Introduction

This document describes how to understand and troubleshoot EtherChannels on Catalyst 9000 series switches.

Prerequisites

Requirements

Cisco recommends that you have knowledge of these topics:

- Catalyst 9000 Series Switches Architecture
- Cisco IOS® XE Software Architecture
- Link Aggregation Control Protocol (LACP) and Port Aggregation Protocol (PAgP)

Components Used

The information in this document is based on these hardware versions:

- Catalyst 9200

- Catalyst 9300
- Catalyst 9400
- Catalyst 9500
- Catalyst 9600

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, ensure that you understand the potential impact of any command.

Background Information

Please refer to the Cisco Official Release Notes and Configuration Guides for up-to-date information about the limitations, restrictions, configuration options, and caveats as well as any other relevant details about this feature.

EtherChannel provides fault-tolerant high-speed links between switches, routers, and servers. Use the EtherChannel to increase the bandwidth between devices, and deploy it anywhere in the network where bottlenecks are likely to occur. EtherChannel provides automatic recovery for the loss of a link, it redistributes the load across the remaining links. If a link fails, EtherChannel redirects traffic from the failed link to the remaining links in the channel without intervention.

EtherChannels can be configured with no negotiation or dynamically negotiate with the support of a Link Aggregation Protocol, either PAgP or LACP.

When you enable PAgP or LACP, a switch learns the identity of partners and the capabilities of each interface. The switch then dynamically groups interfaces with similar configurations into a single logical link (channel or aggregate port); the switch bases these interface groups on hardware, administrative, and port parameter constraints.

LACP Flags

LACP flags are used to negotiate port-channel parameters when it comes up. Have a look at the meaning of every flag:

Flag	Status
LACP Activity (less significant bit)	0 = Passive mode 1 = Active mode
LACP Timeout: Indicates the LACP sent/received timeout	0 = Long timeout. 3 x 30 sec (default) 1 = Short timeout. 3 x 1 sec (LACP rate fast)
Aggregation	0 = Individual link (not considered for aggregation) 1 = Aggregatable (potential candidate for aggregation)

Synchronization	0 = The link is out of Sync (non-good state) 1 = The link is in Sync (good state)
Collecting	0 = Not ready to receive/process the frames 1 = Ready to receive/process the frames
Distributing	0 = Not ready to send/transmit the frames 1 = Ready to send/transmit the frames
Defaulted	0 = It uses the information in the received PDU for the partner 1 = It uses default info for Partner
Expired (most significant bit)	0 = PDU is expired, 1 = PDU is valid

The expected value for LACP flags is 0x3D (hex) or 0111101 (binary) to reach the P (bundled in port-channel) status.

```

.... ...1 = LACP Activity (less significant bit)
.... ..0. = LACP Timeout
.... .1.. = Aggregation
.... 1... = Synchronization

...1 .... = Collecting
..1. .... = Distributing
.0.. .... = Defaulted
0... .... = Expired (most significant bit)

```

Network Diagram

Verify LACP Operation

This section describes how to verify the correct state and operation of the LACP protocol.

Basic Checks

Check the LACP outputs with these commands:

```
<#root>
```

```
show lacp sys-id
```

```
show lacp <channel-group number> neighbor
```

```
show lacp <channel-group number> counters
```

```
show interfaces <interface ID> accounting
```

```
debug lacp [event|packet|fsm|misc]
```

```
debug condition <condition>
```

The first command output displays the switch system ID and its priority (for LACP).

```
<#root>
```

```
switch#
```

```
show lacp sys-id
```

```
32768,
```

```
f04a.0206.1900 <-- Your system MAC address
```

Check the details of the LACP neighbor, such as the operational mode, neighbor system Dev ID, and its priority.

```
<#root>
```

```
switch#
```

```
show lacp 1 neighbor
```

```
Flags:  S - Device is requesting Slow LACPDUs
        F - Device is requesting Fast LACPDUs
        A - Device is in Active mode          P - Device is in Passive mode
```

```
Channel group 1 neighbors
```

Port	Flags	LACP port Priority	Admin	Oper	Port	Port
------	-------	-----------------------	-------	------	------	------

```
Dev ID
```

	Age	key	Key	Number	State
Gi1/0/1		SA	32768		

```
f04a.0205.d600
```

```
12s 0x0 0x1 0x102 0x3D
```

```
<-- Dev ID: Neighbor MAC Address
```

Gi1/0/2	SA	32768
---------	----	-------

```
f04a.0205.d600
```

```
24s 0x0 0x1 0x103 0x3D
```

```
<-- Dev ID: Neighbor MAC Address
```

Gi1/0/3	SA	32768
---------	----	-------

```
f04a.0205.d600
```

```
16s 0x0 0x1 0x104 0x3D
```

```
<-- Dev ID: Neighbor MAC Address
```

Gi1/0/4	SA	32768
---------	----	-------

```
f04a.0205.d600
```

```
24s 0x0 0x1 0x105 0x3D
```

```
<-- Dev ID: Neighbor MAC Address
```

Validate LACP packets sent and received by each interface. If corrupt LACP packets are detected, the Pkts Err counter increases.

```
<#root>
```

switch#

show lacp 1 counters

Port	LACPDUs Sent	Recv	Marker Sent	Recv	Marker Response Sent	Recv	LACPDUs Pkts Err
------	-----------------	------	----------------	------	-------------------------	------	---------------------

Channel group: 1

Gil/0/1

3111 3085

0 0 0 0

0

Gil/0/2

3075 3057

0 0 0 0

0

Gil/0/3

3081 3060

0 0 0 0

0

Gil/0/4

3076 3046

0 0 0 0

0

There is also an option to check the interface accounting for LACP.

<#root>

switch#

show int gil/0/1 accounting

GigabitEthernet1/0/1

Protocol	Pkts In	Chars In	Pkts Out	Chars Out
Other	0	0	10677	640620
PAgP	879	78231	891	79299
Spanning Tree	240	12720	85	5100
CDP	2179	936495	2180	937020
DTP	3545	170160	3545	212700
LACP	3102	384648	3127	387748

Debugs

When there is no LACP sync-up or when the remote peer does not run LACP, Syslog messages are generated.

```
%ETC-5-L3DONTBN DL2: Gig1/0/1 suspended: LACP currently not enabled on the remote port.  
%ETC-5-L3DONTBN DL2: Gig1/0/1 suspended: LACP currently not enabled on the remote port.
```

Enable LACP debugs with the use of these commands:

```
<#root>
```

```
debug lacp [event|packet|fsm|misc]
```

```
debug condition <condition>
```

If you notice LACP negotiation issues, **enable** LACP debugs to analyze why.

```
<#root>
```

```
switch#
```

```
debug lacp event
```

```
Link Aggregation Control Protocol events debugging is on  
switch#
```

```
debug lacp packet
```

```
Link Aggregation Control Protocol packet debugging is on  
switch#
```

```
debug lacp fsm
```

```
Link Aggregation Control Protocol fsm debugging is on  
switch#
```

```
debug lacp misc
```

```
Link Aggregation Control Protocol miscellaneous debugging is on
```

If needed, also **enable** debug condition to a specific interface and filter the output.

<#root>

switch#

debug condition interface gigabitEthernet 1/0/1

Note: LACP debugs are platform agnostic.

Validate debugs and filters are set up.

<#root>

switch#

show debugging

Packet Infra debugs:

```

```
%LINK-3-UPDOWN: Interface Port-channel1, changed state to up
%LINEPROTO-5-UPDOWN: Line protocol on Interface Port-channel1, changed state to up
```

If you focus on the two most important lines of the LACP debugs, there are a few concepts worth to define some LACP PDUs concepts.

<#root>

LACP:

Act

: tlv:1, tlv-len:20,

key:0x1

, p-pri:0x8000, p:0x102,

p-state:0x3D

, s-pri:0x8000,

s-mac:f04a.0205.d600

LACP:

Part

: tlv:2, tlv-len:20,

key:0x1

, p-pri:0x8000, p:0x102,

p-state:0x3D

, s-pri:0x8000,

s-mac:f04a.0206.1900

Concept	Description
Act	Stands for actor (you)
Part	Stands for partner (your neighbor/peer)
key	It is the number of the port channel configured.

p-state	Stands for port state and it is the most important concept. It is built with 8 bits (LACP flags). Check the Background Information section for further information
s-mac	It is the system mac address used by LACP

Note: Values seen on debugs are hexadecimal, to properly read the values they must be translated to decimal or binary systems.

Verify PAgP Operation

This section describes how to verify the correct state and operation of the PAgP protocol.

Basic Checks

Check the PAgP outputs with these commands:

```
<#root>
```

```
show pagp <channel-group number> neighbor
```

```
show pagp <channel-group number> counters
```

```
show interfaces <interface ID> accounting
```

Check the details of the PAgP neighbor, such as the operational mode, partner system ID, hostname, and priority.

```
<#root>
```

```
switch#
```

```
show pagp 1 neighbor
```

```
Flags:  S - Device is sending Slow hello.  C - Device is in Consistent state.
        A - Device is in Auto mode.        P - Device learns on physical port.
```

```
Channel group 1 neighbors
    Partner
```

```
Partner
```

```
Port          Partner          Partner Group
              Name
Device ID
```

```

      Port      Age  Flags    Cap.
Gi1/0/1      switch
f04a.0205.d600

      Gi1/0/1      16s  SC          10001
<-- Dev ID: Neighbor MAC Address

Gi1/0/2      switch
f04a.0205.d600

      Gi1/0/2      19s  SC          10001
<-- Dev ID: Neighbor MAC Address

Gi1/0/3      switch
f04a.0205.d600

      Gi1/0/3      17s  SC          10001
<-- Dev ID: Neighbor MAC Address

Gi1/0/4      switch
f04a.0205.d600

      Gi1/0/4      15s  SC          10001
<-- Dev ID: Neighbor MAC Address

```

Validate the output details of the PAgP packets sent and received by each interface. If corrupt PAgP packets are detected, the Pkts Err counter increases.

<#root>

switch#

show pagp 1 counters

Port	Information		Flush		PAgP

Verify Etherchannel Programming

This section describes how to verify the software and hardware settings for EtherChannel.

Verify Software

Validate the software entries.

```
<#root>
```

```
show run interface <interface ID>
```

```
show etherchannel <channel-group number> summary
```

Check the EtherChannel configuration.

```
<#root>
```

```
switch#
```

```
show run int gigabitEthernet 1/0/1
```

```
<output omitted>
interface GigabitEthernet1/0/1
  channel-group 1 mode active
end
```

```
switch#
```

```
show run int gigabitEthernet 1/0/2
```

```
<output omitted>
interface GigabitEthernet1/0/2
  channel-group 1 mode active
end
```

```
switch#
```

```
show run int gigabitEthernet 1/0/3
```

```
<output omitted>
interface GigabitEthernet1/0/3
  channel-group 1 mode active
end
```

```
switch#
```

```
show run int gigabitEthernet 1/0/4
```

```
<output omitted>
interface GigabitEthernet1/0/4
  channel-group 1 mode active
end
```

```
switch#
```

```
show run int port-channel 1
```

```
<output omitted>
interface Port-channel1
end
```

Validate all port members are bundled in the port channel.

```
<#root>
```

```
switch#
```

```
show etherchannel 1 summary
```

```
<output omitted>
```

Group	Port-channel	Protocol	Ports
1	Po1(SU)	LACP	Gi1/0/1(P) Gi1/0/2(P) Gi1/0/3(P) Gi1/0/4(P)

Verify Hardware

Validate software entries at the hardware level:

```
<#root>
```

```
show platform software interface switch <switch number or role> r0 br
```

```
show platform software fed switch <switch number or role> etherchannel <channel-group number> group-mask
```

```
show platform software fed switch <switch number or role> ifm mappings etherchannel
```

```
show platform software fed switch <switch number or role> ifm if-id <if ID>
```

Check the ID of the port channel and bundled interfaces.

```
<#root>
```

```
switch#
```

```
show platform software interface switch active r0 br
```

Forwarding Manager Interfaces Information

Name

ID

```

                                QFP ID

Platform Tools

This table shows what tools and features are available in order to help understand when to use them:

Tool	Level	When to use it
EPC	Hardware and software	Use it to validate LACP frames landed at the physical interface or to validate they reach out to the CPU.
Platform Forward	Hardware	If you confirmed LACP frames landed on the switch, use this tool to know the internal forwarding decision of the switch.
PSV	Hardware	If you confirmed LACP frames landed on the switch, use this tool to know the internal forwarding decision of the switch.
CoPP	Hardware	If the packet was forwarded to the CPU from a hardware perspective, however, was not seen at the software (CPU) level. It is very likely this feature dropped the LACP frame along the path between the hardware and the CPU.
FED CPU packet capture	Software	Use it to validate that the LACP frame was punted to the CPU through the right queue, it also validates if the CPU sends LACP frames back to the hardware.

Note: Only LACP protocol is analyzed with the use of these tools, however, they can also be used to analyze PAgP frames.

Embedded Packet Capture (EPC)

The commands to set up the Wireshark (EPC) and capture ingress/egress LACP PDUs.

<#root>

```
monitor capture <capture name> [control-plane|interface <interface ID>] BOTH
```

```
monitor capture <capture name> match mac [any|host <source MAC address>|<source MAC address>][any|host <
```

```
monitor capture <capture name> file location flash:<name>.pcap
```

```
show monitor capture <capture name> parameter
```

```
show monitor capture <capture name>
```

```
monitor capture <capture name> start
```

```
monitor capture <capture name> stop
```

```
show monitor capture file flash:<name>.pcap [detailed]
```

Note: Commands are entered under privilege mode.

Set up the Wireshark capture.

Tip: If you want to focus on a specific bundled interface and/or specific source MAC address tune the **interface** and **match mac** keywords.

<#root>

```
monitor capture CAP interface GigabitEthernet1/0/1 BOTH
```

```
monitor capture CAP interface GigabitEthernet1/0/2 BOTH
```

```
monitor capture CAP interface GigabitEthernet1/0/3 BOTH
```

```
monitor capture CAP interface GigabitEthernet1/0/4 BOTH
```

```
monitor capture CAP match mac any host 0180.c200.0002
```

```
show monitor capture CAP file location flash:CAP.pcap
```

Note: Destination MAC address **0180.c200.0002** defined on the capture helps you to filter LACP frames.

Verify the Wireshark was configured properly:

<#root>

switch#

show mon cap CAP parameter

```
monitor capture CAP interface GigabitEthernet1/0/1 BOTH
monitor capture CAP interface GigabitEthernet1/0/2 BOTH
monitor capture CAP interface GigabitEthernet1/0/3 BOTH
monitor capture CAP interface GigabitEthernet1/0/4 BOTH
monitor capture CAP match mac any host 0180.c200.0002
monitor capture CAP file location flash:LACP.pcap
```

switch#

show mon cap CAP

```

Note: Wireshark output format can differ on 9200 devices and not be readable from the switch. Export the capture and read it from your PC if that is the case.

Platform Forward

In order to debug forwarding information and to trace the packet path in the hardware forwarding plane, use the `show platform hardware fed switch <switch number or role> forward interface` command. This command simulates a user-defined packet and retrieves the forwarding information from the hardware forwarding plane. A packet is generated on the ingress port based on the packet parameters that you have specified in this command. You can also provide a complete packet from the captured packets stored in a PCAP file.

This topic elaborates only on the interface forwarding-specific options, that is, the options available with the `show platform hardware fed switch {switch_num|active|standby} forward interface` command.

```
<#root>
```

```

show platform hardware fed switch <switch number or role> forward interface <interface ID> <source mac address>
show platform hardware fed switch <switch number or role> forward interface <interface ID> pcap <pcap filename>
show platform hardware fed switch <switch number or role> forward interface <interface ID> vlan <VLAN ID>

```

Define the Platform Forward capture. In this case, CAP.pcap frame **1** is analyzed.

```
<#root>
```

```
switch#
```

```
show platform hardware fed switch active forward interface gigabitEthernet 1/0/1 pcap flash:CAP.pcap num
```

show forward is running in the background. After completion, syslog will be generated.

Once Platform Forward capture is done, the next Syslog messages are shown.

```
<#root>
```

```
switch#
```

```
show logging
```

```
<output omitted>
```

```
*Mar 28 16:47:57.289: %SHFWD-6-PACKET_TRACE_DONE: Switch 1 R0/0: fed: Packet Trace Complete: Execute (sh
```

```
*Mar 28 16:47:57.289: %SHFWD-6-PACKET_TRACE_FLOW_ID: Switch 1 R0/0: fed: Packet Trace Flow id is 1009909
```

Analyze the Platform Forward capture. The **Egress** section tells you what the internal forwarding decision was. LACP and PAgP frames are expected to be punted to the CPU.

```
<#root>
```

```
switch#
```

```
show platform hardware fed switch active forward last summary
```

Packet State Vector (PSV)

PSV is similar to Platform Forward captures with the exception that PSV captures live ingress frames from the network that matches the trigger criteria.

Note: PSV is only supported on C9500-32C, C9500-32QC, C9500-24Y4C, C9500-48Y4C, and C9606R platforms.

<#root>

```
debug platform hardware fed <switch number or role> capture trigger interface <interface ID> ingress
```

```
debug platform hardware fed <switch number or role> capture trigger layer2 <source MAC address> <destination MAC address>
```

```
show platform hardware fed <switch number or role> capture trigger
```

```
show platform hardware fed <switch number or role> capture status
```

```
show platform hardware fed <switch number or role> capture summary
```

Two C9500-48Y4C connected to each other are used for the next port channel and PSV capture.

```
<#root>
```

```
switch#
```

```
show etherchannel 1 summary
```

```
<output omitted>
```

```
Group Port-channel Protocol Ports
```

```
-----+-----+-----+-----
```

```
1 Po1(SU) LACP
```

```
Twel/0/1(P)
```

```
Twel/0/2(P)
```

Set up the trigger criteria. Use the **layer2** keyword to match with the specific source MAC address and the LACP MAC address as the destination.

```
<#root>
```

```
switch#debug platform hardware fed active capture trigger interface twentyFiveGigE1/0/1 ingress  
switch#debug platform hardware fed active capture trigger layer2
```

```
0000.0000.0000 0180.c200.0002 <-- match source MAC: any, match destination MAC: LACP MAC address
```

```
Capture trigger set successful.
```

Note: MAC address **0000.0000.0000** defined on the PSV capture means **match any**.

Validate trigger criteria were setup.

```
<#root>
```

```
switch#
```

```
show platform hardware fed active capture trigger
```

```
Trigger Set:
```

```
Ingress Interface: TwentyFiveGigE1/0/1
```

```
Dest Mac: 0180.c200.0002
```

Once PST has been triggered, the status is shown as **Completed**.

```
<#root>
```

```
switch#
```

```
show platform hardware fed active capture status
```

```
Asic: 0
```

```
Status: Completed
```

Analyze the PSV capture output with the next command. It is expected to see LACP and PAgP frames are punted to the CPU.

```
<#root>
```

```
switch#
```

```
show platform hardware fed active capture summary
```

```
Trigger: Ingress Interface:TwentyFiveGigE1/0/1 Dest Mac:0180.c200.0002

Control Plane Policer (CoPP)

CoPP is basically a QoS policer applied to the pipe between the data plane (hardware) and the control plane (CPU) to avoid high CPU issues. CoPP can filter LACP and PAgP frames if these frames exceed the threshold established by the feature.

Validate if CoPP drops LACP packets.

```
<#root>
```

```
show platform hardware fed switch active qos queue stats internal cpu policer
```

The output of this command, **L2 Control** queue has no drops:

```
<#root>
```

```
switch#
```

```
show platform hardware fed switch active qos queue stats internal cpu policer
```

```
CPU Queue Statistics
```

```
=====
                                (default)
```

(set)

Queue Queue

QId PlcIdx

Queue Name

Enabled Rate

Rate

Drop(Bytes) Drop(Frames)

0	11	DOT1X Auth	Yes	1000	1000	0	0	
1	1	L2 Control	Yes	2000	2000	0	0	<-- L2 Control
2	14	Forus traffic	Yes	4000	4000	0	0	

<output omitted>

* NOTE: CPU queue policer rates are configured to the closest hardware supported value

CPU Queue Policer Statistics

Policer Index	Policer Accept Bytes	Policer Accept Frames	Policer Drop Bytes	Policer Drop Frames	
0	0	0	0	0	
1	13328202	79853	0	0	<-- QId = 1 matches policer index
2	0	0	0	0	

<output omitted>

Second Level Policer Statistics

20	34149506	389054	0	0	<-- Policer index (level 2) no drop
21	76896	596	0	0	

Policer Index Mapping and Settings

level-2 PlcIndex	:	level-1 PlcIndex	(default) rate	(set) rate	
20	:	1 2 8	13000	13000	<-- Policer index (level 1) = 1 match
21	:	0 4 7 9 10 11 12 13 14 15	6000	6000	

Second Level Policer Config

level-1 QId	level-1 PlcIdx	level-2 PlcIdx	Queue Name	level-2 Enabled
0	11	21	DOT1X Auth	Yes
1	1	20	L2 Control	Yes

2	14	21	Forus traffic	Yes
---	----	----	---------------	-----

<output omitted>

It is not expected to overwhelm the **L2 Control** queue. Control plane packet capture is needed when the opposite is observed.

FED CPU Packet Capture

If you have ensured LACP packets were received at the interface level, EPC and ELAM/PSV confirmed LACP frames were punted to the CPU with no drops observed at the CoPP level, then use the FED CPU packet capture tool.

FED CPU packet capture tells you why a packet was punted from hardware to CPU, it also tells you what CPU queue the packet was sent to. FED CPU packet capture can also capture packets generated by the CPU injected into hardware.

<#root>

```
debug platform software fed sw active punt packet-capture set-filter <filter>
```

```
debug platform software fed switch active punt packet-capture start
```

```
debug platform software fed switch active punt packet-capture stop
```

```
show platform software fed switch active punt packet-capture status
```

```
show platform software fed switch active punt packet-capture brief
```

```
debug platform software fed sw active inject packet-capture set-filter <filter>
```

```
debug platform software fed switch active inject packet-capture start
```

```
debug platform software fed switch active inject packet-capture stop
```

```
show platform software fed switch active inject packet-capture status
```

```
show platform software fed switch active inject packet-capture brief
```

Punt

Define the packet capture to filter only LACP packets.

```
<#root>
```

```
switch#
```

```
debug platform software fed sw active punt packet-capture set-filter "eth.dst==0180.c200.0002"
```

Filter setup successful. Captured packets will be cleared

Start the capture.

```
<#root>
```

```
switch#
```

```
debug platform software fed sw active punt packet-capture start
```

Punt packet capturing started.

Stop it after (at least) 30 seconds if you do not use LACP rate fast timer.

```
<#root>
```

```
switch#
```

```
debug platform software fed switch active punt packet-capture stop
```

Punt packet capturing stopped.

```
Captured 11 packet(s)
```

Check the FED CPU packet capture status.

```
<#root>
```

```
switch#
```

```
show platform software fed switch active punt packet-capture status
```

Punt packet capturing: disabled. Buffer wrapping: disabled

Total captured so far: 11 packets.

Capture capacity : 4096 packets

Capture filter : "eth.dst==0180.c200.0002"

Analyze the FED CPU packet capture output.
