annotation class marker \(\ln \backslash n / * * \backslash n *\) Gives a declaration (a function, a property or a class) specific name in JavaScript.\n *\n * This may be useful in the following cases:\n *\n * * There are two functions for which the compiler gives same name in JavaScript, you canln * mark one with `@JsName(...) to prevent the compiler from reporting error. \(\mathrm{ln} * *\) You are writing a JavaScript library in Kotlin. The compiler produces mangled names \(\backslash \mathrm{n} *\) for functions with parameters, which is unnatural for usual JavaScript developer.\n * You can put `@JsName(...)` on functions you want to be available from JavaScript.\n * * For some reason you want to rename declaration, e.g. there's common term in JavaScriptln * for a concept provided by the declaration, which in uncommon in Kotlin. In * \(\backslash \mathrm{n} *\) Example: \(\backslash \mathrm{n} * \backslash \mathrm{n} * \cdots\) kotlin \(\backslash \mathrm{n}\) * class Person(val name: String) \(\{\backslash \mathrm{n} * \quad\) fun hello() \(\{\backslash \mathrm{n} * \quad\) println( \(\backslash\) "Hello \(\$\) name! \(\ ") \backslash \mathrm{n} * \quad\} \backslash \mathrm{n} * \backslash \mathrm{n} * \quad @ \mathrm{JsName}(\backslash " h e l l o W i t h G r e e t i n g \backslash ") \backslash \mathrm{n} * \quad\) fun hello(greeting: String) \(\{\backslash \mathrm{n}\) * println(\"\$greeting \$name! !") \n * \(\} \backslash n *\} \backslash n * \cdots \backslash \mathrm{n} * \backslash \mathrm{n} *\) @ property name the name which compiler uses both for declaration itself and for all references to the declaration.ln * It's required to denote a valid JavaScript identifier. \(\backslash \mathrm{n} * \backslash \mathrm{n} * / \mathrm{n} @\) Retention(AnnotationRetention.BINARY) \(\operatorname{nn} @ T \operatorname{Target}(\mathrm{CLASS}, ~ F U N C T I O N, ~ P R O P E R T Y, ~\) CONSTRUCTOR, PROPERTY_GETTER, PROPERTY_SETTER)\npublic actual annotation class JsName(actual val name: String) \(\backslash n \backslash n / * * \backslash n *\) Denotes an external` declaration that must be imported from native JavaScript library. \(\mathrm{In} * \backslash \mathrm{n}\) * The compiler produces the code relevant for the target module system, for example, in case of CommonJS, \(\ln\) * it will import the declaration via the `require(...) function. \(\ln * \ln *\) The annotation can be used on top-level external declarations (classes, properties, functions) and files. In * In case of file (which can't be `external`) the following rule applies: all the declarations in\n * the file must be `external`. By applying `@JsModule(...) on a file you tell the compiler to import a JavaScript objectln * that contain all the declarations from the file. \(\ln * \backslash n *\) Example:\n *\n * " \(k\) kotlin\n * @JsModule(\"jquery\")\n * external abstract class JQuery() \{\n * // some
 \(* \backslash \mathrm{n} * @\) property import name of a module to import declaration from. n * \(\quad\) It is not interpreted by the Kotlin compiler, it's passed as is directly to the target module system.\n *\n * @ see JsNonModule\n
* \(\wedge \mathrm{n} @\) Retention(AnnotationRetention.BINARY) \n@Target(CLASS, PROPERTY, FUNCTION, FILE) \npublic annotation class JsModule(val import: String) \(\operatorname{nn} \backslash \mathrm{n} / * * \backslash \mathrm{n}\) * Denotes an `external` declaration that can be used without module system. n * \(\backslash \mathrm{n} *\) By default, an `external` declaration is available regardless your target module system. ln * However, by applying [JsModule] annotation you can make a declaration unavailable to *plain* module system. n * Some JavaScript libraries are distributed both as a standalone downloadable piece of JavaScript and as a module available\n * as an npm package. In * To tell the Kotlin compiler to accept both cases, you can augment [JsModule] with the`@JsNonModule` annotation.\n *\n * For example:\n *\n * … kotlin\n * @JsModule( \((\) "jquery \(\\) " \() \backslash \mathrm{n}\) * @ JsNonModuleln * @JsName(\"\$\")\n * external abstract class JQuery() \{\n* // some declarations hereln * \}\n *\n * @JsModule (\"jquery \(\backslash ") \backslash \mathrm{n} * @ \mathrm{JsNonModule} \mathrm{\backslash n}\) * @JsName (\"\$\")\n * external fun JQuery(element: Element): JQuery \(\backslash n * \cdots \backslash\) n \(* \backslash \mathrm{n} * @\) see JsModule\n * \(\wedge n @\) Retention(AnnotationRetention.BINARY) \n@Target(CLASS, PROPERTY, FUNCTION, FILE)\npublic annotation class JsNonModule\n\n/**\n * Adds prefix to `external` declarations in a source file. \(\backslash \mathrm{n} * \mathrm{n} *\) JavaScript does not have concept of packages (namespaces). They are usually emulated by nested objects. In * The compiler turns references to `external` declarations either to plain unprefixed names (in case of *plain* modules) \(\backslash \mathrm{n} *\) or to plain imports. n * However, if a JavaScript library provides its declarations in packages, you won't be satisfied with this. In * You can tell the compiler to generate additional prefix before references to `external` declarations using the`@JsQualifier(...) \(\backslash n *\) annotation. \(\backslash n * \ln *\) Note that a file marked with the `@JsQualifier(...)` annotation can't contain non-`external` declarations. In *\n * Example:\n *\n * ‥ไn * @ file:JsQualifier(\"my.jsPackageName\")\n * package some.kotlinPackage\n *\n * external fun foo(x: Int)\n \(* \backslash n *\) external fun \(\operatorname{bar}(): S t r i n g \backslash n * \cdots \backslash n *\) n \(* @\) property value the qualifier to add to the declarations in the generated code. In * It must be a sequence of valid JavaScript identifiers separated by the \(\because\). character. \(\mathrm{ln} *\) Examples of valid qualifiers are: `foo`, `bar.Baž, „. \(\$ 0 . \mathrm{f}^{f} . \ln * \mathrm{n} *\) @ see JsModule\n
