`println()` Prints the line separator to the standard output stream. `println(message: Any?)` Prints the given [message] and the line separator to the standard output stream. `print(message: Any?)` Prints the given [message] to the standard output stream. `readln()` Reads a line of input from the standard input stream and returns it, or throws a [RuntimeException] if EOF has already been reached when [readln] is called. LF or CRLF is treated as the line terminator. Line terminator is not included in the returned string. Currently this function is not supported in Kotlin/JS and throws [UnsupportedOperationException]. `readln(): String` Reads a line of input from the standard input stream and returns it, or return `null` if EOF has already been reached when [readlnOrNull] is called. LF or CRLF is treated as the line terminator. Line terminator is not included in the returned string. To start executing the created coroutine, invoke `resume(Unit)` on the returned [Continuation] instance. The [completion] continuation is invoked when coroutine completes with result or exception. This function returns unintercepted continuation. Invocation of `resume(Unit)` starts coroutine immediately in the invoker's call stack without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established. Note that [completion] of this function may get invoked in an arbitrary context. [Continuation.intercepted] can be used to acquire the intercepted continuation. Invocation of `resume(Unit)` on intercepted continuation guarantees that execution of both the coroutine and [completion] happens in the invocation context established by [ContinuationInterceptor]. Repeated invocation of any resume function on the resulting continuation corrupts the state machine of the coroutine and may result in arbitrary behaviour or exception.

top-level external declarations (classes, properties, functions) and files. In case of file (which can't be `external`) the following rule applies: all the declarations in the file must be `external`. By applying `@JsModule(...)` on a file you tell the compiler to import a JavaScript object that contain all the declarations from the file.

Example:

```
kotlin @JsModule("jquery") external abstract class JQuery() {
    // some declarations here
}
@JsModule("jquery") external fun JQuery(element: Element): JQuery
@property import name of a module to import declaration from. It is not interpreted by the Kotlin compiler, it's passed as is directly to the target module system.
@see JsNonModule
@Retention(AnnotationRetention.BINARY) @Target(CLASS, PROPERTY, FUNCTION, FILE) public annotation class JsModule(val import: String)
Denotes an `external` declaration that can be used without module system. By default, an `external` declaration is available regardless your target module system. However, by applying [JsModule] annotation you can make a declaration unavailable to plain module system. Some JavaScript libraries are distributed both as a standalone downloadable piece of JavaScript and as a module available as an npm package. To tell the Kotlin compiler to accept both cases, you can augment [JsModule] with the `@JsNonModule` annotation. For example:
```

```
kotlin @JsModule("jquery") @JsNonModule @JsName("$") external abstract class JQuery() {
    // some declarations here
}
@JsModule("jquery") @JsNonModule @JsName("$") external fun JQuery(element: Element): JQuery
@see JsModule
@Retention(AnnotationRetention.BINARY) @Target(CLASS, PROPERTY, FUNCTION, FILE) public annotation class JsNonModule
Adds prefix to `external` declarations in a source file. JavaScript does not have concept of packages (namespaces). They are usually emulated by nested objects. The compiler turns references to `external` declarations either to plain unprefix names (in case of plain modules) or to plain imports. However, if a JavaScript library provides its declarations in packages, you won't be satisfied with this. You can tell the compiler to generate additional prefix before references to `external` declarations using the `@JsQualifier(...)` annotation. Note that a file marked with the `@JsQualifier(...)` annotation can't contain non-`external` declarations. Example:
```

```
@file:JsQualifier("my.jsPackageName") package some.kotlinPackage
external fun foo(x: Int)
external fun bar(): String
@property value the qualifier to add to the declarations in the generated code. It must be a sequence of valid JavaScript identifiers separated by the `.` character. Examples of valid qualifiers are: `foo`, `bar.Baz`, `_.$.f`
@see JsModule
@Retention(AnnotationRetention.BINARY) @Target(AnnotationTarget.FILE) public annotation class JsQualifier(val value: String)
Exports top-level declaration on JS platform. Compiled module exposes declarations that are marked with this annotation without name mangling. This annotation can be applied to either files or top-level declarations. It is currently prohibited to export the following kinds of declarations:
- `expect` declarations
- inline functions with reified type parameters
- suspend functions
- secondary constructors without `@JsName`
- extension properties
- enum classes
- annotation classes
Signatures of exported declarations must only contain "exportable" types:
- `dynamic`, `Any`, `String`, `Boolean`, `Byte`, `Short`, `Int`, `Float`, `Double`, `BooleanArray`, `ByteArray`, `ShortArray`, `IntArray`, `FloatArray`, `DoubleArray`
- `Array<exportable-type>`
- Function types with exportable parameters and return types
- `external` or `@JsExport` classes and interfaces
- Nullable counterparts of types above
- Unit return type. Must not be nullable
This annotation is experimental, meaning that restrictions mentioned above are subject to change.

Removes the character at the specified [index] from this string builder and returns this instance.
If the `Char` at the specified [index] is part of a supplementary code point, this method does not remove the entire supplementary character.
@param index the index of `Char` to remove.
@throws `IndexOutOfBoundsException` if [index] is out of bounds of this string builder.

`StringBuilder.deleteAt(index: Int): StringBuilder`
Removes characters in the specified range from this string builder and returns this instance.
@param startIndex the beginning (inclusive) of the range to remove.
@param endIndex the end (exclusive) of the range to remove.
@throws `IndexOutOfBoundsException` or `[IllegalArgumentException]` when [startIndex] is out of range of this string builder indices or when `startIndex > endIndex`.

`*\n@SinceKotlin("1.4")\n@WasExperimental(ExperimentalStdlibApi::class)\npublic expect fun`

`StringBuilder.deleteRange(startIndex: Int, endIndex: Int): StringBuilder`
Copies characters from this string builder into the [destination] character array.
@param destination the array to copy to.
@param destinationOffset the position in the array to copy to, 0 by default.
@param startIndex the beginning (inclusive) of the range to copy, 0 by default.
@param endIndex the end (exclusive) of the range to copy, length of this string builder by default.
@throws `IndexOutOfBoundsException` or `[IllegalArgumentException]` when [startIndex] or [endIndex] is out of range of this string builder indices or when `startIndex > endIndex`.

`StringBuilder.toCharArray(destination: CharArray, destinationOffset: Int = 0, startIndex: Int = 0, endIndex: Int = this.length)`
Appends characters in a subarray of the specified character array [value] to this string builder and returns this instance.
Characters are appended in order, starting at specified [startIndex].
@param value the array from which characters are appended.
@param startIndex the beginning (inclusive) of the subarray to append.
@param endIndex the end (exclusive) of the subarray to append.

`StringBuilder.appendRange(value: CharSequence, startIndex: Int, endIndex: Int): StringBuilder`
Inserts characters in a subarray of the specified character array [value] into this string builder at the specified [index] and returns this instance.
The inserted characters go in same order as in the [value] array, starting at [index].
@param index the position in this string builder to insert at.
@param value the array from which characters are inserted.
@param startIndex the beginning (inclusive) of the subarray to insert.
@param endIndex the end (exclusive) of the subarray to insert.
@throws `IndexOutOfBoundsException` or `[IllegalArgumentException]` when [startIndex] or [endIndex] is out of range of the [value] array indices or when `startIndex > endIndex`.

* When two or more function overloads have otherwise the same parameter lists that differ only in the return type of a functional parameter, this annotation enables overload selection by the type of the value returned from the lambda function passed to this functional parameter.
* Example:
@OverloadResolutionByLambdaReturnType fun create(intProducer: () -> Int): Int fun create(doubleProducer: () -> Double): Double val newValue = create { 3.14 }
* The annotation being applied to one of overloads allows to resolve this ambiguity by analyzing what value is returned from the lambda function.
* This annotation is also used to discriminate the annotated overloads in case if overload selection still cannot choose one of them even taking in account the result of lambda parameter analysis. In that case a warning is reported.

Invocation of [Continuation.resumeWith] resumes coroutine directly in the invoker's thread without going through the [ContinuationInterceptor] that might be present in the coroutine's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established. [Continuation.intercepted] can be used to acquire the intercepted continuation. Note that it is not recommended to call either [Continuation.resume] nor [Continuation.resumeWithException] functions synchronously in the same stackframe where suspension function is run. An extension operator that allows delegating a read-only property of type [V] to a property reference to a property of type [V] or its subtype.

@receiver A property reference to a read-only or mutable property of type [V] or its subtype.

The reference is without a receiver, i.e. it either references a top-level property or has the receiver bound to it.

Example:

```

class Login(val
username: String) {

}

val defaultUserName get() = defaultLogin.username

/**
 * Defines deep recursive function that keeps its stack on the heap,
 * which allows very deep recursive computations that do not use the actual call stack.
 * To initiate a call to this deep recursive function use its [invoke] function.
 * As a rule of thumb, it should be used if recursion goes deeper than a thousand calls.
 * The [DeepRecursiveFunction] takes one parameter of type [T] and returns a result of type [R].
 * The [block] of code defines the body of a recursive function. In this block
 * [callRecursive][DeepRecursiveScope.callRecursive] function can be used to make a recursive call
 * to the declared function. Other instances of [DeepRecursiveFunction] can be called
 * in this scope with `callRecursive` extension, too.
 * For example, take a look at the following recursive tree class and a deeply
 * recursive instance of this tree with 100K nodes:
 */
class Tree(val left: Tree? = null, val right: Tree? = null) {
    val deepTree = generateSequence(Tree()) { Tree(it) }.take(100_000).last()
}

```

A regular recursive function can be defined to compute a depth of a tree:

```

fun depth(t: Tree?): Int = if (t == null) 0 else max(depth(t.left), depth(t.right)) + 1
println(depth(deepTree)) // StackOverflowError

```

If this `depth` function is called for a `deepTree` it produces `StackOverflowError` because of deep recursion. However, the `depth` function can be rewritten using `DeepRecursiveFunction` in the following way, and then it successfully computes `depth(deepTree)`:

```

val depth = DeepRecursiveFunction<Tree?, Int> { t -> if (t == null) 0 else max(callRecursive(t.left), callRecursive(t.right)) + 1 }
println(depth(deepTree)) // Ok

```

Deep recursive functions can also mutually call each other using a heap for the stack via `callRecursive` extension. For example, the following pair of mutually recursive functions computes the number of tree nodes at even depth in the tree:

```

val mutualRecursion = object {
    val even: DeepRecursiveFunction<Tree?, Int> = DeepRecursiveFunction { t -> if (t == null) 0 else odd.callRecursive(t.left) + odd.callRecursive(t.right) + 1 }
    val odd: DeepRecursiveFunction<Tree?, Int> = DeepRecursiveFunction { t -> if (t == null) 0 else even.callRecursive(t.left) + even.callRecursive(t.right) }
}

```

@param [T] the function parameter type.
@param [R] the function result type.
@param block the function body.

```

@SinceKotlin("1.4")@ExperimentalStdlibApi
public class DeepRecursiveFunction<T, R> {
    internal val block: suspend DeepRecursiveScope<T, R>.(T) -> R
}

```

Initiates a call to this deep recursive function, forming a root of the call tree. This operator should not be used from inside of `DeepRecursiveScope` as it uses the call stack slot for initial recursive invocation. From inside of `DeepRecursiveScope` use `callRecursive`:

```

callRecursive {
    DeepRecursiveScope.callRecursive {
        // ...
    }
}

```

```

@SinceKotlin("1.4")@ExperimentalStdlibApi

```

```

@param [T] function parameter type
@param [R] function result type

```

`truncate(x)` is `x` where `x` is `NaN` or `+Inf` or `-Inf` or already a mathematical integer.
`public expect fun truncate(x: Float): Float`
 Rounds the given value `[x]` towards the closest integer with ties rounded towards even integer.
 Special cases:
`round(x)` is `x` where `x` is `NaN` or `+Inf` or `-Inf` or already a mathematical integer.
`public expect fun round(x: Float): Float`
 Returns the absolute value of the given value `[x]`.
 Special cases:
`abs(NaN)` is `NaN`
 @see `absoluteValue` extension property for `[Float]`
`public expect fun abs(x: Float): Float`
 Returns the sign of the given value `[x]`:
`-1.0` if the value is negative,
`0.0` if the value is zero,
`1.0` if the value is positive
 Special case:
`sign(NaN)` is `NaN`
`public expect fun sign(x: Float): Float`
 Returns the smaller of two values.
 If either value is `NaN`, then the result is `NaN`.
`public expect fun min(a: Float, b: Float): Float`
 Returns the greater of two values.
 If either value is `NaN`, then the result is `NaN`.
`public expect fun max(a: Float, b: Float): Float`
 // extensions
 Raises this value to the power `[x]`.
 Special cases:
`b.pow(0.0)` is `1.0`
`b.pow(1.0) == b`
`b.pow(NaN)` is `NaN`
`NaN.pow(x)` is `NaN` for `x != 0.0`
`b.pow(Inf)` is `NaN` for `abs(b) == 1.0`
`b.pow(x)` is `NaN` for `b < 0` and `x` is finite and not an integer
`public expect fun Float.pow(x: Float): Float`
 Raises this value to the integer power `[n]`.
 See the other overload of `[pow]` for details.
`public expect fun Float.pow(n: Int): Float`
 Returns the absolute value of this value.
 Special cases:
`NaN.absoluteValue` is `NaN`
 @see `abs` function
`public expect val Float.absoluteValue: Float`
 Returns the sign of this value:
`-1.0` if the value is negative,
`0.0` if the value is zero,
`1.0` if the value is positive
 Special case:
`NaN.sign` is `NaN`
`public expect val Float.sign: Float`
 Returns

this value with the sign bit same as of the [sign] value.
 * If [sign] is `NaN` the sign of the result is undefined.
 * SinceKotlin("1.2")\npublic expect fun Float.withSign(sign: Float): Float

 * SinceKotlin("1.2")\npublic expect fun Float.withSign(sign: Int): Float
 * Rounds this [Float] value to the nearest integer and converts the result to [Int].

 * - `x.roundToInt() == Int.MIN_VALUE` when `x < Int.MIN_VALUE`
 * @throws IllegalArgumentException when this value is `NaN`
 * SinceKotlin("1.2")\npublic expect fun Float.roundToInt(): Int
 * Rounds this [Float] value to the nearest integer and converts the result to [Long].
 * Ties are rounded towards positive infinity.
 * Special cases:
 * - `x.roundToLong() == Long.MAX_VALUE` when `x > Long.MAX_VALUE`
 * - `x.roundToLong() == Long.MIN_VALUE` when `x < Long.MIN_VALUE`
 * @throws IllegalArgumentException when this value is `NaN`
 * SinceKotlin("1.2")\npublic expect fun Float.roundToLong(): Long
