

Cisco TelePresence Supervisor MSE 8050 2.3(1.46)

Software Maintenance Release Notes
August 2015

Product Documentation

The following documents provide guidance on installation, initial configuration, and operation of the product:

- [Cisco TelePresence Supervisor MSE 8050 Getting started](#)

New Feature in 2.3(1.46)

Support for a new TelePresence Server Platform

This release introduces support for a new TelePresence Server platform – Multiparty Media 820. Media 820 is a new blade for MSE 8000 chassis. Supervisor 2.3(1.46) is required to support and cluster Media 820 blades.

New Features in 2.3

- Conversion of media port and TelePresence Server screen licenses
- Mutual authentication
- Certificate-based login
- QoS tagging support for administration packets
- Configurable headers and footers
- Web interface changes

Conversion of Media Port and TelePresence Server Screen Licenses

This release introduces an optional feature that allows you to temporarily convert media port licenses to TelePresence Server screen licenses and vice versa. For example, you can allocate media port licenses to a Cisco TelePresence Server 7010 Blade (up to the port limit of the blade), thus temporarily converting the media port licenses to TelePresence Server screen licenses. Licenses are converted with a ratio of 1 TelePresence Server-screen license to 5 media port licenses. Conversions round up to meet the required number of licenses.

This feature requires the “TS screen migration option” feature key. Contact your Cisco representative for advice on obtaining this feature key. To enable the feature, you install the feature key in the **License key management** section on the **Port licenses > License summary** page.

64-Character User IDs

Supervisor can now accept and store usernames that are 64 Unicode characters long. This applies anywhere that the Supervisor can accept a username, that is, from the web interface, an API call, or a client certificate's common name.

Tighter Password Security

Supervisor never stores passwords in plain text. They are always hashed using the SHA-1 algorithm before they are stored, even if an unhashed password is provided in a configuration file.

Changing passwords is also more secure now irrespective of whether or not advanced security mode is enabled. When a user password changes, all session cookies associated with that username will immediately expire. Any users who are logged in when their passwords change will be logged out and may only log in with the new password.

Mutual Authentication

Supervisor now supports certificate-based user authentication over HTTPS using mutual TLS authentication between certificates on the user (client) side and certificates held in an HTTPS trust store on Supervisor. Certificates are managed through the new **Network > SSL certificates** page.

Chained certificates are supported. Supervisor checks the client certificate chain against its own trust store; if the certificate is trusted, Supervisor can optionally also perform an OSCP (Online Certificate Status Protocol) check of the leaf certificate.

Certificate-Based Login

Certificate-based login can be configured as an optional or required alternative to password-based login. With certificate-based login, Supervisor MSE 8050 checks the usernames in its configuration file for a match to the common name in the client certificate. If a match exists, the user who presents the certificate is automatically logged in without entering a username and password.

CAUTION: When setting certificate-based authentication options for Supervisor, it is possible inadvertently to block all login access (including administrators) to the application. If you decide to implement certificate-based authentication, we strongly recommend that you first review the topics “**Configuring SSL certificates**” and “**Transitioning to certificate-based security**” in the Supervisor online help.

Table 1 Certificate authentication options, listed from lowest to highest security level:

1	Not required	Default. No client-side authentication is required and certificates are irrelevant to Supervisor. All incoming connections are permitted, even if the remote end does not present a valid and trusted certificate (the remote end is always trusted). Password-based login is the sole authentication mechanism over all user interface connection methods (HTTPS, HTTP, FTP, and the console serial port).
2	Verify certificate	Incoming HTTPS connections are only permitted if the remote end has a trusted certificate. Password-based login is required over HTTPS. Password-based login is allowed as normal over HTTP, FTP, and console connections.
3	Certificate-based authentication allowed	Incoming HTTPS connections are only permitted if the remote end has a trusted certificate. Certificate-based login is allowed over HTTPS. If the certificate common name matches a username, the user is logged in automatically. If no match exists, password-based login is required instead. Password-based login is allowed as normal over HTTP, FTP, and console connections.
4	Certificate-based authentication required	Incoming HTTPS connections are only permitted if the remote end has a trusted certificate. Certificate-based login is required over HTTPS <i>and</i> all other connection types. No password login is allowed and HTTP, FTP, and console connections are effectively disabled (except for functions that do not require login).

Effect of Certificate-Based User Authentication on the API

If certificate-based login is allowed, the standard authentication parameters (`authenticationUser` and `authenticationPassword`) are required in API messages only if the client certificate is insufficient for login purposes. If certificate-based login is required, the parameters are ignored altogether and a client certificate must be used for login purposes, meaning only HTTPS access is possible.

OCSP Checking

Supervisor optionally supports OCSP (using SHA-1 hashing) for real-time checking of HTTPS client certificate revocation status against a pre-configured server. If the status response from the OCSP server is anything other than 'good', Supervisor rejects the certificate and prevents authentication. OCSP settings can be configured to require nonce inclusion, and to define clock skew limits and acceptable ages for OCSP records.

Static Certificate Revocation Lists are not supported.

CAUTION: If you enable OCSP checking for Supervisor, it is possible inadvertently to block all login access (including administrators) to the application. If you decide to implement OCSP checking, we strongly recommend that you first review the topics “**Configuring SSL certificates**” and “**Transitioning to certificate-based security**” in the Supervisor online help.

QoS Tagging Support for Administration Packets

This release allows administrators to set their own values for Quality of Service (QoS) bits for administration data packets, including HTTP, HTTPS, FTP, DNS, syslog, OCSP, and NTP traffic.

QoS is set as a six-bit binary value that can be interpreted by networks as either Type of Service (ToS) or Differentiated Services (DiffServ). The online help provides more information about setting the QoS bits.

Configurable Headers and Footers

Header and footer text (up to 100 characters each) can now be configured for the web user interface. Headers and footers will appear on all pages except the online help.

Web Interface Changes

- Network Routes and DNS web pages have been updated. The DNS preference drop-down menu is renamed to "DNS configuration", and routes lists are rearranged and split into "IPv4 routes" and "IPv6 routes".
- The Supervisor has a new **Network > QoS** page to manage QoS tagging of data packets.
- The Supervisor has a new **Network > Connectivity** page that enables administrators to 'ping' other devices.
- The Supervisor has new help topics that provide more information on the new and updated UI pages.

Miscellaneous Changes

- Web status pages (such as **Status > General** or **Hardware > Blades**) no longer auto-refresh by default. You can manually specify an auto-refresh interval on the **Settings > User interface** page.

Resolved and Open Issues in 2.3(1.46)

Use the links below to find up-to-date information about issues resolved since version 2.3(1.38), and open issues in this version, in the Cisco Bug Search Tool.

Issue Type	Link
Resolved Issues	https://tools.cisco.com/bugsearch/search?kw=*&pf=prdNm&pfVal=283645291&rls=2.3%281.46%29&sb=fr&srtBy=byRel&bt=custV
Open Issues	https://tools.cisco.com/bugsearch/search?kw=*&pf=prdNm&pfVal=283645291&rls=2.3%281.46%29&sb=af&srtBy=byRel&bt=custV
Resolved and open issues	https://tools.cisco.com/bugsearch/search?kw=*&pf=prdNm&pfVal=283645291&rls=2.3%281.46%29&sb=anfr&srtBy=byRel&bt=custV

Limitations

Firefox 14 is not supported for use with the MSE 8050. We strongly recommend that you refrain from using Firefox 14 to access the Supervisor web interface. This version of the browser causes an issue that was not present in previous browser versions and which has been fixed in the following version (Firefox 15).

Interoperability

The interoperability test results for this product are posted to <http://www.cisco.com/go/tp-interop>, where you can also find interoperability test results for other Cisco TelePresence products.

Upgrading to version 2.3

Prerequisites and Software Dependencies

The software upgrade requires a restart of the hardware. Notify any users who may be affected by a temporary loss of service.

Back up the Supervisor's configuration before you start – you may need to roll back your upgrade.

CAUTION: You must back up your configuration before upgrading to version 2.3.

You must also remember the administrator user name and password for the backup configuration. You will need these if you ever need to make use of this backup file.

We also recommend that you back up the audit logs.

Upgrade Instructions

1. Unzip the image file
2. Browse to the IP address of the MSE 8050
3. Log in as an administrator
4. Go to **Settings > Upgrade**
5. In the **Main software image** section, type in, or browse to the software image file
6. Click **Upgrade software image**
The web browser uploads the file and displays a progress window. Do not navigate away from or refresh the web page during upload.
When the upload completes, the status window displays an upload success message.
7. Close the status window
8. The web interface reminds you that you need to restart the Supervisor to complete the upgrade
9. Click the **Shutdown** button, then click the **Confirm** button
10. Click the **Restart** button
The Supervisor upgrades itself using the software image you uploaded, and the browser displays a restart in progress message.
11. Wait for a few minutes and then go to the status page to check the software version. You may need to log in again

Note: If you have been logged out due to inactivity, log in again as admin, go to **Settings > Shutdown**, and then click Restart MSE Supervisor and upgrade to complete the upgrade.

The progress of the upgrade can be monitored through the serial port.

Downgrade Instructions

If you need to reverse your upgrade, you can re-install the former version of the software.

Note: We do not support downgrading to MSE 8050 versions earlier than 2.0. The compulsory password protection included from that version onwards makes it impossible to log in to the MSE 8050 after a downgrade to an earlier version. If you are experiencing these circumstances, visit the [Cisco support website](#).

The downgrade procedure is the same as the upgrade procedure except you will use the earlier software image.

You need the correct version of the software and your saved configuration before you proceed.

1. Follow the upgrade procedure using the earlier software image
2. Restart the hardware and check the status via the web interface
The status report indicates the software version.
3. Restore your configuration from the saved XML file

Using the Bug Search Tool

The Bug Search Tool contains information about open and resolved issues for this release and previous releases, including descriptions of the problems and available workarounds. The identifiers listed in these release notes will take you directly to a description of each issue.

To look for information about a specific problem mentioned in this document:

1. Using a web browser, go to the [Bug Search Tool](#).
2. Sign in with a cisco.com username and password.

3. Enter the bug identifier in the **Search** field and click **Search**.

To look for information when you do not know the identifier:

1. Type the product name in the **Search** field and click **Search**.
2. From the list of bugs that appears, use the **Filter** drop-down list to filter on either *Keyword*, *Modified Date*, *Severity*, *Status*, or *Technology*.

Use **Advanced Search** on the Bug Search Tool home page to search on a specific software version.

The Bug Search Tool help pages have further information on using the Bug Search Tool.

Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, using the Cisco Bug Search Tool (BST), submitting a service request, and gathering additional information, see What's New in Cisco Product Documentation at: www.cisco.com/c/en/us/td/docs/general/whatsnew/whatsnew.html.

Subscribe to What's New in Cisco Product Documentation, which lists all new and revised Cisco technical documentation, as an RSS feed and deliver content directly to your desktop using a reader application. The RSS feeds are a free service.

Document Revision History

Table 2 Supervisor release notes revisions

Date	Description
August 2015	Third maintenance release of Cisco TelePresence Supervisor MSE 8050. Version 2.3(1.46)
January 2015	Second maintenance release of Cisco TelePresence Supervisor MSE 8050. Version 2.3(1.38)
May 2014	First maintenance release of Cisco TelePresence Supervisor MSE 8050. Version 2.3(1.32)
December 2012	These notes accompany the release of Cisco TelePresence Supervisor MSE 8050, version 2.3 (1.31)

Cisco Legal Information

THE SPECIFICATIONS AND INFORMATION REGARDING THE PRODUCTS IN THIS MANUAL ARE SUBJECT TO CHANGE WITHOUT NOTICE. ALL STATEMENTS, INFORMATION, AND RECOMMENDATIONS IN THIS MANUAL ARE BELIEVED TO BE ACCURATE BUT ARE PRESENTED WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED. USERS MUST TAKE FULL RESPONSIBILITY FOR THEIR APPLICATION OF ANY PRODUCTS.

THE SOFTWARE LICENSE AND LIMITED WARRANTY FOR THE ACCOMPANYING PRODUCT ARE SET FORTH IN THE INFORMATION PACKET THAT SHIPPED WITH THE PRODUCT AND ARE INCORPORATED HEREIN BY THIS REFERENCE. IF YOU ARE UNABLE TO LOCATE THE SOFTWARE LICENSE OR LIMITED WARRANTY, CONTACT YOUR CISCO REPRESENTATIVE FOR A COPY.

The following information is for FCC compliance of Class A devices: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio-frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case users will be required to correct the interference at their own expense.

The following information is for FCC compliance of Class B devices: This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If the equipment causes interference to radio or television reception, which can be determined by turning the equipment off and on, users are encouraged to try to correct the interference by using one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

Modifications to this product not authorized by Cisco could void the FCC approval and negate your authority to operate the product.

The Cisco implementation of TCP header compression is an adaptation of a program developed by the University of California, Berkeley (UCB) as part of UCB's public domain version of the UNIX operating system. All rights reserved.
