Introduction

This document describes how to set the Differentiated Services Code Point (DSCP) values in Quality of Service (QoS) configurations on a Cisco router.

Prerequisites

Requirements

You must be familiar with the fields in the IP header and Cisco IOS®CLI.

Components Used

This document is not restricted to specific software and hardware versions.

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, ensure that you understand the potential impact of any command.

Conventions

For more information on document conventions, refer to [Cisco Technical Tips Conventions](#).

Background Information

Differentiated Services (DiffServ) is a new model in which traffic is treated by intermediate systems with relative priorities based on the type of services (ToS) field. Defined in [RFC 2474](#) and [RFC 2475](#), the DiffServ standard supersedes the original specification to define packet priority described in [RFC 791](#). DiffServ increases the number of definable priority levels when it reallocates bits of an IP packet to mark it as a priority.

The DiffServ architecture defines the DiffServ (DS) field, which supersedes the ToS field in IPv4 to make per-hop behavior (PHB) decisions about packet classification and traffic conditioning functions, such as metering, marking, shaping, and policing.

The RFCs do not dictate the way to implement PHBs; this is the responsibility of the vendor. Cisco implements queuing techniques that can base their PHB on the IP precedence or DSCP value in the IP header of a packet. Based on DSCP or IP precedence, traffic can be put into a particular service class. Packets within a service class are treated the same way.

Differentiated Services Code Point

The six most significant bits of the DiffServ field is called as the DSCP. The last two Currently Unused (CU) bits in the DiffServ field were not defined within the DiffServ field architecture; these are now used as Explicit Congestion Notification (ECN) bits. Routers at the edge of the network classify packets and mark them with either the IP Precedence or DSCP value in a Diffserv network. Other network devices in the core that support Diffserv use the DSCP value in the IP header to select a PHB behavior for the packet and provide the appropriate QoS treatment.

The diagrams in this section show a comparison between the ToS byte defined by [RFC 791](#) and the DiffServ field.

ToS Byte

P2	P1	P0	T2	T1	T0	CU1	CU0
----	----	----	----	----	----	-----	-----

- IP precedence—three bits (P2 to P0)
- Delay, Throughput and Reliability—three bits (T2 to T0)
- CU (Currently Unused)—two bits(CU1-CU0)

DiffServ Field

DS5	DS4	DS3	DS2	DS1	DS0	ECN	ECN
-----	-----	-----	-----	-----	-----	-----	-----

- DSCP—six bits (DS5-DS0)
- ECN—two bits

The standardized DiffServ field of the packet is marked with a value so that the packet receives a particular forwarding treatment or PHB, at each network node.

The default DSCP is 000 000. Class selector DSCPs are values that are backward compatible with IP precedence. When you convert between IP precedence and DSCP, match the three most significant bits. In

other words:

```
<#root>
IP Prec
5
(101) maps to IP DSCP 101 000
```

ToS Byte

1	0	1	T2	T1	T0	CU2	CU0
---	---	---	----	----	----	-----	-----

DiffServ Field

1	0	1	0	0	0	ECN	ECN
---	---	---	---	---	---	-----	-----

The DiffServ standard utilizes the same precedence bits (the most significant bits—DS5, DS4 and DS3) for priority setting, but further clarifies the definitions, which provides finer granularity through the use of the next three bits in the DSCP. DiffServ reorganizes and renames the precedence levels (still defined by the three most significant bits of the DSCP) into these categories (the levels are explained in greater detail in this document):

Precedence Level	Description
7	Stays the same (link layer and routing protocol keep alive)
6	Stays the same (used for IP routing protocols)
5	Express Forwarding (EF)
4	Class 4
3	Class 3
2	Class 2
1	Class 1
0	Best effort

With this system, a device prioritizes traffic by class first. Then it differentiates and prioritizes same-class traffic, and takes the drop probability into account.

The DiffServ standard does not specify a precise definition of "low," "medium," and "high" drop

probability. Not all devices recognize the DiffServ (DS2 and DS1) settings; and even when these settings are recognized, they do not necessarily trigger the same PHB forwarding action at each network node. Each node implements its own response based on how it is configured.

Assured Forwarding

[RFC 2597](#) defines the assured forwarding (AF) PHB and describes it as a means for a provider DS domain to offer different levels of forwarding assurances for IP packets received from a client DS domain. The Assured Forwarding PHB guarantees a certain amount of bandwidth to an AF class and allows access to extra bandwidth, if available. There are four AF classes, AF1x through AF4x. Within each class, there are three drop probabilities. Contingent on a given network policy, packets can be selected for a PHB based on required throughput, delay, jitter, loss, or by priority of access to network services.

Classes 1 to 4 are referred to as AF classes. This table illustrates the DSCP code that specifies the AF class with the probability. Bits DS5, DS4 and DS3 define the class; bits DS2 and DS1 specify the drop probability; bit DS0 is always zero.

Drop	Class 1	Class 2	Class 3	Class 4
Low	001010 AF11 DSCP 10	010010 AF21 DSCP 18	011010 AF31 DSCP 26	100010 AF41 DSCP 34
Medium	001100 AF12 DSCP 12	010100 AF22 DSCP 20	011100 AF32 DSCP 28	100100 AF42 DSCP 36
High	001110 AF13 DSCP 14	010110 AF23 DSCP 22	011110 AF33 DSCP 30	100110 AF43 DSCP 38

Expedited Forwarding

[RFC 2598](#) defines the Expedited Forwarding (EF) PHB: "The EF PHB can be used to build a low loss, low latency, low jitter, assured bandwidth, end-to-end service through DS (DiffServ) domains. Such a service appears to the endpoints like a point-to-point connection or a "virtual leased line." This service has also been described as Premium service. Codepoint 101110 is recommended for the EF PHB, which corresponds to a DSCP value of 46.

Again, vendor-specific mechanisms need to be configured to implement these PHBs. Refer to [RFC 2598](#) for more information about EF PHB.

Use the DSCP Field

There are three ways you can use the DSCP field:

- Classifier—Select a packet based on the contents of some portions of the packet header and apply PHB based on service characteristic defined by the DSCP value.
- Marker—Set the DSCP field based on the traffic profile.
- Metering—Check compliance to traffic profile with either a shaper or dropper function.

Cisco IOS software considers the precedence bits of the ToS field if there is traffic that is queued in Weighted Fair Queuing (WFQ), Weighted Random Early Detection (WRED) or Weighted Round Robin (WRR). The precedence bits are not considered when Policy Routing, Priority Queuing (PQ), Custom

Queuing (CQ), or Class Based Weighted Fair Queuing (CBWFQ) are configured. For more information, see [Class Based Weighted Fair Queuing \(CBWFQ\)](#).

Packet Classification

Packet classification involves the use of a traffic descriptor to categorize a packet within a specific group and to make the packet accessible for the QoS that manages in the network. When you use packet classification, you can partition network traffic into multiple priority levels or a class of service (CoS).

You can use either access lists (ACLs) or the **match** command in the modular QoS CLI to match on DSCP values. The Cisco IOS Software Release 12.1(5)T introduced the ability to select a DSCP value in the match command.

```
<#root>

Router1(config)#  
  
access-list 101 permit ip any any ?  
  
dscp      Match packets with given dscp value  
fragments Check non-initial fragments  
log       Log matches against this entry  
log-input Log matches against this entry, including input interface  
precedence Match packets with given precedence value  
time-range Specify a time-range  
tos       Match packets with given TOS value
```

When you specify the *ip dscp* value in the **class map** command, you have these:

```
<#root>  
  
Router(config)#  
  
class-map match-all VOIP  
  
1751-uut1(config-cmap)#  
  
match ip dscp ?  
  
<0-63>  Differentiated services codepoint value  
af11     Match packets with AF11 dscp (001010)  
af12     Match packets with AF12 dscp (001100)  
af13     Match packets with AF13 dscp (001110)  
af21     Match packets with AF21 dscp (010010)  
af22     Match packets with AF22 dscp (010100)  
af23     Match packets with AF23 dscp (010110)  
af31     Match packets with AF31 dscp (011010)  
af32     Match packets with AF32 dscp (011100)  
af33     Match packets with AF33 dscp (011110)  
af41     Match packets with AF41 dscp (100010)  
af42     Match packets with AF42 dscp (100100)  
af43     Match packets with AF43 dscp (100110)  
cs1      Match packets with CS1(precedence 1) dscp (001000)  
cs2      Match packets with CS2(precedence 2) dscp (010000)  
cs3      Match packets with CS3(precedence 3) dscp (011000)
```

```

cs4      Match packets with CS4(precedence 4) dscp (100000)
cs5      Match packets with CS5(precedence 5) dscp (101000)
cs6      Match packets with CS6(precedence 6) dscp (110000)
cs7      Match packets with CS7(precedence 7) dscp (111000)
default  Match packets with default dscp (000000)
ef       Match packets with EF dscp (101110)
Router1(config-cmap)#
match ip dscp af31

```

Marking

The DSCP can be set to a desired value at the edge of the network in order to make it easy for core devices to classify the packet as shown in the [Packet Classification](#) section and provide a suitable level of service. [Class-Based Packet Marking](#) can be used to set the DSCP value as shown here:

```

policy-map pack-multimedia-5M
!--- Creates a policy map named pack-multimedia-5M.

class management
!--- Specifies the policy to be created for the !--- traffic classified by class management.

bandwidth 50
set ip dscp 8
!--- Sets the DSCP value of the packets matching !--- class management to 8.

class C1
  priority 1248
  set ip dscp 40
class voice-signalling
  bandwidth 120
  set ip dscp 24

```

Use Committed Access Rate or Class-Based Policing

Committed Access Rate and Class-Based Policing are traffic regulation mechanisms, used to regulate traffic flow to conform with the agreed upon service parameters. These mechanisms along with DSCP can be used to provide different levels of service that do not and do conform to traffic when it appropriately modifies the DSCP value, as shown in this section.

Refer to [Configuring Traffic Policing](#) and [Comparing Class-Based Policing and Committed Access Rate](#) for more information.

```

interface Serial1/0.1 point-to-point
bandwidth 5000
ip address 192.168.126.134 255.255.255.252

```

```

rate-limit output access-group 150 8000 1500 2000 conform-action
  set-dscp-transmit 10 exceed-action set-dscp-transmit 20

!--- For traffic matching access list 150, sets the DSCP value of conforming traffic !--- to 10 and

rate-limit output access-group 152 8000 1500 2000 conform-action
  set-dscp-transmit 15 exceed-action set-dscp-transmit 25
rate-limit output access-group 154 8000 1500 2000 conform-action
  set-dscp-transmit 18 exceed-action set-dscp-transmit 28
frame-relay interface-dlci 17
class shaper-multimedia-5M

```

DSCP-Compliant WRED

Weighted Random Early Detection (WRED), selectively discards lower-priority traffic when the interface begins to get congested. WRED can provide differentiated performance characteristics for different CoS. This differentiated service can be on basis of the DSCP, as shown here:

```

class C2
  bandwidth 1750
  random-detect dscp-based

!--- Enable dscp-based WRED as drop policy.

random-detect exponential-weighting-constant 7

!--- Specifies the exponential weight factor for the !--- average queue size calculation for the d

random-detect dscp 16 48 145 10

!--- Specifies the minimum and maximum queue thresholds !--- for each DSCP value.

random-detect dscp 32 145 435 10

```

Refer to the DiffServ Compliant WRED section of [Congestion Avoidance Overview](#) for more information.

Known Issues in Cisco IOS Software 12.2 Release Trains

Access to Bug tools and information is only available for registered Cisco clients.

You can search for these bugs with the [Bug Search Tool](#).

- Cisco bug ID [CSCdt63295](#) — If you fail to set the ToS byte with the new DSCP marking commands on the dial peers (set to 0) in Cisco IOS Software Release 12.2.2T, then packets cannot be marked and they can remain with a ToS set to 0.
- Cisco bug ID [CSCdt74738](#) — Support for the **set ip dscp** command on the Cisco 7200 router and lower-end platforms for the for multicast packets must be available as of Cisco IOS Software Release 12.2(3.6) and later.
