[Related Information](#)

[Introduction](#)

This document provides a sample configuration for PIX/ASA Security Appliance version 7.x and later with multiple internal networks that connect to the Internet (or an external network) using the command line interface (CLI) or Adaptive Security Device Manager (ASDM) 5.x and later.

Refer to [Establish and Troubleshoot Connectivity through the Cisco Security Appliance](#) for information on how to establish and troubleshoot connectivity through PIX/ASA.

Refer to [Using nat, global, static, conduit, and access-list Commands and Port Redirection\(Forwarding\) on PIX](#) for information about common PIX commands.

Note: Some options in other ASDM versions can appear different from the options in ASDM 5.1. Refer to the [ASDM documentation](#) for more information.

[Prerequisites](#)

[Requirements](#)

When you add more than one internal network behind a PIX Firewall, keep these points in mind:

- The PIX does not support secondary addressing.

- A router has to be used behind the PIX in order to achieve routing between the existing network and the newly added network.
- The default gateway of all the hosts needs to point to the inside router.
- Add a default route on the inside router that points to the PIX.
- Clear the Address Resolution Protocol (ARP) cache on the inside router.

Refer to [Allowing HTTPS Access for ASDM](#) in order to allow the device to be configured by the ASDM.

Components Used

The information in this document is based on these software and hardware versions:

- PIX Security Appliance 515E with software version 7.1
- ASDM 5.1
- Cisco routers with Cisco IOS® Software Release 12.3(7)T

Note: This document has been recertified with PIX/ASA software version 8.x and Cisco IOS Software Release 12.4.

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Related Products

This configuration can also be used with Cisco ASA Security Appliance version 7.x and later.

Conventions

Refer to the [Cisco Technical Tips Conventions](#) for more information on document conventions.

Configure

In this section, you are presented with the information to configure the features described in this document.

Note: Use the [Command Lookup Tool](#) ([registered](#) customers only) to obtain more information on the commands used in this section.

The IP addressing schemes used in this configuration are not legally routable on the Internet. They are RFC 1918 addresses which have been used in a lab environment.

Background Information

In this scenario, there are three internal networks (10.1.1.0/24, 10.2.1.0/24 and 10.3.1.0/24) to be connected to the Internet (or an External network) through PIX. The internal networks are connected to the inside interface of PIX. The Internet connectivity is through a router which is connected to the outside interface of the PIX. The PIX has the IP address 172.16.1.1/24.

The static routes are used to route the packets from the internal networks to the Internet and vice

versa. Instead of using the static routes, you can also use a dynamic routing protocol such as Routing Information Protocol (RIP) or Open Shortest Path First (OSPF).

The internal hosts communicate with the Internet by translating the internal networks on PIX using dynamic NAT (pool of IP addresses - 172.16.1.5 to 172.16.1.10). If the pool of IP addresses is exhausted, the PIX will PAT (using IP address 172.16.1.4) the internal hosts to reach the Internet.

Refer to [PIX/ASA 7.x NAT and PAT Statements](#) for more information on NAT/PAT.

Note: If the static NAT uses the outside IP (global_IP) address to translate, then this might cause a translation. Therefore, use the keyword interface instead of the IP address in the static translation.

[Network Diagram](#)

This document uses this network setup:

The default gateway of the hosts on the 10.1.1.0 network points to RouterA. A default route on RouterB is added that points to RouterA. RouterA has a default route that points to the PIX inside interface.

[Configurations](#)

This document uses these configurations:

- [RouterA Configuration](#)
- [RouterB Configuration](#)
- [PIX Security Appliance 7.1 Configuration](#)[PIX Configuration using ASDM](#)[PIX Security Appliance CLI Configuration](#)

RouterA Configuration

```
RouterA#show running-config Building configuration... Current

RouterB Configuration

```
RouterB#show running-config Building configuration... Current
configuration : 1132 bytes ! version 12.4 service config
service timestamps debug datetime msec service timestamps log
datetime msec no service password-encryption ! hostname
RouterB ! interface FastEthernet0/0 ip address 10.1.1.3
255.255.255.0 speed auto ! interface Ethernet1/0 ip address
10.3.1.1 255.255.255.0 half-duplex ! ip classless ip route
0.0.0.0 0.0.0.0 10.1.1.2 ! control-plane ! ! line con 0 line
aux 0 line vty 0 4 ! end RouterB#
```

If you want to use the ASDM for the configuration of the PIX Security Appliance, but have not bootstrapped the device, complete these steps:

1. Console into the PIX.
2. From a cleared configuration, use the interactive prompts in order to enable ASDM for the management of the PIX from workstation 10.1.1.5.

PIX Security Appliance 7.1 Configuration

```
Pre-configure Firewall now through interactive prompts [yes]?
yes
Firewall Mode [Routed]:
Enable password [<use current password>]: cisco
Allow password recovery [yes]?

[PIX Configuration using ASDM](#)

Complete these steps in order to configure via the ASDM GUI:

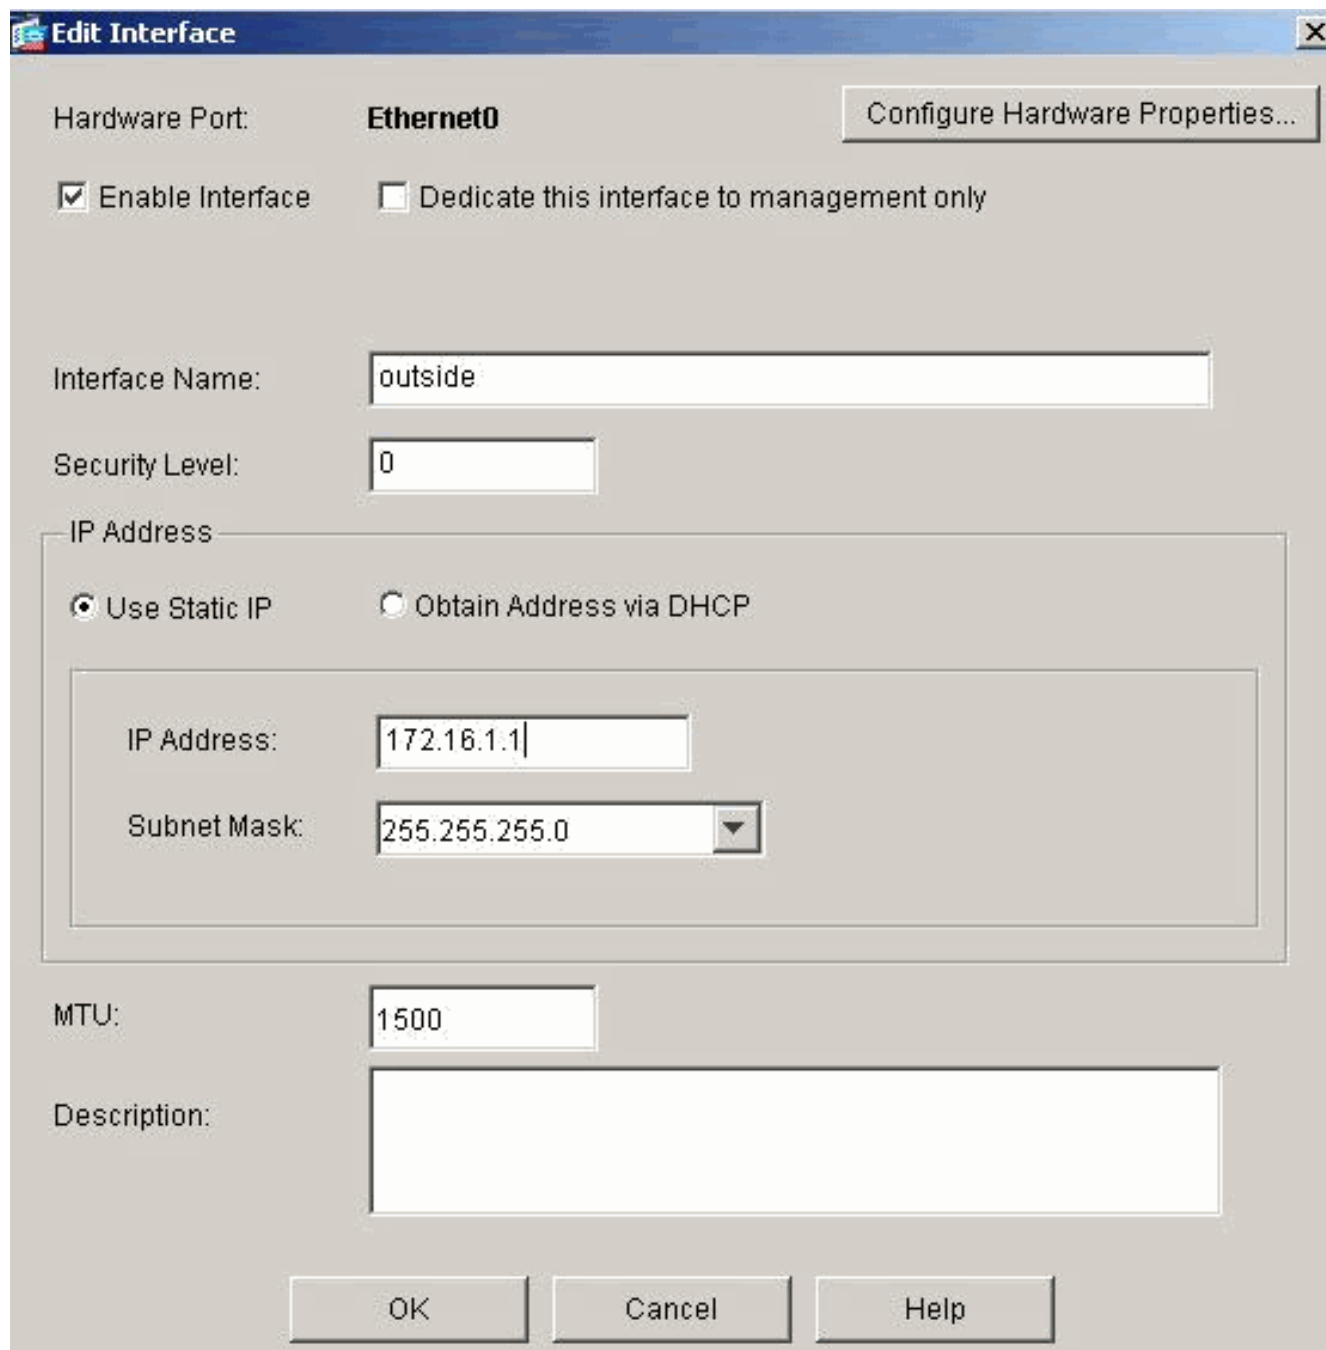

1. From workstation 10.1.1.5, open a web browser to use ASDM (in this example, <https://10.1.1.1>).
2. Click **yes** on the certificate prompts.
3. Log in with the enable password, as previously configured.
4. If this is the first time ASDM is run on the PC, you are prompted to use ASDM Launcher or ASDM as a Java App. In this example, the ASDM Launcher is selected and installed.
5. Go to the ASDM Home window and click **Configuration**.

6. Choose **Interface > Edit** in order to configure the outside interface.

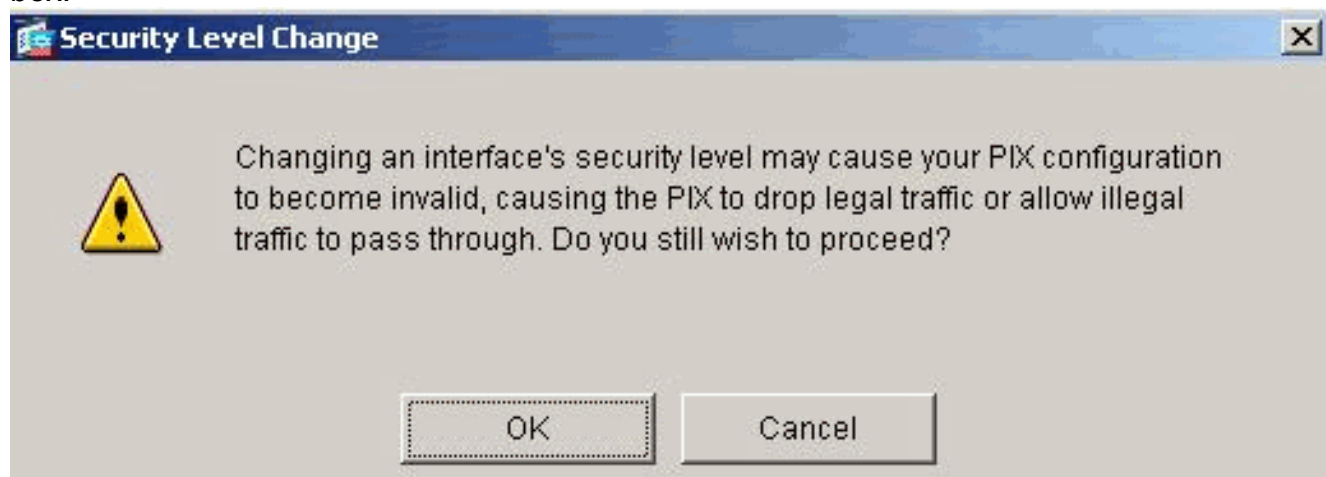

7. Enter the interface details and click **OK** when you are done.

The 'Edit Interface' dialog box is shown with the following configuration:

- Hardware Port: Ethernet0
- Buttons: Configure Hardware Properties...
- Enable Interface: ☒ (checked)
- Dedicate this interface to management only: ☐ (unchecked)
- Interface Name: outside
- Security Level: 0
- IP Address section:
 - Use Static IP: ☒ (selected)
 - Obtain Address via DHCP: ☐ (unchecked)
 - IP Address: 172.16.1.1
 - Subnet Mask: 255.255.255.0
- MTU: 1500
- Description: (empty text box)
- Buttons: OK, Cancel, Help

8. Click **OK** on the Security Level Change dialog box.

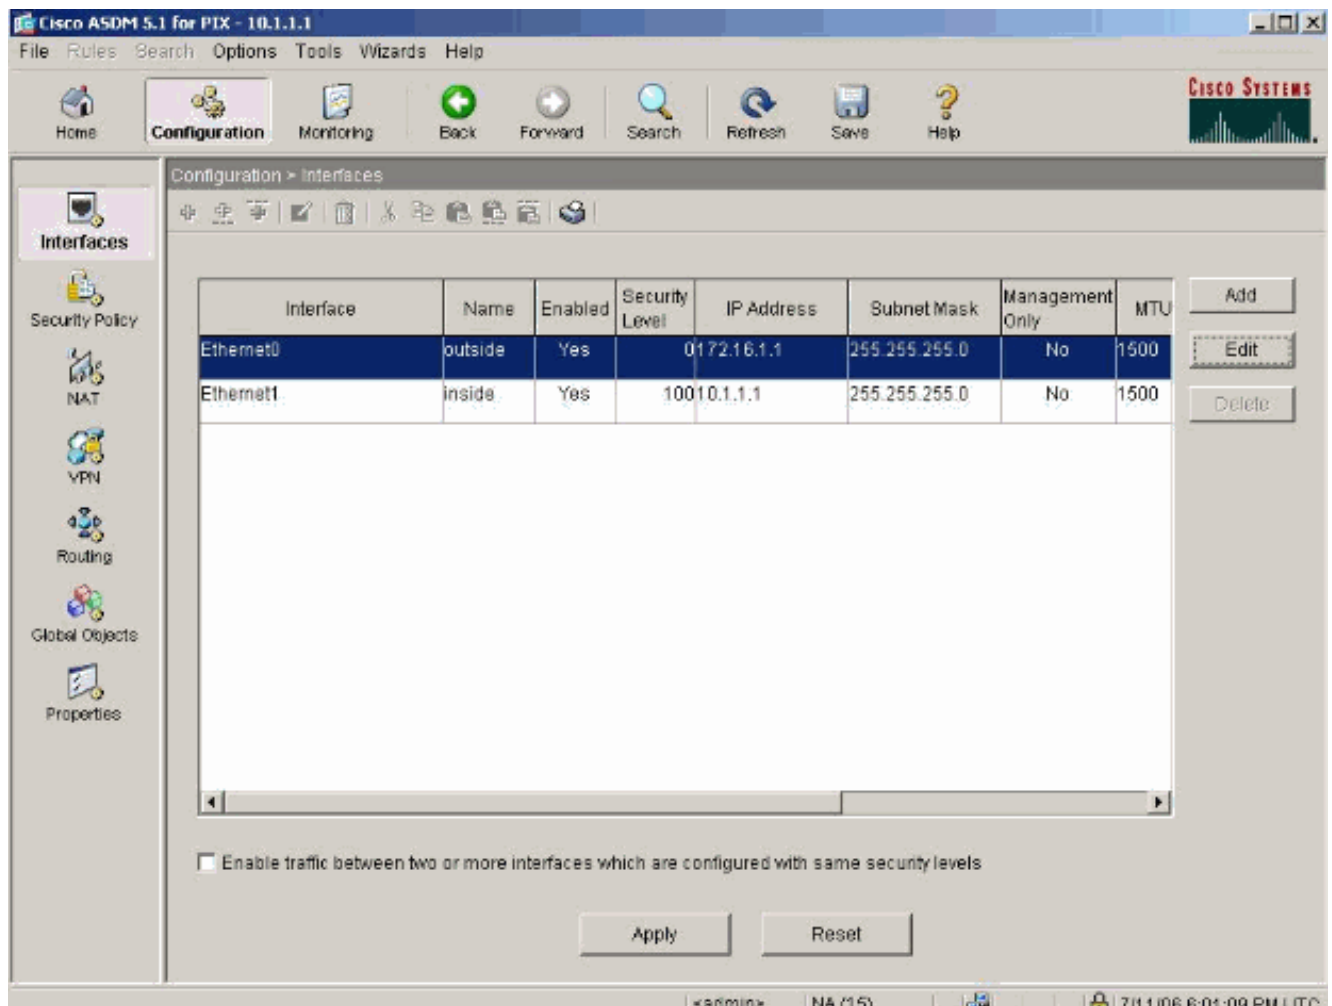

The 'Security Level Change' dialog box displays a warning message:

 Changing an interface's security level may cause your PIX configuration to become invalid, causing the PIX to drop legal traffic or allow illegal traffic to pass through. Do you still wish to proceed?

Buttons: OK, Cancel

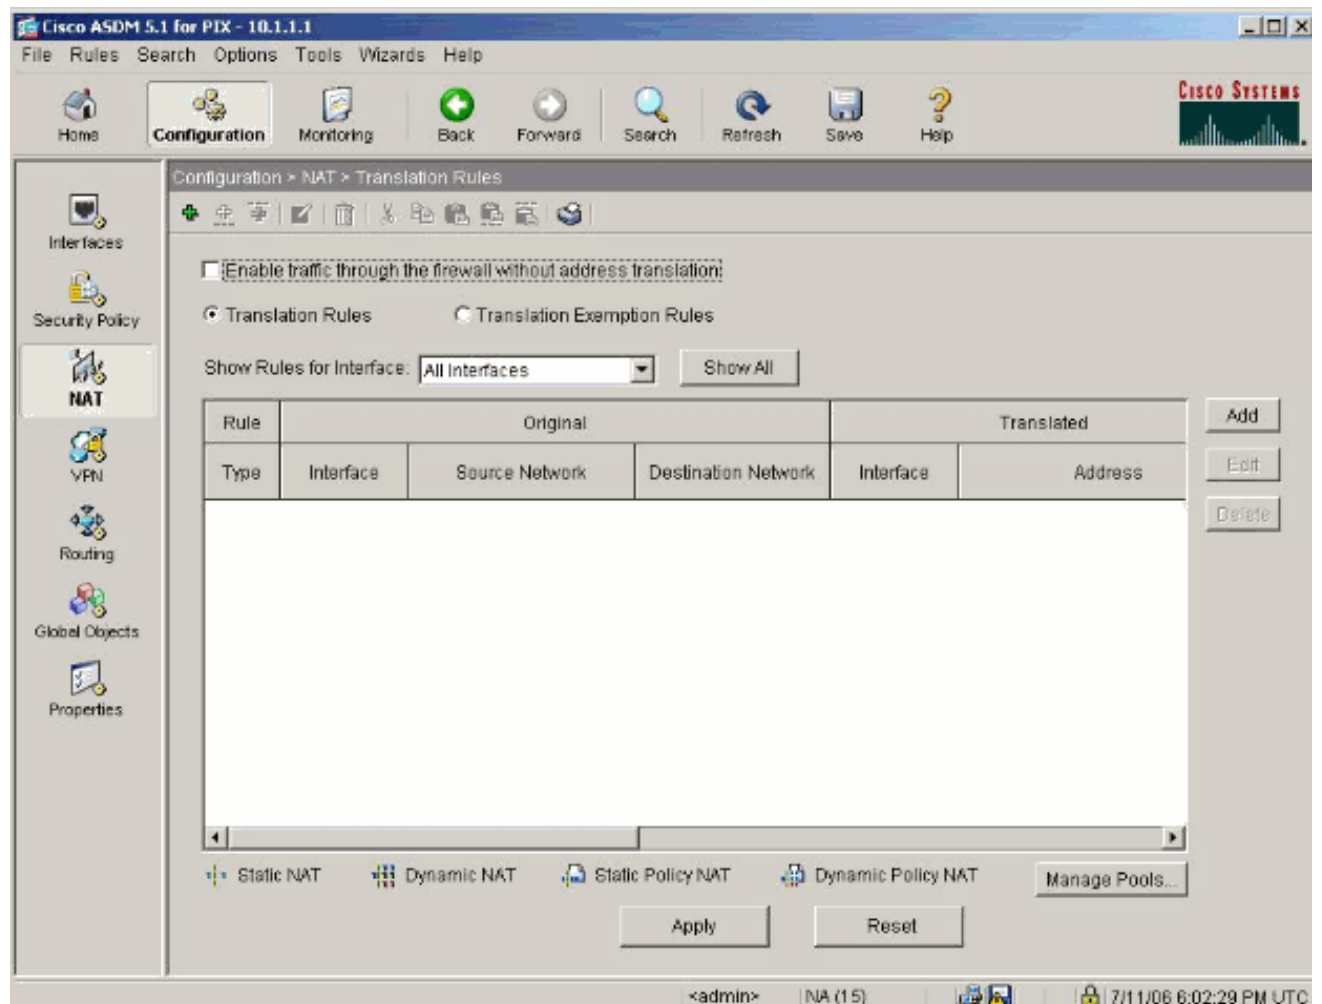

9. Click **Apply** to accept the interface configuration. The configuration also gets pushed onto the PIX.

- Choose **Security Policy** on the Features tab in order to review the security policy rule used. In this example, the default inside rule is used.

11. In this example, NAT is used. Uncheck the **Enable traffic through the firewall without address translation** check box and click **Add** in order to configure the NAT rule.

12. Configure the Source Network. In this example, 10.0.0.0 is used for the IP address, and 255.0.0.0 is used for the mask. Click **Manage Pools** in order to define the NAT pool addresses.

Add Address Translation Rule

☒ Use NAT ☐ Use Policy NAT

Source Host/Network

Interface:

IP Address:

Mask:

Translate Address on Interface:

Translate Address To

☐ Static IP Address:

☐ Redirect port

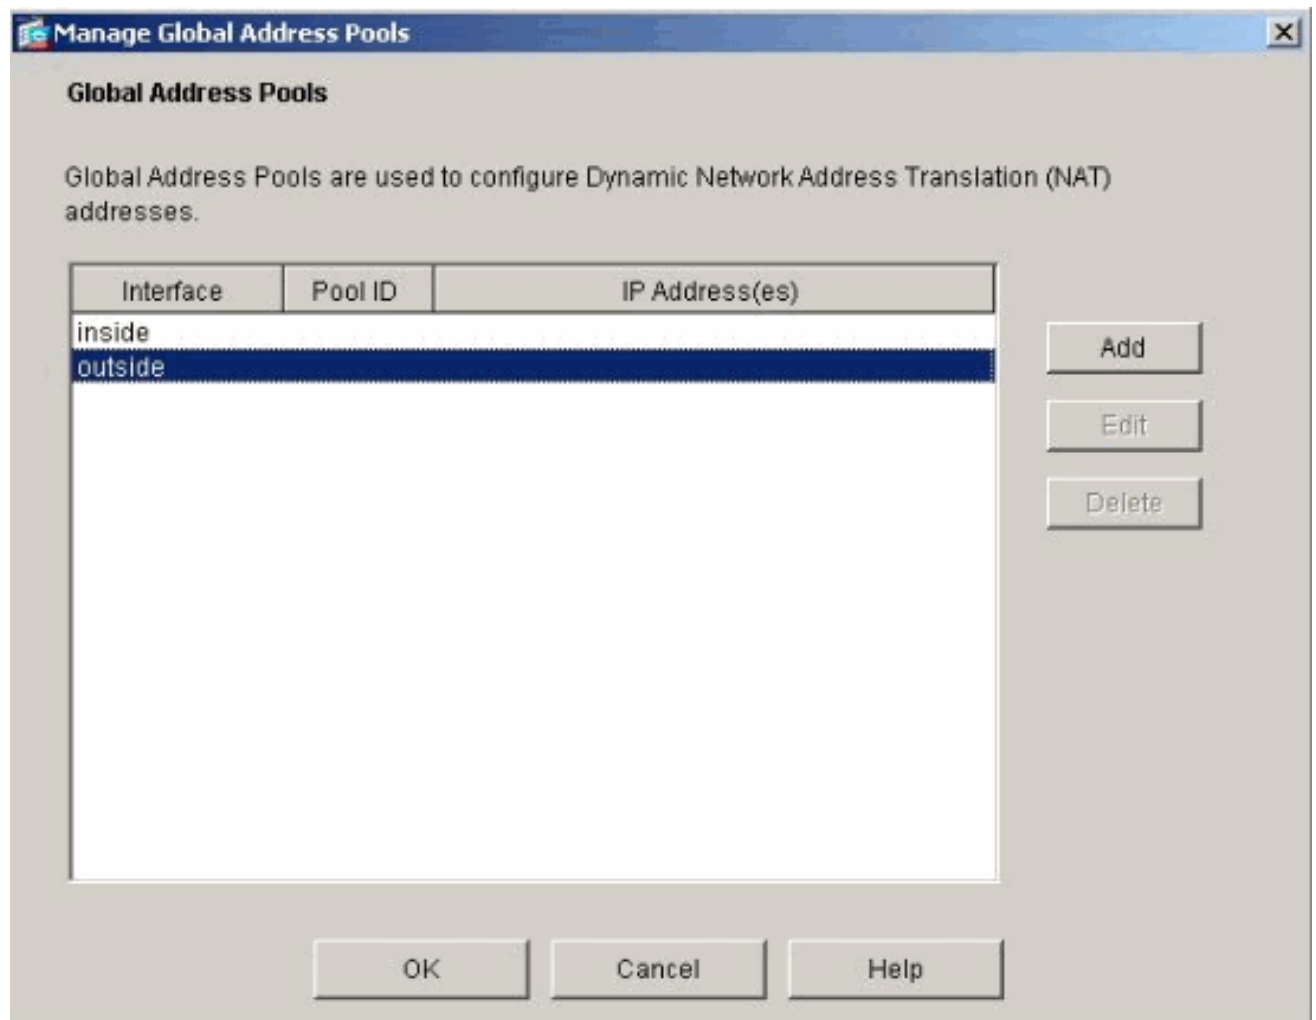

☒ TCP Original port: Translated port:

☐ UDP

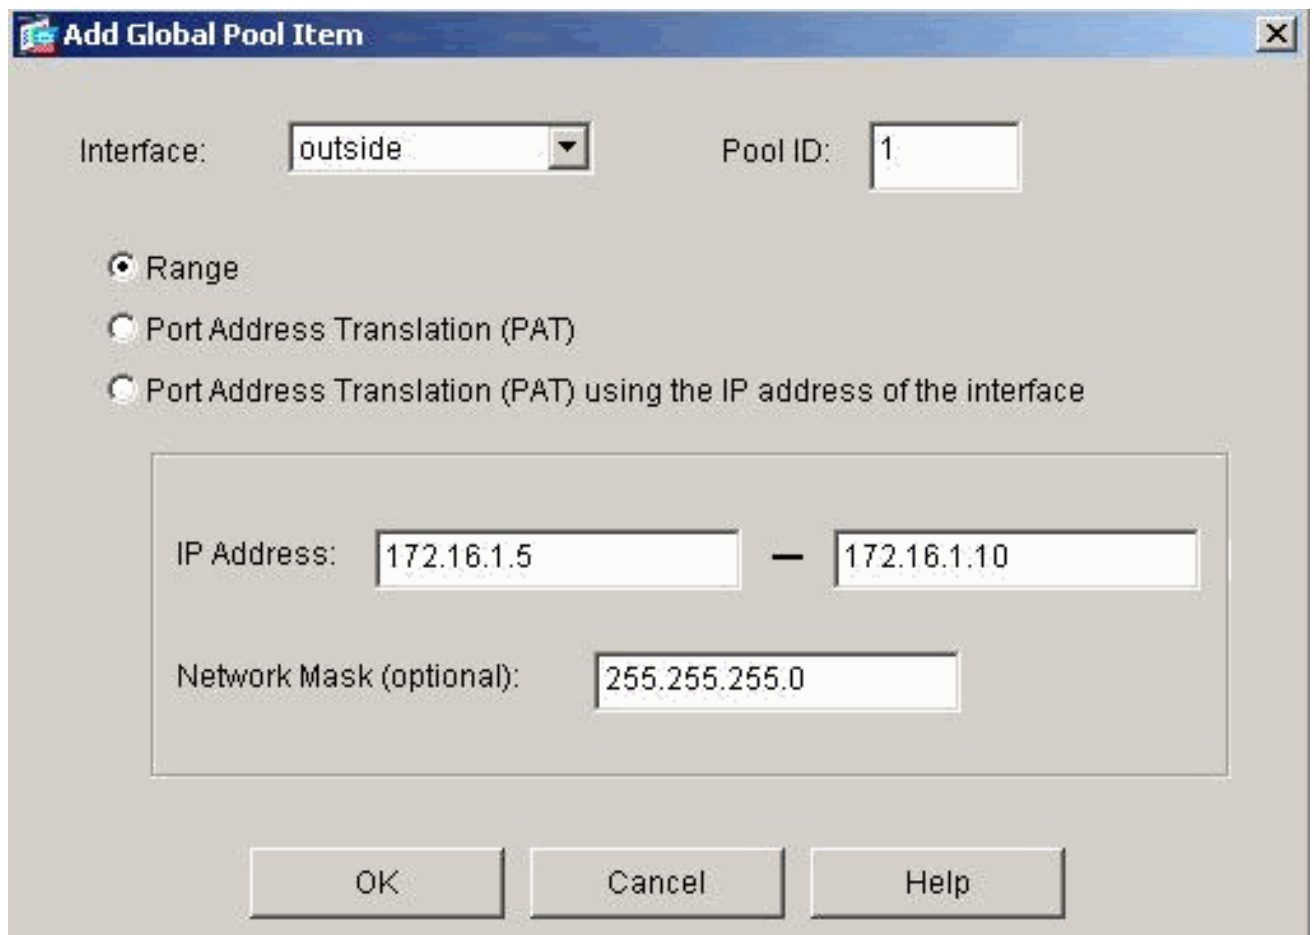

☒ Dynamic Address Pool:

Pool ID	Address
N/A	No address pool defined

13. Select the outside interface and click **Add**.

14. In this example, a Range and PAT address pool are configured. Configure the range NAT pool address and click **OK**.

The dialog box is titled "Add Global Pool Item". It has a standard Windows window frame with a title bar, maximize button, and close button. The interface consists of several fields and radio buttons. At the top, there is a label "Interface:" followed by a dropdown menu showing "outside", and a label "Pool ID:" followed by a text box containing "1". Below these are three radio buttons: "Range" (selected), "Port Address Translation (PAT)", and "Port Address Translation (PAT) using the IP address of the interface". A large rectangular box contains two rows of input fields. The first row is labeled "IP Address:" and contains two text boxes with "172.16.1.5" and "172.16.1.10" separated by a minus sign. The second row is labeled "Network Mask (optional):" and contains a text box with "255.255.255.0". At the bottom of the dialog are three buttons: "OK", "Cancel", and "Help".

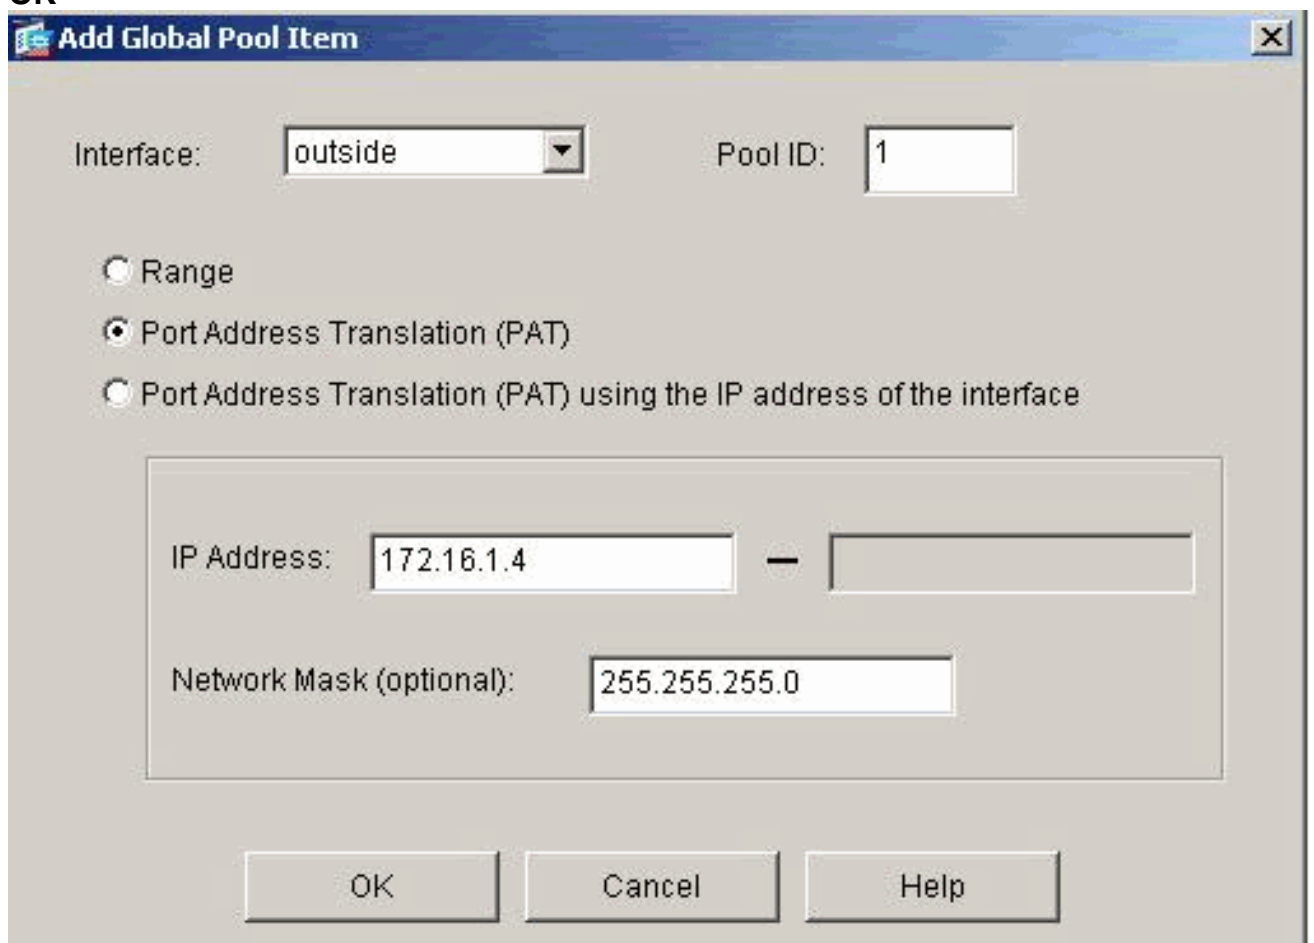

Interface: Pool ID:

☒ Range
☐ Port Address Translation (PAT)
☐ Port Address Translation (PAT) using the IP address of the interface

IP Address: —

Network Mask (optional):

15. Select the outside interface in step 13 in order to configure the PAT address. Click **OK**

This dialog box is identical in layout to the one above, but with different values. The "Interface:" dropdown still shows "outside" and the "Pool ID:" text box still contains "1". The "Range" radio button is now unselected, and the "Port Address Translation (PAT)" radio button is now selected. The "IP Address:" row now has a text box with "172.16.1.4" and an empty text box, separated by a minus sign. The "Network Mask (optional):" text box still contains "255.255.255.0". The "OK", "Cancel", and "Help" buttons remain at the bottom.

Interface: Pool ID:

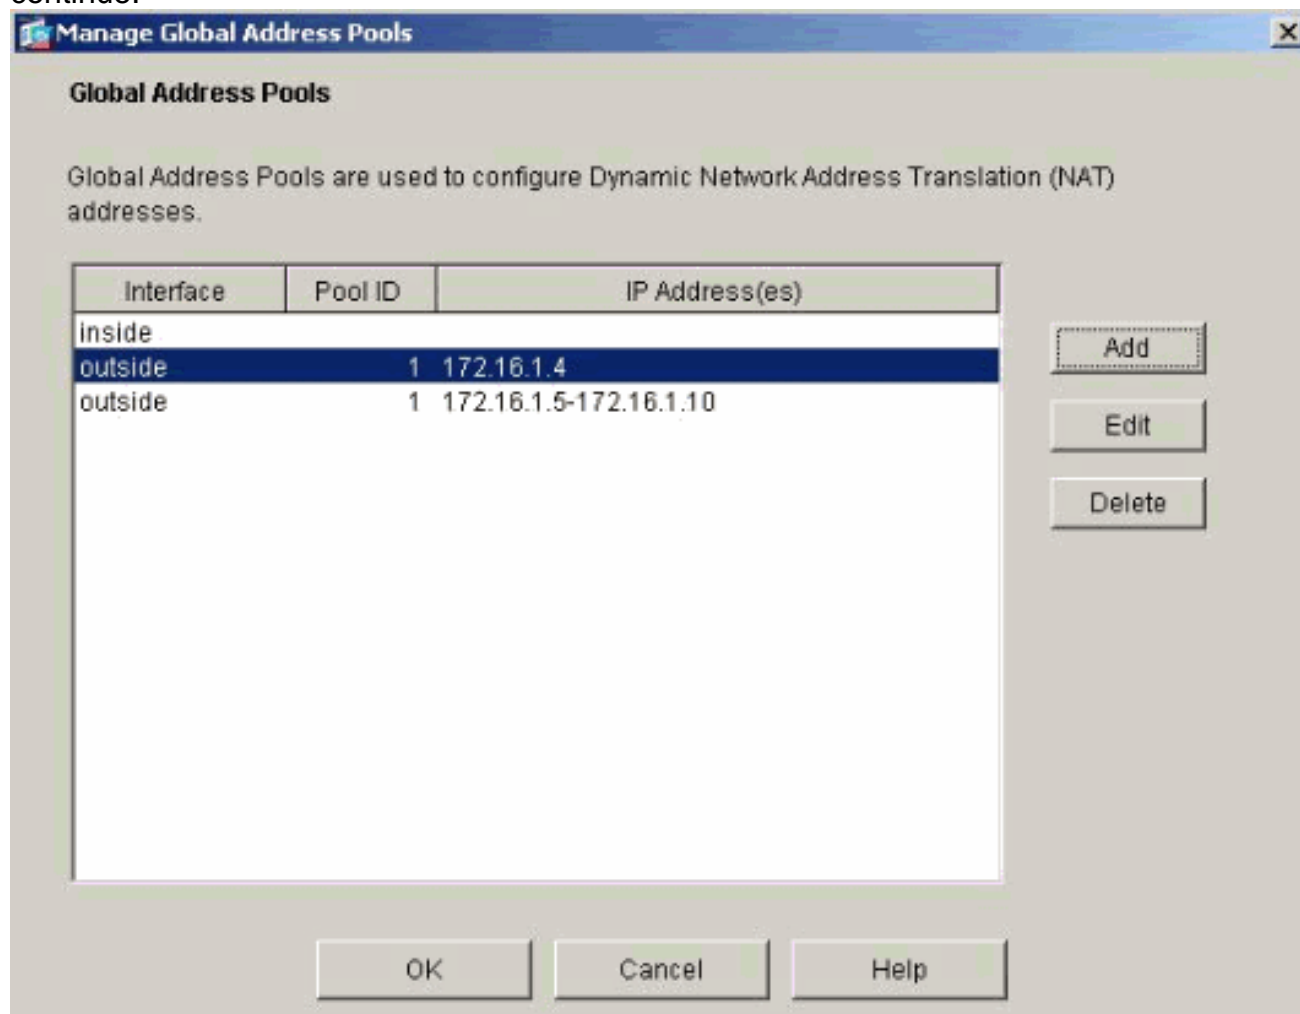

☐ Range
☒ Port Address Translation (PAT)
☐ Port Address Translation (PAT) using the IP address of the interface

IP Address: —

Network Mask (optional):

Click **OK** in order to

continue.

16. On the Edit Address Translation Rule window, select the Pool ID to be used by the source network configured. Click **OK**.

Edit Address Translation Rule

☒ Use NAT ☐ Use Policy NAT

Source Host/Network

Interface:

IP Address:

Mask:

Translate Address on Interface:

Translate Address To

☐ Static IP Address:

☐ Redirect port

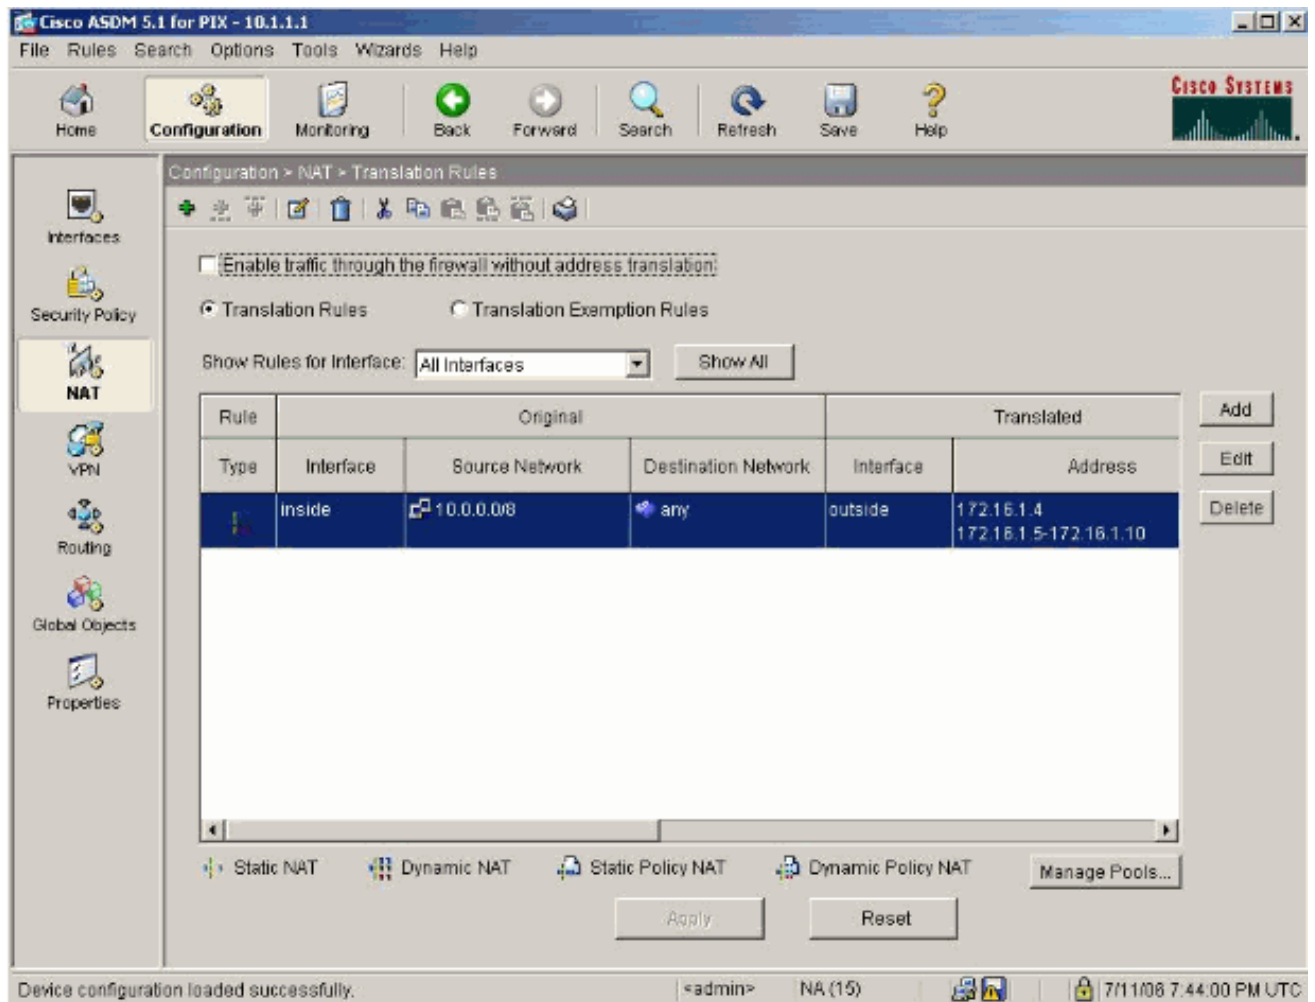

☒ TCP Original port: Translated port:

☐ UDP

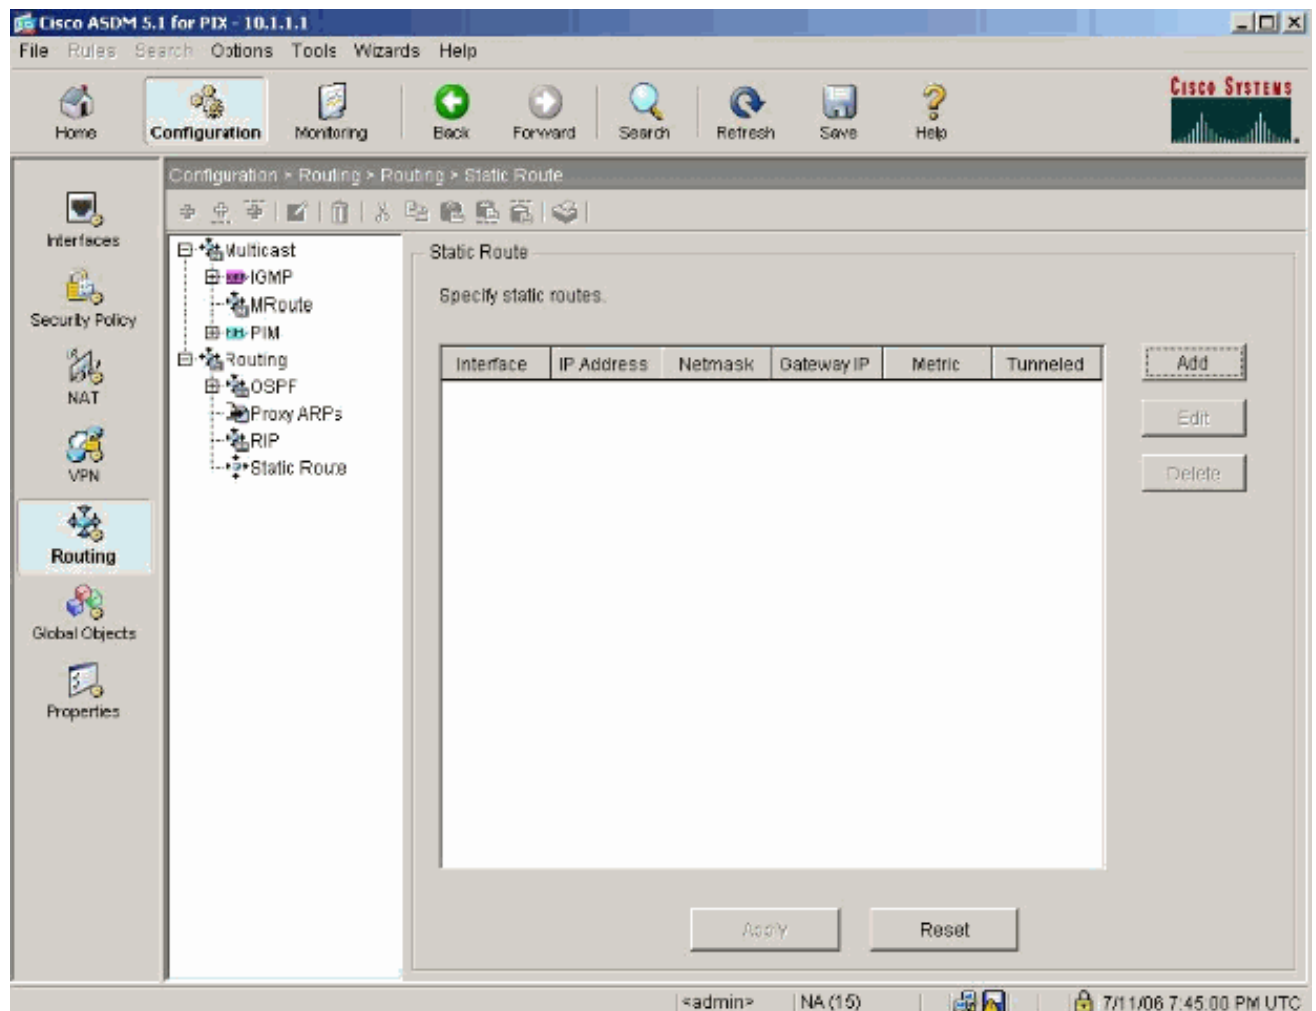

☒ Dynamic Address Pool:

Pool ID	Address
1	172.16.1.4 172.16.1.5-172.16.1.10

17. Click **Apply** in order to push the configured NAT rule to the PIX.

18. In this example, static routes are used. Click **Routing**, choose **Static Route** and click **Add**.

19. Configure the default gateway and click

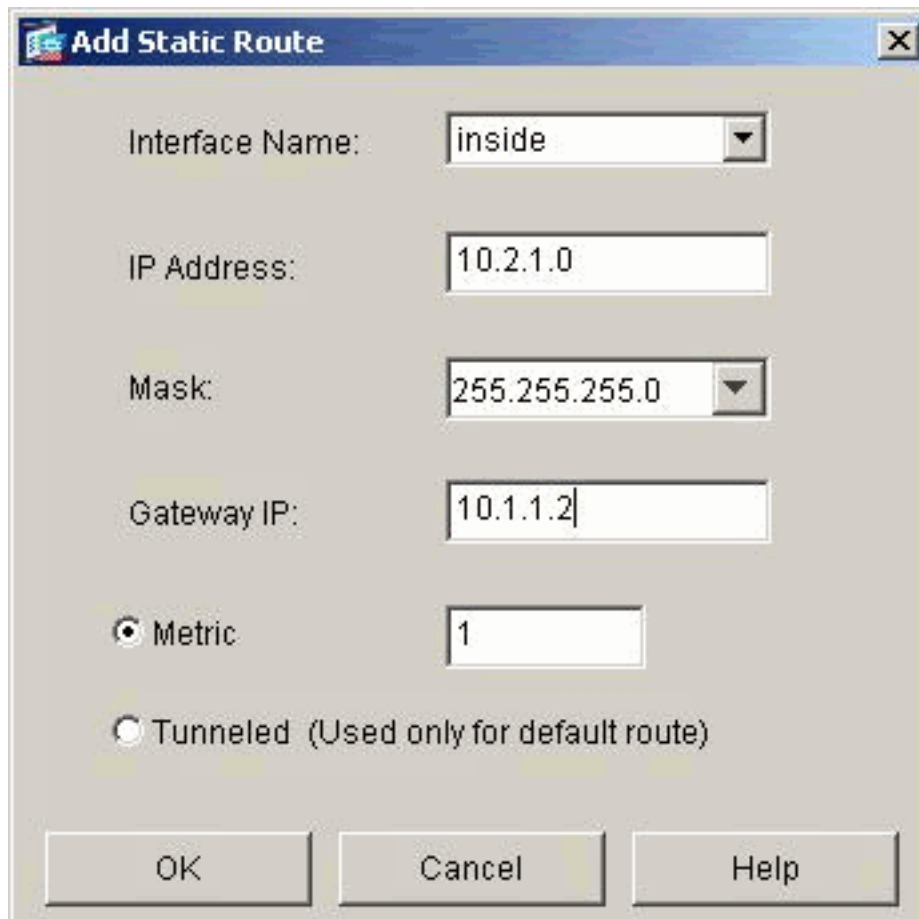

The 'Add Static Route' dialog box is shown. It contains the following fields and options:

- Interface Name:
- IP Address:
- Mask:
- Gateway IP:
- ☒ Metric
- ☐ Tunneled (Used only for default route)

Buttons at the bottom: OK, Cancel, Help.

OK.

20. Click **Add** and add the routes to the inside

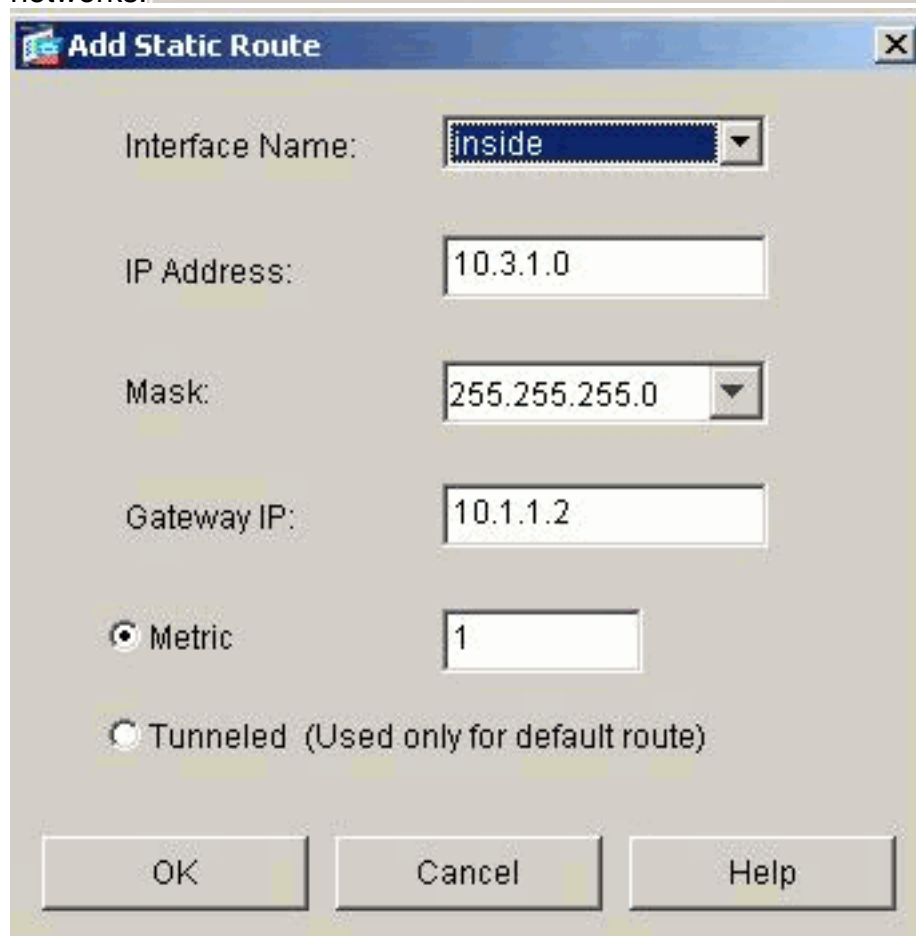

The 'Add Static Route' dialog box is shown with the following configuration:

- Interface Name: inside
- IP Address: 10.2.1.0
- Mask: 255.255.255.0
- Gateway IP: 10.1.1.2
- ☒ Metric: 1
- ☐ Tunneled (Used only for default route)

Buttons: OK, Cancel, Help

networks.

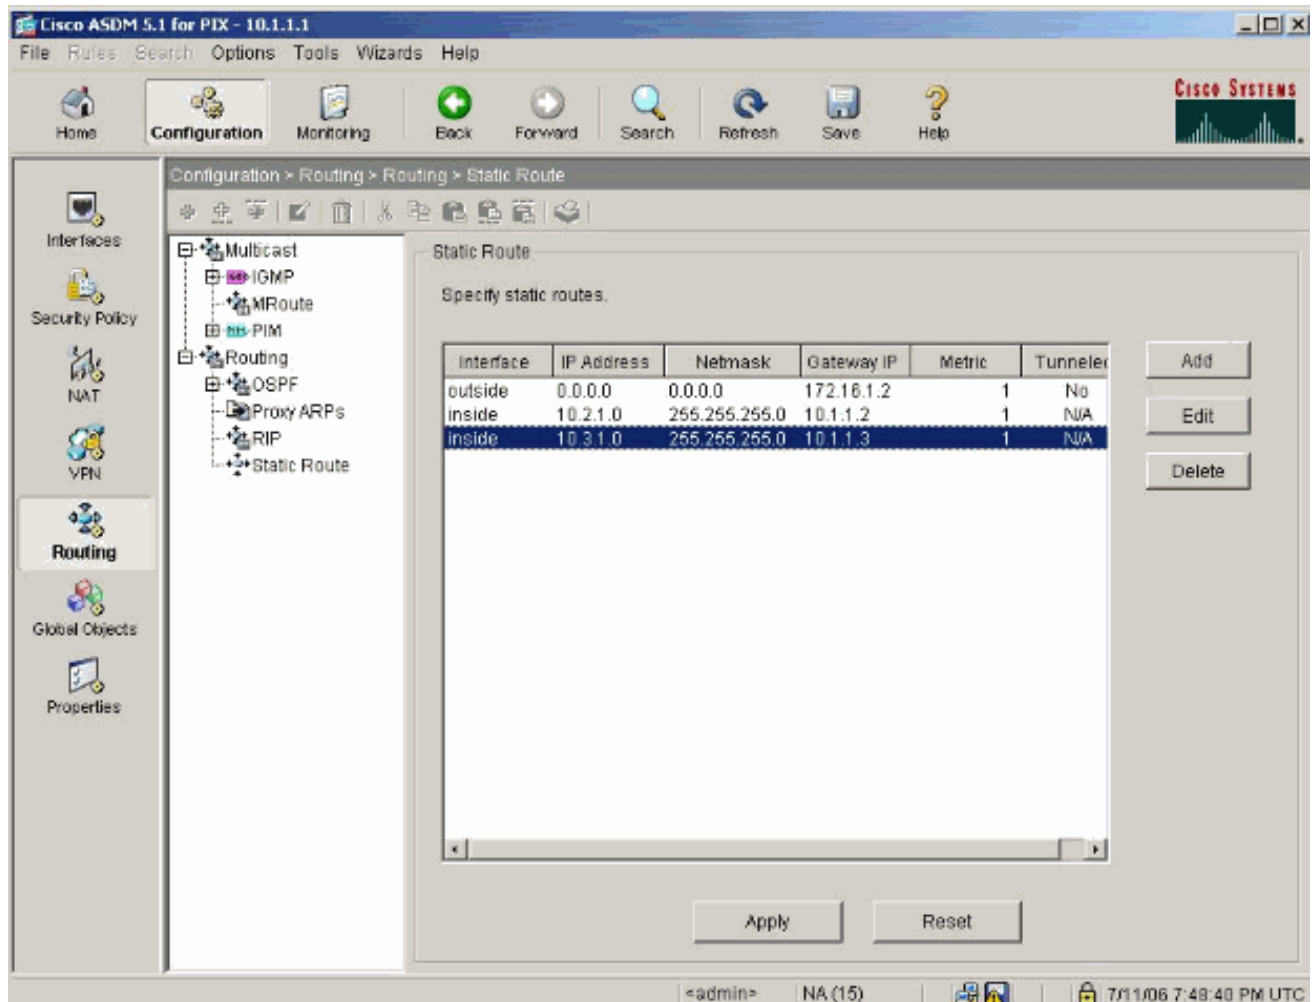

The 'Add Static Route' dialog box is shown with the following configuration:

- Interface Name: inside
- IP Address: 10.3.1.0
- Mask: 255.255.255.0
- Gateway IP: 10.1.1.2
- ☒ Metric: 1
- ☐ Tunneled (Used only for default route)

Buttons: OK, Cancel, Help

21. Confirm that the correct routes are configured and click **Apply**.

PIX Configuration using CLI

Configuration via the ASDM GUI is now complete.

You can see this configuration via the CLI:

PIX Security Appliance CLI

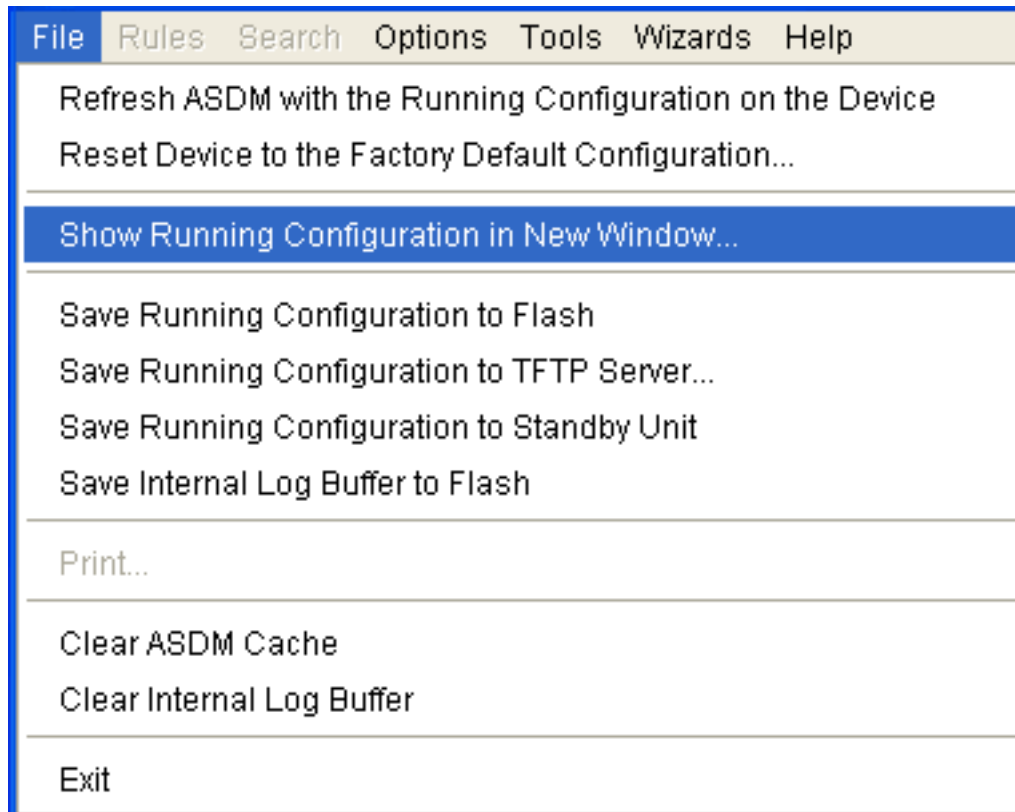

```

Choose **File > Show Running Configuration in New Window** in order to view the CLI configuration in ASDM.

Verify

There is currently no verification procedure available for this configuration.

Troubleshoot

Troubleshooting Commands

The [Output Interpreter Tool](#) ([registered](#) customers only) (OIT) supports certain **show** commands. Use the OIT to view an analysis of **show** command output.

Note: Refer to [Important Information on Debug Commands](#) before you use **debug** commands.

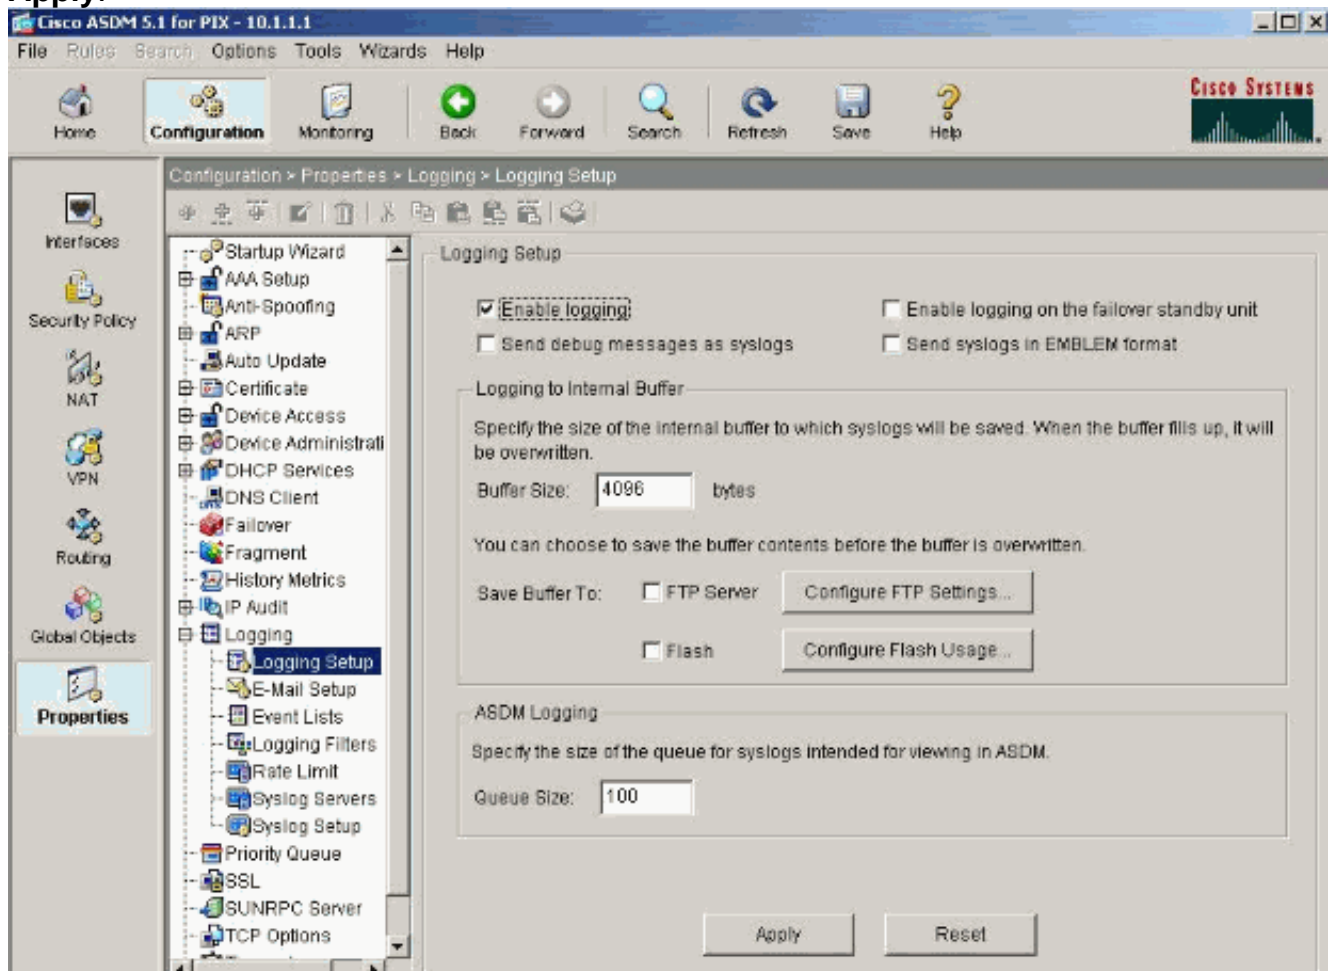

- **debug icmp trace**—Shows whether ICMP requests from the hosts reach the PIX. In order to run this debug, you need to add the **access-list** command to permit ICMP in your configuration.
- **logging buffer debugging**—Shows connections that are established and denied to hosts that

go through the PIX. The information is stored in the PIX log buffer and you can see the output with the **show log** command.

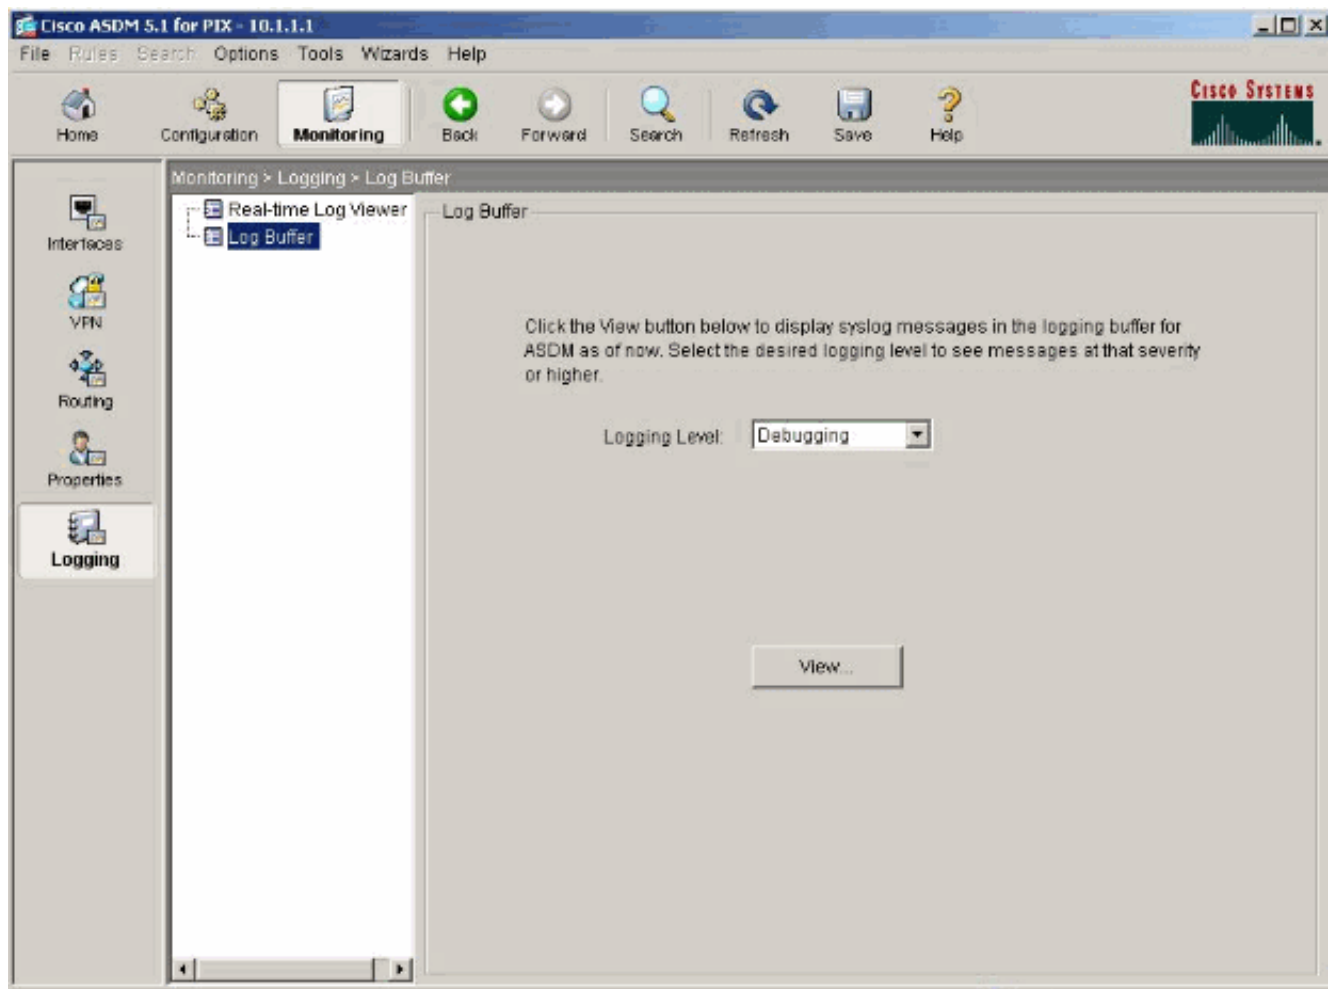

Troubleshooting Procedure

ASDM can be used to enable logging, and also to view the logs:

1. Choose **Configuration > Properties > Logging > Logging Setup**, check **Enable Logging**, and click **Apply**.

2. Choose **Monitoring > Logging > Log Buffer > Logging Level** and choose **Logging Buffer** from the drop-down list. Click **View**.

3. Here is an example of the Log Buffer:

Log Buffer		
Refresh Save Clear Color Settings Create Rule Show Rule Find: <input type="text"/> Help		
This table shows syslog messages in ASDM logging buffer as of now.		
Severity	Time	Message ID: Description

Unable to Access Websites by Name

In certain scenarios, the internal networks cannot access the internet websites by using name (works with IP address) in the web browser. This issue is common and usually occurs if the DNS server is not defined, especially in cases where PIX/ASA is the DHCP server. Also, this can occur in cases if the PIX/ASA is unable to push the DNS server or if the DNS server is not reachable.
