a [Long] number of milliseconds.\n *\n * The value is coerced to the range of [Long] type, if it doesn't fit in
that range, see the conversion [Double.toLong] for details.\n *\n * The range of durations that can be expressed
as a `Long` number of milliseconds is approximately \u00b1292 million years.\n *\n @ExperimentalTime\n
@Deprecated(\"Use inWholeMilliseconds property instead.\", ReplaceWith(\"this.inWholeMilliseconds\"))\n
public fun toLongMilliseconds(): Long = inWholeMilliseconds\n\n /**\n * Returns a string representation of
this duration value\n * expressed as a combination of numeric components, each in its own unit.\n
component is a number followed by the unit abbreviated name: `d`, `h`, `m`, `s`:\n * `5h`, `1d 12h`, `1h 0m
30.340s`\n * The last component, usually seconds, can be a number with a fractional part.\n
duration is less than a second, it is represented as a single number\n * with one of sub-second units: `ms`
(milliseconds), `us` (microseconds), or `ns` (nanoseconds):\n * `140.884ms`, `500us`, `24ns`.\n
negative duration is prefixed with `-` sign and, if it consists of multiple components, surrounded with parentheses:\n
 *`-12m` and `-(1h 30m)`.\n *\n * Special cases:\n * - an infinite duration is formatted as `\"Infinity\"` or
`\"-Infinity\"` without a unit.\n *\n * It's recommended to use [toIsoString] that uses more strict ISO-8601
format instead of this `toString`\n * when you want to convert a duration to a string in cases of serialization,
interchange, etc.\n

PROPERTY)\ninternal annotation class library(public val name: String = \"\")\n\@Target(CLASS)\ninternal
annotation class marker\n\n/**\n * Gives a declaration (a function, a property or a class) specific name in
JavaScript.\n *\n * This may be useful in the following cases:\n *\n * There are two functions for which the
compiler gives same name in JavaScript, you can\n * mark one with `@JsName(...)` to prevent the compiler from
reporting error.\n * * You are writing a JavaScript library in Kotlin. The compiler produces mangled names\n *
for functions with parameters, which is unnatural for usual JavaScript developer.\n * You can put `@JsName(...)`
on functions you want to be available from JavaScript.\n * * For some reason you want to rename declaration, e.g.
there's common term in JavaScript\n * for a concept provided by the declaration, which in uncommon in Kotlin.\n
*\n * Example:\n *\n * ``` kotlin\n * class Person(val name: String) {\n * fun hello() {\n *
                                                                                         println(\"Hello
\ln * \ln * n * n * @ property name the name which compiler uses both for
println(\"$greeting $name!\")\n *
declaration itself and for all references to the declaration.\n *
                                                             It's required to denote a valid JavaScript
identifier.\n *\n *\n@Retention(AnnotationRetention.BINARY)\n@Target(CLASS, FUNCTION, PROPERTY,
CONSTRUCTOR, PROPERTY GETTER, PROPERTY SETTER)\npublic actual annotation class JsName(actual
val name: String)\n\n/**\n * Denotes an `external` declaration that must be imported from native JavaScript
library.\n *\n * The compiler produces the code relevant for the target module system, for example, in case of
CommonJS,\n * it will import the declaration via the `require(...)` function.\n *\n * The annotation can be used on
top-level external declarations (classes, properties, functions) and files.\n * In case of file (which can't be `external`)
the following rule applies: all the declarations in\n * the file must be `external`. By applying `@JsModule(...)` on a
file you tell the compiler to import a JavaScript object\n * that contain all the declarations from the file.\n *\n *
Example:\n *\n * ``` kotlin\n * @JsModule(\"iquery\")\n * external abstract class JQuery() {\n * // some
*\n * @property import name of a module to import declaration from.\n *
                                                                         It is not interpreted by the Kotlin
compiler, it's passed as is directly to the target module system.\n *\n * @see JsNonModule\n
*/n@Retention(AnnotationRetention.BINARY)\n@Target(CLASS, PROPERTY, FUNCTION, FILE)\npublic
annotation class JsModule(val import: String)\n\n/**\n * Denotes an `external` declaration that can be used without
module system.\n *\n * By default, an `external` declaration is available regardless your target module system.\n *
However, by applying [JsModule] annotation you can make a declaration unavailable to *plain* module system.\n *
Some JavaScript libraries are distributed both as a standalone downloadable piece of JavaScript and as a module
available\n * as an npm package.\n * To tell the Kotlin compiler to accept both cases, you can augment [JsModule]
with the `@JsNonModule` annotation.\n *\n * For example:\n *\n * ``` kotlin\n * @JsModule(\"jquery\")\n *
@JsNonModule\n * @JsName(\"$\")\n * external abstract class JQuery() \n * // some declarations here \n * }\n
```

```
*\n * @JsModule(\"jquery\")\n * @JsNonModule\n * @JsName(\"$\")\n * external fun JQuery(element: Element):
JQuery \times ``\n *\n * @see JsModule \n */\n @Retention(AnnotationRetention.BINARY) \n @Target(CLASS,
PROPERTY, FUNCTION, FILE)\npublic annotation class JsNonModule\n\n/**\n * Adds prefix to `external`
declarations in a source file.\n *\n * JavaScript does not have concept of packages (namespaces). They are usually
emulated by nested objects.\n * The compiler turns references to `external` declarations either to plain unprefixed
names (in case of *plain* modules)\n * or to plain imports.\n * However, if a JavaScript library provides its
declarations in packages, you won't be satisfied with this.\n * You can tell the compiler to generate additional prefix
before references to `external` declarations using the `@JsQualifier(...)`\n * annotation.\n *\n * Note that a file
marked with the `@JsQualifier(...)` annotation can't contain non-`external` declarations.\n *\n * Example:\n *\n *
```\n * @file:JsQualifier(\"my.jsPackageName\")\n * package some.kotlinPackage\n *\n * external fun foo(x: Int)\n
*\n * external fun bar(): String\n * ```\n *\n * @ property value the qualifier to add to the declarations in the
generated code.\n *
                         It must be a sequence of valid JavaScript identifiers separated by the `.` character.\n *
 Examples of valid qualifiers are: `foo`, `bar.Baz`, ` .$0.f.\n *\n * @see JsModule\n
*/n@Retention(AnnotationRetention.BINARY)\n@Target(AnnotationTarget.FILE)\npublic annotation class
JsQualifier(val value: String)\n\n/**\n * Exports top-level declaration on JS platform.\n *\n * Compiled module
exposes declarations that are marked with this annotation without name mangling.\n *\n * This annotation can be
applied to either files or top-level declarations.\n *\n * It is currently prohibited to export the following kinds of
declarations:\n *\n * * `expect` declarations\n * * inline functions with reified type parameters\n * * suspend
functions\n * * secondary constructors without `@JsName`\n * * extension properties\n * * enum classes\n * *
annotation classes\n *\n * Signatures of exported declarations must only contain \"exportable\" types:\n *\n * *
`dynamic`, `Any`, `String`, `Boolean`, `Byte`, `Short`, `Int`, `Float`, `Double`\n * * `BooleanArray`, `ByteArray`,
`ShortArray`, `IntArray`, `FloatArray`, `DoubleArray`\n * * `Array<exportable-type>`\n * * Function types with
exportable parameters and return types\n * * `external` or `@JsExport` classes and interfaces\n * * Nullable
counterparts of types above\n * * Unit return type. Must not be nullable\n *\n * This annotation is experimental,
meaning that restrictions mentioned above are subject to change.\n
