Typed values change to black text as you type when they are recognized as valid. A grayed **Add** button activates when a valid value is

recognized. Literal values you add appear immediately in the list of selected conditions.

See the following sections for specific details on adding each type of literal value:

- [Adding Network Conditions](#) on page 493
- [Adding VLAN Tag Conditions](#) on page 495
- [Adding Port Conditions](#) on page 504
- [Adding URL Conditions](#) on page 506

Using Objects in Conditions

LICENSE: Any

Application filters and objects that you create in the object manager (**Objects > Object Management**) are immediately available for you to select from relevant lists of available access control rule conditions. See [Using Objects and Security Zones](#) on page 158 for information.

You can also create many objects on-the-fly from the access control policy. A control on relevant conditions pages provides access to the same configuration controls that you use in the object manager.

Individual objects created on-the-fly appear immediately in the list of available objects, and you can add them to the current rule, and to other existing and future rules. On the relevant conditions page, and also on the policy Edit page, you can hover your pointer over an individual object to display the contents of the object, and over a group object to display the number of individual objects in the group.

Working with Different Types of Conditions

LICENSE: Any

You can filter traffic by one or more of seven types of rule conditions, in any combination. See the following sections for more information:

- [Adding Zone Conditions](#) on page 492 explains how to filter traffic by security zones that you create using the object manager.
- [Adding Network Conditions](#) on page 493 explains how to filter traffic by IP address or address block.
- [Adding VLAN Tag Conditions](#) on page 495 explains how to filter traffic by VLAN tag.
- [Adding User Conditions](#) on page 497 explains how to filter traffic by users and user groups retrieved from a Microsoft Active Directory Server.
- [Working with Application Conditions](#) on page 498 explains how to filter traffic based on a predefined list of applications provided by Sourcefire, custom applications, and application filters you create using the object manager.

- [Adding Port Conditions](#) on page 504 explains how to filter traffic by specified transport protocol ports.
- [Adding URL Conditions](#) on page 506 explains how to filter traffic by URL, including by statistics such as reputation and category.

Adding Zone Conditions

LICENSE: Any

The security zones on your system are comprised of interfaces on your managed devices. Zones that you add to an access control rule target the rule to devices on your network that have interfaces in those zones. You can add security zones as conditions for access control rules. See [Working with Security Zones](#) on page 187 for information on creating security zones using the object manager.

Keep the following important points in mind when you filter traffic by zone:

- All zones in a rule must be of the same type (switched, routed, and so on).
- You can add a passive zone only as a source zone.
- The warning icon (⚠) next to a zone in the list of available zones indicates that the zone does not include an interface. When you hover your pointer over the icon, a message explains that the zone must include at least one interface for the rule to take effect. See [Working with Security Zones](#) on page 187.

IMPORTANT! In a Layer 2 deployment, you cannot block egress traffic based on destination network or destination security zone. You must instead write access control rules that block ingress traffic based on blocking source network or source security zone. For more information on Layer 2 deployments, see [Setting Up Virtual Switches](#) on page 281.

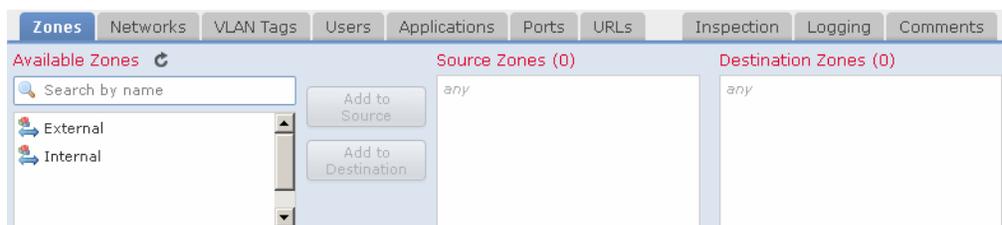

The following procedure explains how to add source and destination zone conditions while adding or editing an access control rule. See [Understanding Rule Conditions and Condition Mechanics](#) on page 482 for more detailed information.

To add zone conditions to an access control rule:

ACCESS: Admin/Access Admin/Network Admin

1. Select the **Zones** tab on the rule Edit page.

The Zones page appears.

2. Optionally, click the **Search by name** prompt above the Available Zones list, then type a name or value.

The list updates as you type to display matching conditions. See [Searching Condition Lists](#) on page 489 for more information.

3. Click a condition in the Available Zones list. Use the Shift and Ctrl keys to select multiple conditions, or right-click and then click **Select All**.

Conditions you select are highlighted.

The warning icon (⚠) next to a zone indicates that the rule will not take effect because the zone does not include an interface. See [Working with Security Zones](#) on page 187.

4. You have the following choices:

- To filter traffic by source zone, click **Add to Source**.
- To filter traffic by destination zone, click **Add to Destination**.

Optionally, you can drag and drop selected conditions into the Source Zones or Destination Zones list.

Selected conditions are added. Note that you can add the same condition as both a source zone and a destination zone.

5. Save or continue editing the rule.

You must apply the access control policy for your changes to take effect; see [Applying an Access Control Policy](#) on page 466.

Adding Network Conditions

LICENSE: Any

You can add any of the following kinds of network conditions to an access control rule:

- individual and group network objects that you have created using the object manager

See [Working with Network Objects](#) on page 161 for information on creating individual and group network objects using the object manager.

- individual network objects that you add from the Network conditions page, and can then add to your rule and to other existing and future rules
See [Using Objects in Conditions](#) on page 491 for more information.
- literal, single IP addresses or address blocks
See [Adding Literal Conditions](#) on page 490 for more information.

IMPORTANT! In a Layer 2 deployment, you cannot block egress traffic based on destination network or destination security zone. You must instead write access control rules that block ingress traffic based on source network or source security zone. For more information on Layer 2 deployments, see [Setting Up Virtual Switches](#) on page 281.

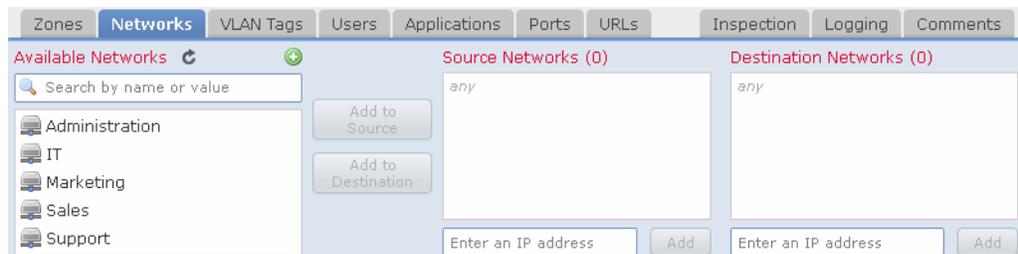

If you add rules to an access control policy that contain conditions matching destination IPv6 traffic, add an Allow rule with port conditions specifying traffic using the IPv6 Neighbor Discovery Protocol (ICMPv6 types 135 and 136) before those rules. For more information on port conditions, see [Adding Port Conditions](#) on page 504.

The following procedure explains how to add source and destination network conditions while adding or editing an access control rule. See [Understanding Rule Conditions and Condition Mechanics](#) on page 482 for more detailed information.

To add network conditions to an access control rule:

ACCESS: Admin/Access Admin/Network Admin

1. Select the **Networks** tab on the rule Edit page.
The Networks page appears.

2. Optionally, click the **Search by name or value** prompt above the **Available Networks** list, then type a name or value.
The list updates as you type to display matching conditions. See [Searching Condition Lists](#) on page 489 for more information.
3. Click a condition in the **Available Networks** list. Use the Shift and Ctrl keys to select multiple conditions, or right-click and then click **Select All**.
Conditions you select are highlighted.

4. You have the following choices:
 - To filter traffic by source network, click **Add to Source**.
 - To filter traffic by destination network, click **Add to Destination**.

Alternatively, you can drag and drop selected conditions into the **Source Networks** or **Destination Networks** list.

Conditions you selected are added. Note that you can add the same condition as both a source network and a destination network.

5. Optionally, click the add icon () above the Available Networks list to add an individual network object.

You can add multiple IP addresses, CIDR blocks, and prefix lengths to each network object. Optionally, you can then select the object you added. See [Working with Network Objects](#) on page 161 and [Using Objects in Conditions](#) on page 491 for more information.

6. Optionally, click the **Enter an IP address** prompt below the **Source Networks** or **Destination Networks** list; then type an IP address or address block and click **Add**.

The list updates to display your entry. See [Adding Literal Conditions](#) on page 490 for more information.

7. Save or continue editing the rule.

You must apply the access control policy for your changes to take effect; see [Applying an Access Control Policy](#) on page 466.

Adding VLAN Tag Conditions

LICENSE: Any

You can add any of the following kinds of VLAN tag conditions to an access control rule:

- individual and group VLAN tag objects that you have created using the object manager
See [Working with Network Objects](#) on page 161 for information creating individual and group VLAN tag objects using the object manager.
- individual VLAN tag objects that you add from the VLAN Tags conditions page, and can then add to your rule and to other existing and future rules
See [Using Objects in Conditions](#) on page 491 for more information.
- literal VLAN tag conditions
See [Adding Literal Conditions](#) on page 490 for more information.

The system inspects all traffic on your network for VLAN tags you specify, and uses the innermost VLAN tag to identify a packet by VLAN.

The following procedure explains how to add VLAN conditions while adding or editing an access control rule. See [Understanding Rule Conditions and Condition](#)

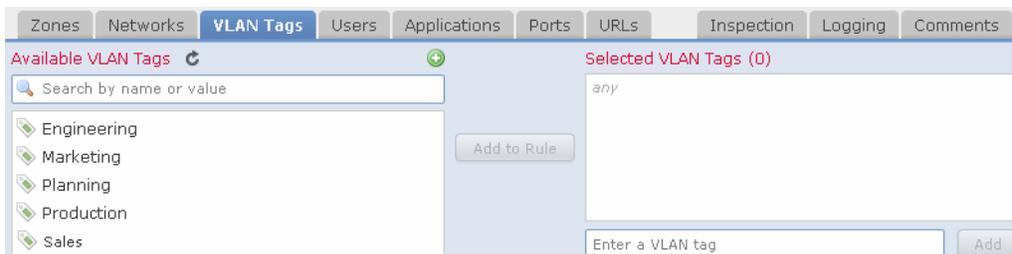

[Mechanics](#) on page 482 for more detailed information.

To add VLAN tag conditions to an access control rule:

ACCESS: Admin/Access Admin/Network Admin

1. Select the **VLAN Tags** tab on the rule Edit page.

The VLAN Tags page appears.

2. Optionally, click the **Search by name or value** prompt above the Available VLAN Tags list, then type a name or value.

The list updates as you type to display matching conditions. See [Searching Condition Lists](#) on page 489 for more information.

3. Click a condition in the Available VLAN Tags list. Use the Shift and Ctrl keys to select multiple conditions, or right-click, then click **Select All**.

Conditions you select are highlighted.

4. You have the following choices:

- Click **Add to Rule**.
- Drag and drop selected conditions into the Selected VLAN Tags list.

Conditions you selected are added.

5. Optionally, click the add icon (+) above the Available VLAN Tags list to add a VLAN tag object.

In each VLAN tag object you add, you can specify any VLAN tag from 1 to 4094; use a hyphen to specify a range of VLAN tags. You can then select the object you added. See [Working with VLAN Tag Objects](#) on page 174 and [Using Objects in Conditions](#) on page 491 for more information.

6. Optionally, click the **Enter a VLAN Tag** prompt beneath the Selected VLAN Tags list, type a VLAN tag or range, then click **Add**.

You can specify any VLAN tag from 1 to 4094. Use a hyphen to specify a range of VLAN tags.

The list updates to display your entry. See [Adding Literal Conditions](#) on page 490 for more information.

7. Save or continue editing the rule.

You must apply the access control policy for your changes to take effect; see [Applying an Access Control Policy](#) on page 466.

Adding User Conditions

LICENSE: Control

SUPPORTED DEVICES: Series 3, virtual

SUPPORTED DEFENSE CENTERS: Any except DC500

You can configure access control rules to match traffic for users and user groups retrieved from a Microsoft Active Directory Server.

Before you can write access control rules with user conditions, you must configure a connection between the Defense Center and at least one of your organization's Microsoft Active Directory servers. This configuration, called an authentication object, contains connection settings and authentication filter settings for the server. It also specifies the users and groups you can use in user conditions. For more information, see [Creating LDAP Connections with the Defense Center](#) on page 1298.

In addition, you must install Sourcefire User Agents, which you install on your Microsoft Active Directory Servers. The agents monitor users when they authenticate against Active Directory credentials, and send records of those logins to the Defense Center. These records associate users with IP addresses, which is what allows access control rules with user conditions to trigger. For more information, see [Configuring Defense Center-User Agent Connections](#) on page 1307.

Keep in mind that if you specify a group, that automatically includes all of the group's members, including members of any sub-groups, with the exception of individually excluded users and members of excluded sub-groups.

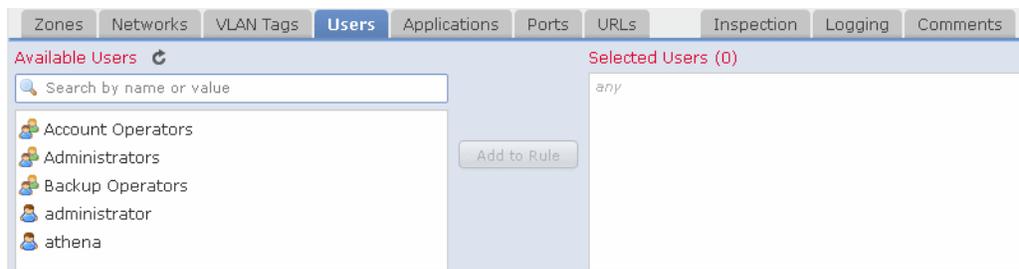

WARNING! If you configure user awareness parameters that include a very large number of user groups, or if you have a very large number of users mapped to hosts on your network, the system may drop user mappings based on groups, due to memory limitations. As a result, access control rules based on user groups may not fire as expected.

The following procedure explains how to add user conditions while adding or editing an access control rule. See [Understanding Rule Conditions and Condition Mechanics](#) on page 482 for more detailed information.

To add user conditions to an access control rule:

ACCESS: Admin/Access Admin/Network Admin

1. Select the **Users** tab on the rule Edit page.
The Users page appears.

2. Optionally, click the **Search by name or value** prompt above the Available Users list, then type a name or value.
The list updates as you type to display matching conditions. See [Searching Condition Lists](#) on page 489 for more information.
3. Click a condition in the Available Users list. Use the Shift and Ctrl keys to select multiple conditions, or right-click and then click **Select All**.
Conditions you select are highlighted.
4. You have the following choices:
 - Click **Add to Rule**.
 - Drag and drop selected conditions into the Selected Users list.Conditions you selected are added.
5. Save or continue editing the rule.
You must apply the access control policy for your changes to take effect; see [Applying an Access Control Policy](#) on page 466.

Working with Application Conditions

LICENSE: Control

SUPPORTED DEVICES: Series 3, virtual

You can configure access control rules to match application traffic. You can use either individual applications or application filters, either Sourcefire-provided and user-defined, as conditions for an access control rule. You can add applications and filters, in any combination, as long as the total number of items does not exceed 50. If the existing filters do not meet your needs, you can create an application filter on the fly while creating an application condition; you can then

use the new filter in your rule and in other existing and future rules. See the following sections for more details:

- For information on Sourcefire-provided and user-defined applications, see [Understanding Application Detection](#) on page 1263 and [Working with Application Detectors](#) on page 1663.
- For information on Sourcefire-provided and user-defined application filters, see [Working with Application Filters](#) on page 176.
- For information on adding an application filter on the fly, see [Using Objects in Conditions](#) on page 491.

Note the following when adding applications:

- The system applies the default policy action to packets that do not have a payload in a connection where an application is identified; this would be the case, for example, when a TCP connection is being established.
- It is not possible to identify applications or filter URLs before a connection is established between the client and the server. Therefore, when a packet matches all the other conditions in a rule containing an application or a URL, if application identification has not been completed, the packet is allowed to pass. This behavior allows a connection to be established so that applications can be identified.
- At least one detector must be enabled (see [Activating and Deactivating Detectors](#) on page 1678) for each application rule condition in the policy. If no detector is enabled for an application, the system automatically enables all Sourcefire-provided detectors for the application; if none exist, the system enables the most recently modified user-defined detector for the application. See [Applying an Access Control Policy](#) on page 466.

See the following sections for more information:

- [Understanding Application Condition Lists](#) on page 499
- [Adding Application Conditions](#) on page 501

Understanding Application Condition Lists

LICENSE: Control

SUPPORTED DEVICES: Series 3, virtual

The Applications conditions page displays three lists:

- The *Application Filters* list on the left displays filters that you can select to constrain the applications listed in the Available Applications list.
- The *Available Applications* list in the middle provides applications from which you can select those you want to add as conditions to your rule.
- The *Selected Applications* list on the right displays the applications that you have added to your rule.

Note the following when selecting the filters in the Application Filters list whose applications you want to display in the Available Applications list:

- You can select multiple filters in the Application Filters list under any combination of filter types provided by Sourcefire.

The system links multiple filters of the same filter type with an OR operation. For example, if you select the Medium and High filters under the Risks type, the resulting filter is:

Risk: Medium OR High

If, for example, the Medium filter contained 110 applications and the High filter contained 82 applications, the system would display all 192 applications in the Available Applications list.

The system links different types of filters with an AND operation. For example, if you select the Medium and High filters under the Risks type, and the Medium and High filters under the Business Relevance type, the resulting filter is:

Risk: Medium OR High

AND

Business Relevance: Medium OR High

In this case, the system would display only those applications that are included in both the Medium or High Risk type AND the Medium or High Business Relevance type.

- You cannot select a custom filter in the Application Filters list in combination with another filter, including another custom filter; this is because you cannot add a filter to a custom filter.
- Selecting one or more filters in the Application Filters list adds an **All apps matching the filter** condition to the Available Applications list. Likewise, searching the Available Applications list when you have not selected any filter in the Application Filters list also adds an **All apps matching the filter** condition to the Available Applications list. If you select one or more filters in the Application Filters list and also search the Available Applications list, your selections and the search-filtered Available Applications list are

combined using an AND operation. That is, the **All apps matching the filter** condition includes all the individual conditions currently displayed in the Available Applications list as well as the search string entered above the Available Applications list.

Adding the **All apps matching the filter** condition to the Selected Applications and Filters list counts as one condition against the maximum of 50 conditions, regardless of the number of individual conditions that comprise it.

When you add **All apps matching the filter**, the name of the filter you add is a concatenation of the filter types represented in the filter plus the names of up to three filters for each type. More than three filters of the same type are followed by an ellipsis (...). For example, the following filter name includes two filters under the Risks type and four under Business Relevance:

Risks: Medium, High Business Relevance: Low, Medium, High,...

Filter types that are not represented in a filter you add with **All apps matching the filter** are not included in the name of the filter you add. The instructional text that is displayed when you hover over the filter name in the Selected Applications and Filters list indicates that these filter types are set to *any*; that is, these filter types do not constrain the filter, so any value is allowed for these.

You can add multiple instances of **All apps matching the filter**. For example, add **All apps matching the filter** for the first filter (for example, Risks, High), clear all your selections and make new selections for a different filter type (for example, Business Relevance, High) then add **All apps matching the filter** again.

- When you apply your access control policy, the system generates a single list of unique applications that you have added to the Selected Applications list. This eliminates any duplicate application conditions that you might add.

Adding Application Conditions

LICENSE: Control

SUPPORTED DEVICES: Series 3, virtual

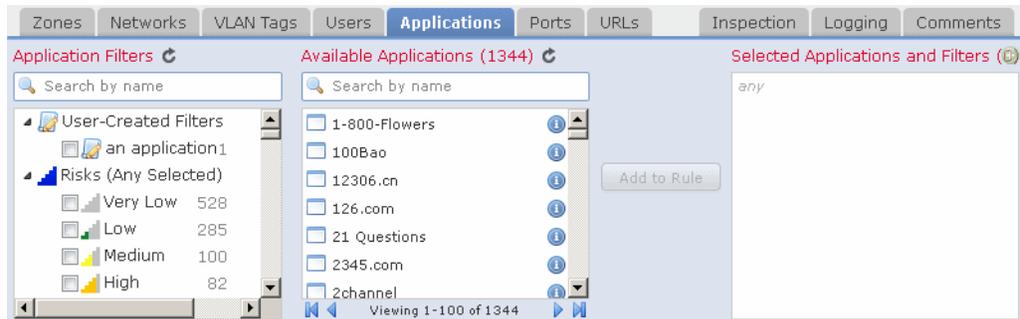

The following procedure explains how to add application conditions while adding or editing an access control rule. See [Understanding Rule Conditions and Condition Mechanics](#) on page 482 for more detailed information.

To add application conditions to an access control rule:

ACCESS: Admin/Access Admin/Network Admin

1. Select the **Applications** tab.

The Applications page appears.

2. Optionally, click the **Search by name** prompt above the Applications Filters list or the Available Applications list, then type a name.

The list updates as you type to display matching conditions. See [Searching Condition Lists](#) on page 489 for more information.

Note that selecting a custom application filter disables the search fields; this is because you cannot add a filter to a selected custom filter.

3. Optionally, constrain the list of applications displayed in the Available Applications list. You have the following choices:
 - Click the arrow next to a filter type to expand it, then select or clear the check box next to each filter whose applications you want to display or hide.

Note that a number beside each filter indicates the number of applications in the filter.
 - Right-click a Sourcefire-provided filter type (Risks, Business Relevance, Types, Categories, or Tags) and click **Check All** or **Uncheck All**. For more information on Sourcefire-provided filter types, see [the Application Characteristics table](#) on page 1264.

The Available Applications list updates in the following ways:

- The list includes the applications in currently selected filters.
 - An **All apps matching the filter** selection appears; this available condition includes all applications and filters currently displayed in the Available Applications list.

Note that you cannot select or add individual applications in combination with **All apps matching the filter**; note also that, although you can add each separately, doing so will result in duplicate rule conditions. The system reduces duplicate conditions to a single condition when you apply your access control policy.
 - A number above the Available Applications list indicates the number of applications in the currently displayed list.
4. Optionally, click the information icon () next to an application in the Available Applications list.

A pop-up window appears with summary information about the application. You have the following choices:

- To display additional information, click any of the Internet search links provided.
 - To exit the pop-up window and return to the Applications page, click the close icon () or click another location within the Available Applications list.
5. Click an application in the Available Applications list. Use the Shift and Ctrl keys to select multiple applications, or right-click to select all currently displayed applications. Note that you can add a maximum of 50 conditions.
 6. You have the following choices:
 - Click **Add to Rule**.
 - Drag and drop selected conditions into the Selected Applications and Filters list.

Selected conditions are added. Filters appear under the heading *Filters*, and applications appear under the heading *Applications*.

7. Optionally, click the add icon (⊕) above the Selected Applications and Filters list to add a custom filter comprised of all the individual applications and filters currently in the Selected Applications and Filters list.

Custom filters you create from the Applications conditions page or using the object manager appear under the *User-Created Filters* heading in the Application Filters list.

See [Working with Application Filters](#) on page 176 for information on adding application filters using the object manager. See [Using Objects in Conditions](#) on page 491 for information on adding filters from conditions pages.

8. Save or continue editing the rule.

You must apply the access control policy for your changes to take effect; see [Applying an Access Control Policy](#) on page 466.

Adding Port Conditions

LICENSE: Any

Add a port condition to a rule to match network traffic based on the source and destination port and transport protocol. You can add any of the following kinds of port conditions to an access control rule:

- individual and group port objects that you have created using the object manager
See [Working with Port Objects](#) on page 173 for information on creating individual and group port objects using the object manager.
- individual port objects that you add from the Ports conditions page, and can then add to your rule and to other existing and future rules
See [Using Objects in Conditions](#) on page 491 for more information.
- literal port values, consisting of a transport protocol, a port, or both (for some transport protocol selections)
See [Adding Literal Conditions](#) on page 490 for more information.

The following procedure explains how to add port conditions while adding or editing an access control rule. See [Understanding Rule Conditions and Condition Mechanics](#) on page 482 for more detailed information.

Note that when you add a destination ICMP port with the type set to 0 or a destination ICMPv6 port with the type set to 129, the access control rule only matches unsolicited echo replies. ICMP echo replies sent in response to ICMP echo requests are ignored. For a rule to match on any ICMP echo, use ICMP type 8 or ICMPv6 type 128.

When you select an ICMP or ICMPv6 type for a port, you can only select a relevant code for the port. For more information on ICMP types and codes, see <http://www.iana.org/assignments/icmp-parameters/icmp-parameters.xml> and <http://www.iana.org/assignments/icmpv6-parameters/icmpv6-parameters.xml>.

When you add both source and destination ports to a rule, you can only add port objects or port literals that share a single transport protocol (TCP or UDP) for all ports in the rule. After you add a port to the Selected Source Ports list, you can only add subsequent ports using the same protocol (TCP or UDP) to either port list. Similarly, after you add a destination port, any additional source or destination port you add must have the same protocol. For example, after you add DNS over TCP as a source port, you can add Yahoo Messenger Voice Chat (TCP) as a destination port but not Yahoo Messenger Voice Chat (UDP).

If you add only source ports to a rule, you can add ports that use different transport protocols. For example, if a rule has no destination ports, you can add both DNS over TCP and DNS over UDP to the rule. Similarly, if you add only destination ports, you can add destination port literals or port objects using different transport protocols. After you add ports using both protocols to the Selected Source Ports list, you cannot add any ports to the Selected Destination Ports list, and vice versa.

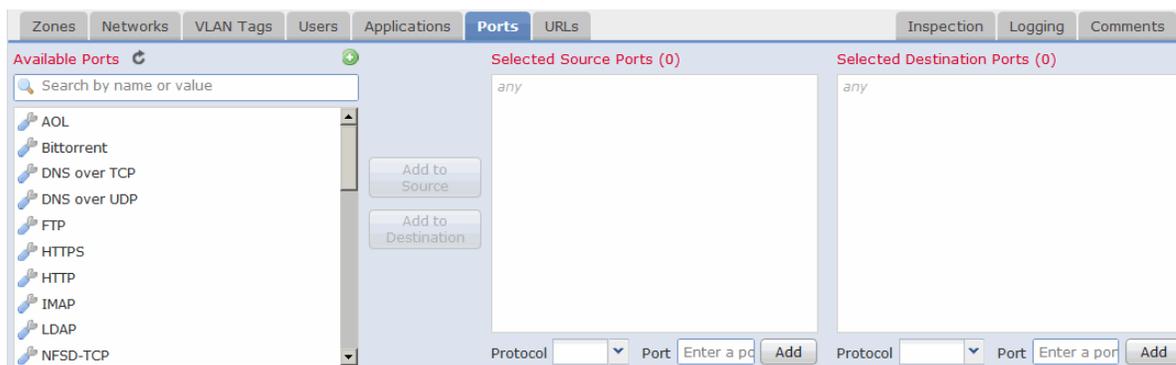

Note that you cannot add a port object or port object group containing a port with a protocol that is invalid for the context. For example, you cannot add an ICMP port object as a source port. If you add a port with an invalid protocol to a port object group already in a rule, a warning displays next to the rule. If you add both source and destination ports, the rule editor requires that all port objects and groups match the protocol specified in the first literal port created in the rule. See [Working with Warnings and Errors](#) on page 455 for more information on how the system omits invalid configurations from the access control policies applied to target devices.

To add port conditions to an access control rule:

ACCESS: Admin/Access Admin/Network Admin

1. Select the **Ports** tab on the rule Edit page.

The Ports page appears.

2. Optionally, click the **Search by name or value** prompt above the Available Ports list, then type a name or value.

The list updates as you type to display matching conditions. See [Searching Condition Lists](#) on page 489 for more information.

3. Click a condition in the Available Ports list. Use the Shift and Ctrl keys to select multiple conditions, or right-click to select all conditions. Note that you can add a maximum of 50 conditions.
Conditions you select are highlighted.
4. You have the following choices:
 - Click **Add to Source** to add the selected port to the Source Ports list.
 - Click **Add to Destination** to add the selected port to the Destination Ports list.
 - Drag and drop available ports into a list.
5. Optionally, to create and add an individual port object click the add icon () above the Available Ports list.
You can identify a single port in each port object that you add. You can then select objects you added as conditions for your rule. See [Working with Port Objects](#) on page 173 and [Using Objects in Conditions](#) on page 491 for more information.
6. Optionally, to add a literal port select an entry from the **Protocol** drop-down list beneath the Selected Source Ports or Selected Destination Ports list.
If you select **TCP**, **UDP** or, for destination ports, **All**, enter a port, if needed; then click **Add**. For destination ports, if you select **ICMP** or **IPv6-ICMP**, a pop-up window appears where you select a type and a related code, if needed, then click **Add**. You can specify a single port with a value from 0 to 65535.
Conditions you selected are added, as long as you add ports with protocols that do not conflict with ports already added.
7. Save or continue editing the rule.
You must apply the access control policy for your changes to take effect; see [Applying an Access Control Policy](#) on page 466.

Adding URL Conditions

LICENSE: URL Filtering

SUPPORTED DEVICES: Series 3, virtual

SUPPORTED DEFENSE CENTERS: feature dependent

The Sourcefire 3D System allows you to write access control rules that determine the traffic that can traverse your network based on URLs requested by monitored hosts, correlated with information about those URLs, which is obtained from the Sourcefire cloud by the Defense Center. This feature is called *URL filtering*.

Without a URL Filtering license, you can specify individual URLs or groups of URLs to allow or block. However, before you can perform category and reputation-based URL filtering, you must not only enable URL Filtering licenses on your target devices, but also explicitly allow the Defense Center to contact the Sourcefire cloud. Note that neither the DC500 Defense Center nor Series 2

devices support URL filtering using category and reputation data, and Series 2 devices do not support specifying individual URLs or URL groups. For more information on URL filtering prerequisites, see [Enabling Sourcefire Cloud Communications](#) on page 2032.

Using URL Category and Reputation Data

When the Defense Center contacts the Sourcefire cloud, it retrieves data on many commonly visited URLs, and saves that data to local databases on your appliances. Each of these URLs has an associated category and reputation:

- The URL *category* is a general classification for the URL. For example, ebay.com belongs to the **Auctions** category, and monster.com belongs to the **Job Search** category. A URL can belong to more than one category.
- The URL *reputation* represents how likely the URL is to be used for purposes that might be against your organization's security policy. A URL's risk can range from **High risk** (level 1) to **Well known** (level 5).

URL categories and reputations allow you to quickly create URL conditions for access control rules; these rules can group and combine URL categories and risks. For example, you could create a URL condition that blocks all **High risk** URLs in the **Abused Drugs** category. Then, if someone on your monitored network attempts to browse to any URL with that category and reputation, the session is blocked.

IMPORTANT! To display URL category and reputation data for URLs in connection logs, intrusion events, and application details, you must create at least one access control rule with a URL condition.

Note that if the cloud does not know the category or reputation of a URL, or if the Defense Center cannot contact the cloud, the URL does **not** trigger access control rules with category or reputation-based URL conditions. You cannot assign categories or reputations to URLs manually.

Also, the system cannot filter URLs before a connection is established between the client and the server. Therefore, when a packet matches all the other conditions in a rule containing a URL condition, if URL identification has not been completed, the packet is allowed to pass. This behavior allows a connection to be established so that URLs can be identified.

When creating a URL condition, selecting a reputation level behaves differently depending on the rule action:

- If you want the rule to block traffic (the rule action is **Block**, **Block with reset**, **Interactive Block**, or **Interactive Block with reset**) selecting a reputation level also selects all reputations more severe than that level. For example, if you configure a rule to block **Suspicious sites** (level 2), it also automatically blocks **High risk** (level 1) sites.
- If you want the rule to allow traffic (the rule action is **Allow**, **Trust**, or **Monitor**), selecting a reputation level also selects all reputations better than that level. For example, if you configure a rule to allow **Benign sites** (level 4), it also automatically allows **Well known** (level 5) sites.

If you change the rule action for a rule, the system automatically changes the reputation levels in URL conditions according to the above points. If you do not specify a reputation level, the system defaults to **any**, meaning all levels. For example, you could block all malware sites, regardless of reputation. You can also use **any** to represent any category. For example, you could block all URLs that match **any** category, but have a **High risk** reputation.

Using Literal URLs, URL Objects, and URL Groups

You are not limited to creating URL conditions using categories and reputations; you can specify individual URLs or groups of URLs to achieve more granular, custom control over allowed and blocked URLs. This is also the only kind of URL filtering you can perform without a special license. You can add either of the following kinds of URL conditions to an access control rule:

- individual URL objects and URL object groups, which represent individual URLs and groups of URLs, respectively; see [Working with URL Objects](#) on page 175

Unlike URL categories, you cannot qualify URL objects and groups with reputations. If the existing URL objects do not meet your needs, you can create a URL object on the fly while creating a URL condition. You can then use the new object in your rule and in other existing and future rules. For more information, see [Using Objects in Conditions](#) on page 491.

- literal URLs; see [Adding Literal Conditions](#) on page 490 for more information

Unlike creating a URL object on the fly, adding a literal URL to an access control rule does not allow you to reuse the URL in other rules.

To determine whether network traffic matches a URL condition, the system performs a simple substring match. If the value of a URL object or literal URL matches any part of a URL requested by a monitored host, the URL condition of

the access control rule is satisfied. For example, if you allow all traffic to example.com, your users could browse to URLs including:

- http://example.com/
- http://example.com/newexample
- http://www.example.com/

This means that when specifying individual URLs in URL conditions, you must carefully consider other traffic that might be affected. For example, consider a scenario where you want to explicitly block ign.com (a gaming site). However, substring matching means that blocking *ign.com* also blocks *verisign.com*, which might not be your intent.

Note that to block HTTPS traffic, you can enter the common name from the Secure Sockets Layer (SSL) certificate for the traffic. When entering a URL from a certificate, enter the domain name and omit subdomain information. (For example, type `example.com` rather than `www.example.com`.) If you block traffic based on the certificate URL, both HTTP and HTTPS traffic to that website are blocked.

Choosing a URL Filtering Strategy

When deciding how to build a URL condition, keep in mind that although using URL literals, objects, and groups gives you precise control over allowed and blocked URLs, you must be careful to make sure that your rules do not have unintended consequences.

Alternately, relying on category and reputation data from the Sourcefire cloud gives you less precise control, but simplifies policy creation and administration. It also grants you more assurance that the system will filter URLs as expected. More important, because the cloud is continually updated with new URLs, as well as new categories and risks for existing URLs, using the cloud ensures that the system uses up-to-date information to filter requested URLs. Malicious sites that represent security threats such as malware, spam, botnets, and phishing may appear and disappear faster than you can update and apply new policies.

For example:

- If a rule blocks all gaming sites, as new domains get registered and classified as **Gaming**, the system can block those sites automatically.
- If a rule blocks all malware, and a blog page gets infected with malware, the cloud can recategorize the URL from **Blog** to **Malware** and the system can block that site.
- If a rule blocks high-risk social networking sites, and somebody posts a link on their profile page that contains links to malicious payloads, the cloud can change the reputation of that page from **Benign sites** to **High risk** so the system can block it.

Search Query Parameters in URLs

Note that the system does not use search query parameters in the URL to match URL conditions. For example, consider a scenario where you block all shopping traffic. In that case, using a web search to search for amazon.com is not blocked, but browsing to amazon.com is.

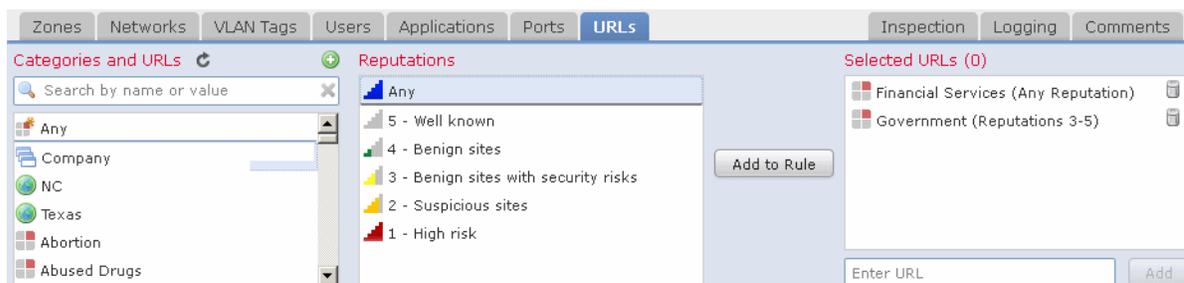

The following procedure explains how to add URL conditions to an access control rule while adding or editing the rule. See [Understanding Rule Conditions and Condition Mechanics](#) on page 482 for more detailed information.

To add URL conditions to an access control rule:

ACCESS: Admin/Access Admin/Network Admin

1. Select the **URLs** tab.

The URLs page appears.

2. Optionally, click the **Search by name or value** prompt above the Available Users list, then type a name or value.

The list updates as you type to display matching conditions. See [Searching Condition Lists](#) on page 489 for more information.

3. Click a condition in the Categories and URLs list to select the condition. Use the Shift and Ctrl keys to select multiple conditions. To clear selected conditions, click any condition in the list.

Note that selecting all conditions in the Categories and URLs list exceeds the maximum of 50 items you can add to the Selected URLs list.

Conditions you select are highlighted.

4. Optionally, click a reputation level in the Reputations window. Note that you can select only a single reputation level even though you can right-click and then click **Select All** to select **Any**.

The level you selected is highlighted.

5. You have the following choices:

- Click **Add to Rule**.
- Drag and drop selected conditions into the Selected URLs list.

Conditions you selected are added with selected reputation levels appended.

6. Optionally, click the add icon () above the Categories and URLs list to add an individual URL object.
You can specify a single URL in each individual URL object you add. You can then select objects you added as conditions for your rule. See [Working with URL Objects](#) on page 175 and [Using Objects in Conditions](#) on page 491 for more information.
7. Optionally, click the **Enter URL** prompt beneath the Selected URLs list, type a literal URL, then click **Add**.
The list updates to display your entry. See [Adding Literal Conditions](#) on page 490 for more information.
Note that you cannot specify a reputation level for a literal URL.
8. Save or continue editing the rule.
You must apply the access control policy for your changes to take effect; see [Applying an Access Control Policy](#) on page 466.

Performing File and Intrusion Inspection on Allowed Traffic

LICENSE: Protection or Malware

SUPPORTED DEVICES: feature dependent

SUPPORTED DEFENSE CENTERS: feature dependent

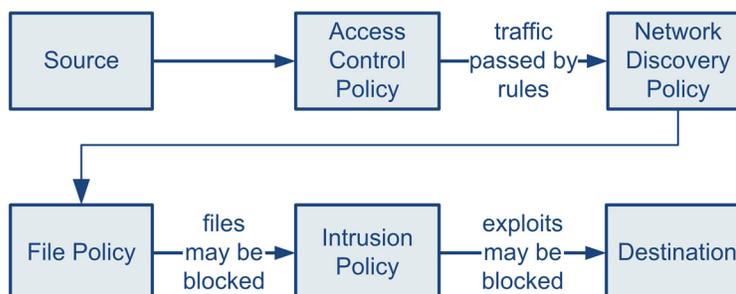

In addition to handling traffic matching the conditions in an access control rule, you can perform further inspection on allowed traffic by associating the rule with an intrusion or file policy.

When you make this association, you are telling the system that before it passes traffic that matches the access control rule's conditions, you first want to inspect the traffic with an intrusion policy, a file policy, or both. Depending on your deployment and on policy configurations, both intrusion and file policies can prevent network traffic from reaching its intended destination.

As shown in the diagram below, for traffic that matches an Allow or user-bypassed Interactive Block rule:

- the system automatically performs discovery on the networks listed in the currently applied network discovery policy,
- an optional file policy performs file control and AMP, and
- an optional intrusion policy performs detection and prevention.

Because file inspection occurs before any intrusion policy inspection, blocked files (including malware) are not inspected for intrusion-related exploits.

For more information on Allow and Interactive Block rules, and why only access control rules with those actions can trigger additional inspection, see [Understanding Rule Actions](#) on page 478. Also note that you can associate an intrusion policy, but not a file policy, with the access control default action.

TIP! The system does not perform any kind of inspection on trusted traffic. Although configuring an Allow rule with neither an intrusion nor file policy passes traffic like a Trust rule, Allow rules let you perform discovery on matching traffic.

An access control policy can have multiple access control rules associated with file and intrusion policies, which allows you to match different inspection profiles against different types of traffic on your network.

Note that the number of unique intrusion policies you can use in a single access control policy depends on the model of the target devices; more powerful devices can handle more. The system does not allow you to apply an access control policy if the target devices have insufficient resources to perform inspection. If you attempt to apply an access control policy with more intrusion policies than your device can support, a pop-up window warns that you have exceeded the maximum number of intrusion policies supported by the device.

TIP! If you exceed the number of intrusion policies supported by your device, reevaluate your access control policy. You may want to consolidate intrusion policies so you can associate a single intrusion policy with multiple access control rules.

File Policies and Access Control Rules

A *file policy* is a set of configurations that the system uses to perform file control — that is, to detect and block your users from uploading (sending) or downloading (receiving) files of specific types over specific application protocols. With a Malware license, file policies also allow you to inspect a restricted set of those files for malware, and optionally block detected malware. For detailed information on file policies, see [Understanding and Creating File Policies](#) on page 1206.

When you associate a file policy with an access control rule, the Defense Center automatically enables file and malware event logging for that file policy. Sourcefire recommends that you leave this logging setting enabled.

Also, when a file policy generates an event, the system automatically logs the end of the associated connection to the Defense Center database, regardless of any other logging configurations in the invoking access control rule. For more information, see [Logging Connection, File, and Malware Information](#) on page 515.

Note that because you cannot use a Malware license with a DC500, you cannot use that appliance to apply file policies that include rules with the Block Malware or Malware Cloud Lookup action. Similarly, because you cannot enable a Malware license on a Series 2 device, you cannot apply a file policy that includes rules with these actions to those appliances.

WARNING! Managed devices **must** be running at least Version 5.1.1 of the Sourcefire 3D System to perform file control and malware detection and at least Version 5.2.0 to block malware.

Intrusion Policies and Access Control Rules

An *intrusion policy* is a set of intrusion detection and prevention configurations that the system uses to analyze network traffic and, optionally, drop offending packets. The system logs intrusion policy violations as intrusion events. For detailed information on intrusion policies, including how to create custom policies, see [Introduction to Sourcefire Intrusion Prevention](#) on page 581 and [Configuring Intrusion Policies](#) on page 667.

When an intrusion policy associated with an access control rule generates an event, the system automatically logs the end of the associated connection to the Defense Center database, regardless of any other logging configurations in the rule. To disable this connection logging on Series 3 or virtual appliances, use the CLI. For more information, see [Logging Connection, File, and Malware Information](#) on page 515.

In contrast, when an intrusion policy associated with the access control default action generates an intrusion event, the system does **not** automatically log the end of the associated connection. This is useful in intrusion detection and prevention-only deployments, where you do not want to log any connection data.

Note, however, if you enable beginning-of-connection logging for the default action, the system **does** log the end of the connection when an associated intrusion policy triggers, in addition to logging the beginning of the connection. For more information, see [Logging Connections for the Default Action](#) on page 431.

You can associate any of the following intrusion policies with an access control rule.

Sourcefire Authored Policies

Each of these non-modifiable *default* intrusion policies is tuned for a specific balance of security and connectivity. By using a default policy either out-of-the-box or as the basis for a custom policy, you can take advantage of the experience of the Sourcefire Vulnerability Research Team (VRT). For more information, see [Using Default Intrusion Policies](#) on page 692.

WARNING! Do **not** use **Experimental Policy 1** unless instructed to do so by a Sourcefire representative. Sourcefire uses this policy for testing.

User Created Policies

You can select a *custom* intrusion policy that is tailored to inspect the traffic that traverses your network and improve performance in your environment.

In addition to custom policies that you create, Sourcefire provides two custom policies: Initial Inline Policy and Initial Passive Policy. These two policies use the Balanced Security and Connectivity default policy as the base policy. The only difference between them is their **Drop When Inline** setting, which is enabled in the inline policy and disabled in the passive policy. For more information, see [Using a Custom Base Policy](#) on page 693.

The following basic procedure explains how to associate an intrusion or file policy with a new access control rule. See [Creating and Editing Access Control Rules](#) on page 474 for complete instructions on adding and modifying rules.

To associate an intrusion or file policy with a new access control rule:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Policies > Access Control**.
The Access Control page appears.
2. Click the edit icon () next to the access control policy you want to modify.
The policy Edit page appears.
3. Click **Add Rule**.
The Add Rule page appears.
4. Ensure the **Action** is set to **Allow**, **Interactive Block**, or **Interactive Block with reset**.

5. Select the **Inspection** tab.

The Inspection page appears.

TIP! You can edit file policies and user-created intrusion policies by clicking the edit icon () next to the appropriate drop-down list.

6. Select an **Intrusion Policy**.

Select **None** to disable intrusion inspection for traffic that matches the access control rule.

WARNING! Do **not** select **Experimental Policy 1** unless instructed to by a Sourcefire representative. Sourcefire uses this policy for testing.

7. Select a **File Policy**.

Select **None** to disable file inspection for traffic that matches the access control rule.

8. Click **Add** to save your changes.

The rule is added and the policy Edit page appears.

Logging Connection, File, and Malware Information

LICENSE: Any

For each access control rule in your policies, you must decide whether you want to log connection data for the traffic that matches the conditions in the rule. Tying connection logging to individual rules gives you granular control over the connections you want to log. An access control rule's logging configuration also determines whether you log file and malware events associated with the connection.

TIP! You can log two other types of connection data, outside of access control rules. First, you can log connections handled by the default action. You can also log the decision made by the system to either deny (blacklist) or inspect (blacklist set to monitor-only) a connection based on Security Intelligence data.

Deciding Which Connections to Log

You should log connections according to the security and compliance needs of your organization. If your goal is to limit the number of events you generate, only enable logging for the rules critical to your analysis. However, if you want a broad view of your network traffic, you can enable logging for additional access control rules or for the default action.

To optimize performance, Sourcefire recommends that you log either the beginning or the end of the connection, but not both. Note that for a single connection, the end-of-connection event contains all of the information in the beginning-of-connection event, as well as information that was gathered over the duration of the session.

Also, keep in mind that the Sourcefire 3D System uses connection data to display the Connection Summary dashboard, create traffic profiles, trigger correlation rules based on connection data or traffic profile changes, and add connection trackers to correlation rules. For connections that you do not log to the Defense Center database, you cannot take advantage of these features.

You can log connection events to the Defense Center database, as well as to the system log (syslog) or to an SNMP trap server. When and how you can log connections depends on the rule action (see [Understanding Rule Actions](#) on page 478), as summarized in the following table.

Connection Logging Options

RULE ACTION OR LOGGING OPTION	LOG AT:		SEND TO:	
	BEGINNING	END	DEFENSE CENTER	SYSLOG/SNMP
Trust Default Action: Trust	X	X	X	X
Allow Default Action: Intrusion Default Action: Discovery	X	X	X	X
Monitor		X (required)	X (required)	X
Block Block with reset Default Action: Block	X		X	X
Interactive Block Interactive Block with reset	X	X (if bypassed, events show Allow action)	X	X
Security Intelligence	X		X	X

Note that regardless of an access control rule's logging configuration, the system may automatically log connections that contain file or intrusion events; see [Logging Connections Associated with File and Malware Events](#) on page 519 and [Logging Connections Associated with Intrusions](#) on page 519.

Deciding Where to Log or Send Connection Events

When you log a connection event, you can save it to the Defense Center database. The Sourcefire 3D System uses connection data to display the Connection Summary dashboard, create traffic profiles, trigger correlation rules based on connection data or traffic profile changes, and add connection trackers to correlation rules. If you want to take advantage of these features, you **must** log connections to the Defense Center database. For information on database limits, see [Configuring Database Event Limits](#) on page 1978.

You can also log connection events to the syslog or to an SNMP trap server using alert responses. For information on setting up alert responses, see [Working with Alert Responses](#) on page 526.

Logging the Beginning or End of a Connection

Depending on the rule action, you can log a connection event at the beginning or end of a connection, or both. Because matching traffic is denied without further inspection, the system can log only beginning-of-connection events for blocked or Security Intelligence blacklisted traffic.

In general, if you want to perform any kind of detailed analysis on connection data, you should log connection events at the end of connections. This is because beginning-of-connection events do not have information determined by examining traffic over the duration of the session, for example, the total amount of data transmitted or the timestamp of the last packet in the connection.

For this reason, the system uses only end-of-connection data to populate connection summaries (see [Understanding Connection Summaries](#) on page 542), which the system then uses to create connection graphs and traffic profiles. Therefore, if you want to use the view connection summaries in custom workflows, view connection data in graphical format, or create and use traffic profiles, you **must** log connection events at the end of connections.

If, however, you simply want to log an event each time the system detects a new connection, beginning-of-connection events are sufficient. You can trigger correlation rules based on either beginning- or end-of-connection events.

Logging Block Rules

Because matching traffic is denied without further inspection, blocking rules can only log beginning-of-connection events. You can, however, configure end-of-connection logging for interactive blocking rules. This is because when the user clicks through the warning page displayed by the system, (see [Adding an HTTP Response Page](#) on page 436), the connection is considered a new, allowed connection which the system can monitor until it terminates.

Therefore, for packets that match an Interactive Block or Interactive Block with reset rule, the system can generate the following connection events:

- a beginning-of-connection event when a user's HTTP request is initially blocked; this event has an associated action of **Interactive Block** or **Interactive Block with reset** in the connection log
- multiple beginning- or end-of-connection events if the user clicks through the warning page and loads the originally requested page; these events have an associated action of **Allow** and a reason of **User Bypass**

Logging Monitor Rules

For packets that match a Monitor rule, the system always generates a connection event at the end of the connection, regardless of the logging configuration of the rule or default action that later handles the connection. In other words, if a packet matches a Monitor rule, the connection is always logged, even if the packet matches no other rules and you do not enable logging on the default action.

Because traffic matching a Monitor rule is always later handled by another rule or by the default action, the action associated with a connection logged due to a monitor rule is never **Monitor**. Rather, it is one of:

- the action for the first non-Monitor rule triggered by the connection, or
- the default action

The system does **not** generate a separate event each time a single connection matches a Monitor rule. Because a single connection can match multiple Monitor rules, each connection event logged to the Defense Center database can include and display information on up to eight matched monitor rules — the first eight Monitor rules that the connection matches.

Similarly, if you send connection events to the syslog or an SNMP trap server, the system does not send a separate alert each time a single connection matches a Monitor rule. Rather, the alert that the system sends at the end of the connection contains information on the first eight Monitor rules that the connection matched.

TIP! Even though the rule action in the connection log can never be **Monitor**, you can still trigger correlation policy violations on connections that match Monitor rules. For more information, see [Specifying Correlation Rule Trigger Criteria](#) on page 1464.

Logging File and Malware Events

When a file policy associated with an access control rule generates a file or malware event, the rule's logging configuration determines whether that event is logged to the database. This setting is automatically enabled, although you can disable it.

File policies can generate the following types of event:

- *file events*, which represent detected or blocked files, including malware files
- *malware events*, which represent the detection or blocking of malware in files evaluated by Malware Cloud Lookup or Block Malware rules
- *retrospective malware events*, which are generated when the malware disposition for a previously detected file changes

When a file policy generates a file or malware event, the system automatically logs the end of the associated connection to the Defense Center database, regardless of the logging configuration of the invoking access control rule.

For more information on performing file inspection, see [Understanding and Creating File Policies](#) on page 1206 and [Performing File and Intrusion Inspection on Allowed Traffic](#) on page 511.

Logging Connections Associated with File and Malware Events

Each connection event logged to the Defense Center database can include and display information on the files detected or blocked in a connection. When a file policy generates a file or malware event, the system automatically logs the end of the associated connection to the Defense Center database, regardless of the logging configuration of the invoking access control rule. You cannot disable this connection logging.

For connections where a file was blocked, the associated action in the connection log is **Block** even though you associated the file policy with an Allow rule. The connection's reason is either **File Monitor** (a file type or malware was detected), or **Malware Block** or **File Block** (a file was blocked).

Logging Connections Associated with Intrusions

Each connection event logged to the Defense Center database can include and display information on the intrusions detected or blocked in a connection. When an intrusion policy associated with an access control rule generates an intrusion event, the system automatically logs the end of the associated connection to the Defense Center database, regardless of the logging configuration of the rule.

TIP! To disable this connection logging on Series 3 or virtual appliances, use the CLI; see [log-ips-connections](#) on page 2270.

For connections where an intrusion was blocked, the associated action in the connection log is **Block**, with a reason of **Intrusion Block**, even though you associated the intrusion policy with an Allow rule.

Note that when an intrusion policy associated with the access control default action generates an intrusion event, the system does **not** automatically log the end of the associated connection. This is useful for intrusion detection and prevention-only deployments, where you do not want to log any connection data.

For more information, see [Logging Connections for the Default Action](#) on page 431.

Logging the Default Action

The options for logging traffic handled by the policy default action largely parallel the options for logging traffic handled by individual access control rules. For example, if your default action blocks all traffic, you cannot log end-of-connection events for the default action. For more information, see [Logging Connections for the Default Action](#) on page 431.

Logging Security Intelligence Filtering Decisions

Logging blacklisted connections allows you to generate a connection event when the system detects network traffic to or from a blacklisted IP address.

Events generated by Security Intelligence filtering represent the beginning of a connection and the decision made by the system to either deny (blacklist) or inspect (blacklist set to monitor-only) the connection. For these inspected connections, the system may generate additional connection events depending on the logging settings in the access control rule or default action that later handles the connection.

The options for logging Security Intelligence filtering decisions are similar to the options for logging traffic handled by individual access control rules. For detailed information, see [Logging Blacklisted Connections](#) on page 445.

Understanding the Connection Log

The information available for any individual connection event depends on several factors, including the options you set when configuring connection logging. For details, see [Information Available in Connection Events](#) on page 550.

The following procedure explains how to set a new rule to log a connection in traffic that matches the conditions of an access control rule. See [Creating and Editing Access Control Rules](#) on page 474 for complete instructions on adding and modifying rules.

To configure an access control rule to log connection, file, and malware information:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Policies > Access Control**.
The Access Control page appears.
2. Click the edit icon () next to the access control policy you want to modify.
The policy Edit page appears.
3. Click **Add Rule**.
The Add Rule page appears.

4. Select the **Logging** tab.

The Logging tab appears. The following graphic shows the Logging page for a rule associated with a file policy.

5. Specify whether you want to **Log at Beginning of Connection** or **Log at End of Connection**.

You cannot log end-of-connection events for blocked traffic.

6. Use the **Log Files** check box to specify whether the system should log any file and malware events associated with the connection.

Associating a file policy with the rule automatically enables the check box. Sourcefire recommends that you leave this setting enabled.

7. Specify where to send connection events. You have the following choices:

- To send connection events to the Defense Center, select **Defense Center**. When your rule action is **Monitor**, you must log connections to the Defense Center.
- To send connection events to syslog, select **Syslog**, then select a syslog alert response from the drop-down list. Optionally, you can add a syslog alert response by clicking the add icon (+); see [Creating a Syslog Alert Response](#) on page 530.
- To send connection events to an SNMP trap server, select **SNMP Trap**, then select an SNMP alert response from the drop-down list. Optionally, you can add an SNMP alert response by clicking the add icon (+); see [Creating an SNMP Alert Response](#) on page 528.

8. Click **Add** to save your changes.

The rule is added and the policy Edit page appears.

Adding Comments to a Rule

LICENSE: Any

You can add comments to an access control rule. For example, you might summarize the overall configuration for the benefit of other users, or note when you change a rule and the reason for the change.

You can edit or delete a comment until you save your rule, then you can no longer edit or delete the comment.

You can display a list of all comments for a rule along with the user who added each comment and the date the comment was added. You can display comments while creating or editing a rule.

Note that you will be prompted to comment when you save changes to a rule if adding a comment is optional or required and you have not already added a comment during the current edit session. See [Configuring Access Control Policy Preferences](#) on page 1970 for more information.

The following basic procedure explains how to add comments to a new rule. See [Creating and Editing Access Control Rules](#) on page 474 for complete instructions on adding and modifying rules.

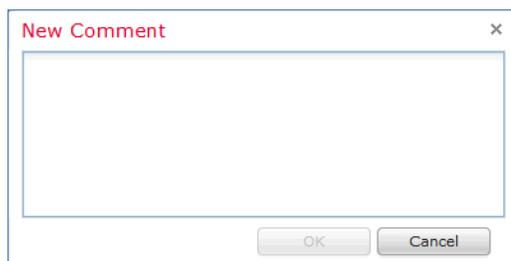

To add a comment to a rule:

ACCESS: Admin/Access Admin/Network Admin

1. Select **Policies > Access Control**.
The Access Control page appears.
2. Click the edit icon (✎) next to the access control policy you want to modify.
The policy Edit page appears.
3. Click **Add Rule**.
The Add Rule page appears.
4. Select the **Comments** tab.
The Comments page appears.

5. Optionally, to add a comment, click **New Comment**.
The New Comment pop-up window appears.

6. Type your comment and click **OK** to add your comment, or click **Cancel** to abandon the comment and return to the Comments page.

Note that you will be prompted to comment when you save changes to a rule if adding a comment is optional or required and you have not already added a comment during the current edit session. See [Configuring Access Control Policy Preferences](#) on page 1970 for more information.

7. Click **Add** to save your changes.
The rule is added and the policy Edit page appears.

CHAPTER 14

CONFIGURING EXTERNAL ALERTING

While the Sourcefire 3D System provides various views of events within the web interface, you may want to configure external event notification to facilitate constant monitoring of critical systems. You can configure the Sourcefire 3D System to generate alerts that notify you via email, SNMP trap, or syslog when one of the following is generated:

- an intrusion event with a specific impact flag
- a specific type of discovery event
- a network-based malware event or retrospective malware event
- a correlation event, triggered by a specific correlation policy violation
- a connection event, triggered by a specific access control rule
- a specific status change for a module in a health policy

To have the system send these alerts, you must first create an *alert response*, which is a set of configurations that allows the Sourcefire 3D System to interact with the external system where you plan to send the alert. Those configurations may specify, for example, an email relay host, SNMP alerting parameters, or syslog facilities and priorities.

After you create the alert response, you associate it with the event that you want to use to trigger the alert. Note that the process for associating alert responses with events is different depending on the type of event:

- You associate alert responses with impact flags, discovery events, and malware events using their own configuration pages.
- You associate correlation events with alert responses (and remediation responses; see [Creating Remediations](#) on page 1607) in your correlation policies.

- You associate SNMP and syslog alert responses with logged connections using access control rules and policies. Email alerting is not supported for logged connections.
- You associate alert responses with health module status changes using the health monitor.

There is another type of alerting you can perform in the Sourcefire 3D System, which is to configure email, SNMP, and syslog intrusion event notifications for individual intrusion events, regardless of impact flag. You configure these notifications in intrusion policies; see [Configuring External Responses to Intrusion Events](#) on page 1033 and [Adding Alerts](#) on page 761.

The following table explains the licenses you must have to generate alerts.

License Requirements for Generating Alerts

TO GENERATE AN ALERT BASED ON...	YOU NEED THIS LICENSE...
an intrusion event with a specific impact flag	FireSIGHT + Protection
a specific type of discovery event	FireSIGHT
a network-based malware event	Malware
a correlation policy violation	the license that was required to trigger the policy violation
a connection event	the license that was required to log the connection
health module status changes	Any

For more information, see:

- [Working with Alert Responses](#) on page 526
- [Configuring Impact Flag Alerting](#) on page 535
- [Configuring Discovery Event Alerting](#) on page 536
- [Configuring Advanced Malware Protection Alerting](#) on page 537
- [Adding Responses to Rules and White Lists](#) on page 1517
- [Logging Connection, File, and Malware Information](#) on page 515
- [Logging Connections for the Default Action](#) on page 431
- [Configuring Health Monitor Alerts](#) on page 2159

Working with Alert Responses

LICENSE: Any

The first step in configuring external alerting is to create an alert response, which is a set of configurations that allows the Sourcefire 3D System to interact with the external system where you plan to send the alert. You can create alert responses to send alerts via email, a simple network management protocol (SNMP) trap, or a system log (syslog).

The information you receive in an alert depends on the type of event that triggered the alert. For example, an impact flag alert contains timestamp, intrusion rule, impact flag, and event description information. As another example, discovery event alerts also contain timestamp and description information, as well as discovery event type information.

If you are using an alert response in a correlation policy, the information in the alert depends on the type of event that triggered the correlation policy violation.

IMPORTANT! If you configure an alert as a response to a correlation rule that contains a connection tracker, the alert information you receive is the same as that for alerts on traffic profile changes, even if the correlation rule itself is based on a different kind of event.

When you create an alert response, it is automatically enabled. Only enabled alert responses can generate alerts. To stop alerts from being generated, you can temporarily disable alert responses rather than deleting your configurations.

You manage alert responses on the Alerts page (**Policies > Actions > Alerts**).

Alerts				
Impact Flag Alerts				
Discovery Event Alerts				
Advanced Malware Protection Alerts				
				 Create Alert
Name	Type	In Use	Enabled	
Sample Email Alert Response	Email	In Use	<input checked="" type="checkbox"/>	 
Sample SNMP Alert Response	SNMP	Not Used	<input checked="" type="checkbox"/>	 
Sample Syslog Alert Response	Syslog	Not Used	<input type="checkbox"/>	 

The slider next to each alert response indicates whether it is active; only enabled alert responses can generate alerts. The page also indicates whether the alert response is being used in a configuration, for example, to log connections in an access control rule. You can sort alert responses by name, type, in use status, and enabled/disabled status by clicking the appropriate column header; click the column header again to reverse the sort.

For more information, see:

- [Creating an Email Alert Response](#) on page 527
- [Creating an SNMP Alert Response](#) on page 528
- [Creating a Syslog Alert Response](#) on page 530

- [Modifying an Alert Response](#) on page 534
- [Deleting an Alert Response](#) on page 534
- [Enabling and Disabling Alert Responses](#) on page 534

Creating an Email Alert Response

LICENSE: Any

Note that you **cannot** perform email alerting on logged connections in an access control policy.

Before you create an email alert response, you should make sure that the Defense Center can reverse-resolve its own IP address. You should also configure your mail relay host as described in [Configuring a Mail Relay Host and Notification Address](#) on page 1983.

To create an email alert response:

ACCESS: Admin

1. Select **Policies > Actions > Alerts**.

The Alerts page appears.

2. From the **Create Alert** drop-down menu, select **Create Email Alert**.

The Create Email Alert Configuration pop-up window appears.

The screenshot shows a dialog box titled "Create Email Alert Configuration". It has a title bar with a question mark and a close button. The dialog contains four input fields: "Name", "To", "From", and "Relay Host". The "Relay Host" field is pre-filled with "mail.example.com" and has a pencil icon next to it. At the bottom right, there are "Save" and "Cancel" buttons.

3. In the **Name** field, type the name you want to use to identify the alert response.
4. In the **To** field, type the email addresses where you want to send alerts. Separate email addresses with commas.
5. In the **From** field, type the email address that you want to appear as the sender of the alert.

6. Next to **Relay Host**, verify the listed mail server is the one that you want to use to send the alert.

To change the server, or if you have not yet configured a relay host, click the edit icon (✎) to display the System Policy page in a pop-up window, then follow the directions in [Configuring a Mail Relay Host and Notification Address](#) on page 1983. You must apply the system policy after you edit it for your changes to take effect.

7. Click **Save**.
The alert response is saved and is automatically enabled.

Creating an SNMP Alert Response

LICENSE: Any

You can create SNMP alert responses using SNMPv1, SNMPv2, or SNMPv3.

IMPORTANT! If you want to monitor 64-bit values with SNMP, you must use SNMPv2 or SNMPv3. SNMPv1 does not support 64-bit monitoring.

If your network management system requires the Defense Center's management information base (MIB) file, you can obtain it at `/etc/sf/DCEALERT.MIB`.

To create an SNMP alert response:

ACCESS: Admin

1. Select **Policies > Actions > Alerts**.
The Alerts page appears.

- From the **Create Alert** drop-down menu, select **Create SNMP Alert**.
The Create SNMP Alert Configuration pop-up window appears.

The screenshot shows a dialog box titled "Create SNMP Alert Configuration". It contains the following fields and options:

- Name: [Text input field]
- Trap Server: [Text input field]
- Version: [Dropdown menu, currently showing v3]
- User Name: [Text input field]
- Authentication:
 - Protocol: [Dropdown menu, currently showing None]
 - Password: [Text input field]
- Privacy:
 - Protocol: [Dropdown menu, currently showing None]
 - Password: [Text input field]
- Engine ID: [Text input field, with placeholder text "Example: 123456789a"]

Buttons: Save, Cancel

- In the **Name** field, type the name that you want to use to identify the SNMP response.
- In the **Trap Server** field, type the hostname or IP address of the SNMP trap server, using alphanumeric characters.
Note that the system does **not** warn you if you enter an invalid IPv4 address (such as 192.169.1.456) in this field. Instead, the invalid address is treated as a hostname.
- From the **Version** drop-down list, select the SNMP version you want to use. SNMP v3 is the default. If you select SNMP v1 or SNMP v2, different options appear.

The screenshot shows the same dialog box, but with the Version dropdown menu set to v1. The Community String field is now visible, and the Authentication and Privacy sections are hidden. The buttons remain the same.

6. Which version of SNMP did you select?
 - For SNMP v1 or SNMP v2, type the SNMP community name, using alphanumeric characters or the special characters * or \$, in the **Community String** field and skip to step 12.
 - For SNMP v3, type the name of the user that you want to authenticate with the SNMP server in the **User Name** field and continue with the next step.
7. From the **Authentication Protocol** drop-down list, select the protocol you want to use for authentication.
8. In the **Authentication Password** field, type the password required for authentication with the SNMP server.
9. From the **Privacy Protocol** list, select **None** to use no privacy protocol or **DES** to use Data Encryption Standard as the privacy protocol.
10. In the **Privacy Password** field, type the privacy password required by the SNMP server.
11. In the **Engine ID** field, type an identifier for the SNMP engine, in hexadecimal notation, using an even number of digits.

When you use SNMPv3, the system uses an Engine ID value to encode the message. Your SNMP server requires this value to decode the message.

Sourcefire recommends that you use the hexadecimal version of the Defense Center's IP address. For example, if the Defense Center has an IP address of 10.1.1.77, use 0a01014D0.
12. Click **Save**.

The alert response is saved and is automatically enabled.

Creating a Syslog Alert Response

LICENSE: Any

When configuring a syslog alert response, you can specify the severity and facility associated with the syslog messages to ensure that they are processed properly by the syslog server. The facility indicates the subsystem that creates the message and the severity defines the severity of the message. Facilities and severities are not displayed in the actual message that appears in the syslog, but are instead used to tell the system that receives the syslog message how to categorize it.

TIP! For more detailed information about how syslog works and how to configure it, refer to the documentation for your system. On UNIX systems, the **man** pages for `syslog` and `syslog.conf` provide conceptual information and configuration instructions.

Although you can select any type of facility when creating a syslog alert response, you should select one that makes sense based on your syslog server; not all syslog servers support all facilities. For UNIX syslog servers, the `syslog.conf` file should indicate which facilities are saved to which log files on the server.

The following table lists the syslog facilities you can select.

Available Syslog Facilities

FACILITY	DESCRIPTION
ALERT	An alert message.
AUDIT	A message generated by the audit subsystem.
AUTH	A message associated with security and authorization.
AUTHPRIV	A restricted access message associated with security and authorization. On many systems, these messages are forwarded to a secure file.
CLOCK	A message generated by the clock daemon. Note that syslog servers running a Windows operating system will use the CLOCK facility.
CRON	A message generated by the clock daemon. Note that syslog servers running a Linux operating system will use the CRON facility.
DAEMON	A message generated by a system daemon.
FTP	A message generated by the FTP daemon.
KERN	A message generated by the kernel. On many systems, these messages are printed to the console when they appear.
LOCAL0- LOCAL7	A message generated by an internal process.
LPR	A message generated by the printing subsystem.
MAIL	A message generated by a mail system.
NEWS	A message generated by the network news subsystem.
NTP	A message generated by the NTP daemon.

Available Syslog Facilities (Continued)

FACILITY	DESCRIPTION
SYSLOG	A message generated by the syslog daemon.
USER	A message generated by a user-level process.
UUCP	A message generated by the UUCP subsystem.

The following table lists the standard syslog severity levels you can select.

Syslog Severity Levels

LEVEL	DESCRIPTION
ALERT	A condition that should be corrected immediately.
CRIT	A critical condition.
DEBUG	Messages that contain debugging information.
EMERG	A panic condition broadcast to all users.
ERR	An error condition.
INFO	Informational messages.
NOTICE	Conditions that are not error conditions, but require attention.
WARNING	Warning messages.

Before you start sending syslog alerts, make sure that the syslog server can accept remote messages.

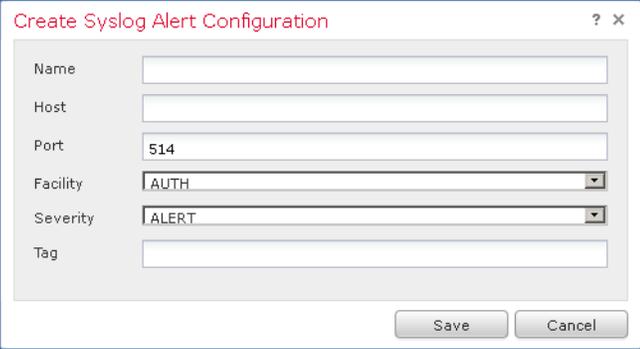

To create a syslog alert:

ACCESS: Admin

1. Select **Policies > Actions > Alerts**.

The Alerts page appears. From the **Create Alert** drop-down menu, select **Create Syslog Alert**.

The Create Syslog Alert Configuration pop-up window appears.

The screenshot shows a dialog box titled "Create Syslog Alert Configuration". It has a title bar with a question mark and a close button. The dialog contains the following fields and controls:

- Name:** A text input field.
- Host:** A text input field.
- Port:** A text input field containing the value "514".
- Facility:** A dropdown menu with "AUTH" selected.
- Severity:** A dropdown menu with "ALERT" selected.
- Tag:** A text input field.
- Buttons:** "Save" and "Cancel" buttons at the bottom right.

2. In the **Name** field, type the name you want to use to identify the saved response.
3. In the **Host** field, type the hostname or IP address of your syslog server.
Note that the system does **not** warn you if you enter an invalid IPv4 address (such as 192.168.1.456) in this field. Instead, the invalid address is treated as a hostname.
4. In the **Port** field, type the port the server uses for syslog messages.
By default, this value is 514.
5. From the **Facility** list, select a facility.
See the [Available Syslog Facilities table](#) on page 531 for a list of the available facilities.
6. From the **Severity** list, select a severity.
See the [Syslog Severity Levels table](#) on page 532 for a list of the available severities.
7. In the **Tag** field, type the tag name that you want to appear with the syslog message.
Use only alphanumeric characters in tag names. You **cannot** use spaces or underscores.
As an example, if you wanted all messages sent to the syslog to be preceded with FromDC, type FromDC in the field.
8. Click **Save**.
The alert response is saved and is automatically enabled.

Modifying an Alert Response

LICENSE: Any

For most types of alerting, if an alert response is enabled and in use, changes to the alert response take effect immediately. However, for alert responses used in access control rules to log connection events, changes do not take effect until you reapply the access control policy.

To edit an alert response:

ACCESS: Admin

1. Select **Policies > Actions > Alerts**.
The Alerts page appears.
2. Next to the alert response you want to edit, click the edit icon (✎).
A configuration pop-up window for that alert response appears.
3. Make changes as needed.
4. Click **Save**.
The alert response is saved.

Deleting an Alert Response

LICENSE: Any

You can delete any alert response that is not in use.

To delete an alert response:

ACCESS: Admin

1. Select **Policies > Actions > Alerts**.
The Alerts page appears.
2. Next to the alert response you want to delete, click the delete icon (🗑️).
3. Confirm that you want to delete the alert response.
The alert response is deleted.

Enabling and Disabling Alert Responses

LICENSE: Any

Only enabled alert responses can generate alerts. To stop alerts from being generated, you can temporarily disable alert responses rather than deleting your configurations. Note that if an alert is in use when you disable it, it is still considered in use even though it is disabled.

To enable or disable an alert response:

ACCESS: Admin

1. Select **Policies > Actions > Alerts**.

The Alerts page appears.

2. Next to the alert response you want to enable or disable, click the enable/disable slider.

If the alert response was enabled, it is disabled. If it was disabled, it is enabled.

Configuring Impact Flag Alerting

LICENSE: Protection

You can configure the system to alert you whenever an intrusion event with a specific impact flag occurs. Impact flags help you evaluate the impact an intrusion has on your network by correlating intrusion data, network discovery data, and vulnerability information. For more information, see [Using Impact Flags to Evaluate Events](#) on page 641.

To configure impact flag alerting:

ACCESS: Admin

1. Select **Policies > Actions > Alerts**, then select the **Impact Flag Alerts** tab.

The Impact Flag Alerts page appears.

The screenshot shows the 'Alerts' configuration page. At the top, there are three dropdown menus for 'Syslog', 'Email', and 'SNMP', all set to 'None'. Below these is the 'Impact Flag Configuration' section, which includes a table with columns for 'Impact Flag', 'Syslog Notification', 'Email Notification', and 'SNMP Notification'. Each row in the table has a checkbox for each notification type. The rows are: 'Unknown', 'Unknown Target', 'Currently Not Vulnerable', 'Potentially Vulnerable', and 'Vulnerable'. A 'Save' button is located at the bottom right of the table.

Impact Flag	Syslog Notification	Email Notification	SNMP Notification
0 Unknown	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4 Unknown Target	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3 Currently Not Vulnerable	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2 Potentially Vulnerable	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
1 Vulnerable	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

2. In the Alerts section, select the alert response you want to use for each alert type.
To create a new alert response, select **New** from any drop-down list. For more information, see [Working with Alert Responses](#) on page 526.
3. In the Impact Configuration section, select the check boxes that correspond to the alerts you want to receive for each impact flag.
4. Click **Save**.
Your impact flag alerting settings are saved.

Configuring Discovery Event Alerting

LICENSE: FireSIGHT

You can configure the system to alert you whenever a specific type of discovery event occurs. For information about the different event types, see [Understanding Discovery Event Types](#) on page 1389 and [Understanding Host Input Event Types](#) on page 1394.

Note that to generate an alert based on a discovery event type, you must configure your network discovery policy to log that event type; see [Configuring Discovery Event Logging](#) on page 1295. By default, logging is enabled for all event types.

To configure discovery event alerting:

ACCESS: Admin

1. Select **Policies > Actions > Alerts**, then select the **Discovery Event Alerts** tab.
The Discovery Event Alerts page appears.

Alerts

Select alert responses to use for discovery event alerts. You must click Save after you make your selections.

Syslog

Email

SNMP

Events Configuration

Select the event types for which you want to generate alerts.

Event	Syslog Notification	Email Notification	SNMP Notification
Add Client	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Add Host	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Vulnerability Set Invalid	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Vulnerability Set Valid	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Save

2. In the **Alerts** section, select the alert response you want to use for each alert type.
To create a new alert response, select **New** from any drop-down list. For more information, see [Working with Alert Responses](#) on page 526.
3. In the **Events Configuration** section, select the check boxes that correspond to the alerts you want to receive for each discovery event type.
4. Click **Save**.
Your discovery event alerting settings are saved.

Configuring Advanced Malware Protection Alerting

LICENSE: Malware

SUPPORTED DEVICES: Series 3, virtual

SUPPORTED DEFENSE CENTERS: Any except DC500

You can configure the system to alert you whenever any network-based malware event, including a retrospective event, is generated. You cannot, however, alert on endpoint-based (FireAMP) malware events. For information on malware events, see [Working with Malware Events](#) on page 1229.

To generate alerts based on malware events, you must create a file policy that performs malware cloud lookups, then associate that policy with an access control rule. For more information, see [Understanding and Creating File Policies](#) on page 1206 and [Performing File and Intrusion Inspection on Allowed Traffic](#) on page 511.

To configure malware event alerting:

ACCESS: Admin

1. Select **Policies > Actions > Alerts**, then select the **Advanced Malware Protections Alerts** tab.

The Advanced Malware Protection Alerts page appears.

Alerts

Select alert responses to use for advanced malware detection event alerts. You must click Save after you make your selections.

Syslog:
Email:
SNMP:

Event Configuration

Select the even types for which you want to generate alerts.

Event	Syslog	Email	SNMP
Retrospective Events	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
All network-based malware events	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

2. In the **Alerts** section, select the alert response you want to use for each alert type.

To create a new alert response, select **New** from any drop-down list. For more information, see [Working with Alert Responses](#) on page 526.

3. In the **Event Configuration** section, select the check boxes that correspond to the alerts you want to receive for each malware event type.

Keep in mind that **All network-based malware events** includes **Retrospective Events**.

4. Click **Save**.

Your malware event alerting settings are saved.

CHAPTER 15

WORKING WITH CONNECTION DATA

Sourcefire managed devices continuously monitor traffic generated by the hosts on your network. You can use the access control feature to generate *connection events* when network traffic matches specific conditions. Connection events contain data about the detected sessions, including timestamps, IP addresses, geolocation, applications, and so on.

Logging connection events to the Defense Center database allows you to take advantage of the analysis, reporting, and correlation features in the Sourcefire 3D System. Optionally, you can send most connection events to the syslog or an SNMP trap server.

To supplement the connection data gathered by your managed devices, you can use records generated by NetFlow-enabled devices to generate connection events. This is especially useful if you have NetFlow-enabled devices deployed on networks that your Sourcefire managed devices cannot monitor.

To further enhance the geolocation information provided with many connection events, you can configure geolocation updates for your system. For more information on geolocation, see [Using Geolocation](#) on page 1816.

For more information, see:

- [Understanding Connection Data](#) on page 540
- [Viewing Connection Data Graphs and Tables](#) on page 555
- [Working with Connection Graphs](#) on page 555
- [Working with Connection Data Tables](#) on page 570
- [Searching for Connection Data](#) on page 575

- [Viewing the Connection Summary Page](#) on page 578
- [Understanding NetFlow](#) on page 1271

Understanding Connection Data

LICENSE: Any

For networks monitored by Sourcefire managed devices, you can configure and apply access control policies to log connection events when:

- network traffic is blacklisted or monitored by Security Intelligence
- network traffic meets the conditions of a non-Monitor access control rule
- network traffic is handled by an access control policy's default action
- network traffic meets the conditions of at least one Monitor rule (automatically enabled)
- an intrusion policy associated with an access control rule generates an event (automatically enabled)
- a file policy associated with an access control rule detects or blocks a file, or discovers or blocks malware (automatically enabled)

Tying connection logging to individual access control rules, policies, and configurations gives you granular control over the connections you want to log.

Note that because NetFlow data collection is not linked to access control rules, you do not have granular control over which NetFlow connections you want to log. Sourcefire managed devices detect records exported by NetFlow-enabled devices, generate unidirectional end-of-connection events based on the data in those records, and finally send those events to the Defense Center to be logged in the database. You cannot send NetFlow events to the system log or an SNMP trap server.

For more information on connection logging, see the following sections:

- [Logging Connection, File, and Malware Information](#) on page 515 explains how to log traffic that meets the conditions of an access control rule, and also contains general guidance on when and how to log those connections. This section also explains how connection logging is affected by the rule action, and how connection event logging relates to intrusion, file, and malware event logging.
- [Logging Blacklisted Connections](#) on page 445 explains how to use the Security Intelligence feature to log the decision to deny (blacklist) or inspect (blacklist set to monitor-only) connections.
- [Logging Connections for the Default Action](#) on page 431 explains how to log connections handled by an access control policy's default action.

- [Understanding NetFlow](#) on page 1271 provides more information on NetFlow, and compares NetFlow connection events with connection events based on traffic monitored by the Sourcefire 3D System.
- [Creating a Network Discovery Policy](#) on page 1275 explains how to create and manage your discovery policy, which is also where you configure NetFlow data collection.

The following table explains the licenses you must have to log connection data.

License Requirements for Logging Connection Data

To...	YOU NEED THIS LICENSE...
perform basic connection logging, including NetFlow connection logging	Any
add data to the network map, including host and user data, based on the information in connection logs; view geolocation information associated with connection events	FireSIGHT
log connections: <ul style="list-style-type: none"> • that represent Security Intelligence filtering decisions • in an access control rule that performs intrusion detection and prevention • in an access control rule that performs file control, but not advanced malware protection 	Protection
log connections in an access control rule that performs advanced malware protection	Malware
log connections in an access control rule that performs application or user control	Control
log connections in an access control rule with URL conditions that use URL category and reputation data display URL category and URL reputation information for URLs requested by monitored hosts	URL Filtering

The following sections provide additional details on the kinds of information available about detected connections, as well as how you log, aggregate, and use connection data as part of your analysis.

- [Understanding Connection Summaries](#) on page 542
- [Connection Data Fields](#) on page 543
- [Information Available in Connection Events](#) on page 550
- [Uses for Connection Data in the Sourcefire 3D System](#) on page 554

Understanding Connection Summaries

LICENSE: Any

The Sourcefire 3D System aggregates connection data collected over five-minute intervals into connection summaries, which the system uses to generate connection graphs and traffic profiles. Optionally, you can create custom workflows based on connection summary data, which you use in the same way as you use workflows based on individual connection events.

To be aggregated, multiple connections must:

- represent the end of connections
- have the same source and destination IP addresses, and use the same port on the responder (destination) host
- use the same protocol (TCP or UDP)
- use the same application protocol
- either be detected by the same Sourcefire managed device, or be exported by the same NetFlow-enabled device

Each connection summary includes total traffic statistics, as well as the number of connections in the summary. Because NetFlow-enabled devices generate unidirectional connections, a summary's connection count is incremented by two for every connection based on NetFlow data.

Note that connection summaries do not contain all of the information associated with its aggregated connections. For example, because client information is not used to aggregate connections into connection summaries, summaries do not contain client information.

For more information, see the following sections:

- [Long-Running Connections](#) on page 542
- [Combined Connection Summaries from External Responders](#) on page 543
- [Information Available in Connection Events](#) on page 550

Long-Running Connections

LICENSE: Any

If a monitored session spans two or more five-minute intervals over which connection data is aggregated, the connection is considered a *long-running connection*. When calculating the number of connections in a connection summary, the system increments the count only for the five-minute interval in which a long-running connection was initiated.

Also, when calculating the number of packets and bytes transmitted by the initiator and responder in a long-running connection, the system does not report the number of packets and bytes that were actually transmitted during each five-minute interval. Instead, the system assumes a constant rate of transmission and calculates estimated figures based on the total number of packets and bytes

transmitted, the length of the connection, and what portion of the connection occurred during each five-minute interval.

Combined Connection Summaries from External Responders

LICENSE: Any

To reduce the space required to store connection data and speed up the rendering of connection graphs, the system combines connection summaries when:

- one of the hosts involved in the connection is not on your monitored network
- other than the IP address of the external host, the connections in the summaries meet the aggregation criteria listed in [Understanding Connection Summaries](#) on page 542: protocol, application protocol, detecting device, and so on

When viewing connection summaries in the event viewer and when working with connection graphs, the system displays `external` instead of an IP address for the non-monitored hosts.

As a consequence of this aggregation, if you attempt to drill down to the table view of connection data (that is, access data on individual connections) from a connection summary or graph that involves an external responder, the table view contains no information.

Connection Data Fields

LICENSE: Any

Each connection table view or connection graph contains information about the connections or connection summaries you are viewing, including timestamps, IP addresses, geolocation information, applications, and so on.

The following list details the connection data logged by the Sourcefire 3D System. For a discussion of the factors that determine the information logged in any individual connection event, see the next section: [Information Available in Connection Events](#) on page 550.

Time

The ending time of the five-minute interval that the system used to aggregate connections in a connection summary.

First Packet or Last Packet

The date and time the first or last packet of the session was seen.

Action

The action associated with the access control rule or default action that logged the connection:

- **Allow** represents explicitly allowed and user-bypassed interactively blocked connections.
- **Trust** represents trusted connections. Note that TCP connections detected by a trust rule on the first packet will not generate a beginning-of-connection event. On virtual appliances, generated events will be reported one hour after the final session packet.
- **Block** and **Block with reset** represent blocked connections. The system also associates the **Block** action with connections blacklisted by Security Intelligence, connections where an exploit was detected by an intrusion policy, and connections where a file was blocked by a file policy.
- **Interactive Block** and **Interactive Block with reset** mark the beginning-of-connection event that you can log when the system initially blocks a user's HTTP request using an Interactive Block rule. If the user clicks through the warning page that the system displays, any additional connection events you log for the session have an action of **Allow**.

For Security Intelligence-monitored connections, the action is that of the first non-Monitor access control rule triggered by the connection. Similarly, because traffic matching a Monitor rule is always handled by a subsequent rule or by the default action, the action associated with a connection logged due to a monitor rule is never **Monitor**.

Reason

The reason or reasons the connection was logged, in the following situations:

- **User Bypass** indicates that the system initially blocked a user's HTTP request, but the user chose to continue to the originally requested site by clicking through a warning page. A reason of **User Bypass** is always paired with an action of **Allow**.
- **IP Block** indicates that the system denied the connection without inspection, based on Security Intelligence data. A reason of **IP Block** is always paired with an action of **Block**.
- **IP Monitor** indicates that the system would have denied the connection based on Security Intelligence data, but you configured the system to monitor, rather than deny, the connection.
- **File Monitor** indicates that the system detected a particular type of file in the connection.
- **File Block** indicates the connection contained a file or malware file that the system prevented from being transmitted. A reason of **File Block** is always paired with an action of **Block**.

- **File Resume Allow** indicates that file transmission was originally blocked by a Block Files or Block Malware file rule, then the HTTP session automatically resumed after a new access control policy was applied that allowed the file.
- **Intrusion Block** indicates the system blocked or would have blocked an exploit (intrusion policy violation) detected in the connection. A reason of **Intrusion Block** is paired with an action of **Block** for blocked exploits and **Allow** for would have blocked exploits.
- **Intrusion Monitor** indicates the system detected, but did not block, an exploit detected in the connection. This occurs when the state of the triggered intrusion rule is set to **Generate Events**.

Initiator IP or Responder IP

The host IP address (and host name, if DNS resolution is enabled) that initiated, or responded to, the session responder. So that you can identify the blacklisted IP address in a blacklisted connection, host icons next to blacklisted IP addresses look slightly different.

Initiator Country or Responder Country

When a routable IP is detected, the country associated with the host IP address that initiated the session, or with the session responder. An icon of the country's flag is displayed, as well as the country's ISO 3166-1 alpha-3 country code. Hover your pointer over the flag icon to view the country's full name.

Note that the DC500 Defense Center does not support this feature.

Initiator User

The user logged into the session initiator.

Security Intelligence Category

The name of the blacklisted object that represents or contains the blacklisted IP address in the connection. The Security Intelligence category can be the name of a network object or group, the global blacklist, a custom Security Intelligence list or feed, or one of the categories in the Sourcefire Intelligence Feed. Note that this field is only populated if the **Reason** is **IP Block** or **IP Monitor**. For more information, see [Filtering Traffic Based on Security Intelligence Data](#) on page 438.

Note that neither the DC500 Defense Center nor Series 2 devices support this feature.

Ingress Security Zone or Egress Security Zone

The ingress or egress security zone associated with the connection.

Source Port/ICMP Type or Destination Port/ICMP Code

The port, ICMP type, or ICMP code used by the session initiator or session responder.

Application Protocol

The application protocol, which represents communications between hosts, detected in the connection.

Client and Client Version

The client application and version of that client detected in the connection.

If the system cannot identify the specific client used in the connection, this field displays `client` appended to the application protocol name to provide a generic name, for example, `FTP client`.

Web Application

The web application, which represents the content or requested URL for HTTP traffic detected in the connection. If the system cannot identify the specific web application in HTTP traffic, this field displays `Web Browsing`.

Category, Tag (Application Protocol, Client, Web Application)

Criteria that characterize the application to help you understand the application's function. For more information, see the [Application Characteristics table](#) on page 1264.

Application Risk

The risk associated with the application traffic detected in the connection: **very High**, **High**, **Medium**, **Low**, or **Very Low**. Each type of application detected in the connection has an associated risk; this field displays the highest of those. For more information, see the [Application Characteristics table](#) on page 1264.

Business Relevance

The business relevance associated with the application traffic detected in the connection: **very High**, **High**, **Medium**, **Low**, or **Very Low**. Each type of application detected in the connection has an associated business relevance; this field displays the lowest (least relevant) of those. For more information, see the [Application Characteristics table](#) on page 1264.

URL, URL Category, and URL Reputation

The URL requested by the monitored host during the session and its associated category and reputation, if available.

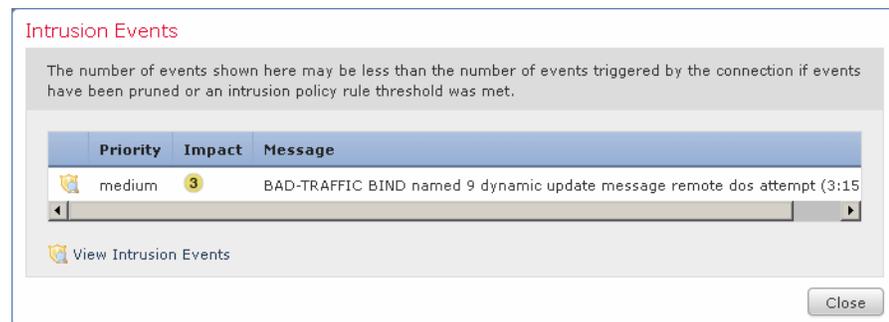

If the system identifies or blocks an SSL application, the requested URL is in encrypted traffic, so the system identifies the traffic based on an SSL certificate. For SSL applications, therefore, this field indicates the common name contained in the certificate. For more information see [Configuring Advanced Access Control Policy Settings](#) on page 447 and the [Enabling Sourcefire Cloud Communications table](#) on page 2032.

Note that neither the DC500 Defense Center nor Series 2 devices support URL category or reputation data.

Intrusion Events

The intrusion events, if any, associated with the connection. Instead of a list of events, the Defense Center displays the view intrusion events icon () in this field.

Click the icon to display a pop-up window with a list of intrusion events associated with the connection, as well as their priority and impact.

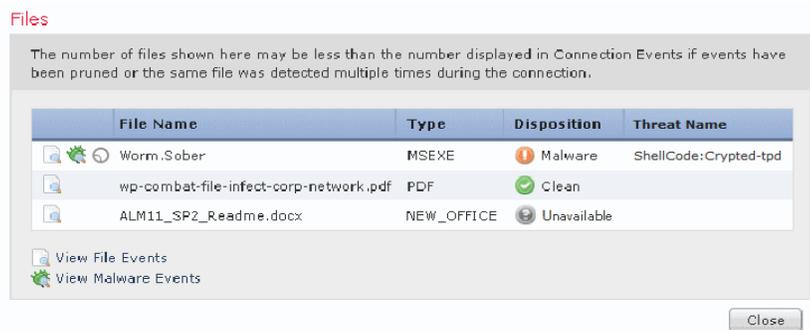

For more information, see [Viewing Intrusion Events Associated with a Connection](#) on page 574.

Files

The file events, if any, associated with the connection. Instead of a list of files, the Defense Center displays the view files icon () in this field. The number on the icon indicates the number of files (including malware files) detected or blocked in that connection.

Click the icon to display a pop-up window with a list of the files detected in the connection, as well as their types and if applicable, their malware lookup dispositions.

Note that neither the DC500 Defense Center nor Series 2 devices support network-based malware file detection.

For more information, see [Viewing Files Detected in a Connection](#) on page 572.

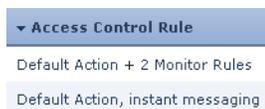

Access Control Policy

The access control policy that contains the access control rule or default action that logged the connection.

Access Control Rule

The access control rule or default action that handled the connection, as well as up to eight Monitor rules matched by that connection.

If the connection matched one Monitor rule, the Defense Center displays the name of the rule that handled the connection, followed by the Monitor rule name. If the connection matched more than one Monitor rule, the event viewer displays how many Monitor rules it matched, for example, **Default Action + 2 Monitor Rules**.

To display a pop-up window with a list of the first eight Monitor rules matched by the connection, click **N Monitor Rules**.

Device

The managed device that detected the connection, or for connections exported by NetFlow-enabled devices, the managed device that processed the NetFlow data.

Ingress Interface or Egress Interface

The ingress or egress interface associated with the connection.

TCP Flags

The TCP flags detected in the connection.

Source Device

The IP address of the NetFlow-enabled device that exported the data for the connection. If the connection was detected by a managed device, this field contains a value of `FireSIGHT`.

NetBIOS Domain

The NetBIOS domain used in the session.

Initiator Packets or Responder Packets

The total number of packets transmitted by the session initiator or the session responder.

Initiator Bytes or Responder Bytes

The total number of bytes transmitted by the session initiator or the session responder.

Connections

The number of connections in the summary. For long-running connections, that is, connections that span multiple connection summary intervals, only the first connection summary interval is incremented.

Count

The number of connections that match the information that appears in each row. Note that the **Count** field appears only after you apply a constraint that creates two or more identical rows.

IMPORTANT! If you create a custom workflow and do not add the **Count** column to a drill-down page, each connection is listed individually and packets and bytes are not summed.

Information Available in Connection Events

LICENSE: Any

The information available for any individual connection or connection summary event depends on several factors.

Detection Method

With one exception (TCP flags), the information available in NetFlow records is more limited than the information generated by monitoring network traffic using managed devices. For more information, see the [Differences Between NetFlow and FireSIGHT Data table](#) on page 1272.

Logging Method

For connections detected directly by Sourcefire managed devices, you can log a connection event at the beginning or end of a connection, or both — depending on the access control rule action, default action, or Security Intelligence blacklist. NetFlow-based connections are considered end-of-connection.

Beginning-of-connection events do not have information that must be determined by examining traffic over the duration of the session (for example, the total amount of data transmitted or the timestamp of the last packet in the connection). Beginning-of-connection events are also not guaranteed to have information about application or URL traffic in the session.

Associated File and Intrusion Policies

Only connections logged by access control rules with associated file policies contain file information. Similarly, you must associate intrusion policies with either access control rules or the default action to view intrusion information in the connection log.

Note that connections detected by pre-5.1.1 devices are not associated with file or intrusion information. Managed devices must be running at least Version 5.1.1 of the Sourcefire 3D System to perform file control and network-based malware detection and at least Version 5.2 to perform malware blocking. For more information, see [Performing File and Intrusion Inspection on Allowed Traffic](#).

Connection Event Type

Connection summaries do not contain all of the information associated with their aggregated connections. For example, because client information is not used to aggregate connections into connection summaries, summaries do not contain client information.

Keep in mind that connection graphs are based on connection summary data, which use only end-of-connection logs. If you logged only beginning-of-connection data, connection graphs and connection summary event views contain no data.

Traffic Type

The system only reports information present in the traffic. For example, non-HTTP traffic does not contain information on URLs or web applications. Or, there could be no user associated with the initiator host.

Other Configurations

An advanced setting in the access control policy controls the number of characters the system stores in the connection log for each URL requested by monitored hosts in HTTP sessions. If you use this setting to disable URL logging, the system does not display individual URLs in the connection log, although you can still view category and reputation data, if it exists.

Also, not all connection events have a **Reason**, which is a field populated only in specific situations, such as when a user bypasses an Interactive Block configuration; see [Reason](#) on page 544.

Appliance Model

Because Series 2 devices and the DC500 Defense Center support feature subsets, the DC500 does not display and Series 2 devices do not detect or provide the following connection data:

- Security Intelligence data
- URL category or reputation data
- File data associated with network-based malware detection

Additionally, because the DC500 Defense Center does not support geolocation data, it does not display the event initiator or responder country.

See [Series 2 Appliances](#) on page 40 for a summary of Series 2 appliance features.

The following table lists each connection event field and whether the system displays information in that field, depending on the detection method, logging method, and connection event type.

TIP! In the table view of connection events, the **Source Device** field, as well as the **Category** and **Tag** fields for each type of application are hidden by default. To show a hidden field in an event view, expand the search constraints, then click the field name under Disabled Columns.

Uses for Connection Data in the Sourcefire 3D System

LICENSE: Any

Logging connection events to the Defense Center database allows you to take advantage of many features in the Sourcefire 3D System, including:

- viewing the Connection Summary dashboard, which provides you with an at-a-glance view of the connections logged by the system; see [Using Dashboards](#) on page 66
- viewing detailed information on the connections logged by the system, which you can display in a graphical or tabular format; see [Viewing Connection Data Graphs and Tables](#) on page 555
- creating reports based on the connections logged by the system; see [Working with Reports](#) on page 1724
- using connection data to create and view a profile of your normal network traffic, called a traffic profile; see [Creating Traffic Profiles](#) on page 1585
- creating correlation rules that trigger and generate correlation events when the system detects certain connection data, or when a traffic profile changes; see [Creating Rules for Correlation Policies](#) on page 1461
- adding connection trackers to correlation rules, so that after the rule's initial criteria are met, the system begins tracking certain connections and only generates a correlation event if the tracked connections meet additional criteria; see [Adding a Connection Tracker](#) on page 1486

Viewing Connection Data Graphs and Tables

LICENSE: Any

To help you gain in-depth insight to connection data, the system can present connection data both graphically and in a tabular format. The page you see when you access connection data differs depending on the workflow you use. You can use one of the predefined workflows or create a custom workflow that displays only the information that matches your specific needs.

Each connection table view or connection graph contains information about the connections or connection summaries you are viewing, including timestamps, IP addresses, applications, and so on. The information available for any individual connection detected by the Sourcefire 3D System depends on several factors, including detection method and logging options. For more information, see [Connection Data Fields](#) on page 543 and [Information Available in Connection Events](#) on page 550.

TIP! The Connection Summary dashboard can provide you with an at-a-glance view of the connections logged by the system. For more information, see [Using Dashboards](#) on page 66.

To view connection data:

ACCESS: Admin/Any Security Analyst

► Select **Analysis > Connections**.

The first page of the default connection data workflow appears. There are two possibilities:

- The workflow page displays a **graph**. See [Working with Connection Graphs](#) on page 555 for information on the actions you can perform.
- The workflow page displays a **table**. See [Working with Connection Data Tables](#) on page 570 for information on the actions you can perform.

To use a different workflow, including a custom workflow, click **(switch workflow)** by the workflow title. For information on specifying a different default workflow, see [Configuring Event View Settings](#) on page 2218. If no events appear, you may need to adjust the time range; see [Setting Event Time Constraints](#) on page 1820.

Working with Connection Graphs

LICENSE: Any

One of the ways the system can present connection data is graphically. There are three different types of connection graphs: line graphs, bar graphs, and pie charts. Bar graphs and line graphs can display multiple datasets; that is, they can display several values on the y-axis for each x-axis data point.

You can manipulate connection graphs in various ways, including:

- changing the type of data that the graph displays
- switching between graph types
- constraining the graph so it shows data for specific time ranges, hosts, applications, ports, and devices

Because traffic profiles are based on connection data (see [Creating Traffic Profiles](#) on page 1585), you can view traffic profiles as line graphs. You can manipulate these graphs in the same way as you would any other connection graph, with some restrictions.

IMPORTANT! To view traffic profiles, you must have Administrator access. Compare this with other connection graphs, which you can view with any Security Analyst or Administrator access.

When you view a connection graph, as described in [Viewing Connection Data Graphs and Tables](#) on page 555, you can perform the basic actions described in the following table.

ACCESS: Admin/Any Security Analyst

Basic Connection Graph Functions

To...	You CAN...
learn more about the data that appears	find more information in Connection Data Fields on page 543.
modify the time and date range	find more information in Setting Event Time Constraints on page 1820.
view a host's profile	on a graph displaying connection data by initiator or responder, click either a bar on a bar graph or a wedge on a pie chart and select View Host Profile .
use a different workflow, including a custom workflow	click (switch workflow) by the workflow title.
navigate between pages in the current workflow	find more information in Using Workflow Pages on page 1812.
navigate to other event views to view associated events	find more information in Navigating Between Workflows on page 1836.

There are many other ways you can manipulate connection graphs as you perform in-depth analysis of connection data. For more information, see:

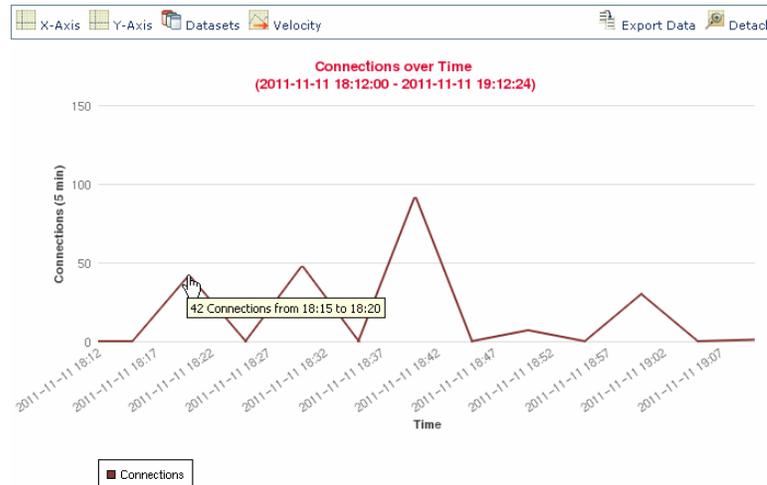

- [Changing the Graph Type](#) on page 557 explains how to change between bar graphs and pie chart, and between standard line graphs and velocity graphs.
- [Selecting Datasets](#) on page 560 explains how to display several values on the y-axis for each x-axis data point on line graphs and bar graphs.
- [Viewing Information About Aggregated Connection Data](#) on page 563 explains how to get more information about the data points on a graph, or to display the host profile of a host whose statistics are being graphed.
- [Manipulating a Connection Graph on a Workflow Page](#) on page 563 explains how to constrain the data that appears on a connection graph without advancing the workflow to the next page.
- [Drilling Down Through Connection Data Graphs](#) on page 564 explains how to constrain the data that appears on a connection graph while advancing the workflow to the next page.
- [Recentering and Zooming on Line Graphs](#) on page 565 explains how to recenter a line graph around any point in time.
- [Selecting Data to Graph](#) on page 565 explains how to change the data displayed on a connection graph by changing its x- or y-axis.
- [Detaching Connection Graphs](#) on page 569 explains how you can detach a connection graph into a new browser window and perform further analysis without affecting the default time range for the Defense Center.
- [Exporting Connection Data](#) on page 569 explains how to export the connection data used to construct a graph as a CSV (comma-separated values) file.

Changing the Graph Type

LICENSE: Any

There are three different connection graphs: line graphs, bar graphs, and pie charts. *Line graphs* plot data over time. For example, the following line graph

displays the total number of connections detected on a monitored network over a one-hour time span. Traffic profiles are always displayed as line graphs.

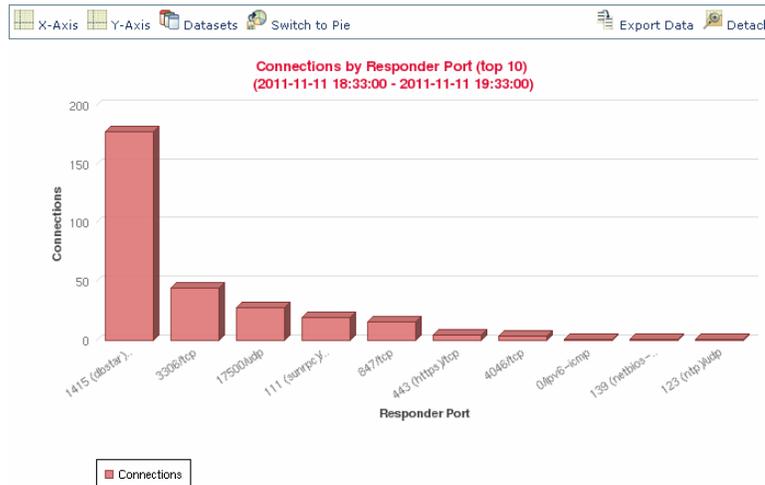

By default, line graphs appear in *standard view*. A standard line graph aggregates data over five minute intervals, plots the aggregated data points, and connects the points.

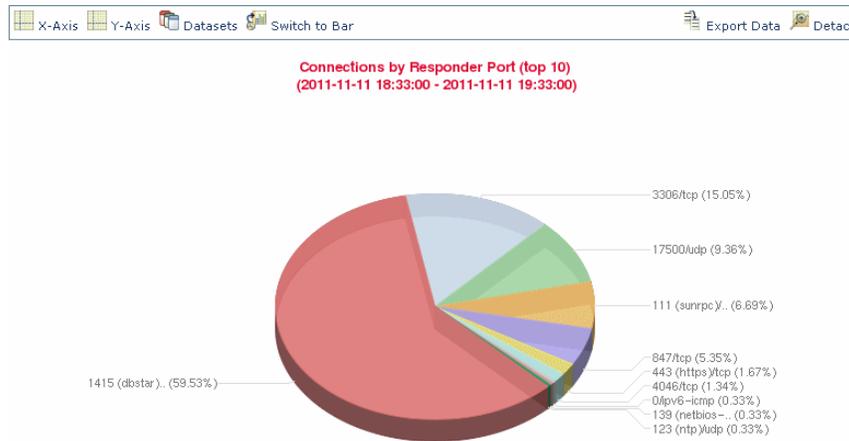

However, you can change a line graph from standard view to *velocity view*. A velocity line graph shows the rate of change between those data points. If you change the above graph to a velocity graph, the y-axis changes from indicating the number of connections to indicating the change in the number of connections over time.

Bar graphs display data grouped into discrete categories. For example, a bar graph could show the number of connections detected on a monitored network for the 10 most active ports over a one-hour time span.

Pie charts, like bar graphs, also display data grouped into discrete categories. The following pie chart shows the same information as the bar graph above.

Follow the directions in the following table to switch between standard and velocity line graphs, and to switch between bar graphs and pie charts.

ACCESS: Admin/Any Security Analyst

Changing Graph Types

TO CHANGE...	YOU CAN...
a bar graph to a pie chart	click Switch to Pie . Note that pie charts cannot display multiple datasets; see Selecting Datasets on page 560.
a pie chart to a bar graph	click Switch to Bar .
a line graph from a standard graph to a velocity graph	click Velocity and select Velocity .
a line graph from a velocity graph to a standard graph	click Velocity and select Standard .

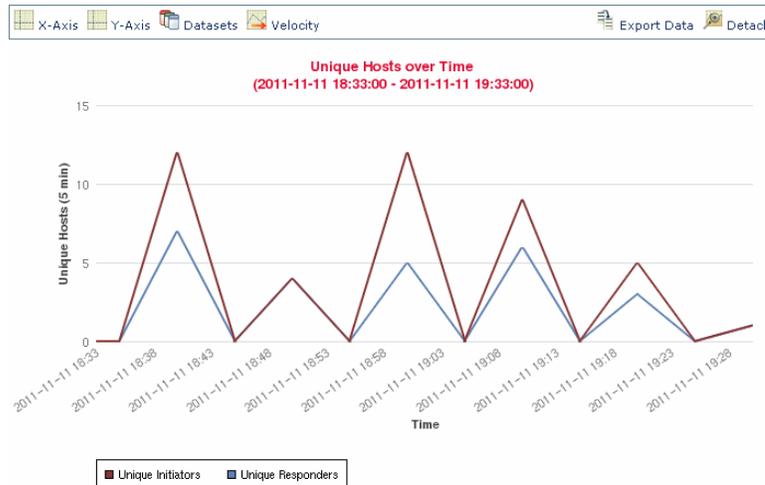

Selecting Datasets

LICENSE: Any

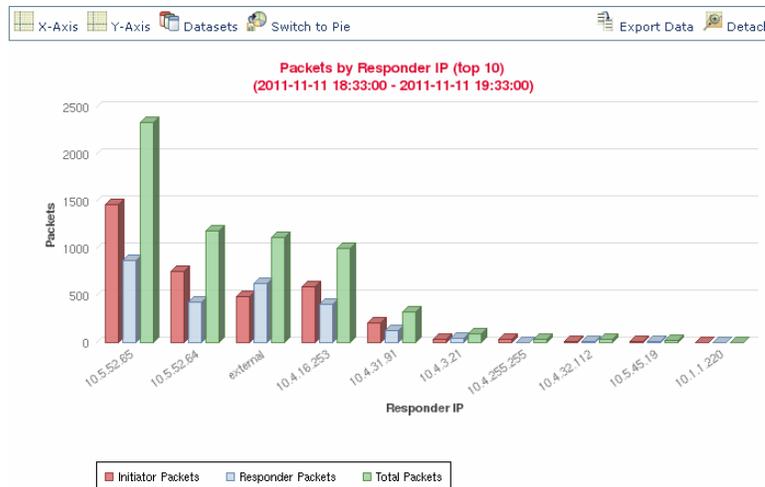

Both bar graphs and line graphs can display multiple datasets; that is, they can display several values on the y-axis for each x-axis data point. For example, you could display the total number of unique initiators and the total number of unique
Pie charts can only display one dataset.

On line graphs, multiple datasets appear as multiple lines, each with a different color. For example, the following graphic displays the total number of unique

initiators and the total number of unique responders detected on a monitored network over a one hour interval.

On bar graphs, multiple datasets appear as a set of colored bars for each x-axis data point. For example, the following bar graph displays the total packets transmitted on a monitored network, packets transmitted by initiators, and packets transmitted by responders.

You **cannot** display multiple datasets on a pie chart. If you switch to a pie chart from a bar graph that has multiple datasets, the pie chart shows only one dataset, which is selected automatically. When selecting which dataset to display, the Defense Center favors total statistics over initiator and responder statistics, and

favors initiator statistics over responder statistics. The [Dataset Options](#) table describes the datasets you can display on the x-axis of a connection graph.

Dataset Options

IF THE Y-AXIS DISPLAYS...	YOU CAN SELECT AS DATASETS...
Connections	<p>the default only, which is the number of connections detected on the monitored network (Connections)</p> <p>This is the only option for traffic profile graphs.</p>
KBytes	<p>combinations of:</p> <ul style="list-style-type: none"> • the total kilobytes transmitted on the monitored network (Total KBytes) • the number of kilobytes transmitted from host IP addresses on the monitored network (Initiator KBytes) • the number of kilobytes received by host IP addresses on the monitored network (Responder KBytes)
KBytes Per Second	<p>the default only, which is the total kilobytes per second transmitted on the monitored network (Total KBytes Per Second)</p>
Packets	<p>combinations of:</p> <ul style="list-style-type: none"> • the total packets transmitted on the monitored network (Total Packets) • the number of packets transmitted from host IP addresses on the monitored network (Initiator Packets) • the number of packets received by host IP addresses on the monitored network (Responder Packets)
Unique Hosts	<p>combinations of:</p> <ul style="list-style-type: none"> • the number of unique session initiators on the monitored network (Unique Initiators) • the number of unique session responders on the monitored network (Unique Responders)
Unique Application Protocols	<p>the default only, which is the number of unique application protocols on the monitored network (Unique Application Protocols)</p>
Unique Users	<p>the default only, which is the number of unique users logged into session initiators on the monitored network (Unique Initiator Users)</p>

To select the datasets displayed on a connection graph:

ACCESS: Admin/Any Security Analyst

- ▶ Click **Datasets** and select the datasets you want to graph.
The datasets you can select are described in the [Dataset Options](#) table.

Viewing Information About Aggregated Connection Data

LICENSE: Any

Connection graphs are based on aggregated data over five-minute intervals, also called *connection summaries*. You can get more information about the specific connection summaries used to construct a connection graph. For example, on a graph of connections over time, you may want to know exactly how many connections were detected over a specific interval.

To get detailed information on aggregated connection data:

ACCESS: Admin/Any Security Analyst

- ▶ Position your cursor over a point on a line graph a bar in a bar graph, or a wedge in a pie chart. A tooltip appears with detailed information about the data used to construct that portion of the graph.

Manipulating a Connection Graph on a Workflow Page

LICENSE: Any

When you open a connection data workflow, the data is initially constrained only by a time range. You can constrain connection graphs with additional criteria without advancing the workflow to the next page.

TIP! Constraining connection data in this manner changes the x-axis (also called the independent variable when viewing a pie chart) of the graph. To change the independent variable without constraining the connection data, use the **X-Axis** and **Y-Axis** menus. For more information, see [Selecting Data to Graph](#) on page 565.

To constrain connection data:

ACCESS: Admin/Any Security Analyst

1. Click a point on a line graph, a bar on a bar graph, or a wedge on a pie chart.
2. Select a **View by...** option.

You can constrain connection data based on any of the criteria listed in the [X-Axis Functions table](#) on page 567.

For example, consider a graph of connections over time. If you constrain a point on the graph by port, a bar graph appears, showing the 10 most active ports based on the number of detected connection events, but constrained by the ten-minute time span that is centered on the point you clicked.

If you further constrain the graph by clicking on one of the bars and selecting **View by Initiator IP**, a new bar graph appears, constrained by not only the same ten-minute time span as before, but also by the port represented by the bar you clicked.

IMPORTANT! Unless you are working with a detached graph, constraining connection data in this manner changes the time range. For more information on detached graphs, see [Detaching Connection Graphs](#) on page 569.

Drilling Down Through Connection Data Graphs

LICENSE: Any

When you open a connection data workflow, the data is initially constrained only by a time range. You can constrain connection graphs while advancing the workflow to the next page.

To drill down in a connection data workflow:

ACCESS: Admin/Any Security Analyst

1. Click a point on a line graph, a bar on a bar graph, or a wedge on a pie chart.
2. Select **Drill-down**.

You drill down to the next workflow page, constraining using the item you clicked:

- Clicking a point on a line graph constrains the time range on the next page to a 10-minute span, centered on the point you clicked.
- Clicking a bar on a bar graph or a wedge on a pie chart constrains the next page based on the criterion represented by the bar or wedge. For example, clicking on a bar that represents port use drills down to the next page in the workflow, which is constrained by the port represented by the bar you clicked.

Recentering and Zooming on Line Graphs

LICENSE: Any

You can recenter line graphs around any point in time. You can recenter using either the default time range, or you can choose a different time range.

IMPORTANT! Unless you are working with a detached graph, recentering changes the default time range. For more information on detached graphs, see [Detaching Connection Graphs](#) on page 569.

To recenter using the default time range:

ACCESS: Admin/Any Security Analyst

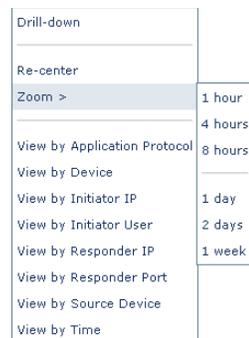

- ▶ Click the point on the line graph where you want to recenter the graph, and click **recenter**.

The graph is redrawn, centered on the point you clicked, with a time span that is the same length as your default time range.

To recenter using a different time range:

ACCESS: Admin/Any Security Analyst

1. Click the point where you want to recenter the graph and click **Zoom**.

2. Select the time span for the new graph, which can be as short as one hour or as long as one week.

The graph is redrawn, centered on the point you clicked, with the time span you selected.

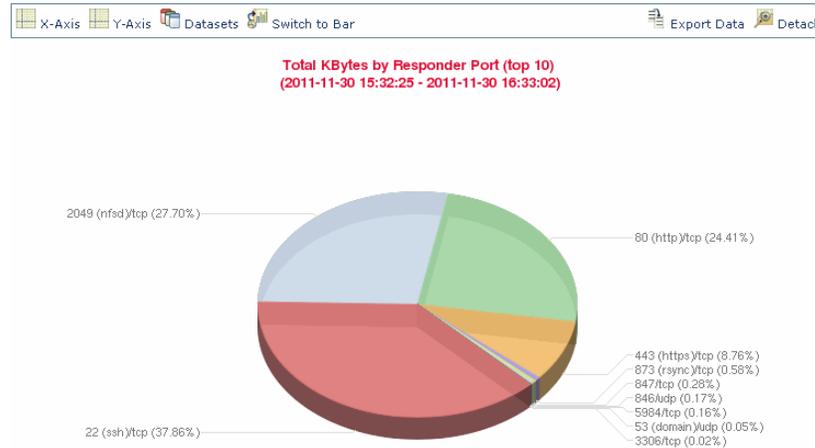

Selecting Data to Graph

LICENSE: Any

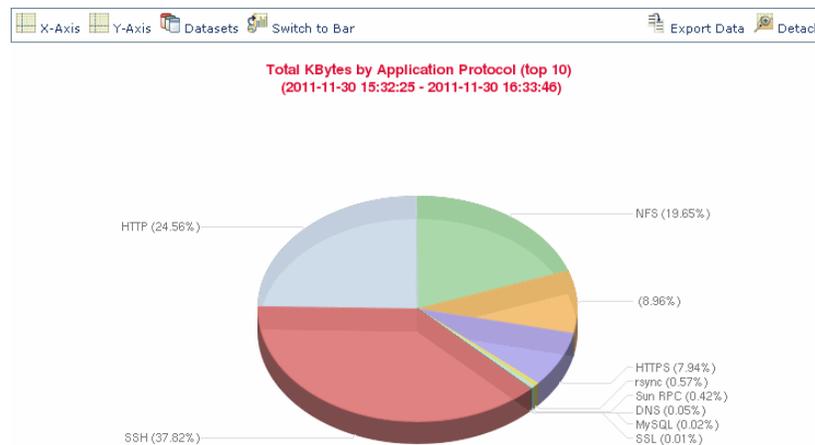

You can display different data on a connection graph by changing either the x-axis, the y-axis, or both.

Note that on a pie chart, changing the x-axis changes the independent variable and changing the y-axis changes the dependent variable. For example, consider a

pie chart that graphs kilobytes per port. In this case, the x-axis is **Responder Port** and the y-axis is **KBytes**. This pie chart represents the total kilobytes of data transmitted over a monitored network during a certain interval. The wedges of the pie represent the percent of the data that was detected on each port.

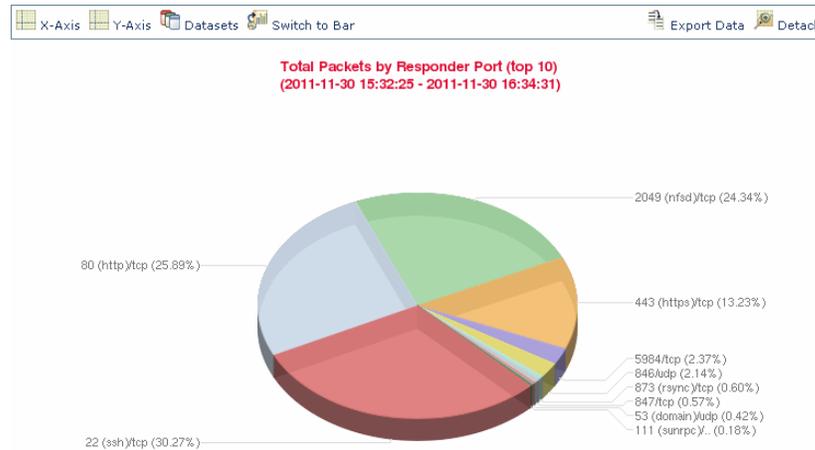

If you change the x-axis of the chart to **Application Protocol**, the pie chart still represents the total kilobytes of data transmitted, but the wedges of the pie represent the percentage of the data transmitted for each detected application protocol.

However, if you change the y-axis of the first pie chart to **Packets**, the pie chart represents the total number of packets transmitted over the monitored network

during a certain interval, and the wedges of the pie represent the percentage of the total number of packets that was detected on each port.

Follow the directions in the [X-Axis Functions](#) table to change the x-axis of a connection graph.

X-Axis Functions

TO GRAPH CONNECTION DATA...	YOU CAN...
by the 10 most active application protocols on the monitored network based on the number of detected connection events	click X-Axis and select Application Protocol .
by the 10 most active managed devices on the monitored network based on the number of detected connection events	click X-Axis and select Device .
by the 10 most active host IP addresses on the monitored network based on the number of connection events where that host IP address initiated the connection transaction	click X-Axis and select Initiator IP .
by the 10 most active users on the monitored network based on the number of connection events where the host where the user is logged in initiated the connection transaction	click X-Axis and select Initiator User .
by the 10 most active host IP addresses on the monitored network based on the number of connection events where that address was the responder in the connection transaction	click X-Axis and select Responder IP .

X-Axis Functions (Continued)

TO GRAPH CONNECTION DATA...	YOU CAN...
by the 10 most active ports on the monitored network based on the number of detected connection events where the host was the responder in the connection transaction	click X-Axis and select Responder Port .
by the 10 most active source devices, which include NetFlow-enabled devices that exported the connection data for the connections, plus a source device named FireSIGHT for all connections detected by Sourcefire managed devices	click X-Axis and select Source Device .
over time	click X-Axis and select Time .

Follow the directions in the [Y-Axis Functions](#) table to change the y-axis of a connection graph.

Y-Axis Functions

TO...	YOU CAN...
graph the number of connections on the monitored network by the criterion you chose for the x-axis	click Y-Axis and select Connections .
graph the total kilobytes transmitted on the monitored network by the criterion you chose for the x-axis	click Y-Axis and select KBytes .
graph the total kilobytes per second transmitted on the monitored network by the criterion you chose for the x-axis	click Y-Axis and select KBytes Per Second .
graph the total number of packets transmitted on the monitored network by the criterion you chose for the x-axis	click Y-Axis and select Packets .
graph the total number of unique hosts detected on the monitored network by the criterion you chose for the x-axis	click Y-Axis and select Unique Hosts .

Y-Axis Functions (Continued)

To...	You CAN...
graph the total number of unique application protocols detected on the monitored network by the criterion you chose for the x-axis	click Y-Axis and select Unique Application Protocols .
graph the total number of unique users detected on the monitored network by the criterion you chose for the x-axis	click Y-Axis and select Unique Users .

Detaching Connection Graphs

LICENSE: Any

If you want to perform further analysis on a connection graph, without affecting the default time range, you can detach the graph into a new browser window. You can perform all the same actions on detached connection graphs that you can on embedded connection graphs. You can also print a detached graph by clicking **Print**. Note that traffic profile graphs are, by default, detached graphs.

TIP! If you are viewing a detached graph, click **New Window** to create another copy of the detached graph in a new browser window. You can then perform different analyses on each of the detached graphs.

To detach a graph:

ACCESS: Admin/Any Security Analyst

- ▶ Click **Detach**.

Exporting Connection Data

LICENSE: Any

You can easily share connection data with others by exporting it as a CSV (comma-separated values) file.

TIP! You can also save a connection graph as an image by right-clicking on the graph and following your browser's prompts.

To export connection data:

ACCESS: Admin/Any Security Analyst

1. Click **Export Data**.

A pop-up window appears, displaying a table view of the data on your graph.

Time	Connections
2011-11-30 15:35:00	30346
2011-11-30 15:45:00	1180
2011-11-30 16:45:00	1755
2011-11-30 16:50:00	11671

2. Click **Download CSV File** and save the file.

Working with Connection Data Tables

LICENSE: Any

The Sourcefire 3D System's event viewer allows you to view connection data in a table, as well as manipulate the event view depending on the information relevant to your analysis. The page you see when you access connection data differs depending on the workflow, which is simply a series of pages you can use to evaluate events by moving from a broad to a more focused view.

The Sourcefire-provided *Connection Events* workflow provides a summary view of basic connection and detected application information, which you can then use to drill down to the table view of events. You can also create a custom workflow that displays only the information that matches your specific needs.

Using the event viewer, you can:

- search for, sort, and constrain events, as well as change the time range for displayed events
- specify the columns that appear (table view only)
- view the host profile associated with an IP address, or the user details and host history associated with a user identity
- view files (including malware files) and intrusions detected in connections
- view geolocation information associated with an IP address
- view the full text of a URL in a connection event
- view events using different workflow pages within the same workflow
- view events using a different workflow altogether
- drill down page-to-page within a workflow, constraining on specific values
- bookmark the current page and constraints so you can return to the same data (assuming the data still exists) at a later time

- create a report template using the current constraints
- delete events from the database
- use the IP address context menu to whitelist, blacklist, or obtain additional information about a host or IP address associated with a connection

Note that when you constrain connection events on a drill-down page, the packets and bytes from identical events are summed. However, if you are using a custom workflow and did not add a **Count** column to a drill-down page, the events are listed individually and packets and bytes are not summed.

The following sections contain information on viewing and analyzing connection event tables:

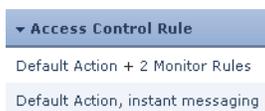

- [Understanding and Using Workflows](#) on page 1791 provides detailed instructions on using the event viewer.
- [Using Geolocation](#) on page 1816 provides information on how to view and interpret geolocation information associated with connection events.
- [Configuring Event View Settings](#) on page 2218 explains how to change the default workflow for viewing connection data.
- [Connection Data Fields](#) on page 543 and [Information Available in Connection Events](#) on page 550 provide details on the data in connection events.
- [Working with Connection Events Associated with Monitor Rules](#) on page 571 explains how to constrain connection events using Monitor rule criteria.
- [Viewing Files Detected in a Connection](#) on page 572 explains how to view the files, including malware files, detected or blocked in a connection.
- [Viewing Intrusion Events Associated with a Connection](#) on page 574 explains how to view the intrusion events associated with a connection.

Working with Connection Events Associated with Monitor Rules

LICENSE: Any

When you view logged connections using the event viewer, the Defense Center displays the access control rule or default action that handled each connection, as well as up to eight Monitor rules matched by each of those connections.

If a connection matched one Monitor rule, the Defense Center displays the name of the rule that handled the connection, followed by the Monitor rule name. If the connection matched more than one Monitor rule, the event viewer displays how many Monitor rules it matched, for example, **Default Action + 2 Monitor Rules**.

You can constrain connection event views using matched Monitor rules, using either of the following:

- the access control rule or default action that handled the connection
- any individual Monitor rule matched by a connection

To constrain connection events using Monitor rule matching:

ACCESS: Admin/Any Security Analyst

1. Select Analysis > Connections.

The first page of the default connection data workflow appears.

2. Display the workflow you want to use for your analysis. Make sure the drill-down page or table view you are using shows the Access Control Rule field.

3. How do you want to constrain the events?

- to constrain on the access control rule or default action that handled the connection, click the rule name or **Default Action**.
- to constrain on the only Monitor rule that matched a logged connection, click the Monitor rule name.
- to constrain on one of several Monitor rules that matched a logged connection, click an **N Monitor Rules** value. For example, click **2 Monitor Rules**.

The Monitor Rules pop-up window for that connection event appears, listing the first eight Monitor rules matched by the connection. Click the Monitor rule name you want to use to constrain connection events.

Your events are constrained. If you were using a drill-down page, the event view advances to the next page in the workflow.

Viewing Files Detected in a Connection

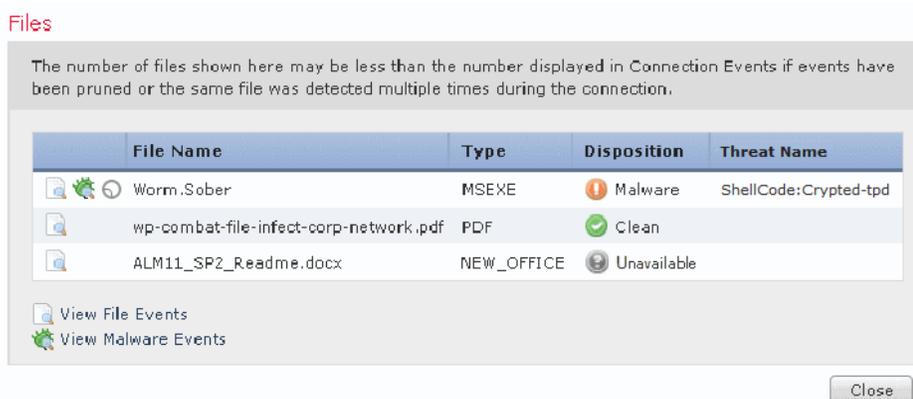

LICENSE: Protection or Malware

SUPPORTED DEVICES: feature dependent

SUPPORTED DEFENSE CENTERS: feature dependent

If you associate a file policy with one or more access control rules, the system can detect files (including malware) in matching traffic. Using the event viewer, you can see the file events, if any, associated with the connections logged by those rules.

Instead of a list of files, the Defense Center displays the view files icon () in the **Files** column. The number on the icon indicates the number of files (including malware files) detected or blocked in that connection. Clicking on the icon does not drill down to the next workflow page or constrain connection events. Instead, it displays a pop-up window with a list of the files detected in the connection as well as their types, and if applicable, their malware dispositions.

In the pop-up window, you can click:

- a file's view icon () to view details in a table view of file events
- a malware file's view icon () to view details in a table view of malware events
- a file's trajectory icon () to track the file's transmission through your network
- **View File Events** or **View Malware Events** to view details on all of the connection's detected file or network-based malware events

TIP! To quickly view file or malware events associated with one or more connections, select the connections using the check boxes in the event viewer, then click either the **Files** or **Malware** tab above the column headings. You can view the connections used to transmit files in a similar way. For more information, see [Navigating Between Workflows](#) on page 1836.

When you view associated events, the Defense Center uses your default workflow for that event type. For more information on file and malware events, see [Working with File Events](#) on page 1222 and [Working with Malware Events](#) on page 1229. For more information on using the network file trajectory feature, see [Working with Network File Trajectory](#) on page 1241.

Note that not all file and malware events are associated with connections, as follows:

- Connections detected by pre-5.1.1 devices are not associated with files. Managed devices must be running at least Version 5.1.1 of the Sourcefire 3D System to perform file control and network-based malware detection.
- Endpoint-based malware events are not associated with connections. Those events are generated by FireAMP Connectors, instead of by the system inspecting network traffic.
- Many IMAP-capable email clients use a single IMAP session, which ends only when the user exits the application. Although long-running connections are logged by the system (see [Long-Running Connections](#) on page 542), files downloaded in the session are not associated with the connection until the session ends.

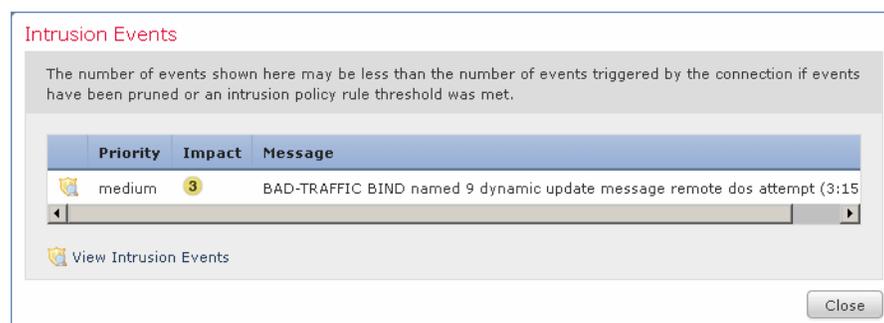

Note also that neither Series 2 devices nor the DC500 Defense Center support network-based advanced malware protection.

Viewing Intrusion Events Associated with a Connection

LICENSE: Protection

If you associate an intrusion policy with an access control rule or default action, the system can detect exploits in matching traffic. Using the event viewer, you can see the intrusion events, if any, associated with logged connections.

Instead of a list of events, the Defense Center displays the view intrusion events icon (🛡️) in the **Intrusion Events** column. Clicking on the icon does not drill down to the next workflow page or constrain connection events. Instead, it displays a pop-up window with a list of the intrusion events associated with the connection, as well as their priority and impact.

In the pop-up window, you can click a listed event's view icon (🔍) to view details in the packet view. You can also click **View Intrusion Events** to view details on all of the connection's associated intrusion events.

TIP! To quickly view intrusion events associated with one or more connections, select the connections using the check boxes in the event viewer, then click the **Intrusion** tab above the column headings. You can view the connections associated with intrusion events in a similar way. For more information, see [Navigating Between Workflows](#) on page 1836.

When you view associated events, the Defense Center uses your default intrusion events workflow. For more information on intrusion events, see [Working with Intrusion Events](#) on page 593.

Note that managed devices **must** be running at least Version 5.1.1 of the Sourcefire 3D System to associate intrusion events with connection events. Connections detected by pre-5.1.1 devices are not associated with intrusion events.

Searching for Connection Data

LICENSE: Any

Using the Defense Center's Search page, you can search for specific connection events or connection summaries, display the results in the event viewer, and save your search criteria to reuse later. Custom Analysis dashboard widgets, report templates, and custom user roles can also use saved searches.

The screenshot shows the 'Search Information' form. At the top, it says 'Note: If a search name is not specified, an automatically generated name will be used.' Below this, there are several fields and options:

- Table:** A dropdown menu set to 'Connection Events'.
- Name:** An empty text input field.
- Save As Private:** A checked checkbox.
- Constraint:** A section with several criteria:
 - First Packet:** > 2009-07-16 13:00:31, < today at 4:30pm
 - Last Packet:** > 2009-07-16 13:00:31, < today at 4:30pm
 - Active:** Allow, Deny, or IP
 - Response Bytes:** > 0
 - Traffic (Bytes):** > 50
 - Connections:** > 10

At the bottom of the form are two buttons: 'Search' and 'Save As New Search'.

Searches delivered with the system, labeled with (sourcefire) in the Saved Searches list, serve as examples.

Because connection graphs are based on connection summaries, the same criteria that constrain connection summaries also constrain connection graphs.

Fields marked with an asterisk (*) constrain connection graphs and connection summaries, as well as individual connection events.

If you search connection summaries using invalid search constraints and view your results using a connection summary page in a custom workflow, the invalid constraints are labeled as not applicable (N/A) and are marked with a strikethrough, as shown in the following graphic.

Also, keep in mind that your search results depend on the available data in the events you are searching. In other words, depending on the available data, your search constraints may not apply. See [Information Available in Connection Events](#) on page 550 for information on when data is available for each connection data field.

General Search Syntax

The system displays examples of valid syntax next to each search field. When entering search criteria, keep the following points in mind:

- All fields accept negation (!).
- All fields accept comma-separated lists. If you enter multiple criteria, the search returns only the records that match all the criteria.
- Many fields accept one or more asterisks (*) as wild cards.
- Specify n/a in any field to identify events where information is not available for that field; use !n/a to identify the events where that field is populated.
- Click the add object icon () that appears next to a search field to use an object as a search criterion.

For detailed information on search syntax, including using objects in searches, see [Searching for Events](#) on page 1770.

Special Search Syntax for Connection Data

To supplement the general search syntax listed above, the following table describes some special search syntax for connection data.

Connection Data Special Search Syntax

SEARCH CRITERION	SPECIAL SYNTAX
a Monitor rule matched by the connection	Use the Access Control Rule criterion to search for connections that matched individual Monitor rules. Because traffic matching a Monitor rule is always later handled by another rule or by the default action, you cannot search for a connection with an action of Monitor . Searching for the name of a Monitor rule returns all connections that matched that Monitor rule, regardless of the rule or default action that later handled the connection.
a criterion with a numerical value (Bytes, Packets, Connections)	You can precede the number with greater than (>), greater than or equal to (>=), less than (<), less than or equal to (<=), or equal to (=). TIP! To view meaningful results for searches using the Connections criterion, you must use a custom workflow that has a connection summary page.
Files or Intrusion Events associated with the connection	You cannot use the connection events Search page to search for file, malware, and intrusion events associated with a connection. For information on viewing these associated events, see Viewing Files Detected in a Connection on page 572 and Viewing Intrusion Events Associated with a Connection on page 574.
the Initiator User or URL for a connection	The system performs a partial match, that is, you can search for all or part of the field contents without using asterisks.
the total Traffic (in bytes) or transport Protocol used in the connection	These columns do not appear in table views. To determine if there is a protocol or traffic constraint on a connection table view, expand the search constraints. To search for a specific protocol, use the name or number protocol as listed in http://www.iana.org/assignments/protocol-numbers .
TCP Flags in a NetFlow connection	Type a list of comma-separated TCP flags to view all connections that have <i>at least</i> one of those flags (instead of all). You can also select the Only check box to search for connections that have any of the flags you specify as their only TCP flag.

To search for connection data:

ACCESS: Admin/Any Security Analyst

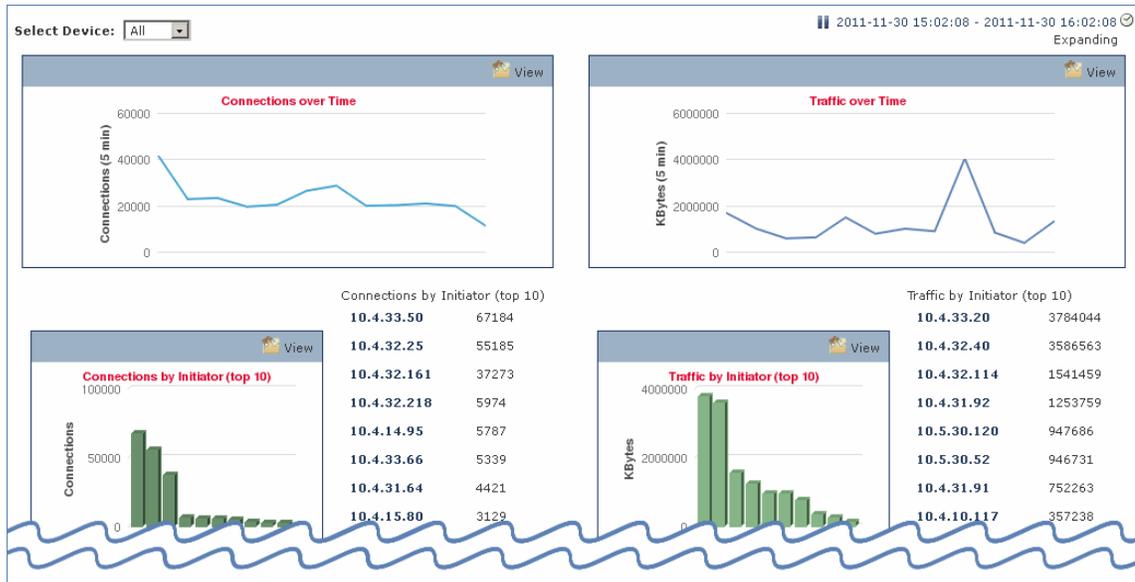

1. Select **Analysis > Search**.
The Search page appears.
2. From the **Table** drop-down list, select **Connection Events**.
The page reloads with the appropriate constraints.
3. Optionally, if you want to save the search, enter a name for the search in the **Name** field.
If you do not enter a name, one is created automatically when you save the search.
4. Enter your search criteria in the appropriate fields.
See [Connection Data Fields](#) on page 543 for information on the fields in the connection events table.
5. If you want to save the search so that other users can access it, clear the **Save As Private** check box. Otherwise, leave the check box selected to save the search as private.
If you want to use the search as a data restriction for a custom user role, you **must** save it as a private search.
6. You have the following options:
 - Click **Search** to start the search.
Your search results appear in your default malware events workflow, constrained by the current time range.
 - Click **Save** if you are modifying an existing search and want to save your changes.
 - Click **Save as New Search** to save the search criteria. The search is saved (and associated with your user account if you selected **Save As Private**).

Viewing the Connection Summary Page

LICENSE: Any

The Connection Summary page provides graphs of the activity on your monitored network organized by different criteria. For example, the Connections over Time

graph displays the total number of connections on your monitored network over the interval that you select.

IMPORTANT! The Connection Summary page is visible only to users who have custom roles that are restricted by searches on connection events and who have been granted explicit access to the Connection Summary page. For more information, see [Understanding Restricted User Access Properties](#) on page 1912 and [Managing Custom User Roles](#) on page 1908.

The following table describes the different actions you can perform on the Connection Summary page.

Connection Summary Page Actions

To...	You CAN...
modify the time and date range for the Connection Summary page	find more information in Setting Event Time Constraints on page 1820.
manipulate connection graphs	find more information in Working with Connection Graphs on page 555.
detach a connection graph from the page	click View on the graph you want to detach. For more information on detached graphs, see Detaching Connection Graphs on page 569.

You can perform almost all the same actions on connection summary graphs that you can perform on connection graphs. However, because the graphs on the Connection Summary page are based on aggregated data, you cannot examine the individual connection events on which the graphs are based. In other words, you cannot drill down to a connection data table view from a connection summary graph.

To view the Connection Summary page:

ACCESS: Custom

1. Select **Overview > Summary > Connection Summary**.

The Connection Summary page appears for the current time range on your Defense Center.

2. From the **Select Device** list, select the device whose summary you want to view, or select **All** to view a summary of all devices.

CHAPTER 16

INTRODUCTION TO SOURCEFIRE INTRUSION PREVENTION

You can deploy your Sourcefire 3D System both to detect and protect against network traffic that could threaten the availability, integrity, and confidentiality of hosts and their data. The term *intrusion detection* generally refers to the process of passively analyzing network traffic for potential intrusions and storing attack data for security analysis. The term *intrusion prevention* includes the concept of intrusion detection, but adds the ability to block or alter malicious traffic as it travels across your network.

The Sourcefire 3D System can perform as both an intrusion detection system and an intrusion prevention system depending on:

- how you attach managed devices to your network: inline or out of band
- how you configure the devices' interface sets: passive, inline, switched, or routed
- the drop behavior of rules set to Drop and Generate Events: enabled or disabled

After you deploy your devices and configure them according to your needs, the Sourcefire 3D System uses several mechanisms to look for the broad range of exploits that attackers have developed. You can then use a broad range of tools to analyze and respond to the intrusion events.

Sensing Intrusions

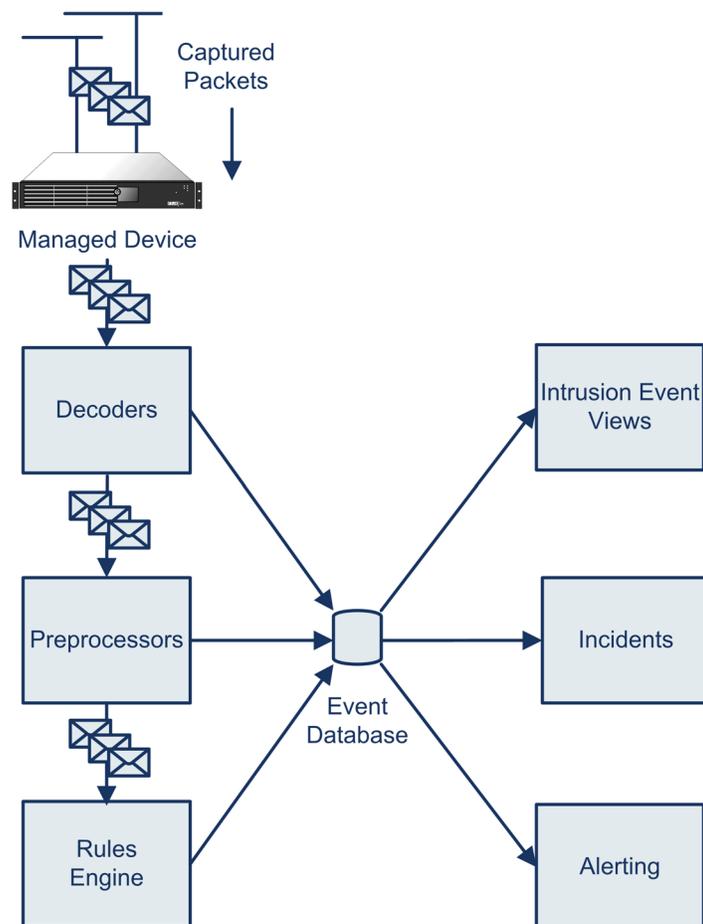

Packet decoders and preprocessors detect anomalous traffic that might signal an intrusion attempt and, when you have enabled accompanying decoder and preprocessor rules, report on detected anomalies. Next, intrusion rules examine the decoded packets for attacks based on patterns. Used together, intrusion rules

and preprocessors provide broader and deeper packet inspection than a signature-based system and help to identify intrusions more effectively.

The Sourcefire Vulnerability Research Team (VRT) regularly sends out updates, called Sourcefire rule updates, that may contain new intrusion rules, so you can be sure that you are detecting the most recently released attacks.

Responding to Intrusions

When a packet travels over a segment, the managed device captures and analyzes it using a series of decoders and preprocessors and then a rules engine. When the device identifies a possible intrusion, it generates an *intrusion event*, which is a record indicating the date, time, the type of exploit, and contextual information about the source of the attack and its target. Unless your device is deployed passively, the system can block possible intrusions or replace harmful content in a packet. For packet-based events, a copy of the packet or packets that triggered the event is also recorded.

To learn more about how a Sourcefire 3D System deployment can help protect your network, see the following sections:

- [Understanding How Traffic Is Analyzed](#) on page 583
- [Analyzing Intrusion Event Data](#) on page 587
- [Using Intrusion Event Responses](#) on page 588
- [Understanding Intrusion Prevention Deployments](#) on page 588
- [The Benefits of Custom Intrusion Policies](#) on page 591

Understanding How Traffic Is Analyzed

LICENSE: Protection

The system uses award-winning Snort® technology to analyze network traffic and generate intrusion events, which are records of the traffic that violates the intrusion policy applied to the device that is monitoring a specific network segment. Event analysts can review the events and determine whether they are important in the context of your network.

Intrusion events can be generated by:

- a link layer decoder, such as the Ethernet II decoder
- a network layer decoder, such as the IP decoder
- a transport layer decoder such, as the TCP decoder
- an application layer decoder or preprocessor, such as the HTTP Inspect preprocessor
- the rules engine

Events include such information as:

- the date and time the event was generated
- the event priority
- when you use network discovery, the impact flag associated with the event
- whether the packet that caused the event was dropped or would have been dropped in an inline, switched, or routed deployment
- the name of the device that generated the event
- the protocol of the packet that caused the event
- the source IP address and port for the event
- the destination IP address and port for the event
- the name of the user logged into the source host
- the ICMP type and code (for ICMP traffic)
- the Sourcefire 3D System component that generated the event (for example, the rule, decoder, or preprocessor)
- a brief description of the event

- the classification of the rule that generated the event
- the VLAN where the host is a member

For a complete list and descriptions of the information included in intrusion events, see [Understanding Intrusion Events](#) on page 604.

IMPORTANT! For events generated by shared object rules, the rule itself is not available.

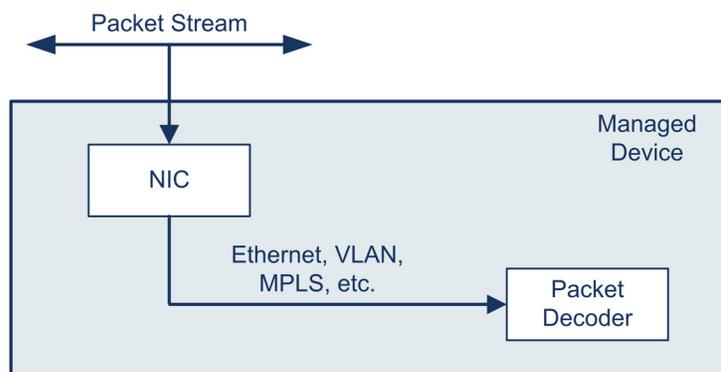

The following sections describe more about how the system acquires and processes information:

- [Capturing and Decoding Packets](#) on page 584
- [Processing Packets](#) on page 585
- [Generating Events](#) on page 586

Capturing and Decoding Packets

LICENSE: Protection

Before packets can be inspected, the packets must be captured from the network. The following illustration shows how the system sniffs packets, then decodes them before any further analysis.

As the system captures packets, it sends them to the packet decoder. The packet decoder converts the packet headers and payloads into a format that can be easily used by the preprocessors and the rules engine. Each layer of the TCP/IP stack is

decoded in turn, beginning with the data link layer and continuing through the network and transport layers, as described in the following table.

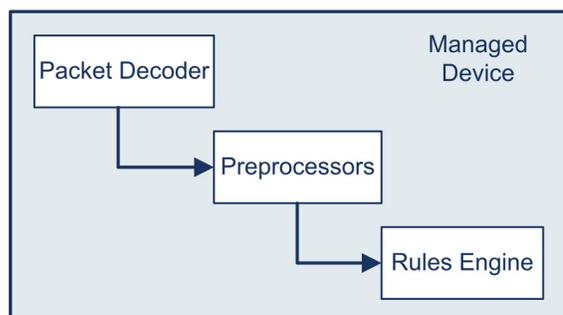

Decoded Packets

TCP/IP LAYER	DECODED PACKETS
Data Link	<ul style="list-style-type: none"> Ethernet Virtual local area network (VLAN) Multiprotocol Label Switching (MPLS)
Network	<ul style="list-style-type: none"> Encapsulated Remote Switched Port Analyzer (ERSPAN) Type II, Type III Internet Protocol version 4 (IPv4) Internet Protocol version 6 (IPv6) Internet Control Message Protocol version 4 (ICMPv4) Internet Control Message Protocol version 6 (ICMPv6) Point-to-Point Protocol (PPP) Point-to-Point Protocol over Ethernet (PPPoE) Generic Routing Encapsulation (GRE) Encapsulating Security Protocol (ESP) Teredo tunneling GPRS Tunneling Protocol (GTP)
Transport	<ul style="list-style-type: none"> Transmission Control Protocol (TCP) User Datagram Protocol (UDP)

Processing Packets

LICENSE: Protection

After the packets are decoded through the first three TCP/IP layers, they are sent to preprocessors, which normalize traffic at the application layer and detect protocol anomalies. After the packets have passed through the preprocessors, they are sent to the rules engine. The rules engine inspects the packet headers and payloads to determine whether they trigger any shared object rules or standard text rules.

You can enable and disable preprocessors and preprocessor options to suit your environment. For example, one of the preprocessors normalizes HTTP traffic. If you are confident that your network does not include any web servers using Microsoft Internet Information Services (IIS), you can disable the preprocessor option that looks for IIS-specific traffic and thereby reduce system processing overhead.

The rules engine takes three tracks as it inspects packets from the preprocessors:

- the rule optimizer
- the multi-rule search engine
- the event selector

For more information on preprocessors, see [Using Advanced Settings in an Intrusion Policy](#) on page 773.

The rule optimizer classifies all activated rules in subsets based on criteria such as transport layer, application protocol, direction to or from the protected network, and so on. As packets arrive at the rules engine, it selects the appropriate rule subsets to apply to each packet.

After the rule subsets are selected, the multi-rule search engine performs three different types of searches:

- The protocol field search looks for matches in particular fields in an application protocol.
- The generic content search looks for ASCII or binary byte matches in the packet payload.
- The packet anomaly search looks for packet headers and payloads that, rather than containing specific content, violate well-established protocols.

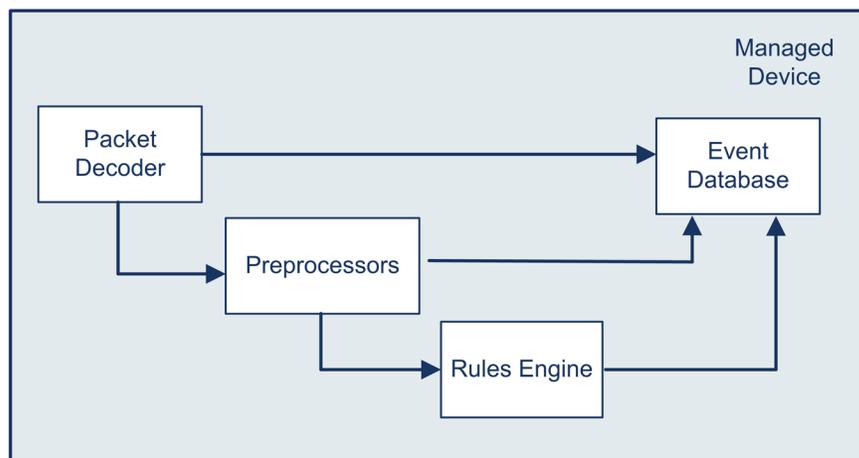

After the multi-rule search engine examines the packets, it generates an event for every rule triggered and adds it to an event queue. The event selector prioritizes the events in the queue and logs an event to the event database. These are the intrusion events that appear in the intrusion event statistics and intrusion event reports.

Generating Events

LICENSE: Protection

Packets are evaluated by the packet decoder, the preprocessors, and the rules engine. At each step of the process, a packet could cause the system to generate an event, which is an indication that the packet or its contents may be a risk to the

security of your network, or, in the case of an attack that originates from within your network, to the security of either your network or an external network.

For example, if the packet decoder receives an IP packet that is less than 20 bytes (which is the size of an IP datagram without any options or payload), the decoder interprets this as anomalous traffic and, when the accompanying decoder rule is enabled, generates an event. Similarly, at the preprocessing step, if the IP defragmentation preprocessor encounters a series of overlapping IP fragments, the preprocessor interprets this as a possible attack and, when the accompanying preprocessor rule is enabled, generates an event. The same kind of response occurs within the rules engine, with most rules written so that they also generate events when triggered by packets.

Each event in the database includes two sources of information about the potential attack. The first is called an event header and contains information about the event name and classification; the source and destination IP addresses; ports; the process that generated the event; and the date and time of the event. The second is the packet log and includes a copy of the decoded packet header and packet payload.

Analyzing Intrusion Event Data

LICENSE: Protection

As the system accumulates intrusion events, you can begin your analysis of potential attacks. The Sourcefire 3D System provides you with the tools you need to review intrusion events and evaluate whether they are important in the context of your network environment and your security policies. These tools include:

- an Intrusion Event Statistics page that gives you an overview of the current activity on your managed device

For more information, see [Viewing Intrusion Event Statistics](#) on page 595.

- text-based and graphical reports that you can generate for any time period you choose; you can also design your own event reports and then configure them to run at scheduled intervals
For more information, see [Working with Reports](#) on page 1724.
- an incident-handling tool that you can use to gather event and packet data related to an attack; you can also add notes to help you track your investigation and response
For more information, see [Handling Incidents](#) on page 656.
- predefined and custom workflows that you can use to drill down through the intrusion events and to identify the events that you want to investigate further
For more information, see [Understanding and Using Workflows](#) on page 1791 and [Working with Intrusion Events](#) on page 593.

Using Intrusion Event Responses

LICENSE: Protection

In addition to generating intrusion events based on attacks, you can use an extensive list of alerting mechanisms to make sure that specific attacks are brought to your attention immediately. Conversely, you can suppress events that are less likely to affect critical systems or set a threshold that the number of events must reach before you are alerted.

For more information about automated alerting, see [Configuring External Responses to Intrusion Events](#) on page 1033.

You can use the following tools to set up automatic responses to intrusion events:

- automated alerting that you can configure for SNMP, email, and syslog
For more information, see [Configuring External Responses to Intrusion Events](#) on page 1033.
- on a Defense Center, automated correlation policies that you can use to respond to and remediate specific intrusion events
For more information, see [Configuring Remediations](#) on page 1606.

Understanding Intrusion Prevention Deployments

LICENSE: Protection

You can configure a passive deployment for a managed device so the device senses traffic out of band from the packet stream. Similarly, you can configure an inline, switched, or routed deployment where using an intrusion policy set to drop packets allows you to drop or replace packets that you know to be harmful.

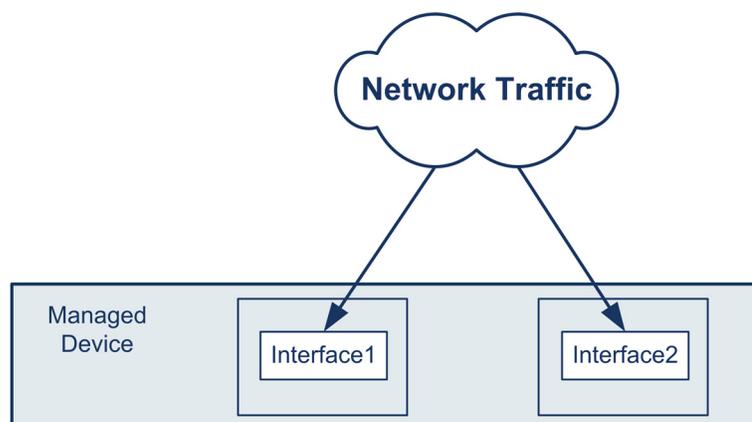

You can tailor intrusion policies for each managed device so they generate events only for the attacks that are likely to affect the security of the hosts on specific

portions of your network. You can specify which rules do not alert, which rules generate events and, except for a passive deployment, which rules generate events and also drop the malicious traffic.

For either type of system, you connect sensing interfaces to the appropriate segments on your network and add those interfaces to an interface set. These interfaces are configured in stealth mode so, to other devices on the network, the device itself does not appear to be connected to the network at all. Additionally, the interfaces are configured in promiscuous mode so that they detect all of the traffic on the network segment regardless of where the traffic is going. In this configuration, the device can see all of the traffic on the network segment, but is itself invisible.

The key deployment difference between an out-of-band deployment and an inline, switched, or routed deployment lies in the interface sets used by each system. An out-of-band deployment uses a passive interface set; an inline, switched, or routed deployment uses an inline set. The interfaces for a passive interface set passively analyze the traffic on the segments they monitor, while traffic flows between pairs of interfaces in an inline set.

The following illustration shows an example of a managed device deployed passively and with two passive interface sets. Each interface is monitoring a different network segment.

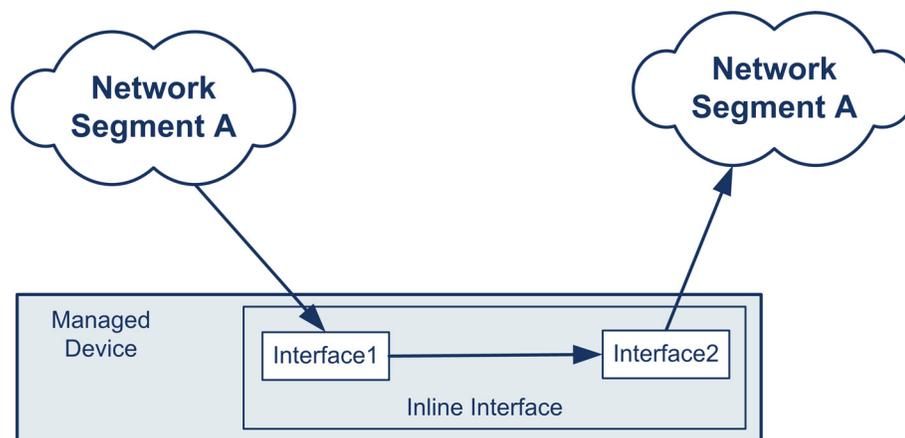

Sensing traffic out-of-band allows you to devote almost all of the device's sensing bandwidth and computational power to monitoring traffic, reconstructing datagrams and streams, normalizing packets, detecting anomalies, and alerting you to possible intrusions. Moreover, because the interface is deployed out of band and operates in stealth mode, attackers are unlikely to know of its existence, which renders it less of a target for attacks.

In an inline deployment, by comparison, you configure a managed device that uses an inline interface set. To do this, you connect the device to your network so that traffic flows between the device's network interfaces. When the interface set is configured as Inline, the interfaces are again configured in promiscuous mode so that they detect all of the traffic on the network segment regardless of where the traffic is going. The device can see all of the traffic on the network segment

but is itself invisible. However, when the interface set is deployed inline, you can configure rules to drop suspicious packets or, for custom standard text rules, to replace malicious portions of a packet payload with more benign content.

For example, the following illustration shows a device deployed inline. The device uses an interface set containing two of the network interfaces monitoring a single network segment.

Similar to a device using a passive interface set, the device using an inline interface set can see all of the traffic that passes through the interfaces in its interface set, regardless of the traffic's destination. However, because the traffic flows between the interfaces, you can modify or block suspicious packets. For example, if the device detects a packet whose payload contains a known exploit to which your network may be vulnerable, you can configure the system to drop the packet. In this case, the malicious packet never reaches its intended target.

In an inline deployment, you can also replace a portion of the payload with content of your own choosing. Consider a simple example where the device detects a packet that contains `bin/sh`, which often indicates a shellcode attack. You can write a custom intrusion rule that replaces all or part of this string with exactly the same number of characters. For example, replacing `bin/sh` with `foo/sh` and then passing the packet on to its destination causes the shellcode attack to fail without tipping off the attacker that the packet was altered.

Compare this result with the result when the same traffic is inspected passively. In that scenario, the same rule detects the exploit, but instead of having an option to drop the packet, you can only alert on its presence.

As you consider the benefits of deploying intrusion protection and prevention, you should weigh some of the trade-offs. First, you must choose a managed device model that matches or exceeds the traffic bandwidth of the network segment. Also, depending on the criticality of the hosts on the network segment, you should consider deploying the managed device with the optional *bypass* network card. The bypass card ensures that traffic continues to pass through the interfaces even if the appliance itself fails or loses power (although you may lose a few packets when you reboot the appliance). For more information on inline sets,

see [Configuring Inline Sets](#) on page 271. You can learn more about deployment options in your managed device's installation guide.

The Benefits of Custom Intrusion Policies

LICENSE: Protection

The system provides default intrusion policies suitable for both passive and inline deployments. However, you may find that the rules, preprocessor options, and other advanced settings configured in those policies do not address the security needs of your network. You can *tune* a policy by enabling, disabling, and setting specific configuration options for advanced settings and rules. Tuning advanced settings and rule sets allows you to configure, at a very granular level, how the system processes and inspects the traffic on your network.

For example, intrusion policies provide the following ways to tune preprocessors:

- Disable preprocessors that do not apply to the traffic on the subnet you are monitoring.
- Specify ports, where appropriate, to focus the activity of the preprocessor.
- Configure preprocessors to generate events when they encounter certain features in packets, for example, state problems or certain combinations of TCP flags.
- Configure adaptive profiles in combination with network discovery to use information about host operating systems from the network discovery map to switch to the most appropriate target-based profile for IP defragmentation and TCP stream preprocessing.

Note that the tuning options available vary by preprocessor or other advanced setting. For details on the available advanced settings, their options, and how to tune them, see [Using Advanced Settings in an Intrusion Policy](#) on page 773.

Additionally, within each intrusion policy, you can tune rules in the following ways:

- Improve performance by using fewer rules; disable rules that are not applicable to your environment.
- Verify that all rules applicable to your environment are enabled.
- For inline deployments, specify which rules should drop malicious packets from the packet stream.

TIP! You can use network discovery to identify the operating systems on your network. This allows you to more easily identify which rules are applicable to your environment.

- Modify the values of variables used in rules so the rules are more specific to your network.

Within the intrusion policy, you can also set suppression levels and thresholds to control how frequently you are notified of intrusion events. You can choose to

suppress event notifications and set thresholds for individual rules or entire intrusion policies. For more information, see [Setting Threshold Options within the Packet View](#) on page 631, [Setting Suppression Options within the Packet View](#) on page 633, and [Filtering Intrusion Event Notification Per Policy](#) on page 746.

Specifying the protocol analysis, data normalization, and traffic inspection performed by the system and saving this configuration as a whole allows you to control the kind of information the system provides you to best meet your enterprise security needs. It also provides a simple mechanism for changing as much or little of your policy as needed to continue to detect new attacks and exploits.

You can also tune rules in the following ways:

- Modify existing rules, if necessary, using the rule editor to correspond the rules to your network infrastructure.
- Write new standard text rules as needed using the Snort language and the rule editor to catch new exploits or to enforce your security policies.

For details on rule keywords, their arguments and syntax, and how to tune your rule set, see [Understanding and Writing Intrusion Rules](#) on page 1046.

CHAPTER 17

WORKING WITH INTRUSION EVENTS

The Sourcefire 3D System can help you monitor your network for traffic that could affect the availability, integrity, and confidentiality of a host and its data. By placing managed devices on key network segments, you can examine the packets that traverse your network for malicious activity. The system has several mechanisms it uses to look for the broad range of exploits that attackers have developed.

When the system identifies a possible intrusion, it generates an *intrusion event*, which is a record of the date, time, the type of exploit, and contextual information about the source of the attack and its target. For packet-based events, a copy of the packet or packets that triggered the event is also recorded. Managed devices transmit their events to the Defense Center where you can view the aggregated data and gain a greater understanding of the attacks against your network assets.

You can also deploy a managed device as an inline, switched, or routed intrusion system, which allows you to configure the device to drop or replace packets that you know to be harmful.

The Sourcefire 3D System also provides you with the tools you need to review intrusion events and evaluate whether they are important in the context of your network environment and your security policies. These tools include:

- an event summary page that gives you an overview of the current activity on your managed devices
- text-based and graphical reports that you can generate for any time period you choose; you can also design your own reports and configure them to run at scheduled intervals
- an incident-handling tool that you can use to gather event data related to an attack; you can also add notes to help you track your investigation and response

- automated alerting that you can configure for SNMP, email, and syslog
- automated correlation policies that you can use to respond to and remediate specific intrusion events
- predefined and custom workflows that you can use to drill down through the data to identify the events that you want to investigate further

See the following sections for more information:

- [Viewing Intrusion Event Statistics](#) on page 595 describes the Intrusion Event Statistics page, which provides you with an overview of the health of the appliance and a summary of the top threats to your network.
- [Viewing Intrusion Event Performance](#) on page 598 explains how to generate graphs of intrusion event performance statistics.
- [Viewing Intrusion Event Graphs](#) on page 601 explains how to generate charts that show event trends over time.
- [Viewing Intrusion Events](#) on page 602 describes how to use the web interface to view and investigate your intrusion events.
- [Understanding Workflow Pages for Intrusion Events](#) on page 612 describes the various pages that are available in intrusion event workflows and explains how you can use them to analyze your intrusion events.
- [Using Drill-Down and Table View Pages](#) on page 616 describes the features of two of the types of pages in an intrusion event workflow.
- [Using the Packet View](#) on page 622 explains how to use the packet view of intrusion events.
- [Using Impact Flags to Evaluate Events](#) on page 641 describes how you can use impact flags to evaluate intrusion events.
- [Searching for Intrusion Events](#) on page 644 explains how you can use the search feature to constrain a list of intrusion events to specific criteria.
- [Using the Clipboard](#) on page 652 describes how to add intrusion events to a holding area called the clipboard so that you can later add the events to incidents. This section also explains how to generate event reports based on the contents of the clipboard.

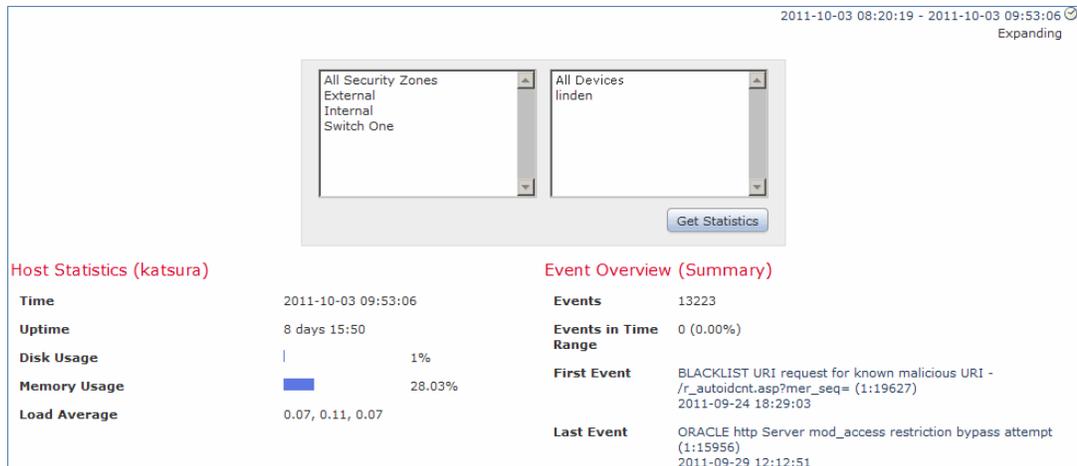

Also, see:

- [Handling Incidents](#) on page 656 for more information about incident handling and how you can use incidents to track the progress of an event analysis.
- [Configuring External Responses to Intrusion Events](#) on page 1033 for more information about automated alerting.
- [Working with Reports](#) on page 1724 for more information about intrusion event reports.
- [Using Geolocation](#) on page 1816 for more information about geolocation information in intrusion events.

Viewing Intrusion Event Statistics

LICENSE: Protection

The Intrusion Event Statistics page provides you with a quick summary of the current state of your appliance and any intrusion events generated for your network.

The Intrusion Event Statistics page has three main areas:

- [Host Statistics](#) on page 596 describes the Host Statistics section, which provides information about the appliance and, for Defense Centers, their managed devices.
- [Event Overview](#) on page 597 describes the Event Overview, which provides an overview of the information in the event database.
- [Event Statistics](#) on page 598 describes the Event Statistics, which provides more specific details about the information in the event database, such as the top 10 event types.

Each of the IP addresses, ports, protocols, event messages, and so on on the page is a link. Click any link to view the associated event information. For example, if one of the top 10 destination ports is **80 (http)/tcp**, clicking that link displays the first page in the default intrusion events workflow, and lists the events targeting that port. Note that only the events (and the managed devices that generate events) in the current time range appear. Also, intrusion events that you have marked reviewed continue to appear in the statistics. For example, if the current time range is the past hour but the first event was generated five hours ago, when you click the **First Event** link, the resulting event pages will not show the event until you change the time range.

To view intrusion event statistics:

ACCESS: Admin/Intrusion Admin

1. Select **Overview > Summary > Intrusion Event Statistics**.
The Intrusion Event Statistics page appears.
2. From the two selection boxes at the top of the page, select the zones and devices whose statistics you want to view, or select **All Security Zones** and **All Devices** to view statistics for all the devices that are collecting intrusion events.
3. Click **Get Statistics**.
The Intrusion Event Statistics page refreshes with data from the devices you selected.

TIP! To view data from a custom time range, click the link in the upper right page area and follow the directions in [Setting Event Time Constraints](#) on page 1820.

4. See the following sections for more information about the statistics that appear on the Intrusion Event Statistics page:
 - [Host Statistics](#) on page 596
 - [Event Overview](#) on page 597
 - [Event Statistics](#) on page 598

Host Statistics

LICENSE: Protection

The Host Statistics section of the Intrusion Event Statistics page provides information about the appliance itself. On the Defense Center, this section also provides information about any managed devices.

Host Statistics (katsura)	
Time	2011-09-27 10:26:50
Uptime	2 days 16:22
Disk Usage	 1%
Memory Usage	 18.71%
Load Average	0.32, 0.14, 0.07

This information includes the following:

- **Time** shows the current time on the appliance.
- **Uptime** shows the number of days, hours, and minutes since the appliance itself was restarted. On the Defense Center, the uptime also shows the last time each managed device was rebooted, the number of users logged in, and the load average.

- **Disk Usage** shows the percentage of the disk that is being used.
- **Memory Usage** shows the percentage of system memory that is being used.
- **Load Average** shows the average number of processes in the CPU queue for the past 1 minute, 5 minutes, and 15 minutes.

Event Overview

LICENSE: Protection

The Event Overview section of the Intrusion Event Statistics page provides an overview of the information in the intrusion event database.

Event Overview (Summary)	
Events	6773
Events in Time Range	220 (3.25%)
First Event	BLACKLIST URI request for known malicious URI - /r_autoidcnt.asp?mer_seq= (1:19627) 2011-09-24 18:29:03
Last Event	BLACKLIST URI request for known malicious URI - vic.aspx?ver= (1:19623) 2011-09-27 10:25:37

These statistics include the following:

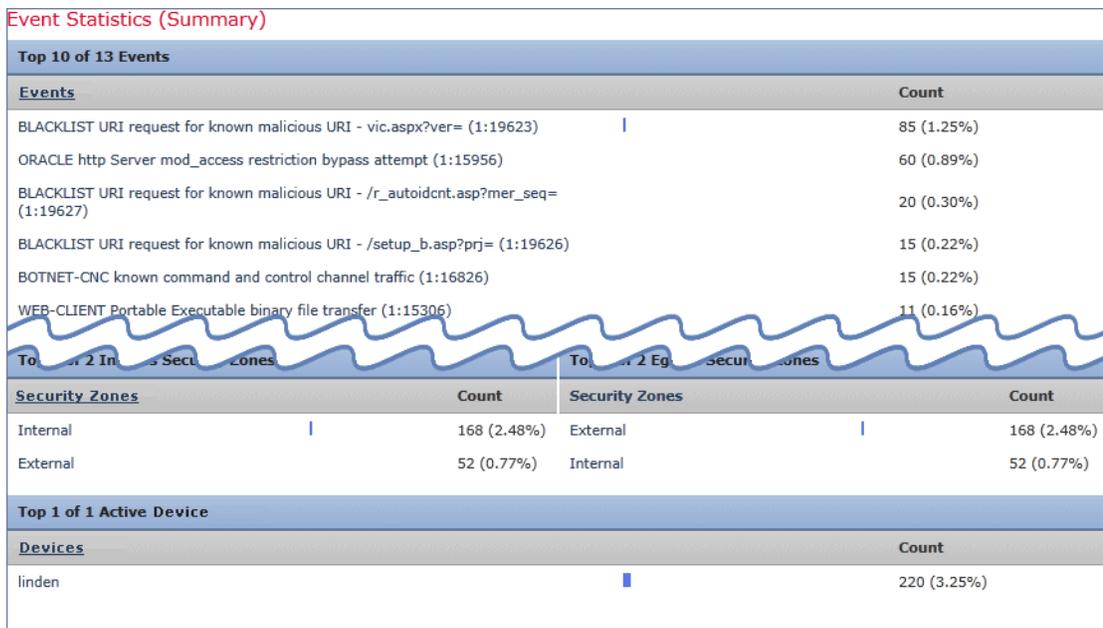

- **Events** shows the number of events in the intrusion event database.
- **Events in Time Range** shows the currently selected time range as well as the number and percentage of events from the database that fall within the time range.
- **First Event** shows the event message for the first event in the event database.
- **Last Event** shows the event message for the last event in the event database.

IMPORTANT! On the Defense Center, note that if you selected a managed device, the Event Overview section for that device appears instead.

Event Statistics

LICENSE: Protection

The Event Statistics section of the Intrusion Event Statistics page provides more specific information about the information in the intrusion event database.

This information includes details on:

- the top 10 event types
- the top 10 source IP addressees
- the top 10 destination IP addresses
- the top 10 destination ports
- the protocols, ingress and egress security zones, and devices with the greatest number of events

Viewing Intrusion Event Performance

LICENSE: Protection

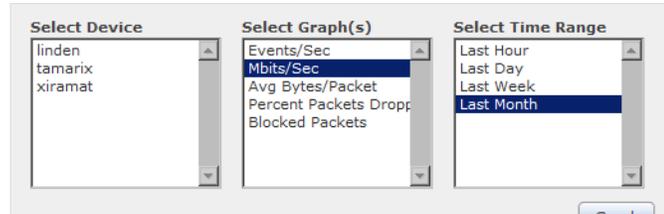

The intrusion event performance page allows you to generate graphs that depict performance statistics for intrusion events over a specific period of time. Graphs can be generated to reflect number of intrusion events per second, number of megabits per second, average number of bytes per packet, the percent of packets uninspected by Snort, and the number of packets blocked as the result of TCP normalization. These graphs can show statistics for the last hour, last day, last week, or last month of operation.

To view the intrusion event performance statistics:

ACCESS: Admin/Maint

- ▶ Select **Overview > Summary > Intrusion Event Performance**.

The Intrusion Event Performance page appears. The Defense Center version of the page is shown below.

See [Generating Intrusion Event Performance Statistics Graphs](#) on page 599 for more information.

Generating Intrusion Event Performance Statistics Graphs

LICENSE: Protection

You can generate graphs that depict performance statistics for a Defense Center or a managed device based on the number of events per second, megabits per second, average bytes per packet, percent of packets uninspected by Snort, and the number of packets blocked as the result of TCP normalization.

IMPORTANT! New data is accumulated for statistics graphs every five minutes. Therefore, if you reload a graph quickly, the data may not change until the next five-minute increment occurs.

The following table lists the available graph types.

Intrusion Event Performance Graph Types

GRAPH TYPE	OUTPUT
Events/Sec	Displays a graph that represents the number of events that are generated on the device per second
Mbits/Sec	Displays a graph that represents the number of megabits of traffic that pass through the device per second
Avg Bytes/ Packet	Displays a graph that represents the average number of bytes included in each packet

Intrusion Event Performance Graph Types (Continued)

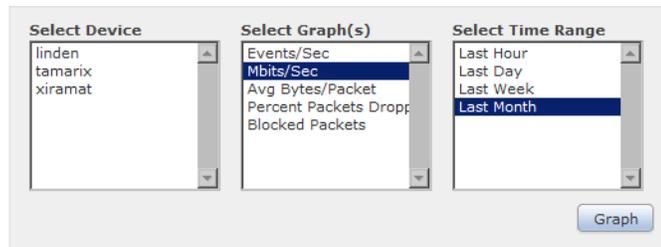

GRAPH TYPE	OUTPUT
Percent Packets Dropped	This graph depicts the average percentage of uninspected packets across all selected devices. For example, if you select two devices, then an average of 50% may indicate that one device has a 90% drop rate and the other has a 10% drop rate. It may also indicate that both devices have a drop rate of 50%. The graph only represents the total % drop when you select a single device.
Blocked Packets	Displays a graph that represents the number of packets blocked as the result of TCP normalization when the inline normalization Normalize TCP option is enabled. See TCP Normalization on page 921 for more information.

To generate intrusion event performance graphs:

ACCESS: Admin/Maint

1. Select **Overview > Summary > Intrusion Event Performance**.

The Intrusion Event Performance page appears. The Defense Center version of the page is shown below.

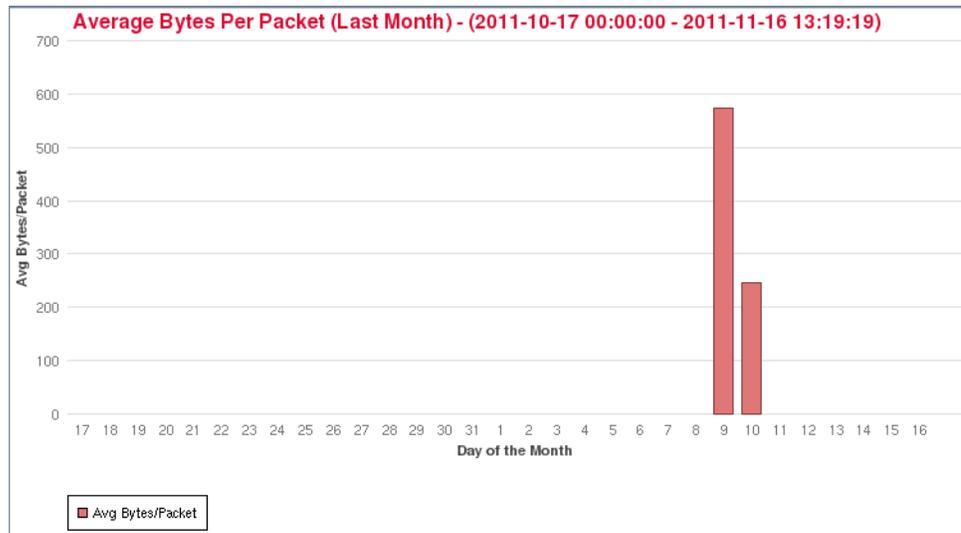

2. From the **Select Device** list, select the devices whose data you want to view.
3. From the **Select Graph(s)** list, select the type of graph you want to create.
4. From the **Select Time Range** list, select the time range you would like to use for the graph.

You can choose from last hour, last day, last week, or last month.

5. Click **Graph**.

The graph appears, displaying the information you specified.

6. To save the graph, right-click it and follow the instructions for your browser to save the image.

Viewing Intrusion Event Graphs

LICENSE: Protection

The Sourcefire 3D System provides graphs that show you intrusion event trends over time. You can generate intrusion event graphs over time ranging from the last hour to the last month, for the following:

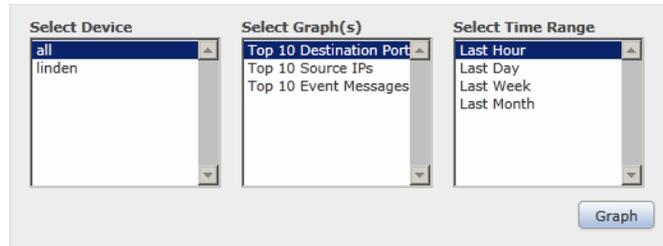

- one or all managed devices
- top 10 destination ports
- top 10 source IP addresses
- top 10 event messages

To generate an event graph:

ACCESS: Admin/Intrusion Admin

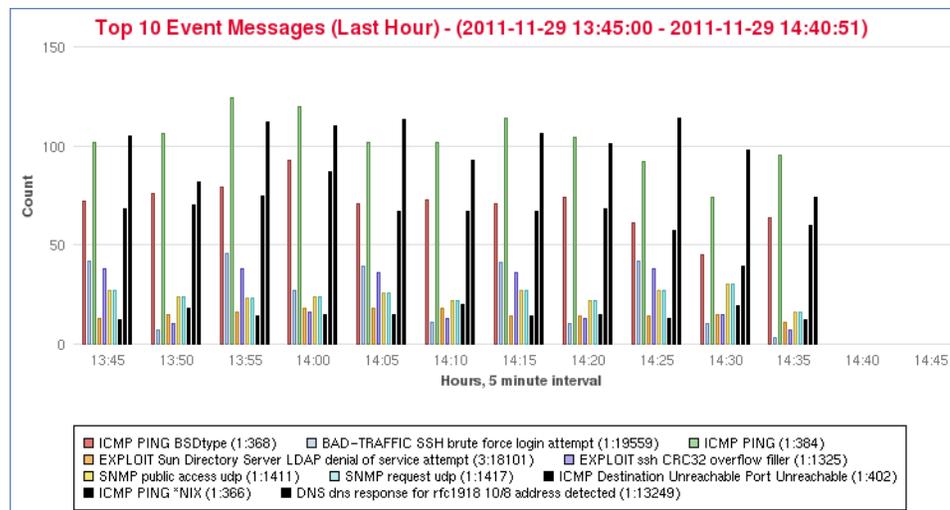

1. Select **Overview > Summary > Intrusion Event Graphs**.

The Intrusion Event Graphs page appears. Three selection boxes at the top of the page control which graph is generated.

2. Under **Select Device**, select **all** to include all devices, or select the specific device you want to include in the graph.
3. Under **Select Graph(s)**, select the type of graph you want to generate.
4. Under **Select Time Range**, select the time range for the graph.
5. Click **Graph**.

The graph is generated.

Viewing Intrusion Events

LICENSE: Protection

When the system recognizes a packet that is potentially malicious, it generates an intrusion event and adds the event to the database.

The initial intrusion events view differs depending on the workflow you use to access the page. You can use one of the predefined workflows, which includes one or more drill-down pages, a table view of intrusion events, and a terminating packet view, or you can create your own workflow. You can also view workflows based on custom tables, which may include intrusion events. Note that an event view may be slow to display if it contains a large number of IP addresses and you have enabled the **Resolve IP Addresses** event view setting. See [Configuring Event View Settings](#) on page 2218 for more information.

You view an intrusion event to determine whether there is a threat to your network security. If you are confident that an intrusion event is not malicious, you can mark the event reviewed. Your name appears as the reviewer, and the reviewed event is no longer listed in the default intrusion events view. You can return a reviewed event to the default intrusion events view by marking the event unreviewed.

You can view intrusion events that you have marked reviewed. Reviewed events are stored in the event database and are included in the event summary statistics, but no longer appear in the default event pages. See [Reviewing Intrusion Events](#) on page 611 for more information.

If you perform a backup and then delete reviewed intrusion events, restoring your backup restores the deleted intrusion events but does not restore their reviewed status. You view those restored intrusion events under Intrusion Events, not under Reviewed Events.

To quickly view connection events associated with one or more intrusion events, select the intrusion events using the check boxes in the event viewer, then click the **Connections** tab above the column headings. This is most useful when navigating between table views of events. You can also view the intrusions associated with particular connections in a similar way. Note that when a pre-Version 5.1.1 managed device generates the event, you cannot view associated events in this way on a Version 5.1.1 or greater Defense Center. For more information, see [Working With Connection Data](#) on page 539 and [Navigating Between Workflows](#) on page 1836.

For more information, see the following sections:

- [Understanding Intrusion Events](#) on page 604
- [Creating Custom Workflows](#) on page 1841
- [Using Drill-Down and Table View Pages](#) on page 616
- [Using the Packet View](#) on page 622
- [Viewing Connection Data Associated with Intrusion Events](#) on page 610
- [Reviewing Intrusion Events](#) on page 611
- [Viewing a Workflow Based on a Custom Table](#) on page 1787

To view intrusion events:

ACCESS: Admin/Intrusion Admin

► Select **Analysis > Intrusion > Events**.

The first page of the default intrusion events workflow appears. For information on specifying a different default workflow, see [Configuring Event View Settings](#) on page 2218. If no events appear, you may need to adjust the time range; see [Setting Event Time Constraints](#) on page 1820.

TIP! If you are using a custom workflow that does not include the table view of intrusion events, select any of the predefined workflows that ship with the appliance by clicking **(switch workflow)** next to the workflow title.

See [Understanding Intrusion Events](#) on page 604 to learn more about the events that appear in intrusion event views. See [Understanding Workflow Pages for Intrusion Events](#) on page 612 to learn more about how to narrow your view to the intrusion events that are important to your analysis.

Understanding Intrusion Events

LICENSE: Protection

The system examines the packets that traverse your network for malicious activity that could affect the availability, integrity, and confidentiality of a host and its data. When the system identifies a possible intrusion, it generates an *intrusion event*, which is a record of the date, time, the type of exploit, and contextual information about the source of the attack and its target. For packet-based events, a copy of the packet or packets that triggered the event is also recorded.

The following list describes the information that an intrusion event contains. Note that some fields in the table view of intrusion events are disabled by default. To enable a field for the duration of your session, click the expand arrow (▶) to expand the search constraints, then click the column name under **Disabled Columns**.

Time

The date and time of the event.

Priority

The event priority as determined by the Sourcefire VRT.

Impact Flag

The impact flag in this field indicates the correlation between intrusion data, network discovery data, and vulnerability information. For more information, see [Using Impact Flags to Evaluate Events](#) on page 641.

Note that because there is no operating system information available for hosts added to the network map based on NetFlow data, the Defense Center cannot assign Vulnerable (impact level 1: red) impact flags for intrusion events involving those hosts, unless you use the host input feature to manually set the host operating system identity.

Inline Result

One of the following:

- a black down arrow, indicating that the system dropped the packet that triggered the rule
- a gray down arrow, indicating that the system would have dropped the packet in an inline deployment if you enabled the **Drop when Inline** intrusion policy option
- blank, indicating that the triggered rule was not set to Drop and Generate Events

Note that the system does not drop packets in a passive deployment, including when an inline interface is in tap mode, regardless of the rule state or the inline drop behavior of the intrusion policy. For more information, see [Setting Rule States](#) on page 743, [Setting Drop Behavior in an Inline Deployment](#) on page 689, [Configuring Passive Interfaces](#) on page 267, and [Tap Mode](#) on page 275.

Source IP

The IP address used by the sending host.

Source Country

The country of the sending host.

Destination IP

The IP address used by the receiving host.

Destination Country

The country of the receiving host.

Original Client IP

The original client IP address that was extracted from an X-Forwarded-For (XFF) or True-Client-IP HTTP header. To display a value for this field, you must enable the HTTP Inspect preprocessor **Extract Original Client IP Address** option. See [Selecting Server-Level HTTP Normalization Options](#) on page 854 for more information.

This field is disabled by default.

Source Port / ICMP Type

The port number on the sending host. For ICMP traffic, where there is no port number, the system displays the ICMP type.

Destination Port / ICMP Code

The port number for the host receiving the traffic. For ICMP traffic, where there is no port number, the system displays the ICMP code.

VLAN ID

The innermost VLAN ID associated with the packet that triggered the intrusion event.

MPLS Label

The Multiprotocol Label Switching label associated with the packet that triggered this intrusion event.

This field is disabled by default.

Message

The explanatory text for the event. For rule-based intrusion events, the event message is pulled from the rule. For decoder- and preprocessor-based events, the event message is hard coded.

Classification

The classification where the rule that generated the event belongs. See the [Rule Classifications table](#) on page 1058 for list of rule classification names and numbers.

Generator

The component that generated the event. See the [Generator IDs table](#) on page 785 for a list of intrusion event generator IDs.

Source User

The User ID for any known user logged in to the source host.

Destination User

The User ID for any known user logged in to the destination host.

Application Protocol

The application protocol, if available, which represents communications between hosts, detected in the traffic that triggered the intrusion event. For information on how the Sourcefire 3D System identifies detected application protocols in the Defense Center web interface, see the [Sourcefire 3D System Identification of Application Protocols table](#) on page 1267.

Client

The client application, if available, which represents software running on the monitored host detected in the traffic that triggered the intrusion event.

Web Application

The web application, which represents the content or requested URL for HTTP traffic detected in the traffic that triggered the intrusion event.

Note that if the system detects an application protocol of HTTP but cannot detect a specific web application, the system supplies a generic web browsing designation here.

Category, Tag (Application Protocol, Client, Web Application)

Criteria that characterize an application to help you understand the application's function. For more information, see the [Application Characteristics table](#) on page 1264.

Application Risk

The risk associated with detected applications in the traffic that triggered the intrusion event. Each type of application detected in a connection has an associated risk; this field displays the highest risk of those. For more information, see the [Application Characteristics table](#) on page 1264.

Business Relevance

The business relevance associated with detected applications in the traffic that triggered the intrusion event. Each type of application detected in a connection has an associated business relevance; this field displays the lowest (least relevant) of those. For more information, see the [Application Characteristics table](#) on page 1264.

Ingress Security Zone

The ingress security zone of the packet that triggered the event. Only this security zone field is populated in a passive deployment. See [Working with Security Zones](#) on page 187.

Egress Security Zone

For an inline deployment, the egress security zone of the packet that triggered the event. This security zone field is not populated in a passive deployment. See [Working with Security Zones](#) on page 187.

Device

The managed device where the access control policy was applied. See [Managing Devices](#) on page 190.

Ingress Interface

The ingress interface of the packet that triggered the event. Only this interface column is populated for a passive interface. See [Configuring Interfaces](#) on page 258.

Egress Interface

For an inline set, the egress interface of the packet that triggered the event. This interface column is not populated for a passive interface. See [Configuring Interfaces](#) on page 258.

Intrusion Policy

The intrusion policy where the intrusion, preprocessor, or decoder rule that generated the event was enabled. You can select an intrusion policy as the default action for an access control policy, or you can associate an intrusion policy with an access control rule. See [Setting the Default Action](#) on page 428 and [Performing File and Intrusion Inspection on Allowed Traffic](#) on page 511.

Access Control Policy

The access control policy that includes the intrusion policy where the intrusion, preprocessor, or decoder rule that generated the event is enabled. See [Using Access Control Policies](#) on page 424.

Access Control Rule

The access control rule associated with an intrusion rule that generated the event; see [Performing File and Intrusion Inspection on Allowed Traffic](#) on page 511. **Default Action** indicates that the intrusion policy where the rule is enabled is not associated with an access control rule but, instead, is configured as the default action of the access control policy; see [Setting the Default Action](#) on page 428.

HTTP Hostname

The host name, if present, that was extracted from the HTTP request Host header. Note that request packets do not always include the host name.

To display host names, you must enable the HTTP Inspect preprocessor **Log Hostname** option. See [Selecting Server-Level HTTP Normalization Options](#) on page 854 for more information.

This column displays the first fifty characters of the extracted host name. You can hover your pointer over the displayed portion of an abbreviated host name to display the complete name, up to 256 bytes. You can also display the complete host name, up to 256 bytes, in the packet view. See [Viewing Event Information](#) on page 625 for more information.

This field is disabled by default.

HTTP URI

The raw URI, if present, associated with the HTTP request packet that triggered the intrusion event. Note that request packets do not always include a URI.

To display the extracted URI, you must enable the HTTP Inspect preprocessor **Log URI** option. See [Selecting Server-Level HTTP Normalization Options](#) on page 854 for more information.

To see the associated HTTP URI in intrusion events triggered by HTTP responses, you should configure HTTP server ports in the **Perform Stream Reassembly on Both Ports** option; note, however, that this increases resource demands for traffic reassembly. See [Selecting Stream Reassembly Options](#) on page 950.

This column displays the first fifty characters of the extracted URI. You can hover your pointer over the displayed portion of an abbreviated URI to display the complete URI, up to 2048 bytes. You can also display the complete URI, up to 2048 bytes, in the packet view. See [Viewing Event Information](#) on page 625 for more information.

This field is disabled by default.

Email Sender

The address of the email sender that was extracted from the SMTP MAIL FROM command. To display a value for this field, you must enable the SMTP preprocessor **Log From Address** option. Multiple sender addresses are supported. See [Understanding SMTP Decoding](#) on page 890 for more information.

This field is disabled by default.

Email Recipient

The address of the email recipient that was extracted from the SMTP RCPT TO command. To display a value for this field, you must enable the SMTP preprocessor **Log To Addresses** option. Multiple recipient addresses are supported. See [Understanding SMTP Decoding](#) on page 890 for more information.

This field is disabled by default.

Email Attachments

The MIME attachment file name that was extracted from the MIME Content-Disposition header. To display attachment file names, you must enable the SMTP preprocessor **Log MIME Attachment Names** option. Multiple attachment file names are supported. See [Understanding SMTP Decoding](#) on page 890 for more information.

This field is disabled by default.

Reviewed By

The name of the user who reviewed the event. See [Reviewing Intrusion Events](#) on page 611.

Count

The number of events that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows.

Viewing Connection Data Associated with Intrusion Events

LICENSE: Protection

When you associate an intrusion policy with an access control rule or the default action of an access control policy, the system can log the connections where intrusion events are detected, as follows:

- Although this logging is automatic for access control rules, you must manually enable connection logging to see associated connection data for the default action; see [Logging Connections for the Default Action](#) on page 431.
- Managed devices **must** be running at least Version 5.1.1 of the Sourcefire 3D System to associate intrusion events with connections. Connections detected by pre-5.1.1 devices are not associated with intrusion events.

To view connection data associated with one or more intrusion events:

ACCESS: Admin

1. Select **Analysis > Intrusion > Events**.

The first page of the default intrusion events workflow appears.

Viewing associated data is most useful when navigating between table views of events. See [Understanding Workflow Pages for Intrusion Events](#) on page 612 to learn more about how to narrow your view to the intrusion events that are important to your analysis.

2. Select the intrusion events using the check boxes in the event viewer, then click the **Connections** tab above the column headings.

You can view the intrusion events associated with particular connections in a similar way. For more information, see [Navigating Between Workflows](#) on page 1836.

When you view associated events, the Defense Center uses your default connection data workflow. For more information on connection data, see [Working With Connection Data](#) on page 539.

TIP! If you are using a custom workflow that does not include the table view of intrusion events, select any of the predefined workflows that ship with the appliance by clicking **(switch workflow)** next to the workflow title.

Reviewing Intrusion Events

LICENSE: Protection

If you have examined an intrusion event and are confident that the event does not represent a threat to your network security (perhaps because you know that none of the hosts on your network are vulnerable to the detected exploit), you can mark the event reviewed. Your name appears as the reviewer, and the reviewed event is no longer listed in the default intrusion events view. Events that you mark reviewed remain in the event database, but no longer appear in intrusion event views.

To mark an intrusion event reviewed:

ACCESS: Admin/Intrusion Admin

- ▶ On a page that displays intrusion events, you have two options:
 - To mark one or more intrusion events from the list of events, select the check boxes next to the events and click **Review**.
 - To mark all intrusion events from the list of events, click **Review All**.

A success message appears and the list of reviewed events is updated.

See [Understanding Intrusion Events](#) on page 604 to learn more about the events that appear in intrusion event views. See [Understanding Workflow Pages for Intrusion Events](#) on page 612 to learn more about how to narrow your view to the intrusion events that are important to your analysis.

IMPORTANT! Although they do not appear on intrusion event-related workflow pages, reviewed events are included in the event summary statistics.

To view events previously marked reviewed:

ACCESS: Admin/Intrusion Admin

► Select **Analysis > Intrusion > Reviewed Events**.

The first page of the default reviewed intrusion events workflow appears. For information on specifying a different default workflow, see [Configuring Event View Settings](#) on page 2218. If no events appear, you may need to adjust the time range; see [Setting Event Time Constraints](#) on page 1820.

TIP! If you are using a custom workflow that does not include the table view of intrusion events, select any of the predefined workflows that ship with the appliance by clicking (**switch workflow**) next to the workflow title.

See [Understanding Intrusion Events](#) on page 604 to learn more about the events that appear in reviewed intrusion event views. See [Understanding Workflow Pages for Intrusion Events](#) on page 612 to learn more about how to narrow your view to the intrusion events that are important to your analysis.

To mark reviewed events unreviewed:

ACCESS: Admin/Intrusion Admin

► On a page that displays reviewed events, you have two options:

- To remove individual intrusion events from the list of reviewed events, select the check boxes next to the events and click **Unreview**.
- To remove all intrusion events from the list of reviewed events, click **Unreview All**.

A success message appears and the list of reviewed events is updated.

Understanding Workflow Pages for Intrusion Events

LICENSE: Protection

The preprocessor, decoder, and intrusion rules that are enabled in the current intrusion policy generate intrusion events whenever the traffic that you monitor violates the policy.

The Sourcefire 3D System provides a set of predefined workflows, populated with event data, that you can use to view and analyze intrusion events. Each of these workflows steps you through a series of pages to help you pinpoint the intrusion events that you want to evaluate.

The predefined intrusion event workflows contain three different types of pages, or event views:

- one or more drill-down pages
- the table view of intrusion events
- a packet view

Drill-down pages generally include two or more columns in a table (and, for some drill-down views, more than one table) that allow you to view one specific type of information. For example, the following graphic shows a drill-down page with the number of events generated for each destination port.

<input type="checkbox"/>	Destination Port	Count
<input type="checkbox"/>	2049 (nfsd) / tcp	68
<input type="checkbox"/>	53 (domain) / udp	46
<input type="checkbox"/>	161 (snmp) / udp	39
<input type="checkbox"/>	31337 / udp	19
<input type="checkbox"/>	3389 / tcp	19
<input type="checkbox"/>	80 (http) / tcp	17
<input type="checkbox"/>	845 / tcp	3
<input type="checkbox"/>	58156 / tcp	3

Displaying rows 1–25 of 198 rows << Page 1 of 8 >>

View Copy Delete Review Download Packets
 View All Copy All Delete All Review All Download All Packets

When you “drill down” to find more information for one or more destination ports, you automatically select those events and the next page in the workflow appears. In this workflow, if you select the check box for the row with 80 (http)/ tcp and click **View**, the next page in the workflow appears (in this case, a page showing the number of events with each event message).

<input type="checkbox"/>	Message	Count
<input type="checkbox"/>	SERVER-IIS cmd.exe access (1:1002)	13
<input type="checkbox"/>	PUA-ADWARE Wajam Monitizer url outbound connection - post install (1:23246)	2
<input type="checkbox"/>	MALWARE-CNC TDS Sutra - request hi.cgi (1:21850)	2

Displaying rows 1–3 of 3 rows << Page 1 of 1 >>

View Copy Delete Review Download Packets
 View All Copy All Delete All Review All Download All Packets

In this way, drill-down tables help you reduce the number of events you are analyzing at one time. On the first page, you eliminated all but 17 events from your analysis. On the second page, if you select the check box for the first row of events (SERVER-ISS cmd.exe access (1:1002)) and click **View**, then the next page in the workflow appears and you have narrowed your list to 13 events.

The initial *table view* of intrusion events lists each intrusion event in its own row. The columns in the table list information such as the time, the source IP address and port, the destination IP address and port, the event priority, the event

message, and more. Note that several of the columns were removed from the table view to simplify the following graphic.

<input type="checkbox"/>	Time ×	Priority ×	Source IP ×	Destination IP ×	Source ×	Destination ×	Message ×
↓	2013-02-19 17:39:45	high	10.10.10.3	10.10.10.2	56820 / tcp	80 (http) / tcp	SERVER-IIS cmd.exe access (1:1002)
↓	2013-02-19 17:39:45	high	10.10.10.3	10.10.10.2	32913 / tcp	80 (http) / tcp	SERVER-IIS cmd.exe access (1:1002)
↓	2013-02-19 16:00:18	high	10.10.10.3	10.10.10.2	4258 / tcp	80 (http) / tcp	SERVER-IIS cmd.exe access (1:1002)
↓	2013-02-19 16:00:17	high	10.10.10.3	10.10.10.2	1079 / tcp	80 (http) / tcp	SERVER-IIS cmd.exe access (1:1002)

When you select events on a table view, instead of selecting events and displaying the next page in the workflow, you add to what are called *constraints*. Constraints are limits that you impose on the types of events that you want to analyze. In the previous two drill-down pages, the events were constrained in two ways: by destination port (80 (http)/tcp) and by event message (SERVER-IIS cmd.exe access (1:1002)). These constraints are carried forward to the table view. You can see the constraints by clicking the black arrow at the top of the table.

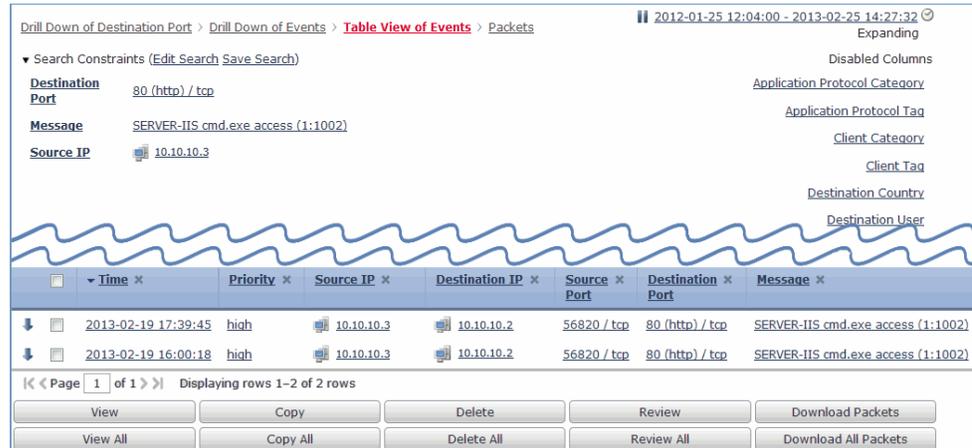

▼ Search Constraints (Edit Search Save Search)

Destination Port 80 (http) / tcp

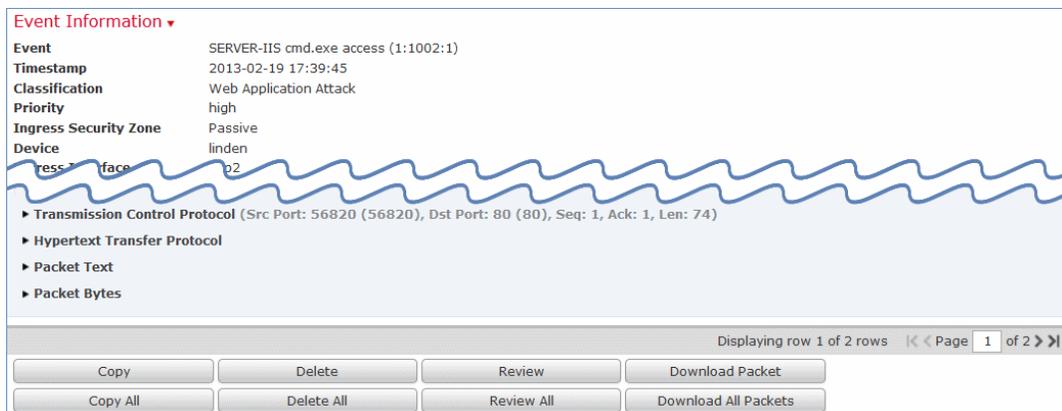

Message SERVER-IIS cmd.exe access (1:1002)

For example, if you click the close column icon (×) in any column and clear **Time** from the drop-down list, you can remove Time as one of the columns. To narrow the list of events in your analysis, you can click the link for a value in one of the rows in the table view. For example, to limit your analysis to the events generated from one of the source IP addresses (presumably, a potential attacker), click the IP address in the **Source IP Address** column. The following graphic shows the result, rows that provide a count of the number of times the attacker (10.10.10.3)

attempted to exploit the specific vulnerability (SERVER-ISS cmd.exe access (1:1002)) against, in this case, a single destination IP address (10.10.10.2).

If you select one or more rows in a table view and then click **View**, the packet view appears. A *packet view* provides information about the packet that triggered the rule or the preprocessor that generated the event. Each section of the packet view contains information about a specific layer in the packet. You can expand collapsed sections to see more information.

IMPORTANT! Because each portscan event is triggered by multiple packets, portscan events use a special version of the packet view. See [Detecting Portscans](#) on page 961 for more information.

If the predefined workflows do not meet your specific needs, you can create custom workflows that display only the information you are interested in. Custom intrusion event workflows can include drill-down pages, a table view of events, or both; the system automatically includes a packet view as the last page. You can

easily switch between the predefined workflows and your own custom workflows depending on how you want to investigate events.

TIP! [Understanding and Using Workflows](#) on page 1791 explains how to use workflows and the features common to all workflow pages. This chapter also explains how to create and use custom intrusion event workflows.

For more information, see:

- [Using Drill-Down and Table View Pages](#) on page 616, which explains how to use drill-down pages and the table view of events, which share many common features.
- [Using the Packet View](#) on page 622, which explains how to use the features in the packet view.
- [Searching for Intrusion Events](#) on page 644 explains how to search the event database for specific intrusion events.

Using Drill-Down and Table View Pages

LICENSE: Protection

The workflows that you can use to investigate intrusion events take advantage of three different types of pages:

- drill-down pages
- the table view of intrusion events
- the packet view

Each of these pages is described in [Understanding Workflow Pages for Intrusion Events](#) on page 612.

The drill-down views and table view of events share some common features that you can use to narrow a list of events and then concentrate your analysis on a

group of related events. The [Intrusion Event Common Features](#) table describes these features.

Intrusion Event Common Features

To...	YOU CAN...
learn more about the columns that appear	find more information in Understanding Intrusion Events on page 604.
view a host's profile	click the host profile icon () that appears next to the host IP address.
view geolocation details	click the flag icon that appears in the Source Country or Destination Country columns.
modify the time and date range for displayed events	find more information in Setting Event Time Constraints on page 1820. Note that events generated outside the appliance's configured time window (whether global or event-specific) may appear in an event view if you constrain the event view by time. This may occur even if you configured a sliding time window for the appliance.
sort and constrain events on the current workflow page	find more information in: <ul style="list-style-type: none"> • Sorting Drill-Down Workflow Pages on page 1835 • the Constraining Events on Drill-Down Pages table on page 620 • the Constraining Events on the Table View of Events table on page 621
navigate within the current workflow page	find more information in Navigating to Other Pages in the Workflow on page 1836. TIP! To avoid displaying the same intrusion events on different workflow pages, the time range pauses when you click a link at the bottom of the page to display another page of events, and resumes when you click to take any other action on the subsequent page. For more information, see Setting Event Time Constraints on page 1820.
navigate between pages in the current workflow, keeping the current constraints	click the appropriate page link at the top left of the workflow page. For more information, see Using Workflow Pages on page 1812.

Intrusion Event Common Features (Continued)

To...	YOU CAN...
add events to the clipboard so you can transfer them to an incident at a later time	<p>use one of the following methods:</p> <ul style="list-style-type: none"> • To copy several intrusion events on a workflow page to the clipboard, select the check boxes next to events you want to copy, then click Copy. • To copy all the intrusion events in the current constrained view to the clipboard, click Copy All. <p>The clipboard stores up to 25,000 events per user. For more information, see Using the Clipboard on page 652.</p>
delete events from the event database	<p>use one of the following methods:</p> <ul style="list-style-type: none"> • To delete selected intrusion events, select the check boxes next to events you want to delete, then click Delete. • To delete all the intrusion events in the current constrained view, click Delete All, then confirm you want to delete all the events.
mark events reviewed to remove them from intrusion event pages, but not the event database	<p>use one of the following methods:</p> <ul style="list-style-type: none"> • To review selected intrusion events, select the check boxes next to events you want to review, then click Review. • To review all the intrusion events in the current constrained view, click Review All. <p>For more information, see Reviewing Intrusion Events on page 611.</p>
download a local copy of the packet (a packet capture file in libpcap format) that triggered each selected event	<p>use one of the following methods:</p> <ul style="list-style-type: none"> • To download the packets that triggered the selected intrusion events, select the check boxes next to events triggered by the packets you want to download, then click Download Packets. • To download all packets that triggered the intrusion events in the current constrained view, click Download All Packets. <p>Captured packets are saved in libpcap format. This format is used by several popular protocol analyzers.</p>
navigate to other event views to view associated events	find more information in Navigating Between Workflows on page 1836.
temporarily use a different workflow	click (switch workflow) . For more information, see Selecting Workflows on page 1809.
bookmark the current page so that you can quickly return to it	click Bookmark This Page . For more information, see Using Bookmarks on page 1838.

Intrusion Event Common Features (Continued)

To...	You CAN...
view the Intrusion Events section of the Summary Dashboard	click Dashboards . For more information, see Working with Dashboards on page 106.
navigate to the bookmark management page	click View Bookmarks . For more information, see Using Bookmarks on page 1838.
generate a report based on the data in the current view	click Report Designer . For more information, see Creating a Report Template from an Event View on page 1725.

The number of intrusion events that appear on the event views may be quite large, depending on:

- the time range you select
- the amount of traffic on your network
- the intrusion policy you apply

To make it easier to analyze intrusion events, you can constrain the event pages. The constraining processes are slightly different for drill-down views and the table view of intrusion events.

TIP! The time range pauses when you click one of the links at the bottom of the intrusion event workflow page to navigate to another page, and resumes when you click to take any other action on the subsequent page, including exiting the workflow; this reduces the likelihood of displaying the same events as you navigate to other pages in the workflow to see more events. For more information, see [Setting Event Time Constraints](#) on page 1820 and [Navigating to Other Pages in the Workflow](#) on page 1836.

The [Constraining Events on Drill-Down Pages](#) table describes how to use the drill-down pages.

Constraining Events on Drill-Down Pages

To...	YOU CAN...
drill down to the next workflow page constraining on a specific value	<p>click the value.</p> <p>For example, on the Destination Port workflow, to constrain the events to those with a destination of port 80, click 80/tcp in the DST Port/ICMP Code column. The next page of the workflow, Events, appears and contains only port 80/tcp events.</p>
drill down to the next workflow page constraining on selected events	<p>select the check boxes next to the events you want to view on the next workflow page, then click View.</p> <p>For example, on the Destination Port workflow, to constrain the events to those with destination ports 20/tcp and 21/tcp, select the check boxes next to the rows for those ports and click View. The next page of the workflow, Events, appears and contains only port 20/tcp and 21/tcp events.</p> <p>IMPORTANT! If you constrain on multiple rows and the table has more than one column (not including a Count column), you build what is called a compound constraint. Compound constraints ensure that you do not include more events in your constraint than you mean to. For example, if you use the Event and Destination workflow, each row that you select on the first drill-down page creates a compound constraint. If you pick event 1:100 with a destination IP address of 10.10.10.100 and you also pick event 1:200 with a destination IP address of 192.168.10.100, the compound constraint ensures that you do not also select events with 1:100 as the event type and 192.168.10.100 as the destination IP address or events with 1:200 as the event type and 10.10.10.100 as the destination IP address.</p>
drill down to the next workflow page keeping the current constraints	click View All .

The [Constraining Events on the Table View of Events](#) table describes how to use the table view.

Constraining Events on the Table View of Events

To...	YOU CAN...
constrain the view to events with a single attribute	click the attribute. For example, to constrain the view to events with a destination of port 80, click 80/tcp in the DST Port/ICMP Code column.
remove a column from the table	click the close icon (✕) in the column heading that you want to hide. In the pop-up window that appears, click Apply . TIP! To hide or show other columns, select or clear the appropriate check boxes before you click Apply . To add a disabled column back to the view, click the expand arrow (▶) to expand the search constraints, then click the column name under Disabled Columns .
view the packets associated with one or more events	either: <ul style="list-style-type: none">• click the down arrow icon (↓) next to the event whose packets you want to view.• select one or more events whose packets you want to view, and, at the bottom of the page, click View.• at the bottom of the page, click View All to view the packets for all events that match the current constraints.

TIP! At any point in the process, you can save the constraints as a set of search criteria. For example, if you find that over the course of a few days your network is being probed by an attacker from a single IP address, you can save your constraints during your investigation and then use them again later. You cannot, however, save compound constraints as a set of search criteria. For more information, see [Performing and Saving Searches](#) on page 1770.

TIP! If no intrusion events appear on the event views, adjusting the selected time range might return results. If you selected an older time range, events in that time range might have been deleted. Adjusting the rule thresholding configuration might generate events.

Using the Packet View

LICENSE: Protection

A packet view provides information about the packet that triggered the rule that generated an intrusion event.

TIP! The packet view on a Defense Center does not contain packet information when the **Transfer Packet** option is disabled for the device detecting the event.

Event Information ▾

Event SERVER-IIS cmd.exe access (1:1002:1)

Copy Delete Review Download Packet
Copy All Delete All Review All Download All Packets

The packet view indicates why a specific packet was captured by providing information about the intrusion event that the packet triggered, including the event's time stamp, message, classification, priority, and, if the event was generated by a standard text rule, the rule that generated the event. The packet view also provides general information about the packet, such as its size.

In addition, the packet view has a section that describes each layer in the packet: data link, network, and transport, as well as a section that describes the bytes that comprise the packet. You can expand collapsed sections to display detailed information.

IMPORTANT! Because each portscan event is triggered by multiple packets, portscan events use a special version of the packet view. See [Detecting Portscans](#) on page 961 for more information.

The [Packet View Actions](#) table describes the actions you can take on the packet view.

Packet View Actions

To...	You CAN...
modify the date and time range in the packet views	find more information in Setting Event Time Constraints on page 1820.
learn more about the information displayed in the packet view	find more information in: <ul style="list-style-type: none">• Viewing Event Information on page 625• Viewing Frame Information on page 634• Viewing Data Link Layer Information on page 635• Viewing Network Layer Information on page 636• Viewing Transport Layer Information on page 638• Viewing Packet Byte Information on page 641
add an event to the clipboard so you can transfer it to the incidents at a later time	either: <ul style="list-style-type: none">• click Copy to copy the event whose packet you are viewing• click Copy All to copy all the events whose packets you previously selected <p>The clipboard stores up to 25,000 events per user. For more information on the clipboard, see Using the Clipboard on page 652.</p>
delete an event from the event database	either: <ul style="list-style-type: none">• click Delete to delete the event whose packet you are viewing• click Delete All to delete all the events whose packets you previously selected

Packet View Actions (Continued)

To...	You CAN...
mark an event reviewed to remove it from event views, but not the event database.	<p>either:</p> <ul style="list-style-type: none">• click Review to review the event whose packet you are viewing• click Review All to review all the events whose packets you previously selected <p>For more information, see Reviewing Intrusion Events on page 611. Note that reviewed events continue to be included in the event statistics on the Intrusion Event Statistics page.</p>
download a local copy of the packet (a packet capture file in libpcap format) that triggered the event	<p>either:</p> <ul style="list-style-type: none">• click Download Packet to save a copy of the captured packet for the event you are viewing• click Download All Packets to save copies of the captured packets for all the events whose packets you previously selected <p>The captured packet is saved in libpcap format. This format is used by several popular protocol analyzers.</p> <p>Note that you cannot download a portscan packet because single portscan events are based on multiple packets; however, the portscan view provides all usable packet information. See Understanding Portscan Events for more information.</p> <p>Note that you must have at least 15% available disk space in order to download.</p>
expand or collapse a page section	click the arrow next to the section.

To display the packet view:

ACCESS: Admin/Intrusion Admin

- ▶ On the table view of intrusion events, select packets to view. See the [Constraining Events on the Table View of Events table](#) on page 621 for more information.

The packet view appears. If you selected more than one event, you can page through the packets by using the page numbers at the bottom of the page.

Viewing Event Information

LICENSE: Protection

On the packet view, you can view information about the packet in the Event Information section.

Event Information ▾	
Event	INDICATOR-SHELLCODE x86 OS agnostic fnstenv geteip dword xor decoder (1:17322:1)

Destination Port	2049 (nfsd) / udp
Intrusion Policy	Balanced Security and Connectivity
Access Control Policy	IPS: balanced
Access Control Rule	Inspection
Rule	alert ip \$EXTERNAL_NET any -> \$HOME_NET any (msg:"INDICATOR-SHELLCODE x86 OS agnostic fnstenv geteip dword xor decoder"; content:"[D9 EE D9 74 24 F4]"; content:"[81]"; distance:1; content:"[13]"; distance:1; content:"[83]"; distance:1; content:"[FC E2 F4]"; distance:1; metadata:policy balanced-ips drop, policy connectivity-ips drop, policy security-ips drop; classtype:shellcode-detect; sid:17322; rev:2;)
Summary	This event is generated when shellcode is detected in network traffic.
Actions ▾	
Rule Actions	Edit View Documentation Rule Comment Set this rule to generate events in all locally created policies Disable this rule in all locally created policies Set this rule to drop the triggering packet and generate an event in all locally created inline intrusion policies
Set Thresholding Options	▶ in all locally created policies
Set Suppression Options	▶ in all locally created policies

Event

The event message. For rule-based events, this corresponds to the rule message. For other events, this is determined by the decoder or preprocessor.

The ID for the event is appended to the message in the format (*GID:SID:Rev*). *GID* is the generator ID of the rules engine, the decoder, or the preprocessor that generated the event. *SID* is the identifier for the rule, decoder message, or preprocessor message. *Rev* is the revision number of the rule. For more information, refer to [Reading Preprocessor Generator IDs](#) on page 784.

Timestamp

The time that the packet was captured.

Classification

The event classification. For rule-based events, this corresponds to the rule classification. For other events, this is determined by the decoder or preprocessor.

Priority

The event priority. For rule-based events, this corresponds to either the value of the `priority` keyword or the value for the `classtype` keyword. For other events, this is determined by the decoder or preprocessor.

Ingress Security Zone

The ingress security zone of the packet that triggered the event. Only this security zone field is populated in a passive deployment. See [Working with Security Zones](#) on page 187.

Egress Security Zone

For an inline deployment, the egress security zone of the packet that triggered the event. See [Working with Security Zones](#) on page 187.

Device

The managed device where the access control policy was applied. See [Managing Devices](#) on page 190.

Ingress Interface

The ingress interface of the packet that triggered the event. Only this interface column is populated for a passive interface. See [Configuring Interfaces](#) on page 258.

Egress Interface

For an inline set, the egress interface of the packet that triggered the event. See [Configuring Interfaces](#) on page 258.

Source/Destination IP

The host IP address or domain name where the packet that triggered the event (source) originated, or the target (destination) host of the traffic that triggered the event.

Note that to display the domain name, you must enable IP address resolution; for more information, see [Configuring Event View Settings](#) on page 2218.

Click the address or domain name to view the context menu, then select **Whois** to do a whois search on the host, **View Host Profile** to view host information, or **Blacklist Now** or **Whitelist Now** to add the address to a global blacklist or whitelist. See [Using Host Profiles](#) on page 1334 and [Working with the Global Whitelist and Blacklist](#) on page 166.

Source Port/ICMP Type

Source port of the packet that triggered the event. For ICMP traffic, where there is no port number, the system displays the ICMP type.

Destination Port/ICMP Code

The port number for the host receiving the traffic. For ICMP traffic, where there is no port number, the system displays the ICMP code.

Email Headers

The data that was extracted from the email header. Note that email headers do not appear in the table view of intrusion events, but you can use email header data as a search criterion.

To associate email headers with intrusion events for SMTP traffic, you must enable the SMTP preprocessor **Log Headers** option. See [Understanding SMTP Decoding](#) on page 890 for more information. For rule-based events, this row appears when email data is extracted.

HTTP Hostname

The host name, if present, extracted from the HTTP request Host header. This row displays the complete host name, up to 256 bytes. Click the expand arrow (▶) to display the complete host name when longer than a single row.

To display host names, you must enable the HTTP Inspect preprocessor **Log Hostname** option. See [Selecting Server-Level HTTP Normalization Options](#) on page 854 for more information.

Note that HTTP request packets do not always include a host name. For rule-based events, this row appears when the packet contains the HTTP host name or the HTTP URI.

HTTP URI

The raw URI, if present, associated with the HTTP request packet that triggered the intrusion event. This row displays the complete URI, up to 2048 bytes. Click the expand arrow (▶) to display the complete URI when it is longer than a single row.

To display the URI, you must enable the HTTP Inspect preprocessor **Log URI** option. See [Selecting Server-Level HTTP Normalization Options](#) on page 854 for more information.

Note that HTTP request packets do not always include a URI. For rule-based events, this row appears when the packet contains the HTTP host name or the HTTP URI.

To see the associated HTTP URI in intrusion events triggered by HTTP responses, you should configure HTTP server ports in the **Perform Stream Reassembly on Both Ports** option; note, however, that this increases resource demands for traffic reassembly. See [Selecting Stream Reassembly Options](#) on page 950.

Intrusion Policy

The intrusion policy, if present, where the intrusion, preprocessor, or decoder rule that generated the intrusion event was enabled. You can select an intrusion policy as the default action for an access control policy or associate an intrusion policy with an access control rule. See [Setting the Default Action](#) on page 428 and [Performing File and Intrusion Inspection on Allowed Traffic](#) on page 511.

Access Control Policy

The access control policy that includes the intrusion policy where the intrusion, preprocessor, or decoder rule that generated the event is enabled. See [Using Access Control Policies](#) on page 424.

Access Control Rule

The access control rule associated with an intrusion rule that generated the event; see [Performing File and Intrusion Inspection on Allowed Traffic](#) on page 511. **Default Action** indicates that the intrusion policy where the rule is enabled is not associated with an access control rule but, instead, is configured as the default action of the access control policy; see [Setting the Default Action](#) on page 428.

Rule

For standard text rule events, the rule that generated the event.

Note that if the event is based on a shared object rule, a decoder, or a preprocessor, the rule is not available.

Because rule data may contain sensitive information about your network, administrators may toggle users' ability to view rule information in the packet view with the View Local Rules permission in the user role editor. For more information, see [Modifying User Privileges and Options](#) on page 1912.

Actions

For standard text rule events, expand **Actions** to take any of the following actions on the rule that triggered the event:

- edit, the rule
- view documentation for the revision of the rule
- add a comment to the rule
- change the state of the rule
- set a threshold for the rule
- suppress the rule

See [Using Packet View Actions](#) on page 629, [Setting Threshold Options within the Packet View](#) on page 631, and [Setting Suppression Options within the Packet View](#) on page 633 for more information.

Note that if the event is based on a shared object rule, a decoder, or a preprocessor, the rule is not available.

Using Packet View Actions

LICENSE: Protection

On the packet view, you can take several actions in the Event Information section on the rule that triggered the event. Note that if the event is based on a shared object rule, a decoder, or a preprocessor, the rule is not available. You must expand **Actions** to display rule actions.

Edit

For standard text rule events, click **Edit** to modify the rule that generated the event.

Note that if the event is based on a shared object rule, a decoder, or a preprocessor, the rule is not available.

IMPORTANT! If you edit a rule provided by Sourcefire (as opposed to a custom standard text rule), you actually create a new local rule. Make sure you set the local rule to generate events and also disable the original rule in the current intrusion policy. Note, however, that you **cannot** enable local rules in the default policies. For more information, see [Modifying Existing Rules](#) on page 1184.

View Documentation

For standard text rule events, click **View Documentation** to learn more about the rule revision that generated the event.

Rule Comment

For standard text rule events, click **Rule Comment** to add a text comment to the rule that generated the event.

This allows you to provide additional context and information about the rule and the exploit or policy violation it identifies. You can also add and view rule comments in the rule editor. For more information, see [Adding Comments to Rules](#) on page 1187.

Disable this rule

If this event is generated by a standard text rule, you can disable the rule, if necessary. You can set the rule in all policies that you can edit locally. Alternately, you can set the rule only in the current policy (that is, the policy that generated the event) if you can edit the current policy locally.

For more information, see [Setting Rule States](#) on page 743.

Note that the current policy option appears only when you can edit the current policy; for example, you can edit a custom policy, but you cannot edit a default policy provided by Sourcefire.

IMPORTANT! You **cannot** disable shared object rules from the packet view, nor can you disable rules in the default policies.

Set this rule to generate events

If this event is generated by a standard text rule, you can set the rule to generate events in all policies that you can edit locally. Alternately, you can set the rule only in the current policy (that is, the policy that generated the event) if you can edit the current policy locally.

For more information, see [Setting Rule States](#) on page 743.

Note that the current policy option appears only when you can edit the current policy; for example, you can edit a custom policy, but you cannot edit a default policy provided by Sourcefire.

IMPORTANT! You **cannot** set shared object rules to generate events from e packet view, nor can you disable rules in the default policies.

Set this rule to drop

If your managed device is deployed inline on your network, you can set the rule that triggered the event to drop packets that trigger the rule in all policies that you can edit locally. Alternately, you can set the rule only in the current policy (that is, the policy that generated the event) if you can edit the current policy locally.

Note that the current policy option appears only when you can edit the current policy; for example, you can edit a custom policy, but you cannot edit a default policy provided by Sourcefire. Note also that this option appears only when **Drop when Inline** is enabled in the current policy. See [Setting Drop Behavior in an Inline Deployment](#) on page 689 for more information.

Set Thresholding Options

You can use this option to create a threshold for the rule that triggered this event in all policies that you can edit locally. Alternately, you create a threshold only for the current policy (that is, the policy that generated the event) if you can edit the current policy locally.

The thresholding options are described in [Setting Threshold Options within the Packet View](#) on page 631.

Note that the current policy option appears only when you can edit the current policy; for example, you can edit a custom policy, but you cannot edit a default intrusion policy provided by Sourcefire.

Set Suppression Options

You can use this object to suppress the rule that triggered this event in all policies that you can edit locally. Alternately, you can suppress the rule only in the current policy (that is, the policy that generated the event) if you can edit the current policy locally.

The suppression options are described in [Setting Suppression Options within the Packet View](#) on page 633.

Note that the current policy option appears only when you can edit the current policy; for example, you can edit a custom policy, but you cannot edit a default policy provided by Sourcefire.

Setting Threshold Options within the Packet View

LICENSE: Protection

You can control the number of events that are generated per rule over time by setting the threshold options in the packet view of an intrusion event. You can set threshold options in all policies that you can edit locally or, when it can be edited locally, only in the in the current policy (that is, the policy that caused the event to be generated).

To set the threshold options within the packet view:

ACCESS: Admin/Intrusion Admin

1. Within the packet view of an intrusion event that was generated by an intrusion rule, expand **Actions** in the Event Information section; expand **Set Thresholding Options** and select one of the two possible options:

- **in the current policy**
- **in all locally created policies**

Note that the current policy option appears only when you can edit the current policy; for example, you can edit a custom policy, but you cannot edit a default policy provided by Sourcefire.

The thresholding options appear.

The screenshot shows a form for configuring thresholding options. It includes radio buttons for 'Type' (limit, threshold, both) and 'Track By' (Source, Destination). There are input fields for 'Count' and 'Seconds'. A checkbox labeled 'Override any existing settings for this rule' is present, along with a 'Save Thresholding' button.

2. Select the type of threshold you want to set:
 - Select **limit** to limit notification to the specified number of event instances per time period.
 - Select **threshold** to provide notification for each specified number of event instances per time period.
 - Select **both** to provide notification once per time period after a specified number of event instances.
3. Select the appropriate radio button to indicate whether you want the event instances tracked by **Source** or **Destination** IP address.
4. In the **Count** field, type the number of event instances you want to use as your threshold.
5. In the **Seconds** field, type a number between 1 and 86400 that specifies the time period for which event instances are tracked.
6. If you want to override any current thresholds for this rule in existing intrusion policies, select **Override any existing settings for this rule**.
7. Click **Save Thresholding**.

The system adds your threshold and displays a message indicating success. If you chose not to override existing settings, a message appears informing you of any conflicts.

Setting Suppression Options within the Packet View

LICENSE: Protection

You can use the suppression options to suppress intrusion events altogether, or based on the source or destination IP address. You can set suppression options in all policies that you can edit locally. Alternately, you can set suppression options only in the current policy (that is, the policy that generated the event) when the current policy can be edited locally.

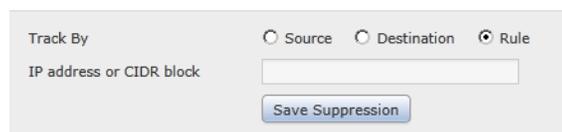

To suppress intrusion events within the packet view:

ACCESS: Admin/Intrusion Admin

1. Within the packet view of an intrusion event that was generated by an intrusion rule, expand **Actions** in the Event Information section; expand **Set Suppression Options** and click one of the two possible options:
 - **in the current policy**
 - **in all locally created policies**

Note that the current policy option appears only when you can edit the current policy; for example, you can edit a custom policy, but you cannot edit a default policy provided by Sourcefire.

The suppression options appear.

The screenshot shows a dialog box for setting suppression options. At the top, it says "Track By" followed by three radio buttons: "Source", "Destination", and "Rule". The "Rule" radio button is selected. Below the radio buttons is a text input field labeled "IP address or CIDR block". At the bottom of the dialog box is a "Save Suppression" button.

2. Select one of the following **Track By** options:
 - To completely suppress events for the rule that triggered this event, select **Rule**.
 - To suppress events generated by packets originating from a specified source IP address, select **Source**.
 - To suppress events generated by packets going to a specified destination IP address, select **Destination**.
3. In the **IP address or CIDR block** field, enter the IP address or CIDR block/prefix length you want to specify as the source or destination IP address.
For information on using CIDR notation and prefix lengths in the Sourcefire 3D System, see [IP Address Conventions](#) on page 57.
4. Click **Save Suppression**.

The suppression options within your intrusion policies are modified according to your specifications. If you chose not to override existing settings, a message appears informing you of any conflicts.

Viewing Frame Information

LICENSE: Protection

On the packet view, click the arrow next to **Frame** to view information about the captured frame. The packet view may display a single frame or multiple frames. Each frame provides information about an individual network packet. You would see multiple frames, for example, in the case of tagged packets or packets in reassembled TCP streams. For information on tagged packets, see [Evaluating Post-Attack Traffic](#) on page 1166. For information on reassembled TCP streams, see [Reassembling TCP Streams](#) on page 949.

Frame n

The captured frame, where n is 1 for single-frame packets and the incremental frame number for multi-frame packets. The number of captured bytes in the frame is appended to the frame number.

Arrival Time

The date and time the frame was captured.

Time delta from previous captured frame

For multi-frame packets, the elapsed time since the previous frame was captured.

Time delta from previous displayed frame

For multi-frame packets, the elapsed time since the previous frame was displayed.

Time since reference or first frame

For multi-frame packets, the elapsed time since the first frame was captured.

Frame Number

The incremental frame number.

Frame Length

The length of the frame in bytes.

Capture Length

The length of the captured frame in bytes.

Frame is marked

Whether the frame is marked (true or false).

Protocols in frame

The protocols included in the frame.

Viewing Data Link Layer Information

LICENSE: Protection

On the packet view, click the arrow next to the data link layer protocol (for example, **Ethernet II**) to view the data link layer information about the packet, which contains the 48-bit media access control (MAC) addresses for the source and destination hosts. It may also display other information about the packet, depending on the hardware protocol.

IMPORTANT! Note that this example discusses Ethernet link layer information; other protocols may also appear.

The packet view reflects the protocol used at the data link layer. The following listing describes the information you might see for an Ethernet II or IEEE 802.3 Ethernet packet in the packet view.

Destination

The MAC address for the destination host.

IMPORTANT! Ethernet can also use multicast and broadcast addresses as the destination address.

Source

The MAC address for the source host.

Type

For Ethernet II packets, the type of packet that is encapsulated in the Ethernet frame; for example, IPv6 or ARP datagrams. Note that this item only appears for Ethernet II packets.

Length

For IEEE 802.3 Ethernet packets, the total length of the packet, in bytes, not including the checksum. Note that this item only appears for IEEE 802.3 Ethernet packets.

Viewing Network Layer Information

LICENSE: Protection

On the packet view, click the arrow next to the network layer protocol (for example, **Internet Protocol**) to view more detailed information about network layer information related to the packet.

IMPORTANT! Note that this example discusses IP packets; other protocols may also appear.

See the following sections for more information:

- [Viewing IPv4 Network Layer Information](#) on page 636
- [Viewing IPv6 Network Layer Information](#) on page 637

Viewing IPv4 Network Layer Information

LICENSE: Protection

The following listing describes protocol-specific information that might appear in an IPv4 packet.

Version

The Internet Protocol version number.

Header Length

The number of bytes in the header, including any IP options. An IP header with no options is 20 bytes long.

Differentiated Services Field

The values for differentiated services that indicate how the sending host supports Explicit Congestion Notification (ECN):

- 0x0 — does not support ECN-Capable Transport (ECT)
- 0x1 and 0x2 — supports ECT
- 0x3 — Congestion Experienced (CE)

Total Length

The length of the IP packet, in bytes, minus the IP header.

Identification

The value that uniquely identifies an IP datagram sent by the source host. This value is used to trace fragments of the same datagram.

Flags

The values that control IP fragmentation, where:

values for the Last Fragment flag indicate whether there are more fragments associated with the datagram:

- 0 — there are no more fragments associated with the datagram
- 1 — there are more fragments associated with the datagram

values for the Don't Fragment flag control whether the datagram can be fragmented:

- 0 — the datagram can be fragmented
- 1 — the datagram must **not** be fragmented

Fragment Offset

The value for the fragment offset from the beginning of the datagram.

Time to Live (ttl)

The remaining number of hops that the datagram can make between routers before the datagram expires.

Protocol

The transport protocol that is encapsulated in the IP datagram; for example, ICMP, IGMP, TCP, or UDP.

Header Checksum

The indicator for whether the IP checksum is valid. If the checksum is invalid, the datagram may have been corrupted during transit or may be being used in an intrusion evasion attempt.

Source/Destination

The IP address or domain name for the source (or destination) host.

Note that to display the domain name, you must enable IP address resolution; for more information, see [Configuring Event View Settings](#) on page 2218.

Click the address or domain name to view the context menu, then select **Whois** to do a whois search on the host, **View Host Profile** to view host information, or **Blacklist Now** or **Whitelist Now** to add the address to a global blacklist or whitelist. See [Using Host Profiles](#) on page 1334 and [Working with the Global Whitelist and Blacklist](#) on page 166.

Viewing IPv6 Network Layer Information

LICENSE: Protection

The following listing describes protocol-specific information that might appear in an IPv6 packet.

Traffic Class

An experimental 8-bit field in the IPv6 header for identifying IPv6 packet classes or priorities similar to the differentiated services functionality provided for IPv4. When unused, this field is set to zero.

Flow Label

A optional 20-bit IPv6 hexadecimal value 1 to FFFFF that identifies a special flow such as non-default quality of service or real-time service. When unused, this field is set to zero.

Payload Length

A 16-bit field identifying the number of octets in the IPv6 payload, which is comprised of all of the packet following the IPv6 header, including any extension headers.

Next Header

An 8-bit field identifying the type of header immediately following the IPv6 header, using the same values as the IPv4 Protocol field.

Hop Limit

An 8-bit decimal integer that each node that forwards the packet decrements by one. The packet is discarded if the decremented value reaches zero.

Source

The 128-bit IPv6 address for the source host.

Destination

The 128-bit IPv6 address for the destination host.

Viewing Transport Layer Information

LICENSE: Protection

On the packet view, click the arrow next to the transport layer protocol (for example, **TCP**, **UDP**, or **ICMP**) to view more information about the packet.

TIP! Click **Data** when present to view the first twenty-four bytes of the payload for the protocol immediately above it in the Packet Information section of the packet view.

The contents of the transport layer for each of the following protocols is described below:

- [TCP Packet View](#) on page 639
- [UDP Packet View](#) on page 640
- [ICMP Packet View](#) on page 640

IMPORTANT! Note that these examples discuss TCP, UDP, and ICMP packets; other protocols may also appear.

TCP Packet View

LICENSE: Protection

This section describes the protocol-specific information for a TCP packet.

Source port

The number that identifies the originating application protocol.

Destination port

The number that identifies the receiving application protocol.

Sequence number

The value for the first byte in the current TCP segment, keyed to initial sequence number in the TCP stream.

Next sequence number

In a response packet, the sequence number of the next packet to send.

Acknowledgement number

The TCP acknowledgement, which is keyed to the sequence number of the previously accepted data.

Header Length

The number of bytes in the header.

Flags

The six bits that indicate the TCP segment's transmission state:

- **U** — the urgent pointer is valid
- **A** — the acknowledgement number is valid
- **P** — the receiver should push data
- **R** — reset the connection

- S — synchronize sequence numbers to start a new connection
- F — the sender has finished sending data

Window size

The amount of unacknowledged data, in bytes, that the receiving host will accept.

Checksum

The indicator for whether the TCP checksum is valid. If the checksum is invalid, the datagram may have been corrupted during transit or may be being used in an evasion attempt.

Urgent Pointer

The position, if present, in the TCP segment where the urgent data ends. Used in conjunction with the u flag.

Options

The values, if present, for TCP options.

UDP Packet View

LICENSE: Protection

This section describes the protocol-specific information for a UDP packet.

Source port

The number that identifies the originating application protocol.

Destination port

The number that identifies the receiving application protocol.

Length

The combined length of the UDP header and data.

Checksum

The indicator for whether the UDP checksum is valid. If the checksum is invalid, the datagram may have been corrupted during transit.

ICMP Packet View

LICENSE: Protection

This section describes the protocol-specific information for an ICMP packet.

Type

The type of ICMP message:

- 0 — echo reply
- 3 — destination unreachable
- 4 — source quench
- 5 — redirect
- 8 — echo request
- 9 — router advertisement
- 10 — router solicitation
- 11 — time exceeded
- 12 — parameter problem
- 13 — timestamp request
- 14 — timestamp reply
- 15 — information request (obsolete)
- 16 — information reply (obsolete)
- 17 — address mask request
- 18 — address mask reply

Code

The accompanying code for the ICMP message type. ICMP message types 3, 5, 11, and 12 have corresponding codes as described in RFC 792.

Checksum

The indicator for whether the ICMP checksum is valid. If the checksum is invalid, the datagram may have been corrupted during transit.

Viewing Packet Byte Information

LICENSE: Protection

On the packet view, click the arrow next to **Packet Bytes** to view hexadecimal and ASCII versions of the bytes that comprise the packet.

Using Impact Flags to Evaluate Events

LICENSE: Protection

To help you evaluate the impact an event has on your network, the Defense Center displays an impact flag in the table view of intrusion events. For each event, the Defense Center adds an impact flag whose color indicates the

correlation between intrusion data, network discovery data, and vulnerability information.

IMPORTANT! Because there is no operating system information available for hosts added to the network map based on NetFlow data, the Defense Center cannot assign impact Vulnerable (impact level 1: red) impact flags for intrusion events involving those hosts, unless you use the host input feature to manually set the hosts' operating system identity.

The [Impact Flags](#) table describes the possible values for the impact flags.

Impact Flags

IMPACT LEVEL	VULNERABILITY	COLOR	DESCRIPTION
0	Unknown	gray	Neither the source nor the destination host is on a network that is monitored by network discovery.
1	Vulnerable	red	Either: <ul style="list-style-type: none">the source or the destination host is in the network map, and a vulnerability is mapped to the hostthe source or destination host is potentially compromised by a virus, trojan, or other piece of malicious software; see Setting a Red (Level 1) Impact Flag on page 1100 for more information
2	Potentially Vulnerable	orange	Either the source or the destination host is in the network map and one of the following is true: <ul style="list-style-type: none">for port-oriented traffic, the port is running a server application protocolfor non-port-oriented traffic, the host uses the protocol

Impact Flags (Continued)

IMPACT LEVEL	VULNERABILITY	COLOR	DESCRIPTION
3	Currently Not Vulnerable	yellow	Either the source or the destination host is in the network map and one of the following is true: <ul style="list-style-type: none"> for port-oriented traffic (for example, TCP or UDP), the port is not open for non-port-oriented traffic (for example, ICMP), the host does not use the protocol
4	Unknown Target	blue	Either the source or destination host is on a monitored network, but there is no entry for the host in the network map.

To use the impact flag on the table view to evaluate events:

ACCESS: Admin/Intrusion Admin

1. Select **Analysis > Intrusion > Events**.

The first page of the default intrusion events workflow appears. For information on specifying a different default workflow, see [Configuring Event View Settings](#) on page 2218. If no events appear, you may need to adjust the time range; see [Setting Event Time Constraints](#) on page 1820.

2. Constrain the event view to view only those events that you want to evaluate.

For more information, see [Using Drill-Down and Table View Pages](#) on page 616.

3. At the top of the page, click **Table View of Events**.

The table view of events appears. **Impact Flag** can have any of the values described in the [Impact Flags table](#) on page 642. Several of the columns in the following graphic were removed from the table view to simplify the graphic.

	Time	Priority	Impact Flag	Inline Result	Source IP	Destination IP	Source Port / ICMP Type	Destination Port / I
↓	2011-09-29 12:12:51	high	0	↓	10.10.10.4	10.10.10.5	36157/tcp	80 (http)/tcp
↓	2011-09-29 12:12:51	high	1	↓	10.10.10.4	10.10.10.5	42398/tcp	80 (http)/tcp
↓	2011-09-29 12:10:50	high	2	↓	10.10.10.4	10.10.10.5	35666/tcp	80 (http)/tcp
↓	2011-09-29 12:10:50	high	3	↓	10.10.10.4	10.10.10.5	41907/tcp	80 (http)/tcp
↓	2011-09-29 12:09:21	high	4	↓	10.10.10.4	10.10.10.5	1035/tcp	80 (http)/tcp

4. To sort the table by impact level, click **Impact Flag**.
The events are sorted by impact level.

TIP! To reverse the sort order, click **Impact Flag** again.

Searching for Intrusion Events

LICENSE: Protection

You can search for specific intrusion events by using a predefined search delivered with the Sourcefire 3D System or by creating your own search criteria.

The predefined searches serve as examples and can provide quick access to important information about your network. You may want to modify specific fields within the default searches to customize them for your network environment, then save them to reuse later. The search criteria you can use are described in the following list.

TIP! For information about the syntax for specifying IP addresses and ports in an intrusion event search, see [Specifying IP Addresses in Searches](#) on page 1776 and [Specifying Ports in Searches](#) on page 1777.

For more information on searching, including how to load and delete saved searches, see the [Searching for Events table](#) on page 1770.

Priority

Specify the priority of the events you want to view. The priority corresponds to either the value of the `priority` keyword or the value for the `classtype` keyword. For other intrusion events, the priority is determined by the decoder or preprocessor. Valid values are **high**, **medium**, and **low**.

Impact

Specify the impact flag assigned to the intrusion event based on the correlation between intrusion data and network discovery data. Valid case-insensitive values are **Impact Level 0**, **Impact Level 1**, **Impact Level 2**, **Impact Level 3**, and **Impact Level 4**.

Do not use impact flag colors or partial strings (for example, do not use **blue**, **level 1**, or **0**).

For more information, see [Using Impact Flags to Evaluate Events](#) on page 641.

Inline Result

Type either:

- **dropped**, to specify whether the packet is dropped in an inline deployment
- **would have dropped**, to specify whether the packet would have dropped if the intrusion policy had been set to drop packets in an inline deployment

Note that the system does not drop packets in a passive deployment, including when an inline interface is in tap mode, regardless of the rule state or the inline drop behavior of the intrusion policy. For more information, see [Setting Rule States](#) on page 743, [Setting Drop Behavior in an Inline Deployment](#) on page 689, [Configuring Passive Interfaces](#) on page 267, and [Tap Mode](#) on page 275.

Source IP

Specify the IP address used by the source host involved in the intrusion events.

Destination IP

Specify the IP address used by the destination host involved in the intrusion events.

Source/Destination IP

Specify the source or destination IP address used by the host whose intrusion events you want to view.

Source Country

Specify the country of the source host involved in the intrusion events.

Destination Country

Specify the country of the destination host involved in the intrusion events.

Source/Destination Country

Specify the country of the source or destination host involved in the intrusion events you want to view.

Source Continent

Specify the continent of the source host involved in the intrusion events.

Destination Continent

Specify the continent of the destination host involved in the intrusion events.

Source/Destination Continent

Specify the continent of the source or destination host involved in the intrusion events you want to view.

Original Client IP

Specify the original client IP address extracted from the X-Forwarded-For (XFF) or True-Client-IP HTTP headers. To extract a value for this field in an intrusion event, you must enable the HTTP Inspect preprocessor **Extract Original Client IP Address** option. See [Selecting Server-Level HTTP Normalization Options](#) on page 854 for more information.

Protocol

Type the name or number of the transport protocol used in the connection as listed in <http://www.iana.org/assignments/protocol-numbers>.

Note that there is no Protocol column in the intrusion event table view. This is the protocol associated with the source and destination port/ICMP column.

Source Port / ICMP Type

Specify the source port associated with the intrusion event.

TIP! For ICMP traffic, which does not target ports, you can use this field to search for events with specific ICMP types.

Destination Port / ICMP Code

Specify the destination port associated with the intrusion event.

TIP! For ICMP traffic, which does not target ports, you can use this field to search for events with specific ICMP codes.

VLAN ID

Specify the innermost VLAN ID associated with the packet that triggered the intrusion event.

MPLS Label

Specify the Multiprotocol Label Switching label of the packet associated with the packet that triggered the intrusion event.

Message

Specify all or part of the event message for the events you want to view.

Classification

Enter the classification number, or all or part of the classification name or description for the rule that generated the events you want to view. You can also enter a comma-separated list of numbers, names, or descriptions. Finally, if you add a custom classification, you can also search using all or part of its name or description. See the [Rule Classifications table](#) on page 1058 for a list of classification numbers, names, and descriptions.

Generator

Specify the component that generated the events you want to view, as listed in the [Generator IDs table](#) on page 785.

Snort ID

Specify the Snort ID (SID) of the rule that generated the event or, optionally, specify the combination generator ID (GID) and SID of the rule, where the GID and SID are separated with a colon (:) in the format GID:SID. You can specify any of the values in the [Snort ID Search Values](#) table:

Snort ID Search Values

VALUE	EXAMPLE
a single SID	10000
a SID range	10000-11000
greater than a SID	>10000
greater than or equal to a SID	>=10000
less than a SID	<10000
less than or equal to a SID	<=10000
a comma-separated list of SIDs	10000,11000,12000
a single GID:SID combination	1:10000
a comma-separated list of GID:SID combinations	1:10000,1:11000,1:12000
a comma-separated list of SIDs and GID:SID combinations	10000,1:11000,12000

For more information, see [Reading Preprocessor Generator IDs](#) on page 784.

Note that the Snort ID column does not appear in search results; the SID of the events you are viewing is listed in the Message column.

Source User

Specify the User ID for a user logged in to the source host.

Destination User

Specify the User ID for a user logged in to the destination host.

Source/Destination User

Specify the User ID for a user logged in to the source or destination host.

Application Protocol

Type the name of the application protocol, which represents communications between hosts, detected in the traffic that triggered the intrusion event.

Client

Type the name of the client application, which represents software running on the monitored host detected in the traffic that triggered the intrusion event.

Web Application

Type the name of the web application, which represents the content or requested URL for HTTP traffic detected in the traffic that triggered the intrusion event.

Category, Tag (Application Protocol, Client, Web Application)

Type a category or tag associated with the application detected in the session. Use a commas to separate multiple categories or tags. These fields are case-insensitive.

Application Risk

Type the highest risk associated with the application detected in the session. Valid criteria are: **Very High**, **High**, **Medium**, **Low**, and **Very Low**. These fields are case-insensitive.

Business Relevance

Type the lowest business relevance associated with an application detected in the session. Valid criteria are: **Very High**, **High**, **Medium**, **Low**, and **Very Low**. These fields are case-insensitive.

Security Zone (Ingress, Egress, Ingress/Egress)

Type the name of a security zone associated with the packet that triggered the event. These fields are case-insensitive. See [Working with Security Zones](#) on page 187.

Device

Specify the device where the access control policy was applied. You can specify a device name, device group, or IP address. See [Managing Devices](#) on page 190, [Editing Assigned Device Names](#) on page 244, and [Managing Device Groups](#) on page 217.

Interface (Ingress, Egress)

Type the name of an interface associated with the packet that triggered the event; see [Configuring Interfaces](#) on page 258.

Intrusion Policy

Type the name of the intrusion policy associated with the event; see [Configuring Intrusion Policies](#) on page 667.

Access Control Policy

Type the name of the access control policy associated with the event; see [Using Access Control Policies](#) on page 424.

Access Control Rule

Type the name of the access control policy associated with the event; see [Understanding and Writing Access Control Rules](#) on page 472.

HTTP Hostname

Specify a single host name that was extracted from the HTTP request Host header.

To associate host names with intrusion events for HTTP client traffic, you must enable the HTTP Inspect preprocessor **Log Hostname** option. See [Selecting Server-Level HTTP Normalization Options](#) on page 854 for more information.

HTTP URI

Specify a single URI associated with the HTTP request packet that triggered the intrusion event.

To associate URIs with intrusion events for HTTP traffic, you must enable the HTTP Inspect preprocessor **Log URI** option. See [Selecting Server-Level HTTP Normalization Options](#) on page 854 for more information.

Email Sender

Specify the address of the email sender that was extracted from the SMTP MAIL FROM command. You can also enter a comma-separated list to search for events associated with all specified addresses. See [Understanding Intrusion Events](#) on page 604 for more information.

Email Recipient

Specify the address of the email recipient that was extracted from the SMTP RCPT TO command. You can also enter a comma-separated list to search for events associated with all specified addresses. See [Understanding Intrusion Events](#) on page 604 for more information.

Email Attachments

Specify the MIME attachment file name that was extracted from the MIME Content-Disposition header. Enter a comma-separated list to search for events associated with all attachment file names in the list. See [Understanding Intrusion Events](#) on page 604 for more information.

Email Headers

Specify data that was extracted from the email header. Note that email headers do not appear in the table view of intrusion events, but you can use email header data as a search criterion.

To associate email headers with intrusion events for SMTP traffic, you must enable the SMTP preprocessor **Log Headers** option. See [Understanding SMTP Decoding](#) on page 890 for more information.

Reviewed By

Specify the name of the user who reviewed the event. See [Reviewing Intrusion Events](#) on page 611.

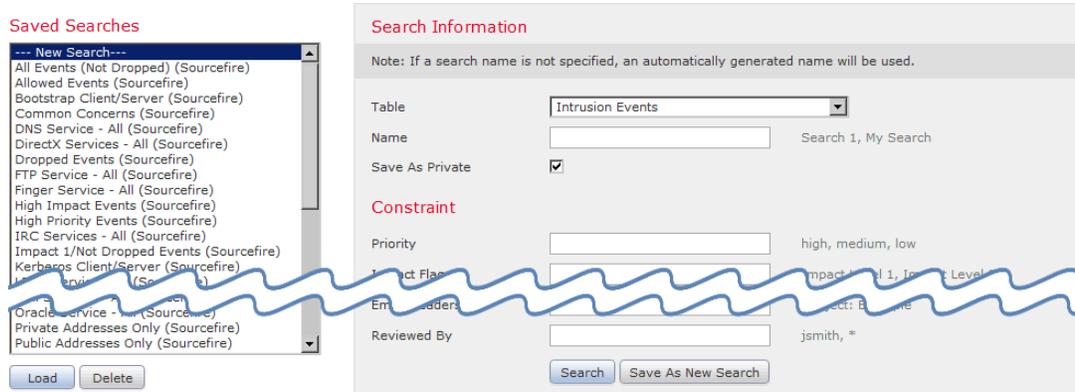

TIP! You can enter **unreviewed** to search for events that have not been reviewed.

To search for intrusion events:

ACCESS: Admin/Intrusion Admin

1. Select **Analysis > Search**.

The Intrusion Events search page appears.

You can also click **Search** while viewing lists of intrusion events (**Analysis > Intrusion > Events**).

2. Optionally, if you want to save the search, enter a name for the search in the **Name** field.

If you do not enter a name, one is automatically created when you save the search.

3. Enter your search criteria in the appropriate fields, as described in the list above the procedure.

For more information on search syntax, including using objects in searches, see [Searching for Events](#) on page 1770.

4. If you want to save the search so that other users can access it, clear the **Save As Private** check box. Otherwise, leave the check box selected to save the search as private. Note that users with the Administrator role can still view searches that you save as private.

If you want to use the search as a data restriction for a custom user role, you **must** save it as a private search.

5. You have the following options:

- Click **Search** to start the search.

Your search results appear in the default intrusion events workflow, constrained by the current time range. For information on specifying a different default workflow, see [Configuring Event View Settings](#) on page 2218.

- Click **Save** if you are modifying an existing search and want to save your changes.
- Click **Save as New Search** to save the search criteria. The search is saved (and associated with your user account if you selected **Save As Private**) so that you can run it at a later time.

Using the Clipboard

LICENSE: Protection

The clipboard is a holding area where you can copy intrusion events from any of the intrusion event views. For information on how to add events to the clipboard, see [Using Drill-Down and Table View Pages](#) on page 616 and [Using the Packet View](#) on page 622.

The contents of the clipboard are sorted by the date and time that the events were generated. After you add intrusion events to the clipboard, you can delete them from the clipboard as well as generate reports on the contents of the clipboard.

You can also add intrusion events from the clipboard to incidents, which are compilations of events that you suspect are involved in a possible violation of your security policies. For more information about adding events from the clipboard to an incident, see [Creating an Incident](#) on page 661.

See the following sections for more information:

- [Generating Clipboard Reports](#) on page 652
- [Deleting Events from the Clipboard](#) on page 654

Generating Clipboard Reports

LICENSE: Protection

You can generate a report for the events on the clipboard just as you would from any of the event views.

To generate a report on intrusion events from the clipboard:

ACCESS: Admin/Intrusion Admin

1. Add one or more events to the clipboard:
 - For information on how to add events to the clipboard from a drill-down page or table view of events, see [Using Drill-Down and Table View Pages](#) on page 616.
 - For information on how to add events to the clipboard from the packet view, see [Using the Packet View](#) on page 622.

2. Select **Analysis > Intrusion > Clipboard**.

The clipboard appears.

<input type="checkbox"/>	Time	Priority	Device	Source IP	Destination IP	Source Port / ICMP Type	Destination Port / ICMP Code	Message
<input type="checkbox"/>	2011-09-29 12:12:51	high	linden	10.10.10.4	10.10.10.5	36157/tcp	80 (http/tcp)	ORACLE http Server mod_access restriction bypass attempt (1:15956)

4. Specify how you want your report to look, then click **Generate**.

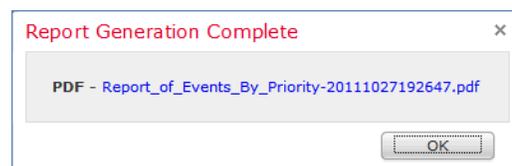

The Generate Report pop-up dialog appears.

5. Select one or more output formats (HTML, PDF, CSV) and, optionally, modify any of the other settings.

TIP! For more information about using the Report Designer, see [Working with Reports](#) on page 1724.

6. Click **Generate**, then click **Yes**.

The Report Generation Complete pop-up window appears with a link to view your report.

7. Click either:
 - a report link, which opens a new window to display the report you selected.
 - **OK** to return to the Report Templates page where you can modify your report design.

Deleting Events from the Clipboard

LICENSE: Protection

If you have intrusion events on the clipboard that you do not want to add to an incident, you can delete the events.

IMPORTANT! Deleting an event from the clipboard does **not** delete the event from the event database. However, deleting an event from the event database does delete the event from the clipboard.

To delete events from the clipboard:

ACCESS: Admin/Intrusion Admin

1. Select **Analysis > Intrusion > Clipboard**.
The clipboard appears.

2. You have the following options:
 - To delete specific intrusion events from a page on the clipboard, navigate to the page, select the check box next to the events, and click **Delete**.
The events are deleted.
 - To delete all the intrusion events from the clipboard, click **Delete All**.
All the events are deleted from the clipboard. Note that if you select the **Confirm 'All' Actions** option in the Event Preferences, you are first prompted to confirm that you want to delete all the events.

CHAPTER 18

HANDLING INCIDENTS

Incident handling refers to the response an organization takes when a violation of its security policies is suspected. The Sourcefire 3D System includes features to support you as you collect and process information that is relevant to your investigation of an incident. You can use these features to gather intrusion events and packet data that may be related to the incident. You can also use the incident as a repository for notes about any activity that you take outside of the Sourcefire 3D System to mitigate the effects of the attack. For example, if your security policies require that you quarantine compromised hosts from your network, you can note that in the incident.

The Sourcefire 3D System also supports an incident life cycle, allowing you to change an incident's status as you progress through your response to an attack. When you close an incident, you can note any changes you have made to your security policies as a result of any lessons learned.

See the following sections for more information about handling incidents in the Sourcefire 3D System:

- [Incident Handling Basics](#) on page 657
- [Creating an Incident](#) on page 661
- [Editing an Incident](#) on page 663
- [Generating Incident Reports](#) on page 664
- [Creating Custom Incident Types](#) on page 665

Incident Handling Basics

LICENSE: Protection

Each organization is likely to have its own process for discovering, defining, and responding to violations of its security policies. The sections that follow describe some of the basics of incident handling and how you can incorporate the Sourcefire 3D System in your incident response plan:

- [Definition of an Incident](#) on page 657
- [Common Incident Handling Processes](#) on page 657
- [Incident Types in the Sourcefire 3D System](#) on page 660

Definition of an Incident

LICENSE: Protection

Generally, an *incident* is defined as one or more intrusion events that you suspect are involved in a possible violation of your security policies. Sourcefire also uses the term to describe the feature you use in the Sourcefire 3D System to track your response to an incident.

As explained in [Working with Intrusion Events](#) on page 593, some intrusion events are more important than others to the availability, confidentiality, and integrity of your network assets. For example, the port scan detection features provided by the Sourcefire 3D System can keep you informed of port scanning activity on your network. Your security policy, however, may not specifically prohibit port scanning or see it as a high priority threat, so rather than take any direct action, you may instead want to keep logs of any port scanning for later forensic study.

On the other hand, if the system generates events that indicate hosts within your network have been compromised and are participating in distributed denial-of-service (DDoS) attacks, then this activity is likely a clear violation of your security policy, and you should create an incident in the Sourcefire 3D System to help you track your investigation of these events.

Common Incident Handling Processes

LICENSE: Protection

Each organization is likely to define its own process for handling security incidents. Most methodologies include some or all of the following phases:

- [Preparation](#) on page 658
- [Detection and Notification](#) on page 658
- [Investigation and Qualification](#) on page 658
- [Communication](#) on page 659
- [Containment and Recovery](#) on page 660
- [Lessons Learned](#) on page 660

Each of these phases is described in the sections that follow. The descriptions also explain how the Sourcefire 3D System fits into each phase.

Preparation

You can prepare for incidents in two ways:

- by having clear and comprehensive security policies in place, as well as the hardware and software resources to enforce them
- by having a clearly defined plan to respond to incidents and a properly trained team that can implement the plan

A key part of incident handling is understanding which parts of your network are at the greatest risk. By deploying Sourcefire 3D System components on those network segments, you can increase your awareness of when and how incidents occur. Also, by taking the time to carefully tune the intrusion policy for each managed device, you can ensure that the events that are generated are of the highest quality.

Detection and Notification

You cannot respond to an incident unless you can detect it. Your incident handling process should note the kinds of security-related events that you can detect and the mechanisms, both software and hardware, that you use to detect them. You should also note where you can detect violations of your security policies. If your network includes segments that are not actively or passively monitored, then you need to note that as well.

The managed devices that you deploy on your network are responsible for analyzing the traffic on the segments where they are installed, for detecting intrusions, and for generating events that describe them. Keep in mind that the access control policy you apply to each of the managed devices governs what kinds of activity they detect and how it is prioritized. You can also set notification options for certain types of intrusion events so that the incident team does not need to sift through hundreds of events. You can specify that you are notified automatically when certain high priority, high severity events are detected.

Investigation and Qualification

Your incident handling process should specify how, after a security incident is detected, an investigation is conducted. In some organizations, junior members of the team triage all the incidents and handle the less severe or lower priority cases themselves. High severity and high priority incidents are handled by more senior members of the team. You should carefully outline the escalation process so that each team member understands the criteria for raising an incident's importance.

Part of the escalation process is tied to understanding how a detected event can affect the security of your network assets. For example, an attack against hosts running Microsoft SQL Server is not a high priority for organizations that use a different database server. Similarly, the attack is less important to you if you use

SQL Server on your network, but you are confident that all the servers are patched and are not vulnerable to the attack. However, if someone has recently installed a copy of the vulnerable version of the software (perhaps for testing purposes), you may have a greater problem than a cursory investigation would suggest.

The Sourcefire 3D System is particularly well suited to supporting the investigation and qualification process. You can create your own event classifications, and then apply them in a way that best describes the vulnerabilities on your network. When traffic on your network triggers an event, that event is automatically prioritized and qualified for you with special indicators showing which attacks are directed against hosts that are known to be vulnerable.

The incident tracking feature in the Sourcefire 3D System also includes a status indicator that you can change to show which incidents have been escalated.

Communication

All incident handling processes should specify how an incident is communicated between the incident handling team and both internal and external audiences. For example, you should consider what kinds of incidents require management intervention and at what level. Also, your process should outline how and when you communicate with outside organizations. Will some incidents require that you notify law enforcement agencies? If your hosts are participating in a distributed denial of service (DDoS) against a remote site, will you inform them? Do you want to share information with organizations such as the CERT Coordination Center (CERT/CC) or FIRST?

Sourcefire 3D System has features that you can use to gather intrusion data in standard formats such as HTML, PDF, and CSV (comma-separated values) so that you can easily share intrusion data with others.

For example, CERT/CC collects standard information about security incidents on its web site. CERT/CC looks for the kinds of information that you can easily extract from the Sourcefire 3D System, such as:

- information about the affected machines, including:
 - the host name and IP
 - the time zone
 - the purpose or function of the host
- information about the sources of the attack, including:
 - the host name and IP
 - the time zone

- whether you had any contact with an attacker
- the estimated cost of handling the incident
- a description of the incident, including:
 - dates
 - methods of intrusion
 - the intruder tools involved
 - the software versions and patch levels
 - any intruder tool output
 - the details of vulnerabilities exploited
 - the source of the attack
 - any other relevant information

You can also use the comment section of an incident to record when you communicate issues and with whom.

Containment and Recovery

Your incident handling process should clearly indicate what steps are taken when a host or other network component is compromised. The range of containment and recovery options stretches from applying patches to vulnerable hosts to shutting down the target and removing it from the network. You should also consider the importance, depending upon the nature and severity of the attack, of preserving evidence in case you pursue criminal charges.

You can use the incident feature of Sourcefire 3D System to maintain a record of the actions you take during the containment and recovery phase of the incident.

Lessons Learned

Each security incident, whether or not it is a successful attack, is an opportunity to review your security policies. Do you need to update your firewall rules? Do you need a more structured approach to patch management? Are unauthorized wireless access points a new security issue? Each lesson learned should feed back into your security policies and help you prepare better for the next incident.

Incident Types in the Sourcefire 3D System

LICENSE: Protection

You can assign an incident type to each incident you create. The following types are supported by default in the Sourcefire 3D System:

- Intrusion
- Denial of Service
- Unauthorized Admin Access
- Web Site Defacement

- Compromise of System Integrity
- Hoax
- Theft
- Damage
- Unknown

You can also create your own incident types, as explained in [Creating Custom Incident Types](#) on page 665.

Creating an Incident

LICENSE: Protection

This section explains how you create an incident.

To create an incident:

ACCESS: Admin/Intrusion Admin

1. Select **Analysis > Intrusion > Incidents**.

The Incidents page appears.

2. Click **Create Incident**.

The Create Incident page appears.

The screenshot shows a web form titled "Create New Incident". It contains the following elements:

- Status:** A dropdown menu with "New" selected.
- Type:** A dropdown menu with "Intrusion" selected, followed by the word "Types".
- Time Spent:** A text input field containing "1m". To its right is the text "e.g. 1d 1h 1m 1s".
- Total Time Spent:** An empty text input field.
- Summary:** A large text area with a vertical scrollbar.
- Add Comment:** A larger text area with a vertical scrollbar.
- Buttons:** "Save" and "Reset" buttons at the bottom.

If you previously copied intrusion events to the clipboard, they are displayed at the bottom of the page, as in the following graphic. See [Using the Clipboard](#) on page 652 for information about using the clipboard.

Events in Your Clipboard

<input type="checkbox"/>	Time	Priority	Protocol	Source IP	Destination IP	Source Port / ICMP Type	Destination Port / ICMP Code	Message
<input type="checkbox"/>	2011-09-27 13:33:30	high	tcp	10.10.10.3	10.10.10.4	4675/tcp	445 (microsoft-ds)/tcp	SHELLCOD x86 OS agnostic xi dword decoder (1:17344)
<input type="checkbox"/>	2011-09-25 18:06:28	high	tcp	10.10.10.3	10.10.10.4	139 (netbios-ssn)/tcp	35361/tcp	SHELLCOD x86 OS agnostic alpha numeric upper case decoder (1:17340)

Displaying rows 1-2 of 2 rows << Page 1 of 1 >>

Add to Incident Add All to Incident

- From the **Type** drop-down menu, select the option that best describes the incident.
- In the **Time Spent** field, enter the amount of time you spent on the incident in the #d #h #m #s format, where # represents the number of days, hours, minutes, or seconds.
- In the **Summary** text box, type a short description (up to 255 alphanumeric characters spaces, and symbols) of the incident.
- In the **Add Comment** text box, type a more complete description (up to 8191 alphanumeric characters, spaces and symbols) for the incident.

7. Do you want to add events to the incident?
 - If **yes**, select the events on the clipboard and click **Add to Incident**.
You can also add all the events from the clipboard by clicking **Add All to Incident**.
 - If **no**, click **Save**.

In either case, the incident is saved with the information you entered.

IMPORTANT! If you want to add individual events from more than one page on the clipboard, you must add the events from one page, then add the events from the other pages separately.

Editing an Incident

LICENSE: Protection

You can update an incident as you collect more information. You can also add or delete events from the incident as your investigation progresses.

To edit an incident:

ACCESS: Admin/Intrusion Admin

1. Select **Analysis > Intrusion > Incidents**.
The Incidents page appears.
2. Click the edit icon (✎) next to the incident you want to edit.
3. You can edit any of the following aspects of the incident:
 - change the status
 - change the type
 - add events from the clipboard
 - delete events
4. In the **Time Spent** field, enter the amount of additional time you spent on the incident.
5. In the **Add Comment** text box, indicate your changes to the incident (up to 8191 alphanumeric characters, spaces and symbols) for the incident.
6. Optionally, you can add or delete events from the incident:
 - To add events from the clipboard, select the events on the clipboard and click **Add to Incident**.
 - To add all the events from the clipboard, click **Add All to Incident**.
 - To delete specific events from the incident, select the events and click **Delete**.

- To delete all events from the incident, click **Delete All**.
 - To update the incident without adding or deleting events, click **Save**.
- Your changes to the incident are saved.

Generating Incident Reports

LICENSE: Protection

You can use the Sourcefire 3D System to generate incident reports that can include the incident summary, incident status, and any comments along with information from the events you add to the incident. You can also specify whether you want to include event summary information in the report.

To generate an incident report:

ACCESS: Admin/Intrusion Admin

1. Select **Analysis > Intrusion > Incidents**.
The Incidents page appears.
2. Click the edit icon (✎) next to the incident you want to include in your report.
3. You have two options:
 - To include all the events from the incident in the report, click **Generate Report All**.
 - To include specific events from the incident in the report, select the check boxes next to the events you want and click **Generate Report**.

In either case, the Generate Report page appears, including the options for incident reports.
4. Type a name for the report. You can use alphanumeric characters, periods, and spaces.
5. In **Incident Report Sections**, select the check boxes for the portions of the incident that you want to include in the report: **status**, **summary**, and **comments**.
6. If you want to include event information in the report, select the workflow you want to use and then, in **Report Sections**, specify whether you want to include event summary information.
7. Select the check boxes next to the workflow pages you want to include in the report.
8. Select the check boxes next to the output formats you want to use for the report: **PDF**, **HTML**, and **CSV**.

IMPORTANT! CSV-based incident reports include only event information. They do **not** include the status, summary, or comments from the incident.

9. Click **Generate Report** and confirm that you want to update the report profile.
The report is generated.

Creating Custom Incident Types

LICENSE: Protection

The Sourcefire 3D System is delivered with the following incident types that you can use to classify your incidents:

- Compromise of System Integrity
- Damage
- Denial of Service
- Hoax
- Intrusion
- Theft
- Unauthorized Admin Access
- Unknown
- Web Site Defacement

If these incident types do not meet your needs, you can add your own. Note that you cannot delete any custom incident types.

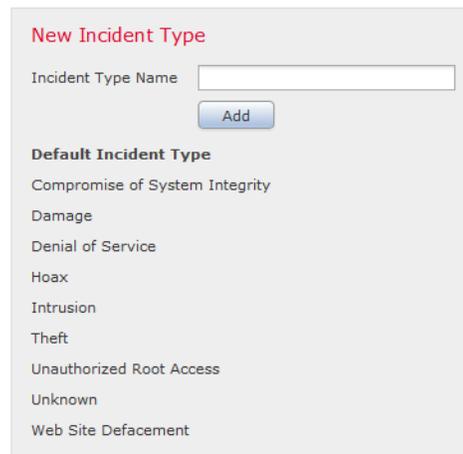

To create a new incident type:

ACCESS: Admin/Intrusion Admin

1. Select **Analysis > Intrusion > Incidents**.
The Incident page appears.
2. Click **Create Incident**.
The Create Incident page appears.

3. In the **Type** area, click **Types**.

The incident management Types page appears. The default incident types are listed at the bottom of the page.

New Incident Type

Incident Type Name

Add

Default Incident Type

- Compromise of System Integrity
- Damage
- Denial of Service
- Hoax
- Intrusion
- Theft
- Unauthorized Root Access
- Unknown
- Web Site Defacement

4. In the **Incident Type Name** field, type a name for the new incident type. Use alphanumeric characters and spaces.
5. Click **Add**.
The new incident type is added.
6. Click **Done** to close the pop-up window and return to the Incidents page.
You can use the new incident type the next time you create or edit an incident.

CHAPTER 19

CONFIGURING INTRUSION POLICIES

An *intrusion policy* is a defined set of intrusion detection and prevention configurations. You can create an intrusion policy using the settings in the default intrusion policies that Sourcefire provides, or you can tailor your own policies to inspect the traffic that traverses your network. You can modify your intrusion policy to improve performance in your environment and to provide a focused view of the traffic on your network. At a minimum, you should consciously choose whether to configure the following settings in your intrusion policy:

- Specify whether you want to drop packets that trigger rules set to Drop and Generate events in an inline deployment. See [Setting Drop Behavior in an Inline Deployment](#) on page 689 for more information.
- Set your variables to accurately reflect your home and external networks and, as appropriate, the servers on your network. See [Managing Variables](#) on page 698 for more information.

You should also consider whether to take advantage of the following procedures, which can improve performance and better focus your network:

- Disable rules that do not apply to your environment, verify that all rules that **do** apply to your environment are enabled, and set rule attributes such as suppression, thresholding, and alerting. See [Setting Rule States](#) on page 743 for more information.
- Associate hosts and applications on your network with rules written to protect those hosts and applications and recommend rule state changes. See [Managing FireSIGHT Rule State Recommendations](#) on page 764 for more information.

See the following sections for more information:

- [Planning and Implementing an Intrusion Policy](#) on page 668 describes, at a high level, the process you use to create an intrusion policy.
- [Managing Intrusion Policies](#) on page 670 explains how to view a listing of your intrusion policies, and create and edit policies.
- [Setting Drop Behavior in an Inline Deployment](#) on page 689 explains how to set whether your policy drops offending packets for rules set to Drop and Generate Events in an inline deployment.
- [Understanding the Base Policy](#) on page 691 explains how to replace your base policy with a different default intrusion policy provided by Sourcefire or a custom base policy that you create.
- [Managing Variables](#) on page 698 explains how you can use policy-specific and system default variables to tailor your policy to your network.
- [Managing Rules in an Intrusion Policy](#) on page 717 explains how you can enable and disable rules and configure other rule attributes such as thresholds, suppression, and so on.
- [Managing FireSIGHT Rule State Recommendations](#) on page 764 explains how you can generate rule state recommendations for intrusion rules based on the hosts and applications on your network.
- [Using Advanced Settings in an Intrusion Policy](#) on page 773 explains how you can enable, disable, and configure preprocessors and other advanced detection and performance features.
- [Defining IP Addresses and Ports for Your Network](#) on page 711 provides the syntax used to specify IP addresses and port numbers in the variables and rules in your policy.
- [Using Layers in an Intrusion Policy](#) on page 792 explains how you can use intrusion policy layers to more efficiently manage multiple intrusion policies in a complex network environment.

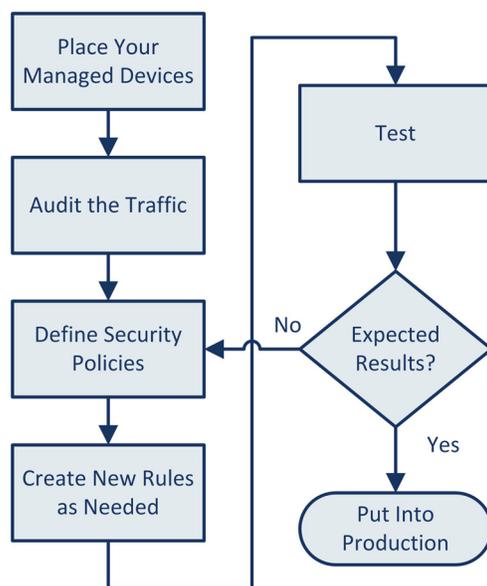

Planning and Implementing an Intrusion Policy

LICENSE: Protection

Building custom intrusion policies can improve the performance of the system in your environment and can provide a focused view of the malicious traffic and policy violations occurring on your network.

Traffic profiles and characteristics may change either by design or from the result of malicious action. Sourcefire recommends building a customized intrusion policy to ensure successful monitoring under a wide range of traffic conditions.

The following illustrates the process you use to define your intrusion policy and tune your system.

When planning your intrusion policy:

1. Decide where to place your managed devices.
There are a variety of deployment options in tuning your device. For details on deciding where to place your managed devices to best monitor the traffic that matters to you, see the *Installation Guide* for your device.
2. Understand the traffic that traverses the network segment.
Before tuning your intrusion policy, it pays to understand the traffic it will monitor. For example, if you are monitoring traffic in the DMZ, you may want to pay special attention to web servers and verify that all applicable web server rules are active. If you are monitoring an internal subnet with no external facing servers, you may want to tune your system differently.
3. Define your security policies.
Security policies include your internal security guidelines, as well as your variable, preprocessor, and rules configurations. You should:
 - Define the security guidelines that govern the hosts on that subnet.
Your internal security policies guide how you tune the decoder engine, preprocessor engine, and rules engine. For example, if your security policies prohibit instant messaging, you may want to identify instant message traffic traversing your network.

- Optionally, configure your preprocessors, enabling and disabling options as appropriate.

For more information on the preprocessors provided in Sourcefire 3D System, as well as details on how to configure them, see [Using Advanced Settings in an Intrusion Policy](#) on page 773.

- Set your variables to accurately reflect your home and external networks.

Defining variables makes rule inspection more effective and efficient by directing rules to inspect the traffic to and from specific IP addresses and ports. Setting these at the policy or system level allows you to tune your policy or system without editing every rule. Variables can also be used when suppressing rules and configuring the advanced adaptive profiles feature. For details on managing variables, see [Managing Variables](#) on page 698.

- Disable shared object rules and standard text rules that do not apply to your environment and verify that all rules that **do** apply to your environment are enabled. For inline deployments, carefully choose the intrusion rules that you want to drop packets rather than simply generate events. For more information on setting rule states, see [Setting Rule States](#) on page 743.

4. If none of the existing intrusion rules meet your needs, write new rules that inspect for intrusion attempts.

For information on the rule keywords you can use to construct custom standard text rules, and their syntax, see [Understanding and Writing Intrusion Rules](#) on page 1046.

5. Test your configuration.

Managing Intrusion Policies

LICENSE: Protection

On the Intrusion Policy page (**Policies > Intrusion > Intrusion Policy**) you can view all your current intrusion policies by name with optional description along with the following information:

- the time and date the policy was last modified and the user who modified it.
- whether dropping packets in an inline deployment is enabled in the policy
- when a policy has unsaved changes, in *italicized* black text

Options on this page also allow you to create a new policy, compare two policies or two revisions of the same policy, view a report that lists all of the most recently saved settings in each policy, and edit, delete, or export a policy.

TIP! You can import intrusion policies from other Defense Centers in your deployment. See [Importing and Exporting Objects](#) on page 2225 for more information.

Note that the Intrusion Policy page displays the time a policy was last modified in local time, but intrusion policy reports list the time the policy was last modified in Coordinated Universal Time (UTC).

The [Intrusion Policy Management Actions](#) table describes the actions you can take to manage your policies on the Intrusion Policy page:

Intrusion Policy Management Actions

To...	You CAN...
compare the settings of two intrusion policies or two revisions of the same policy	click Compare Policies . Optionally, then click Comparison Report to open or save a PDF version of the report, or click New Comparison to begin a new comparison. See Comparing Two Intrusion Policies on page 685 for more information.
create a new intrusion policy	click Create Policy . See Creating an Intrusion Policy on page 672 for more information.
reapply an intrusion policy to your managed devices	click the apply icon (✓). See Reapplying an Intrusion Policy on page 680 for more information.
view a PDF report that lists the current configuration settings in an intrusion policy	click the report icon (📄). See Viewing an Intrusion Policy Report on page 682 for more information.
export an intrusion policy for use on another appliance of the same type	click the export icon (📎). See Exporting Objects on page 2226 for more information.

Intrusion Policy Management Actions (Continued)

To...	You CAN...
modify the settings in an existing intrusion policy	click the edit icon (✎). See Editing an Intrusion Policy on page 675 for information.
delete an intrusion policy	click the delete icon (🗑), then click OK , or click Cancel if you decide not to delete the policy. When prompted whether to continue, you are also informed if another user has unsaved changes in the policy. You cannot delete an intrusion policy if an access control policy references it.

See the following sections for more information:

- [Creating an Intrusion Policy](#) on page 672
- [Editing an Intrusion Policy](#) on page 675
- [Using the Navigation Panel](#) on page 678
- [Committing Intrusion Policy Changes](#) on page 679
- [Reapplying an Intrusion Policy](#) on page 680
- [Viewing an Intrusion Policy Report](#) on page 682
- [Comparing Two Intrusion Policies](#) on page 685

To manage your intrusion policies:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

Compare Policies Create Policy

Intrusion Policy	Drop when Inline	Status	Last Modified	
Initial Inline Policy - katsura Default policy	Yes	Policy not applied on any devices	2012-04-06 12:43:17 Modified by "admin"	✔️ 📄 ✎ 🗑
Initial Passive Policy - katsura Default policy	No	Policy not applied on any devices	2012-04-06 12:43:15 Modified by "admin"	✔️ 📄 ✎ 🗑

2. Take any of the actions described in the [Intrusion Policy Management Actions table](#) on page 671.

Creating an Intrusion Policy

LICENSE: Protection

You can create one or more intrusion policies. For example, you can create policies that monitor traffic on your network. You can also create policies that you use for testing in a safe network environment, or for familiarizing yourself with

features such as FireSIGHT Recommended Rules or the different default policies provided by Sourcefire.

When you create a policy, a pop-up window provides immediate access to the features you are most likely to configure. You can create your intrusion policy using only the options in the pop-up window, or you can save your changes and continue to the advanced intrusion policy editor, where you can configure any intrusion policy features.

TIP! You can import intrusion policies from other Defense Centers in your deployment. See [Importing and Exporting Objects](#) on page 2225 for more information.

To create an intrusion policy:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

2. Click **Create Policy**.

If you have unsaved changes in another policy, click **Cancel** when prompted to return to the Intrusion Policy page. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Create Intrusion Policy pop-up window appears.

The screenshot shows a 'Create Intrusion Policy' dialog box. It contains the following fields and controls:

- Policy Information:**
 - Name * (text input, highlighted with a red box)
 - Description (text input)
 - Drop when Inline (checkbox, checked)
 - Base Policy (dropdown menu, showing 'Connectivity Over Security')
- Variables:**
 - Use the system default value (checkbox, checked)
 - Networks to protect (text input, containing 'any')
- Buttons:** 'Create Policy', 'Create and Edit Policy', and 'Cancel'.
- Legend:** '* Required'

3. Type a unique name of 50 characters or less that identifies your policy and, optionally, a description that differentiates it from other policies.

4. Specify whether you want the system to drop the packet and generate an event when a packet triggers a rule set to Drop and Generate Events in an inline deployment:
 - To drop the packet and generate an event, select the **Drop when Inline** check box.
 - To generate an event but not drop the packet, clear the **Drop when Inline** check box.

Note that the system does not drop packets in a passive deployment, including when an inline interface is in tap mode, regardless of the rule state or the inline drop behavior of the intrusion policy. For more information, see [Setting Rule States](#) on page 743, [Setting Drop Behavior in an Inline Deployment](#) on page 689, [Configuring Passive Interfaces](#) on page 267, and [Tap Mode](#) on page 275.

5. Optionally, select a different Sourcefire default or custom policy that you want to use as the base policy for your intrusion policy from the **Base Policy** drop-down list. See [Understanding the Base Policy](#) on page 691 for more information.

6. Select or clear the **Use the system default value** check box to specify which hosts on your network you want the policy to monitor:

- Select the check box to monitor the hosts specified by default for your system.

Note that the system monitors all traffic on your network unless you reconfigure the system default value for the \$HOME_NET variable. See [Understanding Existing Variables](#) on page 699 and [Modifying Variables](#) on page 701 for more information.

- Clear the check box to use the **Networks to protect** field to identify specific hosts to monitor.

Note that this option sets a policy-specific value for the \$HOME_NET variable, which overrides the system default value of \$HOME_NET.

You can specify **any** (that is, any IPv4 or IPv6 address), or you can specify one or more IP addresses, address blocks, or variables, including negation (!). For more information, see [Managing Variables](#) on page 698, [Defining IP Addresses and Ports for Your Network](#) on page 711, and [IP Address Conventions](#) on page 57.

7. You have the following options:
 - To exit the pop-up window without creating a policy, click **Cancel**. The Intrusion Policy page appears.

- To save your changes, click **Create Policy**.
The Intrusion Policy page appears.
You must apply the appropriate access control policy to put your changes into effect. See [Applying an Access Control Policy](#) for more information.
- To open the advanced intrusion policy editor, click **Create and Edit Policy**.
See [Editing an Intrusion Policy](#) on page 675 for more information.

Editing an Intrusion Policy

LICENSE: Protection

You can use the advanced intrusion policy editor to configure any intrusion policy feature. You can configure most commonly used settings on or directly from the Policy Information page. For information on more advanced intrusion policy features, see [Using Advanced Settings in an Intrusion Policy](#) on page 773 and [Using Layers in an Intrusion Policy](#) on page 792.

The following table explains the most common actions taken when editing an intrusion policy:

Common Intrusion Policy Editing Actions

To...	You CAN...
specify a different drop behavior in an inline deployment	select or clear the Drop when Inline check box. See Setting Drop Behavior in an Inline Deployment on page 689 for more information.
select a different base policy	click Select Base Policy. See Understanding the Base Policy on page 691 for more information.
view the advanced settings that are enabled by default in your base policy	click Manage Base Policy . See Using Advanced Settings in an Intrusion Policy on page 773 for more information.

Common Intrusion Policy Editing Actions (Continued)

To...	You CAN...
tailor variables for your specific network environment	click Manage Variables . See Managing Variables on page 698 for more information. Make sure you accurately specify the values for \$HOME_NET, which represents the IP addresses on the network segment protected by the system, and \$EXTERNAL_NET, which represents all the IP addresses that are not on the network segment. For example, if you set the rule state to Drop and Generate Events for a rule that uses these variables and the variables themselves are not set correctly, your policy could drop the wrong packets or pass packets that you expect to drop.
display or modify configured rule attributes for the rules in your intrusion policy	click Manage Rules . See Managing Rules in an Intrusion Policy on page 717 for more information.
display a filtered view of the intrusion policy Rules page showing rules enabled in your policy by current rule state and, optionally, set rule attributes for specified rules	click View next to the number of rules under Manage Rules that are set to Generate Events or to Drop and Generate Events. See Managing Rules in an Intrusion Policy on page 717 for more information.
display the FireSIGHT Recommended Rules configuration page	click FireSIGHT Recommendations in the navigation panel. Alternately, click Click here to set up FireSIGHT recommendations on the Policy Information page if you have not generated recommendations, or Click to change recommendations if you have generated recommendations. See Managing FireSIGHT Rule State Recommendations on page 764 for more information.
display a filtered view of the Rules page showing rules with recommended rule states and, optionally, can set rule attributes for specified rules	click View next to the number of recommendations to generate events, drop and generate events, or disable rules, or click View Recommended Changes to view all recommendations. These options appear only when you have generated recommendations. See Managing FireSIGHT Rule State Recommendations on page 764 for more information.

Common Intrusion Policy Editing Actions (Continued)

To...	You CAN...
edit advanced settings	click Advanced Settings in the navigation panel. See Using Advanced Settings in an Intrusion Policy on page 773 for more information.
revert advanced settings configuration to default configuration settings in the base policy layer	click Revert to Defaults on an advanced settings configuration page, then click OK at the prompt. See Understanding the Base Policy on page 691 for more information.
manage policy layers	click policy layers in the navigation panel. See Using Layers in an Intrusion Policy on page 792 for more information.
save changes to your policy	click Commit Changes . You must apply the appropriate access control policy to put your changes into effect. See Editing an Intrusion Policy on page 675, Committing Intrusion Policy Changes on page 679, and Applying an Access Control Policy for more information.
discard all unsaved changes	click Discard Changes , then click OK to discard your changes and go to the Intrusion Policy page, or click Cancel to keep your changes and return to the Policy Information page.
exit the policy, leaving changes to the policy in the system cache	select any menu or other path to another page. On exiting, click Leave page when prompted, or click Stay on page to remain in the advanced editor. See Committing Intrusion Policy Changes on page 679 for information on how the system caches one policy per user.

To edit an intrusion policy:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
 The Intrusion Policy page appears.

2. Click the edit icon (✎) next to the policy you want to edit, or the intrusion policy name.

The Policy Information page appears.

3. You can take any of the actions described in [Editing an Intrusion Policy](#) on page 675.
4. Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Using the Navigation Panel

LICENSE: Protection

A navigation panel appears on the left side of the web interface when you are editing an intrusion policy.

A dividing line separates the navigation panel into links to policy settings you can configure with (below) or without (above) direct interaction with policy layers.

The two major links above the dividing line separate intrusion policy settings into Policy Information (the most commonly used settings) and Advanced Settings (settings that typically require little or no modification, and require specific expertise to configure).

Click **Policy Information** to display the Policy Information page, which includes configuration options for commonly used settings and links to configuration

pages for other commonly used settings. Sublinks beneath **Policy Information** provide direct access to the same configuration pages.

Click **Advanced Settings** to display the Advanced Settings page, where you can enable or disable advanced settings and access configuration pages for advanced settings in your intrusion policy. Note that you cannot access advanced intrusion policy settings from the Policy Information page.

Expanding the **Advanced Settings** link displays sublinks to individual configuration pages for all advanced settings that are enabled in your intrusion policy. Clicking any of these sublinks takes you to the same advanced settings configuration pages that you can access from the Advanced Settings page. See [Using Advanced Settings in an Intrusion Policy](#) on page 773 for more information.

You can click **Policy Layers** to display a summary of the intrusion policy layers that comprise your intrusion policy. Expanding the Policy Layers link displays sublinks to summary pages for the layers in your intrusion policy. Expanding each layer sublink displays further sublinks to the configuration pages for all advanced settings that are enabled in the layer, and to a layer-filtered view of intrusion rule settings. See [Using Layers in an Intrusion Policy](#) on page 792 and [Managing Rules in an Intrusion Policy](#) on page 717 for more information.

Dark shading of an item in the navigation panel highlights your current location in the intrusion policy. For example, in the illustration above the Policy Information page would be displayed to the right of the navigation panel.

A policy change icon (⚠) appears next to **Policy Information** when your intrusion policy contains unsaved changes. This icon disappears when you save your changes from the Policy Information page. You can click the policy change icon or **Policy Information** to display the Policy Information page.

Committing Intrusion Policy Changes

LICENSE: Protection

You must save (that is, commit) changes to your intrusion policy before the system recognizes the changes. When you associate an intrusion policy with an access control policy, the system associates the most recently saved configuration. See [Performing File and Intrusion Inspection on Allowed Traffic](#) on page 511 for more information.

The system caches changes to your policy on the system disk when you exit the policy without saving your changes. The system cache stores unsaved changes for one policy per user and you must commit or discard your changes before editing another policy when you are logged in as the same user.

Your changes are cached even when you log out of the system or experience a system crash. The system discards the cached changes when you edit another policy as the same user without saving your changes, or when you import a rule update. See [Importing Rule Updates and Local Rule Files](#) on page 2072 for more information.

The following might also occur when you commit your changes:

- If the **Write changes in Intrusion Policy to audit log** Intrusion Policy Preferences option in the system policy is enabled, the system logs a description of the changes in the audit log. See [Editing a System Policy](#) on page 1963 and [Viewing Audit Records](#) on page 2188 for more information.
- Depending on the configuration of the **Comments on policy change** Intrusion Policy Preferences option in the system policy, the Description of Changes pop-up window might appear when you save your changes, and you might be required to provide a description of your changes. Optionally or if required, provide a description of your changes, then click **OK** to save your changes, or click **Cancel** to return to the advanced editor without saving your changes. See [Configuring Intrusion Policy Preferences](#) on page 1985 for more information.
- If your configuration includes a standard text rule or a shared object rule that requires a disabled preprocessor or other advanced feature, click **OK** when prompted to automatically enable the feature in your policy and commit the policy. Click **Cancel** to return to the Policy Information page. See [Automatically Enabling Advanced Settings](#) on page 787 for more information.
- If your intrusion policy contains a system default variable with the invalid entry `!any`, a pop-up window appears and notifies you. For more information about correctly defining system default variables, see [Managing Variables](#) on page 698.
- If you are editing a policy at the same time another user is editing the same policy, and the other user saves their changes to the policy, you are warned when you commit the policy that you will overwrite the other user's changes. Click **OK** to continue and overwrite the changes, or click **Cancel** to return to the Policy Information page without saving your changes.
- If you are editing the same policy via multiple web interface instances as the same user, and you save your changes for one instance, you are prompted for any other instance if you try to commit the policy where you cannot save your changes. Click **OK** to discard your changes and go to the Intrusion Policy page.

Reapplying an Intrusion Policy

LICENSE: Protection

After you apply an intrusion policy to a managed device using access control (see [Applying an Access Control Policy](#) on page 466), you can reapply the intrusion policy at any time. This allows you to implement intrusion policy changes on your monitored network without reapplying the access control policy. While reapplying, you can also view a comparison report to review the changes made since the last time the intrusion policy was applied.

Note the following when reapplying intrusion policies:

- You can schedule intrusion policy reapply tasks to recur on a regular basis. See [Automating Applying an Intrusion Policy](#) on page 1938 for more information.
- An intrusion policy reapply fails on invalid target devices. For example, if you apply an access control policy that removes a previously applied intrusion policy from a device and then attempt to reapply the intrusion policy before the access control policy apply task resolves, the intrusion policy reapply fails.
- You cannot apply intrusion policies to stacked devices running different versions of the Sourcefire 3D System (for example, if an upgrade on one of the devices fails). You can reapply an intrusion policy to a device stack, but not to individual devices within the stack. See [Managing Stacked Devices](#) on page 237 for more information.
- When you import a rule update, you can automatically apply intrusion policies after the import completes. If you do not enable this option, you must manually reapply the policies changed by the rule update. See [Importing Rule Updates and Local Rule Files](#) on page 2072 for more information.

To reapply an intrusion policy:

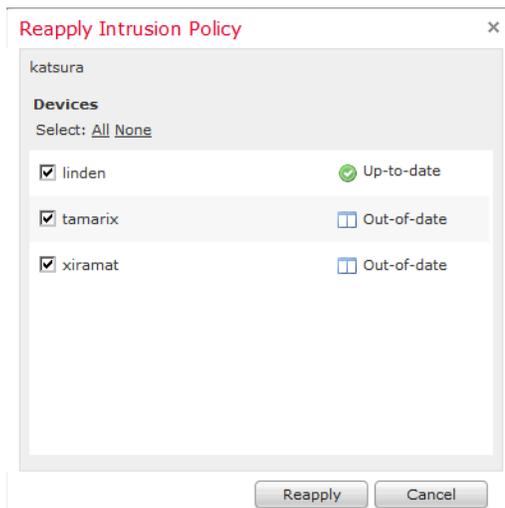

ACCESS: Admin/Security Approver

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

Intrusion Policy	Drop when Inline	Status	Last Modified	
Example Policy 1 Example Intrusion Policy	Yes	Policy not applied on any devices	2012-04-10 09:36:37 Modified by "admin"	   
Example Policy 2 Example Intrusion Policy	Yes	Policy out-of-date on 3 of 3 devices	2012-04-11 12:05:30 Modified by "admin"	   
Example Policy 3 Example Intrusion Policy	Yes	Policy not applied on any devices	2012-04-11 12:01:35 Modified by "admin"	   
Initial Inline Policy - katsura Default policy	Yes	Policy up-to-date on all 3 devices	2012-04-06 12:43:17 Modified by "admin"	   
Initial Passive Policy - katsura Default policy	No	Policy not applied on any devices	2012-04-06 12:43:15 Modified by "admin"	   

- Click the apply icon (✓) next to the policy you want to reapply.
The Reapply Intrusion Policy window appears, listing the devices where the policy is currently applied.

- Specify the devices where you want to reapply the policy.

TIP! Optionally, if a device is listed as **Out-of-date**, click the comparison icon (□) to view a report that compares the currently applied intrusion policy and the updated intrusion policy. See the [Comparing Two Intrusion Policies table](#) on page 685 for more information.

- Click **Reapply**.

The policy is reapplied. You can monitor the status of the apply using the task queue (**System > Monitoring > Task Status**). See [Viewing the Task Queue](#) on page 2238 for more information.

Viewing an Intrusion Policy Report

LICENSE: Protection

An intrusion policy report is a record of all enabled intrusion policy features and settings at a specific point in time. The system combines the settings in the base policy with the settings of the policy layers, and makes no distinction between which settings originated in the base policy or policy layer. You use the report for auditing purposes or to inspect the current configuration of an intrusion policy.

Remember to commit any potential changes before you generate an intrusion policy report; only committed changes appear in the report.

TIP! You can also generate an intrusion policy comparison report that compares two intrusion policies, or two revisions of the same intrusion policy. For more information, see [Comparing Two Intrusion Policies](#) on page 685.

Depending on your configuration, an intrusion policy report can contain one or more sections as described in the [Intrusion Policy Report Sections](#) table.

Intrusion Policy Report Sections

SECTION	DESCRIPTION
Title Page	Identifies the name of the intrusion policy report, the date and time the intrusion policy was last modified, and the name of the user who made that modification. Note that the Intrusion Policy Report lists the Last Modified time in UTC, but the Intrusion Policy page lists the modified time in local time.
Table of Contents	Describes the contents of the report. Only enabled intrusion policy features appear on the report. For example, if the DNS Configuration feature is not enabled in your intrusion policy, it does not appear in the table of contents or in the report.
Policy Information	Provides the name and description of the intrusion policy, whether dropping packets in an inline deployment is enabled or disabled, current rule update version, whether the base policy is locked to the current rule update, the date and time the intrusion policy was last modified, and the name of the user who made that modification. See Editing an Intrusion Policy on page 675.
Variables	Lists any policy-specific variables. See Managing Variables on page 698.
FireSIGHT Recommendations	Provides information on any recommended rule states based on the hosts and applications in your network. Optionally, you can set your intrusion policy to Include all differences between recommendations and rule states in policy reports . See Managing FireSIGHT Rule State Recommendations on page 764.

Intrusion Policy Report Sections (Continued)

SECTION	DESCRIPTION
Advanced Settings	Lists all advanced feature settings (such as Checksum Verification, DCE/RPC Configuration, and so on) and their configurations (such as enabled, default, stateful, and so on). See Using Advanced Settings in an Intrusion Policy on page 773.
Rules	Provides a list of all enabled rules (such as Backdoor — Dagger, DDOS TFN Probe, and so on) and their actions (such as Generate events, Drop and generate events, and so on). See Managing Rules in an Intrusion Policy on page 717.

The following sample graphic displays the Advanced Settings section of an example intrusion policy report, and lists the configuration for each advanced setting. Other sections listed in the table of contents use the same format and provide the same level of detail for their respective sections.

Advanced Settings

Back Orifice Detection

There are no user-configurable options for Back Orifice

Checksum Verification

ICMP Checksums	Enable
IP Checksums	Enable
TCP Checksums	Enable
UDP Checksums	Enable

DCE/RPC Configuration

Global Settings	
Maximum Fragment Size	
Reassembly Threshold	0
Enable Defragmentation	Enabled
Memory cap reached	Disabled
SMB traffic	Enabled
Connection-oriented DCE/RPC traffic	Enabled
Connectionless DCE/RPC traffic	Enabled
Servers	
default	
Networks	default
Policy	WinXP
SMB Invalid Shares	
SMB Maximum AndX Chain	3
RPC over HTTP proxy Ports	
RPC proxy traffic only	Disabled

To view an intrusion policy report:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy.**

The Intrusion Policy page appears.

2. Click the report icon () next to the intrusion policy for which you want to generate a report. Remember to commit any potential changes before you generate an intrusion policy report; only committed changes appear in the report.

The system generates the intrusion policy report. Depending on your browser settings, the report may appear in a pop-up window, or you may be prompted to save the report to your computer.

Comparing Two Intrusion Policies

LICENSE: Protection

To review policy changes for compliance with your organization's standards or to optimize system performance, you can examine the differences between two intrusion policies. You can compare any two intrusion policies or two revisions of the same intrusion policy, for the intrusion policies you can access. Optionally, after you compare, you can then generate a PDF report to record the differences between the two policies or policy revisions.

There are two tools you can use to compare intrusion policies or intrusion policy revisions:

- The comparison view displays only the differences between two intrusion policies or intrusion policy revisions in a side-by-side format; the name of each policy or policy revision appears in the title bar on the left and right sides of the comparison view.
You can use this to view and navigate both policy revisions on the web interface, with their differences highlighted.
- The comparison report creates a record of only the differences between two intrusion policies or intrusion policy revisions in a format similar to the intrusion policy report, but in PDF format.
You can use this to save, copy, print and share your policy comparisons for further examination.

For more information on understanding and using the intrusion policy comparison tools, see:

- [Using the Intrusion Policy Comparison View](#) on page 686
- [Using the Intrusion Policy Comparison Report](#) on page 687

Using the Intrusion Policy Comparison View

LICENSE: Protection

The comparison view displays both intrusion policies or policy revisions in a side-by-side format, with each policy or policy revision identified by name in the title bar on the left and right sides of the comparison view. The time of last modification and the last user to modify are displayed to the right of the policy name. Note that the Intrusion Policy page displays the time a policy was last modified in local time, but the intrusion policy report lists the time modified in UTC.

Example Policy 1 (2011-10-10 10:12:16 by admin)	Example Policy 2 (2011-10-10 10:13:01 by admin)
Policy Information	Policy Information
Name Example Policy 1	Name Example Policy 2
Modified 2011-10-10 10:12:16 by adi	Modified 2011-10-10 10:13:01 by adi
Base Policy Connectivity Over Security	Base Policy Security Over Connectivity
Advanced Settings	Advanced Settings
Back Orifice Detection Enabled	Back Orifice Detection Disabled
Servers default	Servers default
Client Flow Depth 300	Client Flow Depth 0
Server Flow Depth 300	Server Flow Depth 1460
Latency-Based Packet Handling Enabled	Latency-Based Packet Handling Disabled
Threshold 128	Threshold 2000000
Latency-Based Rule Handling Enabled	Latency-Based Rule Handling Disabled
Threshold 256	
Consecutive Threshold Violations Before 5	
Suspension Time 30	
Sun RPC Configuration Disabled	Sun RPC Configuration Enabled
Logged Events 1	Logged Events 3
Rules	Rules

Differences between the two intrusion policies or policy revisions are highlighted:

- Blue indicates that the highlighted setting is different in the two policies or policy revisions, and the difference is noted in red text.
- Green indicates that the highlighted setting appears in one policy or policy revision but not the other.

You can perform any of the actions in the [Intrusion Policy Comparison View Actions](#) table.

Intrusion Policy Comparison View Actions

To...	YOU CAN...
navigate individually through changes	click Previous or Next above the title bar. The double-arrow icon (↔) centered between the left and right sides moves, and the Difference number adjusts to identify which difference you are viewing.
determine which layer contains the configuration for a specific advanced setting	hover over the advanced configuration icon (⚙) next to the configuration you want to view. The window displays the name of the layer that contains the advanced configuration. See Using Layers in an Intrusion Policy on page 792 for more information.
generate a new intrusion policy comparison view	click New Comparison . The Select Comparison window appears. See Using the Intrusion Policy Comparison Report for more information.
generate an intrusion policy comparison report	click Comparison Report . The intrusion policy comparison report creates a PDF that lists only the differences between the two intrusion policies or intrusion policy versions.

Using the Intrusion Policy Comparison Report

LICENSE: Protection

An intrusion policy comparison report is a record of all differences between two intrusion policies or two revisions of the same intrusion policy identified by the intrusion policy comparison view, presented as a PDF. You can use this report to further examine the differences between two intrusion policy configurations and to save and disseminate your findings.

You can generate an intrusion policy comparison report from the comparison view for any intrusion policies to which you have access. Remember to commit any potential changes before you generate an intrusion policy report; only committed changes appear in the report.

The format of the intrusion policy comparison report is the same as the intrusion policy report with one exception: the intrusion policy report contains all settings in

the intrusion policy, and the intrusion policy comparison report lists only those settings which differ between the policies.

Depending on your configuration, an intrusion policy comparison report can contain one or more sections as described in the [Intrusion Policy Report Sections](#) table.

The following sample graphic displays the Advanced Settings section of an intrusion policy comparison report, and lists the configuration for each advanced setting for both intrusion policy configurations. Each section uses the same format and provides the same level of detail. Note that the Value A and Value B columns represent the policies or policy revisions you configured in the comparison view.

IP Defragmentation

Field	Value A	Value B
IP Defragmentation > Servers > default > Overlap Limit		10
IP Defragmentation > Servers > default > Minimum Fragment Size		100

Regular Expression Limits

Field	Value A	Value B
Regular Expression Limits > Match Limit	1500	3500

You use a similar procedure to compare other types of policies on the Sourcefire 3D System. For more information, see:

- [Comparing System Policies](#) on page 1965
- [Comparing Health Policies](#) on page 2150

To compare two intrusion policies or two revisions of the same policy:

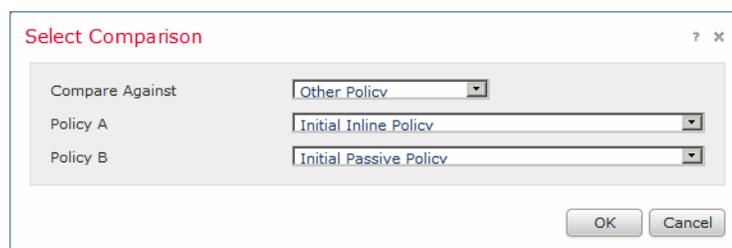

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

2. Click **Compare Policies**.

The **Select Comparison** window appears.

3. From the **Compare Against** drop-down list, select the type of comparison you want to make:

- To compare two different policies, select **Other Policy**.
- To compare two revisions of the same policy, select **Other Revision**.

Remember to commit any changes before you generate an intrusion policy report; only committed changes appear in the report.

4. Depending on the comparison type you selected, you have the following choices:
 - If you are comparing two different policies, select the policies you want to compare from the **Policy A** and **Policy B** drop-down lists.
 - If you are comparing two revisions of the same policy, select the policy from the **Policy** drop-down list, then select the revisions you want to compare from the **Revision A** and **Revision B** drop-down lists.
5. Click **OK** to display the intrusion policy comparison view.
The comparison view appears.
6. Click **Comparison Report** to generate the intrusion policy comparison report.
7. The intrusion policy report appears. Depending on your browser settings, the report may appear in a pop-up window, or you may be prompted to save the report to your computer.

Setting Drop Behavior in an Inline Deployment

LICENSE: Protection

A *drop rule* is an intrusion rule or preprocessor rule whose rule state is set to Drop and Generate Events. You can use the **Drop when Inline** option in your intrusion policy to determine how the system handles drop rules in an inline deployment; see [Setting Rule States](#) on page 743 for information on setting rule states in your intrusion policy.

In an inline deployment, you would typically set your intrusion policy to drop packets that trigger drop rules. However, you might also set your policy to not drop packets so you can assess how your configuration functions on your network. In this case, the system would generate events but would not drop packets that trigger your drop rules. When you are satisfied with the results, you can set your policy to drop packets; then you can reapply the access control policy that includes your policy.

When you set your intrusion policy to drop packets in an inline deployment, the system drops packets that trigger enabled drop rules and generates events for the triggered rules.

For an access control policy using a file policy with **Block Malware** rules for FTP, if you set the default action to an intrusion policy with **Drop when Inline** disabled, the system generates events for detected files or malware matching the rules, but does not drop the files. To block FTP file transfers while using an intrusion policy as the default action for the access control policy where you select the file policy you must select an intrusion policy with **Drop when Inline** enabled.

Note that in a passive deployment, including when an inline interface is in tap mode, the system treats rules set to Drop and Generate Events the same as rules set to Generate Events; that is, the system generates events but does not drop packets that trigger the rules regardless of the drop behavior of your policy. See

[Tap Mode](#) on page 275 for more information.

Note also that the table view of intrusion events indicates when packets are dropped if **Drop when Inline** is enabled in an inline deployment, and when packets would have dropped if **Drop when Inline** is disabled. In a passive deployment, including when an inline interface is in tap mode, the table view of intrusion events always shows that drop rules would have dropped packets in a inline deployment, regardless of the setting for **Drop when Inline**. See [Understanding Intrusion Events](#) on page 604 for more information.

The [Drop Rule Behavior](#) table summarizes drop rule behavior in passive and inline deployments.

Drop Rule Behavior

WHEN THE DEPLOYMENT IS...	AND DROP WHEN INLINE IS...	OFFENDING PACKETS ARE...	AND THE EVENT TYPE IS...
inline	enabled	dropped	Dropped
inline	disabled	not dropped	Would have dropped
inline (tap mode)	enabled	not dropped	Would have dropped
inline (tap mode)	disabled	not dropped	Would have dropped
passive	enabled	not dropped	Would have dropped
passive	disabled	not dropped	Would have dropped

Note that setting what is called a *pass rule* to Generate Events has a different effect. For information, see [Specifying Rule Actions](#) on page 1050.

Note also that your inline intrusion policies can include rules that use the `replace` keyword. For information, see [Replacing Content in Inline Deployments](#) on page 1078.

To set the drop behavior of your intrusion policy:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

2. Click the edit icon () next to the policy you want to edit.

If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

3. Specify whether you want the system to drop the packet and generate an event when the packet triggers a rule set to Drop and Generate Events in an inline deployment:
 - To drop the packet and generate an event, select the **Drop when Inline** check box.
 - To generate an event but not drop the packet, clear the **Drop when Inline** check box.

Note that the system does not drop packets in a passive deployment, including when an inline interface is in tap mode, regardless of the rule state or the inline drop behavior of the intrusion policy. For more information, see [Setting Rule States](#) on page 743, [Setting Drop Behavior in an Inline Deployment](#) on page 689, [Configuring Passive Interfaces](#) on page 267, and [Tap Mode](#) on page 275.

TIP! On 3D9900 and Series 3 devices, an inline set can use *tap mode*, which allows you to passively monitor traffic.

4. Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions](#) table on page 675 for more information.

Understanding the Base Policy

LICENSE: Protection

The base policy in an intrusion policy defines the default settings for all rules and advanced settings in the policy. You can use a default policy provided by the Sourcefire Vulnerability Research Team (VRT) as your base policy, or you can use a custom policy that you create as your base policy.

Note the following important information regarding base policies:

- The base policy includes configurations for rules and advanced settings. It does not include variables or FireSIGHT Recommended Rules.
- Modifying a rule or advanced setting in your policy overrides the corresponding default setting in the base policy.
- The base policy is the lowest layer in an intrusion policy. For information on using policy layers to more effectively manage multiple intrusion policies, see [Using Layers in an Intrusion Policy](#) on page 792.
- Depending on your configuration, importing rule updates may modify settings in your base policy. However, changes that a rule update makes to your base policy do not override changes that you make to rules or advanced settings in your policy. See [Importing Rule Updates and Local Rule Files](#) on page 2072 for more information.

See the following sections for more information:

- [Using Default Intrusion Policies](#) on page 692
- [Using a Custom Base Policy](#) on page 693
- [Allowing Rule Updates to Modify the Base Policy](#) on page 694
- [Selecting the Base Policy](#) on page 695
- [Accepting Rule Setting Changes from a Custom Base Policy](#) on page 696

Using Default Intrusion Policies

LICENSE: Protection

Five default intrusion policies are delivered with the Sourcefire 3D System. You can use four of these default policies. Sourcefire uses the fifth, Experimental Policy 1, for testing purposes and you should not use it unless instructed to do so by a Sourcefire representative.

The Sourcefire Vulnerability Research Team (VRT) sets the state of each intrusion and preprocessor rule in each default policy. The VRT also sets the default state, enabled or disabled, of each preprocessor and of other advanced features, and the default option settings for each. For example, a rule might be enabled in the Security over Connectivity default policy and disabled in the Connectivity over Security default policy. Intrusion protection features in an intrusion policy you create inherit the default settings in a default policy that you use to create your policy. By using the policies provided by Sourcefire as a basis for your intrusion policy, you can take advantage of the experience of the VRT.

The default intrusion policies that you can use are:

- **Balanced Security and Connectivity**
This policy is built for both speed and detection. It serves as a good starting point for most organizations. It is also a good starting point for any type of deployment.
- **Connectivity Over Security**
This policy is built for organizations where connectivity (being able to get to all resources) takes precedence over network infrastructure security. This policy enables far fewer rules than those enabled in the Security over Connectivity policy. Only the most critical rules that block traffic are enabled.

- **No Rules Active**
All intrusion rules, preprocessors, and other configurable intrusion policy features in this policy are disabled by default. This policy provides a starting point if you want to create your own policy instead of basing it on the enabled rules and features in one of the other policies provided by Sourcefire. The system automatically enables any preprocessor required by rules you enable.
Note that all rules and most preprocessors and other advanced features are disabled in this policy.
- **Security Over Connectivity**
This policy is built for organizations where network infrastructure security takes precedence over user convenience. This policy enables numerous network anomaly rules that could alert on or drop legitimate traffic.

You can use copies of Sourcefire default policies or create your own policies with tuned rule sets and advanced settings configurations to inspect traffic in the way that matters most to you. By doing this, you can improve both the performance of your managed device and your ability to respond effectively to the events it generates.

Note that the following initial policies, which come with your system, are custom policies provided by Sourcefire; they are not default policies:

- Initial Inline Policy
- Initial Passive Policy

Each of these custom policies uses a default policy as its base policy.

Using a Custom Base Policy

LICENSE: Protection

Custom policies include policies you create and the following two initial policies that come with your system:

- Initial Inline Policy
- Initial Passive Policy

You can use a custom policy as your base policy. Changes that you make to rules and advanced settings in a custom policy are automatically included in your base policy when you commit, that is, save changes in, the custom policy. However, you can override a default setting by modifying it in the policy that uses the custom policy as its base policy.

In a custom base policy, you do not have the option of allowing rule updates to modify the base policy. However, in some cases importing a rule update may impact the custom base policy when the parent policy, that is, the original policy that you use as your custom base policy, allows rule updates to modify its base policy. See [Allowing Rule Updates to Modify the Base Policy](#) on page 694 for more information.

Note you must create a policy-specific variable in both policies to use it in both. See [Creating New Policy-Specific Variables](#) on page 705 for more information.

Allowing Rule Updates to Modify the Base Policy

LICENSE: Protection

Rule updates that you import provide new and updated intrusion rules and preprocessor rules, modified states for existing rules, and modified default intrusion policy settings. Rule updates can also delete rules and provide new rule categories and system variables. See [Importing Rule Updates and Local Rule Files](#) on page 2072 for more information.

Rule updates always modify the default policies provided by Sourcefire with any changes that a rule update makes to rules and advanced settings. Changes to variables and rule categories are handled at the system level. See [Using Default Intrusion Policies](#) on page 692, [Understanding Existing Variables](#) on page 699, and [Understanding Rule Categories](#) on page 739 for more information.

When you use a default policy provided by Sourcefire as your base policy, you can choose whether to allow rule updates to modify your base policy.

If you allow rule updates to update your base policy, a new rule update makes the same changes in your base policy that it makes to rules and advanced settings in the default policy that you use as your base policy. If you have not modified the corresponding setting, the setting in your base policy determines the setting in your policy. However, a new rule update will not override any changes you have made in your policy.

If you do not allow rule updates to update your base policy, you can manually update your base policy after importing one or more rule updates.

Note that rule updates always delete rules that VRT deletes, regardless of the rule state in your policy or whether you allow rule updates to update your base policy. Until you reapply an access control policy that includes your policy after a rule update deletes a rule, rules in your currently applied intrusion policies will behave as follows:

- Disabled rules will remain disabled.
- Rules set to Generate Events will continue to generate events when triggered.
- Rules set to Drop and Generate Events will continue to generate events and drop offending packets when triggered.

Note also that, in a custom base policy, you do not have the option of allowing rule updates to modify the base policy, because in this case the base policy is not

a default policy provided by Sourcefire. However, a rule update can modify the custom base policy when both of the following conditions are met:

- You allow rule updates to modify the base policy of the parent policy, that is, the policy that originated the custom base policy.
- You have not made changes in the parent policy that override the corresponding settings in the parent's base policy.

When both conditions are met, changes in the rule update are passed to the child policy, that is, the policy using the custom base policy, when you save the parent policy.

For example, if a rule update enables a previously disabled rule, and you have not modified the rule's state in the parent policy, the modified rule state will be passed to custom base policy when you save the parent policy. See [Using a Custom Base Policy](#) on page 693 for more information.

Selecting the Base Policy

LICENSE: Protection

You can select the base policy for your intrusion policy and, when your base policy is a default policy provided by Sourcefire, choose whether to allow rule updates to update your base policy on the Base Policy summary page. You can also view but not change the default state, enabled or disabled, of preprocessors and other advanced features. From this page, you can access the configuration pages for advanced features where you can view but not change their default option settings. You can also access a read-only display of the Rules page, where you can view the default states of all rules in your base policy, filter the display to view subset of rules, and view details of individual rules.

To select the base policy in your intrusion policy:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon (✎) next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Manage Base Policy** on the Policy Information page.
The Base Policy summary page appears.
4. Select the Sourcefire default or custom policy that you want to use as the base policy for your intrusion policy from the **Base Policy** drop-down list. See [Understanding the Base Policy](#) on page 691 for more information.

5. Optionally, select or clear the **Update when a new Rule Update is installed** check box to specify whether you want new rule updates to update your base policy.

When you save your changes with the check box cleared and then import a rule update, an **Update Now** button appears on the Base Policy summary page and the status message on the page updates to inform you that the policy is out of date. Optionally, you can click **Update Now** to update your base policy with the changes in the most recently imported rule update.

See [Allowing Rule Updates to Modify the Base Policy](#) on page 694 for more information.

6. Optionally, take any of the following actions on the page:
 - To display all rules in your base policy on the Rules page in read-only mode, click **View Rule**.
In the read-only display in this page, you can filter the view to display subsets of rules in your base policy. You can also display details of individual rules. See [Managing Rules in an Intrusion Policy](#) on page 717 for more information.
 - To view which preprocessors and other advanced features are enabled or disabled in your base policy, scroll down the page. See [Using Advanced Settings in an Intrusion Policy](#) on page 773 for more information.
 - To display the configuration page and default settings for an advanced feature in read-only mode, click **View** next to the feature whose default settings you want to see. For an overview of advanced features that you can enable or disable and whose default settings you can modify, see [Using Advanced Settings in an Intrusion Policy](#) on page 773.
7. Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Accepting Rule Setting Changes from a Custom Base Policy

LICENSE: Protection

When you set event filters, dynamic states, and alerting for selected rules in a custom policy that you use as your base policy, then remove those settings in the policy that uses the custom policy as its base policy, your intrusion policy ignores subsequent setting changes that you make to the affected rules in the custom policy you use as your base policy.

The following procedure explains how to set a policy where you have not added layers to accept changes to rule settings that you make in the custom policy that you use as your base policy. See [Removing Multi-Layer Rule Settings](#) on page 797 to accept settings for these rules in a policy where you have added layers.

To accept rule setting changes in a policy where you have not added layers:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon () next to the intrusion policy where you want to unblock settings.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Expand **Policy Layers** in the navigation panel.
4. Expand the link beneath **Policy Layers**, which is named **My Changes** if you have not renamed it.
5. Click **Rules** beneath **My Changes**.
The Rules page for My Changes appears.
6. Locate the rule or rules whose settings you want to accept. You have the following options:
 - To sort the current display, click on a column heading or icon. To reverse the sort, click again.
 - Construct a filter by clicking on keywords or arguments in the filter panel on the left. For more information, see [Understanding Rule Filtering in an Intrusion Policy](#) on page 730 and [Setting a Rule Filter in an Intrusion Policy](#) on page 741.The page refreshes to display all matching rules.
7. Select the rule or rules whose settings you want to accept. You have the following options:
 - To select a specific rule, select the check box next to the rule.
 - To select all the rules in the current list, select the check box at the top of the column.
8. Select **Inherit** from the **Rule State** drop-down list.
9. Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Managing Variables

LICENSE: Protection

Variables represent values that are commonly used within intrusion rules, and when configuring some features such as rule suppressions and the advanced adaptive profiles feature. You can view, modify, and create variables. You can also delete variables if they are not used in any active or inactive rules.

Variables are important for several reasons. The following list describes why it is important to review, modify, and even add new variables:

- Most of the shared object rules and standard text rules that the Sourcefire 3D System provides use predefined variables to define networks and port numbers. The majority of the rules use these variables to specify the protected network (`$HOME_NET`) and the unprotected (or outside) network (`$EXTERNAL_NET`). In addition, specialized rules often use other predefined variables. For example, rules that detect exploits against web servers use the `$HTTP_SERVERS` and `$HTTP_PORTS` variables.
- Rules are more effective when variables more accurately reflect your network environment. By ensuring that a variable such as `$HOME_NET` correctly defines your entire network and `$HTTP_SERVERS` includes all web servers on your network, you can be sure that processing is optimized and all relevant systems are monitored for suspicious activity.
- If you create custom standard text rules, you can use variables as shortcuts to simplify the rule creation process. For example, if you create a rule that you want to inspect traffic in the “demilitarized zone” (or DMZ) only, you can create a variable named `$DMZ` whose value lists the server IP addresses that are exposed. You can then use the `$DMZ` variable in any rule written for this zone.
- Variables make it easier to edit preexisting shared object rules, because values are not hard-coded in many of these. You only have to change the variable value, rather than creating your own rules. This is also effective when you have multiple policies in place, as you can maintain multiple variable definitions that are unique to each policy.

See the following sections for more information:

- [Understanding Existing Variables](#) on page 699 describes the predefined system default variables provided with Sourcefire 3D System and includes information about how and why to modify them.
- [Modifying Variables](#) on page 701 explains the syntax used for IP- and port-based variables, and describes how to modify existing variables and variables that you create.
- [Creating New Variables](#) on page 703 describes how to create new variables for use in rules and system configuration.

- [Deleting Unused Variables](#) on page 709 describes how to delete unused variables.
- [Understanding Custom Variables](#) on page 710 describes custom variables you can use to configure intrusion protection capabilities not otherwise configurable via the web interface.

Understanding Existing Variables

LICENSE: Protection

The Sourcefire 3D System provides predefined *system default variables* for use within rules. You should set appropriate values for these variables to optimize system performance across your network. Variables can use values that include:

- **any**, to specify any value
- specific IP addresses or ports (see [Defining IP Addresses and Ports for Your Network](#) on page 711 for more information about acceptable syntax for IP addresses and ports in variables)
- other variables
- a negation of any of the above (excluding **any**), using **!**

IMPORTANT! The **SNORT_BPF** variable, which appears in the list of system default variables, is a custom variable used to enable an advanced intrusion detection feature. Because its function differs from the other default variables, it is not described in the table that follows. For more information on the **SNORT_BPF** variable, see [Understanding Custom Variables](#) on page 710.

The [Variable Descriptions](#) table describes the predefined variables.

Variable Descriptions

VARIABLE NAME	DESCRIPTION	MODIFY?
\$AIM_SERVERS	Defines known AOL Instant Messenger (AIM) servers, and is used in chat-based rules and rules that look for AIM exploits.	Not required
\$DNS_SERVERS	Defines Domain Name Service (DNS) servers. If you create a rule that affects DNS servers specifically, you can use the \$DNS_SERVERS variable as a destination or source IP.	Not required in current rule set
\$EXTERNAL_NET	Defines the network that the Sourcefire 3D System views as the unprotected network, and is used in many rules to define the external network.	Yes, you should adequately define \$HOME_NET and then use !\$HOME_NET as the value for \$EXTERNAL_NET

Variable Descriptions (Continued)

VARIABLE NAME	DESCRIPTION	MODIFY?
\$FILE_DATA_PORTS	Defines non-encrypted ports used in intrusion rules that detect files in a network stream.	Not required
\$GTP_PORTS	Defines the data channel ports where the packet decoder extracts the payload inside a GTP (General Packet Radio Service [GPRS] Tunneling Protocol) PDU.	Not required
\$HOME_NET	Defines the network that the active policy monitors, and is used in many rules to define the internal network.	Yes, to include the IP address range for your internal network
\$HTTP_PORTS	Defines the ports of web servers on your network, and is used for web server exploit rules.	Yes, if your web servers use ports other than the default ports (which you can view in the web interface)
\$HTTP_SERVERS	Defines the web servers on your network. Used in web server exploit rules.	Yes, if you run HTTP servers
\$ORACLE_PORTS	Defines Oracle database server ports on your network, and is used in rules that scan for attacks on Oracle databases.	Yes, if you run Oracle servers
\$SHELLCODE_PORTS	Defines the ports you want the system to scan for shell code exploits, and is used in rules that detect exploits that use shell code.	Not required
\$SMTP_SERVERS	Defines SMTP servers on your network, and is used in rules that address exploits that target mail servers.	Yes, if you run SMTP servers
\$SIP_PORTS	Defines the ports of SIP servers on your network, and is used for SIP exploit rules.	Not required
\$SIP_SERVERS	Defines SIP servers on your network, and is used in rules that address SIP-targeted exploits.	Yes, if you run SIP servers, you should adequately define \$HOME_NET and then use \$HOME_NET as the value for \$SIP_SERVERS
\$SNMP_SERVERS	Defines SNMP servers on your network, and is used in rules that scan for attacks on SNMP servers.	Yes, if you run SNMP servers
\$SQL_SERVERS	Defines database servers on your network, and is used in rules that address database-targeted exploits.	Yes, if you run SQL servers

Variable Descriptions (Continued)

VARIABLE NAME	DESCRIPTION	MODIFY?
\$SSH_PORTS	Defines the ports of SSH servers on your network, and is used for web server exploit rules.	Yes, if your SSH servers use ports other than the default port (which you can view in the web interface)
\$SSH_SERVERS	Defines SSH servers on your network, and is used in rules that address SSH-targeted exploits.	Yes, if you run SSH servers, you should adequately define \$HOME_NET and then use \$HOME_NET as the value for \$SSH_SERVERS
\$TELNET_SERVERS	Defines known Telnet servers on your network, and is used in rules that address Telnet server-targeted exploits.	Yes, if you run Telnet servers

Modifying Variables

LICENSE: Protection

Modifying variables is an essential step in tuning your intrusion policy. By customizing predefined variables to closely match your network configuration, you can optimize system performance and ensure that the system evaluates relevant network traffic.

You can also modify variables that you create. For information on creating variables, see [Creating New Variables](#) on page 703.

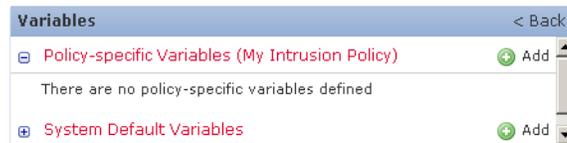

IMPORTANT! For more information about pre-configured variables and what they are used for, see [Understanding Existing Variables](#) on page 699.

To modify an existing variable:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon () next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.

3. Click **Manage Variables** on the Policy Information page.
The Variables page appears.

4. You have the following options:
 - Click the + or - sign to the left of the page section name for a variable type to expand or collapse a list of currently configured variables for that type.
 - Click the delete icon (🗑️) next to a user-defined variable to delete the variable.
 - Click the reset icon (↩️) next to a modified system default variable to reset the variable to its default setting.
 - Click **Add** next to a variable type to create a new variable of that type. See [Creating New Variables](#) on page 703 for more information.
5. Specify a new value for the variable in the field next to the variable you want to modify.

The value for the variable is modified.

Note that modifying the value for a system default variable from within an intrusion policy makes the new value available to all intrusion policies.

See the following for more information:

- If you are modifying an IP-based variable, use the syntax described in [Defining IP Addresses in Variables and Rules](#) on page 713.
- If you are modifying a port-based variable, use the syntax described in [Defining Ports in Variables and Rules](#) on page 715.
- If you are modifying a custom variable, use the syntax described in the [Custom Variables table](#) on page 711.

TIP! For a description of predefined system default variables, see the [Variable Descriptions table](#) on page 699.

6. Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Creating New Variables

LICENSE: Protection

If you create your own Sourcefire 3D System rules, you can also create the following types of variables to use in your rules:

- custom system default variables which, like predefined system default variables, are local to the Sourcefire managed device or Defense Center where you create your intrusion policy

Note that the system exports custom system default variables and their values when you export an intrusion policy. See [Importing and Exporting Objects](#) on page 2225 for more information.

- policy-specific variables, which are specific to the policy in which you create them

Note that only policy-specific variables that you create are added to the policy where you create them. However, the intrusion policy also lists and provides access to system default variables, which reside on the appliance where you create the policy. You can create and modify both types of variables.

In the case of policy-specific variables, you can also use an existing system variable policy-specific value for the same variable. As shown in the following figure, a policy-specific value takes precedence over the value for the system default variable.

Policy-Specific Variable

Name: \$EXAMPLE_VARIABLE
Type: IP
Value: 192.168.1.1

Takes precedence over

System Default Variable

Name: \$EXAMPLE_VARIABLE
Type: IP
Value: any

Policy-specific and system default variables use the same syntax and must follow the same guidelines. You can create nested variables so long as the nesting is not circular.

TIP! Note that non-negated lists defined in the following examples are surrounded with brackets, which was required in previous software versions but is no longer required. However, you must surround negated lists in brackets.

In the following example, `!$SMTP_SERVERS`, `!$HTTP_SERVERS`, and `$OTHER_SERVERS` are valid nested variables; that is, they are variables that are included in other variables:

1. Define `SMTP_SERVERS` as `10.1.1.1`
2. Define `HTTP_SERVERS` as `10.1.1.2`.
3. Create a new variable called `OTHER_SERVERS` and define it as `10.2.2.0/24`.
4. Define `HOME_NET` as
`[10.1.1.0/24, !$SMTP_SERVERS, !$HTTP_SERVERS, $OTHER_SERVERS]`.

In the following example, however, `HOME_NET` is an invalid nested variable because the nesting of `HOME_NET` is circular; that is, the definition of `OTHER_SERVERS` includes `HOME_NET`, so you would be nesting `HOME_NET` in itself:

1. Define `SMTP_SERVERS` as `10.1.1.1`
2. Define `HTTP_SERVERS` as `10.1.1.2`.
3. Create a new variable called `OTHER_SERVERS` and define it as
`[10.2.2.0/24, $HOME_NET]`.
4. Define `HOME_NET` as
`[10.1.1.0/24, !$SMTP_SERVERS, !$HTTP_SERVERS, $OTHER_SERVERS]`.

Note that nested, negated variables are not supported. For example, if you want to create a variable, `NONCORE_NET`, that represents the IP addresses that are outside of your protected networks, you could not create it using the following procedure:

1. Define `HOME_NET` as `[10.1.0.0/16, 10.2.0.0/16, 10.3.0.0/16]`.
2. Define `EXTERNAL_NET` as `!$HOME_NET`.
3. Create a new variable called `DMZ_NET` and define it as `10.4.0.0/16`.
4. Create a new variable called `NOTDMZ_NET` and define it as `!$DMZ_NET`.
5. Create the `NONCORE_NET` variable and define it as
`[$EXTERNAL_NET, $NOTDMZ_NET]`.

Instead, create `NONCORE_NET` as follows:

1. Define `HOME_NET` as `[10.1.0.0/16, 10.2.0.0/16, 10.3.0.0/16]`.
2. Create a new variable called `DMZ_NET` and define it as `10.4.0.0/16`.
3. Create a new variable called `NONCORE_NET` and define it as
`![$HOME_NET, $DMZ_NET]`.

See the following sections for more information:

- [Creating New Policy-Specific Variables](#) on page 705
- [Creating New System Default Variables](#) on page 707

Creating New Policy-Specific Variables

LICENSE: Protection

A policy-specific variable sets an explicit value for the variable in the intrusion policy where you create it. You can add a new policy-specific variable from the Policy-Specific Variables section on the Variables page. You can also set a policy-specific value using an existing system default variable.

When you add a new policy-specific variable to an intrusion policy, the system also creates a system default variable with the same name and a value of **any** and lists the new system default variable in all intrusion policies on the system.

IMPORTANT! Creating a new policy-specific variable also creates a system default variable with the same name and a value of **any**. The new system default variable is available to all other intrusion policies. However, to use the policy-specific variable in another policy, you must add the policy-specific variable to the other policy and give it an explicit value. For example, suppose you create a new policy-specific variable, set the value to **80,8080**, and use it in a rule enabled in one of your custom policies. If you then decide to use the variable in a rule in another policy, you have to add a policy-specific variable with the same name to the second policy and set the value to **80,8080**. In any intrusion policy where you do not explicitly set a policy-specific value for the variable, the system will use the system default value of **any**.

To create a new policy-specific variable:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

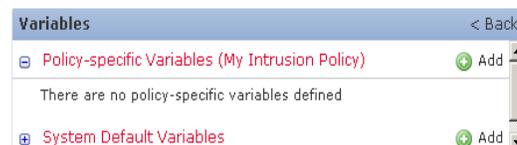

2. Click the edit icon () next to the policy you want to edit.

If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

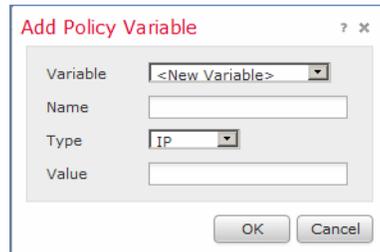

The Policy Information page appears.

3. Click **Manage Variables** on the Policy Information page.

The Variables page appears.

- In the **Policy-Specific Variables** section, click **Add**.
The Add Policy Variable pop-up window appears.

- You have two choices:
 - To create a new policy-specific variable, ensure that **<New Variable>** is selected from the Variable drop-down list and enter a **Name** for the new variable.
For example, if you are creating a variable that defines all Apache web servers on your network, you might decide to name the variable **APACHE_SERVERS**.

TIP! The **Name** field accepts only alphanumeric characters and underscores. Variable names **cannot** contain spaces or punctuation characters. In addition, the system automatically precedes each variable name with a dollar sign (\$), and you receive an error if you use \$ in a variable name.

- To set a policy-specific value using an existing system default variable, select the name of the existing variable from the Variable drop-down list.
The **Type** field is constrained. Go to step 7.
- If you created a new variable in step 5, select **IP**, **Port**, or **Custom** from the **Type** drop-down list:
 - See [Defining IP Addresses in Variables and Rules](#) on page 713 for more information if you are defining a IP address-based variable.
 - See [Defining Ports in Variables and Rules](#) on page 715 for more information if you are defining a port-based variable.
 - See [Understanding Custom Variables](#) on page 710 if you are defining a special-purpose custom variable with one of the reserved variable names described in the [Custom Variables table](#) on page 711.
When the new variable is a custom variable, the **Value** field expands.

7. Enter the new variable **Value**:
 - If the value describes IP addresses, see [Defining IP Addresses in Variables and Rules](#) on page 713 for information about the syntax you can use.
 - If the value describes port numbers, see [Defining Ports in Variables and Rules](#) on page 715 for information about the syntax you can use.
 - If the value is another variable or negation of a variable, enter it in the value field (for example, `$HOME_NET` or `!$HOME_NET`).
 - If the value is for a custom variable, use the syntax described in the [Custom Variables table](#) on page 711.

IMPORTANT! A variable value can include up to 8192 characters. Keep in mind, however, that this limit applies to the size of the expanded value of the variable. If you use one or more variables to define another variable, the total number of characters and spaces of all the variable values cannot exceed 8192 characters.

8. Click **OK**.

The new variable is created. If a corresponding system default variable did not exist, a system default variable with a value of **any** is added in the policy and appears in all future intrusion policies that you create.

Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Creating New System Default Variables

LICENSE: Protection

Each intrusion policy lists the existing, pre-configured system default variables described in the [Variable Descriptions table](#) on page 699. You can also add new system default variables from the System Default Variables section on the Variables page.

System default variables that you add from within an intrusion policy are listed in the policy and are available for use by all intrusion policies created on the Sourcefire Defense Center where you added the variables. When you enable an intrusion rule that uses a particular variable, the system uses the system default value for the variable unless it is overridden in the policy by a policy-specific value.

TIP! An exported policy includes system default variables that you create when you export an intrusion policy that uses them.

To create a new system default variable:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

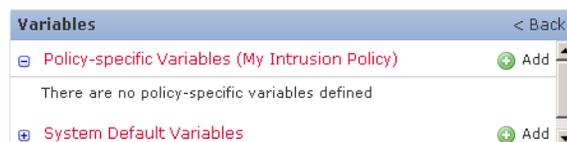

2. Click the edit icon () next to the policy you want to edit.

If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

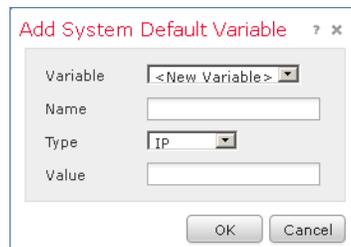

3. Click **Manage Variables** on the Policy Information page.

The Variables page appears.

4. In the **System Default Variables** section, click **Add**.

The Add System Default Variable pop-up window appears.

5. To add a new system default variable, ensure that **<New Variable>** is selected from the **Variable** drop-down list and enter a **Name** for the new variable.

For example, if you are creating a variable that defines all Apache web servers on your network, you might decide to name the variable `APACHE_SERVERS`.

TIP! The **Name** field accepts only alphanumeric characters and underscores. Variable names **cannot** contain spaces or punctuation characters. In addition, the system automatically precedes each variable name with a dollar sign (\$), and you receive an error if you use \$ in a variable name.

Note that you cannot use an existing policy-specific variable to set a value for a system default variable, because the system automatically creates a new system default variable with a value of `any` when you create a new policy-specific variable. See [Modifying Variables](#) on page 701 for information on modifying the value of a system default variable.

6. Select **IP**, **Port**, or **Custom** from the **Type** drop-down list:
 - See [Defining IP Addresses in Variables and Rules](#) on page 713 for more information if you are defining an IP address-based variable.
 - See [Defining Ports in Variables and Rules](#) on page 715 for more information if you are defining a port-based variable.
 - See [Understanding Custom Variables](#) on page 710 if you are defining a special-purpose custom variable with one of the reserved variable names described in the [Custom Variables table](#) on page 711.
When the new variable is a custom variable, the **Value** field expands.
7. Enter the new variable **Value**:
 - If the new variable describes IP addresses, see [Defining IP Addresses in Variables and Rules](#) on page 713 for information about the syntax you can use.
 - If the new variable describes port numbers, see [Defining IP Addresses in Variables and Rules](#) on page 713 for information about the syntax you can use.
 - If the value is another variable or negation of a variable, enter it in the value field (for example, `$HOME_NET` or `!$HOME_NET`).
 - If the new variable is a custom variable, use the syntax described in the [Custom Variables table](#) on page 711.

IMPORTANT! A variable value can include up to 8192 characters. Keep in mind, however, that this limit applies to the size of the expanded value of the variable. If you use one or more variables to define another variable, the total number of characters and spaces of all the variable values cannot exceed 8192 characters.

8. Click **OK**.
The new system default variable is available for use by, and listed in, all intrusion policies.
9. Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Deleting Unused Variables

LICENSE: Protection

You can delete policy-specific variables from an intrusion policy. You cannot delete a variable that is used in any rule, regardless of whether the rule is set to Generate Events, Drop and Generate Events, or Disable. If you delete variables that are in use, an error message appears when you attempt to save the changes in your policy.

You can delete system default variables that you create, but you cannot delete system default variables with predefined default values.

To delete a variable:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon (✎) next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Manage Variables** on the Policy Information page.
The Variables page appears.
4. Optionally, click the + sign to the left of the **Policy-Specific Variables** or **System Default Variables** section name to display the corresponding variables list.
5. Click **Delete** next to the variable that you want to delete.
The variable is deleted.
6. Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Understanding Custom Variables

LICENSE: Protection

Custom variables allow you to configure features that you cannot otherwise configure via the web interface. You create a custom variable using a specific assigned name and a set of instructions appropriate to the function the variable provides. The system recognizes the name and implements the instructions accordingly. You cannot name another variable with a name reserved for a custom variable.

You can create a custom variable as a system default or policy-specific variable. See [Creating New Variables](#) on page 703 for more information.

IMPORTANT! In other variables, **any** might mean, for example, any port or any IP address, but **any** disables a custom variable.

You can type up to 4096 total characters on a single line; the line wraps automatically. You can include any number of valid instructions or lines in a custom variable until you reach the 8192 maximum character length for a variable or a physical limit such as disk space. Use the backslash (\) line continuation

character after any complete argument in a command directive. You can also modify a custom variable and remove or add instructions as needed. See the Value for Variable Binding column in [Custom Variables](#) table for the syntax to use when defining each type of custom variable.

The [Custom Variables](#) table describes the custom variables that are available.

Custom Variables

VARIABLE	DESCRIPTION	VALUE FOR VARIABLE BINDING
SNORT_BPF	<p>Allows you to apply a Berkeley Packet Filter (BPF) to filter traffic before it reaches the system.</p> <p>Note that with or without BPF, the system filters traffic internally so that only traffic covered by intrusion rules and preprocessors is processed.</p>	Use the same standard BPF instruction set as accepted by tcpdump.
USER_CONF	<p>Provides a general tool that allows you to configure one or more features not otherwise available via the web interface.</p> <p>WARNING! Do not use the reserved variable <code>USER_CONF</code> to configure an intrusion policy feature unless you are instructed to do so in the feature description or by Sourcefire Support. Conflicting or duplicate configurations will halt the system.</p>	Use the feature-specific directives provided by Sourcefire Support or in the feature description.

Configuring Custom Variables

You can set an explicit value for the predefined system default SNORT_BPF custom variable by typing a new value in the field next to SNORT_BPF in the System Default Variables section of the intrusion policy Variables page. See [Modifying Variables](#) on page 701 for more information. You can also create a policy-specific variable for SNORT_BPF based on the existing system default variable. See [Modifying Variables](#) on page 701 for more information.

You can create a new USER_CONF variable as a policy-specific variable using the reserved name USER_CONF. See [Creating New Policy-Specific Variables](#) on page 705. You can also create a system default variable using the reserved name USER_CONF. See [Creating New Policy-Specific Variables](#) on page 705.

Defining IP Addresses and Ports for Your Network

LICENSE: Protection

When tuning your system, you can define IP addresses and ports in variables and rules. This lets you specify the level of granularity of inspection so that rules execute against the IP addresses and ports appropriate to your network needs.

Within the following existing, pre-configured variables and also within variables you create, you can define specific IP addresses:

- your home network
- the external network
- AOL Instant Messenger (AIM) servers
- domain name service (DNS) servers
- HTTP servers (or web servers)
- SIP servers
- SQL database servers
- SMTP servers
- SNMP servers
- SSH Servers
- Telnet servers

You can define specific port numbers within variables you create or for the following existing, pre-configured variables:

- ports susceptible to shell code exploits
- HTTP (or web server) ports
- Oracle database server ports
- ports to inspect for downloaded file type in HTTP, IMAP, and POP traffic pointed to by the `file_data` keyword
- non-encrypted ports that detect files in a network stream
- GTP ports
- SIP ports
- SSH server ports

For details on defining variables, see [Managing Variables](#) on page 698. For details on existing variables, see [Understanding Existing Variables](#) on page 699.

Within standard text rules, you can specify the source and destination IP addresses and ports the rule uses to determine whether it executes against a packet. For more information on defining IP addresses and port values in rule headers, see [Understanding Rule Headers](#) on page 1049.

You can set IP addresses and definitions in a variety of ways. See the following sections for more information:

- [Defining IP Addresses in Variables and Rules](#) on page 713 describes the syntax you can use to define single IP addresses, IP address ranges and lists, and any IP address in variables and rules.
- [Defining Ports in Variables and Rules](#) on page 715 describes the syntax you can use to define single and multiple ports in variables and rules.

Defining IP Addresses in Variables and Rules

LICENSE: Protection

When configuring variables and writing standard text rules, you can specify IPv4 and IPv6 addresses in a variety of ways, depending on your needs. You can specify a single IP address, any, IP address lists, CIDR notation, prefix lengths, or a network object or network object group. Additionally, you can indicate that you want to exclude a specific IP address or set of IP addresses. When specifying IPv6 addresses, you can use any addressing convention defined in RFC 4291.

See the following sections for more information on how to specify IP addresses:

- [Specifying Any IP Address](#) on page 713
- [Specifying Multiple IP Addresses](#) on page 713
- [Specifying Network Objects](#) on page 714
- [Excluding IP Addresses](#) on page 714

Specifying Any IP Address

LICENSE: Protection

You can specify the word **any** as a variable value or as a rule source or destination IP address to indicate any IPv4 or IPv6 address.

For example, the following rule uses the argument **any** in the **Source IP** and **Destination IP** fields and evaluates packets with any IPv4 or IPv6 source or destination address:

```
a!ert tcp any any -> any any
```

You can also specify `::` to indicate any IPv6 address.

Specifying Multiple IP Addresses

LICENSE: Protection

You can list individual IP addresses by separating the IP addresses with commas and, optionally, by surrounding non-negated lists with brackets, as shown in the following example:

```
[192.168.1.100,192.168.1.103,192.168.1.105]
```

You can list IPv4 and IPv6 addresses alone or in any combination, as shown in the following example:

```
[192.168.1.100,2001:db8::1234,192.168.1.105]
```

Note that surrounding an IP address list with brackets, which was required in earlier software releases, is not required. Note also that, optionally, you can enter lists with a space before or after each comma.

IMPORTANT! You must surround negated lists with brackets. See [Excluding IP Addresses](#) on page 714 for more information.

You can also use IPv4 Classless Inter-Domain Routing (CIDR) notation or IPv6 prefix lengths to specify address blocks. For example:

- 192.168.1.0/24 specifies the IPv4 addresses in the 192.168.1.0 network with a subnet mask of 255.255.255.0, that is, 192.168.1.0 through 192.168.1.255. For more information, see [IP Address Conventions](#) on page 57.
- 2001:db8::/32 specifies the IPv6 addresses in the 2001:db8:: network with a prefix length of 32 bits, that is, 2001:db8:: through 2001:db8:ffff:ffff:ffff:ffff:ffff:ffff.

TIP! If you need to specify a block of IP addresses but cannot express it using CIDR or prefix length notation alone, you can use CIDR blocks and prefix lengths in an IP address list.

Specifying Network Objects

LICENSE: Protection

You can specify a network object or network object group using the syntax:

```
${object_name | group_name}
```

where:

- *object_name* is the name of a network object
- *group_name* is the name of a network object group

See [Working with Network Objects](#) on page 161 for information on creating network objects and network object groups.

Consider the case where you have created a network object named `192.168sub16` and a network object group named `all_subnets`. You could specify the following to identify IP addresses in variables or rules using the network object:

```
${192.168sub16}
```

and you could specify the following to use the network object group:

```
${all_subnets}
```

You can also use negation with network objects and network object groups. For example:

```
!${192.168sub16}
```

See [Excluding IP Addresses](#) on page 714 for more information.

Excluding IP Addresses

LICENSE: Protection

You can use an exclamation point (!) to negate a specified IP address. That is, you can match any IP address with the exception of the specified IP address or addresses. For example, `!192.168.1.1` specifies any IP address other than

192.168.1.1, and !2001:db8:ca2e::fa4c specifies any IP address other than 2001:db8:ca2e::fa4c.

To negate a list of IP addresses, place ! before a bracketed list of IP addresses. For example, ![192.168.1.1,192.168.1.5] would define any IP address other than 192.168.1.1 or 192.168.1.5.

IMPORTANT! You must use brackets to negate a list of IP addresses.

Be careful when using the negation character with IP address lists. For example, if you use ![192.168.1.1,192.168.1.5] to match any address that is not 192.168.1.1 or 192.168.1.5, the system interprets this syntax as “anything that is not 192.168.1.1, **or** anything that is not 192.168.1.5.”

Because 192.168.1.5 is not 192.168.1.1, and 192.168.1.1 is not 192.168.1.5, both IP addresses match the IP address value of ![192.168.1.1,192.168.1.5], and it is essentially the same as using “any.”

Instead, use ![192.168.1.1,192.168.1.5]. The system interprets this as “**not** 192.168.1.1 **and not** 192.168.1.5,” which matches any IP address other than those listed between brackets.

Note that you cannot logically use negation with any which, if negated, would indicate no address.

Defining Ports in Variables and Rules

LICENSE: Protection

The Sourcefire 3D System uses a specific type of syntax to define the port numbers used in variables and rule headers.

IMPORTANT! The system ignores port definitions in an intrusion rule header when the protocol is set to ip. For more information, see [Specifying Protocols](#) on page 1051.

You can list ports by separating the ports with commas, as shown in the following example:

```
80, 8080, 8138, 8600-9000, !8650-8675
```

Optionally, the following example shows you can surround a port list with brackets, which was required in previous software versions but is no longer required:

```
[80, 8080, 8138, 8600-9000, !8650-8675]
```

Note that you must surround negated port lists in brackets, as shown in the following example:

```
![20, 22, 23]
```

Note also that a list of source or destination ports in an intrusion rule can include a maximum of 64 characters. See [Specifying Source and Destination Ports](#) on page 1053 for more information.

The following table describes the syntax you can use:

Port Syntax for Variables and Rules

SYNTAX	DESCRIPTION	EXAMPLE
any	Specifies any port.	any
port	Specifies a single port.	80
first_port-last_port	Indicates a port range, where <code>first_port</code> specifies the first port, and <code>last_port</code> specifies the last port.	20-21
-port	Indicates all ports less than or equal to port.	-21
port-	Indicates all ports greater than or equal to port.	80-
!	Indicates all ports except the specified port, port list, or range of ports. Note that you can logically use negation with all port designations except <i>any</i> , which if negated would indicate <i>no port</i> .	!80

Note that you must separate port ranges with a dash (-). Port ranges indicated with a colon (:) are supported for backward compatibility, but you cannot use a colon in port variables that you create.

CHAPTER 20

MANAGING RULES IN AN INTRUSION POLICY

You can use the Rules page in an intrusion policy to configure rule states and other settings for shared object rules, standard text rules, and preprocessor rules.

You enable a rule by setting its rule state to Generate Events or to Drop and Generate Events. Enabling a rule causes the system to generate events on traffic matching the rule. Disabling a rule stops processing of the rule. Optionally, you can set your intrusion policy so that a rule set to Drop and Generate Events in an inline deployment generates events on, and drops, matching traffic. See [Setting Drop Behavior in an Inline Deployment](#) on page 689 for more information. In a passive deployment, a rule set to Drop and Generate Events just generates events on matching traffic.

You can filter rules to display a subset of rules, enabling you to select the exact set of rules where you want to change rule states or rule settings.

You can generate rule state recommendations based on vulnerabilities associated with the hosts and applications on your network and, optionally, update rules to reflect the recommended states.

See the following sections for more information:

- [Understanding Intrusion Prevention Rule Types](#) on page 718 describes the intrusion rules and preprocessor rules you can view and configure in an intrusion policy.
- [Viewing Rules in an Intrusion Policy](#) on page 719 describes how you can change the order of rules on the Rules page, interpret the icons on the page, and focus in on rule details.
- [Filtering Rules in an Intrusion Policy](#) on page 729 describes how you can use rule filters to find the rules for which you want to apply rule settings.

- [Setting Rule States](#) on page 743 describes how to enable and disable rules from the Rules page.
- [Filtering Intrusion Event Notification Per Policy](#) on page 746 explains how to set event filtering thresholds for specific rules and set suppression on specific rules.
- [Adding Dynamic Rule States](#) on page 756 explains how to set rule states that trigger dynamically when rate anomalies are detected in matching traffic.
- [Adding Alerts](#) on page 761 describes how to associate SNMP alerts with specific rules.
- [Automatically Enabling Advanced Settings](#) on page 787 explains how to enable preprocessors and other advanced features required by rules when those rules are set to Generate Events or Drop and Generate Events.
- [Adding Rule Comments](#) on page 762 describes how to add comments to rules in an intrusion policy.
- [Managing FireSIGHT Rule State Recommendations](#) on page 764 describes how to generate rule state recommendations based on vulnerabilities associated with the hosts and applications on your network.
- [Using Layers in an Intrusion Policy](#) on page 792 explains how you can more efficiently manage multiple intrusion policies in a complex network by adding intrusion policy layers comprised of individual configurations for rule attributes and advanced settings.

Understanding Intrusion Prevention Rule Types

LICENSE: Protection

An intrusion policy contains two types of rules: intrusion rules and preprocessor rules.

An intrusion rule is a specified set of keywords and arguments that detects attempts to exploit vulnerabilities on your network; an intrusion rule analyzes network traffic to check if it matches the criteria in the rule. The system compares packets against the conditions specified in each rule and, if the packet data matches all the conditions specified in a rule, the rule triggers. The system includes two types of intrusion rules created by the Sourcefire Vulnerability Research Team (VRT): shared object rules, which are compiled and cannot be modified (except for rule header information such as source and destination ports and IP addresses), and standard text rules, which can be saved and modified as new custom instances of the rule.

The system also includes preprocessor rules, which are rules associated with preprocessor and packet decoder detection options. You cannot copy or edit preprocessor rules. Most preprocessor rules are disabled by default and must be enabled (that is, set to Generate Events or to Drop and Generate Events) if you

want the system to generate events for preprocessor rules and, in an inline deployment, drop offending packets.

The VRT determines the default rule states of Sourcefire's shared object rules, standard text rules, and preprocessor rules for each default intrusion policy included with the system.

The [Rule Types](#) table describes each type of rule included with the Sourcefire 3D System.

Rule Types

TYPE	DESCRIPTION
shared object rule	An intrusion rule created by the Sourcefire Vulnerability Research Team (VRT) that is delivered as a binary module compiled from C source code. You can use shared object rules to detect attacks in ways that standard text rules cannot. You cannot modify the rule keywords and arguments in a shared object rule; you are limited to either modifying variables used in the rule, or modifying aspects such as the source and destination ports and IP addresses and saving a new instance of the rule as a custom shared object rule. A shared object rule has a GID (generator ID) of 3. See Modifying Existing Rules on page 1184 for more information.
standard text rule	An intrusion rule either created by the VRT, copied and saved as a new custom rule, created using the rule editor, or imported as a local rule that you create on a local machine and import. You cannot modify the rule keywords and arguments in a standard rule created by the VRT; you are limited to either modifying variables used in the rule, or modifying aspects such as the source and destination ports and IP addresses and saving a new instance of the rule as a custom standard text rule. See Modifying Existing Rules on page 1184, Understanding and Writing Intrusion Rules on page 1046 and Importing Local Rule Files on page 2080 for more information. A standard text rule created by the VRT has a GID (generator ID) of 1. Custom standard text rule that you create using the rule editor or import as local rules have a SID (Signature ID) of 1000000 or greater.
preprocessor rule	A rule associated with a detection option of the packet decoder or with one of the preprocessors included with the Sourcefire 3D System. You must enable preprocessor rules if you want them to generate events. These rules have a decoder- or preprocessor-specific GID (generator ID). See the Generator IDs table on page 785 for more information.

Viewing Rules in an Intrusion Policy

LICENSE: Protection

You can adjust how rules are displayed in the intrusion policy. Rules can be sorted by several criteria. You can also display the details for a specific rule to see rule settings, rule documentation, and other rule specifics.

The Rules page has four primary areas of functionality:

- the filtering features — for more information, see [Filtering Rules in an Intrusion Policy](#) on page 729
- the rule attribute menus — for more information, see [Setting Rule States](#) on page 743, [Filtering Intrusion Event Notification Per Policy](#) on page 746, [Adding Dynamic Rule States](#) on page 756, [Adding Alerts](#) on page 761, and [Adding Rule Comments](#) on page 762
- the rules listing — for more information, see the [Rules Page Columns table](#) on page 720
- the rule details — for more information, see [Viewing Rule Details](#) on page 723

You can also sort rules by different criteria; for more information, see [Sorting the Rule Display](#) on page 722.

Note that the icons used as column headers correspond to the menus in the menu bar, where you access those configuration items. For example, the Rule State menu is marked with the same icon (→) as the Rule State column.

The [Rules Page Columns](#) table that follows describes the columns on the Rules page.

Rules Page Columns

HEADING	DESCRIPTION	FOR MORE INFORMATION, SEE...
GID	Integer which indicates the Generator ID (GID) for the rule.	Reading Preprocessor Generator IDs on page 784
SID	Integer which indicates the Snort ID (SID), which acts a unique identifier for the rule.	Reading Preprocessor Generator IDs on page 784
Message	Message included in events generated by this rule, which also acts as the name of the rule.	Defining the Event Message on page 1058

Rules Page Columns (Continued)

HEADING	DESCRIPTION	FOR MORE INFORMATION, SEE...
	<p>The rule state for the rule, which may be one of four states:</p> <ul style="list-style-type: none"> • drop and generate events () • generate events () • disable () • inherit (blank) <p>Note that you can access the Set rule state dialog box for a rule by clicking on its rule state icon.</p>	Setting Rule States on page 743
	FireSIGHT recommended rule state for the rule.	Managing FireSIGHT Rule State Recommendations on page 764
	Event filter, including event thresholds and event suppression, applied to the rule.	Filtering Intrusion Event Notification Per Policy on page 746
	Dynamic rule state for the rule, which goes into effect if specified rate anomalies occur.	Adding Dynamic Rule States on page 756
	Alerts configured for the rule, including SNMP alerts.	Adding Alerts on page 761
	Comments added to the rule.	Adding Rule Comments on page 762

You can also use the layer drop-down list to switch to the Rules page for other layers in your policy. Note that, unless you add layers to your policy, the only editable views listed in the drop-down list are the policy Rules page and the Rules page for a policy layer that is originally named My Changes; note also that making changes in either of these views is the same as making the changes in the other. See [Using Layers in an Intrusion Policy](#) on page 792 for more information. The drop-down list also lists the Rules page for the read-only base policy. See [Understanding the Base Policy](#) on page 691 for information on the base policy.

To view the rules in an intrusion policy:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

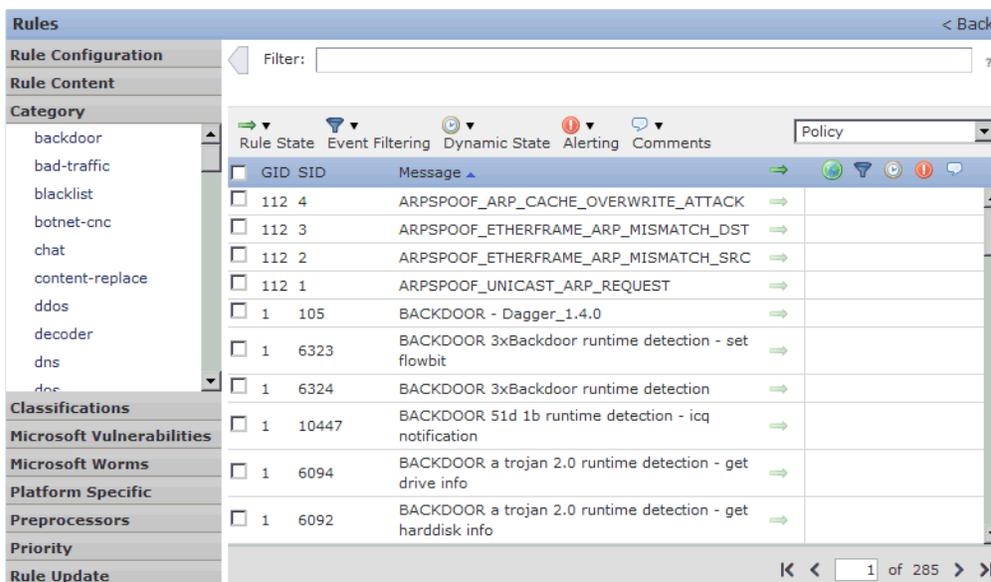

2. Click the edit icon (✎) next to the policy you want to edit.

If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

3. Click **Manage Rules** on the Policy Information page.

The Rules page appears. By default, the page lists the rules alphabetically by message.

Note that selecting **Rules** above the dividing line in the navigation panel takes you to the same rules listing. You can view and set all rule attributes in your policy in this view.

Sorting the Rule Display

LICENSE: Protection

You can sort rules by any of the columns in the Rules page by clicking on the heading title or icon.

Note that an up (▲) or down (▼) arrow on a heading or icon indicates that the sort is on that column in that direction.

To sort rules in an intrusion policy:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon () next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Manage Rules** in the Policy Information page.
The Rules page appears. By default, the page lists the rules alphabetically by message.
4. Click the title or icon in the top of the column by which you want to sort.
The rules are sorted by the column, in the direction indicated by the arrow that appears on the column heading. To sort in the opposite direction, click the heading again. The sort order and the arrow reverse.

Viewing Rule Details

LICENSE: Protection

You can view rule documentation, FireSIGHT recommendations, and rule overhead from the Rule Detail view. You can also view and add rule-specific features.

Note that local rules do not have any overhead, unless they are mapped to a vulnerability.

Rule Details

ITEM	DESCRIPTION	FOR MORE INFORMATION, SEE...
Summary	The rule summary. For rule-based events, this row appears when the rule documentation contains summary information.	Viewing Event Information on page 625
Rule State	The current rule state for the rule. Also indicates the layer where the rule state is set.	Setting Rule States on page 743; Using Layers in an Intrusion Policy on page 792
FireSIGHT Recommendation	If FireSIGHT recommendations have been generated, the recommended rule state for the rule.	Managing FireSIGHT Rule State Recommendations on page 764
Rule Overhead	The rule's potential impact on system performance and the likelihood that the rule might generate false positives.	Understanding Rule Overhead on page 767
Thresholds	Thresholds currently set for this rule, as well as the facility to add a threshold for the rule.	Setting a Threshold for a Rule on page 725
Suppressions	Suppression settings currently set for this rule, as well as the facility to add suppressions for the rule.	Setting Suppression for a Rule on page 726
Dynamic State	Rate-based rule states currently set for this rule, as well as the facility to add dynamic rule states for the rule.	Setting a Dynamic Rule State for a Rule on page 727

Rule Details (Continued)

ITEM	DESCRIPTION	FOR MORE INFORMATION, SEE...
Alerts	Alerts currently set for this rule, as well as the facility to add an alert for the rule.	Setting an SNMP Alert for a Rule on page 728
Comments	Comments added to this rule, as well as the facility to add comments for the rule.	Adding a Rule Comment for a Rule on page 729
Documentation	The rule documentation for the current rule, supplied by the Sourcefire Vulnerability Research Team (VRT).	Using Packet View Actions on page 629

To view rule details:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon () next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Manage Rules** in the Policy Information page.
The Rules page appears. By default, the page lists the rules alphabetically by message.
4. Highlight the rule whose rule details you want to view.
5. Click **Show details**.
The Rule Detail view appears. To hide the details again, click **Hide details**.

TIP! You can also open Rule Detail by double-clicking a rule in the Rules view.

Setting a Threshold for a Rule

LICENSE: Protection

You can set a single threshold for a rule from the Rule Detail page. Adding a threshold overwrites any existing threshold for the rule. For more information on thresholding, see [Configuring Event Thresholding](#) on page 747.

Note that a revert icon (↩) appears in a field when you type an invalid value; click it to revert to the last valid value for that field or to clear the field if there was no previous value.

To set a threshold from the rule details:

ACCESS: Admin/Intrusion Admin

1. Click **Add** next to Thresholds.
The Set Threshold dialog box appears.
2. Select the type of threshold you want to set:
 - Select **Limit** to limit notification to the specified number of event instances per time period.
 - Select **Threshold** to provide notification for each specified number of event instances per time period.
 - Select **Both** to provide notification once per time period after a specified number of event instances.
3. Select the appropriate option for **Track By** to indicate whether you want the event instances tracked by source or destination IP address.
4. In the **Count** field, type the number of event instances you want to use as your threshold.
5. In the **Seconds** field, type a number between 1 and 86400 that specifies the time period for which event instances are tracked.
6. Click **OK**.

The system adds your threshold and displays an event filter icon (🔍) next to the rule in the Event Filtering column. If you add multiple event filters to a rule, the system includes an indication over the icon of the number of event filters.

Setting Suppression for a Rule

LICENSE: Protection

You can set one or more suppressions for a rule from the Rule Detail page. For more information on suppression, see [Configuring Suppression Per Intrusion Policy](#) on page 753.

Note that a revert icon (↩) appears in a field when you type an invalid value; click it to revert to the last valid value for that field or to clear the field if there was no previous value.

To set suppression from the rule details:

ACCESS: Admin/Intrusion Admin

1. Click **Add** next to Suppressions.
The Add Suppression dialog box appears.

2. Select one of the following **Suppression Type** options:
 - Select **Rule** to completely suppress events for a selected rule.
 - Select **Source** to suppress events generated by packets originating from a specified source IP address.
 - Select **Destination** to suppress events generated by packets going to a specified destination IP address.
3. If you selected **Source** or **Destination** for the suppression type, in the **Network** field enter the IP address, an address block, a variable you want to specify as the source or destination IP address, or a comma-separated list comprised of any combination of these.

For information on using IPv4 CIDR and IPv6 prefix length address blocks in the Sourcefire 3D System, see [IP Address Conventions](#) on page 57.

4. Click **OK**.

The system adds your suppression conditions and displays an event filter icon () next to the rule in the Event Filtering column next the suppressed rule. If you add multiple event filters to a rule, a number over the icon indicates the number of filters.

Setting a Dynamic Rule State for a Rule

LICENSE: Protection

You can set one or more dynamic rule states for a rule from the Rule Detail page. The first dynamic rule state listed has the highest priority. Note that when two dynamic rule states conflict, the action of the first is carried out. For more information on dynamic rule states, see [Understanding Dynamic Rule States](#) on page 757.

Note that a revert icon () appears in a field when you type an invalid value; click it to revert to the last valid value for that field or to clear the field if there was no previous value.

To set a dynamic rule state from the rule details:

ACCESS: Admin/Intrusion Admin

1. Click **Add** next to Dynamic State.
The Add Rate-Based Rule State dialog box appears.
2. Select the appropriate **Track By** option to indicate how you want the rule matches tracked:
 - Select **Source** to track the number of hits for that rule from a specific source or set of sources.
 - Select **Destination** to track the number of hits for that rule to a specific destination or set of destinations.
 - Select **Rule** to track all matches for that rule.

3. Optionally, when you set **Track By** to **Source** or **Destination**, enter the IP address of each host you want to track in the **Network** field.
For information on using IPv4 CIDR and IPv6 prefix length notation in the Sourcefire 3D System, see [IP Address Conventions](#) on page 57.
4. Indicate the number of rule matches per time period to set the attack rate:
 - In the **Count** field, using an integer between 1 and 2147483647, specify the number of rule matches you want to use as your threshold.
 - In the **Seconds** field, using an integer between 1 and 2147483647, specify the number of seconds that make up the time period for which attacks are tracked.
5. Select a **New State** radio button to specify the new action to be taken when the conditions are met:
 - Select **Generate Events** to generate an event.
 - Select **Drop and Generate Events** to generate an event and drop the packet that triggered the event in inline deployments or to generate an event in passive deployments.
 - Select **Disabled** to take no action.
6. In the **Timeout** field, using an integer between 1 and 2147483647, type the number of seconds you want the new action to remain in effect. After the timeout occurs, the rule reverts to its original state. Specify 0 or leave the **Timeout** field blank to prevent the new action from timing out.
7. Click **OK**.

The system adds the dynamic rule state and displays a dynamic state icon (🔄) next to the rule in the Dynamic State column. If you add multiple dynamic rule state filters to a rule, a number over the icon indicates the number of filters.

If any required fields are left blank, you will receive an error message indicating which fields must be filled.

Setting an SNMP Alert for a Rule

LICENSE: Protection

You can set an SNMP alert for a rule from the Rule Detail page. For more information on SNMP alerts, see [Adding Alerts](#) on page 761.

To add an SNMP alert from the rule details:

ACCESS: Admin/Intrusion Admin

- ▶ Click **Add SNMP Alert** next to Alerts.

The system adds the alert and displays an alert icon (🚨) next to the rule in the Alerting column. If you add multiple alerts to a rule, the system includes an indication over the icon of the number of alerts.

Adding a Rule Comment for a Rule

LICENSE: Protection

You can add a rule comment for a rule from the Rule Detail page. For more information on rule comments, see [Adding Rule Comments](#) on page 762.

To add a comment from the rule details:

ACCESS: Admin/Intrusion Admin

1. Click **Add** next to Comments.
The Add Comment dialog box appears.
2. Type the rule comment.
3. Click **OK**.

The system adds the comment and displays a comment icon () next to the rule in the Comments column. If you add multiple comments to a rule, a number over the icon indicates the number of comments.

TIP! To delete a rule comment, click **Delete** in the rule comments section. Note that you can only delete a comment if the comment is cached with uncommitted intrusion policy changes. After intrusion policy changes are committed the rule comment is permanent.

Filtering Rules in an Intrusion Policy

LICENSE: Protection

You can filter the rules you display on the Rules page by a single criteria, or a combination of one or more criteria.

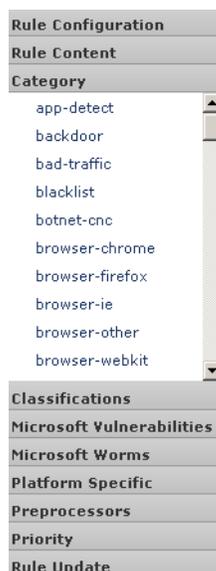

The filter you construct is shown in the Filter text box.

Filter:

You can click keywords and keyword arguments in the filter panel to construct a filter. When you select multiple keywords, The system combines them using AND logic to create a compound search filter. For example, if you select **preprocessor** under **Category** and then select **Rule Content > GID** and enter 116, you get a filter of **Category: "preprocessor" GID:"116"** which retrieves all rules that are preprocessor rules **and** have a GID of 116.

The Category, Microsoft Vulnerabilities, Microsoft Worms, Platform Specific, Preprocessor, and Priority filter groups allow you to submit more than one argument for a keyword, separated by commas. For example, you can press Shift and then select **os-linux** and **os-windows** from **Category** to produce the filter

Category: "os-windows,os-linux", which retrieves any rules in the os-linux category or in the os-windows category.

To show the filter panel, click the show icon (▶).

To hide the filter panel, click the hide icon (◀).

For more information, see the following topics:

- [Understanding Rule Filtering in an Intrusion Policy](#) on page 730
- [Setting a Rule Filter in an Intrusion Policy](#) on page 741

Understanding Rule Filtering in an Intrusion Policy

LICENSE: Protection

Rule filter keywords help you find the rules for which you want to apply rule settings, such as rule states or event filters. You can filter by a keyword and simultaneously select the argument for the keyword by selecting the argument you want from the Rules page filter panel.

For more information, see the following sections:

- [Guidelines for Constructing Intrusion Policy Rule Filters](#) on page 731
- [Understanding Rule Configuration Filters](#) on page 734
- [Understanding Rule Content Filters](#) on page 737
- [Understanding Rule Categories](#) on page 739
- [Editing a Rule Filter Directly](#) on page 739

Guidelines for Constructing Intrusion Policy Rule Filters

LICENSE: Protection

In most cases, when you are building a filter, you can use the filter panel to the left of the Rules page in the intrusion policy to select the keywords/arguments you want to use.

Rule filters are grouped into rule filter groups in the filter panel. Many rule filter groups contain sub-criteria so that you can more easily find the specific rules you are looking for. Some of the rule filters have multiple levels that you expand to drill down to individual rules.

Items in the filter panel sometimes represent filter type groups, sometimes represent keywords, and sometimes represent the argument to a keyword. Use the following rules of thumb to help you build your filters:

- When you select a filter type group heading that is not a keyword (Rule Configuration, Rule Content, Platform Specific, and Priority), it expands to list the available keywords.

When you select a keyword by clicking on a node in the criteria list, a pop-up window appears where you supply the argument you want to filter by.

If that keyword is already used in the filter, the argument you supply replaces the existing argument for that keyword.

For example, if you click **Drop and Generate Events** under Rule Configuration > Recommendation in the filter panel, **Recommendation:"Drop and Generate Events"** is added to the filter text box. If you then click **Generate Events** under Rule Configuration > Recommendation, the filter changes to **Recommendation:"Generate Events"**.

- When you select a filter type group heading that is a keyword (Category, Classifications, Microsoft Vulnerabilities, Microsoft Worms, Priority, and Rule Update), it lists the available arguments.

When you select an item from this type of group, the argument and the keyword it applies to are immediately added to the filter. If the keyword is already in the filter, it replaces the existing argument for the keyword that corresponds to that group.

For example, if you click **os-linux** under Category in the filter panel, **Category:"os-linux"** is added to the filter text box. If you then click **os-windows** under Category, the filter changes to **Category:"os-windows"**.

- Reference under Rule Content is a keyword, and so are the specific reference ID types listed below it. When you select any of the reference keywords, a pop-up window appears where you supply an argument and the keyword is added to the existing filter. If the keyword is already in use in the filter, the new argument you supply replaces the existing argument.
For example, if you click **Rule Content > Reference > CVE ID** in the filter panel, a pop-up window prompts you to supply the CVE ID. If you enter **2007**, then **CVE:"2007"** is added to the filter text box. In another example, if you click **Rule Content > Reference** in the filter panel, a pop-up window prompts you to supply the reference. If you enter **2007**, then **Reference:"2007"** is added to the filter text box.
- When you select rule filter keywords from different groups, each filter keyword is added to the filter and any existing keywords are maintained (unless overridden by a new value for the same keyword).
For example, if you click **os-linux** under Category in the filter panel, **Category:"os-linux"** is added to the filter text box. If you then click **MS00-006** under Microsoft Vulnerabilities, the filter changes to **Category:"os-linux" microsoftvulnerabilities:"MS00-006"**.
- When you select multiple keywords, the system combines them using AND logic to create a compound search filter. For example, if you select **preprocessor** under **Category** and then select **Rule Content > GID** and enter **116**, you get a filter of **Category: "preprocessor" GID:"116"** which retrieves all rules that are preprocessor rules **and** have a GID of 116.
- The Category, Microsoft Vulnerabilities, Microsoft Worms, Platform Specific, and Priority filter groups allow you to submit more than one argument for a keyword, separated by commas. For example, you can hit Shift and then select **os-linux** and **os-windows** from **Category** to produce the filter **Category:"os-windows, app-detect"**, which retrieves any rules in the **os-linux** category or in the **os-windows** category.

The same rule may be retrieved by more than one filter keyword/argument pair. For example, the DOS Cisco attempt rule (SID 1545) appears if rules are filtered by the **dos** category, and also if you filter by the High priority.

IMPORTANT! The Sourcefire VRT may use the rule update mechanism to add and remove rule filters.

Note that the rules on the Rules page may be either shared object rules (generator ID 3) or standard text rules (generator ID 1). The [Rule Filter Groups](#) table describes the different rule filters.

Rule Filter Groups

FILTER GROUP	DESCRIPTION	MULTIPLE ARGUMENT SUPPORT?	HEADING IS...	ITEMS IN LIST ARE...
Rule Configuration	Finds rules according to the configuration of the rule. See Understanding Rule Configuration Filters on page 734.	No	A grouping	keywords
Rule Content	Finds rules according to the content of the rule. See Understanding Rule Content Filters on page 737.	No	A grouping	keywords
Category	Finds rules according to the rule categories used by the rule editor. Note that local rules appear in the local sub-group. See Understanding Rule Categories on page 739.	Yes	A keyword	arguments
Classifications	Finds rules according to the attack classification that appears in the packet display of an event generated by the rule. See Searching for Intrusion Events on page 644 and Defining the Intrusion Event Classification on page 1058.	No	A keyword	arguments
Microsoft Vulnerabilities	Finds rules according to Microsoft bulletin number.	Yes	A keyword	arguments
Microsoft Worms	Finds rules based on specific worms that affect Microsoft Windows hosts.	Yes	A keyword	arguments
Platform Specific	Finds rules according to their relevance to specific versions of operating systems. Note that a rule may affect more than one operating system or more than one version of an operating system. For example, enabling SID 2260 affects multiple versions of Mac OS X, IBM AIX, and other operating systems.	Yes	A keyword	arguments Note that if you pick one of the items from the sub-list, it adds a modifier to the argument.

Rule Filter Groups (Continued)

FILTER GROUP	DESCRIPTION	MULTIPLE ARGUMENT SUPPORT?	HEADING IS...	ITEMS IN LIST ARE...
Preprocessors	Finds rules for individual preprocessors. Note that you must enable preprocessor rules associated with a preprocessor option to generate events for the option when the preprocessor is enabled. See Understanding Preprocessors on page 780 and Setting Rule States on page 743 for more information.	Yes	A grouping	sub-groupings
Priority	Finds rules according to high, medium, and low priorities. The classification assigned to a rule determines its priority. These groups are further grouped into rule categories. Note that local rules (that is, rules that you create) do not appear in the priority groups.	Yes	A keyword	arguments Note that if you pick one of the items from the sub-list, it adds a modifier to the argument.
Rule Update	Finds rules added or modified through a specific rule update. For each rule update, view all rules in the update, only new rules imported in the update, or only existing rules changed by the update.	No	A keyword	arguments

Understanding Rule Configuration Filters

LICENSE: Protection

You can filter the rules listed in the Rules page by several rule configuration settings. For example, if you want to view the set of rules whose rule state does not match the recommended rule state, you can filter on rule state by selecting **Does not match recommendation**.

When you select a keyword by clicking on a node in the criteria list, a pop-up window appears where you supply the argument you want to filter by.

If that keyword is already used in the filter, the argument you supply replaces the existing argument for that keyword.

For example, if you click **Drop and Generate Events** under Rule Configuration > Recommendation in the filter panel, **Recommendation:"Drop and Generate Events"** is added to the filter text box. If you then click **Generate Events** under Rule

Configuration > Recommendation, the filter changes to **Recommendation:"Generate Events"**.

See the following procedures for more information on the rule configuration settings you can use to filter.

To use the Rule State filter:

ACCESS: Admin/Intrusion Admin

1. Under Rule Configuration, click **Rule State**.
2. Select the rule state to filter by:
 - To find rules that only generate events, select **Generate Events**, and click **OK**.
 - To find rules that are set to generate events and drop the matching packet, select **Drop and Generate Events**, and click **OK**.
 - To find disabled rules, select **Disabled**, and click **OK**.
 - To find rules whose rule state does not match the recommended state, select **Does not match recommendation**, and click **OK**.

The Rules page updates to display rules according to current rule state.

To use the Recommendation filter:

ACCESS: Admin/Intrusion Admin

1. Under **Rule Configuration**, click **Recommendation**.
2. Select the FireSIGHT rule state recommendation to filter by.
The Rules page updates to display rules according to recommended rule state.

To use the Threshold filter:

ACCESS: Admin/Intrusion Admin

1. Under Rule Configuration, click **Threshold**.
2. Select the threshold setting to filter by:
 - To find rules with a threshold type of **Limit**, select **Limit**, and click **OK**.
 - To find rules with a threshold type of **threshold**, select **Threshold**, and click **OK**.
 - To find rules with a threshold type of **both**, select **Both**, and click **OK**.
 - To find rules with thresholds tracked by **source**, select **Source**, and click **OK**.
 - To find rules with thresholds tracked by destination, select **Destination**, and click **OK**.
 - To find any rule with a threshold set, select **All**, and click **OK**.

The Rules page updates to display rules where the type of threshold indicated in the filter has been applied to the rule.

To use the Suppression filter:

ACCESS: Admin/Intrusion Admin

1. Under **Rule Configuration**, click **Suppression**.
2. Select the suppression setting to filter by:
 - To find rules where events are suppressed for packets inspected by that rule, select **Rule**, and click **OK**.
 - To find rules where events are suppressed based on the source of the traffic, select **Source**, and click **OK**.
 - To find rules where events are suppressed based on the destination of the traffic, select **Destination**, and click **OK**.
 - To find any rule with suppression set, select **All**, and click **OK**.

The Rules page updates to display rules where the type of suppression indicated in the filter has been applied to the rule.

To use the Dynamic State filter:

ACCESS: Admin/Intrusion Admin

1. Under **Rule Configuration**, click **Dynamic State**.
2. Select the suppression setting to filter by:
 - To find rules where a dynamic state is configured for packets inspected by that rule, select **Rule**, and click **OK**.
 - To find rules where a dynamic state is configured for packets based on the source of the traffic, select **Source**, and click **OK**.
 - To find rules where a dynamic state is configured based on the destination of the traffic, select **Destination**, and click **OK**.
 - To find rules where a dynamic state of **Generate Events** is configured, select **Generate Events**, and click **OK**.
 - To find rules where a dynamic state of **Drop and Generate Events** is configured, select **Drop and Generate Events**, and click **OK**.
 - To find where a dynamic state of **Disabled** is configured, select **Disabled**, and click **OK**.
 - To find any rule with suppression set, select **All**, and click **OK**.

The Rules page updates to display rules where the dynamic rule state indicated in the filter has been applied to the rule.

To use the Comment filter:

ACCESS: Admin/Intrusion Admin

1. Under **Rule Configuration**, click **Comment**.
2. Type the string of comment text to filter by.
The Rules page updates to display rules where comments applied to the rule contain the string indicated in the filter.

Understanding Rule Content Filters

LICENSE: Protection

You can filter the rules listed in the Rules page by several rule content items. For example, you can quickly retrieve a rule by searching for the rule SID. You can also find all rules that inspect traffic going to a specific destination port.

When you select a keyword by clicking on a node in the criteria list, a pop-up window appears where you supply the argument you want to filter by.

If that keyword is already used in the filter, the argument you supply replaces the existing argument for that keyword.

For example, if you click **SID** under Rule Content in the filter panel, a pop-up window appears, prompting you to supply a SID. If you type 1045, then **SID:"1045"** is added to the filter text box. If you then click **SID** again and change the SID filter to 1044, the filter changes to **SID:"1044"**.

For more information on the rule content you can use to filter, see the [Rule Content Filters](#) table.

Rule Content Filters

TO USE THIS FILTER, CLICK...	THEN...	RESULT
Message	Type the message string to filter by, and click OK .	Finds rules that contain the supplied string in the message field.
SID	Type the SID number to filter by, and click OK .	Finds rules that have the specified SID.
GID	Type the GID number to filter by, and click OK .	Finds rules that have the specified GID.
Reference	Type the reference string to filter by, and click OK .	Finds rules that contain the supplied string in the reference field.

Rule Content Filters (Continued)

TO USE THIS FILTER, CLICK...	THEN...	RESULT
Action	Select the action to filter by: <ul style="list-style-type: none"> • To find alert rules, select Alert, and click OK. • To find pass rules, select Pass, and click OK. 	Finds rules that start with alert or pass .
Protocol	Select the protocol to filter by.	Finds rules that include the selected protocol.
Direction	Select a directional setting to filter by: <ul style="list-style-type: none"> • To find rules that inspect traffic moving in a specific direction, select Directional, and click OK. • To find rules that inspect traffic moving in either direction between a source and destination, select Bidirectional, and click OK. 	Finds rules based on whether the rule includes the indicated directional setting.
Source IP	Type the source IP address to filter by. Note that you can filter by a valid IP address, a CIDR block/prefix length, or using variables such as \$HOME_NET or \$EXTERNAL_NET .	Finds rules that use the specified addresses or variables for the source IP address designation in the rule.
Destination IP	Type the destination IP address to filter by. Note that you can filter by a valid IP address, a CIDR block/prefix length, or using variables such as \$HOME_NET or \$EXTERNAL_NET .	Finds rules that use the specified addresses or variables for the source IP address designation in the rule.
Source port	Type the source port to filter by. The port value must be an integer between 1 and 65535 or a port variable.	Finds rules that include the specified source port.

Rule Content Filters (Continued)

TO USE THIS FILTER, CLICK...	THEN...	RESULT
Destination port	Type the destination port to filter by. The port value must be an integer between 1 and 65535 or a port variable.	Finds rules that include the specified destination port.
Rule Overhead	Select the amount of rule overhead to filter by.	Finds rules with the selected rule overhead.
Metadata	Type the metadata key-value pair to filter by, separated by a space. For example, type <code>metadata:"service http"</code> to locate rules with metadata relating to the HTTP application protocol.	Find rules with metadata containing the matching key-value pair.

Understanding Rule Categories

LICENSE: Protection

The Sourcefire 3D System places rules in categories based on the type of traffic the rule detects. On the Rules page, you can filter by rule category so you can set a rule attribute for all rules in a category. For example, if you do not have Linux hosts on your network, you might filter by the **os-linux** category and then disable all the rules showing to disable the entire **os-linux** category.

You can hover your pointer over a category name to display the number of rules in the category.

IMPORTANT! The Sourcefire VRT may use the rule update mechanism to add and remove rule categories.

Editing a Rule Filter Directly

LICENSE: Protection

You can edit your filter to modify the special keywords and their arguments that are supplied when you click on a filter in the filter panel. Custom filters on the Rules page function like those used in the rule editor, but you can also use any of the keywords supplied in the Rules page filter, using the syntax displayed when you select the filter through the filter panel. To determine a keyword for future use, click on the appropriate argument in the filter panel on the right. The filter keyword and argument syntax appear in the filter text box.

To see lists of arguments for keywords which only support specific values, see [Understanding Rule Configuration Filters](#) on page 734, [Understanding Rule Content Filters](#) on page 737, and [Understanding Rule Categories](#) on page 739. Remember that comma-separated multiple arguments for a keyword are only supported for the Category and Priority filter types.

You can use keywords and arguments, character strings, and literal character strings in quotes, with spaces separating multiple filter conditions. A filter cannot include regular expressions, wild card characters, or any special operator such as a negation character (!), a greater than symbol (>), less than symbol (<), and so on. When you type in search terms without a keyword, without initial capitalization of the keyword, or without quotes around the argument, the search is treated as a string search and the category, message, and SID fields are searched for the specified terms.

All keywords, keyword arguments, and character strings are case-insensitive. Except for the `gid` and `sid` keywords, all arguments and strings are treated as partial strings. Arguments for `gid` and `sid` return only exact matches.

Each rule filter can include one or more keywords in the format:

Keyword: "argument"

where *keyword* is one of the keywords in the filter groups described the [Rule Types table](#) on page 719 and *argument* is enclosed in double quotes and is a single, case-insensitive, alphanumeric string to search for in the specific field or fields relevant to the keyword. Note that keywords should be typed with initial capitalization.

Arguments for all keywords except `gid` and `sid` are treated as partial strings. For example, the argument `123` returns `"12345"`, `"41235"`, `"45123"`, and so on. The arguments for `gid` and `sid` return only exact matches; for example, `sid:3080` returns only SID 3080.

Each rule filter can also include one or more alphanumeric character strings. Character strings search the rule Message field, Signature ID, and Generator ID. For example, the string `123` returns the strings `"Lotus123"`, `"123mania"`, and so on in the rule message, and also returns SID 6123, SID 12375, and so on. For information on the rule Message field, see [Defining the Event Message](#) on page 1058. For information on rule SIDs and GIDs, see [Reading Preprocessor Generator IDs](#) on page 784. You can search for a partial SID by filtering with one or more character strings.

All character strings are case-insensitive and are treated as partial strings. For example, any of the strings `ADMIN`, `admin`, or `Admin` return `"admin"`, `"CFADMIN"`, `"Administrator"` and so on.

You can enclose character strings in quotes to return exact matches. For example, the literal string `"overflow attempt"` in quotes returns only that exact string, whereas a filter comprised of the two strings `overflow` and `attempt` without quotes returns `"overflow attempt"`, `"overflow multipacket attempt"`, `"overflow with evasion attempt"`, and so on.

You can narrow filter results by entering any combination of keywords, character strings, or both, separated by spaces. The result includes any rule that matches all the filter conditions.

You can enter multiple filter conditions in any order. For example, each of the following filters returns the same rules:

- `url:at login attempt cve:200`
- `login attempt cve:200 url:at`
- `login cve:200 attempt url:at`

Setting a Rule Filter in an Intrusion Policy

LICENSE: Protection

You can filter the rules on the Rules page to display a subset of rules. You can then use any of the page features, including selecting any of the features available in the context menu. This can be useful, for example, when you want to set a threshold for all the rules in a specific category. You can use the same features with rules in a filtered or unfiltered list. For example, you can apply new rule states to rules in a filtered or unfiltered list.

You can select pre-defined filter keywords from the filter panel on the left side of the Rules page in the intrusion policy. When you select a filter, the page displays all matching rules, or indicates when no rules match.

For more information on all the keywords and arguments you can use and how you can construct filters from the filter panel, see [Understanding Rule Filtering in an Intrusion Policy](#) on page 730.

You can add keywords to a filter to further constrain it. Any filter you enter searches the entire rules database and returns all matching rules. When you enter a filter while the page still displays the result of a previous filter, the page clears and returns the result of the new filter instead.

You can also type a filter using the same keyword and argument syntax supplied when you select a filter, or modify argument values in a filter after you select it. When you type in search terms without a keyword, without initial capitalization of the keyword, or without quotes around the argument, the search is treated as a string search and the category, message, and SID fields are searched for the specified terms.

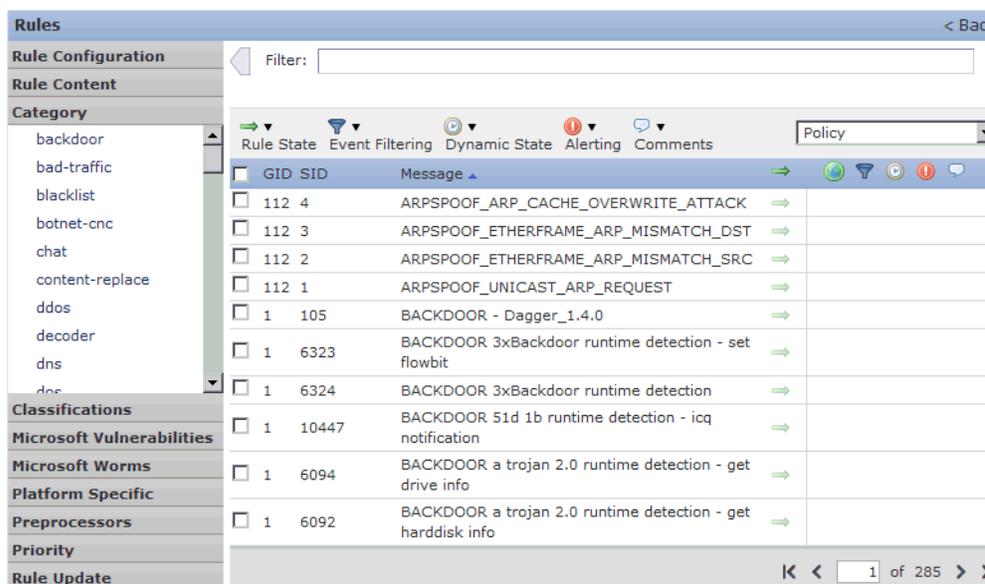

To filter for specific rules in an intrusion policy:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

2. Click the edit icon (✎) next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Manage Rules** in the Policy Information page.
The Rules page appears. By default, the page lists the rules alphabetically by message.

4. Construct a filter by clicking on keywords or arguments in the filter panel on the left. Note that if you click an argument for a keyword already in the filter it replaces the existing argument. See the following for more information:
 - [Guidelines for Constructing Intrusion Policy Rule Filters](#) on page 731.
 - [Understanding Rule Configuration Filters](#) on page 734
 - [Understanding Rule Content Filters](#) on page 737
 - [Understanding Rule Categories](#) on page 739
 - [Editing a Rule Filter Directly](#) on page 739 for more information.The page refreshes to display all matching rules, and the number of rules matching the filter is displayed above the filter text box.
5. Select the rule or rules where you want to apply a new setting. You have the following options:
 - To select a specific rule, select the check box next to the rule.
 - To select all the rules in the current list, select the check box at the top of the column.

6. Optionally, make any changes to the rule that you would normally make on the page. See the following sections for more information:
 - See [Setting Rule States](#) on page 743 for information on enabling and disabling rules on the Rules page.
 - See [Filtering Intrusion Event Notification Per Policy](#) on page 746 for information on adding thresholding and suppression to rules.
 - See [Adding Dynamic Rule States](#) on page 756 for information on setting dynamic rule states that trigger when rate anomalies occur in matching traffic.
 - See [Adding Alerts](#) on page 761 for information on adding SNMP alerts to specific rules.
 - See [Adding Rule Comments](#) on page 762 for more information on adding rule comments to rules.
7. Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Setting Rule States

LICENSE: Protection

The Sourcefire Vulnerability Research Team (VRT) sets the default state of each intrusion and preprocessor rule in each default policy. For example, a rule may be enabled in the Security over Connectivity default policy and disabled in the Connectivity over Security default policy. Intrusion policy rules you create inherit the default states of the rules in the default policy you use to create your policy.

You can set a rule to Generate Events, to Drop and Generate Events, or to Disable individually or you can filter the rules by a variety of factors to select the rules for which you want to modify the state. In an inline deployment, you can use the Drop and Generate Events rule state in inline intrusion deployments to drop malicious packets. Note that rules with the Drop and Generate Events rule state generate events but do not drop packets in a passive deployment, including when a 3D9900 or Series 3 device inline interface set is in tap mode. Setting a rule to Generate Events or Drop and Generate Events enables the rule; setting the rule to Disable disables it.

Consider two scenarios. In the first scenario, the rule state for a specific rule is set to Generate Events. When a malicious packet crosses your network and triggers the rule, the packet is sent to its destination and the system generates an intrusion event. In the second scenario, assume that the rule state for the same rule is set to Drop and Generate Events in an inline deployment. In this case, when the malicious packet crosses the network, the system drops the malicious packet and generates an intrusion event. The packet never reaches its target.

In an intrusion policy, you can set a rule's state to one of the following settings:

- Set the rule state to **Generate Events** if you want the system to detect a specific intrusion attempt and generate an intrusion event when it finds matching traffic.
- Set the rule state to **Drop and Generate Events** if you want the system to detect a specific intrusion attempt, then drop the packet containing the attack and generate an intrusion event when it finds matching traffic in an inline deployment, or to generate an intrusion event when it finds matching traffic in a passive deployment, including when a 3D9900 or Series 3 device inline interface set is in tap mode.

Note that your intrusion policy must be set to drop rules in an inline deployment for the system to drop packets; see [Setting Drop Behavior in an Inline Deployment](#) on page 689 for more information.

- Set the rule state to **Disable** if you do not want the system to evaluate matching traffic.

To use drop rules, you must:

- Enable the **Drop when Inline** option in your intrusion policy.
- Set the rule state to **Drop and Generate Events** for any rules that should drop all packets that match the rule.
- Apply an access control policy that includes an access control rule that is associated with your intrusion policy to a managed device that uses an inline set.

Filtering rules on the Rules page can help you find the rules you want to set as drop rules. For more information, see [Filtering Rules in an Intrusion Policy](#) on page 729.

See [Understanding and Writing Intrusion Rules](#) on page 1046 for information about rule anatomy, rule keywords and their options, and rule writing syntax.

The VRT sometimes uses a rule update to change the default state of one or more rules in a default policy. If you allow rule updates to update your base policy, you also allow the rule update to change the default state of a rule in your policy when the default state changes in the default policy you used to create your policy (or in the default policy it is based on). Note, however, that if you have changed the rule state, the rule update will not override your change.

To change the rule state for one or more rules:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.

2. Click the edit icon (✎) next to the policy you want to edit.

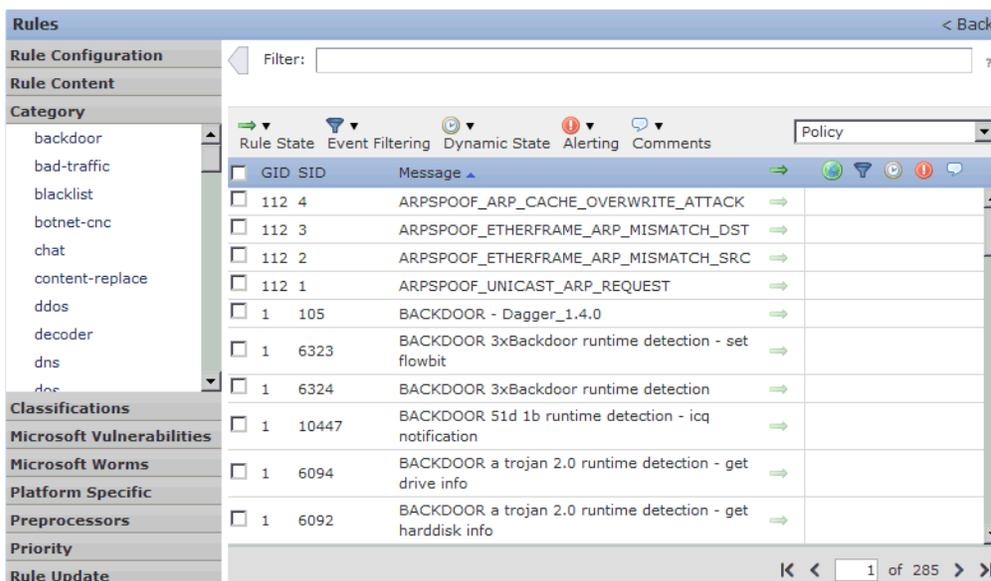

If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

Note that this page indicates the total number of enabled rules and the total number of enabled rules set to Generate Events and the total number set to Drop and Generate Events. Note also that in a passive deployment, rules set to Drop and Generate Events only generate events.

3. Click **Manage Rules** on the Policy Information page.

The Rules page appears. By default, the page lists the rules alphabetically by message.

4. Locate the rule or rules where you want to set the rule state. You have the following options:
 - To sort the current display, click on a column heading or icon. To reverse the sort, click again.
 - Construct a filter by clicking on keywords or arguments in the filter panel on the left. For more information, see the following topics: [Understanding Rule Filtering in an Intrusion Policy](#) on page 730 and [Setting a Rule Filter in an Intrusion Policy](#) on page 741.

The page refreshes to display all matching rules.

5. Select the rule or rules where you want to set the rule state. You have the following options:
 - To select a specific rule, select the check box next to the rule.
 - To select all the rules in the current list, select the check box at the top of the column.
6. You have the following options:
 - To generate events when traffic matches the selected rules, select **Rule State > Generate Events**.
 - To generate events and drop the traffic in inline deployments when traffic matches the selected rules, select **Rule State > Drop and Generate Events**.
 - To not inspect traffic matching the selected rules, select **Rule State > Disable**.

IMPORTANT! Sourcefire **strongly** recommends that you **do not** enable all the intrusion rules in an intrusion policy. The performance of your managed device is likely to degrade if all the rules are enabled. Instead, tune your rule set to match your network environment as closely as possible.

7. Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Filtering Intrusion Event Notification Per Policy

LICENSE: Protection

The importance of an intrusion event can be based on frequency of occurrence, or source or destination IP address. In some cases you may not care about an event until it has occurred a certain number of times. For example, you may not be concerned if someone attempts to log into a server until they fail a certain number of times. In other cases, you may only need to see a few occurrences to know there is a widespread problem. For example, if a DoS attack is launched against your web server, you may only need to see a few occurrences of an intrusion event to know that you need to address the situation. Seeing hundreds of the same event only overwhelms your system.

See the following sections for more information:

- [Configuring Event Thresholding](#) on page 747 explains how to set thresholds that dictate how often (based on the number of occurrences) an event is displayed. You can configure thresholding per event, per policy.
- [Configuring Suppression Per Intrusion Policy](#) on page 753 explains how to suppress notification of specified events per source or destination IP address per policy.

Configuring Event Thresholding

LICENSE: Protection

You can set thresholds for individual rules per intrusion policy to limit the number of times the system logs and displays an intrusion event based on how many times the event is generated within a specified time period. This can prevent you from being overwhelmed with a large number of identical events. You can set thresholds per shared object rule, standard text rule, or preprocessor rule.

For more information see the following sections:

- [Understanding Event Thresholding](#) on page 747
- [Adding and Modifying Intrusion Event Thresholds](#) on page 749
- [Viewing and Deleting Intrusion Event Thresholds](#) on page 751
- [Setting a Threshold for a Rule](#) on page 725

Understanding Event Thresholding

LICENSE: Protection

First, you must specify the thresholding type. You can select from the options discussed in the [Thresholding Options](#) table.

Thresholding Options

OPTION	DESCRIPTION
Limit	Logs and displays events for the specified number of packets (specified by the count argument) that trigger the rule during the specified time period. For example, if you set the type to Limit , the Count to 10, and the Seconds to 60, and 14 packets trigger the rule, the system stops logging events for the rule after displaying the first 10 that occur within the same minute.

Thresholding Options (Continued)

OPTION	DESCRIPTION
Threshold	<p>Logs and displays a single event when the specified number of packets (specified by the count argument) trigger the rule during the specified time period. Note that the counter for the time restarts after you hit the threshold count of events and the system logs that event. For example, you set the type to Threshold, Count to 10, and Seconds to 60 and the rule triggers 10 times by second 33. The system generates one event, then resets the Seconds and Count counters to 0. The rule then triggers another 10 times in the next 25 seconds. Because the counters reset to 0 at second 33, the system logs another event.</p>
Both	<p>Logs and displays an event once per specified time period, after the specified number (count) of packets trigger the rule. For example, if you set the type to Both, Count to two, and Seconds to 10, the following event counts result:</p> <ul style="list-style-type: none"> • If the rule is triggered once in 10 seconds, the system does not generate any events (the threshold is not met) • If the rule is triggered twice in 10 seconds, the system generates one event (the threshold is met when the rule triggers the second time) • If the rule is triggered four times in 10 seconds, the system generates one event (the threshold is met when the rule triggered the second time and following events are ignored)

Next, you must specify the tracking, which determines whether the event threshold is calculated per source or destination IP address. Select one of the options from the [Thresholding IP Options](#) table to specify how the system tracks event instances.

Thresholding IP Options

OPTION	DESCRIPTION
Source	<p>Calculates event instance count per source IP address.</p>
Destination	<p>Calculates the event instance count per destination IP address.</p>

Finally, you must specify the number of instances and time period that define the threshold.

Thresholding Instance/Time Options

OPTION	DESCRIPTION
Count	The number of event instances per specified time period per tracking IP address required to meet the threshold.
Seconds	The number of seconds that elapse before the count resets. If you set the threshold type to limit , the tracking to Source IP , the count to 10, and the seconds to 10, the system logs and displays the first 10 events that occur in 10 seconds from a given source port. If only 7 events occur in the first 10 seconds, the system logs and displays those, if 40 events occur in the first 10 seconds, the system logs and displays 10, then begins counting again when the 10-second time period elapses.

Note that you can use intrusion event thresholding alone or in any combination with rate-based attack prevention, the `detection_filter` keyword, and intrusion event suppression. See [Adding Dynamic Rule States](#) on page 756, [Filtering Events](#) on page 1165, and [Configuring Suppression Per Intrusion Policy](#) on page 753 for more information.

See the following sections for more information:

- [Adding and Modifying Intrusion Event Thresholds](#) on page 749
- [Setting a Threshold for a Rule](#) on page 725
- [Viewing and Deleting Intrusion Event Thresholds](#) on page 751

TIP! You can also add thresholds from within the packet view of an intrusion event. See [Viewing Event Information](#) on page 625 for more information.

Adding and Modifying Intrusion Event Thresholds

LICENSE: Protection

You can set a threshold for one or more specific rules. You can also separately or simultaneously modify existing threshold settings. You can set a single threshold for each. Adding a threshold overwrites any existing threshold for the rule.

For more information on viewing and deleting threshold configurations, see [Viewing and Deleting Intrusion Event Thresholds](#) on page 751.

You can also modify the global threshold that applies by default to all rules and preprocessor-generated events. For more information, see [Using Global Rule Thresholding](#) on page 1009.

Note that a revert icon (↶) appears in a field when you type an invalid value; click it to revert to the last valid value for that field or to clear the field if there was no previous value.

TIP! A global or individual threshold on a managed device with multiple CPUs may result in a higher number of events than expected.

To add or modify event thresholds:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy.**

The Intrusion Policy page appears.

2. Click the edit icon (✎) next to the policy you want to edit.

If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

3. Click **Manage Rules in the Policy Information page.**

The Rules page appears. By default, the page lists the rules alphabetically by message.

4. Locate the rule or rules where you want to set a threshold. You have the following options:

- To sort the current display, click on a column heading or icon. To reverse the sort, click again.
- Construct a filter by clicking on keywords or arguments in the filter panel on the left. For more information, see the following topics: [Understanding Rule Filtering in an Intrusion Policy](#) on page 730 and [Setting a Rule Filter in an Intrusion Policy](#) on page 741.

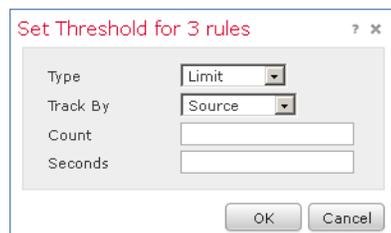

The page refreshes to display all matching rules.

5. Select the rule or rules where you want to set a threshold. You have the following options:

- To select a specific rule, select the check box next to the rule.
- To select all the rules in the current list, select the check box at the top of the column.

6. Select **Event Filtering > Threshold**.

The thresholding pop-up window appears.

7. Select the type of threshold you want to set:

- Select **Limit** to limit notification to the specified number of event instances per time period.
- Select **Threshold** to provide notification for each specified number of event instances per time period.
- Select **Both** to provide notification once per time period after a specified number of event instances.

8. Select the appropriate option for **Track By** to indicate whether you want the event instances tracked by source or destination IP address.

9. In the **Count** field, specify the number of event instances you want to use as your threshold.

10. In the **Seconds** field, specify the number of seconds that make up the time period for which event instances are tracked.

11. Click **OK**.

The system adds your threshold and displays an event filter icon (🔍) next to the rule in the Event Filtering column. If you add multiple event filters to a rule, a number over the icon indicates the number of event filters.

12. Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Viewing and Deleting Intrusion Event Thresholds

LICENSE: Protection

You may want to view or delete an existing threshold setting. You can use the Rules Details view to display the configured settings for a threshold to see if they are appropriate for your system. If they are not, you can add a new threshold to overwrite the existing values.

Note that you can also modify the global threshold that applies by default to all rules and preprocessor-generated events. See [Using Global Rule Thresholding](#) on page 1009 for more information.

To view or delete a threshold:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon () next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Manage Rules** in the Policy Information page.
The Rules page appears. By default, the page lists the rules alphabetically by message.
4. Locate the rule or rules that have a configured threshold you want to view or delete. You have the following options:
 - To sort the current display, click on a column heading or icon. To reverse the sort, click again.
 - Construct a filter by clicking on keywords or arguments in the filter panel on the left. For more information, see the following topics: [Understanding Rule Filtering in an Intrusion Policy](#) on page 730 and [Setting a Rule Filter in an Intrusion Policy](#) on page 741.
The page refreshes to display all matching rules.
5. Select the rule or rules with a configured threshold you want to view or delete. You have the following options:
 - To select a specific rule, select the check box next to the rule.
 - To select all the rules in the current list, select the check box at the top of the column.
6. To remove the threshold for each selected rule, select **Event Filtering > Remove Thresholds**. Click **OK** in the confirmation pop-up window that appears.

TIP! To remove a specific threshold, you can also highlight the rule and click **Show details**. Expand the threshold settings and click **Delete** next to the threshold settings. Click **OK** to confirm that you want to delete the configuration.

The page refreshes and the threshold is deleted.

7. Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Configuring Suppression Per Intrusion Policy

LICENSE: Protection

You can suppress intrusion event notification when a specific IP address or range of IP addresses trigger a specific rule or preprocessor. This is useful for eliminating false positives. For example, if you have a mail server that transmits packets that look like a specific exploit, you can suppress event notification for that event when it is triggered by your mail server. The rule triggers for all packets, but you only see events for legitimate attacks.

Note that you can use intrusion event suppression alone or in any combination with rate-based attack prevention, the `detection_filter` keyword, and intrusion event thresholding. See [Adding Dynamic Rule States](#) on page 756, [Filtering Events](#) on page 1165, and [Configuring Event Thresholding](#) on page 747 for more information.

See the following sections for more information:

- [Suppressing Intrusion Events](#) on page 753
- [Viewing and Deleting Suppression Conditions](#) on page 755

TIP! You can also add suppressions from within the packet view of an intrusion event. See [Viewing Event Information](#) on page 625 for more information. You can also access suppression settings by using the right-click context menu on the Rule Editor page and on any intrusion event page (if the event was triggered by an intrusion rule).

Suppressing Intrusion Events

LICENSE: Protection

You can suppress intrusion event notification for a rule or rules. When notification is suppressed for a rule, the rule triggers but events are not generated. You can set one or more suppressions for a rule. The first suppression listed has the highest priority. Note that when two suppressions conflict, the action of the first is carried out.

Note that a revert icon () appears in a field when you type an invalid value; click it to revert to the last valid value for that field or to clear the field if there was no previous value.

To suppress event display:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

2. Click the edit icon (✎) next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

3. Click **Manage Rules** in the Policy Information page.
The Rules page appears. By default, the page lists the rules alphabetically by message.

4. Locate the rule or rules where you want to set suppression. You have the following options:
 - To sort the current display, click on a column heading or icon. To reverse the sort, click again.
 - Construct a filter by clicking on keywords or arguments in the filter panel on the left. For more information, see the following topics: [Understanding Rule Filtering in an Intrusion Policy](#) on page 730 and [Setting a Rule Filter in an Intrusion Policy](#) on page 741.

The page refreshes to display all matching rules.

5. Select the rule or rules for which you want to configure suppression conditions. You have the following options:
 - To select a specific rule, select the check box next to the rule.
 - To select all the rules in the current list, select the check box at the top of the column.

6. Select **Event Filtering > Suppression**.

The suppression pop-up window appears.

7. Select one of the following **Suppression Type** options:
 - Select **Rule** to completely suppress events for a selected rule.
 - Select **Source** to suppress events generated by packets originating from a specified source IP address.
 - Select **Destination** to suppress events generated by packets going to a specified destination IP address.

8. If you selected **Source** or **Destination** for the suppression type, in the **Network** field enter the IP address, address block, or variable you want to specify as the source or destination IP address, or a comma-separated list comprised of any combination of these.

For information on using IPv4 CIDR and IPv6 prefix length address blocks in the Sourcefire 3D System, see [IP Address Conventions](#) on page 57.

9. Click **OK**.

The system adds your suppression conditions and displays an event filter icon () next to the rule in the Event Filtering column next the suppressed rule. If you add multiple event filters to a rule, a number over the icon indicates the number of event filters.

10. Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Viewing and Deleting Suppression Conditions

LICENSE: Protection

You may want to view or delete an existing suppression condition. For example, you might suppress event notification for packets originating from a mail server IP address because the mail server normally transmits packets that look like exploits. If you then decommission that mail server and reassign the IP address to another host, you should delete the suppression conditions for that source IP address.

To view or delete a defined suppression condition:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

2. Click the edit icon () next to the policy you want to edit.

If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

3. Click **Manage Rules** in the Policy Information page.

The Rules page appears. By default, the page lists the rules alphabetically by message.

4. Locate the rule or rules where you want to view or delete suppressions. You have the following options:
 - To sort the current display, click on a column heading or icon. To reverse the sort, click again.
 - Construct a filter by clicking on keywords or arguments in the filter panel on the left. For more information, see the following topics: [Understanding Rule Filtering in an Intrusion Policy](#) on page 730 and [Setting a Rule Filter in an Intrusion Policy](#) on page 741.The page refreshes to display all matching rules.
5. Select the rule or rules for which you want to view or delete suppressions. You have the following options:
 - To select a specific rule, select the check box next to the rule.
 - To select all the rules in the current list, select the check box at the top of the column.
6. You have two options:
 - To remove all suppression for a rule, select **Event Filtering > Remove Suppressions**. Click **OK** in the confirmation pop-up window that appears.
 - To remove a specific suppression setting, highlight the rule and click **Show details**. Expand the suppression settings and click **Delete** next to the suppression settings. Click **OK** to confirm that you want to delete the configuration.The page refreshes and the suppression is deleted.
7. Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Adding Dynamic Rule States

LICENSE: Protection

Rate-based attacks attempt to overwhelm a network or host by sending excessive traffic toward the network or host, causing it to slow down or deny legitimate requests. You can use rate-based prevention to change the action of a rule in response to excessive rule matches for specific rules.

For more information, see the following sections:

- [Understanding Dynamic Rule States](#) on page 757
- [Setting a Dynamic Rule State](#) on page 758

Understanding Dynamic Rule States

LICENSE: Protection

You can configure your intrusion policies to include a rate-based filter that detects when too many matches for a rule occur in a given time period. You can use this feature on managed devices deployed inline to block rate-based attacks for a specified time and then revert to a rule state where rule matches only generate events and do not drop traffic.

Rate-based attack prevention identifies abnormal traffic patterns and attempts to minimize the impact of that traffic on legitimate requests. You can identify excessive rule matches in traffic going to a particular destination IP address or addresses or coming from a particular source IP address or addresses. You can also respond to excessive matches for a particular rule across all detected traffic.

In the intrusion policy, you can configure a rate-based filter for any intrusion or preprocessor rule. The rate-based filter contains three components:

- the rule matching rate, which you configure as a count of rule matches within a specific number of seconds
- a new action to be taken when the rate is exceeded, with three available actions: Generate Events, Drop and Generate Events, and Disable
- the duration of the action, which you configure as a timeout value

Note that when started, the new action occurs until the timeout is reached, even if the rate falls below the configured rate during that time period. When the timeout is reached, if the rate has fallen below the threshold, the action for the rule reverts to that initially configured for the rule.

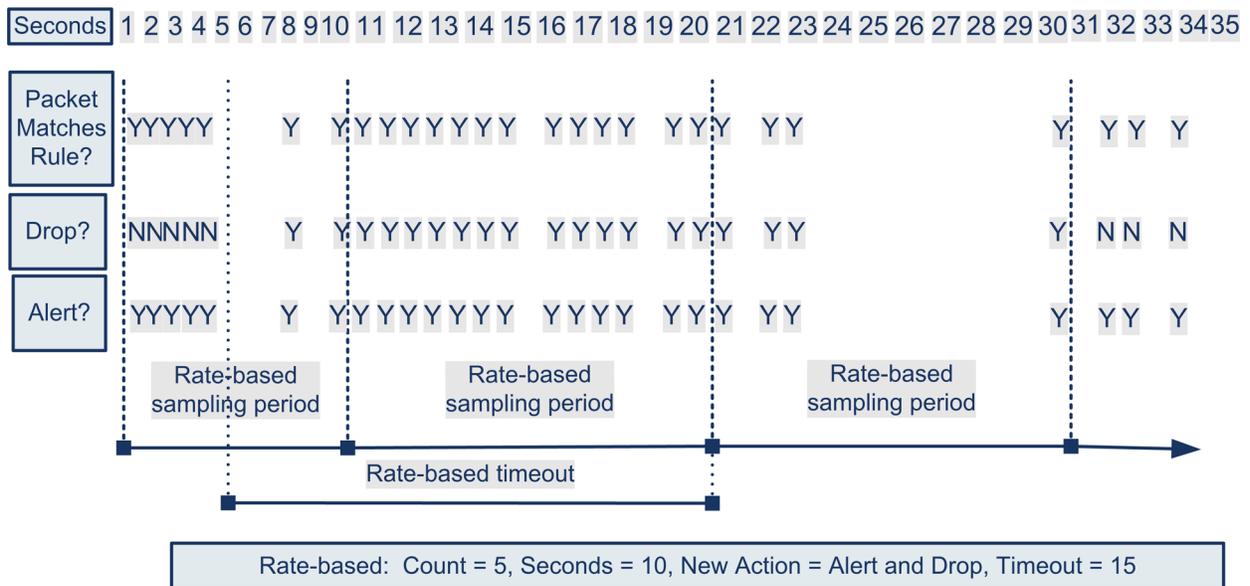

You can configure rate-based attack prevention in an inline deployment to block attacks, either temporarily or permanently. Without rate-based configuration, rules set to Generate Events do generate events, but the system does not drop packets for those rules. However, if the attack traffic matches rules that have rate-based criteria configured, the rate action may cause packet dropping to occur for the period of time that the rate action is active, even if those rules are not initially set to Drop and Generate Events.

IMPORTANT! Rate-based actions cannot enable disabled rules or drop traffic that matches disabled rules.

You can define multiple rate-based filters on the same rule. The first filter listed in the intrusion policy has the highest priority. Note that when two rate-based filter actions conflict, the action of the first rate-based filter is carried out.

The following diagram shows an example where an attacker is attempting to access a host. Repeated attempts to find a password trigger a rule which has rate-based attack prevention configured. The rate-based settings change the rule attribute to Drop and Generate Events after rule matches occur five times in a 10-second span. The new rule attribute times out after 15 seconds.

After the timeout, note that packets are still dropped in the rate-based sampling period that follows. If the sampled rate is above the threshold in the current or previous sampling period, the new action continues. The new action reverts to generate events only after a sampling period completes where the sampled rate was below the threshold rate.

Setting a Dynamic Rule State

LICENSE: Protection

In some cases, you may not want to set a rule to the Drop and Generate Events state because you do not want to drop every packet that matches the rule, but you do want to drop packets matching the rule if a particular rate of matches occurs in a specified time. Dynamic rule states lets you configure the rate that should trigger a change in the action for a rule, what the action should change to when the rate is met, and how long the new action should persist.

You set the number of hits for that rule by specifying a count and the number of seconds within which those hits should occur to trigger the action change. In addition, you can set a timeout to cause the action to revert to the previous state for the rule when the timeout expires.

You can define multiple dynamic rule state filters on the same rule. The first filter listed in the rule details in the intrusion policy has the highest priority. Note that when two rate-based filter actions conflict, the action of the first rate-based filter is carried out.

Note that a revert icon (↶) appears in a field when you type an invalid value; click it to revert to the last valid value for that field or to clear the field if there was no previous value.

IMPORTANT! Dynamic rule states cannot enable disabled rules or drop traffic that matches disabled rules.

To add a dynamic rule state:

ACCESS: Admin/Intrusion Admin

1. Select Policies > Intrusion > Intrusion Policy.

The Intrusion Policy page appears.

2. Click the edit icon (✎) next to the policy you want to edit.

If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

3. Click Rules in the Policy Information page.

The Rules page appears.

4. Locate the rule or rules where you want to add a dynamic rule state. You have the following options:

- To sort the current display, click on a column heading or icon. To reverse the sort, click again.
- Construct a filter by clicking on keywords or arguments in the filter panel on the left. For more information, see the following topics: [Understanding Rule Filtering in an Intrusion Policy](#) on page 730 and [Setting a Rule Filter in an Intrusion Policy](#) on page 741.

The page refreshes to display all matching rules.

5. Select the rule or rules where you want to add a dynamic rule state. You have the following options:

- To select a specific rule, select the check box next to the rule.
- To select all the rules in the current list, select the check box at the top of the column.

6. Select **Dynamic State > Add Rate-Based Rule State**.

The Add Rate-Based Rule State dialog box appears.

7. Select the appropriate **Track By** option to indicate how you want the rule matches tracked:

- Select **Source** to track the number of hits for that rule from a specific source or set of sources.
- Select **Destination** to track the number of hits for that rule to a specific destination or set of destinations.
- Select **Rule** to track all matches for that rule.

8. When you set **Track By** to **Source** or **Destination**, enter the address of each host you want to track in the **Network** field.

You can specify a single IP address, address block, variable, or a comma-separated list comprised of any combination of these. For information on using IPv4 CIDR and IPv6 prefix length address blocks in the Sourcefire 3D System, see [IP Address Conventions](#) on page 57.

9. Indicate the number of rule matches per time period to set the attack rate:

- In the **Count** field, using an integer between 1 and 2147483647, specify the number of rule matches you want to use as your threshold.
- In the **Seconds** field, using an integer between 1 and 2147483647, specify the number of seconds that make up the time period for which attacks are tracked.

10. Select a **New State** radio button to specify the new action to be taken when the conditions are met:

- Select **Generate Events** to generate an event.
- Select **Drop and Generate Events** to generate an event and drop the packet that triggered the event in inline deployments or generate an event in passive deployments.
- Select **Disabled** to take no action.

11. In the **Timeout** field, type the number of seconds you want the new action to remain in effect. After the timeout occurs, the rule reverts to its original state. Specify 0 or leave the **Timeout** field blank to prevent the new action from timing out.

12. Click **OK**.

The system adds the dynamic rule state and displays a dynamic state icon (🔄) next to the rule in the Dynamic State column. If you add multiple dynamic rule state filters to a rule, a number over the icon indicates the number of filters.

If any required fields are left blank, you will receive an error message indicating which fields must be filled.

TIP! To delete all dynamic rule settings for a set of rules, select the rules on the Rules page, select **Dynamic State > Remove Rate-Based States**. You can also delete individual rate-based rule state filters from the rule details for the rule by selecting the rule, clicking **Show details**, and clicking **Delete** by the rate-based filter you want to remove.

13. Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Adding Alerts

LICENSE: Protection

If you configure SNMP alerting for your Sourcefire 3D System, you can add an alert to specific rules in your intrusion policy. For more information, see [Adding SNMP Alerts](#) on page 761.

Adding SNMP Alerts

LICENSE: Protection

If you configure an SNMP alert for your Sourcefire 3D System, you can configure rules within an intrusion policy to use that alert when traffic matches the rule and an event is generated.

To set an SNMP alert:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

2. Click the edit icon (✎) next to the policy you want to edit.

If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

3. Click **Manage Rules** in the Policy Information page.
The Rules page appears.
4. Locate the rule or rules where you want to set SNMP alerts. You have the following options:
 - To sort the current display, click on a column heading or icon. To reverse the sort, click again.
 - Construct a filter by clicking on keywords or arguments in the filter panel on the left. For more information, see the following topics: [Understanding Rule Filtering in an Intrusion Policy](#) on page 730 and [Setting a Rule Filter in an Intrusion Policy](#) on page 741.
The page refreshes to display all matching rules.
5. Select the rule or rules where you want to set SNMP alerts:
 - To select a specific rule, select the check box next to the rule.
 - To select all the rules in the current list, select the check box at the top of the column.

6. Select **Alerting > Add SNMP Alert**.

The system adds the alert and displays an alert icon () next to the rule in the Alerting column. If you add multiple alert types to a rule, a number over the icon indicates the number of alert types.

TIP! To remove an SNMP alert from a rule, click the check box next to the rule and select **Alerting > Remove SNMP Alerts**.

7. Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Adding Rule Comments

LICENSE: Protection

You can add comments to a rule. Any comments you add can be seen in the Rule Details view on the Rules page.

After you commit the intrusion policy changes containing the comment, you can also view the comment by clicking **Rule Comment** on the rule Edit page. For more information on editing rules, see [Modifying Existing Rules](#) on page 1184.

To add a comment to a rule:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.

2. Click the edit icon (✎) next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

3. Click **Manage Rules** in the Policy Information page.

The Rules page appears.

4. Locate the rule or rules where you want to add a comment to a rule. You have the following options:

- To sort the current display, click on a column heading or icon. To reverse the sort, click again.
- Construct a filter by clicking on keywords or arguments in the filter panel on the left. For more information, see the following topics: [Understanding Rule Filtering in an Intrusion Policy](#) on page 730 and [Setting a Rule Filter in an Intrusion Policy](#) on page 741.

The page refreshes to display all matching rules.

5. Select the rule or rules where you want to add a comment to a rule:

- To select a specific rule, select the check box next to the rule.
- To select all the rules in the current list, select the check box at the top of the column.

6. Select **Comments > Add Rule Comment**.

The Add Comment dialog box appears.

7. Type the rule comment.

8. Click **OK**.

The system adds the comment and displays a comment icon () next to the rule in the Comments column. If you add multiple comments to a rule, a number over the icon indicates the number of comments.

TIP! To delete a rule comment, highlight the rule and click **Show Details**. Click **Delete** in the rule comments section. Note that you can only delete a comment if the comment is cached with uncommitted intrusion policy changes. After intrusion policy changes are committed the rule comment is permanent.

9. Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Managing FireSIGHT Rule State Recommendations

LICENSE: FireSIGHT + Protection

You can use the FireSIGHT Recommended Rules feature to associate the operating systems, servers, and client application protocols detected on your network (see [Introduction to Network Discovery](#) on page 1250) with rules written to protect those assets.

When you configure the FireSIGHT Recommended Rules feature, the system searches your base policy for rules that protect against vulnerabilities associated with your network assets, and identifies the current state of rules in your base policy. The system then recommends rule states and, optionally, sets the rules to the recommended states using the criteria in the following table.

FireSIGHT Rule State Recommendations Based on Vulnerabilities

BASE POLICY RULE STATE	RULE PROTECTS YOUR DISCOVERED ASSETS?	RECOMMEND RULE STATE
Generate Events or Disable	yes	Generate Events
Drop and Generate Events	yes	Drop and Generate Events
any	no	Disable

The Sourcefire Vulnerability Research Team (VRT) determines the appropriate state of each rule in the default policies provided by Sourcefire. Thus, when your base policy is a default policy provided by Sourcefire, the net effect of allowing the system to set your rules to the FireSIGHT recommended rule states is that

the rules in your intrusion policy match the settings recommended by Sourcefire for your network assets. See [Using Default Intrusion Policies](#) on page 692 for more information.

Generating rule state recommendations can be as simple as choosing whether to use the recommended rule states, either when you generate recommendations or at a later time. Advanced recommendations options allow you to tailor your configuration.

Note that while the system typically recommends rule state changes for standard text rules and shared object rules, changes can also be recommended for preprocessor and decoder rules.

You can schedule a task to generate recommendations automatically based on the most recently saved configuration settings in your intrusion policy. For information on scheduling a task to generate recommended rule states, see [Automating FireSIGHT Recommendations](#) on page 1943.

See the following sections for more information:

- [Understanding Basic Rule State Recommendations](#)
- [Understanding Advanced Rule State Recommendations](#)
- [Using FireSIGHT Recommendations](#)

Understanding Basic Rule State Recommendations

LICENSE: Protection + FireSIGHT

You can generate recommendations without using the recommended rule states in your policy. You can then display any of three filtered views of the Rules page to show rules that the system recommends you set to Generate Events, Drop and Generate Events, or Disable. This allows you to see beforehand which rules would be modified when you elect to use the recommended rule states. You can also choose to generate recommendations and immediately use them.

While displaying the recommendation-filtered Rules page, or after accessing the Rules page directly from the navigation panel or the Policy Information page, you can manually set rule states, sort rules, and take any of the other actions available on the Rules page such as suppressing rules, setting rule thresholds, and so on. See [Setting Rule States](#) on page 743 for information on manually changing the state of selected rules. See [Managing Rules in an Intrusion Policy](#) on page 717 for information on other actions available on the Rules page for tailoring the rules in your intrusion policy.

The system will not change rule states that you set manually. When you elect to use the recommended rule states while generating recommendations:

- manually setting the states of specified rules before you generate recommendations prevents the system from modifying the states of those rules in the future
- manually setting the states of specified rules after you generate recommendations overrides the recommended states of those rules

TIP! You can include a list in the intrusion policy report of rules whose rule state differs from the recommended state. See [Viewing an Intrusion Policy Report](#) on page 682 for more information.

Note that choosing to use recommended rule states adds a read-only FireSIGHT Recommendations layer to your intrusion policy, and subsequently choosing not to use recommended rule states removes the layer. See [Using Layers in an Intrusion Policy](#) on page 792 for information on using policy layers to more efficiently manage multiple intrusion policies.

Note also that when you generate recommendations without changing the advanced settings for FireSIGHT recommended rules, the system recommends rule state changes for hosts identified by the \$HOME_NET variable. Also by default, the system generates recommendations only for rules with low or medium overhead, and generates recommendations to disable rules. See [Understanding Advanced Rule State Recommendations](#) on page 766 for more information.

Understanding Advanced Rule State Recommendations

LICENSE: Protection or Protection + FireSIGHT

Advanced settings allow you to redefine which hosts on your network the system monitors for vulnerabilities, to influence which rules the system recommends based on rule overhead, and to specify whether to generate recommendations to disable rules.

If you want to dynamically adapt active rule processing for specific packets based on host information, you can also enable adaptive profiles. For more information, see [Adaptive Profiles and FireSIGHT Recommended Rules](#) on page 1005.

See the following sections for more information:

- [Understanding the Network to Examine](#) on page 766
- [Understanding Rule Overhead](#) on page 767

Understanding the Network to Examine

LICENSE: Protection + FireSIGHT

You configure the FireSIGHT Recommended Rules feature by identifying a network in the network map to examine. The system then recommends the rules

you can activate to protect your network. For information on the network map, see [Using the Network Map](#) on page 1314.

You can specify the network to examine for FireSIGHT recommendations using the following methods, separately or combined:

- by using the value defined for the \$HOME_NET variable in your intrusion policy
Note that the value of **any** is used if you do not explicitly set a policy-specific value. See [Managing Variables](#) on page 698 and [Understanding Existing Variables](#) on page 699 for more information.
- by specifying hosts to examine for FireSIGHT recommendations on your network
- by creating a policy-specific value for the \$HOME_NET variable
Note that a policy-specific \$HOME_NET value is used regardless of whether you specify the hosts to examine.

Lists of addresses within the \$HOME_NET variable and within hosts that you specify are linked with an **OR** operation except for negations, which are linked with an **AND** operation after all **OR** operations are calculated. When you combine the two addressing methods, the \$HOME_NET variable and the additional hosts you specify are also linked with an **OR** operation.

Understanding Rule Overhead

LICENSE: Protection

Sourcefire rates the overhead of each intrusion rule as none, low, medium, high, or very high based on the rule's potential impact on system performance and the likelihood that the rule might generate false positives. You can view the overhead rating for a rule in the rule detail view on the Rules page. See [Viewing Rule Details](#) on page 723 for more information.

You can set the system to make rule state recommendations based on all rules up to and including a specified overhead rating, except for very high. You must manually set the rule state for any rule with a very high overhead rating. For example, when you generate recommendations for rules with medium overhead, the system makes recommendations based on all rules with an overhead rating of none, low, or medium, and does not make any recommendations for rules with high or very high overhead.

Note that the system factors rule overhead into recommendations to generate events or to drop and generate events. The system does not factor rule overhead into recommendations to disable rules. Note also that local rules do not have any overhead, unless they are mapped to a third-party vulnerability. See [Importing Local Rule Files](#) on page 2080 and [Managing Third-Party Product Mappings](#) on page 1682 for more information.

Generating recommendations for rules with the overhead rating at a particular setting does not preclude you from generating recommendations with different overhead and then generating recommendations again for the original overhead

setting. You will get the same rule state recommendations for each overhead setting each time you generate recommendations for the same rule set, regardless of the number of times you generate recommendations or with how many different overhead settings you generate. For example, you can generate recommendations with overhead set to medium, then to high, then to very high, and then to medium again and, if the hosts and applications on your network have not changed, both sets of recommendations with overhead set to medium will be the same for that rule set.

Using FireSIGHT Recommendations

LICENSE: FireSIGHT + Protection

You can generate recommendations with or without using the recommended rule states, and with or without modifying the advanced settings for generating recommendations. See [Understanding Basic Rule State Recommendations](#) on page 765 and [Understanding Advanced Rule State Recommendations](#) on page 766 for more information.

After generating recommendations, you can use the recommended rule states; you can also view recommended states and use any features available on the Rules page.

To use FireSIGHT rule state recommendations:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

2. Click the edit icon () next to the policy you want to edit.

If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

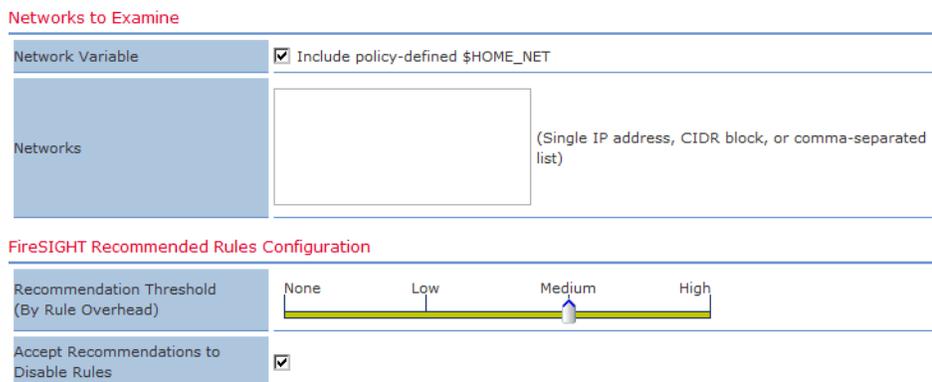

- You have two options:
 - If you have not generated recommendations, click **No recommendations have been generated. Click here to set up FireSIGHT recommendations.**
 - If you have generated recommendations, select **Click to change recommendations.**

The FireSIGHT Recommended Rules Configuration page appears.

- You have the following choices:
 - To have the corresponding intrusion policy report list the rule message, recommended state, and actual state for all rules whose actual state differs from the recommended state, select **Include all differences between recommendations and rule states in policy reports.** See [Viewing an Intrusion Policy Report](#) on page 682 for more information.
 - To generate recommendations using the default settings, go to step 9.
 - To modify the advanced recommendations options, go to step 5.
- Click the plus icon (**+**) to expand the Advanced Settings section.

The advanced FireSIGHT recommendations options appear.

6. You have three choices:
 - To specify the network to examine for FireSIGHT recommendations using the value of the `$HOME_NET` variable, ensure that the **Network Variable** check box is selected. See [Managing Variables](#) on page 698 for more information.

Note that this option is selected by default. When not selected, a default value of `any` is used. See [Modifying Variables](#) on page 701 for information on configuring the value of `$HOME_NET`.

- To manually specify the network to examine for recommendations, clear the **Network Variable** check box and identify the host addresses to examine for recommendations in the **Networks** field.

For information on using IP address notation in the Sourcefire 3D System, see [IP Address Conventions](#) on page 57.

- To specify the network to examine using both the `$HOME_NET` variable and additional hosts you specify, ensure that the **Network Variable** check box is selected and, in the **Networks** field, identify additional hosts to examine for recommendations.

Note that lists of addresses and combined configurations of the `$HOME_NET` variable and **Networks** are linked with an **OR** operation except for negations, which are linked with an **AND** operation after all **OR** operations are calculated. See [Understanding the Network to Examine](#) on page 766 for more information.

7. Optionally, drag the **Recommendation Threshold (By Rule Overhead)** slide bar to specify the amount of overhead a rule must have to be included in the recommendations you generate.

Dragging the slide bar to the right includes rules with higher overhead and will likely result in more recommendations, but could increasingly affect system performance. See [Understanding Rule Overhead](#) on page 767 for more information.

8. You have the following options:
 - To generate recommendations to disable rules, select the **Accept Recommendations to Disable Rules** check box.

Note that accepting recommendations to disable rules restricts your rule coverage.

- To prevent generating recommendations to disable rules, clear the **Accept Recommendations to Disable Rules** check box.

Note that omitting recommendations to disable rules augments your rule coverage.

9. You have several options:
- Click **Generate and Use Recommendations** if you have not yet generated recommendations and want the system to change your rule states automatically to the recommended states while generating recommendations.
The system generates recommended rule state changes and automatically sets rules to the recommended states.
 - Click **Generate Recommendations** if you want the system to generate recommendations without changing your rule states automatically to the recommended states.
The system generates recommended rule state changes.
 - Click **Update Recommendations** to update existing recommendations.
The system generates recommended rule state changes and, if recommendations are in use, automatically sets rules to the recommended states. The status updates for the number of recommendations, the number of hosts with recommended rule state changes, and the number of recommendations to generate events, drop and generate events, or disable rules.
 - Click **Use Recommendations** to use recommendations that you have generated but have not used.
The system automatically sets rules to the recommended states.
 - Click **Do Not Use Recommendations** to stop using recommendations currently in use.
The system automatically resets rules to the default rule states unless a specific rule state was applied to the rule before using recommendations; in that case, the rule reverts to the specific rule state.

Note that the system does not recommend a rule state for an intrusion rule that is based on a vulnerability that you disable using the Impact Qualification feature. For more information, see [Setting the Vulnerability Impact Qualification](#) on page 1367.

Note also that updating the policy to use or not use recommendations may take several minutes, depending on the size of your network and rule set.

IMPORTANT! The system always recommends that you enable a local rule associated with a third-party vulnerability mapped to a host. The system does not make state recommendations for unmapped local rules. For more information, see [Managing Third-Party Product Mappings](#) on page 1682.

10. Optionally, click **View** next to a recommendation type to display a recommendations-filtered view of the Rules page for the type of recommendation you selected.

11. Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

CHAPTER 21

USING ADVANCED SETTINGS IN AN INTRUSION POLICY

Advanced settings are preprocessor and other intrusion policy detection and performance configurations that require specific expertise to configure. Advanced settings typically require little or no modification and are not common to every deployment.

You can enable, disable, and modify the configuration of advanced settings. The base policy for your intrusion policy determines which advanced settings are enabled by default and the default configuration for each. See [Understanding the Base Policy](#) on page 691 for more information.

Some advanced settings must be enabled for certain standard text rules, shared object rules, and preprocessor rules to function correctly. When you save an intrusion policy with a required advanced setting that is disabled, you are prompted whether you want the system to automatically enable the required advanced setting.

The web interface identifies some advanced configuration options as troubleshooting options that you should use only with the assistance of Sourcefire Support.

See the following sections for more information:

- [Modifying Advanced Settings](#) on page 774 explains how to access configuration pages for advanced settings and lists the advanced settings that you can enable, disable, and configure in an intrusion policy.
- [Understanding preprocessors](#) on page 780 explains how preprocessors normalize traffic for use by the rules engine.
- [Automatically Enabling Advanced Settings](#) on page 787 explains how you can automatically enable preprocessors and other advanced settings that are required by enabled rules or rule options.

- [Understanding Troubleshooting Options](#) on page 790 explains troubleshooting options that you should set only when asked to do so by Sourcefire Support.
- [Using Layers in an Intrusion Policy](#) on page 792 explains how you can more efficiently manage multiple intrusion policies in a complex network by adding intrusion policy layers comprised of individual configurations for rule attributes and advanced settings.

Modifying Advanced Settings

LICENSE: Protection

When you select **Advanced Settings** in the navigation panel, you go to the Advanced Settings page, where advanced settings are listed by type. On this page you can enable or disable advanced settings in your intrusion policy and access advanced setting configuration pages.

An advanced setting must be enabled for you to configure it. Your configuration is retained if you configure an advanced setting and then disable it. When you enable an advanced setting, a sublink to the configuration page for the advanced setting appears beneath the **Advanced Settings** link in the navigation panel, and an **Edit** link to the configuration page appears next to the advanced setting on the Advanced Settings page. When you disable an advanced setting, the advanced setting sublink and **Edit** link no longer appear.

TIP! You cannot disable the Performance Statistics Configuration advanced setting. This ensures that Sourcefire Support can troubleshoot your system.

Modifying the configuration of an advanced setting requires an understanding of the configuration you are modifying and its potential impact on your network. The following sections provide links to specific configuration details for each advanced setting.

Application Layer Preprocessors

Application-layer protocol decoders normalize specific types of packet data into formats that the rules engine can analyze. See [Using Application Layer Preprocessors](#) on page 809 for more information.

Application Layer Preprocessor Settings

FOR INFORMATION ON...	SEE...
DCE/RPC Configuration	Configuring the DCE/RPC Preprocessor on page 821
DNS Configuration	Configuring the DNS Preprocessor on page 830
FTP and Telnet Configuration	Decoding FTP and Telnet Traffic on page 832
HTTP Configuration	Decoding HTTP Traffic on page 850
Sun RPC Configuration	Configuring the Sun RPC Preprocessor on page 870
SIP Configuration	Configuring the SIP Preprocessor on page 875
GTP Command Channel Configuration	Configuring the GTP Command Channel on page 878
IMAP Configuration	Configuring the IMAP Preprocessor on page 882
POP Configuration	Configuring the POP Preprocessor on page 887
SMTP Configuration	Configuring SMTP Decoding on page 895
SSH Configuration	Selecting SSH Preprocessor Options on page 901
SSL Configuration	Configuring the SSL Preprocessor on page 907

SCADA Preprocessors

The Modbus and DNP3 preprocessors detect traffic anomalies and provide data to the rules engine for inspection.

SCADA Preprocessor Settings

FOR INFORMATION ON...	SEE...
Modbus Configuration	Configuring the Modbus Preprocessor on page 909
DNP3 Configuration	Configuring the DNP3 Preprocessor on page 911

Transport/Network Layer Preprocessors

Network and transport layers preprocessors detect exploits at the network and transport layers. Before packets are sent to preprocessors, the packet decoder converts packet headers and payloads into a format that can be easily used by the preprocessors and the rules engine; it also detects various anomalous behaviors in packet headers.

Transport and Network Layer Preprocessor Settings

FOR INFORMATION ON...	SEE...
Checksum Verification	Verifying Checksums on page 915
Detection Settings	Ignoring VLAN Headers on page 917
Inline Normalization	Normalizing Inline Traffic on page 918
IP Defragmentation	Configuring IP Defragmentation on page 932
Packet Decoding	Configuring Packet Decoding on page 938
TCP Stream Configuration	Configuring TCP Stream Preprocessing on page 952
UDP Stream Configuration	Configuring UDP Stream Preprocessing on page 957

Specific Threat Detection

The Back Orifice preprocessor analyzes UDP traffic for the Back Orifice magic cookie. The portscan detector can be configured to report scan activity. Rate-based attack prevention can help you protect your network against SYN floods and an extreme number of simultaneous connections designed to overwhelm your network. The sensitive data preprocessor detects sensitive data such as credit card numbers and Social Security numbers in ASCII text.

Specific Threat Detection Settings

FOR INFORMATION ON...	SEE...
Back Orifice Detection	Detecting Back Orifice on page 959
Portscan Detection	Configuring Portscan Detection on page 965
Rate-Based Attack Prevention	Configuring Rate-Based Attack Prevention on page 981
Sensitive Data Detection	Configuring Sensitive Data Detection on page 989

Detection Enhancement

With adaptive profiles, the system can adapt to network traffic by associating traffic with host information from the network map and then processing the traffic accordingly.

Detection Enhancement Settings

FOR INFORMATION ON...	SEE...
Adaptive Profiles	Configuring Adaptive Profiles on page 1006

Intrusion Rule Thresholds

Global rule thresholding can prevent your system from being overwhelmed with a large number of events by allowing you to use thresholds to limit the number of times the system logs and displays intrusion events.

Intrusion Rule Threshold Settings

FOR INFORMATION ON...	SEE...
Global Rule Thresholding	Configuring Global Thresholds on page 1012

Performance Settings

The system provides server settings for improving system performance.

Performance Settings

FOR INFORMATION ON...	SEE...
Event Queue Configuration	Event Queue Configuration on page 1016
Latency-Based Packet Handling	Configuring Packet Latency Thresholding on page 1020
Latency-Based Rule Handling	Configuring Rule Latency Thresholding on page 1025
Performance Statistics Configuration	Performance Statistics Configuration on page 1026
Regular Expression Limits	Constraining Regular Expressions on page 1028
Rule Processing Configuration	Rule Processing Configuration on page 1030

External Responses

In addition to the various views of intrusion events within the web interface, you can enable logging to syslog facilities or send event data to an SNMP trap server. You can specify intrusion event notification limits, set up intrusion event

notification to external logging facilities, and configure external responses to intrusion events.

External Response Settings

FOR INFORMATION ON...	SEE...
SNMP Alerting	Configuring SNMP Responses on page 1037
Syslog Alerting	Configuring Syslog Responses on page 1040

To modify advanced settings:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon (✎) next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. To select the advanced setting you want to modify, click **Advanced Settings** in the navigation panel on the left, enable the configuration if it is disabled, then click **Edit**.
The configuration page appears. You can modify any of the configuration options for the advanced setting you selected.
To access the configuration page for an advanced setting that is enabled, you can also expand **Advanced Settings** in the navigation panel on the left, then click the name of the advanced setting.

TIP! You cannot disable the Performance Statistics Configuration advanced setting. This ensures that Sourcefire Support can troubleshoot your system.

4. Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Understanding Preprocessors

LICENSE: Protection

Preprocessors reformat traffic to make sure the rules engine reads the traffic in the same format it will be received by the host. Without preprocessing, the system cannot appropriately evaluate traffic because protocol differences make pattern matching impossible. Sourcefire preprocessors normalize traffic and help identify network layer and transport layer protocol anomalies by identifying inappropriate header options, defragmenting IP datagrams, providing TCP stateful inspection and stream reassembly, providing UDP stream preprocessing, resolving application protocol command syntax, and validating checksums.

You can configure these preprocessors to ensure that the packets the system analyzes resemble, as closely as possible, the packets processed by the hosts on your network. Each preprocessor has a variety of options and settings that you can configure to meet the needs of your network environment, allowing you to minimize both false positives and false negatives and to optimize performance by executing only those preprocessors appropriate to your network traffic.

In general, as intrusion detection and prevention systems become important components in securing networks, the systems themselves become targets for attackers. For example, attackers sometimes attempt to purposefully create denial of service attacks by sending SYN packets with spoofed source IP addresses, causing the recipient server to allocate memory for the pending TCP connection. The server then sends a SYN-ACK to the originating IP address to establish a TCP session. Because attackers do not use legitimate IP addresses, the SYN-ACK message times out and the server resends it, keeping memory allocated for a longer period of time. These half-open TCP connections drain system resources. Because most systems attempt to perform stateful inspection on TCP sessions, the system may go into a denial-of-service condition while attempting to establish the state of these open TCP sessions. However, the transport layer preprocessor, included as part of the system, detects the state of a TCP connection, and can dispense with half-open connections and prevent overloading the rules engine with false connections.

Preprocessor options can protect you from attacks against the managed device itself, ensuring higher availability and better security for your network. Many preprocessor options are associated with preprocessor rules that you can enable to generate events when triggered. If you deploy your Sourcefire 3D System inline, you can set the rule state for preprocessor rules in your inline intrusion policy to drop malicious packets. For more information on configuring rules to generate events and, in an inline deployment, to drop packets, see [Setting Rule States](#) on page 743.

You can configure rule state, thresholding, suppression, rate-based rule state, alerting, and rule comments for preprocessor rules. Preprocessor rules are listed by preprocessor in the Preprocessors filter group on the intrusion policy Rules page, and also in the preprocessor and packet decoder sub-groupings in the Category filter group. You must set the rule state of preprocessor and decoder rules to Generate Events or, optionally, to Drop and Generate events in an inline

deployment, if you want the preprocessor or packet decoder to log intrusion events. Note that a status message appears at the bottom of the Policy Information page when you enable preprocessor rules and your policy contains unsaved changes. See [Editing an Intrusion Policy](#) on page 675, [Managing Rules in an Intrusion Policy](#) on page 717, and [Setting Rule States](#) on page 743 for more information.

In addition to preprocessors, the system also provides advanced settings for detecting anomalous traffic, enhancing detection, applying a global rule threshold, tuning performance, and configuring external SNMP, and syslog alerting.

See the following sections for more information:

- [Meeting Traffic Challenges with Preprocessors](#) on page 781 describes both normal traffic and the inspection challenges experienced at the network layer, transport layer, and application layer.
- [Understanding Preprocessor Execution Order](#) on page 782 explains the order of execution in Sourcefire 3D System preprocessors.
- [Reading Preprocessor Events](#) on page 784 describes preprocessor events and the information they contain.

Meeting Traffic Challenges with Preprocessors

LICENSE: Protection

The system is responsible for inspecting the traffic that traverses the segment of your network that you want to monitor. Although this seems straightforward, variations in the way data is represented and the characteristics inherent in the way data is transmitted can make the inspection of any traffic more complex. The Sourcefire 3D System mitigates the challenges inherent in normal traffic, as well as those inherent in packets designed to cause damage or to evade inspection.

Each layer of TCP/IP provides challenges:

- Network and Link Layers
Normal traffic at the network layer can be fragmented. That is, IP datagrams can exceed the maximum transmission unit and must be transported in smaller fragments. IP Datagrams that are fragmented must be reconstructed before meaningful attack analysis can occur. Additionally, attackers can use malicious IP fragmentation, including overlapping fragments, multiple zero-offset fragments (the Jolt2 denial of service, or DoS, attack), and fragmented protocol headers, all of which mask traffic you might not normally allow on your network. Additionally, the network layer can be attacked by crafting packets with invalid, zero-length IP options, used to cause DoS attacks.
- Transport Layer
The transport layer is subject to TCP stream-based attacks, such as sending TCP packets with overlapping sequence numbers to force the system to determine which sequence number is valid. The transport layer can be open to TCP header option attacks such as spoofing a TCP packet and changing

header values to choke the TCP connection and propagate further attacks. Additionally, TCP is subject to state-related attacks such as those produced by stick or snot, which generate TCP packets that are not part of an established connection and which can trigger a large volume of rules, creating a DoS attack against both the system and the analyst. Attackers can also launch subterfuge attacks by transmitting TCP, UDP and ICMP packets with invalid checksums in an attempt to cause the system to inspect packets that the destination host never receives. Reassembling TCP sessions provides context for each packet, supporting effective analysis of traffic.

Additionally, tracking associated UDP user datagrams allows the system greater specificity in detecting attacks.

- Application Layer

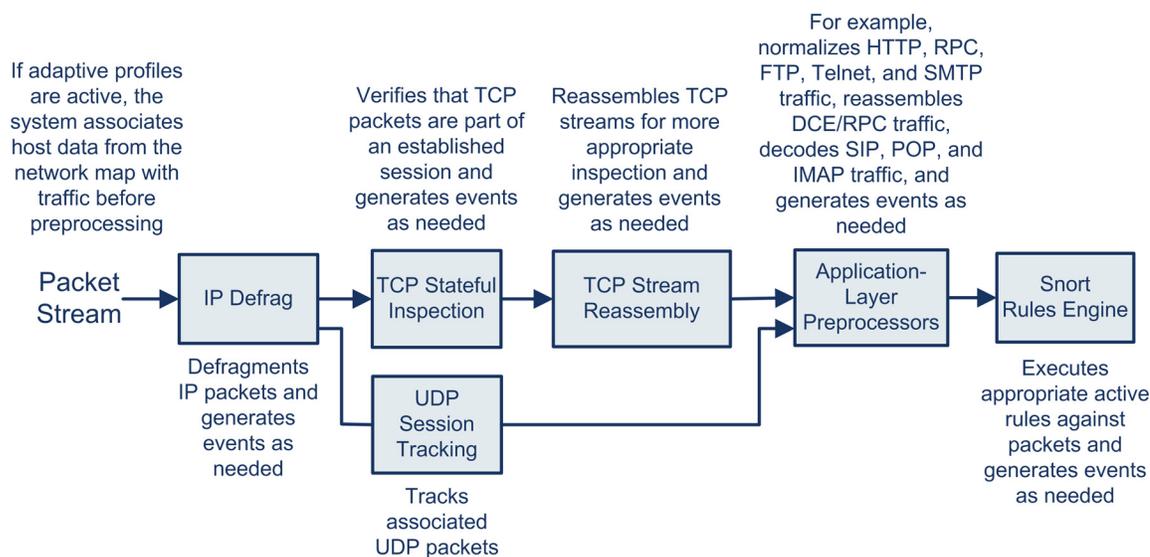

Application layer protocols like HTTP, Telnet, FTP, SMTP, and RPC may have multiple ways of representing the same data. This causes rules designed to check for specific packet payload content to fail because the payload is represented differently in a packet than in the rule. Decoding HTTP, Telnet, FTP, SMTP, and RPC packets and then normalizing their data to a standard representation mitigates this challenge.

Understanding Preprocessor Execution Order

LICENSE: Protection

Protocol decoders, preprocessors, and rules run in a specific order so that they can perform IP transfer layer protocol decoding first, then perform data normalization if needed, and then evaluate the resulting packets against the currently enabled rules. The default policy configuration sets the preprocessors to

perform IP transfer layer protocol decoding first, then perform data normalization as needed.

This approach provides the following benefits:

- The system can generate an intrusion event against fragmented IP datagrams that cannot be defragmented, and then stop inspecting those packets.
- The system can generate an event against TCP packets whose state cannot be validated, and then stop inspecting those packets.
- The system can generate events against related UDP packets.
- Only packets that can be appropriately tested by rules are normalized, optimizing performance by ignoring TCP packets that cannot be reassembled and are not part of a valid TCP session.
- The system can adapt IP defragmentation and stream preprocessing behavior to fit the operating system formats on the target host using adaptive profiles, target-based policies, or both adaptive profiles and target-based policies.
- After preprocessing, traffic can be analyzed by the rules engine in the same way that it is analyzed by the receiving host.

WARNING! Preprocessors are executed based on your configuration. If you change the default configuration, the system will not execute the preprocessors you disabled. If, for example, you disable transport layer protocol preprocessors, the system runs content rules against packets that may have been logged and removed from inspection by transport layer protocol preprocessors had they inspected the packets. Note this does not change the order of execution.

Reading Preprocessor Events

LICENSE: Protection

Preprocessors provide two functions: performing the specified action on the packet (for example, decoding and normalizing HTTP traffic) and reporting the execution of specified preprocessor options by generating an event whenever a packet triggers that preprocessor option and the associated preprocessor rule is enabled (for example, you can enable the **double Encoding** HTTP Inspect option and the associated preprocessor rule with the HTTP Inspect generator (GID) 119 and the Snort ID (SID) 2 to generate an event when the preprocessor encounters IIS double-encoded traffic). Generating events to report the execution of preprocessors helps you detect anomalous protocol exploits. For example, attackers can craft overlapping IP fragments to cause a DoS attack on a host. The IP defragmentation preprocessor can detect this type of attack and generate an intrusion event for it.

See the following sections for more information:

- [Understanding the Preprocessor Event Packet Display](#) on page 784 describes the information contained in a preprocessor-generated event.
- [Reading Preprocessor Generator IDs](#) on page 784 details the information provided by the preprocessor generator ID.

Understanding the Preprocessor Event Packet Display

LICENSE: Protection

Preprocessor events differ from rule events in that the packet display does not include a detailed rule description for the event. Instead, the packet display shows the event message, the generator ID, Snort ID, the packet header data, and the packet payload. This allows you to analyze the packet's header information, determine if its header options are being used and if they can exploit your system, and inspect the packet payload. After the preprocessors analyze each packet, the rules engine executes appropriate rules against it (if the preprocessor was able to defragment it and establish it as part of a valid session) to further analyze potential content-level threats and report on them.

Reading Preprocessor Generator IDs

LICENSE: Protection

Each preprocessor has its own Generator ID number, or GID, that indicates which preprocessor was triggered by the packet. Some of the preprocessors also have related SIDs, which are ID numbers that classify potential attacks. This helps you analyze events more effectively by categorizing the type of event much the way a rule's Snort ID (SID) can offer context for packets triggering rules. You can list preprocessor rules by preprocessor in the Preprocessors filter group on the intrusion policy Rules page; you can also list preprocessor rules in the preprocessor and packet decoder sub-groupings in the Category filter group. See [Managing Rules in an Intrusion Policy](#) on page 717 and the [Rule Types table](#) on

page 719 for more information.

IMPORTANT! Events generated by standard text rules have a generator ID of 1. The event's SID indicates which specific rule triggered. For shared object rules, the events have a generator ID of 3 and a SID that indicates which specific rule was triggered.

The [Generator IDs](#) table describes the types of events that generate each GID.

Generator IDs

ID	COMPONENT	DESCRIPTION
1	Standard Text Rule	The event was generated when the packet triggered a standard text rule. See the Rule Types table on page 719 for more information.
2	Tagged Packets	The event was generated by the Tag generator, which generates packets from a tagged session. This occurs when the <code>tag</code> rule option is used. For more information, see Evaluating Post-Attack Traffic on page 1166.
3	Shared Object Rule	The event was generated when the packet triggered a shared object rule. See the Rule Types table on page 719 for more information.
102	HTTP Decoder	The decoder engine decoded HTTP data within the packet.
105	Back Orifice Detector	The Back Orifice Detector identified a Back Orifice attack associated with the packet. See Detecting Back Orifice on page 959 for more information.
106	RPC Decoder	The RPC decoder decoded the packet. See Using the Sun RPC Preprocessor on page 869 for more information.
116	Packet Decoder	The event was generated by the packet decoder. See Understanding Packet Decoding on page 934 for more information.
119, 120	HTTP Inspect Preprocessor	The event was generated by the HTTP Inspect preprocessor. GID 120 rules relate to server-specific HTTP traffic. See Decoding HTTP Traffic on page 850 for more information.
122	Portscan Detector	The event was generated by the portscan flow detector. See Detecting Portscans on page 961 for more information.
123	IP Defragmentor	The event was generated when a fragmented IP datagram could not be properly reassembled. See Defragmenting IP Packets on page 927 for more information.

Generator IDs (Continued)

ID	COMPONENT	DESCRIPTION
124	SMTP Decoder	The event was generated when the SMTP preprocessor detected an exploit against an SMTP verb. See Understanding SMTP Decoding on page 890 for more information.
125	FTP Decoder	The event was generated when the FTP/Telnet decoder detected an exploit within FTP traffic. See Understanding Server-Level FTP Options on page 838 and Understanding Client-Level FTP Options on page 846 for more information.
126	Telnet Decoder	The event was generated when the FTP/Telnet decoder detected an exploit within telnet traffic. See Decoding FTP and Telnet Traffic on page 832 for more information.
128	SSH Preprocessor	The event was generated when the SSH preprocessor detected an exploit within SSH traffic. See Detecting Exploits Using the SSH Preprocessor on page 899 for more information.
129	Stream Preprocessor	The event was generated during stream preprocessing by the stream preprocessor. See Using TCP Stream Preprocessing on page 940 for more information.
131	DNS Preprocessor	The event was generated by the DNS preprocessor. See Detecting Exploits in DNS Name Server Responses on page 827 for more information.
133	DCE/RPC Preprocessor	The event was generated by the DCE/RPC preprocessor. See Decoding DCE/RPC Traffic on page 810 for more information.
134	Rule Latency, Packet Latency	The event was generated when rule latency suspended (134:1) or re-enabled (134:2) a group of intrusion rules, or when the system stopped inspecting a packet because the packet latency threshold was exceeded (134:3). For more information, see Understanding Packet Latency Thresholding on page 1017, Understanding Troubleshooting Options on page 790, and Understanding Rule Latency Thresholding on page 1021.
135	Rate-Based Attack Detector	The event was generated when a rate-based attack detector identified excessive connections to hosts on the network. See Preventing Rate-Based Attacks on page 971 for more information.
138, 139	Sensitive Data Preprocessor	The event was generated by the sensitive data preprocessor. See Detecting Sensitive Data on page 983 for more information.
140	SIP Preprocessor	The event was generated by the SIP preprocessor. See Decoding the Session Initiation Protocol on page 872 for more information.
141	IMAP Preprocessor	The event was generated by the IMAP preprocessor. See Decoding IMAP Traffic on page 880 for more information.

Generator IDs (Continued)

ID	COMPONENT	DESCRIPTION
142	POP Preprocessor	The event was generated by the POP preprocessor. See Decoding POP Traffic on page 884 for more information.
143	GTP Preprocessor	The event was generated by the GTP preprocessor. See Configuring the GTP Command Channel on page 878 for more information.
144	Modbus Preprocessor	The event was generated by the Modbus SCADA preprocessor. See Configuring the Modbus Preprocessor on page 909 for more information.
145	DNP3 Preprocessor	The event was generated by the DNP3 SCADA preprocessor. See Configuring the DNP3 Preprocessor on page 911 for more information.

Automatically Enabling Advanced Settings

LICENSE: Protection

The system can enable advanced settings when they are required by a standard text rule, shared object rule, preprocessor rule, or another advanced setting. When you save an intrusion policy with a disabled advanced setting that is required by a rule, rule option, or other advanced setting, you are prompted whether you want the system to automatically enable the required advanced setting. Before you can save the policy, you must either manually enable the required advanced setting configuration, allow the system to automatically enable the required advanced setting, or disable any rule or other advanced setting that requires the advanced setting.

Note that the system uses the default configuration for an automatically enabled advanced setting that you have not configured.

The [Automatically Enabled Advanced Settings](#) table lists the rules and rule options required by different advanced settings.

Automatically Enabled Advanced Settings

ADVANCED SETTING TYPE	ADVANCED SETTING	RULE AND RULE OPTIONS CAUSING AUTO-ENABLE PROMPT
Application Layer Preprocessors	DCE/RPC Configuration	Keyword: <ul style="list-style-type: none"> byte_jump (if DCE/RPC option is enabled) byte_test (if DCE/RPC option is enabled) byte_extract (if DCE/RPC option is enabled) dce_iface dce_opnum dce_stub_data
Application Layer Preprocessors	HTTP Configuration	Keyword: <ul style="list-style-type: none"> content (if an HTTP content option is enabled) urilen http_encode pcre (if the P, I, C, K, Y, M, U, S, H, or D option is used in the rule)
Application Layer Preprocessors	SIP Configuration	Keyword: <ul style="list-style-type: none"> sip_header sip_body sip_method sip_status_code
Application Layer Preprocessors	GTP Command Channel Configuration	Keyword: <ul style="list-style-type: none"> gtp_version gtp_type gtp_info
Application Layer Preprocessors	SSL Configuration	Keyword: <ul style="list-style-type: none"> ssl_state ssl_version
SCADA Preprocessors	Modbus Configuration	Keyword: <ul style="list-style-type: none"> modbus_data modbus_func modbus_unit
SCADA Preprocessors	DNP3 Configuration	Keyword: <ul style="list-style-type: none"> dnp3_data dnp3_func dnp3_ind dnp3_obj

Automatically Enabled Advanced Settings (Continued)

ADVANCED SETTING TYPE	ADVANCED SETTING	RULE AND RULE OPTIONS CAUSING AUTO-ENABLE PROMPT
Transport/Network Layer Preprocessors	TCP or UDP Stream Configuration	Keyword: <ul style="list-style-type: none"> • flow • flowbits • stream_size
Transport/Network Layer Preprocessors	TCP Stream Configuration	Keyword: stream_reassemble
Specific Threat Detection	Sensitive Data Detection	Generator ID: <ul style="list-style-type: none"> • 138 • 139
Performance Settings	Regular Expression Limits	Keyword: pcre

When you enable a preprocessor that requires stream preprocessing, you are prompted when you save the policy whether to enable stream preprocessing for the appropriate protocol if stream preprocessing is disabled.

You are prompted whether to enable TCP stream preprocessing when it is disabled and you enable the following preprocessors:

- the DCE/RPC preprocessor when the RPC over HTTP proxy, RPC over HTTP server, TCP, or SMB transport protocol is selected
- the DNS preprocessor
- the FTP/Telnet preprocessor
- the HTTP Inspect preprocessor
- the IMAP preprocessor
- the POP preprocessor
- the SMTP preprocessor
- the SSL preprocessor
- the Modbus preprocessor
- the DNP3 preprocessor
- portscan detection when the TCP protocol is selected
- rate-based attack prevention
- sensitive data detection

You are prompted whether to enable UDP stream preprocessing when it is disabled and you enable any of the following preprocessors:

- the DCE/RPC preprocessor with the UDP transport protocol selected
- the SIP preprocessor
- the GTP preprocessor

Understanding Troubleshooting Options

LICENSE: Protection

Sourcefire Support might ask you to modify one or more troubleshooting options during a troubleshooting call. Troubleshooting options appear on the configuration page for the advanced setting to which they are related. Although these options can be used in conjunction with the other options related to the advanced setting, changing the settings for these options will affect performance and should be done only with Support guidance.

The [Troubleshooting Options](#) table describes these troubleshooting options.

Troubleshooting Options

ADVANCED SETTING	OPTION	DESCRIPTION
FTP and Telnet Configuration (Policy)	Log FTP Command Validation Configuration	This FTP/Telnet target-based policy option enables or disables printing of the configuration information for each FTP command listed for the server. See Understanding Server-Level FTP Options on page 838 for more information.
Performance Statistics Configuration (Global)	Log Session/Protocol Distribution	This global performance option logs protocol distribution, packet length, and port statistics. See Performance Statistics Configuration on page 1026 for more information.
Performance Statistics Configuration (Global)	Summary	This global performance option instructs the system to calculate the performance statistics only when the Snort® process is shut down or restarted. Note that this option is only available when the Log Session/Protocol Distribution troubleshooting option is enabled. See Performance Statistics Configuration on page 1026 for more information.

Troubleshooting Options (Continued)

ADVANCED SETTING	OPTION	DESCRIPTION
TCP Stream Configuration (Global)	Session Termination Logging Threshold	<p>This global TCP option logs a message when an individual connection exceeds the specified threshold.</p> <p>A value of 0 turns off the message.</p> <p>The upper limit of 1GB is also restricted by the amount of memory on the managed device allocated for stream processing.</p> <p>See Using TCP Stream Preprocessing on page 940 for more information.</p>
TCP Stream Configuration (Policy)	Maximum Queued Bytes	<p>This TCP target-based policy option specifies the amount of data that can be queued on one side of a TCP connection.</p> <p>A value of 0 specifies an unlimited number of bytes.</p> <p>See Using TCP Stream Preprocessing on page 940 for more information.</p>
TCP Stream Configuration (Policy)	Maximum Queued Segments	<p>This TCP target-based policy option specifies the maximum number of bytes of data segments that can be queued on one side of a TCP connection.</p> <p>A value of 0 specifies an unlimited number of data segment bytes.</p> <p>See Using TCP Stream Preprocessing on page 940 for more information.</p>

CHAPTER 22

USING LAYERS IN AN INTRUSION POLICY

Larger organizations with many managed devices may have many intrusion policies to support the unique needs of different departments, business units or, in some instances, different companies. The rule settings and advanced settings in an intrusion policy are contained in building blocks called policy *layers*, which you can use to more efficiently manage multiple policies.

You can create and edit a policy without consciously using layers. You can modify rule settings and advanced settings and, if you have not added user layers to your policy, the system automatically includes your changes in a single configurable layer. Optionally, you can also add up to 200 layers where you can configure any combination of rule settings and advanced settings. You can copy, merge, move, and delete user layers and, most importantly, share individual user layers with other policies.

See the following sections for more information:

- [Understanding Intrusion Policy Layers](#) on page 792 explains the layers that comprise a basic policy and how you can use them.
- [Configuring User Layers](#) on page 803 explains how you can add, copy, merge, and share user-configurable layers, and how to view and access the configuration pages for rules and advanced settings.

Understanding Intrusion Policy Layers

LICENSE: Protection

A policy where you do not add layers includes the read-only base policy layer and a single user-configurable layer that is initially named My Changes. If you generate and use rule state recommendations based on network discovery data,

the system automatically inserts a read-only FireSIGHT Recommendations layer immediately above the base policy. You can copy, merge, move, or delete any user-configurable layer and set any user-configurable layer to be shared by other intrusion policies; note that the My Changes layer is a user-configurable layer.

Each policy layer contains complete settings for all intrusion rules, preprocessor rules, and advanced settings. The layer at the bottom of the stack includes all the settings from the base policy you selected when you created the policy. A setting in a higher layer in the policy layer stack takes precedence over the same setting in a lower layer. Features not explicitly set in a layer inherit their settings from the next highest layer below where they are explicitly set.

The following figure shows an example intrusion policy layer stack that, in addition to the base policy layer and the initial My Changes layer, also includes two additional user-configurable layers and the FireSIGHT Recommendations layer. Note in the figure that each user-configurable layer that you add is initially positioned as the highest layer in the stack; thus, User Layer 2 in the figure was added last and is highest in the stack.

User Layer 2
User Layer 1
User Layer (My Changes)
FireSIGHT Recommendations Layer
Base Policy Layer

When the highest layer in your policy is a read-only layer, or a shared layer as described in [Sharing Layers](#) on page 794, the system automatically adds a user-configurable layer as the highest layer in your intrusion policy if you do either of the following:

- modify a rule action (that is, a rule state, event filtering, dynamic state, or alerting) from the intrusion policy Rules page. See [Managing Rules in an Intrusion Policy](#) on page 717 for more information.
- enable, disable, or modify an advanced setting. See [Modifying Advanced Settings](#) on page 774 for more information.

All settings in the system-added layer are inherited except for the rule or advanced setting changes that resulted in the new layer.

Note that in the case where the highest layer is a shared layer, the system adds a layer when you have set the highest layer to be shared by other policies or you have added a shared layer to your policy.

When the system applies a policy to traffic, it *flattens* the layers; that is, it applies only one configuration for each option. If you configure, for example, a rule state for the same rule within more than one layer in an intrusion policy, the system applies the setting that is configured at the highest layer.

Note that regardless of whether you allow rule updates to modify your policy, changes in a rule update never override changes you make in a layer. This is because changes in a rule update are made in the base policy, which determines

the defaults in your base policy layer; your changes are made in a higher layer, so they override any changes that a rule update makes to your default policy. See [Importing Rule Updates and Local Rule Files](#) on page 2072 for more information.

TIP! You can create an intrusion policy based solely on the default settings in the base policy and, optionally, using rule state recommendations.

See the following sections for more information on using policy layers:

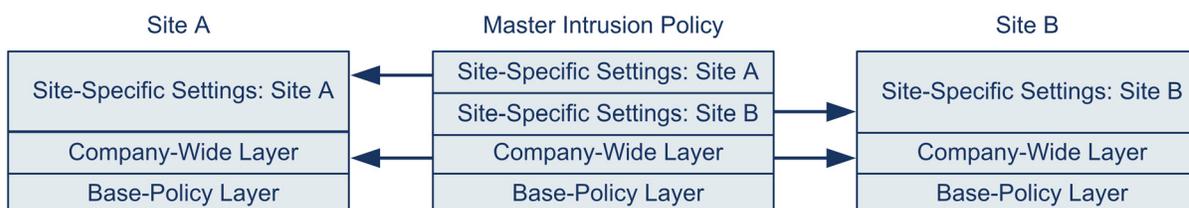

- [Sharing Layers](#) on page 794 provides an example intrusion policy that shows how you can share the settings in a layer with other intrusion policies.
- [Using Rules in Layers](#) on page 795 explains how you can work with rules in an intrusion policy layer.
- [Removing Multi-Layer Rule Settings](#) on page 797 explains how you can remove settings for event filters, dynamic states, and alerting from multiple layers using the intrusion policy Rules page.
- [Using the FireSIGHT Recommendations Layer](#) on page 799 explains how you can view and delete rule attributes in layers.
- [Using Layers with Advanced Settings](#) on page 800 explains how you can work with advanced settings in an intrusion policy layer.

Sharing Layers

LICENSE: Protection

You can share any user-configurable layer with other intrusion policies. When you share a layer and then edit a configuration within that layer, the system updates all policies that use the shared layer when you commit your changes and provides you with a list of all affected policies. A shared layer can only be modified in the policy where it is created.

The following figure shows an example master intrusion policy that serves as the source for site-specific policies.

The master policy in the figure includes a company-wide layer with settings applicable to the intrusion policies at Site A and Site B. It also includes site-specific layers for each policy. For example, Site A might not have web servers on the monitored network and would not require the protection or processing overhead of the HTTP Inspect preprocessor, but both sites would

likely require TCP stream preprocessing. You could enable TCP stream processing in the company-wide layer that you share with both sites, disable the HTTP Inspect preprocessor in the site-specific layer that you share with Site A, and enable the HTTP Inspect preprocessor in the site-specific layer that you share with Site B. By editing settings in a higher layer in the site-specific policies, you could also further tune the policy for each site if necessary with any setting adjustments.

It is unlikely that the flattened net settings in the example master policy would be useful for motoring traffic, but the time saved in configuring and updating the site-specific policies makes this a useful application of policy layers.

Many other advanced layer configurations are possible. For example, you could define policy layers by company, by department, by network, or even by user. You could also include preprocessor settings in one layer, other advanced settings in a second layer, and rule settings in a third.

See the [Policy Layer Configuration Actions](#) table on page 804 for instructions on configuring shared layers.

TIP! You cannot add a shared layer to an intrusion policy where your base policy is a custom policy where the layer you want to share was created. When you attempt to save your changes, an error messages indicates that the policy includes a circular dependency. See [Using a Custom Base Policy](#) on page 693 for more information.

Using Rules in Layers

LICENSE: Protection

You can set the rule state, event filtering, dynamic state, alerting, and rule comments for a rule in any user-configurable layer. After accessing the layer where you want to make your changes, you add settings on the Rules page for the layer the same as you would on the intrusion policy Rules page. You can view individual settings on the Rules page for the layer, or view the effective settings on the policy view of the Rules page. When you modify rule settings on the policy view of the Rules page, you are modifying the highest user-configurable layer in the policy.

Note that you can switch to another layer at any time using the layer drop-down list.

The [Rule Settings in Multiple Layers](#) table describes the effects of configuring the same type of setting in multiple layers.

Rule Settings in Multiple Layers

YOU CAN SET...	OF THIS SETTING TYPE...	TO...
one	Rule State	<p>override a rule state set for the rule in a lower layer, and ignore all threshold, suppression, rate-based rule states, and alerts for that rule configured in lower layers. See Setting Rule States on page 743 for more information.</p> <p>If you want a rule to inherit the rule state for the rule from the base policy or a lower layer, set the rule state to Inherit. Note that you cannot set a rule state to Inherit when you are working on the intrusion policy Rules page, and the Inherit state does not appear in the Rule State column.</p> <p>Note also that rules with rule states set in a lower layer are highlighted in yellow and rules with states set in a higher layer are highlighted in red when you view them on the Rules page for a specific layer. Because the intrusion policy Rules page is a composite view of all rule settings, rule states are not color-coded on the policy view of the Rules page.</p>
one	Threshold SNMP Alert	<p>override a setting of the same type for the rule in a lower layer. Note that setting a threshold overwrites any existing threshold for the rule in the layer. See Configuring Event Thresholding on page 747 and Adding Alerts on page 761 for more information.</p>
one or more	Suppression Rate-Based Rule State	<p>cumulatively combine settings of the same type for each selected rule down to the first layer where a rule state is set for the rule. Settings below the layer where a rule state is set are ignored. See Configuring Suppression Per Intrusion Policy on page 753 and Adding Dynamic Rule States on page 756 for more information.</p>
one or more	Comment	<p>add a comment to a rule. Comments are rule-specific, not policy- or layer-specific. You can add one or more comments to a rule in any layer. See Adding a Rule Comment for a Rule on page 729 for more information.</p>

For example, if you set a rule state to Drop and Generate Events in one layer and to Disabled in a higher layer, the intrusion policy Rules page shows that the rule is disabled.

In another example, if you set a source-based suppression for a rule to 192.168.1.1 in one layer, and you also set a destination-based suppression for the rule to 192.168.1.2 in another layer, the Rules page shows that the cumulative effect is to suppress events for the source address 192.168.1.1 and the destination address 192.168.1.2. Note that suppression and rate-based rule state settings cumulatively combine settings of the same type for each selected rule

down to the first layer where a rule state is set for the rule. Settings below the layer where a rule state is set are ignored.

To modify rules in a layer view:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon () next to the policy you want to view or edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Expand **Policy Layers** in the navigation panel and expand the policy layer you want to view or edit.
4. Click **Rules** under the policy layer you want to view or edit.
The Rules page for the layer appears.
You can modify any of the settings in the [Rule Settings in Multiple Layers table](#) on page 796.
To delete an individual setting from an editable layer, double-click the rule message on the Rules page for the layer to display rule details. Click **Delete** next to the setting you want to delete, then click **OK** twice.

Removing Multi-Layer Rule Settings

LICENSE: Protection

You can select one or more rules on the intrusion policy view of the Rules page and then simultaneously remove a specific type of event filter, dynamic state, or alerting from multiple layers in your policy.

The system removes the setting type downward through each layer where it is set until it removes all the settings or encounters a layer where a rule state is set for the rule. If it encounters a layer where a rule state is set, it removes the setting from that layer and ignores all layers below it.

When the system encounters the setting type in a shared layer or in the base policy, if the highest layer in the policy is editable, the system copies the remaining settings and rule state for the rule to that editable layer. Otherwise, if the highest layer in the policy is a shared layer, the system creates a new editable

layer above the shared layer and copies the remaining settings and rule state for the rule to that editable layer.

IMPORTANT! Removing rule settings from a shared layer or the base policy causes any changes to this rule from lower layers or the base policy to be ignored. To stop ignoring changes from lower layers or the base policy, set the rule state to **Inherit** in the topmost layer. See [Setting Rule States](#) on page 743 for more information.

To remove settings in multiple layers using the Rules page:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon (✎) next to the intrusion policy where you want to remove multiple settings.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. To access the intrusion policy Rules page, click **Rules** in the top of the navigation panel above the dividing line.

TIP! You can also select **Policy** from the layer drop-down list on the Rules page for any layer, or select **Manage Rules** on the Policy Information page.

The intrusion policy Rules page appears. By default, the page lists the rules alphabetically by message.

4. Locate the rule or rules where you want to remove multiple settings. You have the following options:
 - To sort the current display, click on a column heading or icon. To reverse the sort, click again.
 - Construct a filter by clicking on keywords or arguments in the filter panel on the left. For more information, see the following topics: [Understanding Rule Filtering in an Intrusion Policy](#) on page 730 and [Setting a Rule Filter in an Intrusion Policy](#) on page 741.
The page refreshes to display all matching rules.

5. Select the rule or rules for which you want to remove multiple settings. You have the following options:
 - To select a specific rule, select the check box next to the rule.
 - To select all the rules in the current list, select the check box at the top of the column.
6. You have the following options:
 - To remove all thresholds for a rule, select **Event Filtering > Remove Thresholds**. Click **OK** in the confirmation pop-up window that appears.
 - To remove all suppression for a rule, select **Event Filtering > Remove Suppressions**. Click **OK** in the confirmation pop-up window that appears.
 - To remove all rate-based rule states for a rule, select **Dynamic State > Remove Rate-Based Rule States**. Click **OK** in the confirmation pop-up window that appears.
 - To remove all SNMP alert settings for a rule, select **Alerting > Remove SNMP Alerts**. Click **OK** in the confirmation pop-up window that appears.

The system removes the selected setting and copies the remaining settings for the rule to the highest editable layer in the policy. See the introduction to this procedure for conditions that affect how the system copies the remaining settings.

IMPORTANT! Removing rule settings from a shared layer or the base policy causes any changes to this rule from lower layers or the base policy to be ignored. To stop ignoring changes from lower layers or the base policy, set the rule state to **Inherit** in the topmost layer. See [Setting Rule States](#) on page 743 for more information.

7. Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Using the FireSIGHT Recommendations Layer

LICENSE: Protection

When you have generated rule state recommendations, you can choose whether to automatically modify rule states based on the recommendations.

Choosing to use the recommended rule states adds or updates a read-only, built-in FireSIGHT Recommendations system layer immediately above the base layer in your intrusion policy. Subsequently choosing not to use the recommended rule states removes the FireSIGHT Recommendations system layer. Note that you can repeatedly remove and restore the FireSIGHT Recommendations layer by choosing to use or not use recommendations, but you cannot delete the layer manually.

Adding the FireSIGHT Recommendations layer adds a FireSIGHT Recommendations link under Policy Layers in the navigation panel. That link leads you to a read-only view of the FireSIGHT Recommendations layer page. From the FireSIGHT Recommendations layer page, you can display recommendation-filtered views of the Rules page in read-only mode. On the Rules page, you can further filter the read-only recommendations, sort the display by column, and show details of individual rules. See [Managing Rules in an Intrusion Policy](#) on page 717 for more information on working with rules on the Rules page.

Adding the FireSIGHT Recommendations layer also adds a Rules sublink beneath the FireSIGHT Recommendations link in the navigation panel. The Rules sublink provides access to a read-only display of the Rules page in the FireSIGHT Recommendations layer. Note the following in this view:

- When there is no rule state icon in the state column, the state is inherited from the base policy.
- When there is no rule state icon in the FireSIGHT Recommendations column in this or other Rules page views, there is no recommendation for this rule.

Note that when a rule in the FireSIGHT Recommendations layer has no recommendation, its rule overhead rating was higher than the setting for **Recommendation Threshold (By Rule Overhead)** when recommendations were last generated. See [Understanding Rule Overhead](#) on page 767 for more information.

See [Managing FireSIGHT Rule State Recommendations](#) on page 764 for more information.

Using Layers with Advanced Settings

LICENSE: Protection

When you select **Advanced Settings** in the navigation panel, you go to the Advanced Settings page. On this page you can enable or disable advanced settings in your intrusion policy and access advanced setting configuration pages. The Advanced Settings page provides a summary of the effective states for all advanced settings in your intrusion policy. For example, if SSL Configuration is set to Disabled in one layer, then set to Enabled in a higher layer, the Advanced Settings page shows SSL Configuration as set to Enabled. Changes made in the Advanced Settings page appear in the top layer of the policy. See [Modifying Advanced Settings](#) on page 774 for more information on working with advanced settings on the Advanced Settings page.

When you expand **Policy Layers** in the navigation panel and then select any user-configurable layer, you go to the Layer summary page for the layer. On this page you can enable or disable advanced settings and access advanced setting configuration pages for the layer. You can also modify the layer name and description and configure whether to share the layer with other intrusion policies. See [Sharing Layers](#) on page 794 for more information.

If you want an advanced setting to inherit its state and configuration from the base policy or a lower layer, set the state to **Inherit**. Note that the Inherit state does not appear when you are working in the Advanced Settings page. You can switch to the Layer summary page for another layer at any time by selecting the layer name beneath **Policy Layers** in the navigation panel.

When you enable an advanced setting, a sublink to the configuration page for the advanced setting appears beneath the layer name in the navigation panel, and an **Edit** link to the configuration page for the advanced setting appears on the Layer summary page for the advanced setting you enabled. When you disable an advanced setting within a layer or set it to **Inherit**, the advanced setting sublink and **Edit** link no longer appear.

You can display the configuration page for an advanced setting from the Layer summary page by first enabling the configuration if it is disabled and then clicking on **Edit**. When the advanced setting is enabled in the layer, you can also display its configuration page by clicking on the sublink named for the advanced setting in the navigation panel under **Policy Layers**.

You can set the state (enabled or disabled) of advanced settings in the current layer or in a layer above or below that layer. Setting the state for an advanced setting in a layer overrides the state for that advanced setting in lower layers. When the advanced setting is enabled in a layer, the configuration in that layer also overrides the configuration of the advanced setting in lower layers.

Advanced setting states set in a different layer are color-coded to show whether they are set in a layer above or below. Note that because the Advanced Settings page is a composite view of all state settings, it does not use color coding to indicate where an advanced setting state is set in the layer order.

The system uses the configuration for an advanced setting in the highest layer where the configuration is enabled. Unless you explicitly modify the configuration, the system uses the default configuration. For example, if you enable and modify the DCE/RPC configuration in a layer, and you enable the DCE/RPC configuration but do not modify it in a higher layer, the system will use the default configuration in the higher layer.

You can view the layers where advanced settings are enabled, disabled, and inherited by clicking **Policy Layers** in the navigation panel. See [Configuring User Layers](#) on page 803 for more information.

The [Layer Summary Page Actions](#) table describes the actions available on the Layer summary page for user-configurable layers in your intrusion policy.

Layer Summary Page Actions

To...	YOU CAN...
modify the layer name or description	type a new value for Name or Description . Note that this action is not available on the Advanced Settings page.
share the layer with other intrusion policies	select Allow this layer to be used by other policies . See Using Layers with Advanced Settings on page 800 and Configuring User Layers on page 803 for more information. Note that this action is not available on the Advanced Settings page.
enable an advanced setting in the current layer	click Enabled next to the advanced setting you want to enable. The page refreshes, a sublink to the configuration page for the advanced setting appears beneath the layer name in the navigation panel, and an Edit link appears for the advanced setting you enabled. Optionally, click the Edit link or the advanced setting sublink to modify the current configuration. See Modifying Advanced Settings on page 774 for links to the configuration pages for all advanced settings. Note that the Back Orifice preprocessor has no user-configurable options.
disable the advanced setting in the current layer	click Disabled . The page refreshes and, if the advanced setting was enabled, the advanced setting sublink and Edit link no longer appear.
inherit the advanced setting state and configuration from the settings in the highest layer below the current layer	click Inherit . The page refreshes and, if the advanced setting was enabled, the advanced setting sublink and Edit link no longer appear.

To view or modify advanced settings in a layer view:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon () next to the policy you want to view or edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.

3. Expand **Policy Layers** in the navigation panel and click the name of the layer you want to view or edit.
The Layer summary page for the layer appears.
4. Optionally, you can take any of the actions in the [Layer Summary Page Actions table](#) on page 802.
5. Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Configuring User Layers

LICENSE: Protection

The Policy Layers page provides a single-page summary of all of the layers in your intrusion policy. For each layer, you can view whether an advanced setting is enabled or disabled in the layer or in a layer above or below it in the stack. You can also view the number of rules whose states are set in the layer, and the number of rules set to each rule state. You can also see a summary of the net effect of all enabled rules and advanced settings throughout the layers in the policy.

On this page you can also add shared and unshared layers, access rules and advanced settings to edit them within a layer, and copy, merge, move, and delete layers.

The [Policy Layer Configuration Actions](#) table explains how to view and interpret the policy layer summary and describes the layer configuration actions available on the Policy Layers summary page.

Policy Layer Configuration Actions

To...	YOU CAN...
add a shared layer from another policy	<p>click Add Shared Layer, then select the layer you want to add from the drop-down list in the Add Shared Layer pop-up window and click OK, or click Cancel if you decide not to add a shared layer.</p> <p>The Policy Layers summary page appears. If you selected a shared layer, the screen refreshes and the shared layer you selected appears as the highest layer in your policy.</p> <p>If there are no shared layers in any other policies, no drop-down list appears; click OK or Cancel on the pop-up window to return to the Policy Layers summary page.</p>
add a layer to your policy	<p>click Add Layer. Type a unique Name for the layer in the Add Layer pop-up window and click OK, or click Cancel if you decide not to add a layer. You can add up to 200 layers to an intrusion policy.</p> <p>The Policy Layers summary page appears. If you added a layer, the screen refreshes and the layer you added appears as the highest layer in your policy. Note that, in the new layer, the state of all advanced settings and rules is initially set to Inherit, and no event filtering, dynamic state, or alerting rule actions are set.</p>
enable or disable sharing a layer in your policy with other policies	<p>click the name of the layer in the navigation panel and select or clear the Sharing check box, then click Back to return to the Policy Layer summary page.</p> <p>Note that to disable sharing a layer that is in use in another policy, you must first delete the layer from the other policy or delete the other policy.</p>
move a layer above or below another layer	<p>click anywhere inside the layer summary and drag until the position arrow  points to a line above or below a layer where you want to move the layer.</p> <p>The screen refreshes and the layer appears in the new location.</p>
manage rules or modify advanced setting configurations in a layer	<p>click the edit icon () for the layer.</p> <p>The Layer summary page for the layer appears. From this page you can display a layer-filtered view of the intrusion policy Rule page, enable, disable, or inherit advanced settings in the layer, and access advanced setting configuration pages in the layer. See Managing Rules in an Intrusion Policy on page 717 and Modifying Advanced Settings on page 774 for more information.</p> <p>Note that when you add a layer and enable an advanced setting in the new layer, the advanced setting configuration options are initially set to the default settings in the base policy.</p>

Policy Layer Configuration Actions (Continued)

To...	YOU CAN...
merge a layer into the next layer beneath it	<p>click the merge icon () for the layer you want to merge, then click OK when prompted or click Cancel to abandon the merge.</p> <p>The page refreshes and the layer is merged with the layer beneath it.</p> <p>A merged layer retains all settings that were unique to either layer, and accepts the settings from the higher layer if both layers included settings for the same rule or advanced setting. The merged layer retains the name of the lower layer.</p> <p>In the policy where you created a shared layer that you have added to other policies, you can merge an unshared layer immediately above the shared layer with the shared layer, but you cannot merge the shared layer with an unshared layer beneath it.</p> <p>In a policy where you have added a shared layer that you created in another policy, you can merge the shared layer into an unshared layer immediately beneath it and the resulting layer is no longer shared; you cannot merge an unshared layer above the shared layer into the shared layer.</p>
copy a layer	<p>click the copy icon () of the layer you want to copy.</p> <p>The page refreshes and a copy of the layer appears as the highest layer. Note that copying a shared layer creates an unshared copy which, optionally, you can then identify as a layer that can be shared with other policies.</p>
delete a layer	<p>click the delete icon () for the layer you want to delete and then click OK at the prompt, or click Cancel if you decide not to delete the layer.</p> <p>The page refreshes and the layer is deleted.</p> <p>Note that you cannot delete a layer with sharing enabled if the layer is in use by another policy. Note also that you can delete the initial My Changes layer if it is unshared or if sharing is allowed but it has not been added to any other intrusion policies.</p>
display the Policy Information page	<p>click Policy Summary.</p> <p>See Managing Intrusion Policies on page 670 for an explanation of the actions you can take from the Policy Information page.</p>

Policy Layer Configuration Actions (Continued)

To...	YOU CAN...
display the Layer summary page for a layer	<p>click the layer name in the summary for the layer.</p> <p>The Layer summary page for the layer appears.</p> <p>From this page you can modify the layer name and description, set the layer to be shared by other intrusion policies, configure advanced settings states, and access advanced settings configuration pages. You can also display filtered Rules page views of rules whose states are set in the layer; you can display filtered views for all rules or by rule state. See Sharing Layers on page 794, Using Layers with Advanced Settings on page 800, and Using Rules in Layers on page 795 for more information.</p> <p>Note that, alternatively, you can click the view icon () to access the Layer summary page a shared layer. Note also that the Layer summary page for a shared layer is read-only.</p>
display the Layer summary page for the base policy	<p>click the base policy name in the base policy summary.</p> <p>The Layer summary page for the base policy appears.</p> <p>From this page you can select a different base policy for your intrusion policy and specify whether changes in an imported rule update your intrusion policy. You can view which advanced settings are enabled or disabled in your base policy and access read-only configuration pages showing the default configurations of advanced settings in the policy. Status messages give the number of rules enabled in the policy and the number set to generate events and to drop packets and generate events. From this page you can access a read-only view of the Rules page showing the settings for all rules in the base policy. See Understanding the Base Policy on page 691, Allowing Rule Updates to Modify the Base Policy on page 694, Using Layers with Advanced Settings on page 800, and Using Rules in Layers on page 795 for more information.</p>
display a layer-level advanced setting configuration page	<p>click the advanced setting name in the summary for the layer.</p> <p>Note that configuration pages are read-only in the base policy and in shared layers. See Sharing Layers on page 794 and Understanding the Base Policy on page 691, and for more information.</p>
display rules in a layer by rule state type	<p>click the icon for drop and generate events (), generate events (), or disabled () in the summary for the layer, or on the description next to the icon for the rule state type you want to display.</p> <p>Note that disabled rules are not displayed for the base policy or the Policy Summary. Note also that each layer summary provides the total number of rules enabled (that is, the total set to generate events or to drop and generate events) in the layer, and the total for each enabled rule state. Also, note that the base policy rule state totals are the default enabled rule state settings in the policy, and the Policy Summary totals are the effective sum of all enabled rule states for all layers in the policy.</p>

To configure layers in your intrusion policy:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

2. Click the edit icon (✎) next to the policy you want to edit.

If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

3. Click **Policy Layers** in the navigation panel.

The Policy Layers summary page appears, displaying a summary of the rule states and advanced settings in each layer, and a flattened view of the policy showing the net effect of the states in all layers.

Note that the advanced setting name in the summary for each layer indicates which advanced setting configurations are enabled, disabled, overridden, or inherited in the layer, as follows:

WHEN THE ADVANCED SETTING CONFIGURATION IS...	THE ADVANCED SETTING NAME IS...
enabled in the layer	written in plain text

WHEN THE ADVANCED SETTING CONFIGURATION IS...	THE ADVANCED SETTING NAME IS...
disabled in the layer	struck out
overridden by the configuration in a higher layer	written in italic text
inherited from a lower layer	not present

4. Optionally, you can take any of the actions in the [Policy Layer Configuration Actions](#) on page 804.
5. Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

CHAPTER 23

USING APPLICATION LAYER PREPROCESSORS

Application-layer protocols can represent the same data in a variety of ways. Sourcefire provides application-layer protocol decoders that normalize specific types of packet data into formats that the rules engine can analyze. Normalizing application-layer protocol encodings allows the rules engine to effectively apply the same content-related rules to packets whose data is represented differently and obtain meaningful results.

Note that preprocessors do not generate events in most cases unless you enable the accompanying preprocessor rules. See [Setting Rule States](#) on page 743 for more information.

See the following sections for more information:

- [Decoding DCE/RPC Traffic](#) on page 810 describes the DCE/RPC preprocessor and explains how to configure it to prevent evasion attempts and detect anomalies in DCE/RPC traffic.
- [Detecting Exploits in DNS Name Server Responses](#) on page 827 describes the DNS preprocessor and explains how to configure it to detect any of three specific exploits in DNS name server responses.
- [Decoding FTP and Telnet Traffic](#) on page 832 describes the FTP/Telnet decoder and explains how to configure it to normalize and decode FTP and Telnet traffic.
- [Decoding HTTP Traffic](#) on page 850 describes the HTTP decoder and explains how to configure it to normalize HTTP traffic.
- [Using the Sun RPC Preprocessor](#) on page 869 describes the RPC decoder and explains how to configure it to normalize RPC traffic.
- [Decoding the Session Initiation Protocol](#) on page 872 explains how you can use the SIP preprocessor to decode and detect anomalies in SIP traffic.

- [Configuring the GTP Command Channel](#) on page 878 explains how you can use the GTP preprocessor to provide the rules engine with GTP command channel messages extracted by the packet decoder.
- [Decoding IMAP Traffic](#) on page 880 explains how you can use the IMAP preprocessor to decode and detect anomalies in IMAP traffic.
- [Decoding POP Traffic](#) on page 884 explains how you can use the POP preprocessor to decode and detect anomalies in POP traffic.
- [Decoding SMTP Traffic](#) on page 889 describes the SMTP decoder and explains how to configure it to decode and normalize SMTP traffic.
- [Detecting Exploits Using the SSH Preprocessor](#) on page 899 explains how to identify and process exploits in SSH-encrypted traffic.
- [Using the SSL Preprocessor](#) on page 905 explains how you can use the SSL preprocessor to identify encrypted traffic and eliminate false positives by stopping inspection of that traffic.
- [Working with SCADA Preprocessors](#) on page 909 explains how you can use the Modbus and DNP3 preprocessors to detect anomalies in corresponding traffic and provide data to the rules engine for inspection of certain protocol fields.

Decoding DCE/RPC Traffic

LICENSE: Protection

The DCE/RPC protocol allows processes on separate network hosts to communicate as if the processes were on the same host. These inter-process communications are commonly transported between hosts over TCP and UDP. Within the TCP transport, DCE/RPC might also be further encapsulated in the Windows Server Message Block (SMB) protocol or in Samba, an open-source SMB implementation used for inter-process communication in a mixed environment comprised of Windows and UNIX- or Linux-like operating systems. In addition, Windows IIS web servers on your network might use IIS RPC over HTTP, which provides distributed communication through a firewall, to proxy TCP-transported DCE/RPC traffic.

Note that descriptions of DCE/RPC preprocessor options and functionality include the Microsoft implementation of DCE/RPC known as MSRPC; descriptions of SMB options and functionality refer to both SMB and Samba.

Although most DCE/RPC exploits occur in DCE/RPC client requests targeted for DCE/RPC servers, which could be practically any host on your network that is running Windows or Samba, exploits can also occur in server responses. The DCE/RPC preprocessor detects DCE/RPC requests and responses encapsulated in TCP, UDP, and SMB transports, including TCP-transported DCE/RPC using version 1 RPC over HTTP. The preprocessor analyzes DCE/RPC data streams and detects anomalous behavior and evasion techniques in DCE/RPC traffic. It also analyzes SMB data streams and detects anomalous SMB behavior and evasion techniques.

The DCE/RPC preprocessor also desegments SMB and defragments DCE/RPC in addition to IP defragmentation and TCP stream reassembly. Note that TCP stream preprocessing must be enabled to detect TCP-transported DCE/RPC, including SMB and RPC over HTTP, and IP defragmentation must be enabled when you enable the DCE/RPC preprocessor because, ultimately, IP transports all DCE/RPC traffic. See [Using TCP Stream Preprocessing](#) on page 940 and [Defragmenting IP Packets](#) on page 927.

Finally, the DCE/RPC preprocessor normalizes DCE/RPC traffic for processing by the rules engine. See [DCE/RPC Keywords](#) on page 1119 for information on using specific DCE/RPC rule keywords to detect DCE/RPC services, operations, and stub data.

You configure the DCE/RPC preprocessor by modifying any of the global options that control how the preprocessor functions, and by specifying one or more target-based server policies that identify the DCE/RPC servers on your network by IP address and by either the Windows or Samba version running on them:

- You must enable DCE/RPC preprocessor rules, which have a generator ID (GID) of 132 or 133, if you want these rules to generate events. A link on the configuration page takes you to a filtered view of DCE/RPC preprocessor rules on the intrusion policy Rules page, where you can enable and disable rules and configure other rule actions. See [Setting Rule States](#) on page 743 for more information.
- When a shared object rule or standard text rule that requires this preprocessor is enabled in an intrusion policy where the preprocessor is disabled, you must enable the preprocessor or choose to allow the system to enable it automatically before you can save the policy. For more information, see [Automatically Enabling Advanced Settings](#) on page 787.

See the following sections for more information:

- [Selecting Global DCE/RPC Options](#) on page 811
- [Understanding Target-Based DCE/RPC Server Policies](#) on page 813
- [Understanding DCE/RPC Transports](#) on page 814
- [Selecting DCE/RPC Target-Based Policy Options](#) on page 818
- [Configuring the DCE/RPC Preprocessor](#) on page 821

Selecting Global DCE/RPC Options

LICENSE: Protection

Global DCE/RPC preprocessor options control how the preprocessor functions. Except for the **Memory Cap Reached** option, modifying these options could have a negative impact on performance or detection capability. You should not modify them unless you have a thorough understanding of the preprocessor and the interaction between the preprocessor and enabled DCE/RPC rules. In particular, make sure that the **Maximum Fragment Size** option and **Reassembly Threshold** option are greater than or equal to the depth to which the rules need to detect. For more information, see [Constraining Content Matches](#) on page 1065 and [Using](#)

[Byte_Jump and Byte_Test](#) on page 1079.

If no preprocessor rule is mentioned, the option is not associated with a preprocessor rule.

Maximum Fragment Size

When **Enable Defragmentation** is selected, specifies the maximum DCE/RPC fragment length allowed from 1514 to 65535 bytes. The preprocessor truncates larger fragments for processing purposes to the specified size before defragmenting but does not alter the actual packet. A blank field disables this option.

Reassembly Threshold

When **Enable Defragmentation** is selected, 0 disables this option, or 1 to 65535 bytes specifies a minimum number of fragmented DCE/RPC bytes and, if applicable, segmented SMB bytes to queue before sending a reassembled packet to the rules engine. A low value increases the likelihood of early detection but could have a negative impact on performance. You should test for performance impact if you enable this option.

Enable Defragmentation

Specifies whether to defragment fragmented DCE/RPC traffic. When disabled, the preprocessor still detects anomalies and sends DCE/RPC data to the rules engine, but at the risk of missing exploits in fragmented DCE/RPC data.

Although this option provides the flexibility of not defragmenting DCE/RPC traffic, most DCE/RPC exploits attempt to take advantage of fragmentation to hide the exploit. Disabling this option would bypass most known exploits, resulting in a large number of false negatives.

Memory Cap Reached

Detects when the maximum memory limit allocated to the preprocessor is reached or exceeded. When the maximum memory cap is reached or exceeded, the preprocessor frees all pending data associated with the session that caused the memory cap event and ignores the rest of that session.

You can enable rule 133:1 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Auto-Detect Policy on SMB Session

Detects the Windows or Samba version that is identified in SMB **session Setup AndX** requests and responses. When the detected version is different from the Windows or Samba version configured for the **Policy** configuration option, the detected version overrides the configured version for that session

only. See [Understanding Target-Based DCE/RPC Server Policies](#) on page 813 for more information.

For example, if you set **Policy** to Windows XP and the preprocessor detects Windows Vista, the preprocessor uses a Windows Vista policy for that session. Other settings remain in effect.

When the DCE/RPC transport is not SMB (that is, when the transport is TCP or UDP), the version cannot be detected and the policy cannot be automatically configured.

To enable this option, select one of the following from the drop-down list:

- Select **Client** to inspect server-to-client traffic for the policy type.
- Select **Server** to inspect client-to-server traffic for the policy type.
- Select **Both** to inspect server-to-client and client-to-server traffic for the policy type.

Understanding Target-Based DCE/RPC Server Policies

LICENSE: Protection

You can create one or more target-based server policies to configure the DCE/RPC preprocessor to inspect DCE/RPC traffic the same as a specified type of server would process it. Target-based policy configuration includes identifying the Windows or Samba version running on hosts you identify on your network, enabling transport protocols and specifying the ports carrying DCE/RPC traffic to those hosts, and setting other server-specific options.

Windows and Samba DCE/RPC implementations differ significantly. For example, all versions of Windows use the DCE/RPC context ID in the first fragment when defragmenting DCE/RPC traffic, and all versions of Samba use the context ID in the last fragment. As another example, Windows Vista uses the opnum (operation number) header field in the first fragment to identify a specific function call, and Samba and all other Windows versions use the opnum field in the last fragment.

There are also significant differences in Windows and Samba SMB implementations. For example, Windows recognizes the SMB OPEN and READ commands when working with named pipes, but Samba does not recognize these commands.

When you enable the DCE/RPC preprocessor, you automatically enable a default target-based policy. Optionally, you can add target-based policies that target other hosts running different Windows or Samba versions by selecting the correct version from the **Policy** drop-down list. The default target-based policy applies to any host not included in another target-based policy.

In each target-based policy, you can enable one or more transports and specify *detection ports* for each. You can also enable and specify *auto-detection ports*. See [Understanding DCE/RPC Transports](#) on page 814 for more information.

You can also configure other target-based policy options. You can set the preprocessor to detect when there is an attempt to connect to one or more shared SMB resources that you identify. You can also modify an advanced option that should be modified only by a user with SMB protocol expertise; this option lets you set the preprocessor to detect when a number of chained SMB AndX commands exceed a specified maximum number.

Note that you can enable the **Auto-Detect Policy on SMB Session** global option to automatically override the policy type configured for a targeted policy on a per session basis when SMB is the DCE/RPC transport. See [Auto-Detect Policy on SMB Session](#) on page 812.

Understanding DCE/RPC Transports

LICENSE: Protection

In each target-based policy, you can enable one or more of the TCP, UDP, SMB, and RPC over HTTP transports. When you enable a transport, you must also specify one or more *detection ports*, that is, ports that are known to carry DCE/RPC traffic. Optionally, you can also enable and specify *auto-detection ports*, that is, ports that the preprocessor tests first to determine if they carry DCE/RPC traffic and continues processing only when it detects DCE/RPC traffic.

Sourcefire recommends that you use the default detection ports, which are either well-known ports or otherwise commonly-used ports for each protocol. You would add detection ports only if you detected DCE/RPC traffic on a non-default port.

When you enable auto-detection ports, ensure that they are set to the port range from 1024 to 65535 to cover the entire ephemeral port range. Note that it is unlikely that you would enable or specify auto-detection ports for the RPC over HTTP Proxy Auto-Detect Ports option or the SMB Auto-Detect Ports option because there is little likelihood that traffic for either would occur or even be possible except on the specified default detection ports. Note also that auto-detection occurs only for ports not already identified by transport detection ports. See [Selecting DCE/RPC Target-Based Policy Options](#) on page 818 for recommendations for enabling or disabling auto-detection ports for each transport.

Note that any port configured for the **TCP Ports** or **TCP Auto-Detect Ports** option is automatically activated as a TCP stream preprocessor client or server reassembly port for the duration of a DCE/RPC session over the configured TCP port. Only TCP ports are activated, and TCP ports are automatically deactivated at the end of the session. See [Reassembling TCP Streams](#) on page 949 and [Selecting Stream Reassembly Options](#) on page 950 for more information.

You can specify ports for one or more transports in any combination in a Windows target-based policy to match the traffic on your network, but you can only specify ports for the SMB transport in a Samba target-based policy.

Note that you must enable at least one DCE/RPC transport in the default target-based policy except when you have added a DCE/RPC target-based policy

that has at least one transport enabled. For example, you might want to specify the hosts for all DCE/RPC implementations and not have the default target-based policy apply to unspecified hosts, in which case you would not enable a transport for the default target-based policy.

See the following sections for more information:

- [Understanding Connectionless and Connection-Oriented DCE/RPC Traffic](#) on page 815
- [Understanding the RPC over HTTP Transport](#) on page 817

Understanding Connectionless and Connection-Oriented DCE/RPC Traffic

LICENSE: Protection

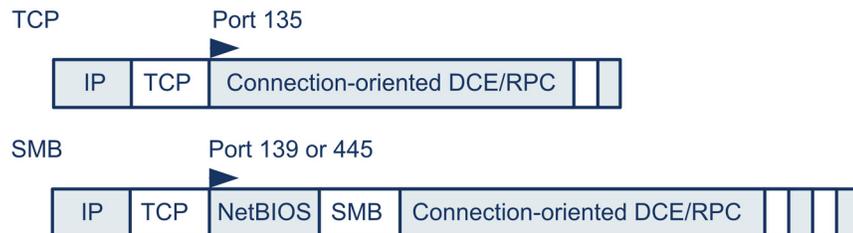

DCE/RPC messages comply with one of two distinct DCE/RPC Protocol Data Unit (PDU) protocols:

- the connection-oriented DCE/RPC PDU protocol
The DCE/RPC preprocessor detects connection-oriented DCE/RPC in the TCP, SMB, and RPC over HTTP transports.
- the connectionless DCE/RPC PDU protocol
The DCE/RPC preprocessor detects connectionless DCE/RPC in the UDP transport.

The two DCE/RPC PDU protocols have their own unique headers and data characteristics. For example, the connection-oriented DCE/RPC header length is typically 24 bytes and the connectionless DCE/RPC header length is fixed at 80 bytes. Also, correct fragment order of fragmented connectionless DCE/RPC cannot be handled by a connectionless transport and, instead, must be ensured by connectionless DCE/RPC header values; in contrast, the transport protocol ensures correct fragment order for connection-oriented DCE/RPC. The DCE/RPC preprocessor uses these and other protocol-specific characteristics to monitor both protocols for anomalies and other evasion techniques, and to decode and defragment traffic before passing it to the rules engine.

The following diagram illustrates the point at which the DCE/RPC preprocessor begins processing DCE/RPC traffic for the different transports.

Connection-oriented DCE/RPC

Connectionless DCE/RPC

▶ = DCE/RPC preprocessor starts decoding

Note the following in the figure:

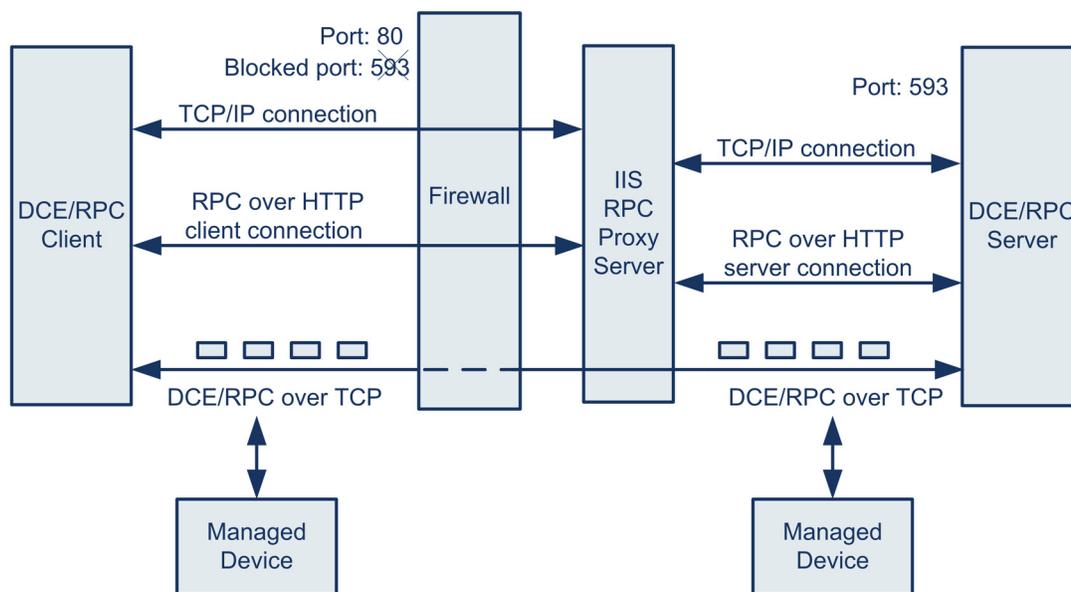

- The well-known TCP or UDP port 135 identifies DCE/RPC traffic in the TCP and UDP transports.
- The figure does not include RPC over HTTP.
For RPC over HTTP, connection-oriented DCE/RPC is transported directly over TCP as shown in the figure after an initial setup sequence over HTTP. See [Understanding the RPC over HTTP Transport](#) on page 817 for more information.
- The DCE/RPC preprocessor typically receives SMB traffic on the well-known TCP port 139 for the NetBIOS Session Service or the similarly implemented well-known Windows port 445.
Because SMB has many functions other than transporting DCE/RPC, the preprocessor first tests whether the SMB traffic is carrying DCE/RPC traffic, stops processing if it is not, and continues processing if it is.
- IP encapsulates all DCE/RPC transports.
You must ensure that IP defragmentation is enabled when you enable the DCE/RPC preprocessor. See [Defragmenting IP Packets](#) on page 927 for more information.

- TCP transports all connection-oriented DCE/RPC.
You must ensure that TCP stream preprocessing is enabled when you enable the TCP, SMB, or RPC over HTTP transport. See [Using TCP Stream Preprocessing](#) on page 940 for more information.
- UDP transports connectionless DCE/RPC.
You must ensure that UDP stream preprocessing is enabled when you enable the UDP transport. See [Using UDP Stream Preprocessing](#) on page 956 for more information.

Understanding the RPC over HTTP Transport

LICENSE: Protection

Microsoft RPC over HTTP allows you to tunnel DCE/RPC traffic through a firewall as shown in the following diagram. The DCE/RPC preprocessor detects version 1 of Microsoft RPC over HTTP.

Example 1: RPC over HTTP proxy

Example 2: RPC over HTTP server

The Microsoft IIS proxy server and the DCE/RPC server can be on the same host or on different hosts. Separate proxy and server options provide for both cases. Note the following in the figure:

- The DCE/RPC server monitors port 593 for DCE/RPC client traffic, but the firewall blocks port 593.
Firewalls typically block port 593 by default.
- RPC over HTTP transports DCE/RPC over HTTP using well-known HTTP port 80, which firewalls are likely to permit.

- Example 1 shows that you would select the **RPC over HTTP proxy** option to monitor traffic between the DCE/RPC client and the MicroSoft IIS RPC proxy server.
- Example 2 shows that you would select the **RPC over HTTP server** option when the MicroSoft IIS RPC proxy server and the DCE/RPC server are located on different hosts and the device monitors traffic between the two servers.
- Traffic is comprised solely of connection-oriented DCE/RPC over TCP after RPC over HTTP completes the proxied setup between the DCE/RPC client and server.

Selecting DCE/RPC Target-Based Policy Options

LICENSE: Protection

Each target-based policy allows you to specify the network addresses where the policy is targeted, the type of Windows or Samba implementation used by the targeted host or hosts, whether to detect specified SMB invalid shares, a maximum number of chained SMB AndX commands to permit, the DCE/RPC transports in which you want to detect DCE/RPC traffic, and the ports to detect or auto-detect for each transport.

Note that, except for the **Memory Cap Reached** and **Auto-Detect Policy on SMB Session** options, modifying these options could have a negative impact on performance or detection capability. You should not modify them unless you have a thorough understanding of the preprocessor and the interaction between the preprocessor and enabled DCE/RPC rules.

If no preprocessor rule is mentioned, the option is not associated with a preprocessor rule.

Networks

The host IP addresses where you want to apply the DCE/RPC target-based server policy.

You can specify a single IP address or address block, or a comma-separated list of either or both. You can specify up to 255 total profiles including the default policy. For information on specifying IPv4 and IPv6 address blocks in the Sourcefire 3D System, see [IP Address Conventions](#) on page 57.

Note that the `default` setting in the default policy specifies all IP addresses on your monitored network segment that are not covered by another target-based policy. Therefore, you cannot and do not need to specify an IP address or CIDR block/prefix length for the default policy, and you cannot leave this setting blank in another policy or use address notation to represent any (for example, 0.0.0.0/0 or ::/0).

Policy

The Windows or Samba DCE/RPC implementation used by the targeted host or hosts on your monitored network segment. See [Understanding Target-Based DCE/RPC Server Policies](#) on page 813 for detailed information on these policies.

Note that you can enable the **Auto-Detect Policy on SMB Session** global option to automatically override the setting for this option on a per session basis when SMB is the DCE/RPC transport. See [Auto-Detect Policy on SMB Session](#) on page 812.

SMB Invalid Shares

A case-insensitive, alphanumeric text string that identifies one or more SMB shared resources; the preprocessor will detect when there is an attempt to connect to a shared resource that you specify. You can specify multiple shares in a comma-separated list and, optionally, you can enclose shares in quotes, which was required in previous software versions but is no longer required; for example:

```
"c$", d$, "admin", private
```

The preprocessor detects invalid shares in SMB traffic when you have enabled both SMB ports and SMB traffic detection.

Note that in most cases you should append a dollar sign to a drive named by Windows that you identify as an invalid share. For example, identify drive C as C\$ or "C\$".

You can enable rule 133:26 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

SMB Maximum AndX Chain

The maximum number between 0 and 255 of chained SMB AndX commands to permit. Typically, more than a few chained AndX commands represent anomalous behavior and could indicate an evasion attempt. Specify 1 to permit no chained commands or 0 to disable detecting the number of chained commands.

Note that the preprocessor first counts the number of chained commands and generates an event if accompanying SMB preprocessor rules are enabled and the number of chained commands equals or exceeds the configured value. It then continues processing.

IMPORTANT! Only someone who is expert in the SMB protocol should modify the default setting for this option.

You can enable rule 133:20 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

RPC proxy traffic only

When **RPC over HTTP Proxy Ports** is enabled, indicates whether detected client-side RPC over HTTP traffic is proxy traffic only or might include other web server traffic. For example, port 80 could carry both proxy and other web server traffic.

When this option is disabled, both proxy and other web server traffic are expected. Enable this option, for example, if the server is a dedicated proxy server. When enabled, the preprocessor tests traffic to determine if it carries DCE/RPC, ignores the traffic if it does not, and continues processing if it does. Note that enabling this option adds functionality only if the **RPC over HTTP Proxy Ports** check box is also enabled.

RPC over HTTP Proxy Ports

Enables detection of DCE/RPC traffic tunneled by RPC over HTTP over each specified port when your managed device is positioned between the DCE/RPC client and the Microsoft IIS RPC proxy server. See [Understanding the RPC over HTTP Transport](#) on page 817.

When enabled, you can add any ports where you see DCE/RPC traffic, although this is unlikely to be necessary because web servers typically use the default port for both DCE/RPC and other traffic. When enabled, you would not enable **RPC over HTTP Proxy Auto-Detect Ports**, but you would enable the **RPC Proxy Traffic Only** when detected client-side RPC over HTTP traffic is proxy traffic only and does not include other web server traffic.

RPC over HTTP Server Ports

Enables detection of DCE/RPC traffic tunneled by RPC over HTTP on each specified port when the Microsoft IIS RPC proxy server and the DCE/RPC server are located on different hosts and the device monitors traffic between the two servers. See [Understanding the RPC over HTTP Transport](#) on page 817.

Typically, when you enable this option you should also enable **RPC over HTTP Server Auto-Detect Ports** with a port range from 1025 to 65535 for that option even if you are not aware of any proxy web servers on your network. Note that the RPC over HTTP server port is sometimes reconfigured, in which case you should add the reconfigured server port to port list for this option.

TCP Ports

Enables detection of DCE/RPC traffic in TCP on each specified port.

Legitimate DCE/RPC traffic and exploits might use a wide variety of ports, and other ports above port 1024 are common. Typically, when this option is enabled you should also enable **TCP Auto-Detect Ports** with a port range from 1025 to 65535 for that option.

UDP Ports

Enables detection of DCE/RPC traffic in UDP on each specified port.

Legitimate DCE/RPC traffic and exploits might use a wide variety of ports, and other ports above port 1024 are common. Typically, when this option is enabled you should also enable **UDP Auto-Detect Ports** with a port range from 1025 to 65535 for that option.

SMB Ports

Enables detection of DCE/RPC traffic in SMB on each specified port.

You could encounter SMB traffic using the default detection ports. Other ports are rare. Typically, use the default settings.

RPC over HTTP Proxy Auto-Detect Ports

Enables auto-detection of DCE/RPC traffic tunneled by RPC over HTTP on the specified ports when your managed device is positioned between the DCE/RPC client and the MicroSoft IIS RPC proxy server. See [Understanding the RPC over HTTP Transport](#) on page 817.

When enabled, you would typically specify a port range from 1025 to 65535 to cover the entire range of ephemeral ports.

RPC over HTTP Server Auto-Detect Ports

Enables auto-detection of DCE/RPC traffic tunneled by RPC over HTTP on the specified ports when the MicroSoft IIS RPC proxy server and the DCE/RPC server are located on different hosts and the device monitors traffic between the two servers. See [Understanding the RPC over HTTP Transport](#) on page 817.

TCP Auto-Detect Ports

Enables auto-detection of DCE/RPC traffic in TCP on the specified ports.

UDP Auto-Detect Ports

Enables auto-detection of DCE/RPC traffic in UDP on each specified port.

SMB Auto-Detect Ports

Enables auto-detection of DCE/RPC traffic in SMB.

Configuring the DCE/RPC Preprocessor

LICENSE: Protection

You can configure DCE/RPC preprocessor global options and one or more target-based server policies.

The preprocessor does not generate events unless you enable rules with generator ID (GID) 133. A link on the configuration page takes you to a filtered view of DCE/RPC preprocessor rules on the intrusion policy Rules page, where you can enable and disable rules and configure other rule actions. See [Selecting Global DCE/RPC Options](#) on page 811 and [Selecting DCE/RPC Target-Based Policy Options](#) on page 818 for rules associated with specific detection options; see also [Setting Rule States](#) on page 743.

In addition, most DCE/RPC preprocessor rules generate events against anomalies and evasion techniques detected in SMB, connection-oriented DCE/RPC, or connectionless DCE/RPC traffic. The [Traffic-Associated DCE/RPC Rules](#) table identifies the rules that you can enable for each type of traffic.

Traffic-Associated DCE/RPC Rules

TRAFFIC	PREPROCESSOR RULE GID:SID
SMB	133:2 through 133:26, and 133:48 through 133:56
Connection-Oriented DCE/RPC	133:27 through 133:39
Detect Connectionless DCE/RPC	133:40 through 133:43

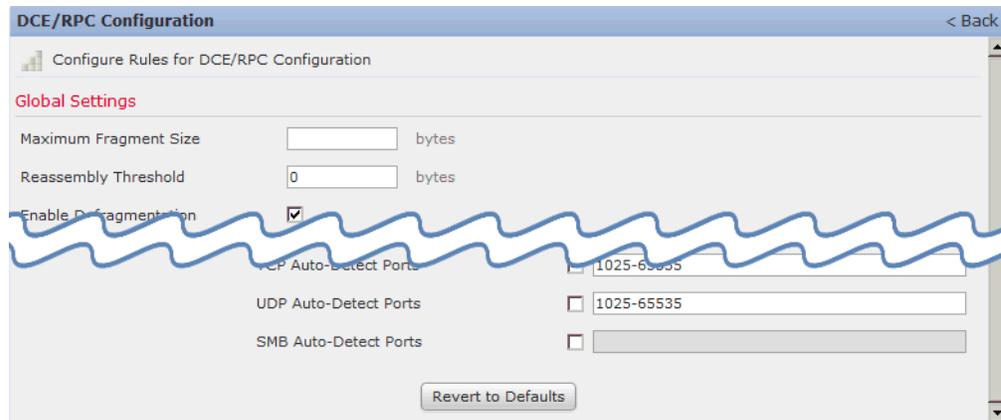

To configure the DCE/RPC preprocessor:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon (✎) next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.

4. You have two choices, depending on whether **DCE/RPC Configuration** under Application Layer Preprocessors is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

The DCE/RPC Configuration page appears.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. You can modify any of the options described in [Selecting Global DCE/RPC Options](#) on page 811.

6. You have two options:

- Add a new target-based policy. Click the add icon () next to **Servers** on the left side of the page. The Add Target pop-up window appears. Specify a one or more IP addresses in the **Server Address** field and click **OK**.

You can specify a single IP address or address block, or a comma-separated list of either or both. For information on using IPv4 and IPv6 address blocks in the Sourcefire 3D System, see [IP Address Conventions](#) on page 57.

You can configure up to 255 policies, including the default policy.

A new entry appears in the list of servers on the left side of the page, highlighted to indicate that it is selected, and the Configuration section updates to reflect the current configuration for the profile you added.

- Modify the settings for an existing target-based policy. Click the configured address for a policy you have added under **Servers** on the left side of the page, or click **default**.

Your selection is highlighted and the Configuration section updates to display the current configuration for the policy you selected. To delete an existing policy, click the delete icon () next to the policy you want to remove.

7. You can modify any of the following target-based policy options:

- To specify the host or hosts where you want to apply the DCE/RPC target-based server policy, enter a single IP address or address block, or a comma-separated list of either or both in the **Networks** field.

You can specify up to 255 total profiles including the default policy. Note that you cannot modify the setting for **Networks** in the default policy. The default policy applies to all servers on your network that are not identified in another policy.

- To specify the type of policy you want to apply to the specified host or hosts on your network segment, select one of the Windows or Samba policy types from the **Policy** drop-down list.

Note that you can enable the **Auto-Detect Policy on SMB Session** global option to automatically override the setting for this option on a per session basis when SMB is the DCE/RPC transport. See [Auto-Detect Policy on SMB Session](#) on page 812.

- To set the preprocessor to detect when there is an attempt to connect to specified shared SMB resources, enter a single or comma-separated list of the case-insensitive strings that identify the shared resources in the **SMB Invalid Shares** field. Optionally, enclose individual strings in quotes, which was required in previous software versions but is no longer required.

For example, to detect shared resources named C\$, D\$, admin, and private, you could enter:

"C\$", D\$, "admin", private

Note that to detect SMB invalid shares, you must also enable **SMB Ports** or **SMB Auto-Detect Ports**, and enable the global **SMB Traffics** option.

Note also that in most cases you should append a dollar sign to a drive named by Windows that you identify as an invalid share. For example, you would enter C\$ or "C\$" to identify drive C.

- To specify a maximum number of chained SMB AndX commands to permit, enter 0 to 255 in the **SMB Maximum AndX Chains** field. Specify 1 to permit no chained commands. Specify 0 or leave this option blank to disable this feature.

IMPORTANT! Only someone who is expert in the SMB protocol should modify the setting for the **SMB Maximum AndX Chains** option.

- To enable the processing of DCE/RPC traffic over ports known to carry DCE/RPC traffic for a Windows policy transport, select or clear the check box next to a detection transport and, optionally, add or delete ports for the transport.

Select one or any combination of **RPC over HTTP Proxy Ports**, **RPC over HTTP Server Ports**, **TCP Ports**, and **UDP Ports** for a Windows policy. Select **RPC Proxy Traffic Only** when **RPC over HTTP proxy** is enabled and detected client-side RPC over HTTP traffic is proxy traffic only; that is, when it does not include other web server traffic.

Select **SMB Ports** for a Samba policy.

In most cases, use the default settings. See [Understanding DCE/RPC Transports](#) on page 814, [Understanding the RPC over HTTP Transport](#) on page 817, and [Selecting DCE/RPC Target-Based Policy Options](#) on page 818 for more information.

You can type a single port, a range of port numbers separated by a dash (-), or a comma-separated list of port numbers and ranges.

- To test whether specified ports carry DCE/RPC traffic and continue processing when they do, select or clear the check box next to an auto-detection transport and, optionally, add or delete ports for the transport.

Select one or any combination of **RPC over HTTP Server Auto-Detect Ports**, **TCP Auto-Detect Ports**, and **UDP Auto-Detect Ports** for a Windows policy.

Note that you would rarely, if ever, select **RPC over HTTP Proxy Auto-Detect Ports** or **SMB Auto-Detect Ports**.

Typically, specify a port range from 1025 to 65535 for auto-detection ports that you enable to cover the entire range of ephemeral ports. See [Understanding DCE/RPC Transports](#) on page 814, [Understanding the RPC over HTTP Transport](#) on page 817, and [Selecting DCE/RPC Target-Based Policy Options](#) on page 818 for more information.

See [Selecting DCE/RPC Target-Based Policy Options](#) on page 818 for more information.

8. Optionally, click **Configure Rules for DCE/RPC Configuration** at the top of the page to display rules associated with individual options.
Click **Back** to return to the DCE/RPC Configuration page.
9. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Detecting Exploits in DNS Name Server Responses

LICENSE: Protection

The DNS preprocessor inspects DNS name server responses for the following specific exploits:

- Overflow attempts on RData text fields
- Obsolete DNS resource record types
- Experimental DNS resource record types

See the following sections for more information:

- [Understanding DNS Preprocessor Resource Record Inspection](#) on page 827
- [Detecting Overflow Attempts in RData Text Fields](#) on page 829
- [Detecting Obsolete DNS Resource Record Types](#) on page 829
- [Detecting Experimental DNS Resource Record Types](#) on page 830
- [Configuring the DNS Preprocessor](#) on page 830

Understanding DNS Preprocessor Resource Record Inspection

LICENSE: Protection

The most common type of DNS name server response provides one or more IP addresses that correspond to domain names in the query that prompted the response. Other types of server responses provide, for example, the destination for an email message or the location of a name server that can provide information not available from the server originally queried.

A DNS response is comprised of a message header, a Question section that contains one or more requests, and three sections that respond to requests in the Question section (Answer, Authority, and Additional Information). Responses in these three sections reflect the information in *resource records* (RR) maintained on the name server. The [DNS Name Server RR Responses](#) table describes these three sections.

DNS Name Server RR Responses

THIS SECTION...	INCLUDES...	FOR EXAMPLE...
Answer	Optionally, one or more resource records that provide a specific answer to a query	The IP address corresponding to a domain name

DNS Name Server RR Responses (Continued)

THIS SECTION...	INCLUDES...	FOR EXAMPLE...
Authority	Optionally, one or more resource records that point to an authoritative name server	The name of an authoritative name server for the response
Additional Information	Optionally, one or more resource records that provided additional information related to the Answer sections	The IP address of another server to query

There are many types of resource records, all adhering to the following structure:

Name	
Type	Class
TTL	
RData Length	
RData	

Theoretically, any type of resource record can be used in the Answer, Authority, or Additional Information section of a name server response message. The DNS preprocessor inspects any resource record in each of the three response sections for the exploits it detects.

The Type and RData resource record fields are of particular importance to the DNS preprocessor. The Type field identifies the type of resource record. The RData (resource data) field provides the response content. The size and content of the RData field differs depending on the type of resource record.

DNS messages typically use the UDP transport protocol but also use TCP when the message type requires reliable delivery or the message size exceeds UDP capabilities. The DNS preprocessor inspects DNS server responses in both UDP and TCP traffic. TCP stream preprocessing must be enabled to enable the DNS preprocessor. However, you do not have to enable UDP session tracking because the DNS preprocessor inspects UDP traffic on a packet-by-packet basis. For more information, see [Using TCP Stream Preprocessing](#) on page 940 and [Using UDP Stream Preprocessing](#) on page 956.

The DNS preprocessor does not inspect TCP sessions picked up in midstream, and ceases inspection if a session loses state because of dropped packets.

The typical port to configure for the DNS preprocessor is well-known port 53, which DNS name servers use for DNS messages in both UDP and TCP.

Detecting Overflow Attempts in RData Text Fields

LICENSE: Protection

When the resource record type is TXT (text), the RData field is a variable-length ASCII text field.

When selected, the DNS preprocessor **Detect Overflow attempts on RData Text fields** option detects a specific vulnerability identified by entry CVE-2006-3441 in MITRE's Current Vulnerabilities and Exposures database. This is a known vulnerability in Microsoft Windows 2000 Service Pack 4, Windows XP Service Pack 1 and Service Pack 2, and Windows Server 2003 Service Pack 1. An attacker can exploit this vulnerability and take complete control of a host by sending or otherwise causing the host to receive a maliciously crafted name server response that causes a miscalculation in the length of an RData text field, resulting in a buffer overflow.

You should enable this feature when your network might include hosts running operating systems that have not been upgraded to correct this vulnerability.

You can enable rule 131:3 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Detecting Obsolete DNS Resource Record Types

LICENSE: Protection

RFC 1035 identifies several resource record types as obsolete. Because these are obsolete record types, some systems do not account for them and may be open to exploits. You would not expect to encounter these record types in normal DNS responses unless you have purposely configured your network to include them.

You can configure the system to detect known obsolete resource record types. The [Obsolete DNS Resource Record Types](#) table lists and describes these record types.

Obsolete DNS Resource Record Types

RR TYPE	CODE	DESCRIPTION
3	MD	a mail destination
4	MF	a mail forwarder

You can enable rule 131:1 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Detecting Experimental DNS Resource Record Types

LICENSE: Protection

RFC 1035 identifies several resource record types as experimental. Because these are experimental record types, some systems do not account for them and may be open to exploits. You would not expect to encounter these record types in normal DNS responses unless you have purposely configured your network to include them.

You can configure the system to detect known experimental resource record types. The [Experimental DNS Resource Record Types](#) table lists and describes these record types.

Experimental DNS Resource Record Types

RR TYPE	CODE	DESCRIPTION
7	MB	a mailbox domain name
8	MG	a mail group member
9	MR	a mail rename domain name
10	NUL	a null resource record

You can enable rule 131:2 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Configuring the DNS Preprocessor

LICENSE: Protection

Use the following procedure to configure the DNS preprocessor. For more information on configuring the options on this page, see [Detecting Overflow Attempts in RData Text Fields](#) on page 829, [Detecting Obsolete DNS Resource Record Types](#) on page 829, and [Detecting Experimental DNS Resource Record Types](#) on page 830.

To configure the DNS preprocessor:

ACCESS: Admin/Intrusion Admin

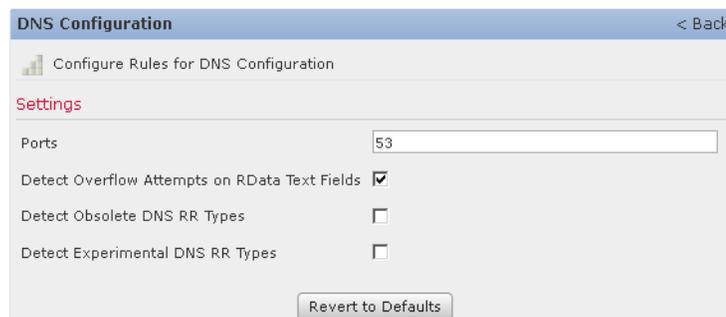

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.

2. Click the edit icon (✎) next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.
4. You have two choices, depending on whether **DNS Configuration** under Application Layer Preprocessors is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

The DNS Configuration page appears.

The screenshot shows the 'DNS Configuration' page with a '< Back' button in the top right. Below the title bar is a section 'Configure Rules for DNS Configuration'. Underneath is a 'Settings' section with the following fields and checkboxes:

Ports	<input type="text" value="53"/>
Detect Overflow Attempts on RData Text Fields	<input checked="" type="checkbox"/>
Detect Obsolete DNS RR Types	<input type="checkbox"/>
Detect Experimental DNS RR Types	<input type="checkbox"/>

At the bottom of the settings area is a 'Revert to Defaults' button.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. Optionally, you can modify any of the following in the Settings area:
 - Specify the source port or ports the DNS preprocessor should monitor for DNS server responses in the **Ports** field. Separate multiple ports with commas.
 - Select the **Detect Overflow Attempts on RData Text fields** check box to enable detection of buffer overflow attempts in RData text fields.
 - Select the **Detect Obsolete DNS RR Types** check box to enable detection of obsolete resource record types.
 - Select the **Detect Experimental DNS RR Types** check box to detect experimental resource record types.
6. Optionally, click **Configure Rules for DNS Configuration** at the top of the page to display rules associated with individual options.
Click **Back** to return to the DNS Configuration page.

7. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Decoding FTP and Telnet Traffic

LICENSE: Protection

The FTP/Telnet decoder analyzes FTP and telnet data streams, normalizing FTP and telnet commands before processing by the rules engine.

Note the following when using the FTP/Telnet decoder:

- The FTP/Telnet decoder requires TCP stream preprocessing. If TCP stream preprocessing is disabled and you enable the preprocessor, you are prompted when you save the policy whether to enable TCP stream preprocessing. See [Automatically Enabling Advanced Settings](#) on page 787 and [Using TCP Stream Preprocessing](#) on page 940 for more information.
- You must enable FTP and telnet preprocessor rules, which have generator IDs (GIDs) of 125 and 126, if you want these rules to generate events. A link on the configuration page takes you to a filtered view of FTP and telnet preprocessor rules on the intrusion policy Rules page, where you can enable and disable rules and configure other rule actions. See [Setting Rule States](#) on page 743 for more information.

For more information, see the following topics:

- [Understanding Global FTP and Telnet Options](#) on page 832
- [Configuring Global FTP/Telnet Options](#) on page 833
- [Understanding Telnet Options](#) on page 835
- [Configuring Telnet Options](#) on page 836
- [Understanding Server-Level FTP Options](#) on page 838
- [Configuring Server-Level FTP Options](#) on page 842
- [Understanding Client-Level FTP Options](#) on page 846
- [Configuring Client-Level FTP Options](#) on page 847

Understanding Global FTP and Telnet Options

LICENSE: Protection

You can set global options to determine whether the FTP/Telnet decoder performs stateful or stateless inspection of packets, whether the decoder detects encrypted FTP or telnet sessions, and whether the decoder continues to check a data stream after it encounters encrypted data.

If no preprocessor rule is mentioned, the option is not associated with a preprocessor rule.

Stateful Inspection

When selected, causes the FTP/Telnet decoder to save state and provide session context for individual packets and only inspects reassembled sessions. When cleared, analyzes each individual packet without session context.

To check for FTP data transfers, this option must be selected.

Detect Encrypted Traffic

Detects encrypted telnet and FTP sessions.

You can enable rules 125:7 and 126:2 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Continue to Inspect Encrypted Data

Instructs the preprocessor to continue checking a data stream after it is encrypted, looking for eventual decrypted data.

Configuring Global FTP/Telnet Options

LICENSE: Protection

You need to configure global options for the FTP/Telnet decoder to control whether stateless or stateful inspection is performed, encrypted traffic is detected, and whether the decoder should continue to check for decrypted data in a data stream that it has identified as encrypted. For more information on global settings, see [Understanding Global FTP and Telnet Options](#) on page 832.

To configure global options:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon (✎) next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.

4. You have two choices, depending on whether **FTP and Telnet Configuration** under Application Layer Preprocessors is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

The FTP and Telnet Configuration page appears.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

TIP! For more information on configuring the other options on this page, see [Configuring Telnet Options](#) on page 836, [Configuring Server-Level FTP Options](#) on page 842, and [Configuring Client-Level FTP Options](#) on page 847.

5. Optionally, you can modify any of the following in the Global Settings page area:
 - Select **Stateful Inspection** to examine reassembled TCP streams containing FTP packets. Clear **Stateful Inspection** to inspect only unreassembled packets.

WARNING! If you disable **TCP Stream Configuration** in an intrusion policy (not recommended), FTP and telnet processing becomes implicitly stateless even if you select **Stateful Inspection** here, because the TCP layer does not pass on any state information. You can determine whether TCP Stream Configuration is enabled by expanding Advanced Settings on the left side of the page; TCP Stream Configuration is enabled if it appears as a sublink beneath Advanced Settings. For more information on stateful inspection and stream reassembly settings, see [Using TCP Stream Preprocessing](#) on page 940 and [Reassembling TCP Streams](#) on page 949.

- Select **Detect Encrypted Traffic** to detect encrypted traffic. Clear **Detect Encrypted Traffic** to ignore encrypted traffic.
 - If needed, select **Continue to Inspect Encrypted Data** to continue checking a stream after it becomes encrypted, in case it becomes decrypted again and can be processed.
6. Optionally, click **Configure Rules for FTP and Telnet Configuration** at the top of the page to display rules associated with individual options.
Click **Back** to return to the FTP and Telnet Configuration page.
 7. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Understanding Telnet Options

LICENSE: Protection

You can enable or disable normalization of telnet commands by the FTP/Telnet decoder, enable or disable a specific anomaly case, and set the threshold number of Are You There (AYT) attacks to permit.

If no preprocessor rule is mentioned, the option is not associated with a preprocessor rule.

Ports

Indicates the ports whose telnet traffic you want to normalize. In the interface, list multiple ports separated by commas.

IMPORTANT! Any port you add to the telnet **Ports** list should also be added in each TCP policy to the appropriate list of TCP reassembly ports, depending on whether you are monitoring client or server traffic, or both. Note, however, that reassembling additional traffic types (client, server, both) increases resource demands. For more information on configuring TCP reassembly ports, see [Selecting Stream Reassembly Options](#) on page 950.

Normalize

Normalizes telnet traffic to the specified ports.

Detect Anomalies

Enables detection of Telnet SB (subnegotiation begin) without the corresponding SE (subnegotiation end).

Telnet supports subnegotiation, which begins with SB (subnegotiation begin) and must end with an SE (subnegotiation end). However, certain implementations of Telnet servers will ignore the SB without a corresponding SE. This is anomalous behavior that could be an evasion case. Because FTP uses the Telnet protocol on the control connection, it is also susceptible to this behavior.

You can enable rule 126:3 to generate an event when this anomaly is detected in Telnet traffic, and rule 125:9 when it is detected on the FTP command channel. See [Setting Rule States](#) on page 743 for more information.

Are You There Attack Threshold Number

Detects when the number of consecutive AYT commands exceeds the specified threshold. Sourcefire recommends that you set the AYT threshold to a value no higher than 20.

You can enable rule 126:1 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Configuring Telnet Options

LICENSE: Protection

You can enable or disable normalization, enable or disable a specific anomaly case, and control the threshold number of Are You There (AYT) attacks to permit. For additional information on telnet options, see [Understanding Telnet Options](#) on page 835.

To configure telnet options:

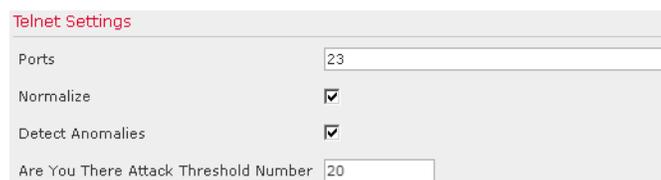

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon () next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.
4. You have two choices, depending on whether **FTP and Telnet Configuration** under Application Layer Preprocessors is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

The FTP and Telnet Configuration page appears.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

TIP! For more information on configuring the other options on this page, see [Configuring Global FTP/Telnet Options](#) on page 833, [Configuring Server-Level FTP Options](#) on page 842, and [Configuring Client-Level FTP Options](#) on page 847.

Telnet Settings	
Ports	<input type="text" value="23"/>
Normalize	<input checked="" type="checkbox"/>
Detect Anomalies	<input checked="" type="checkbox"/>
Are You There Attack Threshold Number	<input type="text" value="20"/>

5. Optionally, you can modify any of the following in the Telnet Settings page area:
 - Specify the port or ports where telnet traffic should be decoded in the **Ports** field. Telnet typically connects to TCP port 23. Separate multiple ports with commas.

Add the same list of ports indicated here to the TCP client reassembly port list. For more information on configuring TCP reassembly ports, see [Reassembling TCP Streams](#) on page 949.

WARNING! Because encrypted traffic (SSL) cannot be decoded, adding port 22 (SSH) could yield unexpected results.

- Select or clear the **Normalize** Telnet Protocol Options check box to enable or disable telnet normalization.
- Select or clear the **Detect Anomalies** Telnet Protocol Options check box to enable or disable anomaly detection.
- Specify an **Are You There Attack Threshold Number** of consecutive AYT commands to permit.

TIP! Sourcefire recommends that you set the AYT threshold to a value no higher than the default value.

6. Optionally, click **Configure Rules for FTP and Telnet Configuration** at the top of the page to display rules associated with individual options.
Click **Back** to return to the FTP and Telnet Configuration page.
7. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Understanding Server-Level FTP Options

LICENSE: Protection

You can set options for decoding on multiple FTP servers. Each server profile you create contains the server IP address and the ports on the server where traffic should be monitored. You can specify which FTP commands to validate and which to ignore for a particular server, and set maximum parameter lengths for commands. You can also set the specific command syntax the decoder should validate against for particular commands and set alternate maximum command parameter lengths.

If no preprocessor rule is mentioned, the option is not associated with a preprocessor rule.

Networks

Use this option to specify one or more IP addresses of FTP servers.

You can specify a single IP address or address block, or a comma-separated list comprised of either or both. You can configure up to 1024 characters, and you can specify up to 255 profiles including the default profile. For information on using IPv4 and IPv6 address blocks in the Sourcefire 3D System, see [IP Address Conventions](#) on page 57.

Note that the `default` setting in the default policy specifies all IP addresses on your monitored network segment that are not covered by another target-based policy. Therefore, you cannot and do not need to specify an IP address or address block for the default policy, and you cannot leave this setting blank in another policy or use address notation to represent **any** (for example, 0.0.0.0/0 or ::/0).

Ports

Use this option to specify the ports on the FTP server where the managed device should monitor traffic. In the interface, list multiple ports separated by commas.

IMPORTANT! Any port you add to the server-level FTP **Ports** list should also be added in each TCP policy to the appropriate list of TCP reassembly ports, depending on whether you are monitoring client or server traffic, or both. Note, however, that reassembling additional traffic types (client, server, both) increases resource demands. For more information on configuring TCP reassembly ports, see [Selecting Stream Reassembly Options](#) on page 950.

File Get Commands

Use this option to define the FTP commands used to transfer files from server to client. Do not change these values unless directed to do so by Sourcefire Support.

File Put Commands

Use this option to define the FTP commands used to transfer files from client to server. Do not change these values unless directed to do so by Sourcefire Support.

Additional FTP Commands

Use this line to specify the additional commands that the decoder should detect. Separate additional commands by spaces.

Default Max Parameter Length

Use this option to detect the maximum parameter length for commands where an alternate maximum parameter length has not been set.

You can enable rule 125:3 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Alternate Max Parameter Length

Use this option to specify commands where you want to detect a different maximum parameter length, and to specify the maximum parameter length for those commands. Click **Add** to add lines where you can specify a different maximum parameter length to detect for particular commands.

Check Commands for String Format Attacks

Use this option to check the specified commands for string format attacks.

You can enable rule 125:5 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Command Validity

Use this option to enter a valid format for a specific command. See [Creating FTP Command Parameter Validation Statements](#) on page 841 for information on creating FTP command parameter validation statements to validate the syntax of a parameter received as part of an FTP communication. Click **Add** to add a command validation line.

You can enable rules 125:2 and 125:4 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Ignore FTP Transfers

Use this option to improve performance on FTP data transfers by disabling all inspection other than state inspection on the data transfer channel.

Detect Telnet Escape Codes within FTP Commands

Use this option to detect when telnet commands are used over the FTP command channel.

You can enable rule 125:1 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Ignore Erase Commands during Normalization

When **Detect Telnet Escape Codes within FTP Commands** is selected, use this option to ignore telnet character and line erase commands when normalizing FTP traffic. The setting should match how the FTP server handles telnet erase commands. Note that newer FTP servers typically ignore telnet erase commands, while older servers typically process them.

Creating FTP Command Parameter Validation Statements

LICENSE: Protection

When setting up a validation statement for an FTP command, you can specify a group of alternative parameters by separating the parameters with spaces. You can also create a binary OR relationship between two parameters by separating them with a pipe character (|) in the validation statement. Surrounding parameters by square brackets ([]) indicates that those parameters are optional. Surrounding parameters with curly brackets ({}) indicates that those parameters are required.

You can create FTP command parameter validation statements to validate the syntax of a parameter received as part of an FTP communication. See [Understanding Server-Level FTP Options](#) on page 838 for more information.

Any of the parameters listed in the following table can be used in FTP command parameter validation statements.

FTP Command Parameters

IF YOU USE...	THE FOLLOWING VALIDATION OCCURS...
<code>int</code>	The represented parameter must be an integer.
<code>number</code>	The represented parameter must be an integer between 1 and 255.
<code>char _chars</code>	<p>The represented parameter must be a single character and a member of the characters specified in the <code>_chars</code> argument.</p> <p>For example, defining the command validity for <code>MODE</code> with the validation statement <code>char SBC</code> checks that the parameter for the <code>MODE</code> command comprises the character <code>S</code> (representing Stream mode), the character <code>B</code> (representing Block mode), or the character <code>C</code> (representing Compressed mode).</p>
<code>date _datefmt</code>	<p>If <code>_datefmt</code> contains <code>#</code>, the represented parameter must be a number.</p> <p>If <code>_datefmt</code> contains <code>C</code>, the represented parameter must be a character.</p> <p>If <code>_datefmt</code> contains literal strings, the represented parameter must match the literal string.</p>
<code>string</code>	The represented parameter must be a string.
<code>host_port</code>	The represented parameter must be a valid host port specifier as defined by RFC 959, the File Transfer Protocol specification by the Network Working Group.

You can combine the syntax in the table above as needed to create parameter validation statements that correctly validate each FTP command where you need to validate traffic.

IMPORTANT! When you include a complex expression in a TYPE command, surround it by spaces. Also, surround each operand within the expression by spaces. For example, type `char A | B` , not `char A|B`.

Configuring Server-Level FTP Options

LICENSE: Protection

You can configure several options at the server level. For each FTP server you add, you can specify the ports to be monitored, the commands to validate, the default maximum parameter length for commands, alternate parameter lengths for specific commands, and validation syntax for particular commands. You can also choose whether to check for string format attacks and telnet commands on the FTP channel and whether to print configuration information with each command. For additional information on server-level FTP options, see [Understanding Server-Level FTP Options](#) on page 838.

To configure server-level FTP options:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon () next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.

4. You have two choices, depending on whether **FTP and Telnet Configuration** under Application Layer Preprocessors is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

The FTP and Telnet Configuration page appears.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

TIP! For more information on configuring the other options on this page, see [Configuring Global FTP/Telnet Options](#) on page 833, [Configuring Telnet Options](#) on page 836, and [Configuring Client-Level FTP Options](#) on page 847.

5. You have two options:

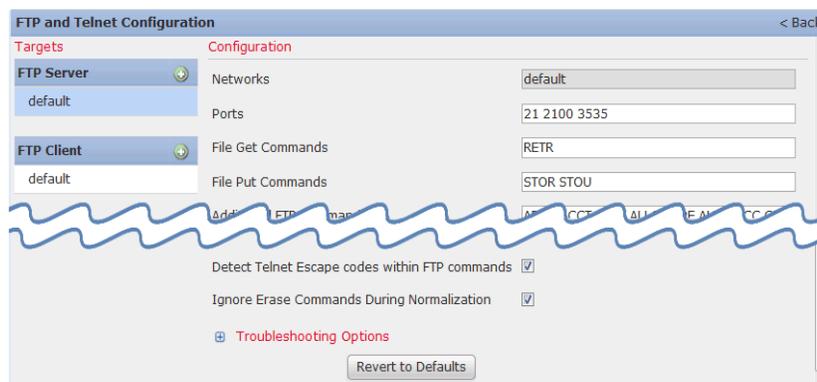

- Add a new server profile. Click the add icon (⊕) next to **FTP Server** on the left side of the page. The Add Target pop-up window appears. Specify one or more IP addresses for the client in the **Server Address** field and click **OK**.

You can specify a single IP address or address block, or a comma-separated list of either or both. You can specify up to 1024 characters, and you can configure up to 255 policies, including the default policy. For information on using IPv4 and IPv6 address blocks in the Sourcefire 3D System, see [IP Address Conventions](#) on page 57.

A new entry appears in the list of FTP servers on the left side of the page, highlighted to indicate that it is selected, and the Configuration section updates to reflect the current configuration for the profile you added.

- Modify the settings for an existing server profile. Click the configured address for a profile you have added under **FTP Server** on the left side of the page, or click **default**.

Your selection is highlighted and the Configuration section updates to display the current configuration for the profile you selected. To delete an existing profile, click the delete icon (🗑) next to the profile you want to remove.

6. Optionally, you can modify any of the following in the Configuration page area:

- Modify the address or addresses listed in the **Networks** field and click any other area of the page.

The highlighted address updates on the left side of the page.

Note that you cannot modify the setting for **Network** in the default profile. The default profile applies to all servers on your network that are not identified in another profile.

- Specify any **Ports** that should be monitored for FTP traffic. Port 21 is the well-known port for FTP traffic.

IMPORTANT! Add the same list of ports indicated here to the TCP client reassembly port list. For more information on configuring TCP reassembly ports, see [Reassembling TCP Streams](#) on page 949.

- Update the FTP commands used to transfer files from server to client in the **File Get Commands** field.
- Update the FTP commands used to transfer files from client to server in the **File Put Commands** field.

IMPORTANT! Do not change the values in the **File Get Commands** and **File Put Commands** field unless directed to do so by Sourcefire Support.

- To detect additional FTP commands outside of those checked by default by the FTP/Telnet preprocessor, type the commands, separated by spaces in the **Additional FTP Commands** field.

You can add as many additional FTP commands as needed.

IMPORTANT! Additional commands you may want to add include XPWD, XCWD, XCUP, XMKD, and XRMD. For more information on these commands, see RFC 775, the Directory oriented FTP commands specification by the Network Working Group.

- Specify the default maximum number of bytes for a command parameter in the **Default Max Parameter Length** field.
- To detect a different maximum parameter length for particular commands, click **Add** next to **Alternate Max Parameter Length**. In the first text box of the row that appears, specify the maximum parameter length. In the second text box, specify the commands, separated by spaces, where this alternate maximum parameter length should apply. You can add as many alternative maximum parameter lengths as needed.
- To check for string format attacks on particular commands, specify the commands, separated by spaces, in the **Check Commands for String Format Attacks** text box.
- To specify the valid format for a command, click **Add** next to **Command Validity**. Specify the command you want to validate, then type a validation statement for the command parameter. For more information on the validation statement syntax, see [Understanding Server-Level FTP Options](#) on page 838.

- To improve performance on FTP data transfers by disabling all inspection other than state inspection on the data transfer channel, enable **Ignore FTP Transfers**.

IMPORTANT! To inspect data transfers, the global FTP/Telnet **Stateful Inspection** option must be selected. For more information on setting global options, see [Understanding Global FTP and Telnet Options](#) on page 832.

- To detect when telnet commands are used over the FTP command channel, select **Detect Telnet Escape Codes within FTP Commands**.
 - To ignore telnet character and line erase commands when normalizing FTP traffic, enable **Ignore Erase Commands during Normalization**.
7. Optionally, click **Configure Rules for FTP and Telnet Configuration** at the top of the page to display rules associated with individual options.
Click **Back** to return to the FTP and Telnet Configuration page.
 8. Optionally, modify the related troubleshooting option only if asked to do so by Sourcefire Support; click the **+** sign next to **Troubleshooting Options** to expand the troubleshooting options section. See [Understanding Troubleshooting Options](#) on page 790 for more information.
 9. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Understanding Client-Level FTP Options

LICENSE: Protection

You can create profiles for FTP clients. Within each profile, you can specify the maximum response length for an FTP response from a client. You can also configure whether the decoder detects bounce attacks and use of telnet commands on the FTP command channel for a particular client.

If no preprocessor rule is mentioned, the option is not associated with a preprocessor rule.

Networks

Use this option to specify one or more IP addresses of FTP clients.

You can specify a single IP address or address block, or a comma-separated list comprised of either or both. You can specify up to 1024 characters, and you can specify up to 255 profiles including the default profile. For information on using IPv4 and IPv6 address blocks in the Sourcefire 3D System, see [IP Address Conventions](#) on page 57.

Note that the `default` setting in the default policy specifies all IP addresses on your monitored network segment that are not covered by another target-based policy. Therefore, you cannot and do not need to specify an IP address or address block for the default policy, and you cannot leave this setting blank in another policy or use address notation to represent **any** (for example, 0.0.0.0/0 or ::/0).

Max Response Length

Use this option to specify the maximum length of a response string from the FTP client.

You can enable rule 125:6 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Detect FTP Bounce Attempts

Use this option to detect FTP bounce attacks.

You can enable rule 125:8 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Allow FTP Bounce to

Use this option to configure a list of additional hosts and ports on those hosts on which FTP PORT commands should not be treated as FTP bounce attacks.

Detect Telnet Escape Codes within FTP Commands

Use this option to detect when telnet commands are used over the FTP command channel.

You can enable rule 125:1 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Ignore Erase Commands During Normalization

When **Detect Telnet Escape Codes within FTP Commands** is selected, use this option to ignore telnet character and line erase commands when normalizing FTP traffic. The setting should match how the FTP client handles telnet erase commands. Note that newer FTP clients typically ignore telnet erase commands, while older clients typically process them.

Configuring Client-Level FTP Options

LICENSE: Protection

You can configure client profiles for FTP clients to monitor FTP traffic from clients. For additional information on the options you can set for monitoring clients, see [Understanding Client-Level FTP Options](#) on page 846. For more information on telnet options, see [Understanding Telnet Options](#) on page 835. For more information on additional FTP options, see [Understanding Server-Level FTP Options](#) on page 838 and [Understanding Global FTP and Telnet Options](#) on

page 832.

To configure client-level FTP options:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

2. Click the edit icon (✎) next to the policy you want to edit.

If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

3. Click **Advanced Settings** in the navigation panel on the left.

The Advanced Settings page appears.

4. You have two choices, depending on whether **FTP and Telnet Configuration** under Application Layer Preprocessors is enabled:

- If the configuration is enabled, click **Edit**.
- If the configuration is disabled, click **Enabled**, then click **Edit**.

The FTP and Telnet Configuration page appears.

5. You have two options:

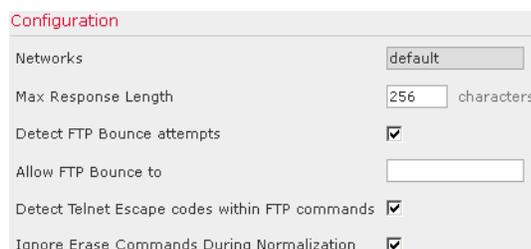

- Add a new client profile. Click the add icon () next to **FTP Client** on the left side of the page. The Add Target pop-up window appears. Specify one or more IP addresses for the client in the **Client Address** field and click **OK**.

You can specify a single IP address or address block, or a comma-separated list of either or both. You can specify up to 1024 characters, and you can configure up to 255 policies, including the default policy. For information on using IPv4 and IPv6 address blocks in the Sourcefire 3D System, see [IP Address Conventions](#) on page 57.

A new entry appears in the list of FTP clients on the left side of the page, highlighted to indicate that it is selected, and the Configuration section updates to reflect the current configuration for the profile you added.

- Modify the settings for an existing client profile. Click the configured address for a profile you have added under **FTP Client on** the left side of the page, or click **default**.

Your selection is highlighted and the Configuration section updates to display the current configuration for the profile you selected. To delete an existing profile, click the delete icon () next to the profile you want to remove.

Configuration	
Networks	default
Max Response Length	256 characters
Detect FTP Bounce attempts	<input checked="" type="checkbox"/>
Allow FTP Bounce to	<input type="text"/>
Detect Telnet Escape codes within FTP commands	<input checked="" type="checkbox"/>
Ignore Erase Commands During Normalization	<input checked="" type="checkbox"/>

6. Optionally, you can modify any of the following in the Configuration page area:

- Optionally, modify the address or addresses listed in the **Networks** field and click any other area of the page.

The highlighted address updates on the left side of the page.

Note that you cannot modify the setting for **Network** in the default profile. The default profile applies to all client hosts on your network that are not identified in another profile.

- Specify, in bytes, the maximum length of responses from the FTP client in the **Max Response Length** field.
- To detect FTP bounce attacks, select **Detect FTP Bounce attempts**.

The FTP/Telnet decoder detects when an FTP PORT command is issued and the specified host does not match the specified host of the client.

- To configure a list of additional hosts and ports where FTP PORT commands should not be treated as FTP bounce attacks, specify each host (or network in CIDR format) followed by a colon (:) and the port or port range in the **Allow FTP Bounce to** field. To enter a range of ports for a host, separate the beginning port in the range and the final port in the range with a dash (-). You can enter multiple hosts by separating the entries for the hosts with a comma.

For example, to permit FTP PORT commands directed to the host 192.168.1.1 at port 21 and commands directed to the host 192.168.1.2 at any of the ports from 22 to 1024, type:

```
192.168.1.1:21, 192.168.1.2:22-1024
```

For information on using CIDR notation and prefix lengths in the Sourcefire 3D System, see [IP Address Conventions](#) on page 57.

IMPORTANT! To specify multiple individual ports for a host, you must repeat the host IP address for each port definition. For example, to specify the ports 22 and 25 on 192.168.1.1, type `192.168.1.1:22, 192.168.1.1:25`.

- To detect when telnet commands are used over the FTP command channel, select **Detect Telnet Escape Codes within FTP Commands**.
 - To ignore telnet character and line erase commands when normalizing FTP traffic, select **Ignore Erase Commands During Normalization**.
7. Optionally, click **Configure Rules for FTP and Telnet Configuration** at the top of the page to display rules associated with individual options.
Click **Back** to return to the FTP and Telnet Configuration page.
 8. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Decoding HTTP Traffic

LICENSE: Protection

The HTTP Inspect preprocessor is responsible for:

- decoding and normalizing HTTP requests sent to and HTTP responses received from web servers on your network
- separating messages sent to web servers into URI, non-cookie header, cookie header, method, and message body components to improve performance of HTTP-related intrusion rules
- separating messages received from web servers into status code, status message, non-set-cookie header, cookie header, and response body components to improve performance of HTTP-related intrusion rules

- detecting possible URI-encoding attacks
- making the normalized data available for additional rule processing

HTTP traffic can be encoded in a variety of formats, making it difficult for rules to appropriately inspect. HTTP Inspect decodes 14 types of encoding, ensuring that your HTTP traffic gets the best inspection possible.

You can configure HTTP Inspect options globally, on a single server, or for a list of servers.

Note the following when using the HTTP Inspect preprocessor:

- The preprocessor engine performs HTTP normalization *statelessly*. That is, it normalizes HTTP strings on a packet-by-packet basis, and can only process HTTP strings that have been reassembled by the TCP stream preprocessor. The HTTP Inspect preprocessor requires TCP stream preprocessing. If TCP stream preprocessing is disabled and you enable the preprocessor, you are prompted when you save the policy whether to enable TCP stream preprocessing. See [Automatically Enabling Advanced Settings](#) on page 787 and [Using TCP Stream Preprocessing](#) on page 940 for more information.
- You must enable HTTP preprocessor rules, which have a generator ID (GID) of 119, if you want these rules to generate events. A link on the configuration page takes you to a filtered view of HTTP preprocessor rules on the intrusion policy Rules page, where you can enable and disable rules and configure other rule actions. See [Setting Rule States](#) on page 743 for more information.
- When a rule that requires this preprocessor is enabled in an intrusion policy where the preprocessor is disabled, you must enable the preprocessor or choose to allow the system to enable it automatically before you can save the policy. For more information, see [Automatically Enabling Advanced Settings](#) on page 787.

See the following sections for more information:

- [Selecting Global HTTP Normalization Options](#) on page 851
- [Configuring Global HTTP Configuration Options](#) on page 853
- [Selecting Server-Level HTTP Normalization Options](#) on page 854
- [Selecting Server-Level HTTP Normalization Encoding Options](#) on page 862
- [Configuring HTTP Server Options](#) on page 865
- [Enabling Additional HTTP Inspect Preprocessor Rules](#) on page 868

Selecting Global HTTP Normalization Options

LICENSE: Protection

The global HTTP options provided for the HTTP Inspect preprocessor control how the preprocessor functions. Use these options to enable or disable HTTP normalization when ports not specified as web server ports receive HTTP traffic.

Note the following:

- If you enable **Unlimited Decompression**, the **Maximum Compressed Data Depth** and **Maximum Decompressed Data Depth** options are automatically set to 65535 when you commit your changes. See [Selecting Server-Level HTTP Normalization Options](#) on page 854 for more information.
- If the values for the **Maximum Compressed Data Depth** and **Maximum Decompressed Data Depth** options are different in an intrusion policy associated with the default action of an access control policy and intrusion policies associated with access control rules, the highest value is used. See [Setting the Default Action](#) on page 428, and [Performing File and Intrusion Inspection on Allowed Traffic](#) on page 511 for more information.

If no preprocessor rule is mentioned, the option is not associated with a preprocessor rule.

Detect Anomalous HTTP Servers

Detects HTTP traffic sent to or received by ports not specified as web server ports.

IMPORTANT! If you turn this option on, make sure to list all ports that do receive HTTP traffic in a server profile on the HTTP Configuration page. If you do not, and you have enabled this option and the accompanying preprocessor rule, normal traffic to and from the server will generate events. The default server profile contains all ports normally used for HTTP traffic, but if you modified that profile, you may need to add those ports to another profile to prevent events from being generated.

You can enable rule 120:1 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Detect HTTP Proxy Servers

Detects HTTP traffic using proxy servers not defined by the **Allow HTTP Proxy Use** option.

You can enable rule 119:17 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Maximum Compressed Data Depth

Sets the maximum size of compressed data to decompress when **Inspect Compressed Data** is enabled. You can specify from 1 to 65535 bytes.

Maximum Decompressed Data Depth

Sets the maximum size of the normalized decompressed data when **Inspect Compressed Data** is enabled. You can specify from 1 to 65535 bytes.

Configuring Global HTTP Configuration Options

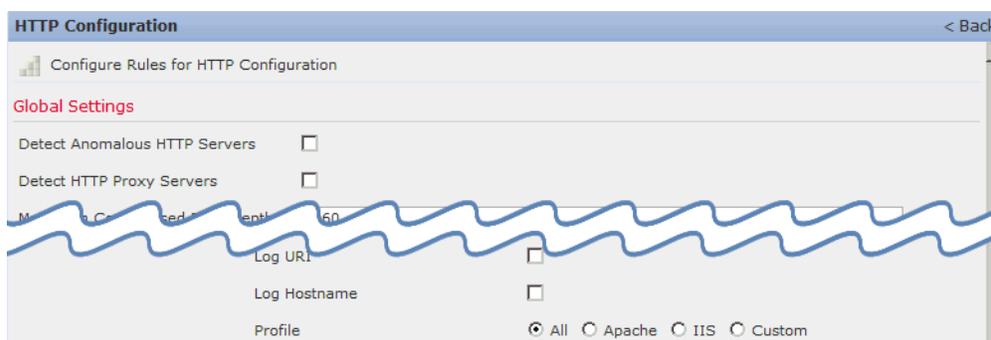

LICENSE: Protection

You can configure detection of HTTP traffic to non-standard ports and on HTTP traffic using proxy servers. For more information on global HTTP configuration options, see [Selecting Global HTTP Normalization Options](#) on page 851.

To configure global HTTP configuration options:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon (✎) next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.
4. You have two choices, depending on whether **HTTP Configuration** under Application Layer Preprocessors is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.The HTTP Configuration page appears.

5. You can modify any of the global options described in [Selecting Global HTTP Normalization Options](#) on page 851.
6. Optionally, click **Configure Rules for HTTP Configuration** at the top of the page to display rules associated with individual options.
Click **Back** to return to the HTTP Configuration page.

7. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Selecting Server-Level HTTP Normalization Options

LICENSE: Protection

You can set server-level options for each server you monitor, globally for all servers, or for a list of servers. Additionally, you can use a predefined server profile to set these options, or you can set them individually to meet the needs of your environment. Use these options, or one of the default profiles that set these options, to specify the HTTP server ports whose traffic you want to normalize, the amount of server response payload you want to normalize, and the types of encoding you want to normalize.

If no preprocessor rule is mentioned, the option is not associated with a preprocessor rule.

Networks

Use this option to specify the IP address of one or more servers.

Note that in addition to a limit of up to 255 total profiles, including the default profile, you can include up to 496 characters, or approximately 26 entries, in an HTTP server list, and specify a total of 256 address entries for all server profiles. For information on using IPv4 CIDR notation and IPv6 prefix lengths in the Sourcefire 3D System, see [IP Address Conventions](#) on page 57.

Note that the `default` setting in the default policy specifies all IP addresses on your monitored network segment that are not covered by another target-based policy. Therefore, you cannot and do not need to specify an IP address or CIDR block/prefix length for the default policy, and you cannot leave this setting blank in another policy or use address notation to represent any (for example, 0.0.0.0/0 or ::/0).

Ports

The ports whose HTTP traffic the preprocessor engine normalizes. Separate multiple port numbers with commas.

IMPORTANT! Any port you add to the HTTP **Ports** list should also be added in each TCP policy to the appropriate list of TCP reassembly ports, depending on whether you are monitoring client or server traffic, or both. Note, however, that reassembling additional traffic types (client, server, both) increases resource demands. For more information on configuring TCP reassembly ports, see [Selecting Stream Reassembly Options](#) on page 950.

Oversize Dir Length

Detects URL directories longer than the specified value.

You can enable rule 119:15 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Client Flow Depth

Specifies the number of bytes for rules to inspect in raw HTTP packets, including header and payload data, in client-side HTTP traffic defined in **Ports**. Client flow depth does not apply when HTTP content rule options within a rule inspect specific parts of a request message. See [HTTP Content Options](#) on page 1069 for more information.

You can specify a value from -1 to 1460. Sourcefire recommends that you set client flow depth to its maximum value. Specify any of the following:

- From 1 to 1460 inspects the specified number of bytes in the first packet. If the first packet contains fewer bytes than specified, inspect the entire packet. Note that the specified value applies to both segmented and reassembled packets.

Note also that a value of 300 typically eliminates inspection of large HTTP Cookies that appear at the end of many client request headers.

- 0 inspects all client-side traffic, including multiple packets in a session and exceeding the 1460 byte limit if necessary. Note that this value is likely to affect performance.
- -1 ignores all client-side traffic.

Server Flow Depth

Specifies the number of bytes for rules to inspect in raw HTTP packets in server-side HTTP traffic specified by **Ports**. Inspection includes the raw header and payload when **Inspect HTTP Responses** disabled and only the raw response body when **Inspect HTTP Response** is enabled.

Server flow depth specifies the number of bytes of raw server response data in a session for rules to inspect in server-side HTTP traffic defined in **Ports**. You can use this option to balance performance and the level of inspection of HTTP server response data. Server flow depth does not apply when HTTP content options within a rule inspect specific parts of a response message. See [HTTP Content Options](#) on page 1069 for more information.

Unlike client flow depth, server flow depth specifies the number of bytes per HTTP response, not per HTTP request packet, for rules to inspect.

You can specify a value from -1 to 65535. Sourcefire recommends that you set the server flow depth to its maximum value. You can specify any of the following:

- From 1 to 65535:

When **Inspect HTTP Responses** is **enabled**, inspects only the raw HTTP response body, and not raw HTTP headers; also inspects decompressed data when **Inspect Compressed Data** is enabled.

When **Inspect HTTP Responses** is **disabled**, inspects the raw packet header and payload.

If the session includes fewer response bytes than specified, rules fully inspect all response packets in a given session, across multiple packets as needed. If the session includes more response bytes than specified, rules inspect only the specified number of bytes for that session, across multiple packets as needed.

Note that a small flow depth value may cause false negatives from rules that target server-side traffic defined in **Ports**. Most of these rules target either the HTTP header or content that is likely to be in the first hundred or so bytes of non-header data. Headers are usually under 300 bytes long, but header size may vary.

Note also that the specified value applies to both segmented and reassembled packets.

- 0 inspects the entire packet for all HTTP server-side traffic defined in **Ports**, including response data in a session that exceeds 65535 bytes.

Note that this value is likely to affect performance.

- -1:

When **Inspect HTTP Responses** is **enabled**, inspects only raw HTTP headers and not the raw HTTP response body.

When **Inspect HTTP Responses** is **disabled**, ignores all server-side traffic defined in **Ports**.

Maximum Header Length

Detects a header field longer than the specified maximum number of bytes in an HTTP request; also in HTTP responses when **Inspect HTTP Responses** is enabled. The value of 0 disables this option. Specify a value from 1 to 65535 to enable it.

You can enable rule 119:19 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Maximum Number of Headers

Detects when the number of headers exceeds this setting in an HTTP request. Specify a value from 1 to 1024 to enable it.

You can enable rule 119:20 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Maximum Number of Spaces

Detects when the number of white spaces in a folded line equals or exceeds this setting in an HTTP request. A value of 0 disables this option. Specify a value from 1 to 65535 to enable it.

You can enable rule 119:26 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

HTTP Client Body Extraction Depth

Specifies the number of bytes to extract from the message body of an HTTP client request. You can use an intrusion rule to inspect the extracted data by selecting the **content** keyword **HTTP Client Body** option. See [HTTP Content Options](#) on page 1069 for more information.

Specify a value from -1 to 65495. Specify -1 to ignore the client body. Specify 0 to extract the entire client body. Note that identifying specific bytes to extract can improve system performance. Note also that you must specify a value from 0 to 65495 for the **HTTP Client Body** option to function in an intrusion rule.

Small Chunk Size

Specifies the maximum number of bytes at which a chunk is considered small. Specify a value of 1 to 255. A value of 0 disables detection of anomalous consecutive small segments. See the **Consecutive Small Chunks** option for more information.

Consecutive Small Chunks

Specifies how many consecutive small chunks represent an abnormally large number in client or server traffic that uses chunked transfer encoding. The **Small Chunk Size** option specifies the maximum size of a small chunk.

For example, set **Small Chunk Size** to 10 and **Consecutive Small Chunks** to 5 to detect 5 consecutive chunks of 10 bytes or less.

You can enable preprocessor rule 119:27 to trigger events on excessive small chunks in client traffic, and rule 120:7 in server traffic. When **Small Chunk Size** is enabled and this option is set to 0 or 1, enabling these rules would trigger an event on every chunk of the specified size or less. See [Setting Rule States](#) on page 743 for more information.

HTTP Methods

Specifies HTTP request methods in addition to GET and POST that you expect the system to encounter in traffic. Use a comma to separate multiple values.

Intrusion rules use the **content** keyword with its **HTTP Method** argument to search for content in HTTP methods. See [HTTP Content Options](#). You can enable rule 119:31 to generate events when a method other than GET, POST, or a method configured for this option is encountered in traffic.

No Alerts

Disables intrusion events when accompanying preprocessor rules are enabled.

IMPORTANT! This option does **not** disable HTTP standard text rules and shared object rules.

Normalize HTTP Headers

When **Inspect HTTP Responses** is enabled, enables normalization of non-cookie data in request and response headers. When **Inspect HTTP Responses** is **not** enabled, enables normalization of the entire HTTP header, including cookies, in request and response headers.

Inspect HTTP Cookies

Enables extraction of cookies from HTTP request headers. Also enables extraction of set-cookie data from response headers when **Inspect HTTP Responses** is enabled. Disabling this option when cookie extraction is not required can improve performance.

Note that the **Cookie:** and **Set-Cookie:** header names, leading spaces on the header line, and the **CRLF** that terminates the header line are inspected as part of the header and not as part of the cookie.

Normalize Cookies in HTTP headers

Enables normalization of cookies in HTTP request headers. When **Inspect HTTP Responses** is enabled, also enables normalization of set-cookie data in response headers. You must select **Inspect HTTP Cookies** before selecting this options.

Allow HTTP Proxy Use

Allows the monitored web server to be used as an HTTP proxy. This option is used only in the inspection of HTTP requests.

Inspect URI Only

Inspects only the URI portion of the normalized HTTP request packet.

Inspect HTTP Responses

Enables extended inspection of HTTP responses so, in addition to decoding and normalizing HTTP request messages, the preprocessor extracts response fields for inspection by the rules engine. Enabling this option causes the system to extract the response header, body, status code, and so on, and also extracts set-cookie data when **Inspect HTTP Cookies** is enabled. For more information, see [HTTP Content Options](#) on page 1069, [Generating Events on the HTTP Encoding Type and Location](#) on page 1175, and [Pointing to a Specific Payload Type](#) on page 1177.

You can enable rules 120:2 and 120:3 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Normalize UTF Encodings to UTF-8

When **Inspect HTTP Responses** is enabled, detects UTF-16LE, UTF-16BE, UTF-32LE, and UTF32-BE encodings in HTTP responses and normalizes them to UTF-8.

You can enable rule 120:4 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Inspect Compressed Data

When **Inspect HTTP Responses** is enabled, enables decompression of gzip and deflate-compatible compressed data in the HTTP response body, and inspection of the normalized decompressed data. The system inspects chunked and non-chunked HTTP response data. The system inspects decompressed data packet by packet across multiple packets as needed; that is, the system does not combine the decompressed data from different packets for inspection. Decompression ends when **Maximum Compressed Data Depth**, **Maximum Decompressed Data Depth**, or the end of the compressed data is reached. Inspection of decompressed data ends when **Server Flow Depth** is reached unless you also select **Unlimited Decompression**. You can use the `file_data` rule keyword to inspect decompressed data; see [Pointing to a Specific Payload Type](#) on page 1177 for more information.

Unlimited Decompression

When **Inspect Compressed Data** is enabled, overrides **Maximum Decompressed Data Depth** across multiple packets; that is, this option enables unlimited decompression across multiple packets. Note that enabling this option does not affect **Maximum Compressed Data Depth** or **Maximum Decompressed Data Depth** within a single packet. Note also that enabling this option sets **Maximum Compressed Data Depth** and **Maximum Decompressed Data Depth** to 65535 when you commit your changes. See [Selecting Global HTTP Normalization Options](#) on page 851.

Normalize Javascript

When **Inspect HTTP Responses** is enabled, enables detection and normalization of Javascript within the HTTP response body. The preprocessor normalizes obfuscated Javascript data such as the unescape and decodeURI functions and the String.fromCharCode method. The preprocessor normalizes the following encodings within the unescape, decodeURI, and decodeURIComponent functions:

- %XX
- %uXXXX
- 0xXX
- \xXX
- \uXXXX

The preprocessor detects consecutive white spaces and normalizes them into a single space. When this option is enabled, a configuration field allows you to specify the maximum number of consecutive white spaces to permit in obfuscated Javascript data. You can enter a value from 1 to 65535. The value 0 disables event generation, regardless of whether the preprocessor rule (120:10) associated with this field is enabled.

The preprocessor also normalizes the Javascript plus (+) operator and concatenates strings using the operator.

You can use the `file_data` keyword to point intrusion rules to the normalized Javascript data. See [Pointing to a Specific Payload Type](#) on page 1177 for more information.

You can enable rules 120:9, 120:10, and 120:11 to generate events for this option, as follows:

Normalize Javascript Option Rules

THIS RULE...	TRIGGERS AN EVENT WHEN...
120:9	the obfuscation level within the preprocessor is greater than or equal to 2.
120:10	the number of consecutive white spaces in the Javascript obfuscated data is greater than or equal to the value configured for the maximum number of consecutive white spaces allowed.
120:11	escaped or encoded data includes more than one type of encoding.

See [Setting Rule States](#) on page 743 for more information.

Extract Original Client IP Address

Enables extraction of the original client IP address from the X-Forwarded-For (XFF) or True-Client-IP HTTP header. You can display the extracted original client IP address in the intrusion events table view. See [Understanding Intrusion Events](#) on page 604 for more information.

You can enable rules 119:23, 119:29 and 119:30 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Log URI

Enables extraction of the raw URI, if present, from HTTP request packets and associates the URI with all intrusion events generated for the session.

When this option is enabled, you can display the first fifty characters of the extracted URI in the HTTP URI column of the intrusion events table view. You can display the complete URI, up to 2048 bytes, in the packet view. See [Understanding Intrusion Events](#) on page 604 and [Viewing Event Information](#) on page 625 for more information.

Log Hostname

Enables extraction of the host name, if present, from the HTTP request Host header and associates the host name with all intrusion events generated for the session. When multiple Host headers are present, extracts the host name from the first header.

When this option is enabled, you can display the first fifty characters of the extracted host name in the HTTP Hostname column of the intrusion events table view. You can display the complete host name, up to 256 bytes, in the packet view. See [Understanding Intrusion Events](#) on page 604 and [Viewing Event Information](#) on page 625 for more information.

You can enable rule 119:25 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Note that when the preprocessor and rule 119:24 are enabled, the preprocessor generates an intrusion event if it detects multiple Host headers in an HTTP request, regardless of the setting for this option. See [Enabling Additional HTTP Inspect Preprocessor Rules](#) on page 868 for more information.

Profile

Specifies the types of encoding that are normalized for HTTP traffic. The system provides a default profile appropriate for most servers, default profiles for Apache servers and IIS servers, and custom default settings that you can tailor to meet the needs of your monitored traffic. See [Selecting Server-Level HTTP Normalization Encoding Options](#) on page 862 for more information.

Selecting Server-Level HTTP Normalization Encoding Options

LICENSE: Protection

You can select server-level HTTP normalization options to specify the types of encoding that are normalized for HTTP traffic, and to cause the system to generate events against traffic containing this type of encoding.

Note that the base36 encoding type has been deprecated. For backward compatibility, the base36 option is allowed in existing intrusion policies, but it does not cause the system to detect base36 traffic.

If no preprocessor rule is mentioned, the option is not associated with a preprocessor rule.

ASCII Encoding

Decodes encoded ASCII characters and specifies whether the rules engine generates an event on ASCII-encoded URIs.

You can enable rule 119:1 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

UTF-8 Encoding

Decodes standard UTF-8 Unicode sequences in the URI.

You can enable rule 119:6 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Microsoft %U Encoding

Decodes the IIS %u encoding scheme that uses %u followed by four characters where the 4 characters are a hex encoded value that correlates to an IIS Unicode codepoint.

TIP! Legitimate clients rarely use %u encodings, so Sourcefire recommends decoding HTTP traffic encoded with %u encodings.

You can enable rule 119:3 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Bare Byte UTF-8 Encoding

Decodes bare byte encoding, which uses non-ASCII characters as valid values in decoding UTF-8 values.

TIP! Bare byte encoding allows the user to emulate an IIS server and interpret non-standard encodings correctly. Sourcefire recommends enabling this option because no legitimate clients encode UTF-8 this way.

You can enable rule 119:4 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Microsoft IIS Encoding

Decodes using Unicode codepoint mapping.

TIP! Sourcefire recommends enabling this option, because it is seen mainly in attacks and evasion attempts.

You can enable rule 119:7 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Double Encoding

Decodes IIS double encoded traffic by making two passes through the request URI performing decodes in each one. Sourcefire recommends enabling this option because it is usually found only in attack scenarios.

You can enable rule 119:2 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Multi-Slash Obfuscation

Normalizes multiple slashes in a row into a single slash.

You can enable rule 119:8 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

IIS Backslash Obfuscation

Normalizes backslashes to forward slashes.

You can enable rule 119:9 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Directory Traversal

Normalizes directory traversals and self-referential directories. If you enable the accompanying preprocessor rules to generate events against this type of traffic, it may generate false positives because some web sites refer to files using directory traversals.

You can enable rules 119:10 and 119:11 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Tab Obfuscation

Normalizes the non-RFC standard of using a tab for a space delimiter. Apache and other non-IIS web servers use the tab character (0x09) as a delimiter in URLs.

IMPORTANT! Regardless of the configuration for this option, the HTTP Inspect preprocessor treats a tab as white space if a space character (0x20) precedes it.

You can enable rule 119:12 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Invalid RFC Delimiter

Normalizes line breaks (n) in URI data.

You can enable rule 119:13 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Webroot Directory Traversal

Detects directory traversals that traverse past the initial directory in the URL.

You can enable rule 119:18 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Tab URI Delimiter

Turns on the use of the tab character (0x09) as a delimiter for a URI. Apache, newer versions of IIS, and some other web servers use the tab character as a delimiter in URLs.

IMPORTANT! Regardless of the configuration for this option, the HTTP Inspect preprocessor treats a tab as white space if a space character (0x20) precedes it.

Non-RFC characters

Detects the non-RFC character list you add in the corresponding field when it appears within incoming or outgoing URI data. When modifying this field, use the hexadecimal format that represents the byte character. If and when you configure this option, set the value with care. Using a character that is very common may overwhelm you with events.

You can enable rule 119:14 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Max Chunk Encoding Size

Detects abnormally large chunk sizes in URI data.

You can enable rules 119:16 and 119:22 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Disable Pipeline Decoding

Disables HTTP decoding for pipelined requests. When this option is disabled, performance is enhanced because HTTP requests waiting in the pipeline are not decoded or analyzed, and are only inspected using generic pattern matching.

Non-Strict URI Parsing

Enables non-strict URI parsing. Use this option only on servers that will accept non-standard URIs in the format "GET /index.html abc xo qr \n". Using this option, the decoder assumes that the URI is between the first and second space, even if there is no valid HTTP identifier after the second space.

Extended ASCII Encoding

Enables parsing of extended ASCII characters in an HTTP request URI. Note that this option is available in custom server profiles only, and not in the default profiles provided for Apache, IIS, or all servers.

Configuring HTTP Server Options

LICENSE: Protection

Use the following procedure to configure HTTP server options. For more information on the HTTP server options, see [Selecting Server-Level HTTP Normalization Options](#) on page 854 and [Selecting Server-Level HTTP Normalization Encoding Options](#) on page 862.

To configure server-level HTTP configuration options:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon () next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.

4. You have two choices, depending on whether **HTTP Configuration** under Application Layer Preprocessors is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

The HTTP Configuration page appears.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. You have two options:

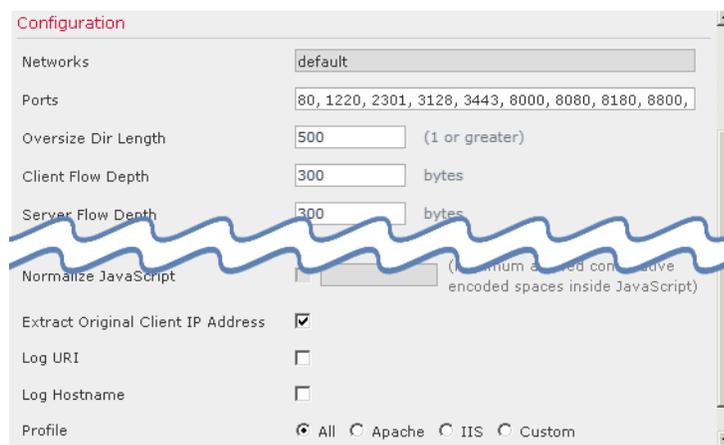

- Add a new server profile. Click the add icon () next to **Servers** on the left side of the page. The Add Target pop-up window appears. Specify one or more IP addresses for the client in the **Server Address** field and click **OK**.

You can specify a single IP address or address block, or a comma-separated list of either or both. You can include up to 496 characters in a list, specify a total of 256 address entries for all server profiles, and create a total of 255 profiles including the default profile. For information on using IPv4 and IPv6 address blocks in the Sourcefire 3D System, see [IP Address Conventions](#) on page 57.

A new entry appears in the list of servers on the left side of the page, highlighted to indicate that it is selected, and the Configuration section updates to reflect the current configuration for the profile you added.

- Modify the settings for an existing profile. Click the configured address for a profile you have added under **Servers** on the left side of the page, or click **default**.

Your selection is highlighted and the Configuration section updates to display the current configuration for the profile you selected. To delete an existing profile, click the delete icon () next to the profile you want to remove.

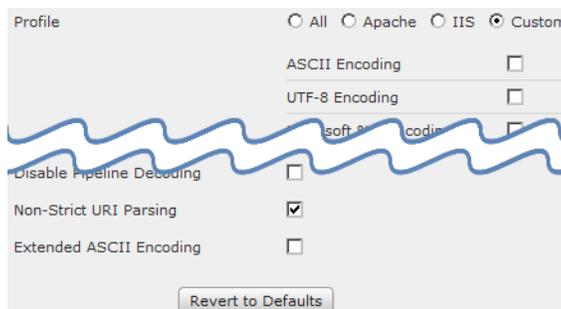

6. Optionally, modify the address or addresses listed in the **Networks** field and click any other area of the page.

The highlighted address updates on the left side of the page.

Note that you cannot modify the setting for **Network** in the default profile. The default profile applies to all servers on your network that are not identified in another profile.

7. In the **Ports** field, list the ports whose traffic you want to inspect with HTTP Inspect. Separate multiple ports with commas.

8. You can modify any of the other options described in [Selecting Server-Level HTTP Normalization Options](#) on page 854.
9. Select a server profile as follows:
 - Select **Custom** to create your own server profile (see [Selecting Server-Level HTTP Normalization Encoding Options](#) on page 862 for more information).
 - Select **All** to use the standard default profile, appropriate for all servers.
 - Select **IIS** to use the default IIS profile.
 - Select **Apache** to use the default Apache profile.
10. If you selected **Custom**, the custom options appear.

11. Configure the HTTP decoding options you want in your profile.
See [Selecting Server-Level HTTP Normalization Options](#) on page 854 for details on available normalization options.
12. Optionally, click **Configure Rules for HTTP Configuration** at the top of the page to display rules associated with individual options.
Click **Back** to return to the HTTP Configuration page.
13. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Enabling Additional HTTP Inspect Preprocessor Rules

LICENSE: Protection

You can enable the rules in the **Preprocessor Rule GID:SID** column of the [Additional HTTP Inspect Preprocessor Rules](#) table to generate events for HTTP Inspect

preprocessor rules that are not associated with specific configuration options. See [Setting Rule States](#) on page 743 for more information.

Additional HTTP Inspect Preprocessor Rules

PREPROCESSOR RULE GID:SID	DESCRIPTION
120:5	Generates an event when UTF-7 encoding is encountered in HTTP response traffic; UTF-7 should only appear where 7-bit parity is required, such as in SMTP traffic.
119:21	Generates an event when an HTTP request header has more than one <code>content-length</code> field.
119:24	Generates an event when an HTTP request has more than one Host header.
119:28 120:8	When enabled, these rules do not generate events.
119:32	Generates an event when HTTP version 0.9 is encountered in traffic. Note that the TCP stream configuration must also be enabled. See Using TCP Stream Preprocessing on page 940.
119:33	Generates an event when an HTTP URI includes an unescaped space.
119:34	Generates an event when a TCP connection contains 24 or more pipelined HTTP requests.

Using the Sun RPC Preprocessor

LICENSE: Protection

RPC (Remote Procedure Call) normalization takes fragmented RPC records and normalizes them to a single record so the rules engine can inspect the complete record. For example, an attacker may attempt to discover the port where RPC `admin` runs. Some UNIX hosts use RPC `admin` to perform remote distributed system tasks. If the host performs weak authentication, a malicious user could take control of remote administration. The standard text rule (generator ID: 1) with the Snort ID (SID) 575 detects this attack by searching for content in specific locations to identify inappropriate `portmap GETPORT` requests.

Ports

Specify the ports whose traffic you want to normalize. In the interface, list multiple ports separated by commas. Typical RPC ports are 111 and 32771. If your network sends RPC traffic to other ports, consider adding them.

IMPORTANT! Any port you add to the RPC **Ports** list should also be added in each TCP policy to the appropriate list of TCP reassembly ports, depending on whether you are monitoring client or server traffic, or both. Note, however, that reassembling additional traffic types (client, server, both) increases resource demands. For more information on configuring TCP reassembly ports, see [Selecting Stream Reassembly Options](#) on page 950.

Detect fragmented RPC records

Detects RPC fragmented records.

You can enable rules 106:1 and 106:5 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Detect multiple records in one packet

Detects more than one RPC request per packet (or reassembled packet).

You can enable rule 106:2 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Detect fragmented record sums which exceed one fragment

Detects reassembled fragment record lengths that exceed the current packet length.

You can enable rule 106:3 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Detect single fragment records which exceed the size of one packet

Detects partial records

You can enable rule 106:4 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Configuring the Sun RPC Preprocessor

LICENSE: Protection

You can use the following procedure to configure the Sun RPC preprocessor. For more information on the Sun RPC preprocessor configuration options, see [Using the Sun RPC Preprocessor](#) on page 869.

To configure the Sun RPC preprocessor:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon (✎) next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.
4. You have two choices, depending on whether **Sun RPC Configuration** under Application Layer Preprocessors is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

The Sun RPC Configuration page appears.

Settings	
Ports	111, 32770, 32771, 32772, 32773
Detect fragmented RPC records	<input type="checkbox"/>
Detect multiple records in one packet	<input type="checkbox"/>
Detect fragmented record sums which exceed one packet	<input type="checkbox"/>
Detect single fragment records which exceed the size of one packet	<input type="checkbox"/>

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. In the **Ports** field, type the port numbers where you want to decode RPC traffic. Separate multiple ports with commas.
6. You can select or clear any of the following detection options on the Sun RPC Configuration page:
 - **Detect fragmented RPC records**
 - **Detect multiple records in one packet**
 - **Detect fragmented record sums which exceed one packet**
 - **Detect single fragment records which exceed the size of one packet**

7. Optionally, click **Configure Rules for Sun RPC Configuration** at the top of the page to display rules associated with individual options.
Click **Back** to return to the Sun RPC Configuration page.
8. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Decoding the Session Initiation Protocol

LICENSE: Protection

The Session Initiation Protocol (SIP) provides call setup, modification, and teardown of one or more sessions for one or more users of such client applications as Internet telephony, multimedia conferencing, instant messaging, online gaming, and file transfer. A *method* field in each SIP request identifies the purpose of the request, and a Request-URI specifies where to send the request. A status code in each SIP response indicates the outcome of the requested action.

After calls are set up using SIP, the Real-time Transport Protocol (RTP) is responsible for subsequent audio and video communication; this part of the session is sometimes referred to as the call channel, the data channel, or the audio/video data channel. RTP uses the Session Description Protocol (SDP) within the SIP message body for data-channel parameter negotiation, session announcement, and session invitation.

The SIP preprocessor is responsible for:

- decoding and analyzing SIP 2.0 traffic
- extracting the SIP header and message body, including SDP data when present, and passing the extracted data to the rules engine for further inspection
- generating events when the following conditions are detected and the corresponding preprocessor rules are enabled: anomalies and known vulnerabilities in SIP packets; out-of-order and invalid call sequences
- optionally ignoring the call channel

The preprocessor identifies the RTP channel based on the port identified in the SDP message, which is embedded in the SIP message body, but the preprocessor does not provide RTP protocol inspection.

Note the following when using the SIP preprocessor:

- UDP typically carries media sessions supported by SIP. UDP stream preprocessing provides SIP session tracking for the SIP preprocessor. UDP session tracking must be enabled before you can save a policy with the SIP preprocessor enabled. See [Using UDP Stream Preprocessing](#) on page 956

and [Automatically Enabling Advanced Settings](#) on page 787 for more information.

- SIP rule keywords allow you to point to the SIP packet header or message body and to limit detection to packets for specific SIP methods or status codes. For more information, see [SIP Keywords](#) on page 1125.
- When enabled, the preprocessor generates no events before sending the extracted data to the rules engine unless you also enable the accompanying rules with generator ID (GID) 140. A link on the configuration page takes you to a filtered view of SIP preprocessor rules on the intrusion policy Rules page, where you can enable and disable rules and configure other rule actions. See [Setting Rule States](#) on page 743 for more information.
- When a shared object rule or standard text rule that requires this preprocessor is enabled in an intrusion policy where the preprocessor is disabled, you must enable the preprocessor or choose to allow the system to enable it automatically before you can save the policy. For more information, see [Automatically Enabling Advanced Settings](#) on page 787.

See the following sections for more information:

- [Selecting SIP Preprocessor Options](#) on page 873
- [Configuring the SIP Preprocessor](#) on page 875
- [Enabling Additional SIP Preprocessor Rules](#) on page 876

Selecting SIP Preprocessor Options

LICENSE: Protection

The following list describes SIP preprocessor options you can modify.

For the **Maximum Request URI Length**, **Maximum Call ID Length**, **Maximum Request Name Length**, **Maximum From Length**, **Maximum To Length**, **Maximum Via Length**, **Maximum Contact Length**, and **Maximum Content Length** options, you can specify from 1 to 65535 bytes, or 0 to disable event generation for the option regardless of whether the associated rule is enabled.

If no preprocessor rule is mentioned, the option is not associated with a preprocessor rule.

Ports

Specifies the ports to inspect for SIP traffic. You can specify an integer from 0 to 65535. Separate multiple port numbers with commas.

Methods to Check

Specifies SIP methods to detect. You can specify any of the following currently defined SIP methods:

`ack, benotify, bye, cancel, do, info, invite, join, message, notify, options, prack, publish, quath, refer, register, service, sprack, subscribe, unsubscribe, update`

Methods are case-insensitive. The method name can include alphabetic characters, numbers, and the underscore character. No other special characters are permitted. Separate multiple methods with commas.

Because new SIP methods might be defined in the future, your configuration can include an alphabetic string that is not currently defined. The system supports up to 32 methods, including the 21 currently defined methods and an additional 11 methods. The system ignores any undefined methods that you might configure.

Note that, in addition to any methods you specify for this option, the 32 total methods includes methods specified using the `sip_method` keyword in intrusion rules. See [sip_method](#) on page 1126 for more information.

Maximum Dialogs within a Session

Specifies the maximum number of dialogs allowed within a stream session. If more dialogs than this number are created, the oldest dialogs are dropped until the number of dialogs does not exceed the maximum number specified; an event also triggers when rule 140:27 is enabled.

You can specify an integer from 1 to 4194303.

Maximum Request URI Length

Specifies the maximum number of bytes to allow in the Request-URI header field. A longer URI triggers an event when rule 140:3 is enabled. The request URI field indicates the destination path or page for the request.

Maximum Call ID Length

Specifies the maximum number of bytes to allow in the request or response Call-ID header field. A longer Call-ID triggers an event when rule 140:5 is enabled. The Call-ID field uniquely identifies the SIP session in requests and responses.

Maximum Request Name Length

Specifies the maximum number of bytes to allow in the request name, which is the name of the method specified in the CSeq transaction identifier. A longer request name triggers an event when rule 140:7 is enabled.

Maximum From Length

Specifies the maximum number of bytes to allow in the request or response From header field. A longer From triggers an event when rule 140:9 is enabled. The From field identifies the message initiator.

Maximum To Length

Specifies the maximum number of bytes to allow in the request or response To header field. A longer To triggers an event when rule 140:11 is enabled. The To field identifies the message recipient.

Maximum Via Length

Specifies the maximum number of bytes to allow in the request or response Via header field. A longer Via triggers an event when rule 140:13 is enabled. The Via field provides the path followed by the request and, in a response, receipt information.

Maximum Contact Length

Specifies the maximum number of bytes to allow in the request or response Contact header field. A longer Contact triggers an event when rule 140:15 is enabled. The Contact field provides a URI that specifies the location to contact with subsequent messages.

Maximum Content Length

Specifies the maximum number of bytes to allow in the content of the request or response message body. Longer content triggers an event when rule 140:16 is enabled.

Ignore Audio/Video Data Channel

Enables and disables inspection of data channel traffic. Note that the preprocessor continues inspection of other non-data-channel SIP traffic when you enable this option.

Configuring the SIP Preprocessor

LICENSE: Protection

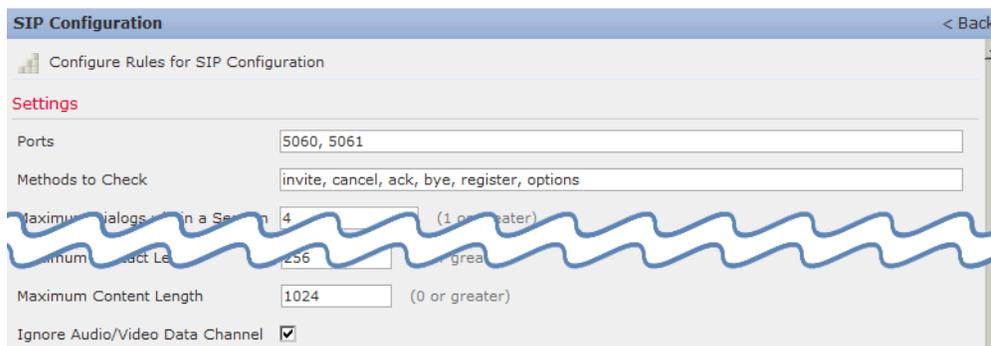

Use the following procedure to configure the SIP preprocessor.

To configure the SIP preprocessor:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.

2. Click the edit icon (✎) next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.
4. You have two choices, depending on whether **SIP Configuration** under Application Layer Preprocessors is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.The SIP Configuration page appears.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. You can modify any of the options described in [Selecting SIP Preprocessor Options](#) on page 873.
6. Optionally, click **Configure Rules for SIP Configuration** at the top of the page to display rules associated with individual options.
Click **Back** to return to the SIP Configuration page.
7. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Enabling Additional SIP Preprocessor Rules

LICENSE: Protection

The SIP preprocessor rules in the following table are not associated with specific configuration options. As with other SIP preprocessor rules, you must enable these rules if you want them to generate events. See [Setting Rule States](#) on

page 743 for information on enabling rules.

Additional SIP Preprocessor Rules

PREPROCESSOR RULE GID:SID	DESCRIPTION
140:1	Generates an event when the preprocessor is monitoring the maximum number of SIP sessions allowed by the system.
140:2	Generates an event when the required Request_URI field is empty in a SIP request.
140:4	Generates an event when the Call-ID header field is empty in a SIP request or response.
140:6	Generates an event when the value for the sequence number in the SIP request or response CSeq field is not a 32-bit unsigned integer less than 231.
140:8	Generates an event an event when the From header field is empty in a SIP request or response.
140:10	Generates an event when the To header field is empty in a SIP request or response.
140:12	Generates an event when the Via header field is empty in a SIP request or response
140:14	Generates an event when the required Contact header field is empty in a SIP request or response.
140:17	Generates an event when a single SIP request or response packet in UDP traffic contains multiple messages. Note that older SIP versions supported multiple messages, but SIP 2.0 supports only one message per packet.
140:18	Generates an event when the actual length of the message body in a SIP request or response in UDP traffic does not match the value specified in the Content-Length header field in a SIP request or response.
140:19	Generates an event when the preprocessor does not recognize a method name in the CSeq field of a SIP response.
140:20	Generates an event when the SIP server does not challenge an authenticated invite message. Note that this occurs in the case of the InviteReplay billing attack.

Additional SIP Preprocessor Rules (Continued)

PREPROCESSOR RULE GID:SID	DESCRIPTION
140:21	Generates an event when session information changes before the call is set up. Note that this occurs in the case of the FakeBusy billing attack.
140:22	Generates an event when the response status code is not a three-digit number.
140:23	Generates an event when the Content-Type header field does not specify a content type and the message body contains data.
140:24	Generates an event when the SIP version is not 1, 1.1, or 2.0.
140:25	Generates an event when the method specified in the CSeq header and the method field do not match in a SIP request.
140:26	Generates an event when the preprocessor does not recognize the method named in the SIP request method field.

Configuring the GTP Command Channel

LICENSE: Protection

The General Service Packet Radio (GPRS) Tunneling Protocol (GTP) provides communication over a GTP core network. The GTP preprocessor detects anomalies in GTP traffic and forwards command channel signalling messages to the rules engine for inspection. You can use the `gtp_version`, `gtp_type`, and `gtp_info` rule keywords to inspect GTP command channel traffic for exploits.

A single configuration option allows you to modify the default setting for the ports that the preprocessor inspects for GTP command channel messages.

Note the following information regarding the use of the GTP preprocessor:

- The GTP preprocessor requires UDP stream configuration. When you enable the GTP preprocessor and UDP stream configuration is disabled, you are prompted whether to enable UDP stream configuration when you save the policy.
- Both the GTP command channel configuration and UDP stream configuration advanced settings must be enabled to allow processing of rules using GTP keywords. When either is disabled and you enable rules that use GTP keywords, you are prompted whether to enable the advanced setting when you save the policy. See [Automatically Enabling Advanced Settings](#) on page 787.

You must enable the GTP preprocessor rules in the following table if you want them to generate events. See [Setting Rule States](#) on page 743 for information on enabling rules.

GTP Preprocessor Rules

PREPROCESSOR RULE GID:SID	DESCRIPTION
143:1	Generates an event when the preprocessor detects an invalid message length.
143:2	Generates an event when the preprocessor detects an invalid information element length.
143:3	Generates an event when the preprocessor detects information elements that are out of order.

You can use the following procedure to modify the ports the GTP preprocessor monitors for GTP command messages.

To configure the GTP command channel:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon () next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.
4. You have two choices, depending on whether **GTP Command Channel Configuration** under Application Layer Preprocessors is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.
 The GTP Command Channel Configuration page appears.

5. Optionally, modify the ports that the preprocessor inspects for GTP command messages. You can specify an integer from 0 to 65535. Use commas to separate multiple ports.
6. Optionally, click **Configure Rules for GTP Command Channel Configuration** at the top of the page to display rules associated with individual options.
Click **Back** to return to the GTP Command Channel Configuration page.
7. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Decoding IMAP Traffic

LICENSE: Protection

The Internet Message Application Protocol (IMAP) is used to retrieve email from a remote IMAP server. The IMAP preprocessor inspects server-to-client IMAP4 traffic and, when associated preprocessor rules are enabled, generates events on anomalous traffic. The preprocessor can also extract and decode email attachments in client-to-server IMAP4 traffic and send the attachment data to the rules engine. You can use the `file_data` keyword in an intrusion rule to point to the attachment data. See [Pointing to a Specific Payload Type](#) on page 1177 for more information.

Extraction and decoding include multiple attachments, when present, and large attachments that span multiple packets.

Note the following when using the IMAP preprocessor:

- Because IMAP traffic is carried over TCP/IP connections, the IMAP preprocessor requires TCP stream preprocessing. If TCP stream preprocessing is disabled and you enable the IMAP preprocessor, you are prompted when you save the policy whether to enable TCP stream preprocessing. See [Automatically Enabling Advanced Settings](#) on page 787 and [Using TCP Stream Preprocessing](#) on page 940 for more information.
- If you want IMAP preprocessor rules to generate events, you must enable the rules. IMAP preprocessor rules have a generator ID (GID) of 141. A link on the configuration page takes you to a filtered view of IMAP preprocessor rules on the intrusion policy Rules page, where you can enable and disable rules and configure other rule actions. See [Setting Rule States](#) on page 743 for more information.

See the following sections for more information:

- [Selecting IMAP Preprocessor Options](#) on page 881
- [Configuring the IMAP Preprocessor](#) on page 882
- [Enabling Additional IMAP Preprocessor Rules](#) on page 884

Selecting IMAP Preprocessor Options

LICENSE: Protection

The following list describes the IMAP preprocessor options you can modify.

Note that decoding, or extraction when the MIME email attachment does not require decoding, includes multiple attachments when present, and large attachments that span multiple packets.

Note also that when the values for the **Base64 Decoding Depth**, **7-Bit/8-Bit/Binary Decoding Depth**, **Quoted-Printable Decoding Depth**, or **Unix-to-Unix Decoding Depth** options are different in an intrusion policy associated with the default action of an access control policy and intrusion policies associated with access control rules, the highest value is used. See [Setting the Default Action](#) on page 428, and [Performing File and Intrusion Inspection on Allowed Traffic](#) on page 511 for more information.

If no preprocessor rule is mentioned, the option is not associated with a preprocessor rule.

Ports

Specifies the ports to inspect for IMAP traffic. You can specify an integer from 0 to 65535. Separate multiple port numbers with commas.

IMPORTANT! Any port you add to the IMAP port list should also be added to the TCP client reassembly list for each TCP policy. For information on configuring TCP reassembly ports, see [Selecting Stream Reassembly Options](#) on page 950.

Base64 Decoding Depth

Specifies the maximum number of bytes to extract and decode from each Base64 encoded MIME email attachment. You can specify from 1 to 65535 bytes, or specify 0 to decode all the Base64 data. Specify -1 to ignore Base64 data.

Note that positive values not divisible by 4 are rounded up to the next multiple of 4 except for the values 65533, 65534, and 65535, which are rounded down to 65532.

When Base64 decoding is enabled, you can enable rule 141:4 to generate an event when decoding fails; decoding could fail, for example, because of incorrect encoding or corrupted data.

7-Bit/8-Bit/Binary Decoding Depth

Specifies the maximum bytes of data to extract from each MIME email attachment that does not require decoding. These attachment types include 7-bit, 8-bit, binary, and various multipart content types such as plain text, jpeg images, mp3 files, and so on. You can specify from 1 to 65535 bytes, or specify 0 to extract all data in the packet. Specify -1 to ignore non-decoded data.

Quoted-Printable Decoding Depth

Specifies the maximum number of bytes to extract and decode from each quoted-printable (QP) encoded MIME email attachment. You can specify from 1 to 65535 bytes, or specify 0 to decode all QP encoded data in the packet. Specify -1 to ignore QP encoded data.

When quoted-printable decoding is enabled, you can enable rule 141:6 to generate an event when decoding fails; decoding could fail, for example, because of incorrect encoding or corrupted data.

Unix-to-Unix Decoding Depth

Specifies the maximum number of bytes to extract and decode from each Unix-to-Unix encoded (uuencoded) email attachment. You can specify from 1 to 65535 bytes, or specify 0 to decode all uuencoded data in the packet. Specify -1 to ignore uuencoded data.

When Unix-to-Unix decoding is enabled, you can enable rule 141:7 to generate an event when decoding fails; decoding could fail, for example, because of incorrect encoding or corrupted data.

Configuring the IMAP Preprocessor

LICENSE: Protection

Use the following procedure to configure the IMAP preprocessor. For additional information on IMAP preprocessor configuration options, see [Selecting IMAP Preprocessor Options](#) on page 881.

To configure the IMAP preprocessor:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

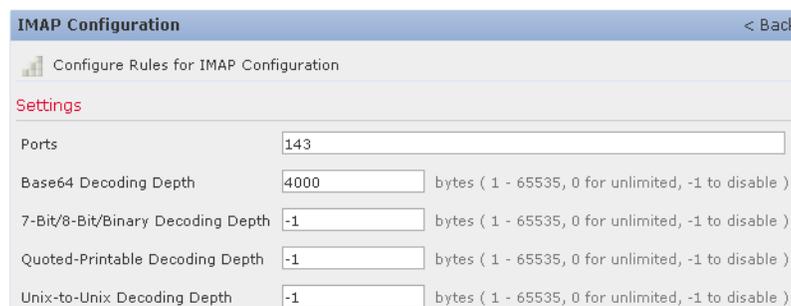

2. Click the edit icon () next to the policy you want to edit.

If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.
4. You have two choices, depending on whether **IMAP Configuration** under Application Layer Preprocessors is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

The IMAP Configuration page appears.

The screenshot shows the 'IMAP Configuration' page with a '< Back' button in the top right. Below the title is a sub-header 'Configure Rules for IMAP Configuration'. Underneath is a 'Settings' section with a table of configuration options:

Setting	Value	Notes
Ports	143	
Base64 Decoding Depth	4000	bytes (1 - 65535, 0 for unlimited, -1 to disable)
7-Bit/8-Bit/Binary Decoding Depth	-1	bytes (1 - 65535, 0 for unlimited, -1 to disable)
Quoted-Printable Decoding Depth	-1	bytes (1 - 65535, 0 for unlimited, -1 to disable)
Unix-to-Unix Decoding Depth	-1	bytes (1 - 65535, 0 for unlimited, -1 to disable)

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. Specify the **Ports** where IMAP traffic should be decoded. Separate multiple port numbers with commas.

IMPORTANT! Any port you add to the IMAP port list should also be added to the TCP client reassembly list for each TCP policy. For information on configuring TCP reassembly ports, see [Selecting Stream Reassembly Options](#) on page 950.

6. Specify the maximum bytes of data to extract and decode from any combination of the following email attachment types:
 - **Base64 Decoding Depth**
 - **7-Bit/8-Bit/Binary Decoding Depth** (includes various multipart content types such as plain text, jpeg images, mp3 files, and so on)
 - **Quoted-Printable Decoding Depth**
 - **Unix-to-Unix Decoding Depth**

For each type, you can specify from 1 to 65535 bytes, or specify 0 to extract and, when necessary, decode all data in the packet. Specify -1 to ignore data for an attachment type.

You can use the `file_data` rule keyword in intrusion rules to inspect the attachment data. See [Pointing to a Specific Payload Type](#) on page 1177 for more information.

7. Optionally, click **Configure Rules for IMAP Configuration** at the top of the page to display rules associated with individual options.
Click **Back** to return to the IMAP Configuration page.
8. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Enabling Additional IMAP Preprocessor Rules

LICENSE: Protection

The IMAP preprocessor rules in the following table are not associated with specific configuration options. As with other IMAP preprocessor rules, you must enable these rules if you want them to generate events. See [Setting Rule States](#) on page 743 for information on enabling rules.

Additional IMAP Preprocessor Rules

PREPROCESSOR RULE GID:SID	DESCRIPTION
141:1	Generates an event when the preprocessor detects a client command that is not defined in RFC 3501.
141:2	Generates an event when the preprocessor detects a server response that is not defined in RFC 3501.
141:3	Generates an event when the preprocessor is using the maximum amount of memory allowed by the system. At this point, the preprocessor stops decoding until memory becomes available.

Decoding POP Traffic

LICENSE: Protection

The Post Office Protocol (POP) is used to retrieve email from a remote POP mail server. The POP preprocessor inspects server-to-client POP3 traffic and, when associated preprocessor rules are enabled, generates events on anomalous traffic. The preprocessor can also extract and decode email attachments in client-to-server POP3 traffic and send the attachment data to the rules engine. You can use the `file_data` keyword in an intrusion rule to point to attachment data. See [Pointing to a Specific Payload Type](#) on page 1177 for more information.

Extraction and decoding include multiple attachments, when present, and large attachments that span multiple packets.

Note the following when using the POP preprocessor:

- Because POP traffic is carried over TCP/IP connections, the POP preprocessor requires TCP stream preprocessing. If TCP stream preprocessing is disabled and you enable the POP preprocessor, you are prompted when you save the policy whether to enable TCP stream preprocessing. See [Automatically Enabling Advanced Settings](#) on page 787 and [Using TCP Stream Preprocessing](#) on page 940 for more information.
- If you want POP preprocessor rules to generate events, you must enable the rules. POP preprocessor rules have a generator ID (GID) of 142. A link on the configuration page takes you to a filtered view of POP preprocessor rules on the intrusion policy Rules page, where you can enable and disable rules and configure other rule actions. See [Setting Rule States](#) on page 743 for more information.

See the following sections for more information:

- [Selecting POP Preprocessor Options](#) on page 885
- [Configuring the POP Preprocessor](#) on page 887
- [Enabling Additional POP Preprocessor Rules](#) on page 889

Selecting POP Preprocessor Options

LICENSE: Protection

The following list describes the POP preprocessor options you can modify.

Note that decoding, or extraction when the MIME email attachment does not require decoding, includes multiple attachments when present, and large attachments that span multiple packets.

Note also that when the values for the **Base64 Decoding Depth**, **7-Bit/8-Bit/Binary Decoding Depth**, **Quoted-Printable Decoding Depth**, or **Unix-to-Unix Decoding Depth** options are different in an intrusion policy associated with the default action of an access control policy and intrusion policies associated with access control rules, the highest value is used. See [Setting the Default Action](#) on page 428, and [Performing File and Intrusion Inspection on Allowed Traffic](#) on page 511 for more information.

If no preprocessor rule is mentioned, the option is not associated with a preprocessor rule.

Ports

Specifies the ports to inspect for POP traffic. You can specify an integer from 0 to 65535. Separate multiple port numbers with commas.

IMPORTANT! Any port you add to the POP port list should also be added to the TCP client reassembly list for each TCP policy. For information on configuring TCP reassembly ports, see [Selecting Stream Reassembly Options](#) on page 950.

Base64 Decoding Depth

Specifies the maximum number of bytes to extract and decode from each Base64 encoded MIME email attachment. You can specify from 1 to 65535 bytes, or specify 0 to decode all the Base64 data. Specify -1 to ignore Base64 data.

Note that positive values not divisible by 4 are rounded up to the next multiple of 4 except for the values 65533, 65534, and 65535, which are rounded down to 65532.

When Base64 decoding is enabled, you can enable rule 142:4 to generate an event when decoding fails; decoding could fail, for example, because of incorrect encoding or corrupted data. See [Setting Rule States](#) on page 743 for more information.

7-Bit/8-Bit/Binary Decoding Depth

Specifies the maximum bytes of data to extract from each MIME email attachment that does not require decoding. These attachment types include 7-bit, 8-bit, binary, and various multipart content types such as plain text, jpeg images, mp3 files, and so on. You can specify from 1 to 65535 bytes, or specify 0 to extract all data in the packet. Specify -1 to ignore non-decoded data.

Quoted-Printable Decoding Depth

Specifies the maximum number of bytes to extract and decode from each quoted-printable (QP) encoded MIME email attachment. You can specify from 1 to 65535 bytes, or specify 0 to decode all QP encoded data in the packet. Specify -1 to ignore QP encoded data.

When quoted-printable decoding is enabled, you can enable rule 142:6 to generate an event when decoding fails; decoding could fail, for example, because of incorrect encoding or corrupted data. See [Setting Rule States](#) on page 743 for more information.

Unix-to-Unix Decoding Depth

Specifies the maximum number of bytes to extract and decode from each Unix-to-Unix encoded (uuencoded) email attachment. You can specify from 1 to 65535 bytes, or specify 0 to decode all uuencoded data in the packet. Specify -1 to ignore uuencoded data.

When Unix-to-Unix decoding is enabled, you can enable rule 142:7 to generate an event when decoding fails; decoding could fail, for example, because of incorrect encoding or corrupted data. See [Setting Rule States](#) on page 743 for more information.

Configuring the POP Preprocessor

LICENSE: Protection

Use the following procedure to configure the POP preprocessor. For additional information on POP preprocessor configuration options, see [Selecting POP Preprocessor Options](#) on page 885.

To configure the POP preprocessor:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon () next to the policy you want to edit.
If you have unsaved advanced editor changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.

- You have two choices, depending on whether **POP Configuration** under Application Layer Preprocessors is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

The POP Configuration page appears.

The screenshot shows the 'POP Configuration' page with a '< Back' link in the top right. Below the title is a 'Configure Rules for POP Configuration' section. Underneath is a 'Settings' section with five rows of configuration options, each with a text input field and a help text: 'Ports' (110), 'Base64 Decoding Depth' (4000), '7-Bit/8-Bit/Binary Decoding Depth' (-1), 'Quoted-Printable Decoding Depth' (-1), and 'Unix-to-Unix Decoding Depth' (-1). The help text for all depth settings is 'bytes (1 - 65535, 0 for unlimited, -1 to disable)'.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

- Specify the **Ports** where IMAP traffic should be decoded. Separate multiple port numbers with commas.

IMPORTANT! Any port you add to the POP port list should also be added to the TCP client reassembly list for each TCP policy. For information on configuring TCP reassembly ports, see [Selecting Stream Reassembly Options](#) on page 950.

- Specify the maximum bytes of data to extract and decode from any combination of the following email attachment types:
 - Base64 Decoding Depth**
 - 7-Bit/8-Bit/Binary Decoding Depth** (includes various multipart content types such as plain text, jpeg images, mp3 files, and so on)
 - Quoted-Printable Decoding Depth**
 - Unix-to-Unix Decoding Depth**

For each type, you can specify from 1 to 65535 bytes, or specify 0 to extract and, when necessary, decode all data in the packet. Specify -1 to ignore data for an attachment type.

You can use the `file_data` rule keyword in intrusion rules to inspect the attachment data. See [Pointing to a Specific Payload Type](#) on page 1177 for more information.

- Optionally, click **Configure Rules for POP Configuration** at the top of the page to display rules associated with individual options.
Click **Back** to return to the POP Configuration page.

8. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Enabling Additional POP Preprocessor Rules

LICENSE: Protection

The POP preprocessor rules in the following table are not associated with specific configuration options. As with other POP preprocessor rules, you must enable these rules if you want them to generate events. See [Setting Rule States](#) on page 743 for information on enabling rules.

Additional POP Preprocessor Rules

PREPROCESSOR RULE GID:SID	DESCRIPTION
142:1	Generates an event when the preprocessor detects a client command that is not defined in RFC 1939.
142:2	Generates an event when the preprocessor detects a server response that is not defined in RFC 1939.
142:3	Generates an event when the preprocessor is using the maximum amount of memory allowed by the system. At this point, the preprocessor stops decoding until memory becomes available.

Decoding SMTP Traffic

LICENSE: Protection

The SMTP preprocessor instructs the rules engine to normalize SMTP commands. The preprocessor can also extract and decode email attachments in client-to-server traffic and, depending on the software version, extract email file names, addresses, and header data to provide context when displaying intrusion events triggered by SMTP traffic.

Note the following when using the SMTP preprocessor:

- The SMTP preprocessor requires TCP stream preprocessing. If TCP stream preprocessing is disabled and you enable the SMTP preprocessor, you are prompted when you save the policy whether to enable TCP stream preprocessing. See [Automatically Enabling Advanced Settings](#) on page 787 and [Using TCP Stream Preprocessing](#) on page 940 for more information.
- You must enable SMTP preprocessor rules, which have a generator ID (GID) of 124, if you want these rules to generate events. A link on the configuration page takes you to a filtered view of SMTP preprocessor rules on the intrusion policy Rules page, where you can enable and disable rules and configure other rule actions. See [Setting Rule States](#) on page 743 for more information.

For more information, see the following sections:

- [Understanding SMTP Decoding](#) on page 890
- [Configuring SMTP Decoding](#) on page 895
- [Enabling SMTP Maximum Decoding Memory Alerting](#) on page 899

Understanding SMTP Decoding

LICENSE: Protection

You can enable or disable normalization, and you can configure options to control the types of anomalous traffic the SMTP decoder detects.

Note that decoding, or extraction when the MIME email attachment does not require decoding, includes multiple attachments when present, and large attachments that span multiple packets.

Note also that when the values for the **Base64 Decoding Depth**, **7-Bit/8-Bit/Binary Decoding Depth**, **Quoted-Printable Decoding Depth**, or **Unix-to-Unix Decoding Depth** options are different in an intrusion policy associated with the default action of an access control policy and intrusion policies associated with access control rules, the highest value is used. See [Setting the Default Action](#) on page 428, and [Performing File and Intrusion Inspection on Allowed Traffic](#) on page 511 for more information.

If no preprocessor rule is mentioned, the option is not associated with a preprocessor rule.

Ports

Specifies the ports whose SMTP traffic you want to normalize. You can specify an integer from 0 to 65535. Separate multiple ports with commas.

IMPORTANT! Any port you add to the SMTP **Ports** list should also be added to the TCP client reassembly list for each TCP policy. For more information on configuring TCP reassembly ports, see [Selecting Stream Reassembly Options](#) on page 950.

Stateful Inspection

When selected, causes SMTP decoder to save state and provide session context for individual packets and only inspects reassembled sessions. When cleared, analyzes each individual packet without session context.

Normalize

When set to All, normalizes all commands. Checks for more than one space character after a command.

When set to None, normalizes no commands.

When set to Cmds, normalizes the commands listed in **Custom Commands**.

Custom Commands

When **Normalize** is set to Cmds, normalizes the listed commands.

Specify commands which should be normalized in the text box. Checks for more than one space character after a command.

The space (ASCII 0x20) and tab (ASCII 0x09) characters count as space characters for normalization purposes.

Ignore Data

Does not process mail data; processes only MIME mail header data.

Ignore TLS Data

Does not process data encrypted under the Transport Layer Security protocol.

No Alerts

Disables intrusion events when accompanying preprocessor rules are enabled.

Detect Unknown Commands

Detects unknown commands in SMTP traffic.

You can enable rules 124:5 and 124:6 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Max Command Line Len

Detects when an SMTP command line is longer than this value. Specify 0 to never detect command line length.

RFC 2821, the Network Working Group specification on the Simple Mail Transfer Protocol, recommends 512 as a maximum command line length.

You can enable rule 124:1 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Max Header Line Len

Detects when an SMTP data header line is longer than this value. Specify 0 to never detect data header line length.

You can enable rules 124:2 and 124:7 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Max Response Line Len

Detects when an SMTP response line is longer than this value. Specify 0 to never detect response line length.

RFC 2821 recommends 512 as a maximum response line length.

You can enable rule 124:3 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Alt Max Command Line Len

Detects when the SMTP command line for any of the specified commands is longer than this value. Specify 0 to never detect command line length for the specified commands. Different default line lengths are set for numerous commands.

This setting overrides the Max Command Line Len setting for the specified commands.

You can enable rule 124:3 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Invalid Commands

Detects if these commands are sent from the client side.

You can enable rule 124:5 and 124:6 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Valid Commands

Permits commands in this list.

Even if this list is empty, the preprocessor permits the following valid commands: ATRN AUTH BDAT DATA DEBUG EHLO EMAL ESAM ESND ESOM ETRN EVFY EXPN HELO HELP IDENT MAIL NOOP ONEX QUEU QUIT RCPT RSET SAML SEND SIZE SOML STARTTLS TICK TIME TURN TURNME VERB VRFY XADR XAUTH XCIR XEXCH50 X-EXPS XGEN XLICENSE X-LINK2STATE XQUE XSTA XTRN XUSR

IMPORTANT! RCPT TO and MAIL FROM are SMTP commands. The preprocessor configuration uses command names of RCPT and MAIL, respectively. Within the code, the preprocessor maps RCPT and MAIL to the correct command name.

You can enable rule 124:4 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Data Commands

Lists commands that initiate sending data in the same way the SMTP DATA command sends data per RFC 5321. Separate multiple commands with spaces.

Binary Data Commands

Lists commands that initiate sending data in a way that is similar to how the BDAT command sends data per RFC 3030. Separate multiple commands with spaces.

Authentication Commands

Lists commands that initiate an authentication exchange between client and server. Separate multiple commands with spaces.

Detect xlink2state

Detects packets that are part of X-Link2State Microsoft Exchange buffer data overflow attacks. In inline deployments, the system can also drop those packets.

You can enable rule 124:8 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Base64 Decoding Depth

When **Ignore Data** is disabled, specifies the maximum number of bytes to extract and decode from each Base64 encoded MIME email attachment. You can specify from 1 to 65535 bytes, or specify 0 to decode all the Base64 data. Specify -1 to ignore Base64 data. The preprocessor will not decode data when **Ignore Data** is selected.

Note that positive values not divisible by 4 are rounded up to the next multiple of 4 except for the values 65533, 65534, and 65535, which are rounded down to 65532.

When Base64 decoding is enabled, you can enable rule 124:10 to generate an event when decoding fails; decoding could fail, for example, because of incorrect encoding or corrupted data. See [Setting Rule States](#) on page 743 for more information.

Note that this option replaces the deprecated options **Enable MIME Decoding** and **Maximum MIME Decoding Depth**, which are still supported in existing intrusion policies for backward compatibility.

7-Bit/8-Bit/Binary Decoding Depth

When **Ignore Data** is disabled, specifies the maximum bytes of data to extract from each MIME email attachment that does not require decoding. These attachment types include 7-bit, 8-bit, binary, and various multipart content types such as plain text, jpeg images, mp3 files, and so on. You can specify from 1 to 65535 bytes, or specify 0 to extract all data in the packet. Specify -1 to ignore non-decoded data. The preprocessor will not extract data when **Ignore Data** is selected.

Quoted-Printable Decoding Depth

When **Ignore Data** is disabled, specifies the maximum number of bytes to extract and decode from each quoted-printable (QP) encoded MIME email attachment.

You can specify from 1 to 65535 bytes, or specify 0 to decode all QP encoded data in the packet. Specify -1 to ignore QP encoded data. The preprocessor will not decode data when **Ignore Data** is selected.

When quoted-printable decoding is enabled, you can enable rule 124:11 to generate an event when decoding fails; decoding could fail, for example, because of incorrect encoding or corrupted data. See [Setting Rule States](#) on page 743 for more information.

Unix-to-Unix Decoding Depth

When **Ignore Data** is disabled, specifies the maximum number of bytes to extract and decode from each Unix-to-Unix encoded (uuencoded) email attachment. You can specify from 1 to 65535 bytes, or specify 0 to decode all uuencoded data in the packet. Specify -1 to ignore uuencoded data. The preprocessor will not decode data when **Ignore Data** is selected.

When Unix-to-Unix decoding is enabled, you can enable rule 124:13 to generate an event when decoding fails; decoding could fail, for example, because of incorrect encoding or corrupted data. See [Setting Rule States](#) on page 743 for more information.

Log MIME Attachment Names

Enables extraction of MIME attachment file names from the MIME Content-Disposition header and associates the file names with all intrusion events generated for the session. Multiple file names are supported.

When this option is enabled, you can view file names associated with events in the Email Attachment column of the intrusion events table view. See [Understanding Intrusion Events](#) on page 604 for more information.

Log To Addresses

Enables extraction of recipient email addresses from the SMTP RCPT TO command and associates the recipient addresses with all intrusion events generated for the session. Multiple recipients are supported.

When this option is enabled, you can view recipients associated with events in the Email Recipient column of the intrusion events table view. See [Understanding Intrusion Events](#) on page 604 for more information.

Log From Addresses

Enables extraction of sender email addresses from the SMTP MAIL FROM command and associates the sender addresses with all intrusion events generated for the session. Multiple sender addresses are supported.

When this option is enabled, you can view senders associated with events in the Email Sender column of the intrusion events table view. See [Understanding Intrusion Events](#) on page 604 for more information.

Log Headers

Enables extraction of email headers. The number of bytes to extract is determined by the value specified for **Header Log Depth**.

You can use the **content** keyword to write intrusion rules that use email header data as a pattern. You can also view the extracted email header in the intrusion event packet view. See [Constraining Content Matches](#) on page 1065 and [Using the Packet View](#) on page 622 for more information.

Header Log Depth

Specifies the number of bytes of the email header to extract when **Log Headers** is enabled. You can specify 0 to 20480 bytes. A value of 0 disables **Log Headers**.

Configuring SMTP Decoding

LICENSE: Protection

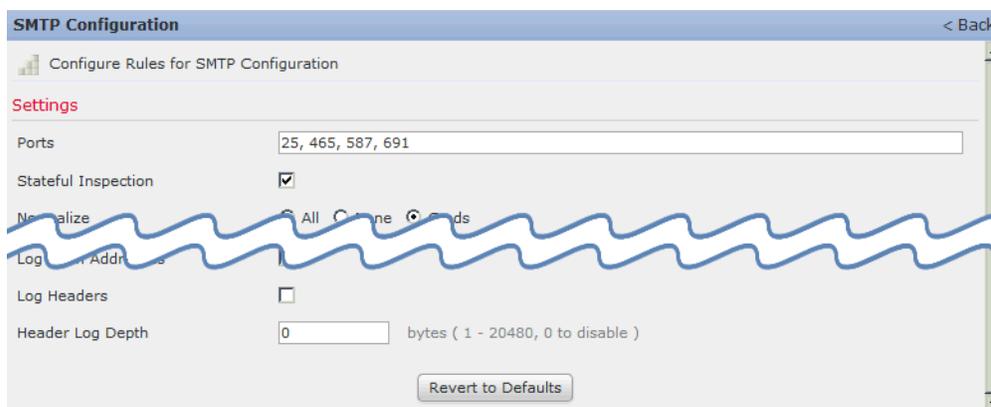

You can use the SMTP Configuration page of an intrusion policy to configure SMTP normalization. For more information on SMTP preprocessor configuration options, see [Understanding SMTP Decoding](#) on page 890.

To configure SMTP decoding options:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon (✎) next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.
4. You have two choices, depending on whether **SMTP Configuration** under Application Layer Preprocessors is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

The SMTP Configuration page appears. The following graphic shows the Defense Center packet view.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. Specify the **Ports** where SMTP traffic should be decoded, separated by commas.
6. Select **Stateful Inspection** to examine reassembled TCP streams containing SMTP packets. Clear **Stateful Inspection** to inspect only unreassembled SMTP packets.

7. Configure the normalization options:
 - To normalize all commands, select **All**.
 - To normalize only commands specified by **Custom Commands**, select **Cmds** and specify the commands to normalize. Separate commands with spaces.
 - To normalize no commands, select **None**.
 - To ignore mail data except for MIME mail header data, check **Ignore Data**.
 - To ignore data encrypted under the Transport Security Layer protocol, check **Ignore TLS Data**.
 - To disable generating events when accompanying preprocessor rules are enabled, check **No Alerts**.
 - To detect unknown commands in SMTP data, select **Detect Unknown Commands**.
8. Specify a maximum command line length in the **Max Command Line Len** field.
9. Specify a maximum data header line length in the **Max Header Line Len** field.
10. Specify a maximum response line length in the **Max Response Line Len** field.

IMPORTANT! RCPT TO and MAIL FROM are SMTP commands. The preprocessor configuration uses command names of RCPT and MAIL, respectively. Within the code, the preprocessor maps RCPT and MAIL to the correct command name.

11. If needed, click **Add** next to **Alt Max Command Line Len** to add commands where you want to specify an alternate maximum command line length, then specify the line length and the command or commands, separated by spaces, where you want that length to be enforced.
12. Specify any commands that you want to treat as invalid and detect in the **Invalid Commands** field. Separate commands with spaces.
13. Specify any commands that you want to treat as valid in the **Valid Commands** field. Separate commands with spaces.

IMPORTANT! Even if the **Valid Commands** list is empty, the preprocessor treats the following commands as valid: ATRN, AUTH, BDAT, DATA, DEBUG, EHLO, EMAL, ESAM, ESND, ESOM, ETRN, EVFY, EXPN, HELO, HELP, IDENT, MAIL, NOOP, QUIT, RCPT, RSET, SAML, SOML, SEND, ONEX, QUEUE, STARTTLS, TICK, TIME, TURN, TURNME, VERB, VRFY, X-EXPS, X-LINK2STATE, XADR, XAUTH, XCIR, XEXCH50, XGEN, XLICENSE, XQUE, XSTA, XTRN, or XUSR.

14. Specify any commands that you want to initiate sending data in the same way the SMTP DATA command sends data per RFC 5321 in the **Data Commands** field. Separate commands with spaces.
15. Specify any commands that initiate sending data in a way that is similar to how the BDAT command sends data per RFC 3030 in the **Binary Data Commands** field. Separate commands with spaces.
16. Specify any commands that initiate an authentication exchange between client and server in the **Authentication Commands** field. Separate commands with spaces.
17. To detect packets that are part of X-Link2State Microsoft Exchange buffer data overflow attacks, select **Detect xlink2state**.
18. To specify the maximum bytes of data to extract and decode for different types of email attachment, specify a value for any of the following attachment types:
 - **Base64 Decoding Depth**
 - **7-Bit/8-Bit/Binary Decoding Depth** (includes various multipart content types such as plain text, jpeg images, mp3 files, and so on)
 - **Quoted-Printable Decoding Depth**
 - **Unix-to-Unix Decoding Depth**

You can specify from 1 to 65535 bytes, or specify 0 to extract and, when necessary, decode all data in the packet for that type. Specify -1 to ignore data for an attachment type.

You can use the `file_data` rule keyword in intrusion rules to inspect extracted data. See [Pointing to a Specific Payload Type](#) on page 1177 for more information.

You must also select the SMTP **Stateful Inspection** option to extract and decode cross-packet data or data crossing multiple TCP segments.

19. Configure options for associating contextual information with intrusion events triggered by SMTP traffic:
 - To enable extraction of MIME attachment file names to associate with intrusion events, select **Log MIME Attachment Names**.
 - To enable extraction of recipient email addresses, select **Log To Addresses**.

- To enable extraction of sender email addresses to associate with intrusion events, select **Log From Addresses**.
- To enable extraction of email headers to associate with intrusion events and for writing rules that inspect email headers, select **Log Headers**.

Note that header information is displayed in the intrusion event packet view. Note also that you can also write intrusion rules that use the **content** keyword with email header data as a pattern. See [Viewing Event Information](#) on page 625 and [Searching for Content Matches](#) on page 1063 for more information.

Optionally, you can specify a **Header Log Depth** of 0 to 20480 bytes of the email header to extract. A value of 0 disables **Log Headers**.

20. Optionally, click **Configure Rules for SMTP Configuration** at the top of the page to display rules associated with individual options.

Click **Back** to return to the SMTP Configuration page.

21. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Enabling SMTP Maximum Decoding Memory Alerting

LICENSE: Protection

You can enable SMTP preprocessor rule 124:9 to generate an event when the enabled preprocessor is using the maximum amount of memory allowed by the system for decoding the following types of encoded data:

- Base64
- 7-bit/8-bit/binary
- Quoted-printable
- Unix-to-Unix

When the maximum decoding memory is exceeded, the preprocessor stops decoding these types of encoded data until memory becomes available. This preprocessor rule is not associated with a single, specific configuration option. See [Setting Rule States](#) on page 743 for information on enabling rules.

Detecting Exploits Using the SSH Preprocessor

LICENSE: Protection

The SSH preprocessor detects the Challenge-Response Buffer Overflow exploit, the CRC-32 exploit, the SecureCRT SSH Client Buffer Overflow exploit, protocol mismatches, and incorrect SSH message direction. The preprocessor also detects any version string other than version 1 or 2.

Both Challenge-Response Buffer Overflow and CRC-32 attacks occur after the key exchange and are, therefore, encrypted. Both attacks send an uncharacteristically large payload of more than 20 KBytes to the server immediately after the authentication challenge. CRC-32 attacks apply only to SSH Version 1; Challenge-Response Buffer Overflow exploits apply only to SSH Version 2. The version string is read at the beginning of the session. Except for the difference in the version string, both attacks are handled in the same way.

The SecureCRT SSH exploit and protocol mismatch attacks occur when attempting to secure a connection, before the key exchange. The SecureCRT exploit sends an overly long protocol identifier string to the client that causes a buffer overflow. A protocol mismatch occurs when either a non-SSH client application attempts to connect to a secure SSH server or the server and client version numbers do not match.

You can configure the preprocessor to inspect traffic on a specified port or list of ports, or to automatically detect SSH traffic. It will continue to inspect SSH traffic until either a specified number of encrypted packets has passed within a specified number of bytes, or until a specified maximum number of bytes is exceeded within the specified number of packets. If the maximum number of bytes is exceeded, it is assumed that a CRC-32 (SSH Version 1) or a Challenge-Response Buffer Overflow (SSH Version 2) attack has occurred. Additionally, you can detect the SecureCRT exploit, protocol mismatches, and bad message direction. Note that the preprocessor detects without configuration any version string value other than version 1 or 2.

Note the following when using the SSH preprocessor:

- You must enable SSH preprocessor rules, which have a generator ID (GID) of 128, if you want these rules to generate events. A link on the configuration page takes you to a filtered view of SSH preprocessor rules on the intrusion policy Rules page, where you can enable and disable rules and configure other rule actions. See [Setting Rule States](#) on page 743 for more information.
- The SSH preprocessor requires TCP stream preprocessing. If TCP stream preprocessing is disabled and you enable the SSH preprocessor, you are prompted when you save the policy whether to enable TCP stream preprocessing. See [Automatically Enabling Advanced Settings](#) on page 787 and [Using TCP Stream Preprocessing](#) on page 940 for more information.
- The SSH preprocessor does not handle brute force attacks. For information on brute force attempts, see [Adding Dynamic Rule States](#) on page 756.

See the following sections for more information:

- [Selecting SSH Preprocessor Options](#) on page 901
- [Configuring the SSH Preprocessor](#) on page 903

Selecting SSH Preprocessor Options

LICENSE: Protection

This section describes the options you can use to configure the SSH preprocessor.

The preprocessor stops inspecting traffic for a session when either of the following occurs:

- a valid exchange between the server and the client has occurred for this number of encrypted packets; the connection continues.
- the **Number of Bytes Sent Without Server Response** is reached before the number of encrypted packets to inspect is reached; the assumption is made that there is an attack.

Each valid server response during **Number of Encrypted Packets to Inspect** resets the **Number of Bytes Sent Without Server Response** and the packet count continues.

Consider the following example SSH preprocessor configuration:

- **Server Ports:** 22
- **Autodetect Ports:** off
- **Maximum Length of Protocol Version String:** 80
- **Number of Encrypted Packets to Inspect:** 25
- **Number of Bytes Sent Without Server Response:** 19,600
- All detect options are enabled.

In the example, the preprocessor inspects traffic only on port 22. That is, auto-detection is disabled, so it inspects only on the specified port.

Additionally, the preprocessor in the example stops inspecting traffic when either of the following occurs:

- The client sends 25 encrypted packets which contain no more than 19,600 bytes, cumulative. The assumption is there is no attack.
- The client sends more than 19,600 bytes within 25 encrypted packets. In this case, the preprocessor considers the attack to be the Challenge-Response Buffer Overflow exploit because the session in the example is an SSH Version 2 session.

The preprocessor in the example will also detect any of the following that occur while it is processing traffic:

- a server overflow, triggered by a version string greater than 80 bytes and indicating a SecureCRT exploit
- a protocol mismatch
- a packet flowing in the wrong direction

Finally, the preprocessor will automatically detect any version string other than version 1 or version 2.

If no preprocessor rule is mentioned, the option is not associated with a preprocessor rule.

Server Ports

Specifies on which ports the SSH preprocessor should inspect traffic. You can configure a single port or a comma-separated list of ports.

Autodetect Ports

Sets the preprocessor to automatically detect SSH traffic.

When this option is selected, the preprocessor inspects all traffic for an SSH version number. It stops processing when neither the client nor the server packet contains a version number. When disabled, the preprocessor inspects only the traffic identified by the **Server Ports** option.

Number of Encrypted Packets to Inspect

Specifies the number of encrypted packets to examine per session.

Setting this option to zero will allow all traffic to pass.

Reducing the number of encrypted packets to inspect may result in some attacks escaping detection. Raising the number of encrypted packets to inspect may negatively affect performance.

Number of Bytes Sent Without Server Response

Specifies the maximum number of bytes an SSH client may send to a server without getting a response before assuming there is a Challenge-Response Buffer Overflow or CRC-32 attack.

Increase the value for this option if the preprocessor generates false positives on the Challenge-Response Buffer Overflow or CRC-32 exploit.

Maximum Length of Protocol Version String

Specifies the maximum number of bytes allowed in the server's version string before considering it to be a SecureCRT exploit.

Detect Challenge-Response Buffer Overflow Attack

Enables or disables detecting the Challenge-Response Buffer Overflow exploit.

You can enable rule 128:1 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Detect SSH1 CRC-32 Attack

Enables or disables detecting the CRC-32 exploit.

You can enable rule 128:2 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Detect Server Overflow

Enables or disables detecting the SecureCRT SSH Client Buffer Overflow exploit.

You can enable rule 128:3 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Detect Protocol Mismatch

Enables or disables detecting protocol mismatches.

You can enable rule 128:4 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Detect Bad Message Direction

Enables or disables detecting when traffic flows in the wrong direction (that is, if the presumed server generates client traffic, or if a client generates server traffic).

You can enable rule 128:5 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Detect Payload Size Incorrect for the Given Payload

Enables or disables detecting packets with an incorrect payload size such as when the length specified in the SSH packet is not consistent with the total length specified in the IP header or the message is truncated, that is, there is not enough data for a full SSH header.

You can enable rule 128:6 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Detect Bad Version String

Note that, when enabled, the preprocessor detects without configuration any version string other than version 1 or 2.

You can enable rule 128:7 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Configuring the SSH Preprocessor

LICENSE: Protection

This section explains how to configure the SSH preprocessor.

To configure the SSH preprocessor:

ACCESS: Admin/Intrusion Admin

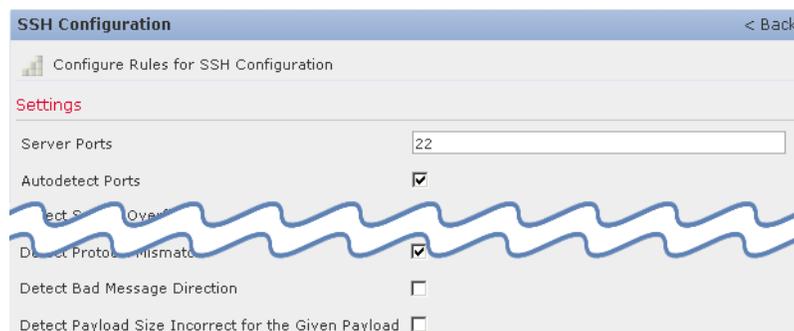

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.

2. Click the edit icon (✎) next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.
4. You have two choices, depending on whether **SSH Configuration** under Application Layer Preprocessors is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

The SSH Configuration page appears.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. You can modify any of the options on the SSH Configuration preprocessor page. See [Selecting SSH Preprocessor Options](#) on page 901 for more information.
6. Optionally, click **Configure Rules for SSH Configuration** at the top of the page to display rules associated with individual options.
Click **Back** to return to the SSH Configuration page.
7. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Using the SSL Preprocessor

LICENSE: Protection

Although the system cannot analyze the contents of encrypted traffic, an SSL preprocessor option can be set to continue to attempt to inspect the traffic, occasionally generating false positives and wasting detection resources. Using the SSL preprocessor, however, the system can analyze the contents of the handshake and key exchange messages exchanged at the beginning of an SSL session to determine when the session becomes encrypted. When SSL preprocessing is active, you can cause the system to suspend inspection of a session as soon as it becomes encrypted. You must ensure that TCP stream preprocessing is enabled to use the SSL preprocessor.

Note the following when using the SSL preprocessor:

- The SSL preprocessor requires TCP stream preprocessing. If TCP stream preprocessing is disabled and you enable the SSL preprocessor, you are prompted when you save the policy whether to enable TCP stream preprocessing. See [Automatically Enabling Advanced Settings](#) on page 787 and [Using TCP Stream Preprocessing](#) on page 940 for more information.
- When an intrusion rule that requires this preprocessor is enabled in an intrusion policy where the preprocessor is disabled, you must enable the preprocessor or choose to allow the system to enable it automatically before you can save the policy. For more information, see [Automatically Enabling Advanced Settings](#) on page 787.

For more information, see the following sections:

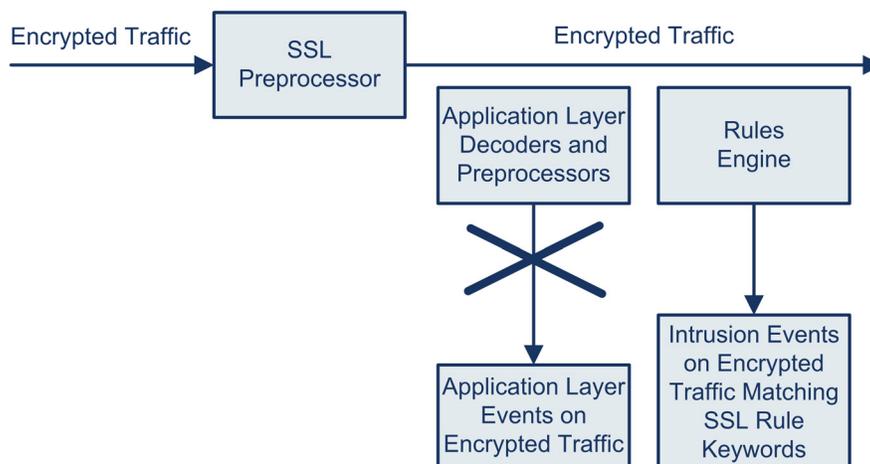

- [Understanding SSL Preprocessing](#) on page 905
- [Enabling SSL Preprocessor Rules](#) on page 907
- [Configuring the SSL Preprocessor](#) on page 907

Understanding SSL Preprocessing

LICENSE: Protection

The SSL preprocessor stops inspection of encrypted data, which can help to eliminate false positives. The SSL preprocessor maintains state information as it inspects the SSL handshake, tracking both the state and SSL version for that session. When the preprocessor detects that a session state is encrypted, the system marks the traffic in that session as encrypted. You can configure the

system to stop processing on all packets in an encrypted session when encryption is established.

For each packet, the SSL preprocessor verifies that the traffic contains an IP header, a TCP header, and a TCP payload, and that it occurs on the ports specified for SSL preprocessing. For qualifying traffic, the following scenarios determine whether the traffic is encrypted:

- the system observes all packets in a session, **Server side data is trusted** is not enabled, and the session includes a Finished message from both the server and the client and at least one packet from each side with an Application record and without an Alert record
- the system misses some of the traffic, **Server side data is trusted** is not enabled, and the session includes at least one packet from each side with an Application record that is not answered with an Alert record
- the system observes all packets in a session, **Server side data is trusted** is enabled, and the session includes a Finished message from the client and at least one packet from the client with an Application record and without an Alert record
- the system misses some of the traffic, **Server side data is trusted** is enabled, and the session includes at least one packet from the client with an Application record that is not answered with an Alert record

If you choose to stop processing on encrypted traffic, the system ignores future packets in a session after it marks the session as encrypted.

IMPORTANT! You can add the `ssl_state` and `ssl_version` keywords to a rule to use SSL state or version information within the rule. For more information, see [Extracting SSL Information from a Session](#) on page 1113. Note that the SSL preprocessor must be enabled to allow processing of rules that contain SSL keywords.

Enabling SSL Preprocessor Rules

LICENSE: Protection

When enabled, the SSL preprocessor inspects the contents of the handshake and key exchange messages exchanged at the beginning of an SSL session.

Note that you must enable SSL preprocessor rules, which have a generator ID (GID) of 137, if you want these rules to generate events. A link on the configuration page takes you to a filtered view of SSL preprocessor rules on the intrusion policy Rules page, where you can enable and disable rules and configure other rule actions. See [Setting Rule States](#) on page 743 for more information.

The [SSL Preprocessor Rules](#) table describes the SSL preprocessor rules you can enable.

SSL Preprocessor Rules

PREPROCESSOR RULE GID:SID	DESCRIPTION
137:1	Detects a client hello after a server hello, which is invalid and considered to be anomalous behavior.
137:2	Detects a server hello without a client hello when Server side data is trusted is disabled, which is invalid and considered to be anomalous behavior. See Configuring the SSL Preprocessor on page 907 for more information.

Configuring the SSL Preprocessor

LICENSE: Protection

By default, the system attempts to inspect encrypted traffic. When you enable the SSL preprocessor, it detects when a session becomes encrypted. After the SSL preprocessor is enabled, the rules engine can invoke the preprocessor to obtain SSL state and version information. If you enable rules using the `ssl_state` and `ssl_version` keywords in an intrusion policy, you should also enable the SSL preprocessor in that policy.

In addition, you can enable the **Stop inspecting encrypted traffic** option to disable inspection and reassembly for encrypted sessions. The SSL preprocessor maintains state for the session so it can disable inspection of all traffic in the session. The system only stops inspecting traffic in encrypted sessions if SSL preprocessing is enabled **and** the **Stop inspecting encrypted traffic** option is selected.

To base identification of encrypted traffic only on server traffic, you can enable the **Server side data is trusted** option; that is, server side data is trusted to indicate that the traffic is encrypted. The SSL preprocessor typically checks both client traffic and the server responses to that traffic to determine if a session is encrypted. However, because the system may not mark a transaction as encrypted if it

cannot detect both sides of a session, you can rely on the SSL server to indicate a session is encrypted. Note that when you enable the **Server side data is trusted** option you must also enable the **Stop inspecting encrypted traffic** option so the system does not continue inspecting traffic in the encrypted session.

You can specify the ports where the preprocessor monitors traffic for encrypted sessions.

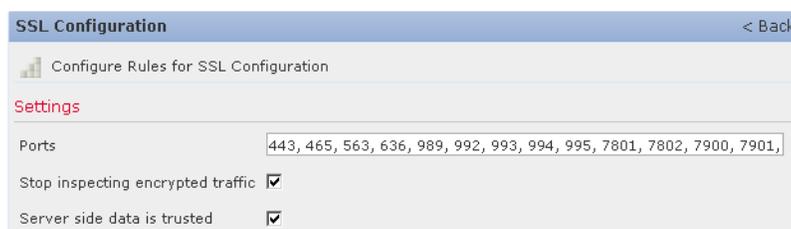

IMPORTANT! If the SSL preprocessor detects non-SSL traffic over the ports specified for SSL monitoring, it tries to decode the traffic as SSL traffic, and then flags it as corrupt.

To configure the SSL preprocessor:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon () next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.
4. You have two choices, depending on whether **SSL Configuration** under Application Layer Preprocessors is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

The SSL Configuration page appears.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. Type the ports, separated by commas, where the SSL preprocessor should monitor traffic for encrypted sessions. Only ports included in the **Ports** field will be checked for encrypted traffic.

6. Click the **Stop inspecting encrypted traffic** check box to enable or disable inspection of traffic in a session after the session is marked as encrypted.
7. Click the **Server side data is trusted** check box to enable or disable identification of encrypted traffic based only on the client-side traffic.
8. Optionally, click **Configure Rules for SSL Configuration** at the top of the page to display rules associated with individual options.
Click **Back** to return to the SSH Configuration page.
9. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Working with SCADA Preprocessors

LICENSE: Protection

Supervisory Control and Data Acquisition (SCADA) protocols monitor, control, and acquire data from industrial, infrastructure, and facility processes such as manufacturing, production, water treatment, electric power distribution, airport and shipping systems, and so on. The Sourcefire 3D System provides preprocessors for the Modbus and DNP3 SCADA protocols.

See the following sections for more information:

- [Configuring the Modbus Preprocessor](#) on page 909
- [Configuring the DNP3 Preprocessor](#) on page 911

Configuring the Modbus Preprocessor

LICENSE: Protection

The Modbus protocol, which was first published in 1979 by Modicon, is a widely used SCADA protocol. The Modbus preprocessor detects anomalies in Modbus traffic and decodes the Modbus protocol for processing by the rules engine, which uses Modbus keywords to access certain protocol fields. See [Modbus Keywords](#) on page 1145 for more information.

A single configuration option allows you to modify the default setting for the port that the preprocessor inspects for Modbus traffic.

You must enable the Modbus predecessor rules in the following table if you want these rules to generate events. See [Setting Rule States](#) on page 743 for information on enabling rules.

Modbus Preprocessor Rules

PREPROCESSOR RULE GID:SID	DESCRIPTION
144:1	<p>Generates an event when the length in the Modbus header does not match the length required by the Modbus function code.</p> <p>Each Modbus function has an expected format for requests and responses. If the length of the message does not match the expected format, this event is generated.</p>
144:2	<p>Generates an event when the Modbus protocol ID is non-zero. The protocol ID field is used for multiplexing other protocols with Modbus. Because the predecessor does not process these other protocols, this event is generated instead.</p>
144:3	<p>Generates an event when the predecessor detects a reserved Modbus function code.</p>

Note the following information regarding the use of the Modbus predecessor:

- If your network does not contain any Modbus-enabled devices, you should not enable this predecessor in an intrusion policy that you apply to traffic.
- The Modbus predecessor requires TCP stream configuration. When you enable the Modbus predecessor and TCP stream configuration is disabled, you are prompted whether to enable the advanced setting when you save the policy.
See [Configuring TCP Stream Preprocessing](#) on page 952 and [Automatically Enabling Advanced Settings](#) on page 787 for more information.
- Both TCP stream configuration and the Modbus predecessor must be enabled to allow processing of rules using Modbus keywords. When either is disabled and you enable rules that use Modbus keywords, you are prompted whether to enable the disabled advanced setting when you save the policy. See [Automatically Enabling Advanced Settings](#) on page 787.

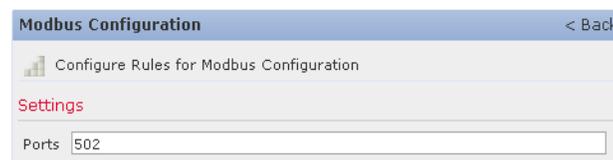

You can use the following procedure to modify the ports the Modbus predecessor monitors.

To configure the Modbus preprocessor:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon (✎) next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.
4. You have two choices, depending on whether **Modbus Configuration** under SCADA Preprocessors is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

The Modbus Configuration page appears.

5. Optionally, modify the **Ports** that the preprocessor inspects for Modbus traffic. You can specify an integer from 0 to 65535. Use commas to separate multiple ports.
6. Optionally, click **Configure Rules for Modbus Configuration** at the top of the page to display rules associated with individual options.
Click **Back** to return to the Modbus Configuration page.
7. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Configuring the DNP3 Preprocessor

LICENSE: Protection

The Distributed Network Protocol (DNP3) is a SCADA protocol that was originally developed to provide consistent communication between electrical stations. DNP3 has also become widely used in the water, waste, transportation, and many other industries.

The DNP3 preprocessor detects anomalies in DNP3 traffic and decodes the DNP3 protocol for processing by the rules engine, which uses DNP3 keywords to access certain protocol fields. See [DNP3 Keywords](#) on page 1148 for more information.

You must enable the DNP3 preprocessor rules in the following table if you want these rules to generate events. See [Setting Rule States](#) on page 743 for information on enabling rules.

DNP3 Preprocessor Rules

PREPROCESSOR RULE GID:SID	DESCRIPTION
145:1	When Log bad CRC is enabled, generates an event when the preprocessor detects a link layer frame with an invalid checksum.
145:2	Generates an event and blocks the packet when the preprocessor detects a DNP3 link layer frame with an invalid length.
145:3	Generates an event and blocks the packet during reassembly when the preprocessor detects a transport layer segment with an invalid sequence number.
145:4	Generates an event when the DNP3 reassembly buffer is cleared before a complete fragment can be reassembled. This happens when a segment carrying the FIR flag appears after other segments have been queued.
145:5	Generates an event when the preprocessor detects a DNP3 link layer frame that uses a reserved address.
145:6	Generates an event when the preprocessor detects a DNP3 request or response that uses a reserved function code.

Note the following information regarding the use of the DNP3 preprocessor:

- If your network does not contain any DNP3-enabled devices, you should not enable this preprocessor in an intrusion policy that you apply to traffic.
- The DNP3 preprocessor requires TCP stream configuration. When you enable the DNP3 preprocessor and TCP stream configuration is disabled, you are prompted whether to enable the advanced setting when you save the policy.
See [Configuring TCP Stream Preprocessing](#) on page 952 and [Automatically Enabling Advanced Settings](#) on page 787 for more information.
- Both TCP stream configuration and the DNP3 preprocessor must be enabled to allow processing of rules using DNP3 keywords. When either is disabled and you enable rules that use DNP3 keywords, you are prompted whether to enable the disabled advanced setting when you save the policy. See [Automatically Enabling Advanced Settings](#) on page 787 for more information.

The following list describes the DNP3 preprocessor options you can configure.

Ports

Enables inspection of DNP3 traffic on each specified port. You can specify a single port or a comma-separated list of ports. You can specify a value from 0 to 65535 for each port.

Log bad CRCs

When enabled, validates the checksums contained in DNP3 link layer frames. Frames with invalid checksums are ignored.

You can enable rule 145:1 to generate events when invalid checksums are detected.

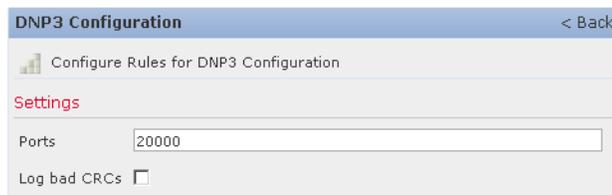

To configure the DNP3 preprocessor:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon () next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.

4. You have two choices, depending on whether **DNP3 Configuration** under SCADA Preprocessors is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

The DNP3 Configuration page appears.

DNP3 Configuration < Back

Configure Rules for DNP3 Configuration

Settings

Ports

Log bad CRCs

5. Optionally, modify the **Ports** that the predecessor inspects for DNP3 traffic. You can specify an integer from 0 to 65535. Use commas to separate multiple ports.
6. Optionally, select or clear the **Log bad CRCs** check box to specify whether to validate the checksums contained in DNP3 link layer frames and ignore frames with invalid checksums.
7. Optionally, click **Configure Rules for DNP3 Configuration** at the top of the page to display rules associated with individual options.
Click **Back** to return to the DNP3 Configuration page.
8. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

CHAPTER 24

USING TRANSPORT & NETWORK LAYER PREPROCESSORS

Sourcefire provides preprocessors that detect exploits at the network and transport layers. These preprocessors detect attacks that exploit IP fragmentation, checksum validation, and TCP and UDP session preprocessing. Before packets are sent to preprocessors, the packet decoder converts packet headers and payloads into a format that can be easily used by the preprocessors and the rules engine and detects various anomalous behaviors in packet headers. After packet decoding and before sending packets to other preprocessors, the inline normalization preprocessor normalizes traffic for inline deployments.

See the following sections for more information:

- [Verifying Checksums](#) on page 915
- [Ignoring VLAN Headers](#) on page 917
- [Normalizing Inline Traffic](#) on page 918
- [Defragmenting IP Packets](#) on page 927
- [Understanding Packet Decoding](#) on page 934
- [Using TCP Stream Preprocessing](#) on page 940
- [Using UDP Stream Preprocessing](#) on page 956

Verifying Checksums

LICENSE: Protection

The system can verify all protocol-level checksums to ensure that complete IP, TCP, UDP, and ICMP transmissions are received and that, at a basic level, packets have not been tampered with or accidentally altered in transit. A checksum uses an algorithm to verify the integrity of a protocol in the packet. The packet is

considered to be unchanged if the system computes the same value that is written in the packet by the end host.

Disabling checksum verification may leave your network susceptible to insertion attacks. Note that the system does not generate checksum verification events. In an inline deployment, you can configure the system to drop packets with invalid checksums.

To configure checksum verifications:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

2. Click the edit icon (✎) next to the policy you want to edit.

If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

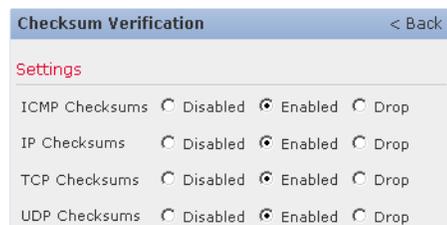

3. Click **Advanced Settings** in the navigation panel on the left.

The Advanced Settings page appears.

4. You have two choices, depending on whether **Checksum Verification** under Transport/Network Layer Preprocessors is enabled:

- If the configuration is enabled, click **Edit**.
- If the configuration is disabled, click **Enabled**, then click **Edit**.

The Checksum Verification page appears.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. You can set any of the options in the Checksum Verification section to **Enable** or **Disable** in a passive or inline deployment, or to **Drop** in an inline deployment:

- **ICMP Checksums**
- **IP Checksums**

- **TCP Checksums**
- **UDP Checksums**

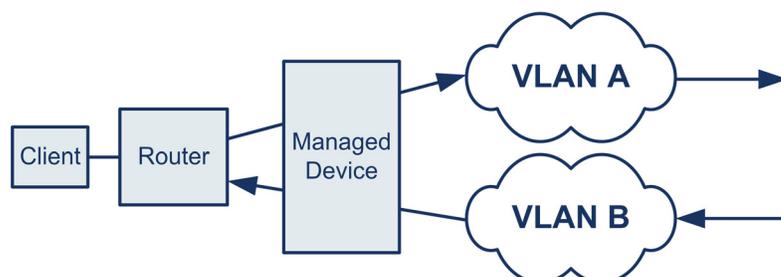

Note that to drop offending packets you must also enable **Drop when Inline** in addition to setting an option to **Drop** in the policy. See [Setting Drop Behavior in an Inline Deployment](#) on page 689 for more information. Note also that setting these options to **Drop** in a passive deployment is the same as setting them to **Enable**.

6. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Ignoring VLAN Headers

LICENSE: Protection

Different VLAN tags in traffic traveling in different directions for the same connection can affect traffic reassembly and rule processing. For example, in the following graphic traffic for the same connection could be transmitted over VLAN A and received over VLAN B.

When you enable the **Ignore VLAN Header** detection setting, the system ignores the VLAN header so packets can be correctly processed for your deployment.

To ignore VLAN headers:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

2. Click the edit icon (✎) next to the policy you want to edit.

If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.
4. You have two choices:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

The Detection Settings page appears.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. You have the following choices:
 - For deployed devices that might detect different VLAN tags for the same connection in traffic traveling in different directions, select the **Ignore VLAN Header** check box to ignore VLAN headers when identifying traffic.
 - For deployed devices that will not detect different VLAN tags for the same connection traffic traveling in different directions, clear the **Ignore VLAN Header** check box to include VLAN headers when identifying traffic.
6. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Normalizing Inline Traffic

LICENSE: Protection

The inline normalization preprocessor normalizes traffic to minimize the chances of attackers evading detection in inline deployments. When you apply an intrusion policy as part of an access control policy and the inline normalization preprocessor is enabled, the system tests the following two conditions to ensure that you are using an inline deployment:

- **Drop when Inline** is enabled
- The policy is applied to a device using an inline set

The preprocessor normalizes specified traffic only when both conditions are met.

You can specify normalization of any combination of IPv4, IPv6, ICMPv4, ICMPv6, and TCP traffic. Most normalizations are on a per-packet basis and are conducted by the inline normalization preprocessor. However, the TCP stream preprocessor handles most state-related packet and stream normalizations, including TCP payload normalization, so you must ensure that the TCP stream preprocessor is enabled when you enable normalization of TCP traffic.

Inline normalization takes place immediately after decoding by the packet decoder and before processing by other preprocessors. Normalization proceeds from the inner to outer packet layers.

Note that the inline normalization preprocessor does not generate events; it prepares packets for use by other preprocessors and the rules engine in inline deployments. The preprocessor also helps ensure that the packets the system processes are the same as the packets received by the hosts on your network.

TIP! In an inline deployment, Sourcefire recommends you configure the inline normalization preprocessor, with the Normalize TCP and Normalize TCP Payload options enabled. In a passive deployment, Sourcefire recommends you configure adaptive profiles. For more information, see [Using Adaptive Profiles](#) on page 1003.

See the following sections for more information:

- [Understanding Protocol Normalization](#) on page 919
- [Configuring Inline Normalization](#) on page 922

Understanding Protocol Normalization

LICENSE: Protection

Normalization of each protocol includes one or more *base* normalizations, which occur automatically when you enable normalization of the protocol. Some protocols also have optional normalizations.

See [Configuring Inline Normalization](#) on page 922 for information on configuring normalization of traffic for different protocols. The following sections list the base normalizations and any optional normalizations for each protocol type:

- [IPv4 Normalization](#) on page 920
- [IPv6 Normalization](#) on page 920
- [ICMPv4 and ICMPv6 Normalization](#) on page 920
- [TCP Normalization](#) on page 921

IPv4 Normalization

LICENSE: Protection

When you enable **Normalize IPv4**, the system performs the following base normalizations:

- truncates packets with excess payload to the datagram length specified in the IP header
- clears the Differentiated Services (DS) field, formerly known as the Type of Service (TOS) field
- sets all option octets to 1 (No Operation)

In addition, the system performs the following optional normalizations when you enable IPv4 normalization and select the corresponding option:

- enabling the **Normalize Don't Fragment Bit** option clears the single-bit Don't Fragment subfield of the IPv4 Flags header field
- enabling the **Normalize Reserved Bit** option clears the single-bit Reserved subfield of the IPv4 Flags header field
- enabling the **Normalize TOS Bit** option clears the one byte Differentiated Services header field, formerly known as Type of Service (ToS)
- enabling the **Normalize Excess Payload** option trims excess payload to the datagram length specified in the IP header plus the Layer 2 header
- enabling the **Reset TTL** and **Minimize TTL** options sets the Time to Live (TTL) field as needed to a specified minimum value

See [Configuring Inline Normalization](#) on page 922 for more information.

IPv6 Normalization

LICENSE: Protection

When you enable **Normalize IPv6**, the system sets all Option Type fields in the Hop-by-Hop Options and Destination Options extension headers to 00 (Skip and continue processing).

Optionally, and as needed, the system also sets the Hop Limit field to a specified minimum value. See the **Reset TTL** and **Minimize TTL** options in [Configuring Inline Normalization](#) on page 922 for more information.

ICMPv4 and ICMPv6 Normalization

LICENSE: Protection

When you enable **Normalize ICMPv4**, **Normalize ICMPv6**, or both, the system clears the 8-bit Code field in Echo (Request) and Echo Reply messages in the corresponding ICMP traffic.

TCP Normalization

LICENSE: Protection

The following sections describe base TCP normalizations, including traffic that is dropped when you enable TCP normalization. It also explains normalizations associated with specific TPC normalization options.

Base TCP Normalizations

When you enable **Normalize TCP**, the system performs the following base normalizations:

- clears the 3-bit Reserved field in the TCP header
- clears the 16-bit Urgent Pointer field if the urgent (URG) control bit is not set
- clears the Urgent Pointer field and the URG control bit if there is no payload
- clears the urgent control bit if the urgent pointer is not set
- clears any option padding bytes
- blocks a subsequent SYN that does not have the same sequence number as the original SYN

Dropped TCP Packets

When you enable **Normalize TCP**, the system drops the following without generating an event:

- retransmitted copies of previously dropped packets
- traffic that attempts to continue a previously dropped session
- any packet that matches any of the following TCP stream preprocessor rules, regardless of whether the rules are enabled:

THESE PREPROCESSOR RULES DROP PACKETS WHEN NORMALIZE TCP IS ENABLED...

129:1, 129:3, 129:4, 129:6, 129:8, 129:11, 129: 14 through 129:19

The Blocked Packets performance graph tracks the number of packets dropped as the result of this options being enabled. See [Generating Intrusion Event Performance Statistics Graphs](#) on page 599 for more information.

Automatically Allowed TCP Options

When you enable **Normalize TCP** and do not specify any for **Allow These TCP Options**, the system performs the following normalizations:

- except MSS, Window Scale, Time Stamp, and any explicitly allowed options, sets all option bytes to No Operation (TCP Option 1)
- sets the Time Stamp octets to No Operation if Time Stamp is present but invalid, or valid but not negotiated

- drops the packet if Time Stamp is negotiated but not present
- clears the Time Stamp Echo Reply (TSecr) option field if the Acknowledgement (ACK) control bit is not set
- sets the MSS and Window Scale options to No Operation (TCP Option 1) if the Synchronization (SYN) control bit is not set

See [Configuring Inline Normalization](#) on page 922 for more information.

Normalizations Associated with Specific TCP Options

The system performs the following optional normalizations when you enable **Normalize TCP** and select the corresponding option:

- enabling the **Normalize Urgent Pointer** option sets the two-byte Urgent Pointer header field to the payload length if the pointer is greater than the payload length
- enabling the **Normalize TCP Payload** option normalizes the TCP Data field to ensure consistency in retransmitted data and drops any segments that cannot be properly reassembled
- enabling the **Normalize TCP Excess Payload** option removes data in SYN and RST packets, and trims the Data field to the size specified in the Window field, or to the Maximum Segment Size (MSS) if the payload is longer than MSS
- enabling the **Explicit Congestion Notification** option clears ECN flags on a per-packet basis regardless of negotiation, or on a per-stream basis if usage was not negotiated

See [Configuring Inline Normalization](#) on page 922 for more information.

Configuring Inline Normalization

LICENSE: Protection

You can configure the inline normalization preprocessor to normalize IPv4, IPv6, ICMPv4, ICMPv6, and TCP traffic in any combination. In addition to the base normalizations provided when you enable normalization of each traffic type, specific optional normalizations are available for all protocols except ICMP; this includes using the **Reset TTL** option to enable TTL normalization when IPv4 normalization is enabled and IPv6 Hop Limit normalization when IPv6 normalization is enabled.

In addition to enabling and configuring the inline normalization preprocessor, you must also ensure the following or the preprocessor will not normalize traffic:

- your policy must be set to drop traffic in inline deployments; see [Setting Drop Behavior in an Inline Deployment](#) on page 689
- you must apply your policy to an inline set; see [Applying an Access Control Policy](#) on page 466

You must also ensure that the TCP stream preprocessor is enabled when you enable TCP normalization; see [Modifying Advanced Settings](#) on page 774.

Minimum TTL

When **Reset TTL** is greater than or equal to the value 1 to 255 set for this option, specifies the following:

- the minimum value the system will permit in the IPv4 Time to Live (TTL) field when **Normalize IPv4** is enabled; a lower value results in normalizing the packet value for TTL to the value set for **Reset TTL**
- the minimum value the system will permit in the IPv6 Hop Limit field when **Normalize IPv6** is enabled; a lower value results in normalizing the packet value for Hop Limit to the value set for **Reset TTL**

The system assumes a value of 1 when the field is empty.

Note that you can enable the following rules in the decoder rule category to generate events for this option:

- You can enable rule 116:428 to generate an event when the system detects an IPv4 packet with a TTL less than the specified minimum.
- You can enable rule 116:270 to generate an event when the system detects an IPv6 packet with a hop limit that is less than the specified minimum.

See the packet decoder **Detect Protocol Header Anomalies** option in [Configuring Packet Decoding](#) on page 938 for more information.

Reset TTL

When set to a value 1 to 255 that is greater than or equal to **Minimum TTL**, normalizes the following:

- the IPv4 TTL field when **Normalize IPv4** is enabled
- the IPv6 Hop Limit field when **Normalize IPv6** is enabled

The system normalizes the packet by changing its TTL or Hop Limit value to the value set for this option when the packet value is less than **Minimum TTL**. Setting this option to a value of 0, or any value less than **Minimum TTL**, disables the option. The system assumes a value of 0 when the field is empty.

Normalize IPv4

Enables normalization of IPv4 traffic. See [IPv4 Normalization](#) on page 920 for information on specific IPv4 normalizations. The system also normalizes the TTL field as needed when this option is enabled and the value set for **Reset TTL** enables TTL normalization. You can also enable **Normalize Don't Fragment Bits** and **Normalize Reserved Bits** when this option is enabled.

Normalize Don't Fragment Bit

Clears the single-bit Don't Fragment subfield of the IPv4 Flags header field. Enabling this option allows a downstream router to fragment packets if necessary instead of dropping them; enabling this option can also prevent evasions based on crafting packets to be dropped. You must enable **Normalize IPv4** to select this option.

Normalize Reserved Bit

Clears the single-bit Reserved subfield of the IPv4 Flags header field. You would typically enable this option. You must enable **Normalize IPv4** to select this option.

Normalize TOS Bit

Clears the one byte Differentiated Services field, formerly known as Type of Service. You must enable **Normalize IPv4** to select this option.

Normalize Excess Payload

Truncates packets with excess payload to the datagram length specified in the IP header plus the Layer 2 (for example, Ethernet) header, but does not truncate below the minimum frame length. You must enable **Normalize IPv4** to select this option.

Normalize IPv6

Sets all Option Type fields in the Hop-by-Hop Options and Destination Options extension headers to 00 (Skip and continue processing). The system also normalizes the Hop Limit field as needed when this option is enabled and the value set for **Reset TTL** enables hop limit normalization.

Normalize ICMPv4

Clears the 8-bit Code field in Echo (Request) and Echo Reply messages in ICMPv4 traffic.

Normalize ICMPv6

Clears the 8-bit Code field in Echo (Request) and Echo Reply messages in ICMPv6 traffic.

Normalize TCP

Enables normalization of TCP traffic. See [TCP Normalization](#) on page 921 for information on specific TCP normalizations. When this option is enabled, you can also enable **Normalize Urgent Pointer**, **Normalize TCP Payload**, **Normalize TCP Excess Payload**, and **Exploit Congestion Payload**, and configure **Allow These TCP Options**. You should ensure that the TCP stream preprocessor is enabled when you enable this option; see [Modifying Advanced Settings](#) on page 774.

Normalize Urgent Pointer

Sets the two-byte Urgent Pointer header field to the payload length if the pointer is greater than the payload length. You must enable **Normalize TCP** to select this option.

Normalize TCP Payload

Enables normalization of the TCP Data field to ensure consistency in retransmitted data. Any segments that cannot be properly reassembled are dropped. You must enable **Normalize TCP** to select this option.

Normalize TCP Excess Payload

Enables the following normalizations:

- removes data in synchronization (SYN) packets
- removes any data from a reset (RST) packet
- trims the Data field to the size specified in the Window field
- trims the Data field to the Maximum Segment Size (MSS) if the payload is longer than MSS

You must enable **Normalize TCP** to select this option.

Explicit Congestion Notification

Enables per-packet or per-stream normalization of Explicit Congestion Notification (ECN) flags as follows:

- select **Packet** to clear ECN flags regardless of negotiation
- select **Stream** to clear ECN flags if ECN use was not negotiated

You must enable **Normalize TCP** to select this option. If you select **Stream**, you must also ensure that the TCP stream preprocessor **Require TCP 3-Way Handshake** option is enabled for this normalization to take place; see [Selecting TCP Policy Options](#) on page 945 for more information.

Allow These TCP Options

Disables normalization of specific TCP options you allow in traffic. You must enable **Normalize TCP** to select this option.

The system does not normalize options that you explicitly allow. It normalizes options that you do not explicitly allow by setting the options to No Operation (TCP Option 1).

The system always allows the Maximum Segment Size (MSS), Window Scale, and Time Stamp TCP options because these options are commonly used for optimal TCP performance. The system normalizes these commonly used options as described in [TCP Normalization](#) on page 921 regardless of the configuration of **Allow These TCP Options**. The system does not allow other, less commonly used options.

You can allow specific options by configuring a comma-separated list of option keywords, option numbers, or both as shown in the following example:

```
sack, echo, 19
```

Specifying an option keyword is the same as specifying the number for one or more TCP options associated with the keyword. For example, specifying **sack** is the same as specifying TCP options 4 (Selective Acknowledgement Permitted) and 5 (Selective Acknowledgement). Option keywords are not case sensitive.

You can also specify **any**, which allows all TCP options and effectively disables normalization of all TCP options. See [TCP Normalization](#) on page 921 for additional normalizations performed when you do not specify **any**.

The following table summarizes how you can specify TCP options to allow. If you leave the field empty, the system allows only the MSS, Window Scale, and Time Stamp options.

SPECIFY...	TO ALLOW...
sack	TCP options 4 (Selective Acknowledgement Permitted) and 5 (Selective Acknowledgement)
echo	TCP options 6 (Echo Request) and 7 (Echo Reply)
partial_order	TCP options 9 (Partial Order Connection Permitted) and 10 (Partial Order Service Profile)
conn_count	TCP Connection Count options 11 (CC), 12 (CC.New), and 13 (CC.Echo)
alt_checksum	TCP options 14 (Alternate Checksum Request) and 15 (Alternate Checksum)
md5	TCP option 19 (MD5 Signature)
the option number, 2 to 255	a specific option, including options for which there is no keyword
any	all TCP options; this setting effectively disables TCP option normalization

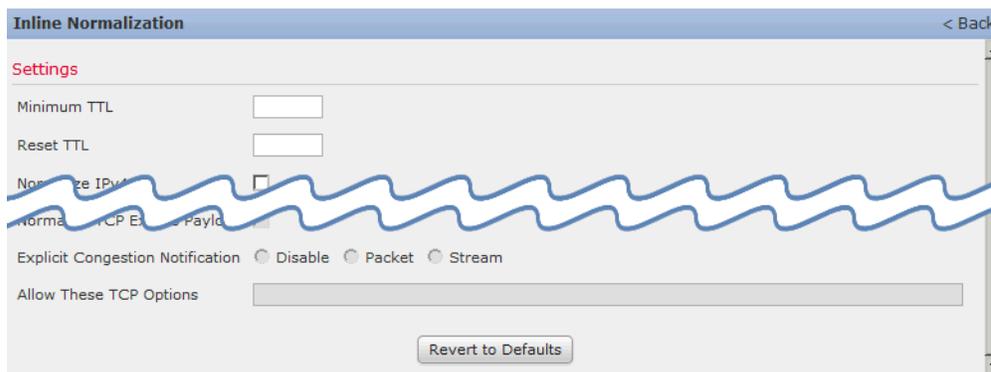

To configure the inline normalizations preprocessor:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

2. Click the edit icon (✎) next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.
4. You have two choices:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.The Inline Normalization page appears.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. You can set any of the options described in [Configuring Inline Normalization](#) on page 922.
6. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions](#) table on page 675 for more information.

Defragmenting IP Packets

LICENSE: Protection

When an IP datagram is broken into two or more smaller IP datagrams because it is larger than the maximum transmission unit (MTU), it is *fragmented*. A single IP datagram fragment may not contain enough information to identify a hidden attack. Attackers may attempt to evade detection by transmitting attack data in fragmented packets. The IP defragmentation preprocessor reassembles fragmented IP datagrams before the rules engine executes rules against them so

that the rules can more appropriately identify attacks in those packets. If fragmented datagrams cannot be reassembled, rules do not execute against them.

Note that you must enable IP defragmentation preprocessor rules, which have a generator ID (GID) of 123, if you want these rules to generate events. A link on the configuration page takes you to a filtered view of IP defragmentation preprocessor rules on the intrusion policy Rules page, where you can enable and disable rules and configure other rule actions. See [Setting Rule States](#) on page 743 for more information.

See the following sections for more information:

- [Understanding IP Fragmentation Exploits](#) on page 928
- [Target-Based Defragmentation Policies](#) on page 929
- [Selecting Defragmentation Options](#) on page 930
- [Configuring IP Defragmentation](#) on page 932

Understanding IP Fragmentation Exploits

LICENSE: Protection

Enabling IP defragmentation helps you detect attacks against hosts on your network, like the teardrop attack, and resource consumption attacks against the system itself, like the Jolt2 attack.

The Teardrop attack exploits a bug in certain operating systems that causes them to crash when trying to reassemble overlapping IP fragments. When enabled and configured to do so, the IP defragmentation preprocessor identifies the overlapping fragments. The IP defragmentation preprocessor detects the first packets in an overlapping fragment attack such as Teardrop, but does not detect subsequent packets for the same attack.

The Jolt2 attack sends a large number of copies of the same fragmented IP packet in an attempt to overuse IP defragmentors and cause a denial of service attack. A memory usage cap disrupts this and similar attacks in the IP defragmentation preprocessor, and places the system self-preservation above exhaustive inspection. The system is not overwhelmed by the attack, remains operational, and continues to inspect network traffic.

Different operating systems reassemble fragmented packets in different ways. Attackers who can determine which operating systems your hosts are running can also fragment malicious packets so that a target host reassembles them in a specific manner. Because the system does not know which operating systems the hosts on your monitored network are running, the preprocessor may reassemble and inspect the packets incorrectly, thus allowing an exploit to pass through undetected. To mitigate this kind of attack, you can configure the defragmentation preprocessor to use the appropriate method of defragmenting packets for each host on your network. See [Target-Based Defragmentation Policies](#) on page 929 for more information.

Note that you can also use adaptive profiles to dynamically select target-based policies for the IP defragmentation preprocessor using host operating system information for the target host in a packet. For more information, see [Using Adaptive Profiles](#) on page 1003.

Target-Based Defragmentation Policies

LICENSE: Protection

A host's operating system uses three criteria to determine which packet fragments to favor when reassembling the packet: the order in which the fragment was received by the operating system, its offset (the fragment's distance, in bytes, from the beginning of the packet), and its beginning and ending position compared to overlap fragments. Although every operating system uses these criteria, different operating systems favor different fragments when reassembling fragmented packets. Therefore, two hosts with different operating systems on your network could reassemble the same overlapping fragments in entirely different ways.

An attacker, aware of the operating system of one of your hosts, could attempt to evade detection and exploit that host by sending malicious content hidden in overlapping packet fragments. This packet, when reassembled and inspected, seems innocuous, but when reassembled by the target host, contains a malicious exploit. However, if you configure the IP defragmentation preprocessor to be aware of the operating systems running on your monitored network segment, it will reassemble the fragments the same way that the target host does, allowing it to identify the attack.

You can configure the IP defragmentation preprocessor to use one of seven defragmentation policies, depending on the operating system of the target host. The [Target-Based Defragmentation Policies](#) table lists the seven policies and the operating systems that use each one. The First and Last policy names reflect whether those policies favor original or subsequent overlapping packets.

Target-Based Defragmentation Policies

POLICY	OPERATING SYSTEMS
BSD	AIX FreeBSD IRIX VAX/VMS
BSD-right	HP JetDirect
First	Mac OS HP-UX

Target-Based Defragmentation Policies (Continued)

POLICY	OPERATING SYSTEMS
Linux	Linux OpenBSD
Last	Cisco IOS
Solaris	SunOS
Windows	Windows

Selecting Defragmentation Options

LICENSE: Protection

You can choose to simply enable or disable IP defragmentation; however, Sourcefire recommends that you specify the behavior of the enabled IP defragmentation preprocessor at a more granular level.

If no preprocessor rule is mentioned, the option is not associated with a preprocessor rule.

You can configure the global **Preallocated Fragments** option:

Preallocated Fragments

The maximum number of individual fragments that the preprocessor can process at once. Specifying the number of fragment nodes to preallocate enables static memory allocation.

WARNING! Processing an individual fragment uses approximately 1550 bytes of memory. If the preprocessor requires more memory to process the individual fragments than the predetermined allowable memory limit for the managed device, the memory limit for the device takes precedence.

You can configure the following options for each IP defragmentation policy:

Network

The IP address of the host or hosts to which you want to apply the defragmentation policy.

You can specify a single IP address or address block, or a comma-separated list of either or both. You can specify up to 255 total profiles, including the default policy. For information on using IPv4 and IPv6 address blocks in the Sourcefire 3D System, see [IP Address Conventions](#) on page 57.

Note that the `default` setting in the default policy specifies all IP addresses on your monitored network segment that are not covered by another target-based policy. Therefore, you cannot and do not need to specify an IP address or CIDR block/prefix length for the default policy, and you cannot leave this setting blank in another policy or use address notation to represent any (for example, 0.0.0.0/0 or ::/0).

Policy

The defragmentation policy you want to use for a set of hosts on your monitored network segment. You can choose among seven policies: BSD, BSD-Right, First, Linux, Last, Solaris, and Windows. See [Target-Based Defragmentation Policies](#) on page 929 for detailed information on these policies.

Timeout

The maximum amount of time, in seconds, that the preprocessor engine can use when reassembling a fragmented packet. If the packet cannot be reassembled within the specified time period, the preprocessor engine stops attempting to reassemble the packet and discards received fragments.

Minimum TTL

Specifies the minimum acceptable TTL value a packet may have. This option detects TTL-based insertion attacks.

You can enable rule 123:1 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Detect Anomalies

Identifies fragmentation problems such as overlapping fragments.

You can enable the following rules to generate events for this option:

- 123:1 through 123:4
- 123:5 (BSD policy)
- 123:6 through 123:8

Overlap Limit

Specifies that when the configured number between 0 (unlimited) and 255 of overlapping segments in a session has been detected, defragmentation stops for that session. You must enable **Detect Anomalies** to configure this option. A blank value disables this option.

You can enable rule 123:12 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Minimum Fragment Size

Specifies that when a non-last fragment smaller than the configured number between 0 (unlimited) and 255 of bytes has been detected, the packet is considered malicious. You must enable **Detect Anomalies** to configure this option. A blank value disables this option.

You can enable rule 123:13 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Configuring IP Defragmentation

LICENSE: Protection

You can use the following procedure to configure the IP defragmentation preprocessor. For more information on the IP defragmentation preprocessor configuration options, see [Selecting Defragmentation Options](#) on page 930.

To configure IP defragmentation:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

2. Click the edit icon (✎) next to the policy you want to edit.

If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

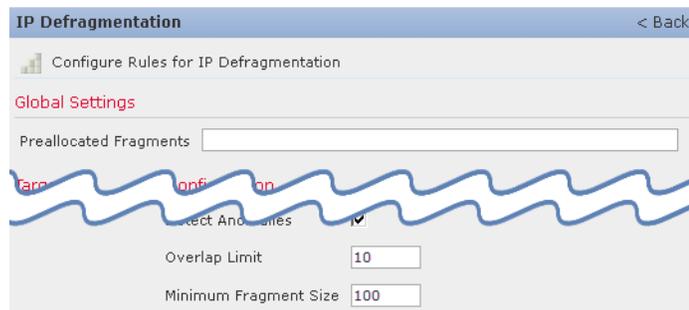

The Policy Information page appears.

3. Click **Advanced Settings** in the navigation panel on the left.

The Advanced Settings page appears.

4. You have two choices, depending on whether **IP Defragmentation** under Transport/Network Layer Preprocessors is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

The IP Defragmentation page appears.

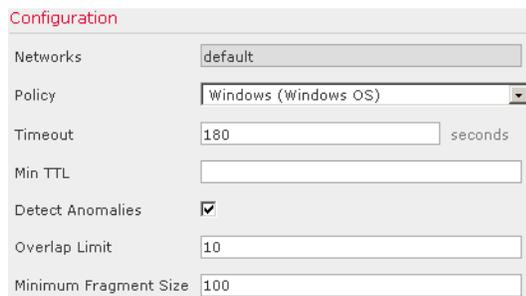

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. Optionally, you can modify the setting for **Preallocated Fragments** in the Global Settings page area.

6. You have two options:
 - Add a new target-based policy. Click the add icon () next to **Hosts** on the left side of the page. The Add Target pop-up window appears. Specify one or more IP addresses in the **Host Address** field and click **OK**.
You can specify a single IP address or address block, or a comma-separated list of either or both. You can create a total of 255 target-based policies including the default policy. For information on using IP address blocks in the Sourcefire 3D System, see [IP Address Conventions](#) on page 57.
A new entry appears in the list of targets on the left side of the page, highlighted to indicate that it is selected, and the Configuration section updates to reflect the current configuration for the policy you added.
 - Modify the settings for an existing target-based policy. Click the configured address for a policy you have added under **Hosts** on the left side of the page, or click **default**.
Your selection is highlighted and the Configuration section updates to display the current configuration for the policy you selected. To delete an existing target-based policy, click the delete icon () next to the policy you want to remove.

The screenshot shows a configuration window titled "Configuration". It contains several fields and a checkbox:

Networks	default
Policy	Windows (Windows OS)
Timeout	180 seconds
Min TTL	
Detect Anomalies	<input checked="" type="checkbox"/>
Overlap Limit	10
Minimum Fragment Size	100

7. Optionally, you can modify any of the options in the Configuration page area.
8. Optionally, click **Configure Rules for IP Defragmentation** at the top of the page to display rules associated with individual options.
Click **Back** to return to the IP Defragmentation page.
9. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Understanding Packet Decoding

LICENSE: Protection

Before sending captured packets to a preprocessor, the system first sends the packets to the packet decoder. The packet decoder converts packet headers and

payloads into a format that preprocessors and the rules engine can easily use. Each stack layer is decoded in turn, beginning with the data link layer and continuing through the network and transport layers. For more information on packet decoding, see [Capturing and Decoding Packets](#) on page 584.

Note that you must enable packet decoder rules, which have a generator ID (GID) of 116, if you want these rules to generate events. A link on the configuration page takes you to a filtered view of packet decoder rules on the intrusion policy Rules page, where you can enable and disable rules and configure other rule actions. See [Setting Rule States](#) on page 743 for more information.

If no preprocessor rule is mentioned, the option is not associated with a preprocessor rule.

Decode GTP Data Channel

Decodes the encapsulated GTP (General Packet Radio Service [GPRS] Tunneling Protocol) data channel. By default, the decoder decodes version 0 data on port 3386 and version 1 data on port 2152. You can use the `GTP_PORTS` system default variable to modify the ports that identify encapsulated GTP traffic. See [Understanding Existing Variables](#) on page 699 for more information.

You can enable rules 116:297 and 116:298 to generate events for this option.

Detect Teredo on Non-Standard Ports

Inspects Teredo tunneling of IPv6 traffic that is identified on a UDP port other than port 3544.

The system always inspects IPv6 traffic when it is present. By default, IPv6 inspection includes the 4in6, 6in4, 6to4, and 6in6 tunneling schemes, and also includes Teredo tunneling when the UDP header specifies port 3544.

In an IPv4 network, IPv4 hosts can use the Teredo protocol to tunnel IPv6 traffic through an IPv4 Network Address Translation (NAT) device. Teredo encapsulates IPv6 packets within IPv4 UDP datagrams to permit IPv6 connectivity behind an IPv4 NAT device. The system normally uses UDP port 3544 to identify Teredo traffic. However, an attacker could use a non-standard port in an attempt to avoid detection. You can enable **Detect Teredo on Non-Standard Ports** to cause the system to inspect all UDP payloads for Teredo tunneling.

Teredo decoding occurs only on the first UDP header, and only when IPv4 is used for the outer network layer. When a second UDP layer is present after the Teredo IPv6 layer because of UDP data encapsulated in the IPv6 data, the rules engine uses UDP intrusion rules to analyze both the inner and outer UDP layers.

Note that intrusion rules 12065, 12066, 12067, and 12068 in the **policy-other** rule category detect, but do not decode, Teredo traffic. Optionally, you can use these rules to drop Teredo traffic in an inline deployment; however, you should ensure that these rules are disabled or set to generate events without

dropping traffic when you enable **Detect Teredo on Non-Standard Ports**. See [Filtering Rules in an Intrusion Policy](#) on page 729 and [Setting Rule States](#) on page 743 for more information.

Detect Excessive Length Value

Detects when the packet header specifies a packet length that is greater than the actual packet length.

You can enable rules 116:6, 116:47, 116:97, and 116:275 to generate events for this option.

Detect Invalid IP Options

Detects invalid IP header options to identify exploits that use invalid IP options. For example, there is a denial of service attack against a firewall which causes the system to freeze. The firewall attempts to parse invalid Timestamp and Security IP options and fails to check for a zero length, which causes an irrecoverable infinite loop. The rules engine identifies the zero length option, and provides information you can use to mitigate the attack at the firewall.

You can enable rules 116:4 and 116:5 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Detect Experimental TCP Options

Detects TCP headers with experimental TCP options. The following table describes these options.

TCP OPTION	DESCRIPTION
9	Partial Order Connection Permitted
10	Partial Order Service Profile
14	Alternate Checksum Request
15	Alternate Checksum Data
18	Trailer Checksum
20	Space Communications Protocol Standards (SCPS)
21	Selective Negative Acknowledgements (SCPS)
22	Record Boundaries (SCPS)

TCP OPTION	DESCRIPTION
23	Corruption (SPCS)
24	SNAP
26	TCP Compression Filter

Because these are experimental options, some systems do not account for them and may be open to exploits.

IMPORTANT! In addition to the experimental options listed in the above table, the system considers any TCP option with an option number greater than 26 to be experimental.

You can enable rule 116:58 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Detect Obsolete TCP Options

Detects TCP headers with obsolete TCP options. Because these are obsolete options, some systems do not account for them and may be open to exploits. The following table describes these options.

TCP OPTION	DESCRIPTION
6	Echo
7	Echo Reply
16	Skeeter
17	Bubba
19	MD5 Signature
25	Unassigned

You can enable rule 116:57 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Detect T/TCP

Detects TCP headers with the CC.ECHO option. The CC.ECHO option confirms that TCP for Transactions (T/TCP) is being used. Because T/TCP header options are not in widespread use, some systems do not account for them and may be open to exploits.

You can enable rule 116:56 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Detect Other TCP Options

Detects TCP headers with invalid TCP options not detected by other TCP decoding event options. For example, this option detects TCP options with the incorrect length or with a length that places the option data outside the TCP header.

You can enable rules 116:54, 116:55, and 116:59 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Detect Protocol Header Anomalies

Detects other decoding errors not detected by the more specific IP and TCP decoder options. For example, the decoder might detect a malformed data-link protocol header.

To generate events for this option, you can enable any packet decoder rule other than rules specifically associated with other packet decoder options. See [Setting Rule States](#) on page 743 for more information.

Note that the following rules generate events triggered by anomalous IPv6 traffic: 116:270 through 116:274, 116:275 through 116:283, 116:291, 116:292, 116:295, 116:296, 116:406, 116:458, 116:460, 116:461.

Note also the following rules associated with the inline normalization preprocessor **Minimum TTL** option:

- You can enable rule 116:428 to generate an event when the system detects an IPv4 packet with a TTL less than the specified minimum.
- You can enable rule 116:270 to generate an event when the system detects an IPv6 packet with a hop limit that is less than the specified minimum.

See the inline normalization **Minimum TTL** option in [Configuring Inline Normalization](#) on page 922 for more information.

Configuring Packet Decoding

LICENSE: Protection

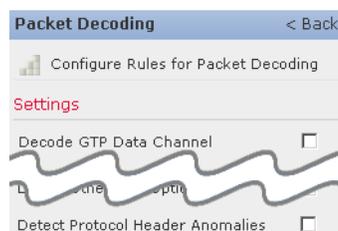

You can configure packet decoding on the Packet Decoding configuration page. For more information packet decoding configuration options, see [Understanding Packet Decoding](#) on page 934.

To configure packet decoding:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon (✎) next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.
4. You have two choices, depending on whether **Packet Decoding** under Transport/Network Layer Preprocessors is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

The Packet Decoding page appears.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. You can enable or disable any of the detection options on the Packet Decoding page. See [Understanding Packet Decoding](#) on page 934 for more information.
6. Optionally, click **Configure Rules for Packet Decoding** at the top of the page to display rules associated with individual options.
Click **Back** to return to the Packet Decoding page.
7. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Using TCP Stream Preprocessing

LICENSE: Protection

The TCP protocol defines various states in which connections can exist. Each TCP connection is identified by the source and destination IP addresses and source and destination ports. TCP permits only one connection with the same connection parameter values to exist at a time.

Note that you must enable TCP stream preprocessor rules, which have a generator ID (GID) of 129, if you want these rules to generate events. A link on the configuration page takes you to a filtered view of TCP stream preprocessor rules on the intrusion policy Rules page, where you can enable and disable rules and configure other rule actions. See [Setting Rule States](#) on page 743 for more information.

Note also that when a rule that requires this preprocessor is enabled in an intrusion policy, you must enable the preprocessor or choose to allow the system to enable it automatically before you can save the policy. For more information, see [Automatically Enabling Advanced Settings](#) on page 787.

If you enable any of the following, TCP stream preprocessing must be enabled:

- the DCE/RPC preprocessor when the RPC over HTTP proxy, RPC over HTTP server, TCP, or SMB transport protocol is selected
- the DNS preprocessor
- the FTP/Telnet preprocessor
- the HTTP Inspect preprocessor
- the IMAP preprocessor
- the POP preprocessor
- the SMTP preprocessor
- the SSL preprocessor
- the Modbus preprocessor
- the DNP3 preprocessor
- portscan detection when the TCP protocol is selected
- TCP intrusion rules that use the `flow`, `flowbits`, `stream-size`, or `stream-reassemble` keyword

See the following sections for more information:

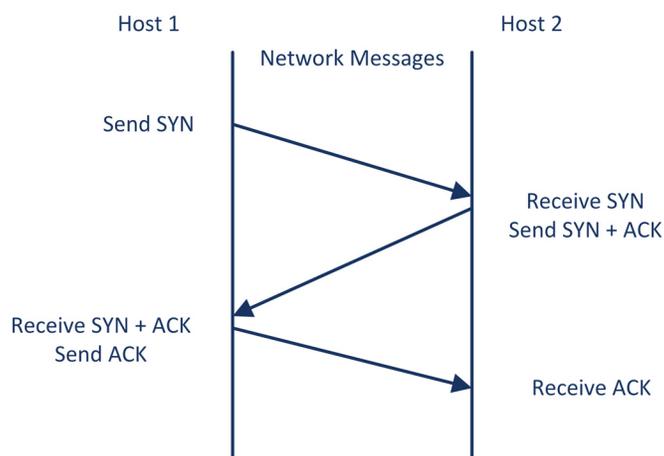

- [Understanding State-Related TCP Exploits](#) on page 941.
- [Initiating Active Responses with Drop Rules](#) on page 941.
- [Selecting TCP Global Options](#) on page 943.
- [Understanding Target-Based TCP Policies](#) on page 943.
- [Selecting TCP Policy Options](#) on page 945.

- [Reassembling TCP Streams](#) on page 949.
- [Configuring TCP Stream Preprocessing](#) on page 952.

Understanding State-Related TCP Exploits

LICENSE: Protection

If you add the `flow` keyword with the `established` argument to an intrusion rule, the rules engine inspects packets matching the rule and the flow directive in stateful mode. Stateful mode evaluates only the traffic that is part of a TCP session established with a legitimate three-way handshake between a client and server. The following diagram illustrates a three-way handshake.

You can configure the system so that the preprocessor detects any TCP traffic that cannot be identified as part of an established TCP session, although this is not recommended for typical use because the events would quickly overload the system and not provide meaningful data.

Attacks like `stick` and `snot` use the system's extensive rule sets and packet inspection against itself. These tools generate packets based on the patterns in Snort-based intrusion rules, and send them across the network. If your rules do not include the `flow` or `flowbits` keyword to configure them for stateful inspection, each packet will trigger the rule, overwhelming the system. Stateful inspection allows you to ignore these packets because they are not part of an established TCP session and do not provide meaningful information. When performing stateful inspection, the rules engine detects only those attacks that are part of an established TCP session, allowing analysts to focus on these rather than the volume of events caused by `stick` or `snot`.

Initiating Active Responses with Drop Rules

LICENSE: Protection

In an inline deployment, the system responds to TCP or UDP drop rules by dropping the triggering packet and blocking the session where the packet

originated. In a passive deployment, the system cannot drop the packet and does not block the session except with the use of active responses.

TIP! Because UDP data streams are not typically thought of in terms of *sessions*, see [Using UDP Stream Preprocessing](#) on page 956 for further explanation of how the stream processor uses the source and destination IP address fields in the encapsulating IP datagram header and the port fields in the UDP header to determine the direction of flow and identify a UDP session.

You can configure the **Maximum Active Responses** option to initiate one or more *active responses* to more precisely and specifically close a TCP connection or UDP session when an offending packet triggers a TCP or UDP drop rule.

When active responses are enabled in an inline deployment, the system responds to TCP drop rules by dropping the triggering packet and inserting a TCP Reset (RST) packet in both the client and server traffic. When active responses are enabled in a passive deployment, the system cannot drop the packet or insert resets but sends a TCP reset to both the client and server ends of a TCP connection. When active responses are enabled in inline or passive deployments, the system closes a UDP session by sending a UDP unreachable packet to each end of the session. Active responses are most effective in inline deployments because resets are more likely to arrive in time to affect the connection or session.

Depending on how you configure the **Maximum Active Responses** option, the system can also initiate additional active responses if it sees additional traffic from either end of the connection or session. The system initiates each additional active response, up to a specified maximum, after a specified number of seconds have elapsed since the previous response. Note that to initiate additional TCP resets you must ensure that TCP Stream Configuration is enabled, and to initiate additional ICMP unreachable packets you must ensure that UDP Stream Configuration is enabled. See [Modifying Advanced Settings](#) on page 774 for more information.

See [Selecting TCP Global Options](#) on page 943 for information on setting the maximum number of active responses.

Note that a triggered **resp** or **react** rule also initiates an active response regardless of the configuration of **Maximum Active Responses**; however, **Maximum Active Responses** control whether the system initiates additional active responses for **resp** and **react** rules in the same way it controls the maximum number of active responses for drop rules. See [Initiating Active Responses with Rule Keywords](#) on page 1160 for more information.

You can also use the **config response** command to configure the active response interface to use and the number of TCP resets to attempt in a passive deployment. See [Setting the Active Response Reset Attempts and Interface](#) on page 1164 for more information.

Selecting TCP Global Options

LICENSE: Protection

This section describes the options that control how the TCP stream preprocessor functions.

If no preprocessor rule is mentioned, the option is not associated with a preprocessor rule.

Packet Type Performance Boost

Enables ignoring TCP traffic for all ports and application protocols that are not specified in enabled rules, except when a TCP rule with both the source and destination ports set to **any** has a **flow** or **flowbits** option. This performance improvement could result in missed attacks.

Maximum Active Responses

Specifies a maximum of 1 to 25 active responses per TCP connection. When additional traffic occurs on a connection where an active response has been initiated, and the traffic occurs more than **Minimum Response Seconds** after a previous active response, the system sends another active response unless the specified maximum has been reached. A setting of 0 disables active responses triggered by drop rules and disables additional active responses triggered by **resp** or **react** rules. For more information, see [Initiating Active Responses with Drop Rules](#) on page 941 and [Initiating Active Responses with Rule Keywords](#) on page 1160.

Minimum Response Seconds

Until **Maximum Active Responses** occur, specifies waiting 1 to 300 seconds before any additional traffic on a connection where the system has initiated an active response results in a subsequent active response.

Understanding Target-Based TCP Policies

LICENSE: Protection

Different operating systems implement TCP in different ways. For example, Windows and some other operating systems require a TCP reset segment to have a precise TCP sequence number to reset a session, while Linux and other operating systems permit a range of sequence numbers. In this example, the stream preprocessor must understand exactly how the destination host will respond to the reset based on the sequence number. The stream preprocessor stops tracking the session only when the destination host considers the reset to be valid, so an attack cannot evade detection by sending packets after the preprocessor stops inspecting the stream. Other variations in TCP implementations include such things as whether an operating system employs a TCP timestamp option and, if so, how it handles the timestamp, and whether an operating system accepts or ignores data in a SYN packet.

Different operating systems also reassemble overlapping TCP segments in different ways. Overlapping TCP segments could reflect normal retransmissions of unacknowledged TCP traffic. They could also represent an attempt by an attacker, aware of the operating system of one of your hosts, to evade detection and exploit that host by sending malicious content hidden in overlapping segments. However, you can configure the stream preprocessor to be aware of the operating systems running on your monitored network segment so it reassembles segments the same way the target host does, allowing it to identify the attack.

You can create one or more TCP policies to tailor TCP stream inspection and reassembly to the different operating systems on your monitored network segment. For each policy, you identify one of thirteen operating system policies. You bind each TCP policy to a specific IP address or address block using as many TCP policies as you need to identify any or all of the hosts using a different operating system. The default TCP policy applies to any hosts on the monitored network that you do not identify in any other TCP policy, so there is no need to specify an IP address, CIDR block, or prefix length for the default TCP policy.

Note that you can also use adaptive profiles to dynamically select target-based policies for the TCP stream preprocessor using host operating system information for the target host in a packet. For more information, see [Using Adaptive Profiles](#) on page 1003.

The [TCP Operating System Policies](#) table identifies the operating system policies and the host operating systems that use each.

TIP! The First operating system policy could offer some protection when you do not know the host operating system. However, it may result in missed attacks. You should edit the policy to specify the correct operating system if you know it.

TCP Operating System Policies

POLICY	OPERATING SYSTEMS
First	unknown OS
Last	Cisco IOS
BSD	AIX FreeBSD OpenBSD
Linux	Linux 2.4 kernel Linux 2.6 kernel

TCP Operating System Policies (Continued)

POLICY	OPERATING SYSTEMS
Old Linux	Linux 2.2 and earlier kernel
Windows	Windows 98 Windows NT Windows 2000 Windows XP
Windows 2003	Windows 2003
Windows Vista	Windows Vista
Solaris	Solaris OS SunOS
IRIX	SGI Irix
HPUX	HP-UX 11.0 and later
HPUX 10	HP-UX 10.2 and earlier
Mac OS	Mac OS 10 (Mac OS X)

Selecting TCP Policy Options

LICENSE: Protection

The following list describes the options you can set to identify and control TCP traffic that the stream preprocessor inspects.

If no preprocessor rule is mentioned, the option is not associated with a preprocessor rule.

Network

Specifies the host IP addresses to which you want to apply the TCP stream reassembly policy.

You can specify a single IP address or address block. You can specify up to 255 total profiles including the default policy. For information on using IPv4 and IPv6 address blocks in the Sourcefire 3D System, see [IP Address Conventions](#) on page 57.

Note that the `default` setting in the default policy specifies all IP addresses on your monitored network segment that are not covered by another target-based policy. Therefore, you cannot and do not need to specify an IP address or CIDR block/prefix length for the default policy, and you cannot leave this setting blank in another policy or use address notation to represent any (for example, 0.0.0.0/0 or ::/0).

Policy

Identifies the TCP policy operating system of the target host or hosts. For more information, see [Understanding Target-Based TCP Policies](#) on page 943.

Timeout

The number of seconds between 1 and 86400 the rules engine keeps an inactive stream in the state table. If the stream is not reassembled in the specified time, the rules engine deletes it from the state table.

IMPORTANT! If your managed device is deployed on a segment where the network traffic is likely to reach the device's bandwidth limits, you should consider setting this value higher (for example, to 600 seconds) to lower the amount of processing overhead.

Maximum TCP Window

Specifies the maximum TCP window size between 1 and 1073725440 bytes allowed as specified by a receiving host. Setting the value to 0 disables checking for the TCP window size.

WARNING! The upper limit is the maximum window size permitted by RFC, and is intended to prevent an attacker from evading detection, but setting a significantly large maximum window size could result in a self-imposed denial of service.

You can enable rule 129:6 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Overlap Limit

Specifies that when the configured number between 0 (unlimited) and 255 of overlapping segments in a session has been detected, segment reassembly stops for that session and, if **Stateful Inspection Anomalies** is enabled and the accompanying preprocessor rule is enabled, an event is generated.

You can enable rule 129:7 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Flush Factor

In an inline deployment, specifies that when a segment of decreased size has been detected subsequent to the configured number between 1 and 2048 of segments of non-decreasing size, the system flushes segment data accumulated for detection. Setting the value to 0 disables detection of this segment pattern, which can indicate the end of a request or response. Note that you must enable the Inline Normalization **Normalize TCP** option for this option to be effective. See [Normalizing Inline Traffic](#) on page 918 for more information.

Stateful Inspection Anomalies

Detects anomalous behavior in the TCP stack. When accompanying preprocessor rules are enabled, this may generate many events if TCP/IP stacks are poorly written.

You can enable the following rules to generate events for this option:

- 129:1 through 129:5
- 129:6 (Mac OS only)
- 129:8 through 129:11
- 129:13 through 129:19

See [Setting Rule States](#) on page 743 for more information:

TCP Session Hijacking

Detects TCP session hijacking by validating the hardware (MAC) addresses detected from both sides of a TCP connection during the 3-way handshake against subsequent packets received on the session. When the MAC address for one side or the other does not match, if **Stateful Inspection Anomalies** is enabled and one of the two corresponding preprocessor rules are enabled, the system generates events.

You can enable rules 129:9 and 129:10 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Consecutive Small Segments

When **Stateful Inspection Anomalies** is enabled, specifies a maximum number of 1 to 2048 consecutive small TCP segments allowed. Setting the value to 0 disables checking for consecutive small segments.

You must set this option together with the **Small Segment Size** option, either disabling both or setting a non-zero value for both. Note that receiving as many as 2000 consecutive segments, even if each segment was 1 byte in length, without an intervening ACK would be far more consecutive segments than you would normally expect.

You can enable rule 129:12 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

Small Segment Size

When **Stateful Inspection Anomalies** is enabled, specifies the 1 to 2048 byte TCP segment size that is considered small. Setting the value to 0 disables specifying the size of a small segment.

You must set this option together with the **Consecutive Small Segments** option, either disabling both or setting a non-zero value for both. Note that a 2048 byte TCP segment is larger than a normal 1500 byte Ethernet frame.

Ports Ignoring Small Segments

When **Stateful Inspection Anomalies**, **Consecutive Small Segments**, and **Small Segment Size** are enabled, optionally specifies a comma-separated list of one or more ports that ignore small TCP segment detection. Leaving this option blank specifies that no ports are ignored.

You can add any port to the list, but the list only affects ports specified in one of the **Perform Stream Reassembly on** port lists in the TCP policy.

Require TCP 3-Way Handshake

Specifies that sessions are treated as established only upon completion of a TCP three-way handshake. Disable this option to increase performance, protect from SYN flood attacks, and permit operation in a partially asynchronous environment. Enable it to avoid attacks that attempt to generate false positives by sending information that is not part of an established TCP session.

You can enable rule 129:20 to generate events for this option. See [Setting Rule States](#) on page 743 for more information.

3-Way Handshake Timeout

Specifies the number of seconds between 0 (unlimited) and 86400 (twenty-four hours) by which a handshake must be completed when **Require TCP 3-Way Handshake** is enabled. You must enable **Require TCP 3-Way Handshake** to modify the value for this option.

Packet Size Performance Boost

Sets the preprocessor to not queue large packets in the reassembly buffer. This performance improvement could result in missed attacks. Disable this option to protect against evasion attempts using small packets of one to twenty bytes. Enable it when you are assured of no such attacks because all traffic is comprised of very large packets.

Legacy Reassembly

Sets the stream preprocessor to emulate the deprecated Stream 4 preprocessor when reassembling packets, which lets you compare events reassembled by the stream preprocessor to events based on the same data stream reassembled by the Stream 4 preprocessor.

Asynchronous Network

Specifies whether the monitored network is an asynchronous network, that is, a network where the system sees only half the traffic. When this option is enabled, the system does not reassemble TCP streams to increase performance.

Perform Stream Reassembly on Client Ports, Server Ports, Both Ports

Specifies for client ports, server ports, or both, a comma-separated list of ports to identify the traffic for the stream preprocessor to reassemble. See [Selecting Stream Reassembly Options](#) on page 950.

Perform Stream Reassembly on Client Services, Server Services, Both Services

Specifies for client services, server services, or both, services to identify in the traffic for the stream preprocessor to reassemble. See [Selecting Stream Reassembly Options](#) on page 950.

Reassembling TCP Streams

LICENSE: Protection

The stream preprocessor collects and reassembles all the packets that are part of a TCP session's server-to-client communication stream, client-to-server communication stream, or both. This allows the rules engine to inspect the stream as a single, reassembled entity rather than inspecting only the individual packets that are part of a given stream.

IMPORTANT! Any port you add to the server-level FTP port list, or the DCE/RPC, HTTP, SMTP, Session Initiation Protocol, POP, IMAP, or SSL port list should also be added in each TCP policy to the appropriate list of TCP reassembly ports, depending on whether you are monitoring client or server traffic, or both. Note, however, that reassembling additional traffic types (client, server, both) increases resource demands. For more information, [Configuring the DCE/RPC Preprocessor](#) on page 821, see [Understanding Server-Level FTP Options](#) on page 838, [Selecting Server-Level HTTP Normalization Options](#) on page 854, [Decoding the Session Initiation Protocol](#) on page 872, [Decoding IMAP Traffic](#) on page 880, [Decoding POP Traffic](#) on page 884, [Decoding SMTP Traffic](#) on page 889, [Using the SSL Preprocessor](#) on page 905, and [Understanding Target-Based TCP Policies](#) on page 943.

See the following sections for more information:

- [Understanding Stream-Based Attacks](#) on page 950
- [Selecting Stream Reassembly Options](#) on page 950

Understanding Stream-Based Attacks

LICENSE: Protection

Stream reassembly allows the rules engine to identify stream-based attacks, which it may not detect when inspecting individual packets. You can specify which communication streams the rules engine reassembles based on your network needs. For example, when monitoring traffic on your web servers, you may only want to inspect client traffic because you are much less likely to receive malicious traffic from your own web server.

Selecting Stream Reassembly Options

LICENSE: Protection

In each TCP policy, you can specify a comma-separated list of ports to identify the traffic for the stream preprocessor to reassemble. If adaptive profiles are enabled, you can also list services that identify traffic to reassemble, either as an alternative to ports or in combination with ports. See [Using Adaptive Profiles](#) on page 1003 for information on enabling and using adaptive profiles.

You can specify ports, services, or both. You can specify separate lists of ports for any combination of client ports, server ports, and both. You can also specify separate lists of services for any combination of client services, server services, and both. For example, assume that you wanted to reassemble the following:

- SMTP (port 25) traffic from the client
- FTP server responses (port 21)
- telnet (port 23) traffic in both directions

You could configure the following:

- For client ports, specify 23, 25
- For server ports, specify 21, 23

Or, instead, you could configure the following:

- For client ports, specify 25
- For server ports, specify 21
- For both ports, specify 23

Additionally, consider the following example which combines ports and services and would be valid when adaptive profiles are enabled:

- For client ports, specify 23
- For client services, specify `smtp`
- For server ports, specify 21
- For server services, specify `telnet`

Although you can also specify `a11` as the argument to provide reassembly for all ports, Sourcefire does **not** recommend setting ports to `a11` because it may increase the amount of traffic inspected by this preprocessor and slow performance unnecessarily.

If no preprocessor rule is mentioned, the option is not associated with a preprocessor rule.

Perform Stream Reassembly on Client Ports

Enables stream reassembly based on ports for the client side of the connection. In other words, it reassembles streams destined for web servers, mail servers, or other IP addresses typically defined by the IP addresses specified in \$HOME_NET. Use this option when you expect malicious traffic to originate from clients.

Perform Stream Reassembly on Client Services

Enables stream reassembly based on services for the client side of the connection. Use this option when you expect malicious traffic to originate from clients.

At least one client detector must be enabled (see [Activating and Deactivating Detectors](#) on page 1678) for each client service you select. By default, all Sourcefire-provided detectors are activated. If no detector is enabled for an associated client application, the system automatically enables all Sourcefire-provided detectors for the application; if none exist, the system enables the most recently modified user-defined detector for the application.

This feature requires Protection and Control licenses.

Perform Stream Reassembly on Server Ports

Enables stream reassembly based on ports for the server side of the connection only. In other words, it reassembles streams originating from web servers, mail servers, or other IP addresses typically defined by the IP addresses specified in \$EXTERNAL_NET. Use this option when you want to watch for server side attacks. You can disable this option by not specifying ports.

Perform Stream Reassembly on Server Services

Enables stream reassembly based on services for the server side of the connection only. Use this option when you want to watch for server side attacks. You can disable this option by not specifying services.

At least one detector must be enabled (see [Activating and Deactivating Detectors](#) on page 1678) for each service you select. By default, all Sourcefire-provided detectors are activated. If no detector is enabled for a service, the system automatically enables all Sourcefire-provided detectors for the associated application protocol; if none exist, the system enables the most recently modified user-defined detector for the application protocol.

This feature requires Protection and Control licenses.

Perform Stream Reassembly on Both Ports

Enables stream reassembly based on ports for both the client and server side of the connection. Use this option when you expect that malicious traffic for the same ports may travel in either direction between clients and servers. You can disable this option by not specifying ports.

Perform Stream Reassembly on Both Services

Enables stream reassembly based on services for both the client and server side of the connection. Use this option when you expect that malicious traffic for the same services may travel in either direction between clients and servers. You can disable this option by not specifying services.

At least one detector must be enabled (see [Activating and Deactivating Detectors](#) on page 1678) for each service you select. By default, all Sourcefire-provided detectors are activated. If no detector is enabled for an associated client application or application protocol, the system automatically enables all Sourcefire-provided detectors for the application or application protocol; if none exist, the system enables the most recently modified user-defined detector for the application or application protocol.

This feature requires Protection and Control licenses.

Configuring TCP Stream Preprocessing

LICENSE: Protection

You can configure TCP stream preprocessing, including TCP policies. For more information on the TCP stream preprocessor configuration options, see [Selecting TCP Policy Options](#) on page 945.

To configure the stream preprocessor to track TCP sessions:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

2. Click the edit icon (✎) next to the policy you want to edit.

If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

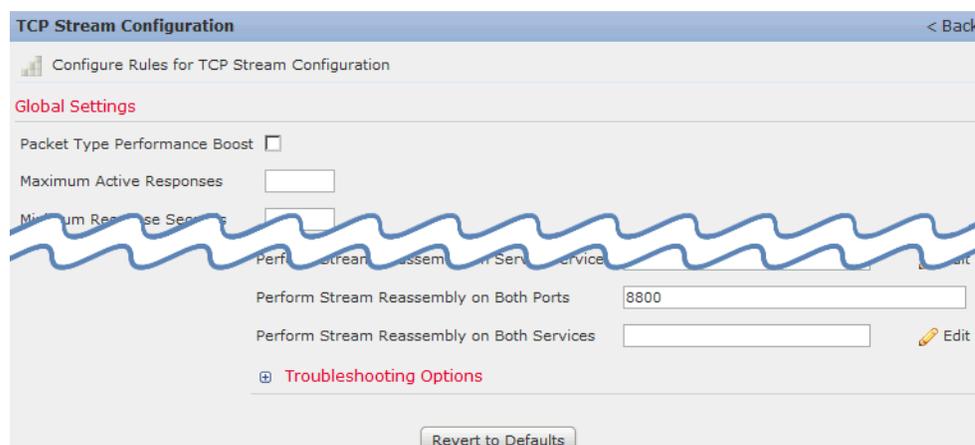

3. Click **Advanced Settings** in the navigation panel on the left.

The Advanced Settings page appears.

4. You have two choices, depending on whether **TCP Stream Configuration** under Transport/Network Layer Preprocessors is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

IMPORTANT! You cannot disable TCP stream preprocessing when the DNS, FTP/Telnet, HTTP Inspection, SMTP, or SSL preprocessor is enabled, or when the DCE/RPC preprocessor is enabled with the RPC over HTTP proxy, RPC over HTTP server, TCP, or SMB transport protocol selected, or when portscan detection is enabled with the TCP protocol selected. Also, you should not disable TCP stream preprocessing when you have TCP rules enabled that use the `flow` or `flowbits` keyword because these rules will not trigger unless TCP stream preprocessing is enabled.

The TCP Stream Configuration page appears.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. Optionally, modify any of the options under Global Settings. See [Selecting TCP Global Options](#) on page 943 for more information.

6. You have two options:

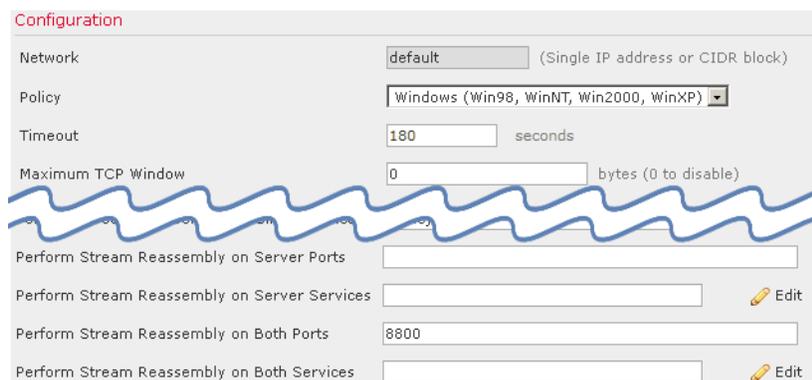

- Add a new target-based policy. Click the add icon () next to **Hosts** on the left side of the page. The Add Target pop-up window appears. Specify one or more IP addresses in the **Host Address** field and click **OK**.

You can specify a single IP address or address block. You can create a total of 255 target-based policies including the default policy. For information on using IP address blocks in the Sourcefire 3D System, see [IP Address Conventions](#) on page 57.

A new entry appears in the list of targets on the left side of the page, highlighted to indicate that it is selected, and the Configuration section updates to reflect the current configuration for the policy you added.

- Modify the settings for an existing target-based policy. Click the configured address for a policy you have added under **Hosts** on the left side of the page, or click **default**.

Your selection is highlighted and the Configuration section updates to display the current configuration for the policy you selected. To delete an existing target-based policy, click the delete icon () next to the policy you want to remove.

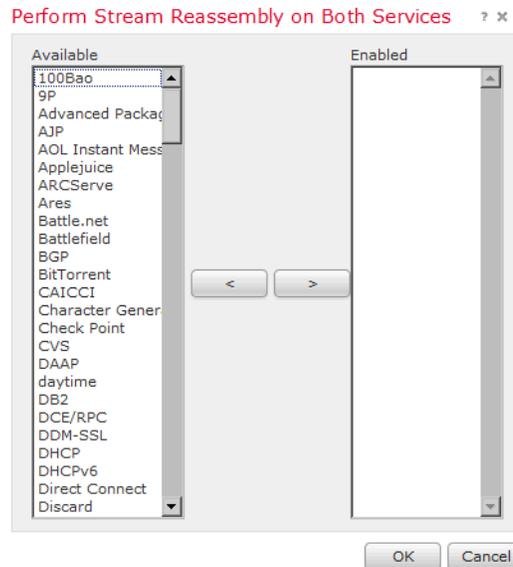

Configuration	
Network	default (Single IP address or CIDR block)
Policy	Windows (Win98, WinNT, Win2000, WinXP)
Timeout	180 seconds
Maximum TCP Window	0 bytes (0 to disable)
Perform Stream Reassembly on Server Ports	<input type="checkbox"/>
Perform Stream Reassembly on Server Services	<input type="checkbox"/> Edit
Perform Stream Reassembly on Both Ports	8800
Perform Stream Reassembly on Both Services	<input type="checkbox"/> Edit

7. Optionally, modify any of the TCP policy options under Configuration.

For specific instructions on modifying settings for stream reassembly based on client services, server services, or both go to step 8; otherwise, go to step 11.

For more information, see [Selecting TCP Policy Options](#) on page 945, and [Selecting Stream Reassembly Options](#) on page 950.

8. To modify settings for stream reassembly based on client, server, or both services, click inside the field you want to modify or click **Edit** next to the field. The pop-up window for the field you selected appears. For example, the following graphic shows the Perform Stream Reassembly on Both Services pop-up window.

Note that you can enable adaptive profiles to monitor traffic for the stream preprocessor to reassemble based on services discovered on your network. See [Working with Servers](#) on page 1418 and [Using Adaptive Profiles](#) on page 1003 for more information.

9. You have two choices:
 - To add services to monitor, select one or more services from the **Available** list on the left, then click the right arrow (>) button.
 - To remove a service, select it from the **Enabled** list on the right, then click the left arrow (<) button.

Use Ctrl or Shift while clicking to select multiple service detectors. You can also click and drag to select multiple adjacent service detectors.

10. Click **OK** to add the selections. The TCP Stream Configuration page is displayed and the services are updated.
11. Optionally, click **Configure Rules for TCP Stream Configuration** at the top of the page to display rules associated with individual TCP policy options. Click **Back** to return to the TCP Stream Configuration page.

12. Optionally, modify any of the TCP stream preprocessing global or policy troubleshooting options only if asked to do so by Sourcefire Support; click the **+** sign next to **Troubleshooting options** to expand the troubleshooting options section. For more information, see [Understanding Troubleshooting Options](#) on page 790.
13. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Using UDP Stream Preprocessing

LICENSE: Protection

UDP stream preprocessing occurs when the rules engine processes packets against a UDP rule that includes the `flow` keyword (see [Applying Rules to a TCP or UDP Client or Server Flow](#) on page 1108) using any of the following arguments:

- `Established`
- `To Client`
- `From Client`
- `To Server`
- `From Server`

UDP is a connectionless protocol that does not provide a means for two endpoints to establish a communication channel, exchange data, and close the channel. UDP data streams are not typically thought of in terms of *sessions*. However, the stream preprocessor uses the source and destination IP address fields in the encapsulating IP datagram header and the port fields in the UDP header to determine the direction of flow and identify a session. A session ends when a configurable timer is exceeded, or when either endpoint receives an ICMP message that the other endpoint is unreachable or the requested service is unavailable.

Note that the system does not generate events related to UDP stream preprocessing; however, you can enable related packet decoder rules to detect UDP protocol header anomalies. For information on events generated by the packet decoder, see [Understanding Packet Decoding](#) on page 934.

Note also that UDP stream preprocessing can be automatically enabled when a rule that requires UDP stream preprocessing is enabled. For more information, see [Automatically Enabling Advanced Settings](#) on page 787.

The following configurations require UDP stream preprocessing to be enabled:

- DNS preprocessor
- SIP preprocessor

- DCE/RPC preprocessor with the UDP transport protocol selected
- UDP intrusion rules that use the `flow`, `flowbits`, or `stream-size` keyword

Configuring UDP Stream Preprocessing

LICENSE: Protection

You can configure UDP stream preprocessing.

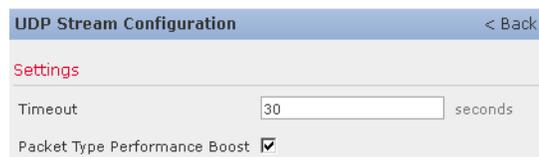

To configure the stream preprocessor to track UDP sessions:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon (✎) next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.
4. You have two choices, depending on whether **UDP Stream Configuration** under Transport/Network Layer Preprocessors is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

IMPORTANT! You cannot disable UDP stream preprocessing when the DCE/RPC preprocessor is enabled with the UDP transport protocol selected, or when portscan detection is enabled with the UDP protocol selected. Also, you should not disable UDP stream preprocessing when you have UDP intrusion rules enabled that use the `flow` or `flowbits` keyword because these rules will not trigger unless UDP stream preprocessing is enabled.

The UDP Stream Configuration page appears.

UDP Stream Configuration < Back

Settings

Timeout 30 seconds

Packet Type Performance Boost

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. Optionally, configure a **Timeout** value to specify the number of seconds between 1 and 86400 the predecessor keeps an inactive stream in the state table. If additional datagrams are not seen in the specified time, the predecessor deletes the stream from the state table.
6. Optionally, select **Packet Type Performance Boost** to ignore UDP traffic for all ports and application protocols that are not specified in enabled rules, except when a UDP rule with both the source and destination ports set to **any** has a **fLow** or **fLowbits** option. This performance improvement could result in missed attacks.
7. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

CHAPTER 25

DETECTING SPECIFIC THREATS

You can use some of the advanced configuration options in an intrusion policy to detect specific threats, such as back orifice attacks, several portscan types, and rate-based attacks that attempt to overwhelm your network with excessive traffic. See the following sections for more information:

- [Detecting Back Orifice](#) on page 959 explains detection of Back Orifice attacks.
- [Detecting Portscans](#) on page 961 describes the different types of portscans and explains how you can use portscan detection to identify threats to your networks before they develop into attacks.
- [Preventing Rate-Based Attacks](#) on page 971 explains how to limit denial of service (DoS) and SYN flood attacks.
- [Detecting Sensitive Data](#) on page 983 explains how to detect and generate events on sensitive data such as credit card numbers and Social Security numbers in ASCII text.

Detecting Back Orifice

LICENSE: Protection

The Sourcefire 3D System provides a preprocessor that detects the existence of the Back Orifice program. This program can be used to gain admin access to your Windows hosts. The Back Orifice preprocessor analyzes UDP traffic for the Back Orifice magic cookie, "!*QWTY?", which is located in the first eight bytes of the packet and is XOR-encrypted.

The Back Orifice preprocessor has a configuration page, but no configuration options. When it is enabled, you must also enable the preprocessor rules in the

[Back Orifice GID:SDs](#) table for the preprocessor to generate corresponding events. A link on the configuration page takes you to a filtered view of Back Orifice preprocessor rules on the Rules page, where you can enable and disable rules and configure other rule attributes. See [Setting Rule States](#) on page 743 for more information.

Back Orifice GID:SDs

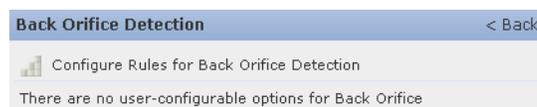

PREPROCESSOR RULE GID:SID	DESCRIPTION
105:1	Back Orifice traffic detected
105:2	Back Orifice client traffic detected
105:3	Back Orifice server traffic detected
105:4	Back Orifice snort buffer attack detected

To view the [Back Orifice Detection](#) page:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon (✎) next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.
4. You have two choices, depending on whether **Back Orifice Detection** under Specific Threat Detection is enabled:
 - If the preprocessor is enabled, click **Edit**.
 - If the preprocessor is disabled, click **Enabled**, then click **Edit**.

The Back Orifice Detection page appears.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. Optionally, click **Configure Rules for Back Orifice Detection** at the top of the page. A filtered view appears of Back Orifice preprocessor rules on the Rules page, where you can enable and disable rules and configure other rule attributes. See [Setting Rule States](#) on page 743 for more information.
Note that you must set the rule state of preprocessor rules to Generate Events or, optionally, to Drop and Generate events in an inline policy, if you want the preprocessor to log intrusion events.
Click **Back** to return to the Back Orifice Detection page.
6. Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Detecting Portscans

LICENSE: Protection

A portscan is a form of network reconnaissance that is often used by attackers as a prelude to an attack. In a portscan, an attacker sends specially crafted packets to a targeted host. By examining the packets that the host responds with, the attacker can often determine which ports are open on the host and, either directly or by inference, which application protocols are running on these ports.

Note that when portscan detection is enabled, you must enable rules on the Rules page with generator ID (GID) 122 for enabled portscan types for the portscan detector to generate portscan events. A link on the configuration page takes you to a filtered view of portscan detection rules on the Rules page, where you can enable and disable rules and configure other rule attributes. See [Setting Rule States](#) on page 743 and the [Portscan Detection SIDs \(GID:122\) table](#) on page 968 for more information.

By itself, a portscan is not evidence of an attack. In fact, some of the portscanning techniques used by attackers can also be employed by legitimate users on your network. Sourcefire's portscan detector is designed to help you determine which portscans might be malicious by detecting patterns of activity.

Attackers are likely to use several methods to probe your network. Often they use different protocols to draw out different responses from a target host, hoping that

if one type of protocol is blocked, another may be available. The [Protocol Types](#) table describes the protocols you can activate in the portscan detector.

Protocol Types

PROTOCOL	DESCRIPTION
TCP	Detects TCP probes such as SYN scans, ACK scans, TCP connect() scans, and scans with unusual flag combinations such as Xmas tree, FIN, and NULL
UDP	Detects UDP probes such as zero-byte UDP packets
ICMP	Detects ICMP echo requests (pings)
IP	Detects IP protocol scans. These scans differ from TCP and UDP scans because the attacker, instead of looking for open ports, is trying to discover which IP protocols are supported on a target host.

IMPORTANT! For events generated by the portscan connection detector, the protocol number is set to 255. Because portscan does not have a specific protocol associated with it by default, the Internet Assigned Numbers Authority (IANA) does not have a protocol number assigned to it. IANA designates 255 as a reserved number, so that number is used in portscan events to indicate that there is not an associated protocol for the event.

Portscans are generally divided into four types based on the number of targeted hosts, the number of scanning hosts, and the number of ports that are scanned. The [Portscan Types](#) table describes the kinds of portscan activity you can detect.

Portscan Types

TYPE	DESCRIPTION
Portscan Detection	<p>A one-to-one portscan in which an attacker uses one or a few hosts to scan multiple ports on a single target host.</p> <p>One-to-one portscans are characterized by:</p> <ul style="list-style-type: none">• a low number of scanning hosts• a single host that is scanned• a high number of ports scanned <p>This option detects TCP, UDP, and IP portscans.</p>
Port Sweep	<p>A one-to-many portsweep in which an attacker uses one or a few hosts to scan a single port on multiple target hosts.</p> <p>Portsweeps are characterized by:</p> <ul style="list-style-type: none">• a low number of scanning hosts• a high number of scanned hosts• a low number of unique ports scanned <p>This option detects TCP, UDP, ICMP, and IP portsweeps.</p>
Decoy Portscan	<p>A one-to-one portscan in which the attacker mixes spoofed source IP addresses with the actual scanning IP address.</p> <p>Decoy portscans are characterized by:</p> <ul style="list-style-type: none">• a high number of scanning hosts• a low number of ports that are scanned only once• a single (or a low number of) scanned hosts <p>The decoy portscan option detects TCP, UDP, and IP protocol portscans.</p>
Distributed Portscan	<p>A many-to-one portscan in which multiple hosts query a single host for open ports.</p> <p>Distributed portscans are characterized by:</p> <ul style="list-style-type: none">• a high number of scanning hosts• a high number of ports that are scanned only once• a single (or a low number of) scanned hosts <p>The distributed portscan option detects TCP, UDP, and IP protocol portscans.</p>

The information that the portscan detector learns about a probe is largely based on seeing negative responses from the probed hosts. For example, when a web

client tries to connect to a web server, the client uses port 80/tcp and the server can be counted on to have that port open. However, when an attacker probes a server, the attacker does not know in advance if it offers web services. When the portscan detector sees a negative response (that is, an ICMP unreachable or TCP RST packet), it records the response as a potential portscan. The process is more difficult when the targeted host is on the other side of a device such as a firewall or router that filters negative responses. In this case, the portscan detector can generate *filtered* portscan events based on the sensitivity level that you select.

The [Sensitivity Levels](#) table describes the three different sensitivity levels you can choose from.

Sensitivity Levels

LEVEL	DESCRIPTION
Low	<p>Detects only negative responses from targeted hosts. Select this sensitivity level to suppress false positives, but keep in mind that some types of portscans (slow scans, filtered scans) might be missed.</p> <p>This level uses the shortest time window for portscan detection.</p>
Medium	<p>Detects portscans based on the number of connections to a host, which means that you can detect filtered portscans. However, very active hosts such as network address translators and proxies may generate false positives.</p> <p>Note that you can add the IP addresses of these active hosts to the Ignore Scanned field to mitigate this type of false positive.</p> <p>This level uses a longer time window for portscan detection.</p>
High	<p>Detects portscans based on a time window, which means that you can detect time-based portscans. However, if you use this option, you should be careful to tune the detector over time by specifying IP addresses in the Ignore Scanned and Ignore Scanner fields.</p> <p>This level uses a much longer time window for portscan detection.</p>

See the following sections for more information:

- [Configuring Portscan Detection](#) on page 965
- [Understanding Portscan Events](#) on page 968

Configuring Portscan Detection

LICENSE: Protection

The portscan detection configuration options allow you to finely tune how the portscan detector reports scan activity.

Note that when portscan detection is enabled, you must enable rules on the Rules page with generator ID (GID) 122 for enabled portscan types for the portscan detector to generate portscan events. See [Setting Rule States](#) on page 743 and the [Portscan Detection SIDs \(GID:122\) table](#) on page 968 for more information.

To configure portscan detection:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

2. Click the edit icon () next to the policy you want to edit.

If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

3. Click **Advanced Settings** in the navigation panel on the left.

The Advanced Settings page appears.

4. You have two choices, depending on whether **Portscan Detection** under Specific Threat Detection is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.The Portscan Detection page appears.

Portscan Detection < Back

Configure Rules for Portscan Detection

Settings

Protocol: TCP, UDP, ICMP, IP

Scan Type: Portscan Detection, Port Sweep, Decoy Portscan, Distributed Portscan

Sensitivity Level: Low

Watch IP: (Single IP address, CIDR block, or comma-separated list)

Ignore Scanners: (Single IP address, CIDR block, or comma-separated list)

Ignore Scanned: (Single IP address, CIDR block, or comma-separated list)

Detect Ack Scans:

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. In the **Protocol** field, specify which of the following protocols you want to enable:
 - TCP
 - UDP
 - ICMP
 - IP

Use Ctrl or Shift while clicking to select multiple protocols or clear individual protocols. See the [Protocol Types table](#) on page 962 for more information.

Note that you must ensure that TCP stream processing is enabled to detect scans over TCP, and that UDP stream processing is enabled to detect scans over UDP.

6. In the **Scan Type** field, specify which of the following portscans you want to detect:
 - Portscan Detection
 - Port Sweep

- Decoy Portscan
- Distributed Portscan

Use Ctrl or Shift while clicking to select or deselect multiple protocols. See the [Portscan Types table](#) on page 963 for more information.

7. In the **Sensitivity Level** list, select the level you want to use: low, medium, or high.

See the [Sensitivity Levels table](#) on page 964 for more information.

8. Optionally, in the **Watch IP** field, specify which host you want to watch for signs of portscan activity, or leave the field blank to watch all network traffic.

You can specify a single IP address or address block, or a comma-separated lists of either or both. For information on using IPv4 and IPv6 address blocks in the Sourcefire 3D System, see [IP Address Conventions](#) on page 57.

9. Optionally, in the **Ignore Scanners** field, specify which hosts you want to ignore as scanners. Use this field to indicate hosts on your network that are especially active. You may need to modify this list of hosts over time.

You can specify a single IP address or address block, or a comma-separated lists of either or both. For information on using IPv4 and IPv6 address blocks in the Sourcefire 3D System, see [IP Address Conventions](#) on page 57.

10. Optionally, in the **Ignore Scanned** field, specify which hosts you want to ignore as the target of a scan. Use this field to indicate hosts on your network that are especially active. You may need to modify this list of hosts over time.

You can specify a single IP address or address block, or a comma-separated lists of either or both. For information on using IPv4 and IPv6 address blocks in the Sourcefire 3D System, see [IP Address Conventions](#) on page 57.

11. Optionally, clear the **Detect Ack Scans** check box to discontinue monitoring of sessions picked up in mid-stream.

IMPORTANT! Detection of mid-stream sessions helps to identify ACK scans, but may cause false events, particularly on networks with heavy traffic and dropped packets.

12. Set the portscan detection rules for each enabled portscan type to Generate Events; click **Configure Rules for Portscan Detection** at the top of the page to display rules associated with individual TCP policy options.

Note that although you can set portscan rules to Drop and Generate Events, the portscan detector does not drop packets, including in an inline deployment.

See [Setting Rule States](#) on page 743 for information on setting rule states.

To identify the rules associated with different portscan types, see the [Portscan Detection SIDs \(GID:122\) table](#) on page 968.

Click **Back** to return to the Portscan Detection page.

13. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Understanding Portscan Events

LICENSE: Protection

When portscan detection is enabled, you must enable rules with generator ID (GID) 122 and a Snort® ID (SID) from among SIDs 1 through 27 to generate events for each enabled portscan type. See [Setting Rule States](#) on page 743 for more information. The **Preprocessor Rule SID** column in the [Portscan Detection SIDs \(GID:122\)](#) table lists the SID for the preprocessor rule you must enable for each portscan type.

Portscan Detection SIDs (GID:122)

PORTSCAN TYPE	PROTOCOL:	SENSITIVITY LEVEL	PREPROCESSOR RULE SID
Portscan Detection	TCP	Low	1
		Medium or High	5
	UDP	Low	17
		Medium or High	21
	ICMP	Low	Does not generate events.
		Medium or High	Does not generate events.
IP	Low	9	
	Medium or High	13	
Port Sweep	TCP	Low	3, 27
		Medium or High	7
	UDP	Low	19
		Medium or High	23
	ICMP	Low	25
		Medium or High	26
	IP	Low	11
		Medium or High	15

Portscan Detection SIDs (GID:122) (Continued)

PORTSCAN TYPE	PROTOCOL:	SENSITIVITY LEVEL	PREPROCESSOR RULE SID
Decoy Portscan	TCP	Low	2
		Medium or High	6
	UDP	Low	18
		Medium or High	22
	ICMP	Low	Does not generate events.
IP	Medium or High	Does not generate events.	
	Low	10	
		Medium or High	14
	<hr/>		
Distributed Portscan	TCP	Low	4
		Medium or High	8
	UDP	Low	20
		Medium or High	24
	ICMP	Low	Does not generate events.
Medium or High		Does not generate events.	
IP	Low	12	
	Medium or High	16	

When you enable the accompanying preprocessor rules, the portscan detector generates intrusion events that you can view just as you would any other intrusion event. However, the information presented on the packet view is different from the other types of intrusion events. This section describes the fields that appear on the packet view for a portscan event and how you can use that information to understand the types of probes that occur on your network.

Begin by using the intrusion event views to drill down to the packet view for a portscan event. You can follow the procedures in [Working with Intrusion Events](#) on page 593.

Note that you cannot download a portscan packet because single portscan events are based on multiple packets; however, the portscan packet view provides all usable packet information.

IMPORTANT! For events generated by the portscan connection detector, the protocol number is set to 255. Because portscan does not have a specific protocol associated with it by default, the Internet Assigned Numbers Authority (IANA) does not have a protocol number assigned to it. IANA designates 255 as a reserved number, so that number is used in portscan events to indicate that there is not an associated protocol for the event.

The [Portscan Packet View](#) table describes the information provided in the packet view for portscan events. For any IP address, you can click the address to view

the context menu and select **whois** to perform a lookup on the IP address or **View Host Profile** to view the host profile for that host.

Portscan Packet View

INFORMATION	DESCRIPTION
Device	The device that detected the event.
Time	The time when the event occurred.
Message	The event message generated by the preprocessor.
Source IP	The IP address of the scanning host.
Destination IP	The IP address of the scanned host.
Priority Count	The number of negative responses (for example, TCP RSTs and ICMP unreachables) from the scanned host. The higher the number of negative responses, the higher the priority count.
Connection Count	The number of active connections on the hosts. This value is more accurate for connection-based scans such as TCP and IP.
IP Count	The number of times that the IP addresses that contact the scanned host changes. For example, if the first IP address is 10.1.1.1, the second IP is 10.1.1.2, and the third IP is 10.1.1.1, then the IP count is 3. This number is less accurate for active hosts such as proxies and DNS servers.
Scanner/Scanned IP Range	The range of IP addresses for the scanned hosts or the scanning hosts, depending on the type of scan. For portsweeps, this field shows the IP range of scanned hosts. For portscans, this shows the IP range of the scanning hosts.
Port/Proto Count	For TCP and UDP portscans, the number of times that the port being scanned changes. For example, if the first port scanned is 80, the second port scanned is 8080, and the third port scanned is again 80, then the port count is 3. For IP protocol portscans, the number of times that the protocol being used to connect to the scanned host changes.

Portscan Packet View (Continued)

INFORMATION	DESCRIPTION
Port/Proto Range	For TCP and UDP portscans, the range of the ports that were scanned. For IP protocol portscans, the range of IP protocol numbers that were used to attempt to connect to the scanned host.
Open Ports	The TCP ports that were open on the scanned host. This field appears only when the portscan detects one or more open ports.

Preventing Rate-Based Attacks

LICENSE: Protection

Rate-based attacks are attacks that depend on frequency of connection or repeated attempts to perpetrate the attack. You can use rate-based detection criteria to detect a rate-based attack as it occurs and respond to it when it happens, then return to normal detection settings after it stops. For more information on configuring rate-based detection, see the following topics:

- [Understanding Rate-Based Attack Prevention](#) on page 971
- [Rate-Based Attack Prevention and Other Filters](#) on page 974
- [Configuring Rate-Based Attack Prevention](#) on page 981
- [Understanding Dynamic Rule States](#) on page 757
- [Setting a Dynamic Rule State](#) on page 758

Understanding Rate-Based Attack Prevention

LICENSE: Protection

You can configure your intrusion policy to include rate-based filters that detect excessive activity directed at hosts on your network. You can use this feature on managed devices deployed in inline mode to block rate-based attacks for a specified time and then revert to only generating events and not drop traffic.

Rate-based attack prevention identifies abnormal traffic patterns and attempts to minimize the impact of that traffic on legitimate requests. Rate-based attacks usually have one of the following characteristics:

- any traffic containing excessive incomplete connections to hosts on the network, indicating a SYN flood attack

To configure SYN attack detection, see [Preventing SYN Attacks](#) on page 974.

- any traffic containing excessive complete connections to hosts on the network, indicating a TCP/IP connection flood attack
To configure simultaneous connection detection, see [Controlling Simultaneous Connections](#) on page 974.
- excessive rule matches in traffic going to a particular destination IP address or addresses or coming from a particular source IP address or addresses.
To configure source or destination-based dynamic rule states, see [Setting a Dynamic Rule State](#) on page 758.
- excessive matches for a particular rule across all traffic.
To configure rule-based dynamic rule states, see [Setting a Dynamic Rule State](#) on page 758.

In an intrusion policy, you can either configure SYN flood or TCP/IP connection flood detection for the entire policy, or set rate-based filters for individual intrusion or preprocessor rules. Note that manually adding a rate-based filter to rules 135:1 and 135:2 has no effect. See [Preventing SYN Attacks](#) on page 974 and [Controlling Simultaneous Connections](#) on page 974 for more information.

Each rate-based filter contains several components:

- for policy-wide or rule-based source or destination settings, the network address designation
- the rule matching rate, which you configure as a count of rule matches within a specific number of seconds
- a new action to be taken when the rate is exceeded

When you set a rate-based setting for the entire policy, the system generates events when it detects a rate-based attack, and optionally can drop the traffic in an inline deployment. When setting rate-based actions for individual rules, you have three available actions: Generate Events, Drop and Generate Events, and Disable.

- the duration of the action, which you configure as a timeout value

Note that when started, the new action occurs until the timeout is reached, even if the rate falls below the configured rate during that time period. When the timeout period expires, if the rate has fallen below the threshold, the action for the rule reverts to the action initially configured for the rule. For policy-wide settings, the action reverts to the action of each rule the traffic matches or stops if it does not match any rules.

You can configure rate-based attack prevention in an inline deployment to block attacks, either temporarily or permanently. Without rate-based configuration, rules set to Generate Events create events, but the system does not drop packets for those rules. However, if the attack traffic matches rules that have rate-based criteria configured, the rate action may cause packet dropping to occur for the

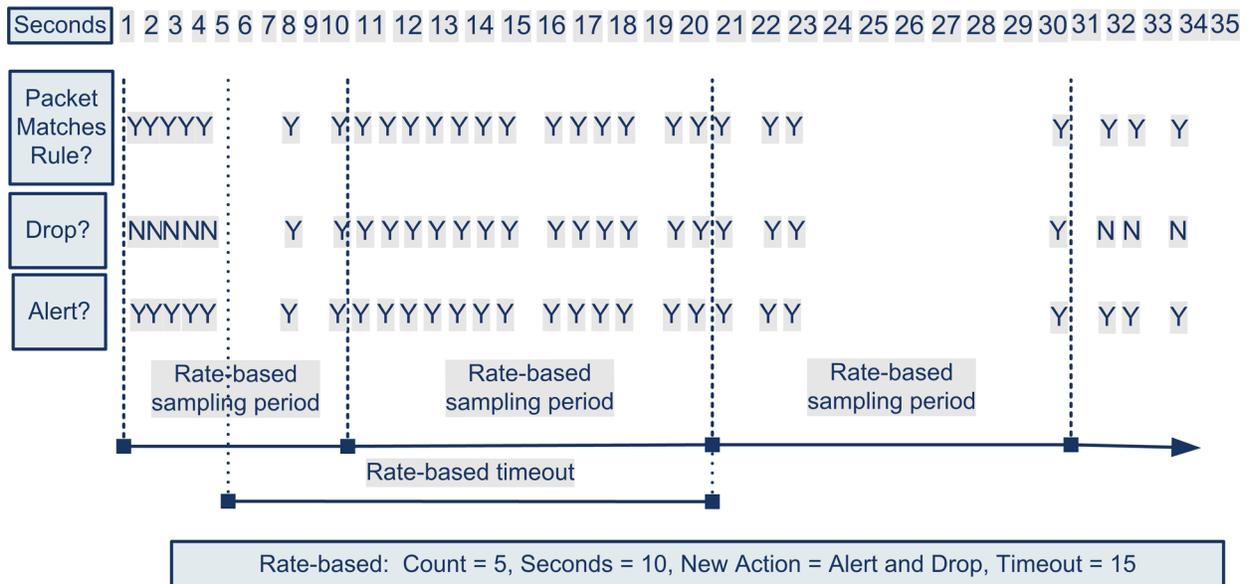

period of time that the rate action is active, even if those rules are not initially set to Drop and Generate Events.

IMPORTANT! Rate-based actions cannot enable disabled rules or drop traffic that matches disabled rules. However, if you set a rate-based filter at the policy level, you can generate events on or generate events on and drop traffic that contains an excessive number of SYN packets or SYN/ACK interactions within a designated time period.

You can define multiple rate-based filters on the same rule. The first filter listed in the intrusion policy has the highest priority. Note that when two rate-based filter actions conflict, the system implements the action of the first rate-based filter. Similarly, policy-wide rate-based filters override rate-based filters set on individual rules if the filters conflict.

The following diagram shows an example where an attacker is attempting to access a host. Repeated attempts to find a password trigger a rule which has rate-based attack prevention configured. The rate-based settings change the rule attribute to Drop and Generate Events after rule matches occur five times in a 10-second span. The new rule attribute times out after 15 seconds.

After the timeout, note that packets are still dropped in the rate-based sampling period that follows. If the sampled rate is above the threshold in the current or previous sampling period, the new action continues. The new action reverts to generating events only after a sampling period completes where the sampled rate is below the threshold rate.

Preventing SYN Attacks

LICENSE: Protection

The SYN attack prevention option helps you protect your network hosts against SYN floods. You can protect individual hosts or whole networks based on the number of packets seen over a period of time. If your device is deployed passively, you can generate events. If your device is placed inline, you can also drop the malicious packets. After the timeout period elapses, if the rate condition has stopped, the event generation and packet dropping stops.

For example, you could configure a setting to allow a maximum of 10 SYN packets from any one IP address, and block further connections from that IP address for 60 seconds.

Enabling this option also activates rule 135:1. Manually activating this rule has no effect. The rule state is always displayed as Disabled, and never changes. The rule generates events when this option is enabled and a defined rate condition is exceeded.

Controlling Simultaneous Connections

LICENSE: Protection

You can limit TCP/IP connections to or from hosts on your network to prevent denial of service (DoS) attacks or excessive activity by users. When the system detects the configured number of successful connections to or from a specified IP address or range of addresses, it generates events on additional connections. The rate-based event generation continues until the timeout period elapses without the rate condition occurring. In an inline deployment you can choose to drop packets until the rate condition times out.

For example, you could configure a setting to allow a maximum of 10 successful simultaneous connections from any one IP address, and block further connections from that IP address for 60 seconds.

Enabling this option also activates rule 135:2. Manually activating this rule has no effect. The rule state is always displayed as Disabled, and never changes. The rule generates events when this option is enabled and a defined rate condition is exceeded.

Rate-Based Attack Prevention and Other Filters

LICENSE: Protection

The `detection_filter` keyword and the thresholding and suppression features provide other ways to filter either the traffic itself or the events that the system generates. You can use rate-based attack prevention alone or in any combination with thresholding, suppression, or the `detection_filter` keyword.

See the following examples for more information:

- [Rate-Based Attack Prevention and Detection Filtering](#) on page 975
- [Dynamic Rule States and Thresholding or Suppression](#) on page 976

- [Policy-Wide Rate-Based Detection and Thresholding or Suppression](#) on page 978
- [Rate-Based Detection with Multiple Filtering Methods](#) on page 979

Rate-Based Attack Prevention and Detection Filtering

LICENSE: Protection

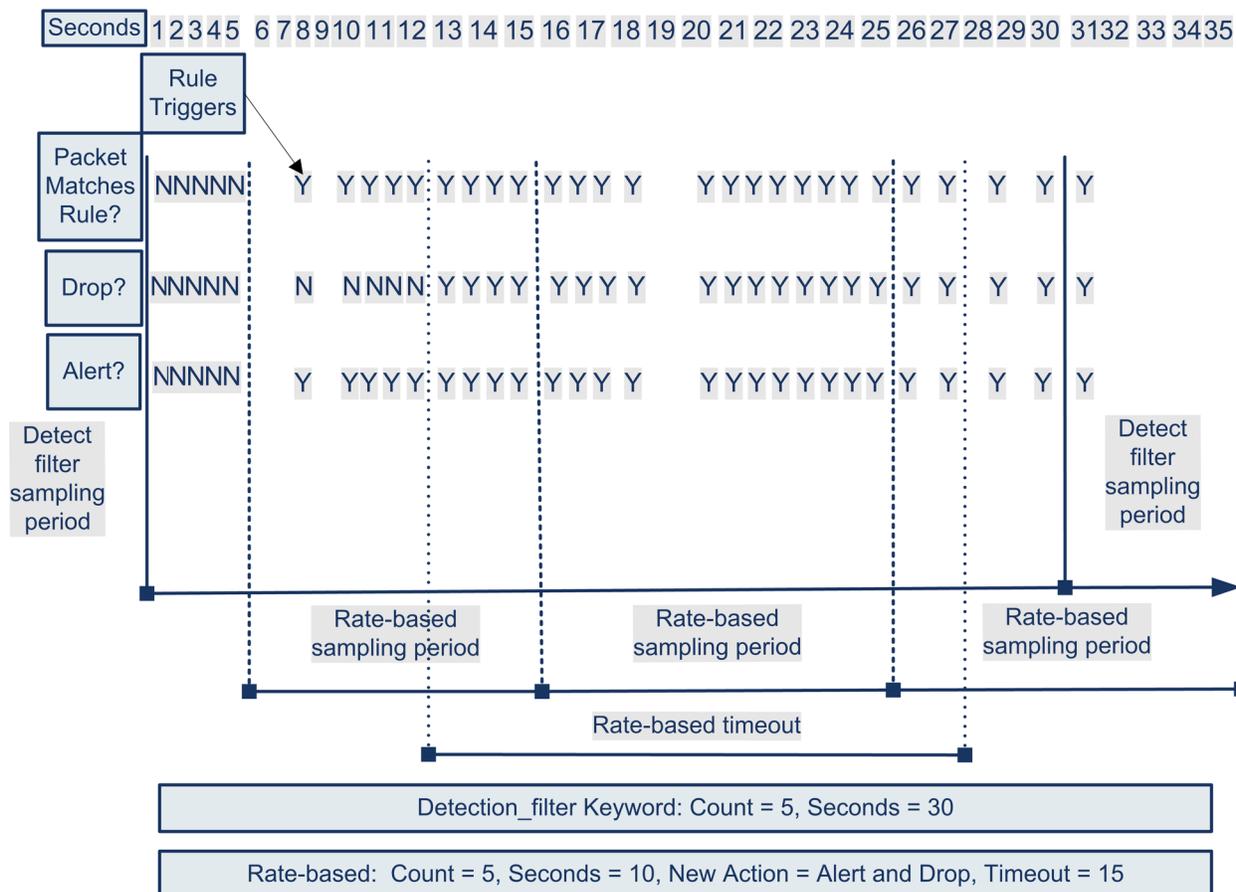

The `detection_filter` keyword prevents a rule from triggering until a threshold number of rule matches occur within a specified time. When a rule includes the `detection_filter` keyword, the system tracks the number of incoming packets matching the pattern in the rule per timeout period. The system can count hits for that rule from particular source or destination IP addresses. After the rate exceeds the rate in the rule, event notification for that rule begins.

The following example shows an attacker attempting a brute-force login. Repeated attempts to find a password trigger a rule that also includes the `detection_filter` keyword, with a count set to 5. This rule has rate-based attack prevention configured. The rate-based settings change the rule attribute to Drop and Generate Events for 20 seconds when there are five hits on the rule in a 10-second span.

As shown in the diagram, the first five packets matching the rule do not generate events because the rule does not trigger until the rate exceeds the rate indicated by the `detection_filter` keyword. After the rule triggers, event notification begins, but the rate-based criteria do not trigger the new action of Drop and Generate Events until five more packets pass.

After the rate-based criteria are met, events are generated and the packets are dropped until the rate-based timeout period expires and the rate falls below the threshold. After twenty seconds elapse, the rate-based action times out. After the timeout, note that packets are still dropped in the rate-based sampling period that

follows. Because the sampled rate is above the threshold rate in the previous sampling period when the timeout happens, the rate-based action continues.

Note that although the example does not depict this, you can use the Drop and Generate Events rule state in combination with the `detection_filter` keyword to start dropping traffic when hits for the rule reach the specified rate. When deciding whether to configure rate-based settings for a rule, consider whether setting the rule to Drop and Generate Events and including the `detection_filter` keyword would achieve the same result, or whether you want to manage the rate and timeout settings in the intrusion policy. For more information, see [Setting Rule States](#) on page 743.

Dynamic Rule States and Thresholding or Suppression

LICENSE: Protection

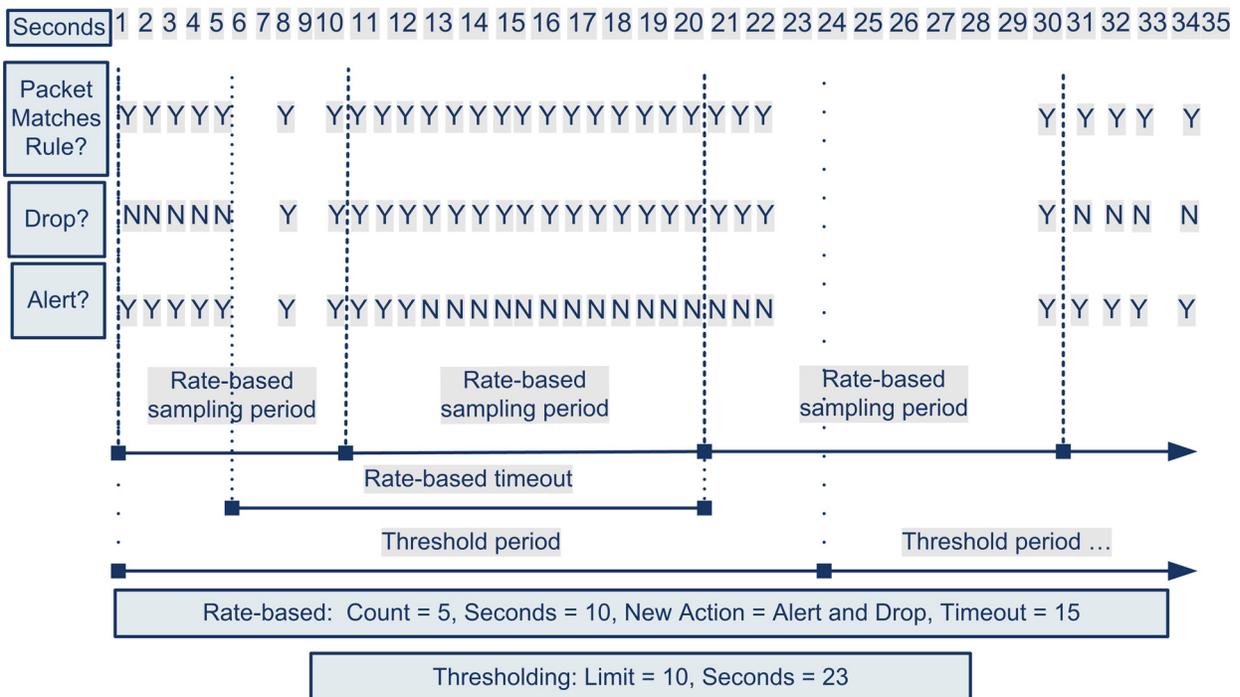

You can use thresholding and suppression to reduce excessive events by limiting the number of event notifications for a rule or by suppressing notifications altogether for that rule. For more information on the available options for thresholding and suppression, see [Configuring Event Thresholding](#) on page 747 and [Configuring Suppression Per Intrusion Policy](#) on page 753.

If you apply suppression to a rule, the system suppresses event notifications for that rule for all applicable IP addresses even if a rate-based action change occurs. However, the interaction between thresholding and rate-based criteria is more complex.

The following example shows an attacker attempting a brute-force login. Repeated attempts to find a password trigger a rule that has rate-based attack prevention configured. The rate-based settings change the rule attribute to Drop and Generate Events for 15 seconds when there are five hits on the rule in 10 seconds. In addition, a limit threshold limits the number of events the rule can generate to 10 events in 23 seconds.

As shown in the diagram, the rule generates events for the first five matching packets. After five packets, the rate-based criteria trigger the new action of Drop and Generate Events, and for the next five packets the rule generates events and the system drops the packet. After the tenth packet, the limit threshold has been reached, so for the remaining packets the system does not generate events but does drop the packets.

After the timeout, note that packets are still dropped in the rate-based sampling period that follows. If the sampled rate is above the threshold rate in the current or previous sampling period, the new action continues. The new action reverts to Generate Events only after a sampling period completes where the sampled rate is below the threshold rate.

Note that although it is not shown in this example, if a new action triggers because of rate-based criteria *after* a threshold has been reached, the system

generates a single event to indicate the change in action. So, for example, when the limit threshold of 10 is reached and the system stops generating events and the action changes from Generate Events to Drop and Generate Events on the 14th packet, the system generates an eleventh event to indicate the change in action.

Policy-Wide Rate-Based Detection and Thresholding or Suppression

LICENSE: Protection

You can use thresholding and suppression to reduce excessive events by limiting the number of event notifications for a source or destination or by suppressing notifications altogether for that rule. For more information on the available options for thresholding and suppression, see [Configuring Global Thresholds](#) on page 1012, [Configuring Event Thresholding](#) on page 747, and [Configuring Suppression Per Intrusion Policy](#) on page 753.

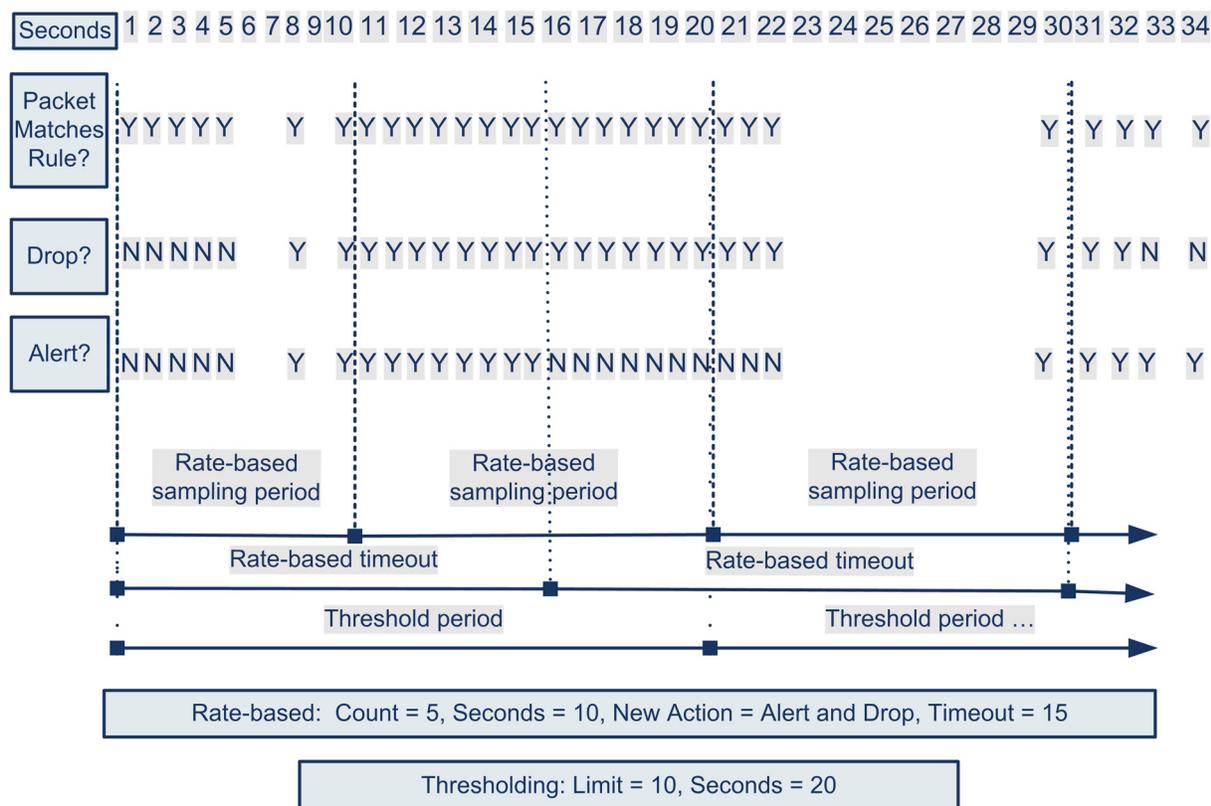

If suppression is applied to a rule, event notifications for that rule for all applicable IP addresses are suppressed even if a rate-based action change occurs because of a policy-wide or rule-specific rate-based setting. However, the interaction between thresholding and rate-based criteria is more complex.

The following example shows an attacker attempting denial of service (DoS) attacks on hosts in your network. Many simultaneous connections to hosts from the same sources trigger a policy-wide Control Simultaneous Connections setting. The setting generates events and drops malicious traffic when there are five connections from one source in 10 seconds. In addition, a global limit threshold limits the number of events any rule or setting can generate to 10 events in 20 seconds.

As shown in the diagram, the policy-wide setting generates events for the first ten matching packets and drops the traffic. After the tenth packet, the limit threshold is reached, so for the remaining packets no events are generated but the packets are dropped.

After the timeout, note that packets are still dropped in the rate-based sampling period that follows. If the sampled rate is above the threshold rate in the current or previous sampling period, the rate-based action of generating events and

dropping traffic continues. The rate-based action stops only after a sampling period where the sampled rate is below the threshold rate.

Note that although it is not shown in this example, if a new action triggers because of rate-based criteria *after* a threshold has been reached, the system generates a single event to indicate the change in action. So, for example, if the limit threshold of 10 has been reached and the system stops generating events and the action changes to Drop and Generate events on the 14th packet, the system generates an eleventh event to indicate the change in action.

Rate-Based Detection with Multiple Filtering Methods

LICENSE: Protection

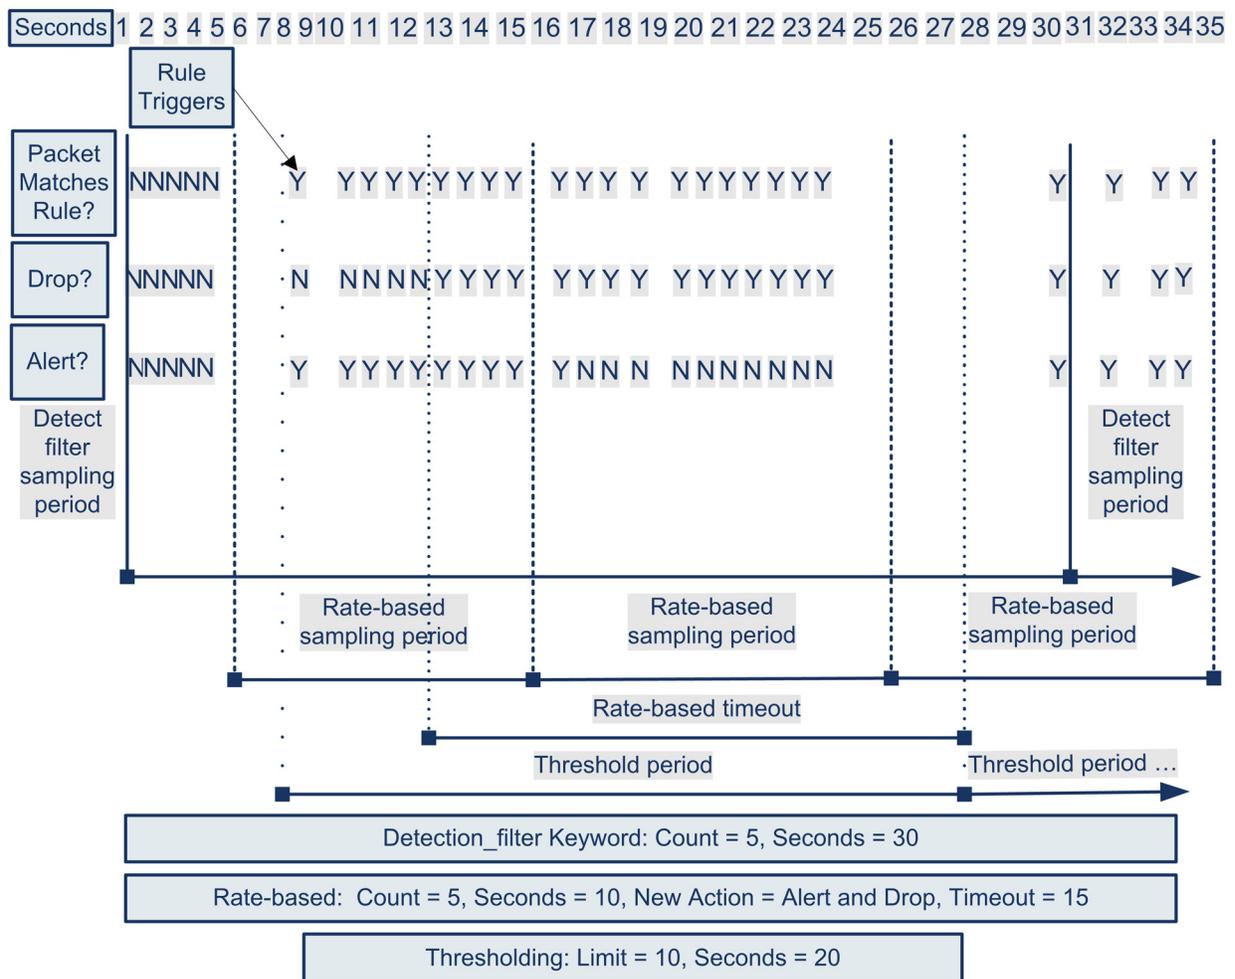

You may encounter situations where the `detection_filter` keyword, thresholding or suppression, and rate-based criteria all apply to the same traffic. When you enable suppression for a rule, events are suppressed for the specified IP addresses even if a rate-based change occurs.

The following example shows an attacker attempting a brute force login, and describes a case where a `detection_filter` keyword, rate-based filtering, and thresholding interact. Repeated attempts to find a password trigger a rule which includes the `detection_filter` keyword, with a count set to 5. This rule also has

rate-based attack prevention settings that change the rule attribute to Drop and Generate Events for 30 seconds when there are five rule hits in 15 seconds. In addition, a limit threshold limits the rule to 10 events in 30 seconds.

As shown in the diagram, the first five packets matching the rule do not cause event notification because the rule does not trigger until the rate indicated in the **detection_filter** keyword is exceeded. After the rule triggers, event notification begins, but the rate-based criteria do not trigger the new action of Drop and Generate Events until five more packets pass. After the rate-based criteria are met, the system generates events for packets 11-15 and drops the packets. After the fifteenth packet, the limit threshold has been reached, so for the remaining packets the system does not generate events but does drop the packets.

After the rate-based timeout, note that packets are still dropped in the rate-based sampling period that follows. Because the sampled rate is above the threshold rate in the previous sampling period, the new action continues.

Configuring Rate-Based Attack Prevention

LICENSE: Protection

You can configure rate-based attack prevention at the policy level to stop SYN flood attacks. You can also stop excessive connections from a specific source or to a specific destination.

To configure rate-based attack prevention:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon (✎) next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.
4. You have two choices, depending on whether **Rate-Based Attack Prevention** under **Specific Threat Detection** is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

The Rate-Based Attack Prevention page appears.

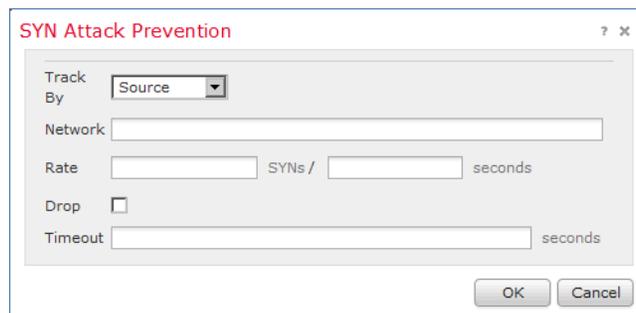

Rate-Based Attack Prevention < Back					
SYN Attack Prevention Add					
Track By	Network	Rate	Drop	Timeout	
Control Simultaneous Connections Add					
Track By	Network	Count	Drop	Timeout	

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. You have two options:

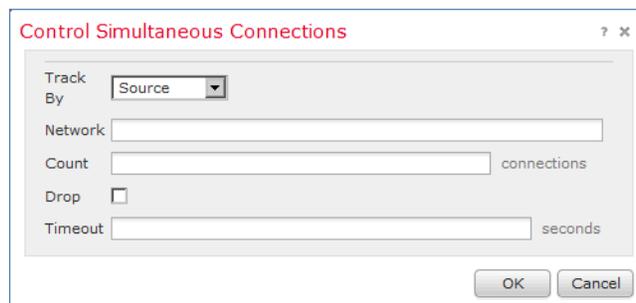

- To prevent incomplete connections intended to flood a host, click **Add** under **SYN Attack Prevention**.

The SYN Attack Prevention dialog box appears.

- To prevent excessive numbers of connections, click **Add** under **Control Simultaneous Connections**.

The Control Simultaneous Connections dialog box appears.

6. Select how you want to track traffic:

- To track all traffic from a specific source or range of sources, select **Source** from the **Track By** drop-down list and type a single IP address or address block in the **Network** field.
- To track all traffic to a specific destination or range of destinations, select **Destination** from the **Track By** drop-down list and type an IP address or address block in the **Network** field.

Note that the system tracks traffic separately for each IP address included in the Network field. Traffic from an IP address that exceeds the configured rate results in generated events only for that IP address. As an example, you might set a source CIDR block of 10.1.0.0/16 for the network setting and configure the system to generate events when there are ten simultaneous connections open. If eight connections are open from 10.1.4.21 and six from

10.1.5.10, the system does not generate events, because neither source has the triggering number of connections open. However, if eleven simultaneous connections are open from 10.1.4.21, the system generates events only for the connections from 10.1.4.21.

For information on using CIDR notation and prefix lengths in the Sourcefire 3D System, see [IP Address Conventions](#) on page 57.

7. Indicate the triggering rate for the rate tracking setting:
 - For SYN attack configuration, indicate the number of SYN packets per number of seconds in the **Rate** fields.
 - For simultaneous connection configuration, indicate the number of connections in the **Count** field.
8. To drop packets matching the rate-based attack prevention settings, select **Drop**.
9. In the **Timeout** field, indicate the time period after which to stop generating events, and if applicable, dropping, for traffic with the matching pattern of SYNs or simultaneous connections.

WARNING! Timeout values can be integers from 1 to 1,000,000. However, setting a high timeout value may entirely block connection to a host in an inline deployment.

10. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Detecting Sensitive Data

LICENSE: Protection

Sensitive data such as Social Security numbers, credit card numbers, driver's license numbers, and so on may be leaked onto the Internet, intentionally or accidentally. The system provides a sensitive data preprocessor that can detect and generate events on sensitive data in ASCII text, which can be particularly useful in detecting accidental data leaks.

The system does not detect encrypted or obfuscated sensitive data, or sensitive data in a compressed or encoded format such as a Base64-encoded email attachment. For example, the system would detect the phone number (555)123-4567, but not an obfuscated version where each number is separated by spaces, as in (5 5 5) 1 2 3 - 4 5 6 7, or by intervening HTML code, such as `(555)-<i>123-4567</i>`. However, the system would detect, for example,

the HTML coded number `(555)-123-4567` where no intervening codes interrupt the numbering pattern.

TIP! The sensitive data preprocessor can detect sensitive data in unencrypted Microsoft Word files that are uploaded and downloaded using FTP or HTTP; this is possible because of the way Word files group ASCII text and formatting commands separately.

The system detects sensitive data per TCP session by matching individual data types against traffic. You can modify the default settings for each data type and for global options that apply to all data types in your intrusion policy. Sourcefire provides predefined, commonly used data types. You can also create custom data types.

A sensitive data preprocessor rule is associated with each data type. You enable sensitive data detection and event generation for each data type by enabling the corresponding preprocessor rule for the data type. A link on the configuration page takes you to a filtered view of sensitive data rules on the Rules page, where you can enable and disable rules and configure other rule attributes. When you save changes to your intrusion policy, you are given the option to automatically enable the sensitive data preprocessor if the rule associated with a data type is enabled and sensitive data detection is disabled. See [Automatically Enabling Advanced Settings](#) on page 787 for more information.

Because the system uses TCP stream preprocessing to establish monitored sessions, TCP stream preprocessing must be enabled to use sensitive data detection in your policy. When you save changes to your policy, you are given the option to automatically enable TCP stream preprocessing if sensitive data detection is enabled and TCP stream preprocessing is disabled. See [Using TCP Stream Preprocessing](#) on page 940 for more information.

See the following sections for more information:

- [Deploying Sensitive Data Detection](#) on page 985
- [Selecting Global Sensitive Data Detection Options](#) on page 985
- [Selecting Individual Data Type Options](#) on page 987
- [Using Predefined Data Types](#) on page 988
- [Configuring Sensitive Data Detection](#) on page 989
- [Selecting Application Protocols to Monitor](#) on page 993
- [Special Case: Detecting Sensitive Data in FTP Traffic](#) on page 995
- [Using Custom Data Types](#) on page 996

Deploying Sensitive Data Detection

LICENSE: Protection

Because sensitive data detection can have a high impact on the performance of your Sourcefire 3D System, Sourcefire recommends that you adhere to the following guidelines when creating your intrusion policy and applying it as part of an access control policy:

- Select the No Rules Active default policy as your base policy; see [Selecting the Base Policy](#) on page 695 for more information.
- Ensure that the IP Defragmentation, FTP and Telnet Configuration, and TCP Stream Configuration advanced settings are enabled in your intrusion policy; see [Modifying Advanced Settings](#) on page 774 for more information.
- Apply the access control policy that includes the intrusion policy containing your sensitive data configuration to a separate device reserved for sensitive data detection; see [Applying an Access Control Policy](#) on page 466 for more information.

Selecting Global Sensitive Data Detection Options

LICENSE: Protection

Global sensitive data preprocessor options control how the preprocessor functions. You can modify global options that specify the following:

- whether the preprocessor replaces all but the last four credit card or Social Security numbers in triggering packets
- which destination hosts on your network to monitor for sensitive data
- how many total occurrences of all data types in a single session result in an event

Note that global sensitive data options are policy-specific and apply to all data types within an intrusion policy. That is, you can configure different global sensitive data settings in different intrusion policies, but not for different data types within the same intrusion policy.

The [Global Sensitive Data Detection Options](#) table describes the global sensitive data detection options you can configure.

Global Sensitive Data Detection Options

OPTION	DESCRIPTION
Mask	Replaces with Xs all but the last four digits of credit card numbers and Social Security numbers in the triggering packet. The masked numbers appear in the intrusion event packet view in the web interface and in downloaded packets. See Using the Packet View on page 622 for more information.
Networks	Specifies the destination host or hosts to monitor for sensitive data. You can specify a single IP address, address block, or a comma-separated list of either or both. The system interprets a blank field as any , meaning any destination IP address. For information on using IPv4 and IPv6 address blocks in the Sourcefire 3D System, see IP Address Conventions on page 57.
Global Threshold	<p>Specifies the total number of all occurrences of all data types during a single session that the preprocessor must detect in any combination before generating a global threshold event. You can specify 1 through 65535.</p> <p>Sourcefire recommends that you set the value for this option higher than the highest threshold value for any individual data type that you enable in your policy. See Selecting Individual Data Type Options on page 987 for more information.</p> <p>Note the following points regarding global thresholds:</p> <ul style="list-style-type: none">• You must enable preprocessor rule 139:1 to detect and generate events on combined data type occurrences. See Setting Rule States on page 743 for information on enabling rules in your intrusion policy.• The preprocessor generates up to one global threshold event per session.• Global threshold events are independent of individual data type events; that is, the preprocessor generates an event when the global threshold is reached, regardless of whether the event threshold for any individual data type has been reached, and vice versa.

Selecting Individual Data Type Options

LICENSE: Protection

Individual data types identify the sensitive data you can detect and generate events on in your specified destination network traffic. You can modify default settings for data type options that specify the following:

- a threshold that must be met for a detected data type to generate a single per-session event
- the destination ports to monitor for each data type
- the application protocols to monitor for each data type

At a minimum, each data type must specify an event threshold and at least one port or application protocol to monitor.

Each predefined data type provided by Sourcefire uses an otherwise inaccessible `sd_pattern` keyword to define a built-in data pattern to detect in traffic. See the [Sensitive Data Types table](#) on page 989 for a listing of predefined data types. You can also create custom data types for which you use simple regular expressions to specify your own data patterns. See [Using Custom Data Types](#) on page 996 for more information.

Note that data type names and patterns are system-wide; all other data type options are policy-specific.

The [Individual Data Type Options](#) table describes the data type options you can configure.

Individual Data Type Options

OPTION	DESCRIPTION
Data Type	Displays the unique name for the data type.
Threshold	<p>Specifies the number of occurrences of the data type when the system generates an event. You receive an error message when you save the policy if you do not set a threshold for an enabled data type. You can specify 1 through 255.</p> <p>Note that the preprocessor generates one event for a detected data type per session. Note also that global threshold events are independent of individual data type events; that is, the preprocessor generates an event when the data type event threshold is reached, regardless of whether the global event threshold has been reached, and vice versa.</p>
Destination Ports	Specifies destination ports to monitor for the data type. You can specify a single port, a comma-separated list of ports, or any , meaning any destination port. You receive an error message when you save the policy if you enable the rule for a data type without setting at least one port or application protocol for the data type.

Individual Data Type Options (Continued)

OPTION	DESCRIPTION
Application Protocols Note that this feature requires Protection and Control licenses.	Specifies up to eight application protocols to monitor for the data type. You receive an error message when you save the policy if you enable the rule for a data type without setting at least one port or application protocol for the data type. At least one detector must be enabled (see Activating and Deactivating Detectors on page 1678) for each application protocol you select. By default, all Sourcefire-provided detectors are activated. If no detector is enabled for an application protocol, the system automatically enables all Sourcefire-provided detectors for the application; if none exist, the system enables the most recently modified user-defined detector for the application. See Selecting Application Protocols to Monitor on page 993 for detailed instructions for selecting application protocols for data types.
Pattern	For a custom data type, the specified pattern to detect (data patterns for data types provided by Sourcefire are predefined). See Using Custom Data Types on page 996 for more information. The web interface does not display built-in patterns for predefined data types. Note that custom and predefined data patterns are system-wide.

Using Predefined Data Types

LICENSE: Protection

Each intrusion policy includes predefined data types for detecting commonly used data patterns such as credit card numbers, email addresses, U.S. phone numbers, and U.S. Social Security numbers with and without dashes. Each predefined data type is associated with a single sensitive data preprocessor rule that has a generator ID (GID) of 138. You must enable the associated sensitive data rule to enable detection, and event generation, for each data type you want to use in your policy. See [Setting Rule States](#) on page 743 for information on enabling rules in an intrusion policy.

To help you enable sensitive data rules, a link on the configuration page takes you to a filtered view of the Rules page that displays all predefined and custom sensitive data rules. You can also display only predefined sensitive data rules by selecting the sensitive-data rule filtering category on the Rules page. See [Filtering Rules in an Intrusion Policy](#) on page 729 for more information. Predefined sensitive data rules are also listed on the Rule Editor page (**Policies > Intrusion > Rule Editor**), where you can view but not edit them under the sensitive-data rule category.

The [Sensitive Data Types](#) table describes each data type and lists the corresponding preprocessor rule that you must enable to enable detection and event generation for the data type.

Sensitive Data Types

DATA TYPE	DESCRIPTION	PREPROCESSOR RULE GID:SID
Credit Card Numbers	Matches Visa®, MasterCard®, Discover® and American Express® fifteen- and sixteen-digit credit card numbers, with or without their normal separating dashes or spaces; also uses the Luhn algorithm to verify credit card check digits.	138:2
Email Addresses	Matches email addresses.	138:5
U.S. Phone Numbers	Matches U.S. phone numbers adhering to the pattern <code>(\d{3}) ?\d{3}-\d{4}</code> .	138:6
U.S. Social Security Numbers Without Dashes	Matches 9-digit U.S. Social Security numbers that have valid 3-digit area numbers, valid 2-digit group numbers, and do not have dashes.	138:4
U.S. Social Security Numbers With Dashes	Matches 9-digit U.S. Social Security numbers that have valid 3-digit area numbers, valid 2-digit group numbers, and dashes.	138:3
Custom	Matches a user-defined data pattern in the specified traffic. See Using Custom Data Types on page 996 for more information.	138:>999999

To reduce false positives from 9-digit numbers other than Social Security numbers, the preprocessor uses an algorithm to validate the 3-digit area number and 2-digit group number that precede the 4-digit serial number in each Social Security number. The preprocessor validates Social Security group numbers through November 2009.

Configuring Sensitive Data Detection

LICENSE: Protection

You can modify default global settings and settings for individual data types. You must also enable the preprocessor rule for each data type you want to detect.

If you enable sensitive data preprocessor rules in your policy without enabling sensitive data detection, you will be prompted to enable sensitive data detection when you save changes to your policy. See [Automatically Enabling Advanced Settings](#) on page 787 for more information.

The [Sensitive Data Configuration Actions](#) table describes actions you can take on the Sensitive Data Detection page.

Sensitive Data Configuration Actions

To...	YOU CAN...
modify global settings	see the Global Sensitive Data Detection Options table on page 986 for information on the global settings you can modify.
modify data type options	click the data type name in the Targets page area. The Configuration page area updates to display the current settings for the data type. See the Individual Data Type Options table on page 987 for information on the options you can modify.

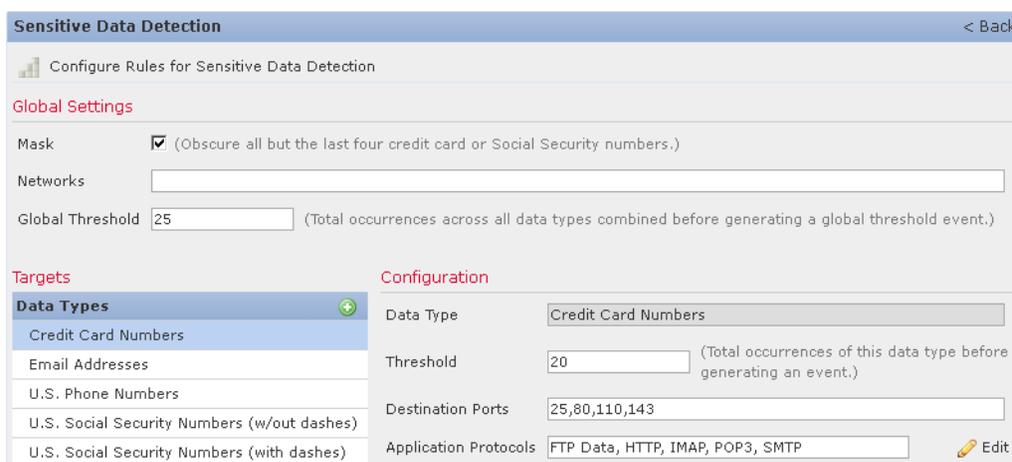

Sensitive Data Configuration Actions (Continued)

To...	YOU CAN...
<p>add or remove application protocols to monitor for a data type</p> <p>Note that this feature requires Protection and Control licenses.</p>	<p>click inside the Application Protocols field, or click Edit next to the field. The Application Protocols pop-up window appears:</p> <ul style="list-style-type: none">• To add up to eight application protocols to monitor, select one or more application protocols from the Available list on the left, then click the right arrow (>) button.• To remove an application protocol, select it from the Enabled list on the right, then click the left arrow (<) button. <p>Use Ctrl or Shift while clicking to select multiple application protocols. You can also click and drag to select multiple adjacent application protocols.</p> <p>At least one detector must be enabled (see Activating and Deactivating Detectors on page 1678) for each application protocol you select. By default, all Sourcefire-provided detectors are activated. If no detector is enabled for an application protocol, the system automatically enables all Sourcefire-provided detectors for the application; if none exist, the system enables the most recently modified user-defined detector for the application.</p> <p>IMPORTANT! To detect sensitive data in FTP traffic, you must add the Ftp data application protocol and enable the FTP/Telnet preprocessor. See Special Case: Detecting Sensitive Data in FTP Traffic on page 995 for more information.</p>
<p>create a custom data type</p>	<p>click the + sign next to Data Types on the left side of the page. The Add Data Type pop-up window appears.</p> <p>Specify a unique data type name and the pattern you want to detect with this data type and click OK, or click Cancel to abandon your edits. See Using Custom Data Types on page 996 for more information.</p>
<p>display sensitive data preprocessor rules</p>	<p>click the Configure Rules for Sensitive Data Detection link above the Global Settings page area. A listing of all sensitive data preprocessor rules appears in a filtered display of the Rules page.</p> <p>Optionally, you can enable or disable any of the listed rules. Note that you must enable the sensitive data preprocessor rule for each data type that you want to use in your intrusion policy. See Setting Rule States on page 743 for more information.</p> <p>You can also configure sensitive data rules for any of the other actions available on the Rules page, such as rule suppression, rate-based attack prevention, and so on; see Managing Rules in an Intrusion Policy on page 717 for more information.</p> <p>Click Back to return to the Sensitive Data Detection page.</p>

To configure sensitive data detection:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon () next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.
4. You have two choices, depending on whether **Sensitive Data Detection** under **Specific Threat Detection** is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.The Sensitive Data Detection page appears.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. You can take any of the actions described in the [Sensitive Data Configuration Actions table](#) on page 990.
6. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Selecting Application Protocols to Monitor

LICENSE: Control

You can specify up to eight application protocols to monitor for each data type. See [Working with Servers](#) on page 1418 for more information on the application protocols the system can detect on your network.

At least one detector must be enabled (see [Activating and Deactivating Detectors](#) on page 1678) for each application protocol you select. By default, all Sourcefire-provided detectors are activated. If no detector is enabled for an application protocol, the system automatically enables all Sourcefire-provided detectors for the application; if none exist, the system enables the most recently modified user-defined detector for the application.

You must specify at least one application protocol or port to monitor for each data type. However, except in the case where you want to detect sensitive data in FTP traffic, Sourcefire recommends for the most complete coverage that you specify corresponding ports when you specify application protocols. For example, if you specify HTTP, you might also configure the well-known HTTP port 80. If a new host on your network implements HTTP, the system will monitor port 80 during the interval when it is discovering the new HTTP application protocol.

In the case where you want to detect sensitive data in FTP traffic, you must specify the **FTP data** application protocol and enable the FTP/Telnet preprocessor, and there is no advantage in specifying a port number. See [Special Case: Detecting Sensitive Data in FTP Traffic](#) on page 995 and [Decoding FTP and Telnet Traffic](#) on page 832 for more information.

To modify application protocols to detect sensitive data:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon () next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.

4. You have two choices, depending on whether **Sensitive Data Detection** under **Specific Threat Detection** is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

The Sensitive Data Detection page appears.

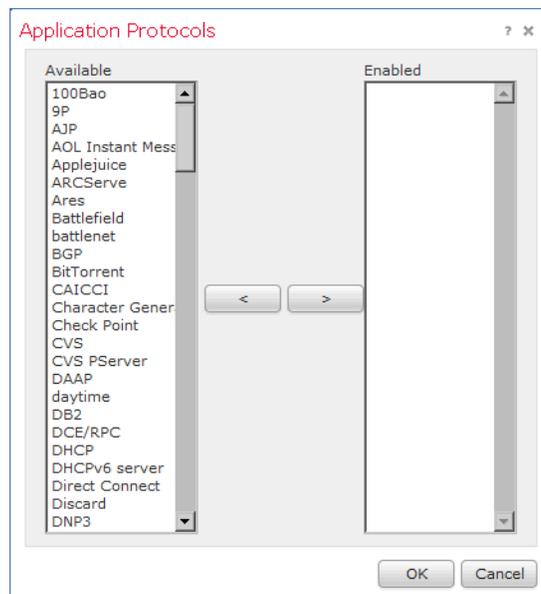

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. Click the data type name under **Data Types** to select the data type you want to modify.

The Configuration area updates to display the current settings for the selected data type.

6. Click inside the **Application Protocols** field, or click **Edit** next to the field.

The Application Protocols pop-up window appears.

7. You have two choices:
 - To add up to eight application protocols to monitor, select one or more application protocols from the **Available** list on the left, then click the right arrow (>) button.
 - To remove an application protocol, select it from the **Enabled** list on the right, then click the left arrow (<) button.

Use Ctrl or Shift while clicking to select multiple application protocols. You can also click and drag to select multiple adjacent application protocols.

IMPORTANT! To detect sensitive data in FTP traffic, you must add the **FTP data** application protocol and ensure that the FTP/Telnet preprocessor is enabled. See [Special Case: Detecting Sensitive Data in FTP Traffic](#) on page 995 for more information.

8. Click **OK** to add the application protocols.

The Sensitive Data Detection page is displayed and the application protocols are updated.

Special Case: Detecting Sensitive Data in FTP Traffic

LICENSE: Control

You usually determine which traffic to monitor for sensitive data by specifying the ports to monitor or, optionally, specifying application protocols in deployments. However, specifying ports or application protocols is not sufficient for detecting sensitive data in FTP traffic. Sensitive data in FTP traffic is found in traffic for the FTP application protocol, which occurs intermittently and uses a transient port number, making it difficult to detect. To detect sensitive data in FTP traffic, you **must** include the following in your configuration:

- Specify the **FTP data** application protocol.

Specifying the **FTP data** application protocol enables detection of sensitive data in FTP traffic. See [Selecting Application Protocols to Monitor](#) on page 993 for more information.
- Ensure that the FTP/Telnet preprocessor is enabled.

In the special case of detecting sensitive data in FTP traffic, specifying the **FTP data** application protocol does not invoke detection; instead, it invokes the rapid processing of the FTP/Telnet processor to detect sensitive data in FTP traffic. See [Decoding FTP and Telnet Traffic](#) on page 832 for more information.

- Ensure that the FTP Data detector, which is enabled by default, is enabled. See [Activating and Deactivating Detectors](#) on page 1678.
- Ensure that your configuration includes at least one port to monitor for sensitive data.

Note that it is not necessary to specify an FTP port except in the unlikely case where you only want to detect sensitive data in FTP traffic. Most sensitive data configurations will include other ports such as HTTP or email ports. In the case where you do want to specify only one FTP port and no other ports to monitor, Sourcefire recommends that you specify the FTP command port 23. See [Configuring Sensitive Data Detection](#) on page 989 or more information.

Using Custom Data Types

LICENSE: Protection

You can create and modify custom data types to detect data patterns that you specify. For example, a hospital might create a data type to protect patient numbers, or a university might create a data type to detect student numbers that have a unique numbering pattern.

Each custom data type you create also creates a single sensitive data preprocessor rule that has a generator ID (GID) of 138 and a Snort ID of 1000000 or greater, that is, a SID for a local rule. You must enable the associated sensitive data rule to enable detection, and event generation, for each custom data type you want to use in your policy. See [Setting Rule States](#) on page 743 for information on enabling rules in an intrusion policy.

To help you enable sensitive data rules, a link on the configuration page takes you to a filtered view of the Rules page that displays all predefined and custom sensitive data rules. You can also display only custom sensitive data rules by selecting the local rule filtering category on the Rules page. See [Filtering Rules in an Intrusion Policy](#) on page 729 for more information. Note that custom sensitive data rules are not listed on the Rule Editor page.

Custom data types you create are added to all intrusion policies. You must enable the associated sensitive data rule in any policy that you want to use to detect and generate events for a particular custom data type.

Note that you must use the Sensitive Data Detection configuration page to create data types and their associated rules. You cannot use the rule editor to create sensitive data rules.

See the following sections for more information:

- [Defining Data Patterns in Custom Data Types](#) on page 997
- [Configuring Custom Data Types](#) on page 999
- [Editing Custom Data Type Names and Detection Patterns](#) on page 1001

Defining Data Patterns in Custom Data Types

LICENSE: Protection

You define the data pattern for a custom data type using a simple set of regular expressions comprised of the following:

- three metacharacters
- escaped characters that allow you to use the metacharacters as literal characters
- six character classes

Metacharacters are literal characters that have special meaning within regular expressions. The [Sensitive Data Pattern Metacharacters](#) table describes the metacharacters you can use when defining a custom data pattern.

Sensitive Data Pattern Metacharacters

METACHARACTER	DESCRIPTION	EXAMPLE
?	Matches zero or one occurrence of the preceding character or escape sequence; that is, the preceding character or escape sequence is optional.	<code>colou?r</code> matches <code>color</code> or <code>colour</code>
{ <i>n</i> }	Matches the preceding character or escape sequence <i>n</i> times.	For example, <code>\d{2}</code> matches <code>55</code> , <code>12</code> , and so on; <code>\l{3}</code> matches <code>Abc</code> , <code>www</code> , and so on; <code>\w{3}</code> matches <code>a1B</code> , <code>25C</code> , and so on; <code>x{5}</code> matches <code>xxxxx</code>
\	Allows you to use metacharacters as actual characters and is also used to specify a predefined character class. See the Sensitive Data Pattern Character Classes table on page 998 for a description of the character classes you can use in sensitive data patterns.	<code>\?</code> matches a question mark, <code>\\</code> matches a backslash, <code>\d</code> matches numeric characters, and so on

You must use a backslash to escape the characters in the [Escaped Sensitive Data Pattern Characters](#) table for the sensitive data preprocessor to interpret them correctly as literal characters.

Escaped Sensitive Data Pattern Characters

USE THIS ESCAPED CHARACTER...	TO REPRESENT THIS LITERAL CHARACTER...
\?	?
\{	{
\}	}
\\	\

The [Sensitive Data Pattern Character Classes](#) table describes the character classes you can use when defining a custom sensitive data pattern.

Sensitive Data Pattern Character Classes

CHARACTER CLASS	DESCRIPTION	CHARACTER CLASS DEFINITION
\d	Matches any numeric ASCII character 0-9	0-9
\D	Matches any byte that is not a numeric ASCII character	not 0-9
\l (lowercase "ell")	Matches any ASCII letter	a-zA-Z
\L	Matches any byte that is not an ASCII letter	not a-zA-Z
\w	Matches any ASCII alphanumeric character Note that, unlike PCRE regular expressions, this does not include an underscore (_).	a-zA-Z0-9
\W	Matches any byte that is not an ASCII alphanumeric character	not a-zA-Z0-9

The preprocessor treats characters entered directly, instead of as part of a regular expression, as literal characters. For example, the data pattern 1234 matches 1234.

The following data pattern example, which is used in predefined sensitive data rule 138:4, uses the escaped digits character class, the multiplier and option-specifier metacharacters, and the literal dash (-) and left and right parentheses () characters to detect U.S. phone numbers:

```
(\d{3}) ?\d{3}-\d{4}
```

Exercise caution when creating custom data patterns. Consider the following alternative data pattern for detecting phone numbers which, although using valid syntax, could cause many false positives:

```
(?\d{3})? ?\d{3}-?\d{4}
```

Because the second example combines optional parentheses, optional spaces, and optional dashes, it would detect, among others, phone numbers in the following desirable patterns:

- (555)123-4567
- 555123-4567
- 5551234567

However, the second example pattern would also detect, among others, the following potentially invalid patterns, resulting in false positives:

- (555 1234567
- 555)123-4567
- 555) 123-4567

Consider finally, for illustration purposes only, an extreme example in which you create a data pattern that detects the lowercase letter a using a low event threshold in all destination traffic on a small company network. Such a data pattern could overwhelm your system with literally millions of events in only a few minutes.

Configuring Custom Data Types

LICENSE: Protection

You configure essentially the same data type options for custom data types that you configure for predefined data types. See [Selecting Individual Data Type Options](#) on page 987 for information on setting options that are common to all data types. In addition, you must also specify the name and data pattern for custom data types.

Note that creating a custom data type also creates an associated custom sensitive data preprocessing rule, which you must enable in each policy where you want to use that data type. See [Setting Rule States](#) on page 743 for information on enabling rules in your intrusion policy.

To create or modify a custom data type:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

2. Click the edit icon (✎) next to the policy you want to edit.

If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

3. Click **Advanced Settings** in the navigation panel on the left.

The Advanced Settings page appears.

4. You have two choices, depending on whether **Sensitive Data Detection** under **Specific Threat Detection** is enabled:

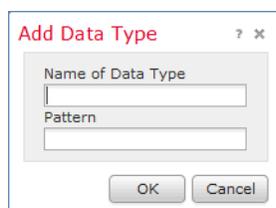

- If the configuration is enabled, click **Edit**.
- If the configuration is disabled, click **Enabled**, then click **Edit**.

The Sensitive Data Detection page appears.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. You have the following options:

- To create a custom data type, click the **+** sign next to **Data Types** on the left side of the page. The Add Data Type pop-up window appears.

Specify a unique data type name and the pattern you want to detect with this data type and click **OK**, or click **Cancel** to abandon your edits. See [Editing Custom Data Type Names and Detection Patterns](#) on page 1001 for more information.

The Sensitive Data Detection page appears. If you clicked **OK**, the page updates to display your changes.

- To modify any of the options that are common to predefined and custom data types, click the data type name in the **Targets** page area.

The Configuration page area updates to display the current settings for the data type. See [Configuring Sensitive Data Detection](#) on page 989 for more information.

- To edit the system-wide name and data pattern for a custom data type, see [Editing Custom Data Type Names and Detection Patterns](#) on page 1001.
- To delete a custom data type, click the delete icon () next to the data type you want to remove and then click **OK**, or click **Cancel** to abandon deleting the data type.

Note that you cannot delete a data type when the sensitive data rule for that data type is enabled in any intrusion policy. Deleting a custom data type deletes it from all intrusion policies.

Editing Custom Data Type Names and Detection Patterns

LICENSE: Protection

You can modify the system-wide name and detection pattern for custom sensitive data rules. Note that changing these settings changes them in all other policies on the system. Note also that you must reapply any applied access control policies that include intrusion policies that use custom data types that you modify.

Except for custom data type names and data patterns, all data type options are policy-specific for both custom and predefined data types. See [Selecting Individual Data Type Options](#) on page 987 for information on modifying options other than the name and data pattern in your custom data types.

To edit custom data type names and data patterns:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

2. Click the edit icon () next to the policy you want to edit.

If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

3. Click **Advanced Settings** in the navigation panel on the left.

The Advanced Settings page appears.

4. You have two choices, depending on whether **Sensitive Data Detection** under **Specific Threat Detection** is enabled:

- If the configuration is enabled, click **Edit**.
- If the configuration is disabled, click **Enabled**, then click **Edit**.

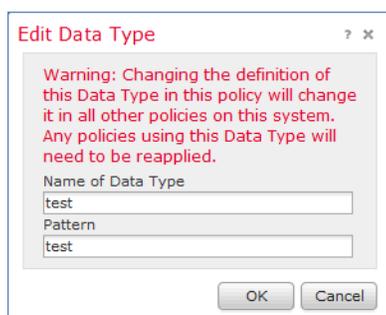

The Sensitive Data Detection page appears.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. In the **Targets** page area, click the name of the custom data type you want to modify.

The page updates to show the current settings for the data type, and the **Edit Data Type Name and Pattern** link appears in the upper right of the Configuration page area.

6. Click the **Edit Data Type Name and Pattern** link.
The Edit Data Type pop-up window appears.

7. Modify the data type name, pattern, or both and click **OK**, or click **Cancel** to abandon your edits. See [Defining Data Patterns in Custom Data Types](#) on page 997 for information on specifying the data pattern.

The Sensitive Data Detection page appears. If you clicked **OK**, the page displays your changes.

CHAPTER 26

USING ADAPTIVE PROFILES

Typically, the system uses the static settings you configure in an intrusion policy to process and analyze traffic. With the adaptive profiles feature, however, the system can adapt to network traffic by associating traffic with host information from the network map and then processing the traffic accordingly.

When a host receives traffic, the operating system running on the host reassembles IP fragments. The order used for that reassembly depends on the operating system. Similarly, each operating system may implement TCP in different ways, and therefore reassemble TCP streams differently. If preprocessors reassemble data using a format other than that used for the operating system of the destination host, the system may miss content that could be malicious when reassembled on the receiving host.

TIP! In a passive deployment, Sourcefire recommends you configure adaptive profiles. In an inline deployment, Sourcefire recommends you configure the inline normalization preprocessor, with the Normalize TCP and Normalize TCP Payload options enabled. For more information, see [TCP Normalization](#) on page 921 and [Configuring Inline Normalization](#) on page 922.

For more information on using adaptive profiles to improve reassembly of packet fragments and TCP streams, see the following topics:

- [Understanding Adaptive Profiles](#) on page 1004
- [Configuring Adaptive Profiles](#) on page 1006

Understanding Adaptive Profiles

LICENSE: FireSIGHT + Protection

Adaptive profiles enable use of the most appropriate operating system profiles for IP defragmentation and for TCP stream preprocessing. For more information on the aspects of the intrusion policy affected by adaptive profiles, see [Defragmenting IP Packets](#) on page 927 and [Using TCP Stream Preprocessing](#) on page 940.

The system can use host information detected by network discovery, obtained through an Nmap scan, or added through the host input feature to adapt processing behavior.

IMPORTANT! When you input host information from a third-party application using the command line import utility or the host input API, you must first map the data to product definitions so the system can use it for adaptive profiles. For more information, see [Managing Third-Party Product Mappings](#) on page 1682.

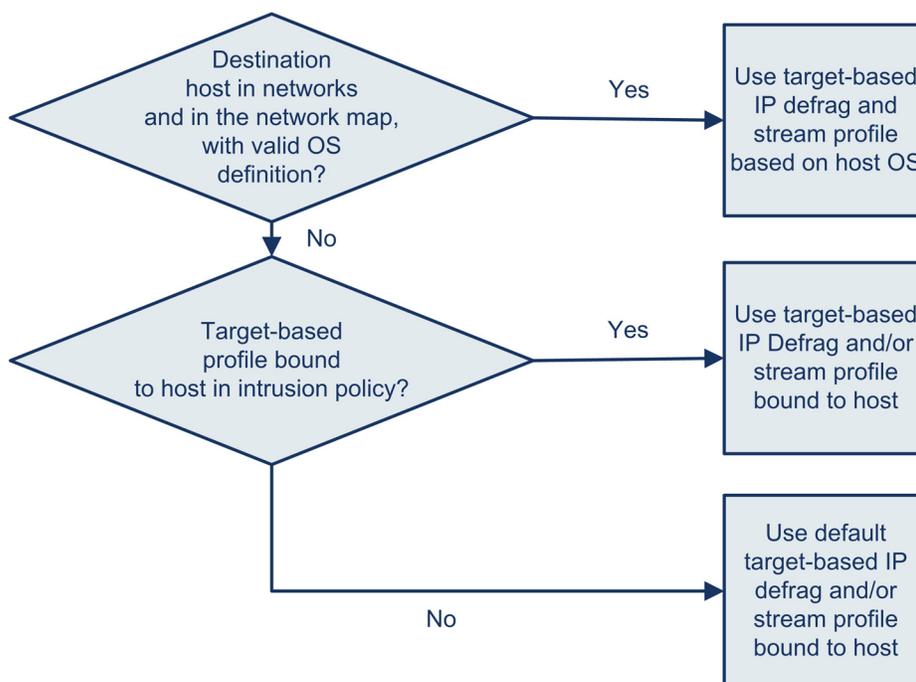

Using Adaptive Profiles with Preprocessors

LICENSE: FireSIGHT + Protection

Adaptive profiles, like the target-based profiles you can configure in an intrusion policy, help to defragment IP packets and reassemble streams in the same way as the operating system on the target host. The rules engine then analyzes the data in the same format as that used by the destination host.

Manually configured target-based profiles only apply the default operating system profile you select or profiles you bind to specific hosts. Adaptive profiles, however, switch to the appropriate operating system profile based on the

operating system in the host profile for the target host, as illustrated in the following diagram.

For example, you configure an intrusion policy where adaptive profiles are enabled for the 10.6.0.0/16 subnet and where you have set the default IP Defragmentation target-based policy to Linux. The Defense Center where you configure the policy has a network map that includes the 10.6.0.0/16 subnet.

When a device detects traffic from Host A, which is not in the 10.6.0.0/16 subnet, it uses the Linux target-based policy to reassemble IP fragments. However, when it detects traffic from Host B, which is in the 10.6.0.0/16 subnet, it retrieves Host B's operating system data from the network map, where Host B is listed as running Microsoft Windows XP Professional. The system uses the Windows target-based profile to do the IP defragmentation for the traffic destined for Host B.

See [Defragmenting IP Packets](#) on page 927 for information on the IP Defragmentation preprocessor. See [Using TCP Stream Preprocessing](#) on page 940 for information on the stream preprocessor.

Adaptive Profiles and FireSIGHT Recommended Rules

LICENSE: FireSIGHT + Protection

Like FireSIGHT recommended rules, adaptive profiles compare metadata in a rule to host information to determine whether a rule should apply for a particular host. However, while FireSIGHT recommended rules provide recommendations for

enabling or disabling rules using that information, adaptive profiles use the information to apply specific rules to specific traffic.

FireSIGHT recommended rules require your interaction to implement suggested changes to rule states. Adaptive profiles, on the other hand, do not modify the intrusion policy. Adaptive treatment of rules happens on a packet-by-packet basis.

Additionally, FireSIGHT recommended rules can result in enabling disabled rules. Adaptive profiles, in contrast, only affect the application of rules that are already enabled in the intrusion policy. Adaptive profiles never change the rule state.

You can use adaptive profiles and FireSIGHT recommended rules in the same policy. Adaptive profiles use the rule state for a rule when the policy is applied to determine whether to include it as a candidate for applying, and your choices to accept or decline recommendations are reflected in that rule state. You can use both features to ensure that you have enabled or disabled the most appropriate rules for each network you monitor, and then to apply enabled rules most efficiently for specific traffic.

See [Managing FireSIGHT Rule State Recommendations](#) on page 764 for more information.

Configuring Adaptive Profiles

LICENSE: FireSIGHT + Protection

To use host information to determine which target-based profiles are used for IP defragmentation and TCP stream preprocessing, you can configure adaptive profiles.

When you configure adaptive profiles, you need to bind the adaptive profile setting to a specific network or networks. To successfully use adaptive profiles, that network must exist in the network map and must be in the segment monitored by the device where you apply the access control policy that includes your intrusion policy.

You can indicate the hosts in the network map where adaptive profiles should be used to process traffic by specifying an IP address or block of addresses. You can also use a variable to indicate the network where adaptive profiles should be applied. See [Managing Variables](#) on page 698 for information on using variables.

You can use any of these addressing methods alone or in any combination as a list of IP addresses, address blocks, or variables separated by commas, as shown in the following example:

```
192.168.1.101, 192.168.4.0/24, $HOME_NET
```

For information on specifying address blocks in the Sourcefire 3D System, see [IP Address Conventions](#) on page 57.

TIP! You can apply adaptive profiles to all hosts in the network map by using a variable with a value of `any` or by specifying `0.0.0.0/0` as the network value.

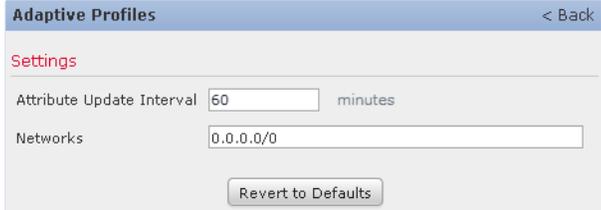

You can also control how frequently network map data is synced from the Defense Center to the managed device. The system uses the data to determine what profiles should be used when processing traffic.

To configure adaptive profiles:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon () next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.
4. You have two choices, depending on whether **Adaptive Profiles** under **Detection Enhancement** is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

The Adaptive Profiles page appears.

Adaptive Profiles < Back

Settings

Attribute Update Interval 60 minutes

Networks 0.0.0.0/0

Revert to Defaults

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. Optionally, in the **Attribute Update Interval** field, type the number of minutes that should elapse between synchronization of network map data from the Defense Center to the managed device.

IMPORTANT! Increasing the value for **Attribute Update Interval** could improve performance in a large network.

6. In the **Networks** field, type the specific IP address, address block, or variable, or a list that includes any of these addressing methods separated by commas, to identify any host in the network map for which you want to use adaptive profiles.
See [Managing Variables](#) on page 698 for information on configuring variables in an intrusion policy. See [Creating a Network Discovery Policy](#) on page 1275 for information on configuring the network map.
7. Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

CHAPTER 27

USING GLOBAL RULE THRESHOLDING

You can use thresholds to limit the number of times the system logs and displays intrusion events. Thresholds cause the system to generate events based on how many times traffic matching a rule originates from or is targeted to a specific address or address range within a specified time period. This can prevent you from being overwhelmed with a large number of events.

You can set event notification thresholds in two ways:

- You can set a global threshold across all traffic to limit how often events from a specific source or destination are logged and displayed per specified time period. For more information, see [Understanding Thresholding](#) on page 1009 and [Configuring Global Thresholds](#) on page 1012.
- You can set thresholds per shared object rule, standard text rule, or preprocessor rule in your intrusion policy configuration, as described in [Configuring Event Thresholding](#) on page 747.

Understanding Thresholding

LICENSE: Protection

By default, every intrusion policy contains a global rule threshold. The default threshold limits event generation for each rule to one event every 60 seconds on traffic going to the same destination. This global threshold applies by default to all intrusion rules and preprocessor rules. Note that you can disable the threshold in the Advanced Settings page in an intrusion policy.

You can also override this threshold by setting individual thresholds on specific rules. For example, you might set a global limit threshold of five events every 60 seconds, but then set a specific threshold of ten events for every 60 seconds for

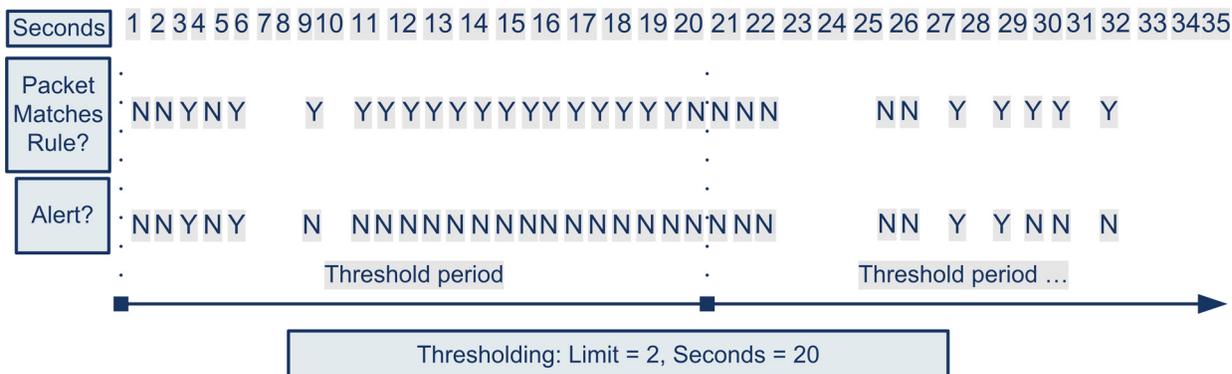

SID 1315. All other rules generate no more than five events in each 60 second period, but the system generates up to ten events for each 60 second period for SID 1315.

For more information on setting rule-based thresholds, see [Configuring Event Thresholding](#) on page 747.

TIP! A global or individual threshold on a managed device with multiple CPUs may result in a higher number of events than expected.

The following diagram shows an example where an attack is in progress for a specific rule. A global limit threshold limits event generation for each rule to two events every 20 seconds.

Note that the period starts at one second and ends at 21 seconds. After the period ends, note that the cycle starts again and the next two rule matches generate events, then the system does not generate any more events during that period.

Understanding Thresholding Options

LICENSE: Protection

Thresholding allows you to limit intrusion event generation by generating only a specific number of events in a time period or by generating one event for a set of

events. When you configure global thresholding, first, specify the thresholding type, as described in the following table.

Thresholding Options

OPTION	DESCRIPTION
Limit	<p>Logs and displays events for the specified number of packets (specified by the count argument) that trigger the rule during the specified time period. For example, if you set the type to Limit, the Count to 10, and the Seconds to 60, and 14 packets trigger the rule, the system stops logging events for the rule after displaying the first 10 that occur within the same minute.</p>
Threshold	<p>Logs and displays a single event when the specified number of packets (specified by the count argument) trigger the rule during the specified time period. Note that the counter for the time restarts after you hit the threshold count of events and the system logs that event. For example, you set the type to Threshold, Count to 10, and Seconds to 60 and the rule triggers 10 times by second 33. the system generates one event, then resets the Seconds and Count counters to 0. The rule then triggers another 10 times in the next 25 seconds. Because the counters reset to 0 at second 33, the system logs another event.</p>
Both	<p>Logs and displays an event once per specified time period, after the specified number (count) of packets trigger the rule. For example, if you set the type to Both, Count to two, and Seconds to 10, the following event counts result:</p> <ul style="list-style-type: none"> • If the rule is triggered once in 10 seconds, the system does not generate any events (the threshold is not met) • If the rule is triggered twice in 10 seconds, the system generates one event (the threshold is met when the rule triggers the second time) • If the rule is triggered four times in 10 seconds, the system generates one event (the threshold is met when the rule triggered the second time and following events are ignored)

Next, specify the tracking, which determines whether the event instance count is calculated per source or destination IP address. Finally, specify the number of instances and time period that define the threshold.

Thresholding Instance/Time Options

OPTION	DESCRIPTION
Count	The number of event instances per specified time period per tracking IP address or address range required to meet the threshold.
Seconds	The number of seconds that elapse before the count resets. If you set the threshold type to Limit , the tracking to Source , Count to 10, and Seconds to 10, the system logs and displays the first 10 events that occur in 10 seconds from a given source port. If only seven events occur in the first 10 seconds, the system logs and displays those, if 40 events occur in the first 10 seconds, the system logs and displays 10, then begins counting again when the 10-second time period elapses.

Configuring Global Thresholds

LICENSE: Protection

You can set a global threshold to manage the number of events generated by each rule over a period of time. When you set a global threshold, that threshold applies for each rule that does not have an overriding specific threshold. For more information on configuring thresholds, see [Understanding Thresholding](#) on page 1009.

A global threshold is configured by default. The default values are as follows:

- **Type** — Limit
- **Track By** — Destination
- **Count** — 1
- **Seconds** — 60

To configure global thresholding:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.

2. Click the edit icon (✎) next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.
4. You have two choices, depending on whether **Global Rule Thresholding** under Intrusion Rule Thresholds is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

The Global Rule Thresholding page appears.

Global Rule Thresholding < Back

Settings

Type Limit Threshold Both

Track By Source Destination

Count

Seconds seconds

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. Select the type of threshold from the **Type** drop-down list to do the following during the time specified by the seconds argument:
 - Select **Limit** to log and display an event for each packet that triggers the rule until the limit specified by the count argument is exceeded.
 - Select **Threshold** to log and display a single event for each packet that triggers the rule and represents either the instance that matches the threshold set by the count argument or is a multiple of the threshold.
 - Select **Both** to log and display a single event after the number of packets specified by the count argument trigger the rule.
6. Select the tracking method from the **Track By** drop-down list:
 - Select **Source** to identify rule matches in traffic coming from a particular source IP address or addresses.
 - Select **Destination** to identify rule matches in traffic going to a particular destination IP address.

7. You have the following options:
 - For a **Threshold** threshold, specify the number of rule matches you want to use as your threshold in the **Count** field.
 - For a **Limit** threshold, specify the number of event instances per specified time period per tracking IP address required to meet the threshold in the **Count** field.
8. You have the following options:
 - For a **Limit** threshold, specify the number of seconds that make up the time period for which attacks are tracked in the **Seconds** field.
 - For a **Threshold** threshold specify the number of seconds that elapse before the count resets in the **Seconds** field. Note that the count resets if the number of rule matches indicated by the **Count** field occur before the number of seconds indicated elapse.
9. Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Disabling the Global Threshold

LICENSE: Protection

By default, a global limit threshold limits the number of events on traffic going to a destination to one event per 60 seconds. You can disable global thresholding in the highest policy layer if you want to threshold events for specific rules and not apply thresholding to every rule by default.

To disable global thresholding:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon (✎) next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.
4. Disable **Global Rule Thresholding** under Intrusion Rule Thresholds.
5. Save your policy, continue editing, discard your changes, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

CHAPTER 28

USING PERFORMANCE SETTINGS IN AN INTRUSION POLICY

Sourcefire provides several features for improving the performance of your system as it analyzes traffic for attempted intrusions. See the following sections for more information:

- [Event Queue Configuration](#) on page 1016 describes how you can specify the number of packets to allow in the event queue, and enable or disable inspection of packets that will be rebuilt into larger streams.
- [Understanding Packet Latency Thresholding](#) on page 1017 describes how you can balance security with the need to maintain device latency at an acceptable level with packet latency thresholding.
- [Understanding Rule Latency Thresholding](#) on page 1021 describes how you can balance security with the need to maintain device latency at an acceptable level with rule latency thresholding.
- [Performance Statistics Configuration](#) on page 1026 describes how you can configure the basic parameters of how your managed devices monitor and report on their own performance.
- [Constraining Regular Expressions](#) on page 1028 describes how you can override default match and recursion limits on PCRE regular expressions.
- [Rule Processing Configuration](#) on page 1030 describes how you can configure rule processing event queue settings.

Event Queue Configuration

LICENSE: Protection

You can specify the number of packets to allow in the event queue, and enable or disable, before and after stream reassembly, inspection of packets that will be rebuilt into larger streams.

To configure event queue settings:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

2. Click the edit icon (✎) next to the policy you want to edit.

If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

3. Click **Advanced Settings** in the navigation panel on the left.

The Advanced Settings page appears.

4. You have two choices, depending on whether **Event Queue Configuration** under Performance Settings is enabled:

- If the configuration is enabled, click **Edit**.
- If the configuration is disabled, click **Enabled**, then click **Edit**.

The Event Queue Configuration page appears.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. You can modify the following options:
 - Type a value for the maximum number of events to allow in queue in the **Maximum Queued Events** field.
 - To inspect packets which will be rebuilt into larger streams of data before and after stream reassembly, select **Disable content checks that will be inserted through the stream reassembly process**. Inspection before and after reassembly requires more processing overhead and may decrease performance.
 - To disable inspection of packets which will be rebuilt into larger streams of data before and after stream reassembly, clear **Disable content checks that will be inserted through the stream reassembly process**. Disabling inspection decreases the processing overhead for inspection of stream inserts and may boost performance.
6. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Understanding Packet Latency Thresholding

LICENSE: Protection

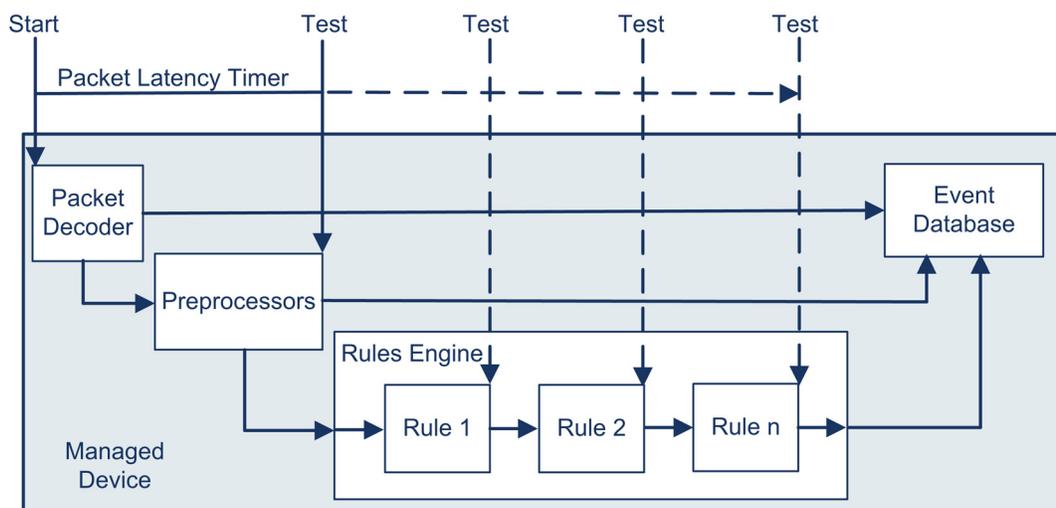

You can balance security with the need to maintain latency at an acceptable level by enabling packet latency thresholding. Packet latency thresholding measures the total elapsed time taken to process a packet by applicable decoders, preprocessors, and rules, and ceases inspection of the packet if the processing time exceeds a configurable threshold.

Packet latency thresholding measures elapsed time, not just processing time, in order to more accurately reflect the actual time required for the rule to process a packet. However, latency thresholding is a software-based latency implementation that does not enforce strict timing.

The trade-off for the performance and latency benefits derived from latency thresholding is that uninspected packets could contain attacks. However, packet latency thresholding gives you a tool you can use to balance security with connectivity.

When you enable packet latency thresholding, a timer starts for each packet when decoder processing begins. Timing continues either until all processing

ends for the packet or until the processing time exceeds the threshold at a timing test point.

As illustrated in the above figure, packet latency timing is tested at the following test points:

- after the completion of all decoder and preprocessor processing and before rule processing begins
- after processing by each rule

If the processing time exceeds the threshold at any test point, packet inspection ceases.

TIP! Total packet processing time does not include routine TCP stream or IP fragment reassembly times.

Packet latency thresholding has no effect on events triggered by a decoder, preprocessor, or rule processing the packet. Any applicable decoder, preprocessor, or rule triggers normally until a packet is fully processed, or until packet processing ends because the latency threshold is exceeded, whichever comes first. If a drop rule detects an intrusion in an inline deployment, the drop rule triggers an event and the packet is dropped.

IMPORTANT! No packets are evaluated against rules after processing for that packet ceases because of a packet latency threshold violation. A rule that would have triggered an event cannot trigger that event, and for drop rules, cannot drop the packet.

For more information on drop rules, see [Setting Rule States](#) on page 743.

Packet latency thresholding can improve system performance in both passive and inline deployments, and can reduce latency in inline deployments, by stopping inspection of packets that require excessive processing time. These performance benefits might occur when, for example:

- for both passive and inline deployments, sequential inspection of a packet by multiple rules requires an excessive amount of time
- for inline deployments, a period of poor network performance, such as when someone downloads an extremely large file, slows packet processing

In a passive deployment, stopping the processing of packets might not contribute to restoring network performance because processing simply moves to the next packet.

See the following sections for more information:

- [Setting Packet Latency Thresholding Options](#) on page 1019.
- [Configuring Packet Latency Thresholding](#) on page 1020.

Setting Packet Latency Thresholding Options

LICENSE: Protection

The [Packet Latency Thresholding Options](#) table describes the options you can set to configure packet latency thresholding.

Packet Latency Thresholding Options

OPTION	DESCRIPTION
Threshold	Specifies the time in microseconds when inspection of a packet ceases. See Minimum Packet Latency Threshold Settings on page 1020 for recommended minimum threshold settings.

You can enable rule 134:3 to generate an event when the system stops inspecting a packet because the packet latency threshold is exceeded. See [Viewing Intrusion Events](#) on page 602 and [Setting Rule States](#) on page 743 for more information.

Many factors affect measurements of system performance and packet latency, such as CPU speed, data rate, packet size, and protocol type. For this reason, Sourcefire recommends that, if you enable packet latency thresholding, you use the threshold settings in the [Minimum Packet Latency Threshold Settings](#) table

until your own calculations provide you with settings tailored to your particular network environment.

Minimum Packet Latency Threshold Settings

FOR THIS DATA RATE...	SET THRESHOLD MICROSECONDS TO AT LEAST...
1 Gbps	100
100 Mbps	250
5 Mbps	1000

Determine the following when calculating your settings:

- average packets per second
- average microseconds per packet

Multiply the average microseconds per packet for your network by a significant safety factor to ensure that you do not unnecessarily discontinue packet inspections.

For example, the [Minimum Packet Latency Threshold Settings](#) table recommends a minimum packet latency threshold of 100 microseconds in a one gigabit environment. This minimum recommendation is based on test data showing an average of 250,000 packets per second, which is 0.25 packets per microsecond or, said differently, 4 microseconds per packet. Multiplying by a factor of twenty-five results in a recommended minimum threshold of 100 microseconds.

Configuring Packet Latency Thresholding

LICENSE: Protection

You can enable or disable packet latency thresholding and modify the latency threshold.

To configure packet latency thresholding:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

2. Click the edit icon () next to the policy you want to edit.

If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.
4. You have two choices, depending on whether **Latency-Based Packet Handling** under Performance Settings is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

The Latency-Based Packet Handling page appears.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. See the [Minimum Packet Latency Threshold Settings table](#) on page 1020 for recommended minimum **Threshold** settings.
6. Optionally, click **Configure Rules for Latency-Based Packet Handling** at the top of the page to display rules associated with individual options.
Click **Back** to return to the Latency-Based Packet Handling page.
7. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Understanding Rule Latency Thresholding

LICENSE: Protection

You can balance security with the need to maintain latency at an acceptable level by enabling rule latency thresholding. Rule latency thresholding measures the elapsed time each rule takes to process an individual packet, suspends the violating rule along with a group of related rules for a specified time if the processing time exceeds the rule latency threshold a configurable consecutive number of times, and restores the rules when the suspension expires.

Rule latency thresholding measures elapsed time, not just processing time, in order to more accurately reflect the actual time required for the rule to process a packet. However, latency thresholding is a software-based latency implementation that does not enforce strict timing.

The trade-off for the performance and latency benefits derived from latency thresholding is that uninspected packets could contain attacks. However, rule latency thresholding gives you a tool you can use to balance security with connectivity.

When you enable rule latency thresholding, a timer measures the processing time each time a packet is processed against a group of rules. Any time the rule processing time exceeds a specified rule latency threshold, the system increments a counter. If the number of consecutive threshold violations reaches a specified number, the system takes the following actions:

- suspends the rules for the specified period
- triggers an event indicating the rules have been suspended
- re-enables the rules when the suspension expires
- triggers an event indicating the rules have been re-enabled

The system zeroes the counter when the group of rules has been suspended, or when rule violations are not consecutive. Permitting some consecutive violations before suspending rules lets you ignore occasional rule violations that might have negligible impact on performance and focus instead on the more significant impact of rules that repeatedly exceed the rule latency threshold.

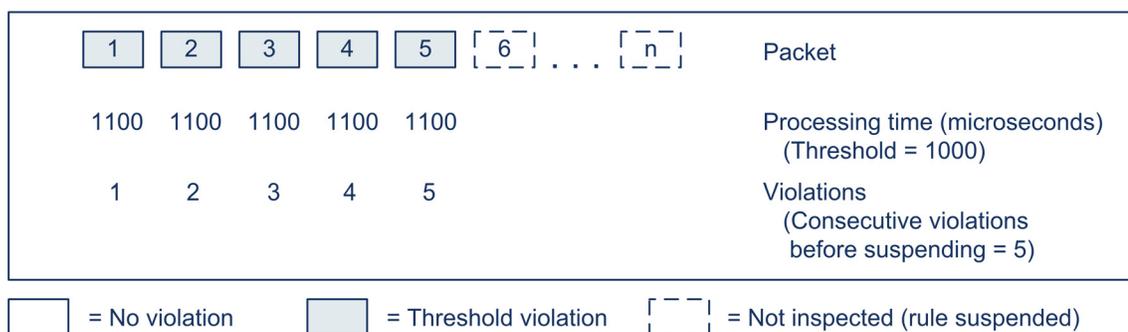

The following example shows five consecutive rule processing times that do not result in rule suspension.

1	2	3	4	5	Packet
1100	1100	1100	500	1100	Processing time (microseconds) (Threshold = 1000)
1	2	3	0	1	Violations (Consecutive violations before suspending = 5)

= No violation = Threshold violation

In the above example, the time required to process each of the first three packets violates the rule latency threshold of 1000 microseconds, and the violations counter increments with each violation. Processing of the fourth packet does not violate the threshold, and the violations counter resets to zero. The fifth packet violates the threshold and the violations counter restarts at one.

The following example shows five consecutive rule processing times that do result in rule suspension.

In the second example, the time required to process each of the five packets violates the rule latency threshold of 1000 microseconds. The group of rules is suspended because the rule processing time of 1100 microseconds for each packet violates the threshold of 1000 microseconds for the specified five consecutive violations. Any subsequent packets, represented in the figure as packets 6 through n, are not examined against suspended rules until the suspension expires. If more packets occur after the rules are re-enabled, the violations counter begins again at zero.

Rule latency thresholding has no effect on intrusion events triggered by the rules processing the packet. A rule triggers an event for any intrusion detected in the packet, regardless of whether the rule processing time exceeds the threshold. If the rule detecting the intrusion is a drop rule in an inline deployment, the packet is dropped. When a drop rule detects an intrusion in a packet that results in the rule being suspended, the drop rule triggers an intrusion event, the packet is dropped, and that rule and all related rules are suspended. For more information on drop rules, see [Setting Rule States](#) on page 743.

IMPORTANT! Packets are not evaluated against suspended rules. A suspended rule that would have triggered an event cannot trigger that event and, for drop rules, cannot drop the packet.

Rule latency thresholding can improve system performance in both passive and inline deployments, and can reduce latency in inline deployments, by suspending rules that take the most time to process packets. Packets are not evaluated again against suspended rules until a configurable time expires, giving the overloaded device time to recover. These performance benefits might occur when, for example:

- hastily written, largely untested rules require an excessive amount of processing time
- a period of poor network performance, such as when someone downloads an extremely large file, causes slow packet inspection

See the following sections for more information:

- [Setting Rule Latency Thresholding Options](#) on page 1024.
- [Configuring Rule Latency Thresholding](#) on page 1025.

Setting Rule Latency Thresholding Options

LICENSE: Protection

When enabled, rule latency thresholding suspends rules for the time specified by **Suspension Time** when the time rules take to process a packet exceeds **Threshold** for the consecutive number of times specified by **Consecutive Threshold Violations Before Suspending Rule**.

You can enable rule 134:1 to generate an event when rules are suspended, and rule 134:2 to generate an event when suspended rules are enabled. See [Viewing Intrusion Events](#) on page 602 and [Setting Rule States](#) on page 743 for more information.

The [Rule Latency Thresholding Options](#) table further describes the options you can set to configure rule latency thresholding.

Rule Latency Thresholding Options

OPTION	DESCRIPTION
Threshold	Specifies the time in microseconds that rules should not exceed when examining a packet. See Minimum Rule Latency Threshold Settings on page 1025 for recommended minimum threshold settings.
Consecutive Threshold Violations Before Suspending Rule	Specifies the consecutive number of times rules can take longer than the time set for Threshold to inspect packets before rules are suspended.
Suspension Time	Specifies the number of seconds to suspend a group of rules.

Many factors affect measurements of system performance, such as CPU speed, data rate, packet size, and protocol type. For this reason, Sourcefire recommends that, if you enable rule latency thresholding, you use the threshold settings in the

[Minimum Rule Latency Threshold Settings](#) table until your own calculations provide you with settings tailored to your particular network environment.

Minimum Rule Latency Threshold Settings

FOR THIS DATA RATE...	SET THRESHOLD MICROSECONDS TO AT LEAST...
1 Gbps	500
100 Mbps	1250
5 Mbps	5000

Determine the following when calculating your settings:

- average packets per second
- average microseconds per packet

Multiply the average microseconds per packet for your network by a significant safety factor to ensure that you do not unnecessarily suspend rules.

Configuring Rule Latency Thresholding

LICENSE: Protection

You can enable or disable rule latency thresholding, and modify the rule latency threshold, the suspension time for suspended rules, and the number of consecutive threshold violations that must occur before suspending rules.

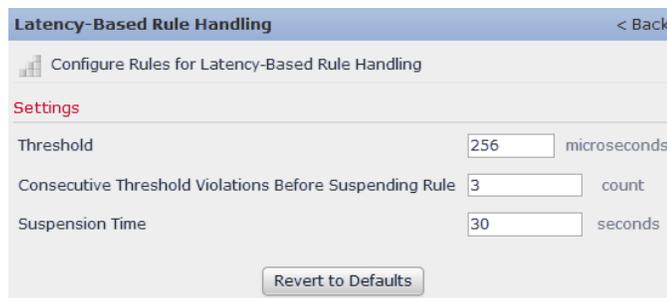

To configure rule latency thresholding:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon () next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.

4. You have two choices, depending on whether **Latency-Based Rule Handling** under Performance Settings is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

The Latency-Based Rule Handling page appears.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. See the [Minimum Rule Latency Threshold Settings table](#) on page 1025 for recommended minimum **Threshold** settings.
6. Optionally, click **Configure Rules for Latency-Based Rule Handling** at the top of the page to display rules associated with individual options. Click **Back** to return to the Latency-Based Rule Handling page.
7. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Performance Statistics Configuration

LICENSE: Protection

You can configure the basic parameters of how devices monitor and report on their own performance. This allows you to specify the intervals at which the system updates performance statistics on your devices by configuring the following:

- number of seconds
- number of packets analyzed

WARNING! Do not apply an access control policy that includes an intrusion policy with the Performance Statistics **Log Session/Protocol Distribution** check box selected unless directed to do so by Sourcefire Support.

When the number of seconds specified has elapsed since the last performance statistics update, the system verifies that the specified number of packets has been analyzed. If so, the system updates performance statistics. If not, the system waits until the specified number of packets has been analyzed.

To configure basic performance statistics parameters:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

2. Click the edit icon () next to the policy you want to edit.

If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

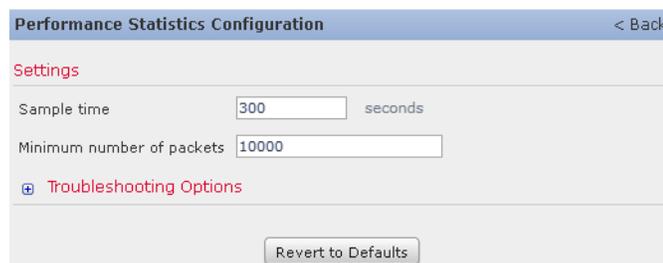

The Policy Information page appears.

3. Click **Advanced Settings** in the navigation panel on the left.

The Advanced Settings page appears.

4. Click **Edit** next to **Performance Statistics Configuration** under **Performance Settings**.

The Performance Statistics Configuration page appears.

TIP! You cannot disable the Performance Statistics Configuration advanced setting. This ensures that Sourcefire Support can troubleshoot your system.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. Optionally, you can modify any of the performance statistics options:
 - To specify the number of seconds for the system to wait since the last performance statistics update before counting the number of packets that have been analyzed, modify the value for **Sample time**.
 - To specify the number of packets to analyze before updating performance statistics, modify the value for **Minimum number of packets**.

6. Optionally, modify the troubleshooting options only if asked to do so by Sourcefire Support; click the + sign next to **Troubleshooting Options**. See [Understanding Troubleshooting Options](#) on page 790 for more information.

WARNING! Do not apply an access control policy that includes an intrusion policy with the **Log Session/Protocol Distribution** troubleshooting option enabled unless directed to do so by Support.

7. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Constraining Regular Expressions

LICENSE: Protection

You can override default match and recursion limits on PCRE regular expressions that are used in intrusion rules to examine packet payload content. See [Searching for Content Using PCRE](#) on page 1086 for information on using the PCRE keyword in intrusion rules. The default limits ensure a minimum level of performance. Overriding these limits could increase security, but could also significantly impact performance by permitting packet evaluation against inefficient regular expressions.

WARNING! Do not override default PCRE limits unless you are an experienced intrusion rule writer with knowledge of the impact of degenerative patterns.

Note that when a rule that requires this feature is enabled in an intrusion policy where this feature is disabled, you must enable the feature or choose to allow the system to enable it automatically before you can save the policy. For more information, see [Automatically Enabling Advanced Settings](#) on page 787.

The [Regular Expression Constraint Options](#) table describes the options you can configure to override the default limits.

Regular Expression Constraint Options

OPTION	DESCRIPTION
Match Limit State	<p>Specifies whether to override Match Limit. You have the following options:</p> <ul style="list-style-type: none"> select Default to use the value configured for Match Limit select Unlimited to permit an unlimited number of attempts. select Custom to specify either a limit of 1 or greater for Match Limit, or to specify 0 to completely disable PCRE match evaluations
Match Limit	<p>Specifies the number of times to attempt to match a pattern defined in a PCRE regular expression.</p>
Match Recursion Limit State	<p>Specifies whether to override Match Recursion Limit. You have the following options:</p> <ul style="list-style-type: none"> select Default to use the value configured for Match Recursion Limit select Unlimited to permit an unlimited number of recursions select Custom to specify either a limit of 1 or greater for Match Recursion Limit, or to specify 0 to completely disable PCRE recursions <p>Note that for Match Recursion Limit to be meaningful, it must be smaller than Match Limit.</p>
Match Recursion Limit	<p>Specifies the number of recursions when evaluating a PCRE regular expression against the packet payload.</p>

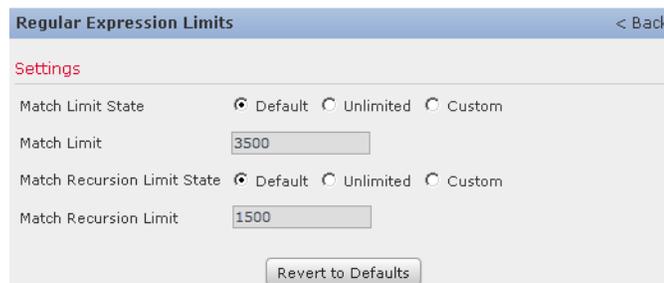

To configure PCRE overrides:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
 The Intrusion Policy page appears.
2. Click the edit icon () next to the policy you want to edit.
 If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
 The Policy Information page appears.

3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.
4. You have two choices, depending on whether **Regular Expression Limits** under Performance Settings is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

The Regular Expression Limits page appears.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. You can modify any of the options in the [Regular Expression Constraint Options table](#) on page 1029.
6. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Rule Processing Configuration

LICENSE: Protection

When the rules engine evaluates traffic against rules, it places the events generated for a given packet or packet stream in an event queue, then reports the top events in the queue to the user interface. You can elect to have the rules engine log more than one event per packet or packet stream when multiple events are generated. Logging these events allows you to collect information beyond the reported event. When configuring this option, you can specify how many events can be placed in the queue and how many are logged, and select the criteria for determining event order within the queue.

The [Rule Processing Configuration Options](#) table describes the options you can configure to determine how many events are logged per packet or stream.

Rule Processing Configuration Options

OPTION	DESCRIPTION
Maximum Queued Events	The maximum number of events that can be stored for a given packet or packet stream.
Logged Events	The number of events logged for a given packet or packet stream. This cannot exceed the Max Events value.
Order Events By	The value used to determine event ordering within the event queue. The highest ordered event is reported through the user interface. You can select from: <ul style="list-style-type: none">• priority, which orders events in the queue by the event priority.• content_length, which orders events by the longest identified content match. When events are ordered by content length, rule events always take precedence over decoder and preprocessor events.

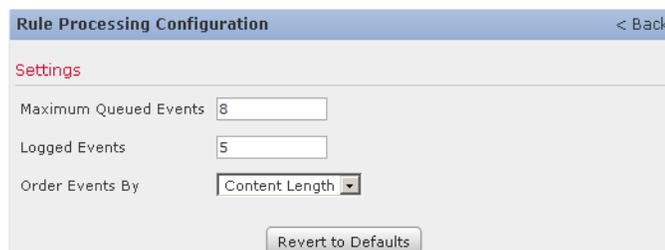

To configure how many events are logged per packet or stream:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon () next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.

4. You have two choices, depending on whether **Rule Processing Configuration** under Performance Settings is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.

The Rule Processing Configuration page appears.

The screenshot shows a web interface for configuring rule processing. It has a title bar 'Rule Processing Configuration' with a back arrow. Below is a 'Settings' section with three rows: 'Maximum Queued Events' (input field with '8'), 'Logged Events' (input field with '5'), and 'Order Events By' (dropdown menu with 'Content Length'). A 'Revert to Defaults' button is at the bottom.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. You can modify any of the options on the Rule Processing Configuration page. See the [Rule Processing Configuration Options table](#) on page 1031 for a full description of each available option.
6. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

CHAPTER 29

CONFIGURING EXTERNAL RESPONSES TO INTRUSION EVENTS

While the Sourcefire 3D System provides various views of intrusion events within the web interface, some enterprises prefer to define external intrusion event notification to facilitate constant monitoring of critical systems. If you want to immediately notify a specific person of critical events, you can set up email alerts to do so. You can also enable logging to syslog facilities or send event data to an SNMP trap server.

Within each intrusion policy, you can specify intrusion event notification limits, set up intrusion event notification to external logging facilities, and configure external responses to intrusion events.

TIP! Some analysts prefer not to receive multiple alerts for the same intrusion event, but want to control how often they are notified of a given intrusion event occurrence. See [Filtering Intrusion Event Notification Per Policy](#) on page 746 for more information.

There is another type of alerting you can perform in the Sourcefire 3D System, outside of your intrusion policies. You can configure email, SNMP, and syslog alert responses for other types of events, including intrusion events with specific impact flags, or connection events logged by specific access control rules. For more information, see [Configuring External Alerting](#) on page 524.

See the following sections for more information on external intrusion event notification:

- [Using SNMP Responses](#) on page 1034 describes the options you can configure to send event data to specified SNMP trap servers and provides the procedure for specifying the SNMP alerting options.
- [Using Syslog Responses](#) on page 1038 describes the options you can configure to send event data to an external syslog and provides the procedure for specifying the syslog alerting options.
- [Understanding Email Alerting](#) on page 1042 describes the options you can configure to send notifications of intrusion events by email.

Using SNMP Responses

LICENSE: Protection

An *SNMP trap* is a network management notification. You can configure the device to send intrusion event notifications as SNMP traps, also known as *SNMP alerts*. Each SNMP alert includes:

- the name of the server generating the trap
- the IP address of the device that detected it
- the name of the device that detected it
- the event data

You can set a variety of SNMP alerting parameters. Available parameters vary depending on the version of SNMP you use. For details on enabling and disabling SNMP alerting, see [Modifying Advanced Settings](#) on page 774.

TIP! If your network management system requires a management information base file (MIB), you can obtain it from the Defense Center at `/etc/sf/DCEALERT.MIB`.

SNMP v2 Options

For SNMP v2, you can specify the options described in the [SNMP v2 Options](#) table.

SNMP v2 Options

OPTION	DESCRIPTION
Trap Type	The trap type to use for IP addresses that appear in the alerts. If your network management system correctly renders the INET_IPV4 address type, then you can select as Binary . Otherwise, select as String . For example, HP Openview requires the string type.
Trap Server	The server that will receive SNMP traps notification. You can specify a single IP address or hostname.
Community String	The community name.

SNMP v3 Options

For SNMP v3, you can specify the options described in the [SNMP v3 Options](#) table.

IMPORTANT! When using SNMP v3, the appliance uses an Engine ID value to encode the message. Your SNMP server requires this value to decode the message. Currently, this Engine ID value will always be the hexadecimal version of the appliance's IP address with 01 at the end of the string. For example, if the appliance sending the SNMP alert has an IP address of 172.16.1.50, the Engine ID is 0xAC10013201 or, if the appliance has an IP address of 10.1.1.77, 0x0a01014D01 is used as the Engine ID.

SNMP v3 Options

OPTION	DESCRIPTION
Trap Type	The trap type to use for IP addresses that appear in the alerts. If your network management system correctly renders the INET_IPV4 address type, then you can select as Binary . Otherwise, select as String . For example, HP Openview requires the string type.
Trap Server	The server that will receive SNMP traps notification. You can specify a single IP address or hostname.
Authentication Password	The password required for authentication. SNMP v3 uses either the Message Digest 5 (MD5) hash function or the Secure Hash Algorithm (SHA) hash function to encrypt this password, depending on configuration. If you specify an authentication password, authentication is enabled.
Private Password	The SNMP key for privacy. SNMP v3 uses the Data Encryption Standard (DES) block cipher to encrypt this password. If you specify a private password, privacy is enabled. If you specify a private password, you must also specify an authentication password.
User Name	Your SNMP user name.

For information about configuring SNMP Alerting, see [Configuring SNMP Responses](#) on page 1037.

Configuring SNMP Responses

LICENSE: Protection

You can configure SNMP alerting in an intrusion policy. After you apply the policy as part of an access control policy, the system notifies you of any intrusion events it detects via SNMP trap. For more details on SNMP alerting, see [Using SNMP Responses](#) on page 1034 and [Applying an Access Control Policy](#) on page 466.

To configure SNMP alerting options:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.

The Intrusion Policy page appears.

2. Click the edit icon () next to the policy you want to edit.

If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.

The Policy Information page appears.

3. Click **Advanced Settings** in the navigation panel on the left.

The Advanced Settings page appears.

4. You have two choices, depending on whether **SNMP Alerting** under External Responses is enabled:

- If the configuration is enabled, click **Edit**.
- If the configuration is disabled, click **Enabled**, then click **Edit**.

The SNMP Alerting page appears.

SNMP Alerting < Back

Settings

Trap Type as Binary as String

SNMP Version Version2 Version3

SNMP v3

Trap Server

Authentication Password

Private Password (SNMP v3 passwords must be 8 or more characters)

Username

Revert to Defaults

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. Specify the trap type format that you want to use for IP addresses that appear in the alerts, **as Binary** or **as String**.

IMPORTANT! If your network management system correctly renders the INET_IPV4 address type, then you can use the **as Binary** option. Otherwise, use the **as String** option. For example, HP OpenView requires the **as String** option.

6. Select either SNMP v2 or SNMP v3:
 - To configure SNMP v2, enter the IP address and the community name of the trap server you want to use in the corresponding fields. See [SNMP v2 Options](#) on page 1035.
 - To configure SNMP v3, enter the IP address of the trap server you want to use, an authentication password, a private password, and a user name in the corresponding fields. See [SNMP v3 Options](#) on page 1036 for more information.

IMPORTANT! You must select SNMP v2 **or** SNMP v3.

IMPORTANT! When you enter an SNMP v3 password, the password displays in plain text during initial configuration but is saved in encrypted format.

7. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Using Syslog Responses

LICENSE: Protection

The system log, or *syslog*, is the standard logging mechanism for network event logging. You can send *syslog alerts*, which are intrusion event notifications, to the syslog on an appliance. The syslog allows you to categorize information in the syslog by priority and facility. The *priority* reflects the severity of the alert and the *facility* indicates the subsystem that generated the alert. Facilities and priorities are not displayed in the actual message that appears in syslog, but are instead used to tell the system that receives the syslog message how to categorize it.

Syslog alerts contain the following information:

- date and time of alert generation
- event message
- event data

- generator ID of the triggering event
- Snort ID of the triggering event
- revision

In an intrusion policy, you can turn on syslog alerting and specify the syslog priority and facility associated with intrusion event notifications in the syslog. When you apply the intrusion policy as part of an access control policy, the system then sends syslog alerts for the intrusion events it detects to the syslog facility on the local host or on the logging host specified in the policy. The host receiving the alerts uses the facility and priority information you set when configuring syslog alerting to categorize the alerts.

The [Available Syslog Facilities](#) table lists the facilities you can select when configuring syslog alerting. Be sure to configure a facility that makes sense based on the configuration of the remote syslog server you use. The `syslog.conf` file located on the remote system (if you are logging syslog messages to a UNIX- or Linux-based system) indicates which facilities are saved to which log files on the server.

Available Syslog Facilities

FACILITY	DESCRIPTION
AUTH	A message associated with security and authorization.
AUTHPRIV	A restricted access message associated with security and authorization. On many systems, these messages are forwarded to a secure file.
CRON	A message generated by the clock daemon.
DAEMON	A message generated by a system daemon.
FTP	A message generated by the FTP daemon.
KERN	A message generated by the kernel. On many systems, these messages are printed to the console when they appear.
LOCAL0- LOCAL7	A message generated by an internal process.
LPR	A message generated by the printing subsystem.
MAIL	A message generated by a mail system.
NEWS	A message generated by the network news subsystem.
SYSLOG	A message generated by the syslog daemon.

Available Syslog Facilities (Continued)

FACILITY	DESCRIPTION
USER	A message generated by a user-level process.
UUCP	A message generated by the UUCP subsystem.

Select one of the following standard syslog priority levels to display on all notifications generated by this alert:

Syslog Priority Levels

LEVEL	DESCRIPTION
EMERG	A panic condition broadcast to all users
ALERT	A condition that should be corrected immediately
CRIT	A critical condition
ERR	An error condition
WARNING	Warning messages
NOTICE	Conditions that are not error conditions, but require attention
INFO	Informational messages
DEBUG	Messages that contain debug information

For more detailed information about how syslog works and how to configure it, refer to the documentation that accompanies your system. If you are logging to a UNIX- or Linux-based system's syslog, the `syslog.conf` man file (type `man syslog.conf` at the command line) and syslog man file (type `man syslog` at the command line) provide information about how syslog works and how to configure it.

Configuring Syslog Responses

LICENSE: Protection

You can configure syslog alerting in an intrusion policy. After you apply the policy as part of an access control policy, the system notifies you of any intrusion events it detects via the syslog. For more information on syslog alerting, see [Using Syslog Responses](#) on page 1038 and [Applying an Access Control Policy](#) on page 466.

To configure syslog alerting options:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Intrusion Policy**.
The Intrusion Policy page appears.
2. Click the edit icon (✎) next to the policy you want to edit.
If you have unsaved changes in another policy, click **OK** to discard those changes and continue. See [Committing Intrusion Policy Changes](#) on page 679 for information on saving unsaved changes in another policy.
The Policy Information page appears.
3. Click **Advanced Settings** in the navigation panel on the left.
The Advanced Settings page appears.
4. You have two choices, depending on whether **Syslog Alerting** under External Responses is enabled:
 - If the configuration is enabled, click **Edit**.
 - If the configuration is disabled, click **Enabled**, then click **Edit**.The Syslog Alerting page appears.

The screenshot shows the 'Syslog Alerting' configuration interface. It includes a 'Logging Hosts' text field, 'Facility' and 'Priority' dropdown menus, and a 'Revert to Defaults' button.

A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. See [Using Layers in an Intrusion Policy](#) on page 792 for more information.

5. Optionally, in the **Logging Hosts** field, enter the remote access IP address you want to specify as logging host. Separate multiple hosts with commas.
6. Select facility and priority levels from the drop-down lists.
See [Using Syslog Responses](#) on page 1038 for details on facility and priority options.
7. Save your policy, continue editing, discard your changes, revert to the default configuration settings in the base policy, or exit while leaving your changes in the system cache. See the [Common Intrusion Policy Editing Actions table](#) on page 675 for more information.

Understanding Email Alerting

LICENSE: Protection

Email alerts are notifications of intrusion events by email. Email alerts include the following information:

- total number of alerts in the database
- last email time (the time that the system generated the last email report)
- current time (the time that the system generated the current email report)
- total number of new alerts
- number of events that matched specified email filters (if events are configured for specific rules)
- timestamp, protocol, event message, and session information (source and destination IPs and ports with traffic direction) for each event (if Summary Output is off)

IMPORTANT! If multiple intrusion events originate from the same source IP, a note appears beneath the event that displays the number of additional events.

- number of events per destination port
- number of events per source IP

For each rule or rule group, you can enable or disable email alerting on intrusion events. Your email alert settings are used regardless of which intrusion policy you apply to the device as part of an access control policy.

The following list describes the parameters you can set for email alerting.

On/Off

Enables or disables email notification.

From Address

Specifies the email address or addresses from which the system sends intrusion events.

To Address

Specifies the email address where the system sends intrusion events. To send email to multiple recipients, separate email addresses with commas. For example:

`user1@example.com, user2@example.com`

Max Alerts

Specifies the maximum number of intrusion events the system sends via email in the time frame specified by Frequency (seconds).

Frequency (seconds)

Specifies how often the system mails intrusion events. The Frequency setting also specifies the frequency with which email settings are saved.

Minimum frequency: 300 seconds

Maximum frequency: 4 billion seconds

Coalesce Alerts

Enables or disables grouping of intrusion events by source IP and event so that multiple identical intrusion events generated against the same source IP only present one event on the page.

Note that alert coalescence (grouping) occurs after events are filtered. Therefore, if you configure email alerting on specific rules, you will only receive a list of events that match the rules you specified in the Mail Alerting Configuration.

Summary Output

Enables or disables brief email alerting, which is suitable for text-limited devices such as pagers. Brief email alerts contain:

- event timestamp
- for Defense Centers, the IP address for the device that generated the event
- event protocol
- source IP and port
- destination IP and port
- event message
- the number of intrusion events generated against the same source IP

For example:

```
2011-05-18 10:35:10 10.1.1.100 icmp 10.10.10.1:8 -> 10.2.1.3:0  
snort_decoder: Unknown Datagram decoding problem! (116:108)
```

Email Alerting on Specific Rules Configuration

Specifies the rules or rule groups whose events you want mailed to the specified email address or addresses.

For information about configuring email alerting, see [Configuring Email Alerting](#) on page 1044.

Configuring Email Alerting

LICENSE: Protection

You can configure email alerting so that your appliance notifies you whenever an intrusion event occurs for an specific rule or rule group.

Before you can receive email alerts, you **must**:

- configure your mail host to receive email alerts (see [Configuring a Mail Relay Host and Notification Address](#) on page 1983)
- make sure that both the managed device and the Defense Center can reverse resolve their own IP addresses

To configure email alerting options:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Email**.

The Email Alerting page appears.

Email Alerting

State on off

From Address

To Address

Max Alerts

Min Frequency Note: Frequency is set by number of seconds

Coalesce Alerts on off

Summary Output on off

Time Zone

Rules Email Alerting per Rule Configuration
 Select All

2. Next to **State**, select **on** to enable email alerting.
3. In the **From Address** field, type the address you want to display in the From field in the email alerts.
4. In the **To Address** field, type the address where you want to receive the email alerts.
5. In the **Max Alerts** field, type the maximum number of events you want included in a single email.
6. In the **Min Frequency** field, type the number of seconds for the minimum frequency with which you want to receive email alerts.
7. To group events by IP address, next to **Coalesce Alerts**, select **on**.

- To send brief email alerts, next to **Summary Output**, select **on**.

TIP! If you enable **Summary Output**, consider enabling **Coalesce Alerts** to reduce the number of alerts generated. Also consider setting **Max Alerts** to 1 to avoid overflowing your device's text message buffer.

- In the **Time Zone** field, select your time zone from the drop-down list.
- To enable email alerting per rule, click **Email Alerting per Rule Configuration**. The rule groups appear.

TIP! To receive email alerts for all rules in all categories, select **Select All**.

- Perform one or both of the following:
 - Click **All** next to rule categories for which you want to receive email alerts for all rules belonging to the category.
 - Click the category folder within which you want to specify email alerting on individual rules in that category, then enable the rules for which you want to receive email alerts.
- Click **Save**.

The system saves your email alerting configuration. When applicable intrusion events occur, you receive email alerts.

CHAPTER 30

UNDERSTANDING AND WRITING INTRUSION RULES

An *intrusion rule* is a specified set of keywords and arguments that detects attempts to exploit vulnerabilities on your network by analyzing network traffic to check if it matches the criteria in the rule. The system compares packets against the conditions specified in each rule and, if the packet data matches all the conditions specified in a rule, the rule triggers. If a rule is an *alert rule*, it generates an intrusion event. If it is a *pass rule*, it ignores the traffic. You can view and evaluate intrusion events from the Defense Center web interface.

WARNING! Make sure you use a controlled network environment to test any intrusion rules that you write before you use the rules in a production environment. Poorly written intrusion rules may seriously affect the performance of your Sourcefire 3D System.

Note the following:

- For a *drop* rule in an inline deployment, the system drops the packet and generates an event. For more information on drop rules, see [Setting Rule States](#) on page 743.
- Sourcefire provides two types of intrusion rules: shared object rules and standard text rules. The Sourcefire Vulnerability Research Team (VRT) can use shared object rules to detect attacks against vulnerabilities in ways that traditional standard text rules cannot. You cannot create shared object rules. When you write your own intrusion rule, you create a standard text rule.

You can write custom standard text rules to tune the types of events you are likely to see. Note that while this documentation sometimes discusses rules targeted to detect specific exploits, the most successful rules target traffic that may

attempt to exploit known vulnerabilities rather than specific known exploits. By writing rules and specifying the rule's event message, you can more easily identify traffic that indicates attacks and policy evasions. For more information about evaluating events, see [Working with Intrusion Events](#) on page 593.

See the following sections for more information:

- [Understanding Rule Anatomy](#) on page 1047 describes the components, including the rule header and rule options, that make up a valid standard text rule.
- [Understanding Rule Headers](#) on page 1049 provides a detailed description of the parts of a rule header.
- [Understanding Keywords and Arguments in Rules](#) on page 1055 explains the usage and syntax of the intrusion rule keywords available in the Sourcefire 3D System.
- [Constructing a Rule](#) on page 1181 explains how to build a new rule using the rule editor.
- [Searching for Rules](#) on page 1189 explains how to search for existing rules.
- [Filtering Rules on the Rule Editor Page](#) on page 1192 explains how to display a subset of rules to help you find specific rules.

Understanding Rule Anatomy

LICENSE: Protection

All standard text rules contain two logical sections: the rule header and the rule options. The rule header contains:

- the rule's action or type
- the protocol
- the source and destination IP addresses and netmasks
- direction indicators showing the flow of traffic from source to destination
- the source and destination ports

The rule options section contains:

- event messages
- keywords and their parameters and arguments
- patterns that a packet's payload must match to trigger the rule
- specifications of which parts of the packet the rules engine should inspect

The following diagram illustrates the parts of a rule:

Rule Header

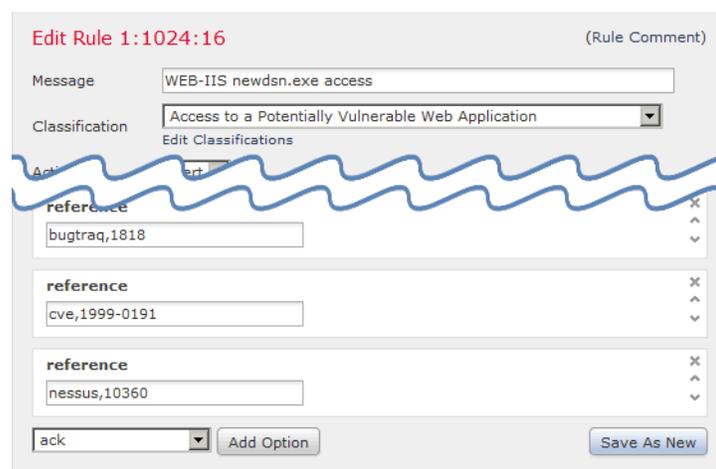

```
alert tcp $EXTERNAL_NET any -> $HTTP_SERVERS $HTTP_PORTS
```

Rule Keywords and Arguments

```
(msg:"WEB-IIS newdsn.exe access";  
flow:to_server,established; uricontent:"/scripts/  
tools/newdsn.exe"; nocase; metadata:service http;  
reference:bugtraq,1818; reference:cve,1999-0191;  
reference:nessus,10360; classtype:web-application-  
activity; sid:1024; rev:10; )
```

Note that the options section of a rule is the section enclosed in parentheses. The rule editor provides an easy-to-use interface to help you build standard text rules.

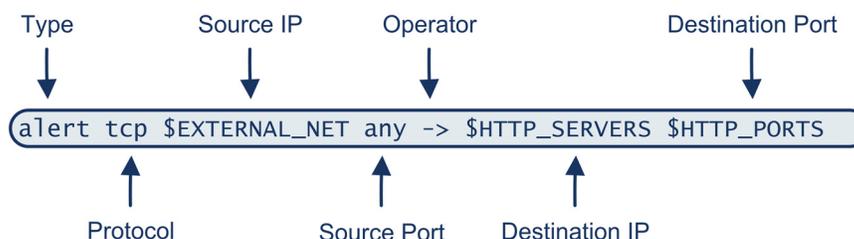

The following displays the same standard text rule within the rule editor:

Understanding Rule Headers

LICENSE: Protection

Every standard text rule and shared object rule has a rule header containing parameters and arguments. The following illustrates parts of a rule header:

The [Rule Header Values](#) table describes each part of the rule header shown above.

Rule Header Values

RULE HEADER COMPONENT	EXAMPLE VALUE	THIS VALUE...
Action	alert	Generates an intrusion event when triggered.
Protocol	tcp	Tests TCP traffic only.
Source IP Address	\$EXTERNAL_NET	Tests traffic coming from any host that is not on your internal network.
Source Ports	any	Tests traffic coming from any port on the originating host.
Operator	->	Tests external traffic (destined for the web servers on your network).
Destination IP Address	\$HTTP_SERVERS	Tests traffic to be delivered to any host specified as a web server on your internal network.
Destination Ports	\$HTTP_PORTS	Tests traffic delivered to an HTTP port on your internal network.

IMPORTANT! The previous example uses system variables, as do most intrusion rules. See [Managing Variables](#) on page 698 for more information about variables, what they mean, and how to configure them.

See the following sections for more information about rule header parameters:

- [Specifying Rule Actions](#) on page 1050 describes rule types and explains how to specify the action that occurs when the rule triggers.
- [Specifying Protocols](#) on page 1051 explains how to define the traffic protocol for traffic that the rule should test.
- [Specifying Source and Destination IP Addresses](#) on page 1051 explains how to define the individual IP addresses and IP ranges in the rule header.
- [Specifying Source and Destination Ports](#) on page 1053 explains how to define the individual ports and port ranges in the rule header.
- [Specifying Direction](#) on page 1055 describes the available operators and explains how to specify the direction traffic must be traveling to be tested by the rule.

Specifying Rule Actions

LICENSE: Protection

Each rule header includes a parameter that specifies the action the system takes when a packet triggers a rule. Rules with the action set to *alert* generate an intrusion event against the packet that triggered the rule and log the details of that packet. Rules with the action set to *pass* do not generate an event against, or log the details of, the packet that triggered the rule.

IMPORTANT! In an inline deployment, rules with the rule state set to *Drop and Generate Events* generate an intrusion event against the packet that triggered the rule. Also, if you apply a drop rule in a passive deployment, the rule acts as an alert rule. For more information on drop rules, see [Setting Rule States](#) on page 743.

By default, pass rules override alert rules. You can create pass rules to prevent packets that meet criteria defined in the pass rule from triggering the alert rule in specific situations, rather than disabling the alert rule. For example, you might want a rule that looks for attempts to log into an FTP server as the user “anonymous” to remain active. However, if your network has one or more legitimate anonymous FTP servers, you could write and activate a pass rule that specifies that, for those specific servers, anonymous users do not trigger the original rule.

Within the rule editor, you select the rule type from the **Action** list. For more information about the procedures you use to build a rule header using the rule editor, see [Constructing a Rule](#) on page 1181.

Specifying Protocols

LICENSE: Protection

In each rule header, you must specify the protocol of the traffic the rule inspects. You can specify the following network protocols for analysis:

- ICMP (Internet Control Message Protocol)
- IP (Internet Protocol)

IMPORTANT! The system ignores port definitions in an intrusion rule header when the protocol is set to `ip`. For more information, see [Specifying Source and Destination Ports](#) on page 1053.

- TCP (Transmission Control Protocol)
- UDP (User Datagram Protocol)

Use **IP** as the protocol type to examine all protocols assigned by IANA, including TCP, UDP, ICMP, IGMP, and many more. See <http://www.iana.org/assignments/protocol-numbers> for a full list of IANA-assigned protocols.

IMPORTANT! You cannot currently write rules that match patterns in the next header (for example, the TCP header) in an IP payload. Instead, content matches begin with the last decoded protocol. As a workaround, you can match patterns in TCP headers by using rule options.

Within the rule editor, you select the protocol type from the **Protocol** list. See [Constructing a Rule](#) on page 1181 for more information about the procedures you use to build a rule header using the rule editor.

Specifying Source and Destination IP Addresses

LICENSE: Protection

Rule headers include the source and destination IP addresses of traffic that the rule inspects. You can restrict packet inspection to the packets originating from specific IP addresses or those destined to a specific IP address. This reduces the amount of packet inspection the system must perform. This also reduces false positives by making the rule more specific and removing the possibility of the rule triggering against packets whose source and destination IP addresses do not indicate suspicious behavior.

WARNING! The system recognizes only IP addresses and will not accept host names for source or destination IP addresses.

The [Source/Destination IP Address Syntax](#) table describes the various ways you can specify source and destination IP addresses.

Source/Destination IP Address Syntax

To SPECIFY...	USE...	EXAMPLE
any IP address	any	any
a specific IP address	the IP address Note that you would not mix IPv4 and IPv6 source and destination addresses in the same rule.	192.168.1.1 2001:db8::abcd
a list of IP addresses	brackets ([]) to enclose the IP addresses and commas to separate them	[192.168.1.1,192.168.1.15] [2001:db8::b3ff, 2001:db8::0202]
a range of IP addresses	IPv4 CIDR block or IPv6 address prefix notation	192.168.1.0/24 2001:db8::/32
anything except a specific IP address or set of addresses	the ! character before the IP address or addresses you want to negate	!192.168.1.15 !2001:db8::0202:b3ff:fe1e
anything in a range of IP addresses except one or more specific IP addresses	a range of addresses followed by a list of negated addresses or ranges	[10.0.0/8, !10.2.3.4, !10.1.0.0/16] [2001:db8::/32, !2001:db8::8329, !2001:db8::0202]
IP addresses defined by an IP address variable	the variable name, in uppercase letters, preceded by \$ See Managing Variables on page 698 for more information.	\$HOME_NET

Source/Destination IP Address Syntax (Continued)

To SPECIFY...	USE...	EXAMPLE
all IP addresses except addresses defined by an IP address variable	the variable name, in uppercase letters, preceded by !\$ See Managing Variables on page 698 for more information.	!\$HOME_NET
IP addresses defined by a network object or network object group	the object or group name using the format <code>!{object_name}</code> . See Working with Network Objects on page 161 for more information.	!\$192.168sub16}
all IP addresses except addresses defined by a network object or network object group	the object or group name, in curly braces ({}), preceded by !\$. See Working with Network Objects on page 161 for more information.	!\${192.168sub16}

For more in-depth information about the syntax you can use to specify source and destination IP addresses, and for information about using variables to specify IP addresses, see [Defining IP Addresses in Variables and Rules](#) on page 713, [Managing Variables](#) on page 698, and [IP Address Conventions](#) on page 57.

Within the rule editor, you specify source and destination IP addresses in the **Source IP** and **Destination IP** fields. See [Constructing a Rule](#) on page 1181 for more information about the procedures you use to build a rule header using the rule editor.

Specifying Source and Destination Ports

LICENSE: Protection

Rule headers specify the source and destination ports of the traffic the rule inspects. You can restrict packet inspection to packets originating from or destined to specific ports. This reduces the amount of packet inspection the system must perform. This also reduces false positives, making the rule more specific and removing the possibility for the rule to trigger against packets whose source and destination ports do not indicate suspicious behavior.

IMPORTANT! The system ignores port definitions in an intrusion rule header when the protocol is set to `ip`. For more information, see [Specifying Protocols](#) on page 1051.

The [Source/Destination Port Syntax](#) table describes the different ways you can specify source and destination ports.

Source/Destination Port Syntax

To SPECIFY...	USE	EXAMPLE
any port	any	any
a specific port	the port number	80
a range of ports	a dash between the first and last port number in the range	80-443
all ports less than or equal to a specific port	a dash before the port number	-21
all ports greater than or equal to a specific port	a dash after the port number	80-
all ports except a specific port or range of ports	the ! character before the port, port list, or range of ports you want to negate Note that you can logically use negation with all port designations except <i>any</i> , which if negated would indicate <i>no port</i> .	!20
all ports defined by a port variable	the variable name, in uppercase letter, preceded by \$ See Managing Variables on page 698 for more information.	\$HTTP_PORTS
all ports except ports defined by a port variable	the variable name, in uppercase letter, preceded by !\$ See Managing Variables on page 698 for more information.	!\$HTTP_PORTS

You can currently substitute a colon (:) for the hyphen (-) in any port definition in an rule header, although eventually the colon will be deprecated.

You can create a list of ports up to 64 characters in length by surrounding the port list with brackets and separating the ports with commas, as shown in the following example:

[80, 8080, 8138, 8600-9000, !8650-8675]

For information about using variables to specify ports, see [Defining Ports in Variables and Rules](#) on page 715.

Within the rule editor, you specify source and destination ports in the **Source Port** and **Destination Port** fields. See [Constructing a Rule](#) on page 1181 for more information about the procedures you use to build a rule header using the rule editor.

Specifying Direction

LICENSE: Protection

Within the rule header, you can specify the direction that the packet must travel for the rule to inspect it. The [Directional Options in Rule Headers](#) table describes these options.

Directional Options in Rule Headers

USE...	TO TEST...
Directional	only traffic from the specified source IP address to the specified destination IP address
Bidirectional	all traffic traveling between the specified source and destination IP addresses

See [Constructing a Rule](#) on page 1181 for more information about the procedures you use to build a rule header using the rule editor.

Understanding Keywords and Arguments in Rules

LICENSE: Protection

Using the rules language, you can specify the behavior of a rule by combining keywords. Keywords and their associated values (called *arguments*) dictate how the system evaluates packets and packet-related values that the rules engine tests. The Sourcefire 3D System currently supports keywords that allow you to perform inspection functions, such as content matching, protocol-specific pattern matching, and state-specific matching. You can define up to 100 arguments per keyword, and combine any number of compatible keywords to create highly specific rules. This helps decrease the chance of false positives and false negatives and focus the intrusion information you receive.

Note that you can also use adaptive profiles to dynamically adapt active rule processing for specific packets based on rule metadata and host information. For more information, see [Using Adaptive Profiles](#) on page 1003.

See the following sections for more information:

- [Defining Intrusion Event Details](#) on page 1057 describes the syntax and use of keywords that allow you to define the event's message, priority information, and references to external information about the exploit the rule detects.
- [Searching for Content Matches](#) on page 1063 describes how to use the `content` keyword to test the content of the packet payload.
- [Constraining Content Matches](#) on page 1065 describes how to use modifying keywords for the `content` keyword.
- [Replacing Content in Inline Deployments](#) on page 1078 describes how to use the `replace` keyword in inline deployments to replace specified content of equal length.
- [Using Byte_Jump and Byte_Test](#) on page 1079 describes how to use the `byte_jump` and `byte_test` keywords to calculate where in a packet the rules engine should begin testing for a content match, and which bytes it should evaluate.
- [Searching for Content Using PCRE](#) on page 1086 describes how to use the `pcr` keyword to use Perl-compatible regular expressions in rules.
- [Adding Metadata to a Rule](#) on page 1096 describes how to use the `metadata` keyword to add information to a rule.
- [Inspecting IP Header Values](#) on page 1101 describes the syntax and use of keywords that test values in the packet's IP header.
- [Inspecting ICMP Header Values](#) on page 1104 describes the syntax and use of keywords that test values in the packet's ICMP header.
- [Inspecting TCP Header Values and Stream Size](#) on page 1106 describes the syntax and use of keywords that test values in the packet's TCP header.
- [Enabling and Disabling TCP Stream Reassembly](#) on page 1112 describes how to enable and disable stream reassembly for a single connection when inspected traffic on the connection matches the conditions of the rule.
- [Extracting SSL Information from a Session](#) on page 1113 describes the use and syntax of keywords that extract version and state information from encrypted traffic.
- [Reading Packet Data into Keyword Arguments](#) on page 1156 describes how to read a value from a packet into a variable that you can use later in the same rule to specify the value for arguments in certain other keywords.
- [Inspecting Application Layer Protocol Values](#) on page 1116 describes the use and syntax of keywords that test application layer protocol properties.
- [Inspecting Packet Characteristics](#) on page 1153 describes the use and syntax of the `dsize`, `sameIP`, `isdataat`, `fragoffset`, and `cvs` keywords.

- [Initiating Active Responses with Rule Keywords](#) on page 1160 explains how to use the `resp` keyword to actively close TCP connections or UDP sessions, the `react` keyword to send an HTML page and then actively close TCP connections, and the `config response` command to specify the active response interface and the number of TCP resets to attempt in a passive deployment.
- [Filtering Events](#) on page 1165 describes how to prevent a rule from triggering an event unless a specified number packets meet the rule's detection criteria within a specified time.
- [Evaluating Post-Attack Traffic](#) on page 1166 describes how to log additional traffic for the host or session.
- [Detecting Attacks That Span Multiple Packets](#) on page 1168 describes how to assign state names to packets from attacks that span multiple packets in a single session, then analyze and alert on packets according to their state.
- [Generating Events on the HTTP Encoding Type and Location](#) on page 1175 describes how to generate events on the type of encoding in an HTTP request or response URI, header, or cookie, including set-cookies, before normalization.
- [Pointing to a Specific Payload Type](#) on page 1177 describes how to point to the beginning of the HTTP response entity body, SMTP payload, or encoded email attachment.
- [Pointing to the Beginning of the Packet Payload](#) on page 1178 describes how to point to the beginning of the packet payload.
- [Decoding and Inspecting Base64 Data](#) on page 1179 describes how you can use the `base64_decode` and `base64_data` keywords to decode and inspect Base64 data, especially in HTTP requests.

Defining Intrusion Event Details

LICENSE: Protection

As you construct a standard text rule, you can include contextual information that describes the vulnerability that the rule detects attempts to exploit. You can also include external references to vulnerability databases and define the priority that the event holds in your organization. When analysts see the event, they then have information about the priority, exploit, and known mitigation readily available.

See the following sections for more information about event-related keywords:

- [Defining the Event Message](#) on page 1058
- [Defining the Event Priority](#) on page 1058
- [Defining the Intrusion Event Classification](#) on page 1058
- [Defining the Event Reference](#) on page 1062

Defining the Event Message

LICENSE: Protection

You can specify meaningful text that appears as a message when the rule triggers. The message gives immediate insight into the nature of the vulnerability that the rule detects attempts to exploit. You can use any printable standard ASCII characters except curly braces ({}). The system strips quotes that completely surround the message.

TIP! You must specify a rule message. Also, the message cannot consist of white space only, one or more quotation marks only, one or more apostrophes only, or any combination of just white space, quotation marks, or apostrophes.

To define the event message in the rule editor, enter the event message in the **Message** field. See [Constructing a Rule](#) on page 1181 for more information about using the rule editor to build rules.

Defining the Event Priority

LICENSE: Protection

By default, the priority of a rule derives from the event classification for the rule. However, you can override the classification priority for a rule by adding the **priority** keyword to the rule.

To specify a priority using the rule editor, select **priority** from the **Detection Options** list, and select **high**, **medium**, or **low** from the drop-down list. For example, to assign a **high** priority for a rule that detects web application attacks, add the **priority** keyword to the rule and select **high** as the priority. See [Constructing a Rule](#) on page 1181 for more information about using the rule editor to build rules.

Defining the Intrusion Event Classification

LICENSE: Protection

For each rule, you can specify an attack classification that appears in the packet display of the event. The [Rule Classifications](#) table lists the name and number for each classification.

Rule Classifications

NUMBER	CLASSIFICATION NAME	DESCRIPTION
1	not-suspicious	Not Suspicious Traffic
2	unknown	Unknown Traffic
3	bad-unknown	Potentially Bad Traffic
4	attempted-recon	Attempted Information Leak

Rule Classifications (Continued)

NUMBER	CLASSIFICATION NAME	DESCRIPTION
5	successful-recon-limited	Information Leak
6	successful-recon-largescale	Large Scale Information Leak
7	attempted-dos	Attempted Denial of Service
8	successful-dos	Denial of Service
9	attempted-user	Attempted User Privilege Gain
10	unsuccessful-user	Unsuccessful User Privilege Gain
11	successful-user	Successful User Privilege Gain
12	attempted-admin	Attempted Administrator Privilege Gain
13	successful-admin	Successful Administrator Privilege Gain
14	rpc-portmap-decode	Decode of an RPC Query
15	shellcode-detect	Executable Code was Detected
16	string-detect	A Suspicious String was Detected
17	suspicious-filename-detect	A Suspicious Filename was Detected
18	suspicious-login	An Attempted Login Using a Suspicious Username was Detected
19	system-call-detect	A System Call was Detected
20	tcp-connection	A TCP Connection was Detected
21	trojan-activity	A Network Trojan was Detected
22	unusual-client-port-connection	A Client was Using an Unusual Port
23	network-scan	Detection of a Network Scan
24	denial-of-service	Detection of a Denial of Service Attack
25	non-standard-protocol	Detection of a Non-Standard Protocol or Event
26	protocol-command-decode	Generic Protocol Command Decode

Rule Classifications (Continued)

NUMBER	CLASSIFICATION NAME	DESCRIPTION
27	web-application-activity	Access to a Potentially Vulnerable Web Application
28	web-application-attack	Web Application Attack
29	misc-activity	Misc Activity
30	misc-attack	Misc Attack
31	icmp-event	Generic ICMP Event
32	inappropriate-content	Inappropriate Content was Detected
33	policy-violation	Potential Corporate Privacy Violation
34	default-login-attempt	Attempt to Login By a Default Username and Password
35	sdf	Sensitive Data
36	malware-cnc	Known malware command and control traffic
37	client-side-exploit	Known client side exploit attempt
38	file-format	Known malicious file or file based exploit

To specify a classification in the rule editor, select a classification from the **Classification** list. See [Writing New Rules](#) on page 1182 for more information on the rule editor.

Adding Custom Classifications

LICENSE: Protection

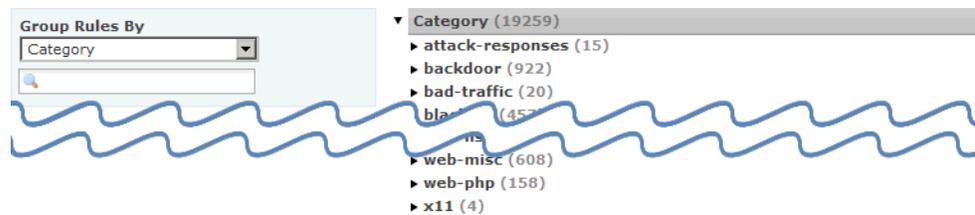

If you want more customized content for the packet display description of the events generated by a rule you define, create a custom classification.

To add classifications to the **Classification** list:

ACCESS: Admin/Intrusion Admin

1. Select **Policies > Intrusion > Rule Editor**.

The Rule Editor page appears.

2. Click **Create Rule**.

The Create Rule page appears.

3. Under the **Classification** drop-down list, click **Edit Classifications**.

A pop-up window appears.

Default Classification	Description	Priority	Custom Classification	Description	Priority
attempted-admin	Attempted Administrator Privilege Gain	high	No Custom Classifications		
attempted-dos	Attempted Denial of Service	medium			
web-application-activity	Potentially Vulnerable Web Application	medium			
web-application-attack	Web Application Attack	high			

4. Type the name of the classification in the **Classification Name** field.
 You can use up to 255 alphanumeric characters, but the page is difficult to read if you use more than 40 characters.
5. Type a description of the classification in the **Classification Description** field.
 You can use up to 255 alphanumeric characters and spaces.
6. Select a priority from the **Priority** list.
 You can select **high**, **medium**, or **low**.
7. Click **Add**.
 The new classification is added to the list and becomes available for use in the rule editor.

New Classification

Classification Name

Classification Description

Priority high

Default Classification	Description	Priority	Custom Classification	Description	Priority
attempted-admin	Attempted Administrator Privilege Gain	high	TestClassification	test classification	high
attempted-dos	Attempted Denial of Service	medium			
web-application-activity	Potentially Vulnerable Web Application	medium			
web-application-attack	Web Application Attack	high			

8. Click **Done**.

Defining the Event Reference

LICENSE: Protection

You can use the **reference** keyword to add references to external web sites and additional information about the event. Adding a reference provides analysts with an immediately available resource to help them identify why the packet triggered

a rule. The [External Attack Identification Systems](#) table lists some of the external systems that can provide data on known exploits and attacks.

External Attack Identification Systems

SYSTEM ID	DESCRIPTION	EXAMPLE ID
bugtraq	Bugtraq page	8550
cve	Common Vulnerabilities and Exposure page	CAN-2003-0702
mcafee	McAfee page	98574
url	Website reference	www.example.com?exploit=14
msb	Microsoft security bulletin	MS11-082
nessus	Nessus page	10039
secure-url	Secure Website Reference (https://...)	intranet/exploits/exploit=14

Note that you can use `secure-url` with any secure website.

To specify a reference using the rule editor, select **reference** from the **Detection Options** list, and enter a value in the corresponding field as follows:

id_system, id

where *id_system* is the system being used as a prefix, and *id* is the Bugtraq ID, CVE number, Arachnids ID, or URL (without `http://`).

For example, to specify the authentication bypass vulnerability on Microsoft Commerce Server 2002 servers documented in Bugtraq ID 17134, enter the following in the **reference** field:

`bugtraq,17134`

Note the following when adding references to a rule:

- Do not use a space after the comma.
- Do not use uppercase letters in the system ID.

See [Constructing a Rule](#) on page 1181 for more information about using the rule editor to build rules.

Searching for Content Matches

LICENSE: Protection

Use the **content** keyword to specify content that you want to detect in a packet. The rules engine searches the packet payload or stream for that string. For

example, if you enter `/bin/sh` as the value for the `content` keyword, the rules engine searches the packet payload for the string `/bin/sh`.

Match content using either an ASCII string, hexadecimal content (binary byte code), or a combination of both. Surround hexadecimal content with pipe characters (`|`) in the keyword value. For example, you can mix hexadecimal content and ASCII content using something that looks like `|90C8 C0FF FFFF|/bin/sh`.

You can specify multiple content matches in a single rule. To do this, use additional instances of the `content` keyword. For each content match, you can indicate that content matches must be found in the packet payload or stream for the rule to trigger.

You should almost always follow a `content` keyword by modifiers that indicate where the content should be searched for, whether the search is case-sensitive, and other options. See [Constraining Content Matches](#) for more information about modifiers to the `content` keyword.

Note that all content matches must be true for the rule to trigger an event, that is, each content match has an AND relationship with the others.

Note also that, in an inline deployment, you can set up rules that match malicious content and then replace it with your own text string of equal length. See [Replacing Content in Inline Deployments](#) on page 1078 for more information.

To enter content to be matched:

ACCESS: Admin/Intrusion Admin

1. In the `content` field, type the content you want to find (for example, `|90C8 C0FF FFFF|/bin/sh`).

If you want to specify that the rule search for any content that is **not** the specified content, check the **Not** box.

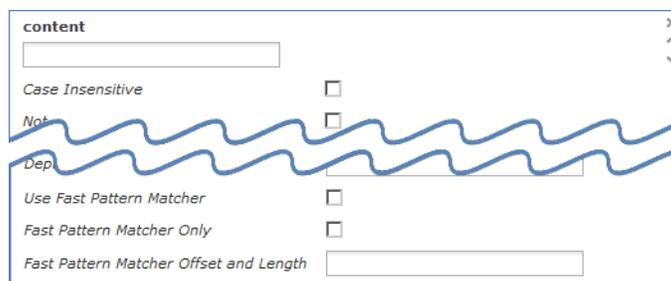

WARNING! You could invalidate your intrusion policy if you create a rule that includes only one `content` keyword and that keyword has the **Not** option selected. For more information, see [Not](#) on page 1066.

2. Optionally, add additional keywords that modify the `content` keyword or add constraints for the keyword. For more information on other keywords, see [Understanding Keywords and Arguments in Rules](#) on page 1055. For more information on constraining the `content` keyword, see [Constraining Content Matches](#) on page 1065.
3. Continue with creating or editing the rule. See [Writing New Rules](#) on page 1182 or [Modifying Existing Rules](#) on page 1184 for more information.

Constraining Content Matches

LICENSE: Protection

You can constrain the location and case-sensitivity of content searches with parameters that modify the **content** keyword. Configure options that modify the **content** keyword to specify the content for which you want to search.

For more information, see the following sections:

- [Case Insensitive](#) on page 1065
- [Raw Data](#) on page 1065
- [Not](#) on page 1066
- [Search Location Options](#) on page 1067
- [HTTP Content Options](#) on page 1069
- [Use Fast Pattern Matcher](#) on page 1074

Case Insensitive

LICENSE: Protection

You can instruct the rules engine to ignore case when searching for content matches in ASCII strings. To make your search case-insensitive, check **Case Insensitive** when specifying a content search.

To specify Case Insensitive when doing a content search:

ACCESS: Admin/Intrusion Admin

1. Select **Case Insensitive** for the **content** keyword you are adding.
2. Continue with creating or editing the rule. See [Constraining Content Matches](#), [Searching for Content Matches](#) on page 1063, [Writing New Rules](#) on page 1182 or [Modifying Existing Rules](#) on page 1184 for more information.

Raw Data

LICENSE: Protection

The **Raw Data** option instructs the rules engine to analyze the original packet payload before analyzing the normalized payload data (data decoded by a Sourcefire 3D System preprocessor) and does not use an argument value. You

can use this keyword when analyzing telnet traffic to check the telnet negotiation options in the payload before normalization.

You cannot use the **Raw Data** option together in the same **content** keyword with any HTTP content option. See [HTTP Content Options](#) on page 1069 for more information.

TIP! You can configure the HTTP Inspect preprocessor **Client Flow Depth** and **Server Flow Depth** options to determine whether raw data is inspected in HTTP traffic, and how much raw data is inspected, when the HTTP Inspect preprocessor is enabled. For more information, see [Selecting Server-Level HTTP Normalization Options](#) on page 854.

To analyze raw data:

ACCESS: Admin/Intrusion Admin

1. Select the **Raw Data** check box for the **content** keyword you are adding.
2. Continue with creating or editing the rule. See [Constraining Content Matches](#), [Searching for Content Matches](#) on page 1063, [Writing New Rules](#) on page 1182, or [Modifying Existing Rules](#) on page 1184 for more information.

Not

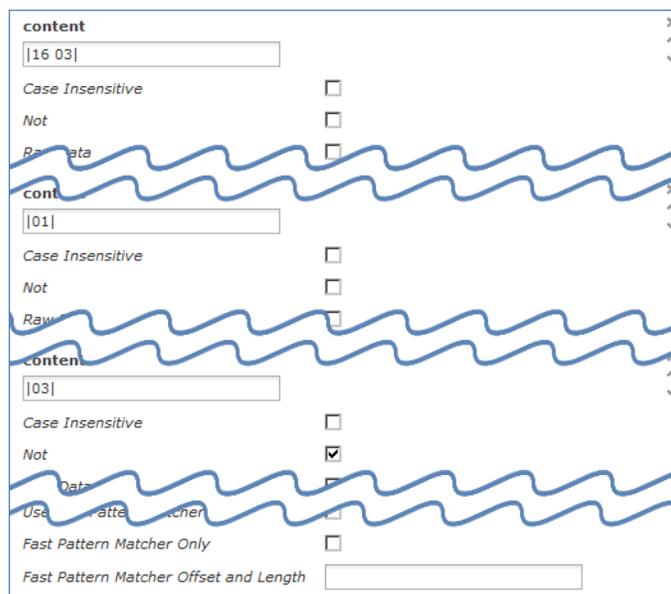

LICENSE: Protection

Select the **Not** option to search for content that does not match the specified content. If you create a rule that includes a **content** keyword with the **Not** option selected, you must also include in the rule at least one other **content** keyword without the **Not** option selected.

WARNING! Do not create a rule that includes only one **content** keyword if that keyword has the **Not** option selected. You could invalidate your intrusion policy. For more information, see [Configuring Intrusion Policies](#) on page 667.

For example, SMTP rule 1:2541:9 includes three **content** keywords, one of which has the **Not** option selected. A custom rule based on this rule would be invalid if

you removed all of the **content** keywords except the one with the **Not** option selected. Adding such a rule to your intrusion policy could invalidate the policy.

To search for content that does not match the specified content:

ACCESS: Admin/Intrusion Admin

1. Select the **Not** check box for the **content** keyword you are adding.

TIP! You cannot select the **Not** check box and the **Use Fast Pattern Matcher** check box with the same **content** keyword.

2. Include in the rule at least one other **content** keyword that does not have the **Not** option selected.
3. Continue with creating or editing the rule. See [Constraining Content Matches](#), [Searching for Content Matches](#) on page 1063, [Writing New Rules](#) on page 1182, or [Modifying Existing Rules](#) on page 1184 for more information.

Search Location Options

LICENSE: Protection

You can use either of two **content** location pairs to specify where to begin searching for the specified content and how far to continue searching, as follows:

- Use **Offset** and **Depth** together to search relative to the beginning of the packet payload.
- Use **Distance** and **Within** together to search relative to the current search location.

When you specify only one of a pair, the default for the other option in the pair is assumed.

You cannot mix the **Offset** and **Depth** options with the **Distance** and **Within** options. For example, you cannot pair **Offset** and **Within**. You can use any number of location options in a rule.

When no location is specified, the defaults for **Offset** and **Depth** are assumed; that is, the content search starts at the beginning of the packet payload and continues to the end of the packet.

You can also use an existing `byte_extract` variable to specify the value for a location option. See [Reading Packet Data into Keyword Arguments](#) on page 1156 for more information.

Offset

Specifies in bytes where in the packet payload to start searching for content relative to the beginning of the packet payload. You can specify a value of -65535 to 65535 bytes.

Because the offset counter starts at byte 0, specify one less than the number of bytes you want to move forward from the beginning of the packet payload. For example, if you specify 7, the search begins at the eighth byte.

The default offset is 0, meaning the beginning of the packet.

Depth

Specifies the maximum content search depth, in bytes, from the beginning of the offset value, or if no offset is configured, from the beginning of the packet payload.

For example, in a rule with a content value of `cgi-bin/phf`, and `offset` value of 3, and a `depth` value of 22, the rule starts searching for a match to the `cgi-bin/phf` string at byte 3, and stops after processing 22 bytes (byte 25) in packets that meet the parameters specified by the rule header.

You must specify a value that is greater than or equal to the length of the specified content, up to a maximum of 65535 bytes. You cannot specify a value of 0.

The default depth is to search to the end of the packet.

Distance

Instructs the rules engine to identify subsequent content matches that occur a specified number of bytes after the previous successful content match.

Because the distance counter starts at byte 0, specify one less than the number of bytes you want to move forward from the last successful content match. For example, if you specify 4, the search begins at the fifth byte.

You can specify a value of -65535 to 65535 bytes. If you specify a negative **Distance** value, the byte you start searching on may fall outside the beginning of a packet. Any calculations will take into account the bytes outside the packet, even though the search actually starts on the first byte in the packet. For example, if the current location in the packet is the fifth byte, and the next content rule option specifies a **Distance** value of -10 and a **within** value of 20, the search starts at the beginning of the payload and the **within** option is adjusted to 15.

The default distance is 0, meaning the current location in the packet subsequent to the last content match.

Within

The **Within** option indicates that, to trigger the rule, the next content match must occur within the specified number of bytes after the end of the last successful content match. For example, if you specify a **Within** value of 8, the next content match must occur within the next eight bytes of the packet payload or it does not meet the criteria that triggers the rule.

You can specify a value that is greater than or equal to the length of the specified content, up to a maximum of 65535 bytes.

The default for **Within** is to search to the end of the packet.

To specify a search location value in the user interface:

ACCESS: Admin/Intrusion Admin

1. Type the value in the field for the **content** keyword you are adding. You have the following choices:
 - **Offset**
 - **Depth**
 - **Distance**
 - **Within**

You can use any number of location options in a rule.

2. Continue with creating or editing the rule. See [Constraining Content Matches](#) on page 1065, [Searching for Content Matches](#) on page 1063, [Writing New Rules](#) on page 1182 or [Modifying Existing Rules](#) on page 1184 for more information.

HTTP Content Options

LICENSE: Protection

HTTP **content** keyword options let you specify where to search for content matches within an HTTP message decoded by the HTTP Inspect preprocessor.

Two options search status fields in HTTP responses:

- **HTTP Status Code**
- **HTTP Status Message**

Note that although the rules engine searches the raw, unnormalized status fields, these options are listed here separately to simplify explanation below of the restrictions to consider when combining other raw HTTP fields and normalized HTTP fields.

Five options search normalized fields in HTTP requests, responses, or both, as appropriate (see [HTTP Content Options](#) on page 1069 for more information):

- **HTTP URI**
- **HTTP Method**
- **HTTP Header**
- **HTTP Cookie**
- **HTTP Client Body**

Three options search raw (unnormalized) non-status fields in HTTP requests, responses, or both, as appropriate (see [HTTP Content Options](#) on page 1069 for more information):

- **HTTP Raw URI**
- **HTTP Raw Header**
- **HTTP Raw Cookie**

Use the following guidelines when selecting HTTP **content** options:

- HTTP **content** options apply only to TCP traffic.
- To avoid a negative impact on performance, select only those parts of the message where the specified content might appear.
For example, when traffic is likely to include large cookies such as those in shopping cart messages, you might search for the specified content in the HTTP header but not in HTTP cookies.
- To improve performance and reduce false positives, ensure that the HTTP Inspect preprocessor is enabled so HTTP message traffic can be normalized and evaluated against rules that include HTTP **content** options.
- To take advantage of HTTP Inspect preprocessor normalization, and to improve performance, any HTTP-related rule you create should at a minimum include at least one **content** keyword with an **HTTP URI**, **HTTP Method**, **HTTP Header**, or **HTTP Client Body** option selected.
- You cannot use the replace keyword in conjunction with HTTP **content** keyword options.

You can specify a single normalized HTTP option or status field, or use normalized HTTP options and status fields in any combination to target a content area to match. However, note the following restrictions when using HTTP field options:

- You cannot use the **Raw Data** option together in the same **content** keyword with any HTTP option.
- You cannot use a raw HTTP field option (**HTTP Raw URI**, **HTTP Raw Header**, or **HTTP Raw Cookie**) together in the same **content** keyword with its normalized counterpart (**HTTP URI**, **HTTP Header**, or **HTTP Cookie**, respectively).
- You cannot select **Use Fast Pattern Matcher** in combination with one or more of the following HTTP field options:

HTTP Raw URI, **HTTP Raw Header**, **HTTP Raw Cookie**, **HTTP Cookie**, **HTTP Method**, **HTTP Status Message**, or **HTTP Status Code**

However, you can include the options above in a content keyword that also uses the fast pattern matcher to search one of the following normalized fields:

HTTP URI, **HTTP Header**, or **HTTP Client Body**

For example, if you select **HTTP Cookie**, **HTTP Header**, and **Use Fast Pattern Matcher**, the rules engine searches for content in both the HTTP cookie and the HTTP header, but the fast pattern matcher is applied only to the HTTP header, not to the HTTP cookie.

- When you combine restricted and unrestricted options, the fast pattern matcher searches only the unrestricted fields you specify to test whether to pass the rule to the rule editor for complete evaluation, including evaluation of the restricted fields. See [Use Fast Pattern Matcher](#) on page 1074 for more information.

The above restrictions are reflected in the description of each option in the following list describing the HTTP **content** keyword options.

Note that the HTTP preprocessor must be enabled to allow processing of rules using any of these **content** keyword options. When the HTTP preprocessor is disabled and you enable rules that use any of these keywords, you are prompted whether to enable the preprocessor when you save the policy. See [Automatically Enabling Advanced Settings](#) on page 787.

The following list describes the HTTP **content** keyword options.

HTTP URI

Select this option to search for content matches in the normalized request URI field.

Note that you cannot use this option in combination with the `pcre` keyword HTTP URI (U) option to search the same content. See the [Snort-Specific Post Regular Expression Modifiers table](#) on page 1092 for more information.

IMPORTANT! A pipelined HTTP request packet contains multiple URIs. When **HTTP URI** is selected and the rules engine detects a pipelined HTTP request packet, the rules engine searches all URIs in the packet for a content match.

HTTP Raw URI

Select this option to search for content matches in the normalized request URI field.

Note that you cannot use this option in combination with the `pcre` keyword HTTP URI (U) option to search the same content. See the [Snort-Specific Post Regular Expression Modifiers table](#) on page 1092 for more information.

IMPORTANT! A pipelined HTTP request packet contains multiple URIs. When **HTTP URI** is selected and the rules engine detects a pipelined HTTP request packet, the rules engine searches all URIs in the packet for a content match.

HTTP Method

Select this option to search for content matches in the request method field, which identifies the action such as GET and POST to take on the resource identified in the URI.

HTTP Header

Select this option to search for content matches in the normalized header field, except for cookies, in HTTP requests; also in responses when the HTTP Inspect preprocessor **Inspect HTTP Responses** option is enabled.

Note that you cannot use this option in combination with the `pcre` keyword HTTP header (H) option to search the same content. See the [Snort-Specific Post Regular Expression Modifiers table](#) on page 1092 for more information.

HTTP Raw Header

Select this option to search for content matches in the raw header field, except for cookies, in HTTP requests; also in responses when the HTTP Inspect preprocessor **Inspect HTTP Responses** option is enabled.

Note that you cannot use this option in combination with the `pcre` keyword HTTP raw header (D) option to search the same content. See the [Snort-Specific Post Regular Expression Modifiers table](#) on page 1092 for more information.

HTTP Cookie

Select this option to search for content matches in any cookie identified in a normalized HTTP client request header; also in response set-cookie data when the HTTP Inspect preprocessor **Inspect HTTP Responses** option is enabled. Note that the system treats cookies included in the message body as body content.

You must enable the HTTP Inspect preprocessor **Inspect HTTP Cookies** option to search only the cookie for a match; otherwise, the rules engine searches the entire header, including the cookie. See [Selecting Server-Level HTTP Normalization Options](#) on page 854 for more information.

Note the following:

- You cannot use this option in combination with the `pcre` keyword HTTP cookie (C) option to search the same content. See the [Snort-Specific Post Regular Expression Modifiers table](#) on page 1092 for more information.
- The `Cookie:` and `Set-Cookie:` header names, leading spaces on the header line, and the `CRLF` that terminates the header line are inspected as part of the header and not as part of the cookie.

HTTP Raw Cookie

Select this option to search for content matches in any cookie identified in a raw HTTP client request header; also in response set-cookie data when the HTTP Inspect preprocessor **Inspect HTTP Responses** option is enabled; note that the system treats cookies included in the message body as body content.

You must enable the HTTP Inspect preprocessor **Inspect HTTP Cookies** option to search only the cookie for a match; otherwise, the rules engine searches the entire header, including the cookie. See [Selecting Server-Level HTTP Normalization Options](#) on page 854 for more information.

Note the following:

- You cannot use this option in combination with the `pcre` keyword HTTP raw cookie (K) option to search the same content. See the [Snort-Specific Post Regular Expression Modifiers table](#) on page 1092 for more information.
- The `Cookie:` and `Set-Cookie:` header names, leading spaces on the header line, and the `CRLF` that terminates the header line are inspected as part of the header and not as part of the cookie.

HTTP Client Body

Select this option to search for content matches in the message body in an HTTP client request.

Note that for this option to function, you must specify a value of 0 to 65535 for the HTTP Inspect preprocessor **HTTP Client Body Extraction Depth** option. See [Selecting Server-Level HTTP Normalization Options](#) on page 854 for more information.

HTTP Status Code

Select this option to search for content matches in the 3-digit status code in an HTTP response.

You must enable the HTTP Inspect preprocessor **Inspect HTTP Responses** option for this option to return a match. See [Selecting Server-Level HTTP Normalization Options](#) on page 854 for more information.

HTTP Status Message

Select this option to search for content matches in the textual description that accompanies the status code in an HTTP response.

You must enable the HTTP Inspect preprocessor **Inspect HTTP Responses** option for this option to return a match. See [Selecting Server-Level HTTP Normalization Options](#) on page 854 for more information.

To specify an HTTP content option when doing a content search of TCP traffic:

ACCESS: Admin/Intrusion Admin

1. Optionally, to take advantage of HTTP Inspect preprocessor normalization, and to improve performance, select at least one from among the **HTTP URI**, **HTTP Raw URI**, **HTTP Method**, **HTTP Header**, **HTTP Raw Header**, or **HTTP Client Body** options for the **content** keyword you are adding; also, optionally, select the **HTTP Cookie** or **HTTP Raw Cookie** option.
2. Continue with creating or editing the rule. See [Constraining Content Matches](#) on page 1065, [Searching for Content Matches](#) on page 1063, [Writing New Rules](#) on page 1182, or [Modifying Existing Rules](#) on page 1184 for more information.

Use Fast Pattern Matcher

LICENSE: Protection

The fast pattern matcher quickly determines which rules to evaluate before passing a packet to the rules engine. This initial determination improves performance by significantly reducing the number of rules used in packet evaluation.

By default, the fast pattern matcher searches packets for the longest content specified in a rule; this is to eliminate as much as possible needless evaluation of a rule. Consider the following example rule fragment:

```
alert tcp any any -> any 80 (msg:"Exploit"; content:"GET";  
http_method; nocase; content:"/exploit.cgi"; http_uri;  
nocase;)
```

Almost all HTTP client requests contain the content `GET`, but few will contain the content `/exploit.cgi`. Using `GET` as the fast pattern content would cause the rules engine to evaluate this rule in most cases and would rarely result in a match. However, most client `GET` requests would not be evaluated using `/exploit.cgi`, thus increasing performance.

The rules engine evaluates the packet against the rule only when the fast pattern matcher detects the specified content. For example, if one `content` keyword in a rule specifies the content `short`, another specifies `longer`, and a third specifies `longest`, the fast pattern matcher will use the content `longest` and the rule will be evaluated only if the rules engine finds `longest` in the payload.

You can use the **Use Fast Pattern Matcher** option to specify a shorter search pattern for the fast pattern matcher to use. Ideally, the pattern you specify is less likely to be found in the packet than the longest pattern and, therefore, more specifically identifies the targeted exploit.

Note the following restrictions when selecting **Use Fast Pattern Matcher** and other options in the same `content` keyword:

- You can specify **Use Fast Pattern Matcher** only one time per rule.
- You cannot use **Distance**, **Within**, **Offset**, or **Depth** when you select **Use Fast Pattern Matcher** in combination with **Not**.
- You cannot select **Use Fast Pattern Matcher** in combination with any of the following HTTP field options:

HTTP Raw URI, **HTTP Raw Header**, **HTTP Raw Cookie**, **HTTP Cookie**, **HTTP Method**, **HTTP Status Message**, or **HTTP Status Code**

However, you can include the options above in a content keyword that also uses the fast pattern matcher to search one of the following normalized fields:

HTTP URI, **HTTP Header**, or **HTTP Client Body**

For example, if you select **HTTP Cookie**, **HTTP Header**, and **Use Fast Pattern Matcher**, the rules engine searches for content in both the HTTP cookie and the HTTP header, but the fast pattern matcher is applied only to the HTTP header, not to the HTTP cookie.

Note that you cannot use a raw HTTP field option (**HTTP Raw URI**, **HTTP Raw Header**, or **HTTP Raw Cookie**) together in the same `content` keyword with its normalized counterpart (**HTTP URI**, **HTTP Header**, or **HTTP Cookie**, respectively). See [HTTP Content Options](#) on page 1069 for more information.

When you combine restricted and unrestricted options, the fast pattern matcher searches only the unrestricted fields you specify to test whether to pass the packet to the rules engine for complete evaluation, including evaluation of the restricted fields.

- Optionally, when you select **Use Fast Pattern Matcher** you can also select **Fast Pattern Matcher Only** or **Fast Pattern Matcher Offset and Length**, but not both.
- You cannot use the fast pattern matcher when inspecting Base64 data; see [Decoding and Inspecting Base64 Data](#) on page 1179 for more information.

Using the Fast Pattern Matcher Only

The **Fast Pattern Matcher Only** option allows you to use the `content` keyword only as a fast pattern matcher option and not as a rule option. You can use this option to conserve resources when rules engine evaluation of the specified content is not necessary. For example, consider a case where a rule requires only that the content `12345` be anywhere in the payload. When the fast pattern matcher detects the pattern, the packet can be evaluated against additional keywords in the rule. There is no need for the rules engine to reevaluate the packet to determine if it includes the pattern `12345`.

You would not use this option when the rule contains other conditions relative to the specified content. For example, you would not use this option to search for the content `1234` if another rule condition sought to determine if `abcd` occurs before `1234`. In this case, the rules engine could not determine the relative location because specifying **Fast Pattern Matcher Only** instructs the rules engine not to search for the specified content.

Note the following conditions when using this option:

- The specified content is location-independent; that is, it may occur anywhere in the payload; thus, you cannot use positional options (**Distance**, **Within**, **Offset**, **Depth**, or **Fast Pattern Matcher Offset and Length**).
- You cannot use this option in combination with **Not**.
- You cannot use this option in combination with **Fast Pattern Matcher Offset and Length**.
- The specified content will be treated as case-insensitive, because all patterns are inserted into the fast pattern matcher in a case-insensitive manner; this is handled automatically, so it is not necessary to select **Case Insensitive** when you select this option.
- You should not immediately follow a `content` keyword that uses the **Fast Pattern Matcher Only** option with the following keywords, which set the search location relative to the current search location:
 - `isdataat`
 - `pcre`
 - `content` when **Distance** or **Within** is selected
 - `content` when **HTTP URI** is selected
 - `asn1`
 - `byte_jump`
 - `byte_test`

- `byte_extract`
- `base64_decode`

Specifying Fast Pattern Matcher Offset and Length

The **Fast Pattern Matcher Offset and Length** option allows you to specify a portion of the content to search. This can reduce memory consumption in cases where the pattern is very long and only a portion of the pattern is sufficient to identify the rule as a likely match. When a rule is selected by the fast pattern matcher, the entire pattern is evaluated against the rule.

You determine the portion for the fast pattern matcher to use by specifying in bytes where to begin the search (offset) and how far into the content (length) to search, using the syntax:

offset, length

For example, for the content:

1234567

if you specify the number of offset and length bytes as:

1, 5

the fast pattern matcher searches only for the content 23456.

Note that you cannot use this option together with **Fast Pattern Matcher Only**.

To specify the content searched for by the fast pattern matcher:

ACCESS: Admin/Intrusion Admin

1. Select **Use Fast Pattern Matcher** for the content keyword you are adding.
2. Optionally, select **Fast Pattern Matcher Only** to determine without rules engine evaluation if the specified pattern exists in the packet.
Evaluation will proceed only if the fast pattern matcher detects the specified content.

3. Optionally, specify in **Fast Pattern Matcher Offset and Length** a portion of the pattern to search for the content using the syntax:

offset, length

where *offset* specifies how many bytes from the beginning of the content to begin the search, and *length* specifies the number of bytes to continue.

4. Continue with creating or editing the rule. See [Constraining Content Matches](#) on page 1065, [Searching for Content Using PCRE](#) on page 1086, [Writing New Rules](#) on page 1182, or [Modifying Existing Rules](#) on page 1184 for more information.

Replacing Content in Inline Deployments

LICENSE: Protection

You can use the `replace` keyword in an inline deployment to replace specified content.

IMPORTANT! You cannot use the `replace` keyword to replace content in SSL traffic detected by the Sourcefire SSL Appliance. The original encrypted data, not the replacement data, will be transmitted. See the *Sourcefire SSL Appliance Administration and Deployment Guide* for more information.

To use the `replace` keyword, construct a custom standard text rule that uses the `content` keyword to look for a specific string. Then use the `replace` keyword to specify a string to replace the content. The replace value and content value must be the same length.

Optionally, you can enclose the replacement string in quotation marks for backward compatibility with previous Sourcefire 3D System software versions. If you do not include quotation marks, they are added to the rule automatically so the rule is syntactically correct. To include a leading or trailing quotation mark as part of the replacement text, you must use a backslash to escape it, as shown in the following example:

```
"replacement text plus \"quotation\" marks"
```

A rule can contain multiple `replace` keywords, but only one per `content` keyword. Only the first instance of the content found by the rule is replaced.

The following explain example uses of the `replace` keyword:

- If the system detects an incoming packet that contains an exploit, you can replace the malicious string with a harmless one. Sometimes this technique is more successful than simply dropping the offending packet. In some attack scenarios, the attacker simply resends the dropped packet until it bypasses your network defenses or floods your network. By substituting one string for another rather than dropping the packet, you may trick the attacker into believing that the attack was launched against a target that was not vulnerable.
- If you are concerned about reconnaissance attacks that try to learn whether you are running a vulnerable version of, for example, a web server, then you can detect the outgoing packet and replace the banner with your own text.

IMPORTANT! Make sure that you set the rule state to Generate Events in the inline intrusion policy where you want to use the replace rule; setting the rule to Drop and Generate events would cause the packet to drop, which would prevent replacing the content.

As part of the string replacement process, the system automatically updates the packet checksums so that the destination host can receive the packet without error.

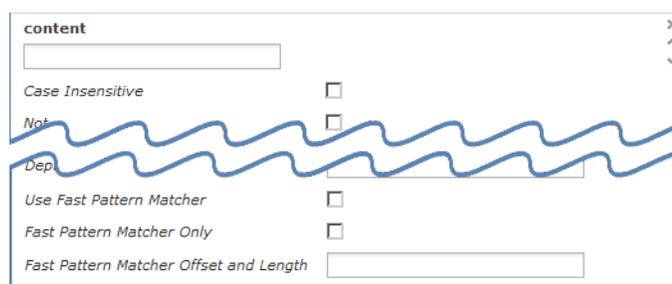

Note that you cannot use the `replace` keyword in combination with HTTP request message `content` keyword options. See [Searching for Content Matches](#) on page 1063 and [HTTP Content Options](#) on page 1069 for more information.

To replace content in an inline deployment:

ACCESS: Admin/Intrusion Admin

1. On the Create Rule page, select **content** in the drop-down list and click **Add Option**.

The `content` keyword appears.

2. Specify the content you want to detect in the `content` field and, optionally, select any applicable arguments. Note that you cannot use the HTTP request message `content` keyword options with the `replace` keyword.

3. Select **replace** in the drop-down list and click **Add Option**.

The `replace` keyword appears beneath the `content` keyword.

4. Specify the replacement string for the specified content in the `replace:` field.

Using `Byte_Jump` and `Byte_Test`

LICENSE: Protection

You can use `byte_jump` and `byte_test` to calculate where in a packet the rules engine should begin testing for a data match, and which bytes it should evaluate.

You can also use the `byte_jump` and `byte_test DCE/RPC` argument to tailor either keyword for traffic processed by the DCE/RPC preprocessor. When you use the **DCE/RPC** argument, you can also use `byte_jump` and `byte_test` in conjunction with other specific DCE/RPC keywords. See [Decoding DCE/RPC Traffic](#) on page 810 and [DCE/RPC Keywords](#) on page 1119 for more information.

See the following sections for more information:

- [byte_jump](#) on page 1080
- [byte_test](#) on page 1083

byte_jump

LICENSE: Protection

The `byte_jump` keyword calculates the number of bytes defined in a specified byte segment, and then skips that number of bytes within the packet, either forward from the end of the specified byte segment, or from the beginning of the packet payload, depending on the options you specify. This is useful in packets where a specific segment of bytes describe the number of bytes included in variable data within the packet.

The [Required byte_jump Arguments](#) table describes the arguments required by the `byte_jump` keyword.

Required byte_jump Arguments

ARGUMENT	DESCRIPTION
Bytes	The number of bytes to calculate from the packet.
Offset	The number of bytes into the payload to start processing. The <code>offset</code> counter starts at byte 0, so calculate the <code>offset</code> value by subtracting 1 from the number of bytes you want to jump forward from the beginning of the packet payload or the last successful content match. You can also use an existing <code>byte_extract</code> variable to specify the value for this argument. See Reading Packet Data into Keyword Arguments on page 1156 for more information.

The [Additional Optional byte_jump Arguments](#) table describes options you can use to define how the system interprets the values you specified for the required arguments.

Additional Optional byte_jump Arguments

ARGUMENT	DESCRIPTION
Relative	Makes the offset relative to the last pattern found in the last successful content match.
Align	Rounds the number of converted bytes up to the next 32-bit boundary.

Additional Optional byte_jump Arguments (Continued)

ARGUMENT	DESCRIPTION
Multiplier	Indicates the value by which the rules engine should multiply the byte_jump value obtained from the packet to get the final byte_jump value. That is, instead of skipping the number of bytes defined in a specified byte segment, the rules engine skips that number of bytes multiplied by an integer you specify with the Multiplier argument.
Post Jump Offset	The number of bytes -63535 through 63535 to skip forward or backward after applying other byte_jump arguments. A positive value skips forward and a negative value skips backward. Leave the field blank or enter 0 to disable. See the DCE/RPC argument in the Endianness Arguments table for byte_jump arguments that do not apply when you select the DCE/RPC argument.
From Beginning	Indicates that the rules engine should skip the specified number of bytes in the payload starting from the beginning of the packet payload, rather than from the end of the byte segment that specifies the number of bytes to skip.

You can specify only one of **DCE/RPC**, **Endian**, or **Number Type**.

If you want to define how the byte_jump keyword calculates the bytes, you can choose from the arguments described in the [Endianness Arguments](#) table (if neither argument is specified, network byte order is used).

Endianness Arguments

ARGUMENT	DESCRIPTION
Big Endian	Processes data in big endian byte order, which is the default network byte order.

Endianness Arguments (Continued)

ARGUMENT	DESCRIPTION
Little Endian	Processes data in little endian byte order.
DCE/RPC	<p>Specifies a <code>byte_jump</code> keyword for traffic processed by the DCE/RPC preprocessor. See Decoding DCE/RPC Traffic on page 810 for more information.</p> <p>The DCE/RPC preprocessor determines big endian or little endian byte order, and the Number Type, Endian, and From Beginning arguments do not apply.</p> <p>When you enable this argument, you can also use <code>byte_jump</code> in conjunction with other specific DCE/RPC keywords. See DCE/RPC Keywords on page 1119 for more information.</p> <p>The DCE/RPC preprocessor must be enabled to allow processing of rules that include this option. When the DCE/RPC preprocessor is disabled and you enable rules that use this option, you are prompted whether to enable the preprocessor when you save the policy. See Automatically Enabling Advanced Settings on page 787.</p>

Define how the system views string data in a packet by using one of the arguments in the [Number Type Arguments](#) table.

Number Type Arguments

ARGUMENT	DESCRIPTION
Hexadecimal String	Represents converted string data in hexadecimal format.
Decimal String	Represents converted string data in decimal format.
Octal String	Represents converted string data in octal format.

For example, if the values you set for `byte_jump` are as follows:

- Bytes = 4
- Offset = 12
- Relative enabled
- Align enabled

the rules engine calculates the number described in the four bytes that appear 13 bytes after the last successful content match, and skips ahead that number of bytes in the packet. For instance, if the four calculated bytes in a specific packet

were 00 00 00 1F, the rules engine would convert this to 31. Because `align` is specified (which instructs the engine to move to the next 32-bit boundary), the rules engine skips ahead 32 bytes in the packet.

Alternately, if the values you set for `byte_jump` are as follows:

- Bytes = 4
- Offset = 12
- From Beginning enabled
- Multiplier = 2

the rules engine calculates the number described in the four bytes that appear 13 bytes after the beginning of the packet. Then, the engine multiplies that number by two to obtain the total number of bytes to skip. For instance, if the four calculated bytes in a specific packet were 00 00 00 1F, the rules engine would convert this to 31, then multiply it by two to get 62. Because From Beginning is enabled, the rules engine skips the first 63 bytes in the packet.

To use `byte_jump`:

ACCESS: Admin/Intrusion Admin

- ▶ Select `byte_jump` in the drop-down list and click **Add Option**.

The `byte_jump` section appears beneath the last keyword you selected.

byte_test

LICENSE: Protection

The `byte_test` keyword calculates the number of bytes in a specified byte segment and compares them, according to the operator and value you specify.

The [Required byte_test Arguments](#) table describes the required arguments for the `byte_test` keyword.

Required byte_test Arguments

ARGUMENT	DESCRIPTION
Bytes	The number of bytes to calculate from the packet. You can specify 1 to 10 bytes.
Operator and Value	Compares the specified value to <code><</code> , <code>></code> , <code>=</code> , <code>!</code> , <code>&</code> , <code>^</code> , <code>!></code> , <code>!<</code> , <code>!=</code> , <code>!&</code> , or <code>!^</code> . For example, if you specify <code>!1024</code> , <code>byte_test</code> would convert the specified number, and if it did not equal 1024, it would generate an event (if all other keyword parameters matched). Note that <code>!</code> and <code>!=</code> are equivalent. You can also use an existing <code>byte_extract</code> variable to specify the value for this argument. See Reading Packet Data into Keyword Arguments on page 1156 for more information.
Offset	The number of bytes into the payload to start processing. The <code>offset</code> counter starts at byte 0, so calculate the <code>offset</code> value by subtracting 1 from the number of bytes you want to count forward from the beginning of the packet payload or the last successful content match. You can also use an existing <code>byte_extract</code> variable to specify the value for this argument. See Reading Packet Data into Keyword Arguments on page 1156 for more information.

You can further define how the system uses `byte_test` arguments with the arguments described in the [Additional Optional byte_test Arguments](#) table.

Additional Optional byte_test Arguments

ARGUMENT	DESCRIPTION
Relative	Makes the offset relative to the last successful pattern match.
Align	Rounds the number of converted bytes up to the next 32-bit boundary.

You can specify only one of **DCE/RPC**, **Endian**, or **Number Type**.

To define how the `byte_test` keyword calculates the bytes it tests, choose from the arguments in the [Endianness byte_test Arguments](#) table. If neither argument is specified, network byte order is used.

Endianness byte_test Arguments

ARGUMENT	DESCRIPTION
Big Endian	Processes data in big endian byte order, which is the default network byte order.
Little Endian	Processes data in little endian byte order.
DCE/RPC	<p>Specifies a <code>byte_test</code> keyword for traffic processed by the DCE/RPC preprocessor. See Decoding DCE/RPC Traffic on page 810 for more information.</p> <p>The DCE/RPC preprocessor determines big endian or little endian byte order, and the Number Type and Endian argument do not apply.</p> <p>When you enable this argument, you can also use <code>byte_test</code> in conjunction with other specific DCE/RPC keywords. See DCE/RPC Keywords on page 1119 for more information.</p> <p>The DCE/RPC preprocessor must be enabled to allow processing of rules that include this option. When the DCE/RPC preprocessor is disabled and you enable rules that use this option, you are prompted whether to enable the preprocessor when you save the policy. See Automatically Enabling Advanced Settings on page 787.</p>

You can define how the system views string data in a packet by using one of the arguments in the [Number Type byte-test Arguments](#) table.

Number Type byte-test Arguments

ARGUMENT	DESCRIPTION
Hexadecimal String	Represents converted string data in hexadecimal format.
Decimal String	Represents converted string data in decimal format.
Octal String	Represents converted string data in octal format.

For example, if the value for `byte_test` is specified as the following:

- Bytes = 4
- Operator and Value > 128
- Offset = 8
- Relative enabled

the rules engine calculates the number described in the four bytes that appear 9 bytes away from (relative to) the last successful content match, and, if the calculated number is larger than 128 bytes, the rule is triggered.

To use `byte_test`:

ACCESS: Admin/Intrusion Admin

- ▶ On the Create Rule page, select `byte_test` in the drop-down list and click **Add Option**.

The `byte_test` section appears beneath the last keyword you selected.

The screenshot shows a configuration window for the `byte_test` keyword. It contains the following fields and controls:

- Bytes:** A text input field.
- Offset:** A text input field.
- Value:** A dropdown menu with a right-pointing arrow, followed by a text input field.
- Number Type:** A dropdown menu with a right-pointing arrow.
- Endian:** A dropdown menu with a right-pointing arrow.
- Relative:** A checkbox.
- DCE/RPC:** A checkbox.

Searching for Content Using PCRE

LICENSE: Protection

The `pcre` keyword allows you to use Perl-compatible regular expressions (PCRE) to inspect packet payloads for specified content. You can use PCRE to avoid writing multiple rules to match slight variations of the same content.

Regular expressions are useful when searching for content that could be displayed in a variety of ways. The content may have different attributes that you want to account for in your attempt to locate it within a packet's payload.

Note that the regular expression syntax used in intrusion rules is a subset of the full regular expression library and varies in some ways from the syntax used in commands in the full library. When adding a `pcre` keyword using the rule editor, enter the full value in the following format:

```
!/pcre/ ismxAEGRBUIPHDMCKSY
```

where:

- `!` is an optional negation (use this if you want to match patterns that **do not** match the regular expression).
- `/pcre/` is a Perl-compatible regular expression.
- `i smxAEGRBUIPHDMCKSY` is any combination of modifier options.

Also note that you must escape the characters listed in the following table for the rules engine to interpret them correctly when you use them in a PCRE to search for specific content in a packet payload.

Escaped PCRE Characters

YOU MUST ESCAPE...	WITH A BACKSLASH...	OR HEX CODE...
# (hash mark)	\#	\x23
;(semicolon)	\;	\x3B
(vertical bar)	\	\x7C
:(colon)	\:	\x3A

TIP! Optionally, you can surround your Perl-compatible regular expression with quote characters, for example, `pcre_expression` or `"pcre_expression"`. The option of using quotes accommodates experienced users accustomed to previous versions when quotes were required instead of optional. The rule editor does not display quotation marks when you display a rule after saving it.

You can also use `m?regex?`, where `?` is a delimiter other than `/`. You may want to use this in situations where you need to match a forward slash within a regular expression and do not want to escape it with a backslash. For example, you might use `m?regex? i smxAEGRBUIPHDMCKSY` where `regex` is your Perl-compatible regular expression and `i smxAEGRBUIPHDMCKSY` is any combination of modifier options. See [Perl-Compatible Regular Expression Basics](#) on page 1088 for more information about regular expression syntax.

The following sections provide more information about building valid values for the `pcre` keyword:

- [Perl-Compatible Regular Expression Basics](#) on page 1088 describes the common syntax used in Perl-compatible regular expressions.
- [PCRE Modifier Options](#) on page 1090 describes the options you can use to modify your regular expression.
- [Example PCRE Keyword Values](#) on page 1094 gives example usage of the `pcre` keyword in rules.

Perl-Compatible Regular Expression Basics

LICENSE: Protection

The `pcre` keyword accepts standard Perl-compatible regular expression (PCRE) syntax. The following sections describe that syntax.

TIP! While this section describes the basic syntax you may use for PCRE, you may want to consult an online reference or book dedicated to Perl and PCRE for more advanced information.

Metacharacters

LICENSE: Protection

Metacharacters are literal characters that have special meaning within regular expressions. When you use them within a regular expression, you must “escape” them by preceding them with a backslash.

The [PCRE Metacharacters](#) table describes the metacharacters you can use with PCRE and gives examples of each.

PCRE Metacharacters

METACHARACTER	DESCRIPTION	EXAMPLE
.	Matches any character except newlines. If <code>s</code> is used as a modifying option, it also includes newline characters.	<code>abc.</code> matches <code>abcd</code> , <code>abc1</code> , <code>abc#</code> , and so on.
*	Matches zero or more occurrences of a character or expression.	<code>abc*</code> matches <code>abc</code> , <code>abcc</code> , <code>abccc</code> , <code>abccccc</code> , and so on.
?	Matches zero or one occurrence of a character or expression.	<code>abc?</code> matches <code>abc</code> .
+	Matches one or more occurrences of a character or expression.	<code>abc+</code> matches <code>abc</code> , <code>abcc</code> , <code>abccc</code> , <code>abccccc</code> , and so on.
()	Groups expressions.	<code>(abc)+</code> matches <code>abc</code> , <code>abcabc</code> , <code>abcabcabc</code> and so on.
{}	Specifies a limit for the number of matches for a character or expression. If you want to set a lower and upper limit, separate the lower limit and upper limit with a comma.	<code>a{4,6}</code> matches <code>aaaa</code> , <code>aaaaa</code> , or <code>aaaaaa</code> . <code>(ab){2}</code> matches <code>abab</code> .

PCRE Metacharacters (Continued)

METACHARACTER	DESCRIPTION	EXAMPLE
[]	Allows you to define character classes, and matches any character or combination of characters described in the set.	[abc123] matches a or b or c, and so on.
^	Matches content at the beginning of a string. Also used for negation, if used within a character class.	^in matches the "in" in info, but not in bin. [^a] matches anything that does not contain a.
\$	Matches content at the end of a string.	ce\$ matches the "ce" in announce, but not cent.
	Indicates an OR expression.	(MAILTO HELP) matches MAILTO or HELP
\	Allows you to use metacharacters as actual characters and is also used to specify a predefined character class.	\. matches a period, * matches an asterisk, \\ matches a backslash and so on. \d matches the numeric characters, \w matches alphanumeric characters, and so on. See Character Classes on page 1089 for more information about using character classes in PCRE.

Character Classes

LICENSE: Protection

Character classes include alphabetic characters, numeric characters, alphanumeric characters, and white space characters. While you can create your own character classes within brackets (see [Metacharacters](#) on page 1088), you can use the predefined classes as shortcuts for different types of character types. When used without additional qualifiers, a character class matches a single digit or character.

The [PCRE Character Classes](#) table describes and provides examples of the predefined character classes accepted by PCRE.

PCRE Character Classes

CHARACTER CLASS	DESCRIPTION	CHARACTER CLASS DEFINITION
\d	Matches a numeric character ("digit").	[0-9]
\D	Matches anything that is not an numeric character.	[^0-9]

PCRE Character Classes (Continued)

CHARACTER CLASS	DESCRIPTION	CHARACTER CLASS DEFINITION
\w	Matches an alphanumeric character ("word").	[a-zA-Z0-9_]
\W	Matches anything that is not an alphanumeric character.	[^a-zA-Z0-9_]
\s	Matches white space characters, including spaces, carriage returns, tabs, newlines, and form feeds.	[\r\n\t\f]
\S	Matches anything that is not a white space character.	[^\r\n\t\f]

PCRE Modifier Options

LICENSE: Protection

You can use modifying options after you specify regular expression syntax in the `pcre` keyword's value. These modifiers perform Perl, PCRE, and Snort-specific processing functions. Modifiers always appear at the end of the PCRE value, and appear in the following format:

`/pcre/i smxAEGRBUIPHDMCKSY`

where `i smxAEGRBUPHMC` can include any of the modifying options that appear in the following tables.

TIP! Optionally, you can surround the regular expression and any modifying options with quotes, for example, `"/pcre/i smxAEGRBUIPHDMCKSY"`. The option of using quotes accommodates experienced users accustomed to previous versions when quotes were required instead of optional. The rule editor does not display quotation marks when you display a rule after saving it.

The [Perl-Related Post Regular Expression Options](#) table describes options you can use to perform Perl processing functions.

Perl-Related Post Regular Expression Options

OPTION	DESCRIPTION
i	Makes the regular expression case-insensitive.
s	The dot character (.) describes all characters except the newline or \n character. You can use "s" as an option to override this and have the dot character match all characters, including the newline character.
m	By default, a string is treated as a single line of characters, and ^ and \$ match the beginning and ending of a specific string. When you use "m" as an option, ^ and \$ match content immediately before or after any newline character in the buffer, as well as at the beginning or end of the buffer.
x	Ignores white space data characters that may appear within the pattern, except when escaped (preceded by a backslash) or included inside a character class.

The [PCRE-Related Post Regular Expression Options](#) table describes the PCRE modifiers you can use after the regular expression.

PCRE-Related Post Regular Expression Options

OPTION	DESCRIPTION
A	The pattern must match at the beginning of the string (same as using ^ in a regular expression).
E	Sets \$ to match only at the end of the subject string. (Without E, \$ also matches immediately before the final character if it is a newline, but not before any other newline characters).
G	By default, * + and ? are "greedy," which means that if two or more matches are found, they will choose the longest match. Use the G character to change this so that these characters always choose the first match unless followed by a question mark character (?). For example, *? +? and ?? would be greedy in a construct using the G modifier, and any incidences of *, +, or ? without the additional question mark will not be greedy.

The [Snort-Specific Post Regular Expression Modifiers](#) table describes the Snort-specific modifiers that you can use after the regular expression.

The HTTP preprocessor must be enabled to allow processing of rules using the C, H, U, M, or P expression modifiers. When the HTTP preprocessor is disabled and you enable rules that use these modifiers, you are prompted whether to enable

the preprocessor when you save the policy. See [Automatically Enabling Advanced Settings](#) on page 787.

Snort-Specific Post Regular Expression Modifiers

OPTION	DESCRIPTION
R	Searches for matching content relative to the end of the last match found by the rules engine.
B	Searches for the content within data before it is decoded by a preprocessor (this option is similar to using the Raw Data argument with the content keyword).
U	Searches for the content within the URI of a normalized HTTP request message decoded by the HTTP Inspect preprocessor. Note that you cannot use this option in combination with the content keyword HTTP URI option to search the same content. See HTTP Content Options on page 1069 for more information. IMPORTANT! A pipelined HTTP request packet contains multiple URIs. A PCRE expression that includes the U option causes the rules engine to search for a content match only in the first URI in a pipelined HTTP request packet. To search all URIs in the packet, use the content keyword with HTTP URI selected, either with or without an accompanying PCRE expression that uses the U option.
I	Searches for the content within the URI of a raw HTTP request message decoded by the HTTP Inspect preprocessor. Note that you cannot use this option in combination with the content keyword HTTP Raw URI option to search the same content. See HTTP Content Options on page 1069 for more information.
P	Searches for the content within the body of a normalized HTTP request message decoded by the HTTP Inspect preprocessor. See the content keyword HTTP Client Body option in HTTP Content Options on page 1069 for more information.
H	Searches for the content within the header, excluding cookies, of an HTTP request or response message decoded by the HTTP Inspect preprocessor. Note that you cannot use this option in combination with the content keyword HTTP Header option to search the same content. See HTTP Content Options on page 1069 for more information.
D	Searches for the content within the header, excluding cookies, of a raw HTTP request or response message decoded by the HTTP Inspect preprocessor. Note that you cannot use this option in combination with the content keyword HTTP Raw Header option to search the same content. See HTTP Content Options on page 1069 for more information.
M	Searches for the content within the method field of a normalized HTTP request message decoded by the HTTP Inspect preprocessor; the method field identifies the action such as GET, PUT, CONNECT, and so on to take on the resource identified in the URI. See the content keyword HTTP Method option in HTTP Content Options on page 1069 for more information.

Snort-Specific Post Regular Expression Modifiers (Continued)

OPTION	DESCRIPTION
C	<p>When the HTTP Inspect preprocessor Inspect HTTP Cookies option is enabled, searches for the normalized content within any cookie in an HTTP request header, and also within any set-cookie in an HTTP response header when the preprocessor Inspect HTTP Responses option is enabled. When Inspect HTTP Cookies is not enabled, searches the entire header, including the cookie or set-cookie data.</p> <p>Note the following:</p> <ul style="list-style-type: none">• Cookies included in the message body are treated as body content.• You cannot use this option in combination with the content keyword HTTP Cookie option to search the same content. See HTTP Content Options on page 1069 for more information.• The Cookie: and Set-Cookie: header names, leading spaces on the header line, and the CRLF that terminates the header line are inspected as part of the header and not as part of the cookie.
K	<p>When the HTTP Inspect preprocessor Inspect HTTP Cookies option is enabled, searches for the raw content within any cookie in an HTTP request header, and also within any set-cookie in an HTTP response header when the preprocessor Inspect HTTP Responses option is enabled. When Inspect HTTP Cookies is not enabled, searches the entire header, including the cookie or set-cookie data.</p> <p>Note the following:</p> <ul style="list-style-type: none">• Cookies included in the message body are treated as body content.• You cannot use this option in combination with the content keyword HTTP Raw Cookie option to search the same content. See HTTP Content Options on page 1069 for more information.• The Cookie: and Set-Cookie: header names, leading spaces on the header line, and the CRLF that terminates the header line are inspected as part of the header and not as part of the cookie.
S	<p>Searches the 3-digit status code in an HTTP response. See the content keyword HTTP Status Code option in HTTP Content Options on page 1069 for more information.</p>
Y	<p>Searches the textual description that accompanies the status code in an HTTP response. See the content keyword HTTP Status Message option in HTTP Content Options on page 1069 for more information.</p>

IMPORTANT! Do not use the U option in combination with the R option. This could cause performance problems. Also, do not use the U option in combination with any other HTTP **content** option (I, P, H, D, M, C, K, S, or Y).

Example PCRE Keyword Values

LICENSE: Protection

The following examples show values that you could enter for `pcre`, with descriptions of what each example would match.

- `/feedback[(\d{0,1})]?\.cgi/U`

This example searches packet payload for `feedback`, followed by zero or one numeric character, followed by `.cgi`, and located only in URI data.

This example would match:

- `feedback.cgi`
- `feedback1.cgi`
- `feedback2.cgi`
- `feedback3.cgi`

This example would **not** match:

- `feedbacka.cgi`
- `feedback11.cgi`
- `feedback21.cgi`
- `feedbackzb.cgi`

- `/^ez(\w{3,5})\.cgi/iU`

This example searches packet payload for `ez` at the beginning of a string, followed by a word of 3 to 5 letters, followed by `.cgi`. The search is case-insensitive and only searches URI data.

This example would match:

- `EZBoard.cgi`
- `ezman.cgi`
- `ezadmin.cgi`
- `EZAdmin.cgi`

This example would **not** match:

- `ezez.cgi`
- `fez.cgi`
- `abcezboard.cgi`
- `ezboardman.cgi`

- **/mail(file|seek)\.cgi/U**
This example searches packet payload for `mail`, followed by either `file` or `seek`, in URI data.
This example would match:
 - `mailfile.cgi`
 - `mailseek.cgi`This example would **not** match:
 - `MailFile.cgi`
 - `mailfilefile.cgi`
- **m?http\x3a\x2f\x2f.*(\n|\t)+?U**
This example searches packet payload for URI content for a tab or newline character in an HTTP request, after any number of characters. This example uses `m?regex?` to avoid using `http:\` in the expression. Note that the colon is preceded by a backslash.
This example would match:
 - `http://www.example.com?scriptvar=x&othervar=\n\...\`
 - `http://www.example.com?scriptvar=\t`This example would **not** match:
 - `ftp://ftp.example.com?scriptvar=&othervar=\n\...\`
 - `http://www.example.com?scriptvar=|/bin/sh -i|`
- **m?http\x3a\x2f\x2f.*=|.*\|+?sU**
This example searches packet payload for a URL with any number of characters, including newlines, followed by an equal sign, and pipe characters that contain any number of characters or white space. This example uses `m?regex?` to avoid using `http:\` in the expression.
This example would match:
 - `http://www.example.com?value=|/bin/sh/ -i|`
 - `http://www.example.com?input=|cat /etc/passwd|`This example would **not** match:
 - `ftp://ftp.example.com?value=|/bin/sh/ -i|`
 - `http://www.example.com?value=x&input?|cat /etc/passwd|`
- **/[0-9a-f]{2}\:[0-9a-f]{2}\:[0-9a-f]{2}\:[0-9a-f]{2}\:[0-9a-f]{2}\:[0-9a-f]{2}/i**
This example searches packet payload for any MAC address. Note that it escapes the colon characters with backslashes.

Adding Metadata to a Rule

LICENSE: Protection

You can use the `metadata` keyword to add descriptive information to a rule. You can use the information you add to organize or identify rules in ways that suit your needs, and to search for rules.

The system validates metadata based on the format:

key value

where *key* and *value* provide a combined description separated by a space.

This is the format used by the Sourcefire Vulnerability Research Team (VRT) for adding metadata to rules provided by Sourcefire.

Alternatively, you can also use the format:

key=value

For example, you could use the *key value* format to identify rules by author and date, using a category and sub-category as follows:

`author SnortGuru_20050406`

You can use multiple `metadata` keywords in a rule. You can also use commas to separate multiple *key value* statements in a single `metadata` keyword, as seen in the following example:

```
author SnortGuru_20050406, revised_by SnortUser1_20050707,  
revised_by SnortUser2_20061003, revised_by  
SnortUser1_20070123
```

You are not limited to using a *key value* or *key=value* format; however, you should be aware of limitations resulting from validation based on these formats.

Avoiding Restricted Characters

LICENSE: Protection

Note the following character restrictions:

- Do not use a semicolon (;) or colon (:) in a `metadata` keyword.
- Be aware when using commas that the system interprets a comma as a separator for multiple *key value* or *key=value* statements. For example:
`key value, key value, key value`
- Be aware when using the equal to (=) character or space character that the system interprets these characters as separators between *key* and *value*. For example:

`key value`

`key=value`

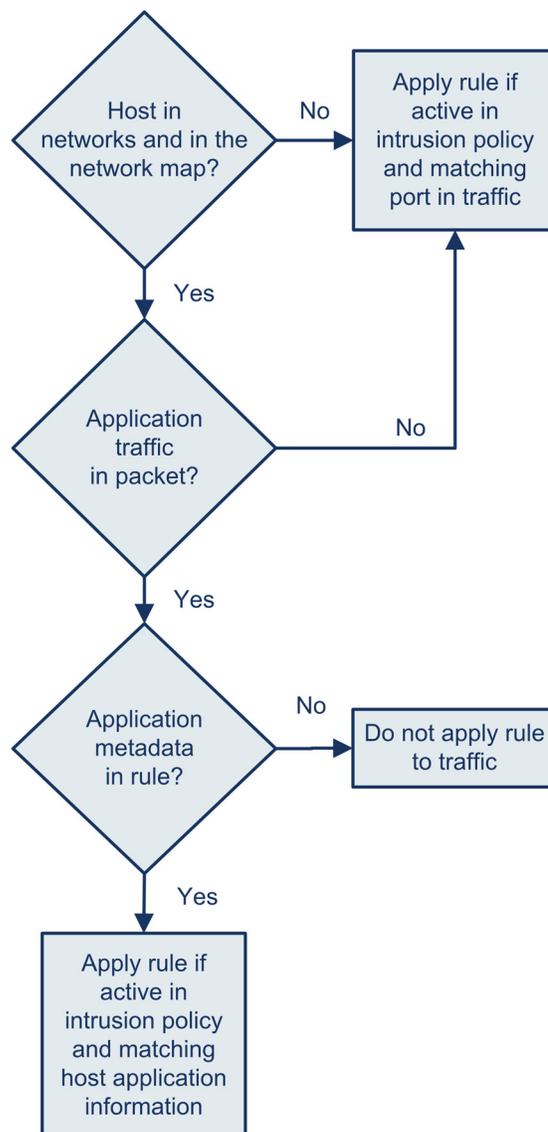

All other characters are permitted.

Adding service Metadata

LICENSE: Protection

The rules engine applies active rules with `service` metadata that match the application protocol information for the host in a packet to analyze and process traffic. If it does not match, the system does not apply the rule to the traffic. If a host does not have application protocol information, or if the rule does not have `service` metadata, the system checks the port in the traffic against the port in the rule to determine whether to apply the rule to the traffic.

The following diagram illustrates matching a rule to traffic based on application information:

To match a rule with an identified application protocol, you must define the `metadata` keyword and a *key value* statement, with `service` as the *key* and an application for the *value*. For example, the following *key value* statement in a `metadata` keyword associates the rule with HTTP traffic:

```
service http
```

The [service Values](#) table describes the most common application values.

IMPORTANT! Contact Sourcefire Support for assistance in defining applications not in the [service Values](#) table.

service Values

VALUE	DESCRIPTION
dcerpc	Distributed Computing Environment/Remote Procedure Calls System
dns	Domain Name System
finger	Finger user information protocol
ftp	File Transfer Protocol
ftp-data	File Transfer Protocol (Data Channel)
http	Hypertext Transfer Protocol
imap	Internet Message Access Protocol
isakmp	Internet Security Association and Key Management Protocol
netbios-dgm	NETBIOS Datagram Service
netbios-ns	NETBIOS Name Service
netbios-ssn	NETBIOS Session Service
nntp	Network News Transfer Protocol
oracle	Oracle Net Services
pop2	Post Office Protocol, version 2
pop3	Post Office Protocol, version 3

service Values (Continued)

VALUE	DESCRIPTION
smtp	Simple Mail Transfer Protocol
ssh	Secure Shell network protocol
telnet	Telnet network protocol
tftp	Trivial File Transfer Protocol
x11	X Window System

Avoiding Reserved Metadata

LICENSE: Protection

Avoid using the following words in a `metadata` keyword, either as a single argument or as the key in a *key value* statement; these are reserved for use by the VRT:

- application
- engine
- impact_flag
- os
- policy
- rule-type
- rule-flushing
- soid

IMPORTANT! Contact Sourcefire Support for assistance in adding restricted metadata to local rules that might not otherwise function as expected. See [Importing Local Rule Files](#) on page 2080 for more information.

Searching for Rules with Metadata

LICENSE: Protection

To search for rules that use the `metadata` keyword, select the `metadata` keyword on the rules Search page and, optionally, type any portion of the metadata. For example, you can type:

- `author` to display all rules where you have used `author` for `key`.
- `author snortguru` to display all rules where you have used `author` for `key` and `SnortGuru` for `value`.
- `author s` to display all rules where you have used `author` for `key` and any terms such as `SnortGuru` or `SnortUser1` or `SnortUser2` for `value`.

TIP! When you search for both `key` and `value`, use the same connecting operator (equal to [=] or a space character) in searches that is used in the `key value` statement in the rule; searches return different results depending on whether you follow `key` with equal to (=) or a space character.

Note that regardless of the format you use to add metadata, the system interprets your metadata search term as all or part of a `key value` or `key=value` statement. For example, the following would be valid metadata that does not follow a `key value` or `key=value` format:

```
ab cd ef gh
```

However, the system would interpret each space in the example as a separator between a key and value. Thus, you could successfully locate a rule containing the example metadata using any of the following searches for juxtaposed and single terms:

```
cd ef
ef gh
ef
```

but you would not locate the rule using the following search, which the system would interpret as a single `key value` statement:

```
ab ef
```

For more information, see [Searching for Rules](#) on page 1189.

Setting a Red (Level 1) Impact Flag

LICENSE: Protection

You can use the following reserved `key value` statement in a `metadata` keyword:

```
impact_flag red
```

This `key value` statement sets the impact flag to red (level 1) for a local rule you import or a custom rule you create using the rule editor.

Note that when the Sourcefire Vulnerability Research Team (VRT) includes the `impact_flag red` statement in a rule provided by Sourcefire, VRT has

determined that a packet triggering the rule indicates that the source or destination host is potentially compromised by a virus, trojan, or other piece of malicious software. See [Using Impact Flags to Evaluate Events](#) on page 641 for more information.

Inspecting IP Header Values

LICENSE: Protection

You can use keywords to identify possible attacks or security policy violations in the IP headers of packets. See the following sections for more information:

- [Inspecting Fragments and Reserved Bits](#) on page 1101
- [Inspecting the IP Header Identification Value](#) on page 1102
- [Identifying Specified IP Options](#) on page 1102
- [Identifying Specified IP Protocol Numbers](#) on page 1103
- [Inspecting a Packet's Type of Service](#) on page 1103
- [Inspecting a Packet's Time-To-Live Value](#) on page 1103

Inspecting Fragments and Reserved Bits

LICENSE: Protection

The `fragbits` keyword inspects the fragment and reserved bits in the IP header. You can check each packet for the Reserved Bit, the More Fragments bit, and the Don't Fragment bit in any combination.

Fragbits Argument Values

ARGUMENT	DESCRIPTION
R	Reserved bit
M	More Fragments bit
D	Don't Fragment bit

To further refine a rule using the `fragbits` keyword, you can specify any operator described in the [Fragbit Operators](#) table after the argument value in the rule.

Fragbit Operators

OPERATOR	DESCRIPTION
plus sign (+)	The packet must match against all specified bits.

Fragbit Operators (Continued)

OPERATOR	DESCRIPTION
asterisk (*)	The packet can match against any of the specified bits.
exclamation point (!)	The packet meets the criteria if none of the specified bits are set.

For example, to generate an event against packets that have the Reserved Bit set (and possibly any other bits), use `R+` as the `fragbits` value.

Inspecting the IP Header Identification Value

LICENSE: Protection

The `id` keyword tests the IP header fragment identification field against the value you specify in the keyword's argument. Some denial-of-service tools and scanners set this field to a specific number that is easy to detect. For example, in SID 630, which detects a Synscan portscan, the `id` value is set to `39426`, the static value used as the ID number in packets transmitted by the scanner.

IMPORTANT! `id` argument values must be numeric.

Identifying Specified IP Options

LICENSE: Protection

The `IPopts` keyword allows you to search packets for specified IP header options. The [IPoption Arguments](#) table lists the available argument values.

IPoption Arguments

ARGUMENT	DESCRIPTION
rr	record route
eol	end of list
nop	no operation
ts	time stamp
sec	IP security option
lsrr	loose source routing

IPoption Arguments (Continued)

ARGUMENT	DESCRIPTION
ssrr	strict source routing
satid	stream identifier

Analysts most frequently watch for strict and loose source routing because these options may be an indication of a spoofed source IP address.

Identifying Specified IP Protocol Numbers

LICENSE: Protection

The `ip_proto` keyword allows you to identify packets with the IP protocol specified as the keyword's value. You can specify the IP protocols as a number, 0 through 255. You can find the complete list of protocol numbers at <http://www.iana.org/assignments/protocol-numbers>. You can combine these numbers with the following operators: `<`, `>`, or `!`. For example, to inspect traffic with any protocol that is not ICMP, use `!1` as a value to the `ip_proto` keyword. You can also use the `ip_proto` keyword multiple times in a single rule; note, however, that the rules engine interprets multiple instances of the keyword as having a Boolean AND relationship. For example, if you create a rule containing `ip_proto:!3; ip_proto:!6`, the rule ignores traffic using the GGP protocol AND the TCP protocol.

Inspecting a Packet's Type of Service

LICENSE: Protection

Some networks use the type of service (ToS) value to set precedence for packets traveling on that network. The `tos` keyword allows you to test the packet's IP header ToS value against the value you specify as the keyword's argument. Rules using the `tos` keyword will trigger on packets whose ToS is set to the specified value and that meet the rest of the criteria set forth in the rule.

IMPORTANT! Argument values for `tos` must be numeric.

The ToS field has been deprecated in the IP header protocol and replaced with the Differentiated Services Code Point (DSCP) field.

Inspecting a Packet's Time-To-Live Value

LICENSE: Protection

A packet's time-to-live (ttl) value indicates how many hops it can make before it is dropped. You can use the `ttl` keyword to test the packet's IP header ttl value against the value, or range of values, you specify as the keyword's argument. It

may be helpful to set the `tT1` keyword parameter to a low value such as 0 or 1, as low time-to-live values are sometimes indicative of a traceroute or intrusion evasion attempt. (Note, though, that the appropriate value for this keyword depends on your managed device placement and network topology.) Use syntax as follows:

- Use an integer from 0 to 255 to set a specific value for the TTL value. You can also precede the value with an equal (=) sign (for example, you can specify 5 or =5).
- Use a hyphen (-) to specify a range of TTL values (for example, 0-2 specifies all values 0 through 2, -5 specifies all values 0 through 5, and 5- specifies all values 5 through 255).
- Use the greater than (>) sign to specify TTL values greater than a specific value (for example, >3 specifies all values greater than 3).
- Use the greater than and equal to signs (>=) to specify TTL values greater than or equal to a specific value (for example, >=3 specifies all values greater than or equal to 3).
- Use the less than (<) sign to specify TTL values less than a specific value (for example, <3 specifies all values less than 3).
- Use the less than and equal to signs (<=) to specify TTL values less than or equal to a specific value (for example, <=3 specifies all values less than or equal to 3).

Inspecting ICMP Header Values

LICENSE: Protection

The Sourcefire 3D System supports keywords that you can use to identify attacks and security policy violations in the headers of ICMP packets. Note, however, that predefined rules exist that detect most ICMP types and codes. Consider enabling an existing rule or creating a local rule based on an existing rule; you may be able to find a rule that meets your needs more quickly than if you build an ICMP rule from scratch.

See the following sections for more information about ICMP-specific keywords:

- [Identifying Static ICMP ID and Sequence Values](#) on page 1104
- [Inspecting the ICMP Message Type](#) on page 1105
- [Inspecting the ICMP Message Code](#) on page 1105

Identifying Static ICMP ID and Sequence Values

LICENSE: Protection

The ICMP identification and sequence numbers help associate ICMP replies with ICMP requests. In normal traffic, these values are dynamically assigned to packets. Some covert channel and Distributed Denial of Server (DDoS) programs use static ICMP ID and sequence values. The following keywords allow you to identify ICMP packets with static values.

icmp_id

The `icmp_id` keyword inspects an ICMP echo request or reply packet's ICMP ID number. Use a numeric value that corresponds with the ICMP ID number as the argument for the `icmp_id` keyword.

icmp_seq

The `icmp_seq` keyword inspects an ICMP echo request or reply packet's ICMP sequence. Use a numeric value that corresponds with the ICMP sequence number as the argument for the `icmp_seq` keyword.

Inspecting the ICMP Message Type

LICENSE: Protection

Use the `i type` keyword to look for packets with specific ICMP message type values. You can specify either a valid ICMP type value (see <http://www.iana.org/assignments/icmp-parameters> or <http://www.faqs.org/rfcs/rfc792.html> for a full list of ICMP type numbers) or an invalid ICMP type value to test for different types of traffic. For example, attackers may set ICMP type values out of range to cause denial of service and flooding attacks.

You can specify a range for the `i type` argument value using less than (<) and greater than (>).

For example:

- <35
- >36
- 3<>55

TIP! See <http://www.iana.org/assignments/icmp-parameters> or <http://www.faqs.org/rfcs/rfc792.html> for a full list of ICMP type numbers.

Inspecting the ICMP Message Code

LICENSE: Protection

ICMP messages sometimes include a code value that provides details when a destination is unreachable. (See the second section in <http://www.iana.org/assignments/icmp-parameters> for a full list of ICMP message codes correlated with the message types for which they can be used.)

You can use the `i code` keyword to identify packets with specific ICMP code values. You can choose to specify either a valid ICMP code value or an invalid ICMP code value to test for different types of traffic.

You can specify a range for the `i code` argument value using less than (<) and greater than (>).

For example:

- to find values less than 35, specify `<35`.
- to find values greater than 36, specify `>36`.
- to find values between 3 and 55, specify `3<>55`.

TIP! You can use the `icode` and `itype` keywords together to identify traffic that matches both. For example, to identify ICMP traffic that contains an ICMP Destination Unreachable code type with an ICMP Port Unreachable code type, specify an `itype` keyword with a value of 3 (for Destination Unreachable) and an `icode` keyword with a value of 3 (for Port Unreachable).

Inspecting TCP Header Values and Stream Size

LICENSE: Protection

The Sourcefire 3D System supports keywords that are designed to identify attacks attempted using TCP headers of packets and TCP stream size. See the following sections for more information about TCP-specific keywords:

- [Inspecting the TCP Acknowledgement Value](#) on page 1106
- [Inspecting TCP Flag Combinations](#) on page 1107
- [Applying Rules to a TCP or UDP Client or Server Flow](#) on page 1108
- [Identifying Static TCP Sequence Numbers](#) on page 1110
- [Identifying TCP Windows of a Given Size](#) on page 1110
- [Identifying TCP Streams of a Given Size](#) on page 1111

Inspecting the TCP Acknowledgement Value

LICENSE: Protection

You can use the `ack` keyword to compare a value against a packet's TCP acknowledgement number. The rule triggers if a packet's TCP acknowledgement number matches the value specified for the `ack` keyword.

Argument values for `ack` must be numeric.

Inspecting TCP Flag Combinations

LICENSE: Protection

You can use the `flags` keyword to specify any combination of TCP flags that, when set in an inspected packet, cause the rule to trigger.

IMPORTANT! In situations where you would traditionally use `A+` as the value for `flags`, you should instead use the `flow` keyword with a value of `established`. Generally, you should use the `flow` keyword with a value of `stateless` when using flags to ensure that all combinations of flags are detected. See [Applying Rules to a TCP or UDP Client or Server Flow](#) on page 1108 for more information about the `flow` keyword.

You can specify the values described in the [flag Arguments](#) table for the `flag` keyword.

flag Arguments

ARGUMENT	TCP FLAG
Ack	Acknowledges data.
Psh	Data should be sent in this packet.
Syn	A new connection.
Urg	Packet contains urgent data.
Fin	A closed connection.
Rst	An aborted connection.
CWR	An ECN congestion window has been reduced. This was formerly the R1 argument, which is still supported for backward compatibility.
ECE	ECN echo. This was formerly the R2 argument, which is still supported for backward compatibility.

TIP! For more information on Explicit Congestion Notification (ECN), see the information provided at: <http://www.faqs.org/rfcs/rfc3168.html>.

When using the `flags` keyword, you can use an operator to indicate how the system performs matches against multiple flags. The [Operators Used with flags](#) table describes these operators.

Operators Used with flags

OPERATOR	DESCRIPTION	EXAMPLE
all	The packet must contain all specified flags.	Select <code>urg</code> and <code>all</code> to specify that a packet must contain the Urgent flag and may contain any other flags.
any	The packet can contain any of the specified flags.	Select <code>ack</code> , <code>psh</code> , and <code>any</code> to specify that either or both the <code>ack</code> and <code>psh</code> flags must be set to trigger the rule, and that other flags may also be set on a packet.
not	The packet must not contain the specified flag set.	Select <code>urg</code> and <code>not</code> to specify that the Urgent flag is not set on packets that trigger this rule.

Applying Rules to a TCP or UDP Client or Server Flow

LICENSE: Protection

You can use the `flow` keyword to select packets for inspection by a rule based on session characteristics. The `flow` keyword allows you to specify the direction of the traffic flow to which a rule applies, applying rules to either the client flow or server flow. To specify how the `flow` keyword inspects your packets, you can set the direction of traffic you want analyzed, the state of packets inspected, and whether the packets are part of a rebuilt stream.

Stateful inspection of packets occurs when rules are processed. If you want a TCP rule to ignore stateless traffic (traffic without an established session context), you must add the `flow` keyword to the rule and select the **Established** argument for the keyword. If you want a UDP rule to ignore stateless traffic, you must add the `flow` keyword to the rule and select either the **Established** argument or a directional argument, or both. This causes the TCP or UDP rule to perform stateful inspection of a packet.

When you add a directional argument, the rules engine inspects only those packets that have an established state with a flow that matches the direction specified. For example, if you add the `flow` keyword with the **established** argument and the `From Client` argument to a rule that triggers when a TCP or UDP connection is detected, the rules engine only inspects packets that are sent from the client.

TIP! For maximum performance, always include a `flow` keyword in a TCP rule or a UDP session rule.

To specify flow, select the `f1ow` keyword from the **Detection Options** list on the Create Rule page and click **Add Option**. Next, select the arguments from the list provided for each field.

The [State-Related flow Arguments](#) table describes the stream-related arguments you can specify for the `f1ow` keyword:

State-Related flow Arguments

ARGUMENT	DESCRIPTION
Established	Triggers on established connections.
Stateless	Triggers regardless of the state of the stream processor.

The [flow Directional Arguments](#) table describes the directional options you can specify for the `f1ow` keyword:

flow Directional Arguments

ARGUMENT	DESCRIPTION
To Client	Triggers on server responses.
To Server	Triggers on client responses.
From Client	Triggers on client responses.
From Server	Triggers on server responses.

Notice that `From Server` and `To Client` perform the same function, as do `To Server` and `From Client`. These options exist to add context and readability to the rule. For example, if you create a rule designed to detect an attack from a server to a client, use `From Server`. But, if you create a rule designed to detect an attack from the client to the server, use `From Client`.

The [Stream-Related flow Arguments](#) table describes the stream-related arguments you can specify for the `flow` keyword:

Stream-Related flow Arguments

ARGUMENT	DESCRIPTION
Ignore Stream Traffic	Does not trigger on rebuilt stream packets.
Only Stream Traffic	Triggers only on rebuilt stream packets.

To use the `Established` and `only stream traffic` arguments in TCP or UDP stream preprocessing rules, TCP or UDP stream preprocessing must be enabled as needed. When the required preprocessor is disabled and you enable rules that include these arguments, you are prompted whether to enable the required TCP or UDP preprocessor when you save the policy. See [Using TCP Stream Preprocessing](#) on page 940 and [Reassembling TCP Streams](#) on page 949 for information about using TCP stream preprocessing. See [Using UDP Stream Preprocessing](#) on page 956 for information about using UDP stream preprocessing. See [Automatically Enabling Advanced Settings](#) on page 787 for more information on automatically enabling processors.

For example, you can use `To Server`, `Established`, `only stream traffic` as the value for the `flow` keyword to detect traffic, traveling from a client to the server in an established session, that has been reassembled by the stream preprocessor.

Identifying Static TCP Sequence Numbers

LICENSE: Protection

The `seq` keyword allows you to specify a static sequence number value. Packets whose sequence number matches the specified argument trigger the rule containing the keyword. While this keyword is used rarely, it is helpful in identifying attacks and network scans that use generated packets with static sequence numbers.

Identifying TCP Windows of a Given Size

LICENSE: Protection

You can use the `window` keyword to specify the TCP window size you are interested in. A rule containing this keyword triggers whenever it encounters a packet with the specified TCP window size. While this keyword is used rarely, it is helpful in identifying attacks and network scans that use generated packets with static TCP window sizes.

Identifying TCP Streams of a Given Size

LICENSE: Protection

You can use the `stream_size` keyword in conjunction with the stream preprocessor to determine the size in bytes of a TCP stream, using the format:

direction, operator, bytes

where *bytes* is number of bytes.

Note that you must separate each option in the argument with a comma (,).

TCP stream preprocessing must be enabled to use the `stream_size` keyword in a rule. See [Using TCP Stream Preprocessing](#) on page 940 for more information. When TCP stream preprocessing is disabled and you enable rules that use this keyword, you are prompted whether to enable TCP stream preprocessing when you save the policy. See [Automatically Enabling Advanced Settings](#) on page 787 for more information.

The [stream_size Keyword Directional Arguments](#) table describes the case-insensitive directional options you can specify for the `stream_size` keyword:

stream_size Keyword Directional Arguments

ARGUMENT	DESCRIPTION
client	triggers on a stream from the client matching the specified stream size.
server	triggers on a stream from the server matching the specified stream size.
both	triggers on traffic from the client and traffic from the server both matching the specified stream size. For example, the argument <code>both, >, 200</code> would trigger when traffic from the client is greater than 200 bytes AND traffic from the server is greater than 200 bytes.
either	triggers on traffic from either the client or the server matching the specified stream size, whichever occurs first. For example, the argument <code>either, >, 200</code> would trigger when traffic from the client is greater than 200 bytes OR traffic from the server is greater than 200 bytes.

The [stream_size Keyword Argument Operators](#) table describes the operators you can use with the `stream_size` keyword:

stream_size Keyword Argument Operators

OPERATOR	DESCRIPTION
=	equal to
!=	not equal to
>	greater than
<	less than
>=	greater than or equal to
<=	less than or equal to

For example, you could use `client, >=, 5001216` as the argument for the `stream_size` keyword to detect a TCP stream traveling from a client to a server and greater than or equal to 5001216 bytes.

Enabling and Disabling TCP Stream Reassembly

LICENSE: Protection

You can use the `stream_reassemble` keyword to enable or disable TCP stream reassembly for a single connection when inspected traffic on the connection matches the conditions of the rule. Optionally, you can use this keyword multiple times in a rule.

Use the following syntax to enable or disable stream reassembly:

`enable|disable, server|client|both, option, option`

The [stream_reassemble Optional Arguments](#) table describes the optional arguments you can use with the `stream_reassemble` keyword.

stream_reassemble Optional Arguments

ARGUMENT	DESCRIPTION
noalert	Generate no events regardless of any other detection options specified in the rule.
fastpath	Ignore the rest of the connection traffic when there is a match.

For example, the following rule disables TCP client-side stream reassembly without generating an event on the connection where a 200 OK status code is detected in an HTTP response:

```
alert tcp any 80 -> any any (flow:to_client, established;  
content: "200 OK"; stream_reassemble:disable, client,  
noalert
```

Note that the TCP stream preprocessor must be enabled to allow processing of rules using the `stream_reassemble` keyword. When the TCP stream preprocessor is disabled and you enable rules that use this keyword, you are prompted whether to enable the preprocessor when you save the policy. See [Automatically Enabling Advanced Settings](#) on page 787.

To use `stream_reassemble`:

ACCESS: Admin/Intrusion Admin

- ▶ On the Create Rule page, select `stream_reassemble` in the drop-down list and click **Add Option**.

The `stream_reassemble` section appears.

Extracting SSL Information from a Session

LICENSE: Protection

You can use SSL rule keywords to invoke the Secure Sockets Layer (SSL) preprocessor and extract information about SSL version and session state from packets in an encrypted session.

When a client and server communicate to establish an encrypted session using SSL or Transport Layer Security (TLS), they exchange handshake messages. Although the data transmitted in the session is encrypted, the handshake messages are not.

The SSL preprocessor extracts state and version information from specific handshake fields. Two fields within the handshake indicate the version of SSL or TLS used to encrypt the session and the stage of the handshake.

For more information, see the following sections:

- [ssl_state](#) on page 1113
- [ssl_version](#) on page 1115

ssl_state

LICENSE: Protection

The `ssl_state` keyword can be used to match against state information for an encrypted session. To check for two or more SSL versions used simultaneously, use multiple `ssl_version` keywords in a rule.

When a rule uses the `ssl_state` keyword, the rules engine invokes the SSL preprocessor to check traffic for SSL state information.

For example, to detect an attacker's attempt to cause a buffer overflow on a server by sending a `clientHello` message with an overly long challenge length and too much data, you could use the `ssl_state` keyword with `client_hello` as an argument then check for abnormally large packets.

Use a comma-separated list to specify multiple arguments for the SSL state. When you list multiple arguments, the system evaluates them using the OR operator. For example, if you specify `client_hello` and `server_hello` as arguments, the system evaluates the rule against traffic that has a `client_hello` OR a `server_hello`.

You can also negate any argument; for example:

```
!client_hello, !unknown
```

To ensure the connection has reached each of a set of states, multiple rules using the `ssl_state` rule option should be used.

Note that the SSL preprocessor must be enabled to allow processing of rules using the `ssl_state` keyword. When the SSL preprocessor is disabled and you enable rules that use this keyword, you are prompted whether to enable the preprocessor when you save the policy. See [Automatically Enabling Advanced Settings](#) on page 787.

The `ssl_state` keyword takes the following identifiers as arguments:

ssl_state Arguments

ARGUMENT	PURPOSE
<code>client_hello</code>	Matches against a handshake message with <code>clientHello</code> as the message type, where the client requests an encrypted session.
<code>server_hello</code>	Matches against a handshake message with <code>serverHello</code> as the message type, where the server responds to the client's request for an encrypted session.
<code>client_keyx</code>	Matches against a handshake message with <code>clientKeyExchange</code> as the message type, where the client transmits a key to the server to confirm receipt of a key from the server.
<code>server_keyx</code>	Matches against a handshake message with <code>serverKeyExchange</code> as the message type, where the client transmits a key to the server to confirm receipt of a key from the server.
<code>unknown</code>	Matches against any handshake message type.

ssl_version

LICENSE: Protection

The `ssl_version` keyword can be used to match against version information for an encrypted session. When a rule uses the `ssl_version` keyword, the rules engine invokes the SSL preprocessor to check traffic for SSL version information.

For example, if you know there is a buffer overflow vulnerability in SSL version 2, you could use the `ssl_version` keyword with the `sslv2` argument to identify traffic using that version of SSL.

Use a comma-separated list to specify multiple arguments for the SSL version. When you list multiple arguments, the system evaluates them using the OR operator. For example, if you wanted to identify any encrypted traffic that was not using SSLv2, you could add `ssl_version:ssl_v3,tls1.0,tls1.1,tls1.2` to a rule. The rule would evaluate any traffic using SSL Version 3, TLS Version 1.0, TLS Version 1.1, or TLS Version 1.2.

Note that the SSL preprocessor must be enabled to allow processing of rules using the `ssl_version` keyword. When the SSL preprocessor is disabled and you enable rules that use this keyword, you are prompted whether to enable the preprocessor when you save the policy. See [Automatically Enabling Advanced Settings](#) on page 787.

The `ssl_version` keyword takes the following SSL/TLS version identifiers as arguments:

ssl_version Arguments

ARGUMENT	PURPOSE
<code>sslv2</code>	Matches against traffic encoded using Secure Sockets Layer (SSL) Version 2.
<code>sslv3</code>	Matches against traffic encoded using Secure Sockets Layer (SSL) Version 3.
<code>tls1.0</code>	Matches against traffic encoded using Transport Layer Security (TLS) Version 1.0.
<code>tls1.1</code>	Matches against traffic encoded using Transport Layer Security (TLS) Version 1.1.
<code>tls1.2</code>	Matches against traffic encoded using Transport Layer Security (TLS) Version 1.2.

Inspecting Application Layer Protocol Values

LICENSE: Protection

Although preprocessors perform most of the normalization and inspection of application layer protocol values, you can continue to inspect application layer values using the keywords described in the following sections:

- [RPC](#) on page 1116
- [ASN.1](#) on page 1117
- [urilen](#) on page 1118
- [DCE/RPC Keywords](#) on page 1119
- [SIP Keywords](#) on page 1125
- [GTP Keywords](#) on page 1128
- [Modbus Keywords](#) on page 1145
- [DNP3 Keywords](#) on page 1148

RPC

LICENSE: Protection

The `rpc` keyword identifies Open Network Computing Remote Procedure Call (ONC RPC) services in TCP or UDP packets. This allows you to detect attempts to identify the RPC programs on a host. Intruders can use an RPC portmapper to determine if any of the RPC services running on your network can be exploited. They can also attempt to access other ports running RPC without using portmapper. The [rpc Keyword Arguments](#) table lists the arguments that the `rpc` keyword accepts.

rpc Keyword Arguments

ARGUMENT	DESCRIPTION
application	The RPC application number
procedure	The RPC procedure invoked
version	The RPC version

To specify the arguments for the `rpc` keyword, use the following syntax:

application, procedure, version
