A collection that holds pairs of objects (keys and values) and supports efficiently retrieving the value corresponding to each key. Map keys are unique; the map holds only one value for each key.

Methods in this interface support only read-only access to the map; read-write access is supported through the [MutableMap] interface.

`@param K` the type of map keys. The map is invariant in its key type, as it can accept key as a parameter (of [containsKey] for example) and return it in [keys] set.

`@param V` the type of map values. The map is covariant in its value type.

compiler gives same name in JavaScript, you can\n * mark one with `@JsName(...)` to prevent the compiler from
reporting error.\n * * You are writing a JavaScript library in Kotlin. The compiler produces mangled names\n *
for functions with parameters, which is unnatural for usual JavaScript developer.\n * You can put `@JsName(...)`
on functions you want to be available from JavaScript.\n * * For some reason you want to rename declaration, e.g.
there's common term in JavaScript\n * for a concept provided by the declaration, which is uncommon in Kotlin.\n
*/\n * Example:\n */\n * ``` kotlin\n * class Person(val name: String) {\n * fun hello() {\n * println("Hello
$name!")\n * }\n * @JsName("helloWithGreeting")\n * fun hello(greeting: String) {\n *
println("$greeting $name!")\n * }\n * }\n * ```\n */\n * @property name the name which compiler uses both for
declaration itself and for all references to the declaration.\n * It's required to denote a valid JavaScript
identifier.\n */\n * @Retention(AnnotationRetention.BINARY)\n * @Target(CLASS, FUNCTION, PROPERTY,
CONSTRUCTOR, PROPERTY_GETTER, PROPERTY_SETTER)\n * public actual annotation class JsName(actual
val name: String)\n\n/**\n * Denotes an `external` declaration that must be imported from native JavaScript
library.\n */\n * The compiler produces the code relevant for the target module system, for example, in case of
CommonJS,\n * it will import the declaration via the `require(...)` function.\n */\n * The annotation can be used on
top-level external declarations (classes, properties, functions) and files.\n * In case of file (which can't be `external`)
the following rule applies: all the declarations in\n * the file must be `external`. By applying `@JsModule(...)` on a
file you tell the compiler to import a JavaScript object\n * that contain all the declarations from the file.\n */\n *
Example:\n */\n * ``` kotlin\n * @JsModule("jquery")\n * external abstract class JQuery() {\n * // some
declarations here\n * }\n * @JsModule("jquery")\n * external fun JQuery(element: Element): JQuery\n * ```\n
*/\n * @property import name of a module to import declaration from.\n * It is not interpreted by the Kotlin

```

compiler, it's passed as is directly to the target module system.

/* Denotes an `external` declaration that can be used without
module system.
By default, an `external` declaration is available regardless your target module system.
However, by applying [JsModule] annotation you can make a declaration unavailable to `plain` module system.
Some JavaScript libraries are distributed both as a standalone downloadable piece of JavaScript and as a module
available as an npm package.
To tell the Kotlin compiler to accept both cases, you can augment [JsModule]
with the `@JsNonModule` annotation.
For example:
kotlin
@JsModule("jquery")
@JsNonModule
@JsName("$")
external abstract class JQuery() {
 // some declarations here
}
@JsModule("jquery")
@JsNonModule
@JsName("$")

/* Adds prefix to `external`
declarations in a source file.
JavaScript does not have concept of packages (namespaces). They are usually
emulated by nested objects.
The compiler turns references to `external` declarations either to plain unprefixes
names (in case of `plain` modules) or to plain imports.
However, if a JavaScript library provides its
declarations in packages, you won't be satisfied with this.
You can tell the compiler to generate additional prefix
before references to `external` declarations using the `@JsQualifier(...)` annotation.
Note that a file
marked with the `@JsQualifier(...)` annotation can't contain non-`external` declarations.
Example:
@file:JsQualifier("my.jsPackageName")
package some.kotlinPackage
external fun foo(x: Int)
external fun bar(): String
*/
@property value the qualifier to add to the declarations in the
generated code.
It must be a sequence of valid JavaScript identifiers separated by the `.` character.
Examples of valid qualifiers are: `foo`, `bar.Baz`, `_.$.f`

`BooleanArray`, `ByteArray`,

`Array<exportable-type>`
Function types with

`external` or `@JsExport` classes and interfaces
Nullable

/** Represents a compiled regular expression. */
Provides functions to match strings in text with a pattern, replace the found occurrences and split text around matches.
For pattern syntax reference see [MDN RegExp](https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/RegExp#Special_characters_meaning_in_regular_expressions) and
http://www.w3schools.com/jsref/jsref_obj_regexp.asp.

Note that `Regex` objects under the hood are constructed with [the `u` flag](https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/RegExp/unicode) that enables Unicode-related features in regular expressions. This also makes the pattern syntax more strict, for example, prohibiting unnecessary escape sequences.

Effectively this means that `*` an extension annotated with this annotation will win in overload resolution over a member with the same signature. `*` `@Target(AnnotationTarget.FUNCTION, AnnotationTarget.PROPERTY)` `@Retention(AnnotationRetention.BINARY)` `internal annotation class HidesMembers` `*` The value of this type parameter should be mentioned in input types (argument types, receiver type or expected type). `*` `@Target(AnnotationTarget.TYPE_PARAMETER)` `@Retention(AnnotationRetention.BINARY)` `internal annotation class OnlyInputTypes` `*` Specifies that this function should not be called directly without inlining `*` `@Target(AnnotationTarget.FUNCTION, AnnotationTarget.PROPERTY, AnnotationTarget.PROPERTY_GETTER, AnnotationTarget.PROPERTY_SETTER)` `@Retention(AnnotationRetention.BINARY)` `internal annotation class InlineOnly` `*` Specifies that this declaration can have dynamic receiver type. `*` `@Target(AnnotationTarget.FUNCTION, AnnotationTarget.PROPERTY)` `@Retention(AnnotationRetention.BINARY)` `internal annotation class DynamicExtension` `*` The value of this parameter should be a property reference expression (`this::foo`), referencing a `lateinit` property, `*` the backing field of which is accessible at the point where the corresponding argument is passed. `*` `@Target(AnnotationTarget.VALUE_PARAMETER)` `@Retention(AnnotationRetention.BINARY)` `@SinceKotlin("1.2")` `internal annotation class AccessibleLateinitPropertyLiteral` `*` Specifies that this declaration is only completely supported since the specified version. `*` `*` The Kotlin compiler of an earlier version is going to report a diagnostic on usages of this declaration. `*` The diagnostic message can be specified with `[message]`, or via `[errorCode]` (takes less space, but might not be immediately clear `*` to the user). The diagnostic severity can be specified with `[level]`: `WARNING/ERROR` mean that either a warning or an error `*` is going to be reported, `HIDDEN` means that the declaration is going to be removed from resolution completely. `*` `*` `[versionKind]` specifies which version should be compared with the `[version]` value, when compiling the usage of the annotated declaration. `*` Note that prior to 1.2, only `[RequireKotlinVersionKind.LANGUAGE_VERSION]` was supported, so the Kotlin compiler before 1.2 is going to `*` treat any `[RequireKotlin]` as if it requires the language version. Since 1.2, the Kotlin compiler supports `*` `[RequireKotlinVersionKind.LANGUAGE_VERSION]`, `[RequireKotlinVersionKind.COMPILER_VERSION]` and `[RequireKotlinVersionKind.API_VERSION]`. `*` If the actual value of `[versionKind]` is something different (e.g. a new version kind, added in future versions of Kotlin), `*` Kotlin 1.2 is going to ignore this `[RequireKotlin]` altogether, where as Kotlin before 1.2 is going to treat this as a requirement `*` on the language version. `*` `*` This annotation is erased at compile time; its arguments are stored in a more compact form in the Kotlin metadata. `*` `@Target(AnnotationTarget.CLASS,`

max(depth(t.left), depth(t.right)) + 1\n * println(depth(deepTree)) // StackOverflowError\n * ```\n * If this
`depth` function is called for a `deepTree` it produces [StackOverflowError] because of deep recursion.\n *

callRecursive(t.right)) + 1\n * }\n * println(depth(deepTree)) // Ok\n * ```\n * Deep recursive functions can also
mutually call each other using a heap for the stack via\n * [callRecursive][DeepRecursiveScope.callRecursive]
extension. For example, the\n * following pair of mutually recursive functions computes the number of tree nodes at
even depth in the tree.\n */\n * ```\n * val mutualRecursion = object {\n * val even:
