`CharArray.subtract(other: Iterable<Char>): Set<Char>` {`val set = this.toMutableSet()``set.removeAll(other)``return set`}  
 Returns a mutable set containing all distinct elements from the given array. The returned set preserves the element iteration order of the original array.

`<T> Array<out T>.toMutableSet(): MutableSet<T>` {`val set = LinkedHashSet<T>(mapCapacity(size))``for (item in this) set.add(item)``return set`}  
 Returns a mutable set containing all distinct elements from the given array. The returned set preserves the element iteration order of the original array.

`ByteArray.toMutableSet(): MutableSet<Byte>` {`val set = LinkedHashSet<Byte>(mapCapacity(size))``for (item in this) set.add(item)``return set`}  
 Returns a mutable set containing all distinct elements from the given array. The returned set preserves the element iteration order of the original array.

`ShortArray.toMutableSet(): MutableSet<Short>` {`val set = LinkedHashSet<Short>(mapCapacity(size))``for (item in this) set.add(item)``return set`}

Accumulates value starting with the first element and applying `[operation]` from left to right to current accumulator value and each element. Returns null if the sequence is empty.

The operation is `_terminal_`.

`@sample samples.collections.Collections.Aggregates.reduceOrNull`

```

@SinceKotlin("1.3")

    var accumulator: S = iterator.next()
    while (iterator.hasNext()) {
        accumulator = operation(accumulator, iterator.next())
    }
    return accumulator
}

```

Returns a sequence containing successive accumulation values generated by applying `[operation]` from left to right to each element and current accumulator value that starts with `[initial]` value.

Note that ``acc`` value passed to `[operation]` function should not be mutated; otherwise it would affect the previous value in resulting sequence.

The `[initial]` value should also be immutable (or should not be mutated) as it may be passed to `[operation]` function later because of sequence's lazy nature.

`@param [operation]` function that takes current accumulator value and an element, and calculates the next accumulator value.

The operation is `_intermediate_` and `_stateless_`.

            yield(accumulator)
        }
    }
}

```

Returns a sequence containing successive accumulation values generated by applying `[operation]` from left to right to each element, its index in the original sequence and current accumulator value that starts with `[initial]` value.

Note that ``acc`` value passed to `[operation]` function should not be mutated; otherwise it would affect the previous value in resulting sequence.

The `[initial]` value should also be immutable (or should not be mutated) as it may be passed to `[operation]` function later because of sequence's lazy nature.

Returns a sequence containing successive accumulation values generated by applying `[operation]` from left to right to each element and current accumulator value that starts with the first element of this sequence.

Note that ``acc`` value passed to `[operation]` function should not be mutated; otherwise it would affect the previous value in resulting sequence.

/**
 * Gives a declaration (a function, a property or a class) specific name in JavaScript.
 * This may be useful in the following cases:
 * * There are two functions for which the compiler gives same name in JavaScript, you can mark one with `@JsName(...)` to prevent the compiler from reporting error.
 * * You are writing a JavaScript library in Kotlin. The compiler produces mangled names for functions with parameters, which is unnatural for usual JavaScript developer. You can put `@JsName(...)` on functions you want to be available from JavaScript.
 * * For some reason you want to rename declaration, e.g. there's common term in JavaScript for a concept provided by the declaration, which is uncommon in Kotlin.
 * Example:
 * ```
 * kotlin
 * class Person(val name: String) {
 *     fun hello() {
 *         println("Hello $name!")
 *     }
 * }
 * ```
