

EXEC Mode Commands

Use the EXEC mode for setting, viewing, and testing system operations. In general, the user EXEC commands allow you to connect to remote devices, change terminal line settings on a temporary basis, perform basic tests, and list system information.

The EXEC mode is divided into two access levels: user and privileged.

The user EXEC mode is used by local and general system administrators, while the privileged EXEC mode is used by the root administrator. Use the **enable** and **disable** commands to switch between the two levels. Access to the user-level EXEC command line requires a valid password.

The user-level EXEC commands are a subset of the privileged-level EXEC commands. The user-level EXEC prompt is the hostname followed by a right angle bracket (>). The prompt for the privileged-level EXEC command line is the pound sign (#). To execute an EXEC command, enter the command at the EXEC system prompt and press the **Return** key.

**Note**

You can change the hostname using the **hostname** global configuration command.

The following example shows how to access the privileged-level EXEC command line from the user level:

```
WAE> enable
WAE#
```

To leave EXEC mode, use the **exit** command at the system prompt:

```
WAE# exit
WAE>
```

cd

To change from one directory to another directory in the WAAS software, use the **cd** EXEC command.

cd *directoryname*

Syntax Description	<i>directoryname</i> Directory name.
Defaults	No default behavior or values.
Command Modes	EXEC
Device Modes	application-accelerator central-manager
Usage Guidelines	Use this command to navigate between directories and for file management. The directory name becomes the default prefix for all relative paths. Relative paths do not begin with a slash (/). Absolute paths begin with a slash (/).
Examples	<p>The following example shows how to change to a directory using a relative path:</p> <pre>WAE(config)# cd local1</pre> <p>The following example shows how to change to a directory using an absolute path:</p> <pre>WAE(config)# cd /local1</pre>
Related Commands	deltree dir lls ls mkdir pwd

cifs

To control legacy CIFS adapter operations and run-time configurations, use the **cifs EXEC** command.

cifs auto-discovery { **disable** | **enable** | **reset-log** }

cifs mss *value*

cifs restart [**core** | **edge**]

cifs reverse-dns { **active** | **disable** | **enable** }

cifs session disconnect [**client-ip** *ipaddress* | **server-ip** *ipaddress*]

Syntax Description		
auto-discovery		Controls the CIFS auto-discovery configuration and debug.
disable		Disables the CIFS server operation.
enable		Enables the CIFS server operation.
reset-log		Resets the log memory.
mss <i>value</i>		Sets the TCP maximum segment size (MSS) for the CIFS adapter. This value must be an integer in the range of 512–1460.
restart		Restarts the CIFS application.
core		(Optional) Restarts the CIFS application on the Core WAE.
edge		(Optional) Restarts the CIFS application on the Edge WAE.
reverse-dns		Uses reverse DNS to resolve server names on the Core WAE.
active		Checks whether reverse DNS is active.
session		Configures operations on active CIFS sessions.
disconnect		Disconnects the CIFS sessions.
client-ip <i>ipaddress</i>		Sets the client IP address or address set.
server-ip <i>ipaddress</i>		Sets the server IP address or address set.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator

Usage Guidelines This command controls legacy mode WAFS. To control the transparent CIFS accelerator, use the **(config) accelerator cifs** command. These two modes are mutually exclusive. For more information on the two WAFS modes, see the chapter “Configuring Wide Area File Services” in the *Cisco Wide Area Application Services Configuration Guide*.

Use the **cifs restart** command to restart the WAFS services for a configuration change without having to reboot the WAE.

Examples

The following example shows how to set the TCP maximum segment size (MSS) value to 512 for the CIFS adapter:

```
WAE# cifs mss 512
```

Related Commands

clear arp-cache

To clear the ARP cache, use the **clear arp-cache** EXEC command.

clear arp-cache [*ipaddress* | **interface** { **GigabitEthernet** *1-2/port* | **PortChannel** *1-2* | **Standby** *1-4*}]

Syntax Description

arp-cache	Clears the ARP cache.
<i>ipaddress</i>	(Optional) ARP entries for the IP address.
interface	(Optional) Clears all ARP entries on the interface.
GigabitEthernet <i>1-2/port</i>	GigabitEthernet interface (slot/port).
PortChannel <i>1-2</i>	PortChannel interface number. Values are 1 or 2
Standby <i>1-4</i>	Standby interface number 1, 2, 3, or 4.

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Examples

The following example shows how to clear the ARP cache on the WAAS device:

```
WAE# clear arp-cache
```

Related Commands

[show wccp](#)

clear cache

To clear cached objects, use the **clear cache** EXEC command.

clear cache { cifs | dre }

Syntax Description

cache	Clears cached objects.
cifs	Clears the CIFS cache.

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

After you use the **clear cache dre** command, the first 1 MB of data is not optimized. The Cisco WAAS software does not optimize the first 1 MB of data after a restart of the tcpproxy service. The data that is transmitted after the first 1 MB of data will be optimized according to the configured policy.

Examples

The following example shows how to clear the CIFS cached objects on the WAAS device:

```
WAE# clear cache cifs
```

clear cdp

To clear Cisco Discovery Protocol statistics, use the **clear cdp** EXEC command.

clear cdp {counters | table}

Syntax Description

cdp	Resets the Cisco Discovery Protocol (CDP) statistical data.
counters	Clears the CDP counters.
table	Clears the CDP tables.

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Examples

The following example shows how to clear the CDP counter statistics on the WAAS device:

```
WAE# clear cdp counters
```

Related Commands

clear ip

To clear IP access list statistics, use the **clear ip** EXEC command.

clear ip access-list counters [*acl-num* | *acl-name*]

Syntax Description	ip	Clears the IP statistical information.
	access-list	Clears the access list statistical information.
	counters	Clears the IP access list counters.
	<i>acl-num</i>	(Optional) Clears the counters for the specified access list, identified using a numeric identifier (standard access list: 1–99; extended access list: 100–199).
	<i>acl-name</i>	(Optional) Clears the counters for the specified access list, identified using an alphanumeric identifier of up to 30 characters, beginning with a letter.

Defaults	No default behavior or values.
----------	--------------------------------

Command Modes	EXEC
---------------	------

Device Modes	application-accelerator central-manager
--------------	--

Examples	The following example shows how to clear the IP access list counters on the WAAS device:
----------	--

```
WAE# clear ip access-list counters
```

Related Commands	license add show interface show license show wccp
------------------	--

clear license

To clear licensing configuration, use the **clear license** EXEC command.

clear license [*license-name*]

Syntax Description	license	Removes all installed software licenses, when specified without options.
	<i>license-name</i>	Name of the software license to remove. The following license names are supported: <ul style="list-style-type: none"> • Transport—Enables basic DRE, TFO, and LZ optimization. • Enterprise—Enables the EPM, HTTP, MAPI, NFS, CIFS (WAFS), and Windows Print application accelerators, the WAAS Central Manager, and basic DRE, TFO, and LZ optimization. You cannot remove this license if the video or virtualization licenses are installed. You must remove both of those licenses first. • Video—Enables the video application accelerator. • Virtual-Blade—Enables the virtualization feature.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Examples The following example shows how to clear the licensing configuration on the WAAS device:

```
WAE# clear license
```

Related Commands

clear logging

To clear syslog messages saved in a disk file, use the **clear logging** EXEC command.

clear logging

Syntax Description	logging Clears the syslog messages saved in the disk file.
Defaults	No default behavior or values.
Command Modes	EXEC
Device Modes	application-accelerator central-manager
Usage Guidelines	The clear logging command removes all current entries from the <i>syslog.txt</i> file but does not make an archive of the file. It puts a “Syslog cleared” message in the <i>syslog.txt</i> file to indicate that the syslog has been cleared.
Examples	<p>The following example shows how to clear all entries in the <i>syslog.txt</i> file on the WAAS device:</p> <pre>WAE# clear logging</pre> <p>Feb 14 12:17:18 WAE# exec_clear_logging:Syslog cleared</p>
Related Commands	license add show interface show license show wccp

clear statistics

To reset statistics data, use the **clear statistics** EXEC command.

```
clear statistics {all | authentication | auto-discovery | directed-mode | filtering | flow monitor  
tcpstat-v1 | generic-gre | icmp | inline | ip | radius | synq | tacacs | tcp | tfo | udp |  
windows-domain}
```

Syntax Description		
	all	Clears all statistics.
	authentication	Clears authentication statistics.
	auto-discovery	Clears the auto-discovery statistics.
	directed-mode	Clears the directed mode statistics.
	filtering	Clears the filter table statistics.
	flow	Clears the network traffic flow statistics.
	monitor	Clears the monitor flow performance statistics.
	tcpstat-v1	Clears the tcpstat-v1 collector statistics.
	generic-gre	Clears the generic GRE statistics.
	icmp	Clears the ICMP statistics.
	inline	Clears the inline interception statistics.
	ip	Clears the IP statistics.
	radius	Clears the RADIUS statistics.
	synq	Clears the SynQ module statistics.
	tacacs	Clears the TACACS+ statistics.
	tcp	Clears the TCP statistics.
	tfo	Clears the TCP flow optimization (TFO) statistics.
	udp	Clears the UDP statistics.
	windows-domain	Clears the Windows domain statistics.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines The **clear statistics** command clears all statistical counters from the parameters given. Use this command to monitor fresh statistical data for some or all features without losing cached objects or configurations.

Examples

The following example shows how to clear all authentication, RADIUS and TACACS+ information on the WAAS device:

```
WAE# clear statistics radius
WAE# clear statistics tacacs
WAE# clear statistics authentication
```

Related Commands

clear statistics accelerator

To clear all global statistics, use the **clear statistics accelerator** EXEC command.

clear statistics accelerator { **cifs** | **epm** | **generic** | **http** | **mapi** | **nfs** | **video** }

Syntax Description	statistics	Clears the statistics as specified.
	accelerator	Clears the statistics for an application accelerator.
	cifs	Clears the statistics for the CIFS application accelerator.
	epm	Clears the statistics for the EPM application accelerator.
	generic	Clears the statistics for generic accelerator.
	http	Clears the statistics for the HTTP application accelerator.
	mapi	Clears the statistics for the MAPI application accelerator.
	nfs	Clears the statistics for the NFS application accelerator.
	video	Clears the statistics for the video application accelerator.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Examples The following example shows how to clear the statistics for the CIFS application accelerator on the WAAS device:

```
WAE# clear statistics accelerator
```

Related Commands

clear statistics connection

To clear connection statistics, use the **clear statistics connection** EXEC command.

clear statistics connection conn-id *connection_id*

clear statistics connection optimized [**cifs** | **client-ip** {*ip_address* | *hostname*} | **client-port** *port* | {**cifs** | **http** | **mapi** | **nfs** | **video**} **dre** | **peer-id** *peer_id* | **server-ip** {*ip_address* | *hostname*} | **server-port** *port*]

Syntax Description

statistics connection	Clears the connection statistics as specified.
conn-id <i>connection_id</i>	Clears connection statistics for the connection with the specified number identifier.
optimized	Clears connection statistics for optimized connections.
cifs	(Optional) Clears connection statistics for connections optimized by the CIFS application accelerator.
client-ip	(Optional) Clears connection statistics for the client with the specified IP address or hostname.
<i>ip_address</i>	IP address of a client or server.
<i>hostname</i>	Hostname of a client or server.
client-port <i>port</i>	(Optional) Clears the connection statistics for the client with the specified port number. Port number 1–65535.
http	(Optional) Clears connection statistics for connections optimized by the HTTP application accelerator.
mapi	(Optional) Clears connection statistics for connections optimized by the MAPI application accelerator.
nfs	(Optional) Clears connection statistics for connections optimized by the NFS application accelerator.
video	(Optional) Clears connection statistics for connections optimized by the video application accelerator.
dre	(Optional) Clears connection statistics for connections optimized by the DRE feature.
peer-id <i>peer_id</i>	(Optional) Clears the connection statistics for the peer with the specified identifier. Number from 0 to 4294967295 identifying a peer.
server-ip	(Optional) Clears the connection statistics for the server with the specified IP address or hostname.
server-port <i>port</i>	(Optional) Clears the connection statistics for the server with the specified port number. Port number 1–65535.

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Examples

The following example shows how to clear the connection 1 statistics on the WAAS device:

```
WAE# clear statistics connection conn-id 1
```

clear statistics dre global

To clear data redundancy elimination statistics, use the **clear statistics dre global** EXEC command.

clear statistics dre global

Syntax Description	dre	Clears the Data Redundancy Elimination (DRE) statistics.
	global	(Optional) Clears the global DRE statistics.

Defaults	No default behavior or values.
----------	--------------------------------

Command Modes	EXEC
---------------	------

Device Modes	application-accelerator central-manager
--------------	--

Examples	The following example shows how to clear the global Data Redundancy Elimination statistics on the WAAS device:
----------	--

```
WAE# clear statistics dre global
```

Related Commands	license add show interface show license show wccp
------------------	--

clear statistics peer dre

To clear peer statistics, use the **clear statistics peer dre** EXEC command.

clear statistics peer dre

Syntax Description

peer	Clears all peer statistics.
dre	Clears the Data Redundancy Elimination (DRE) statistics.

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Examples

The following example shows how to clear statistics peer DRE information on the WAAS device:

```
WAE# clear statistics peer dre
```

Related Commands

clear transaction-log

To archive working transaction log file, use the **clear transaction-log** EXEC command.

clear transaction-log {flow}

Syntax Description	transaction-log	Clears the transaction log.
	flow	Clears the TFO transaction log.

Defaults	No default behavior or values.
----------	--------------------------------

Command Modes	EXEC
---------------	------

Device Modes	application-accelerator central-manager
--------------	--

Examples	The following example shows how to archive the flow transaction log file on the WAAS device: WAE# clear transaction-log flow
----------	--

Related Commands	license add show interface show license show wccp
------------------	--

clear users

To clear user connections or to unlock users that have been locked out, use the **clear users** EXEC command.

clear users [**administrative** | **locked-out** {**all** | **username** *username*}]

Syntax Description

users	Clears the connections (logins) of authenticated users.
administrative	(Optional) Clears the connections (logins) of administrative users authenticated through a remote login service.
locked-out	(Optional) Unlocks specified locked-out user accounts.
all	Specifies all user accounts.
username <i>username</i>	Specifies account username.

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

The **clear users administrative** command clears the connections for all administrative users who are authenticated through a remote login service, such as TACACS. This command does not affect an administrative user who is authenticated through the local database.

The **clear users locked-out** command unlocks user accounts that have been locked out. If a strong password policy is enabled (see the [\(config\) authentication strict-password-policy](#) command) a user account will be locked out if the user fails three consecutive login attempts. (This restriction does not apply to the admin account.)

Examples

The following example shows how to clear the connections of all authenticated users:

```
WAE(config)# clear users
```

The following example shows how to clear the connections of all administrative users authenticated through a remote login service (it does not affect administrative users authenticated through the local database):

```
WAE(config)# clear users administrative
```

The following example shows how to unlock all locked-out user accounts:

```
WAE(config)# clear users locked-out all
```

The following example shows how to unlock the account for username darcy:

```
WAE(config)# clear users locked-out username darcy
```

Related Commands

[clear arp-cache](#)

[\(config\) authentication strict-password-policy](#)

clear windows-domain-log

To clear the Windows domain server log file, use the **clear windows-doman-log** EXEC command.

clear windows-domain-log

Syntax Description	windows-domain-log Clears the Samba, Kerberos, and Winbind log files.
Defaults	No default behavior or values.
Command Modes	EXEC
Device Modes	application-accelerator central-manager
Examples	<p>The following example shows how to clear all entries in the Windows domain log file on the WAAS device:</p> <pre>WAE# clear windows-domain-log</pre>
Related Commands	license add show interface show license show wccp

clock

To set clock functions or update the calendar, use the **clock EXEC** command.

clock { **read-calendar** | **set** *time day month year* | **update-calendar** }

Syntax Description	read-calendar	Reads the calendar and updates the system clock.
	set <i>time day month year</i>	Sets the time and date. Current time in hh:mm:ss format (hh: 00–23; mm: 00–59; ss: 00–59). Day of the month (1–31). Month of the year (January, February, March, April, May, June, July, August, September, October, November, December). Year (1993–2035).
	update-calendar	Updates the calendar with the system clock.

Defaults	No default behavior or values.
-----------------	--------------------------------

Command Modes	EXEC
----------------------	------

Device Modes	application-accelerator central-manager
---------------------	--

Usage Guidelines	<p>If you have an outside source on your network that provides time services (such as a NTP server), you do not need to set the system clock manually. When setting the clock, enter the local time. The WAAS device calculates the UTC based on the time zone set by the clock timezone global configuration command.</p> <p>Two clocks exist in the system: the software clock and the hardware clock. The software uses the software clock. The hardware clock is used only at bootup to initialize the software clock.</p> <p>The set keyword sets the software clock.</p>
-------------------------	--

Examples	<p>The following example shows how to set the software clock on the WAAS device:</p> <pre>WAE# clock set 13:32:00 01 February 2005</pre>
-----------------	--

Related Commands	show clock
-------------------------	----------------------------

cms

To configure the Centralized Management System (CMS) embedded database parameters for a WAAS device, use the **cms EXEC** command.

cms { **config-sync** | **deregister** [**force**] | **lcm** { **enable** | **disable** } | **maintenance** { **full** | **regular** } | **recover** { **identity** *word* } | **restore** *filename* | **validate** }

cms database { **backup** | **create** | **delete** | **downgrade** [**script** *filename*] }

Syntax Description

config-sync	Sets the node to synchronize configuration with the WAAS Central Manager.
deregister	Removes the device registration record and its configuration on the WAAS Central Manager.
force	(Optional) Forces the removal of the node registration. This option is available only on WAEs and the standby Central Manager.
lcm	Configures local/central management on a WAAS device that is registered with the WAAS Central Manager.
enable	Enables synchronization of the WAAS network configuration of the device with the local CLI configuration.
disable	Disables synchronization of the WAAS network configuration of the device with the local CLI configuration.
maintenance	Cleans and reindexes the embedded database tables.
full	Specifies a full maintenance routine for the embedded database tables.
regular	Specifies a regular maintenance routine for the embedded database tables.
recover	Recovers the identity of a WAAS device.
identity <i>word</i>	Specifies the identity of the recovered device.
restore <i>filename</i>	Restores the database management tables using the backup local filename.
validate	Validates the database files.
database	Creates, backs up, deletes, restores, or validates the CMS-embedded database management tables or files.
backup	Backs up the database management tables.
create	Creates the embedded database management tables.
delete	Deletes the embedded database files.
downgrade	Downgrades the CMS database.
script <i>filename</i>	(Optional) Downgrades the CMS database by applying a downgrade script (filename).

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

Use the **cms config-sync** command to enable registered WAAS devices and standby WAAS Central Manager to contact the primary WAAS Central Manager immediately for a getUpdate (get configuration poll) request before the default polling interval of 5 minutes. For example, when a node is registered with the primary WAAS Central Manager and activated, it appears as Pending in the WAAS Central Manager GUI until it sends a getUpdate request. The **cms config-sync** command causes the registered node to send a getUpdate request at once, and the status of the node changes as Online.

Use the **cms database create** command to initialize the CMS database. Before a node can join a WAAS network, it must first be registered and then activated. The **cms enable** global configuration command automatically registers the node in the database management tables and enables the CMS. Activate the node using the WAAS Central Manager GUI.

The **cms deregister** command removes the node from the WAAS network by deleting registration information and database tables.

To back up the existing management database for the WAAS Central Manager, use the **cms database backup** command. For database backups, specify the following items:

- Location, password, and user ID
- Dump format in PostgreSQL plain text syntax

The naming convention for backup files includes the time stamp.

**Note**

For information on the procedure to back up and restore the CMS database on the WAAS Central Manager, see the *Cisco Wide Area Application Services Configuration Guide*.

When you use the **cms recover identity word** command when recovering lost registration information, or replacing a failed node with a new node that has the same registration information, you must specify the device recovery key that you configured in the Modifying Config Property, System.device.recovery.key window of the WAAS Central Manager GUI.

Use the **lcm** command to configure local/central management (LCM) on a WAE. The LCM feature allows settings that are configured using the device CLI or GUI to be stored as part of the WAAS network-wide configuration data (enable or disable).

When you enter the **cms lcm enable** command, the CMS process running on WAEs and the standby WAAS Central Manager detects the configuration changes that you made on these devices using CLIs and sends the changes to the primary WAAS Central Manager.

When you enter the **cms lcm disable** command, the CMS process running on the WAEs and the standby WAAS Central Manager does not send the CLI changes to the primary WAAS Central Manager. Settings configured using the device CLIs will not be sent to the primary WAAS Central Manager.

If LCM is disabled, the settings configured through the WAAS Central Manager GUI will overwrite the settings configured from the WAEs; however, this rule applies only to those local device settings that have been overwritten by the WAAS Central Manager when you have configured the local device settings. If you (as the local CLI user) change the local device settings after the particular configuration has been overwritten by the WAAS Central Manager, the local device configuration will be applicable until the WAAS Central Manager requests a full device statistics update from the WAEs (clicking the

Force full database update button from the Device Dashboard window of the WAAS Central Manager GUI triggers a full update). When the WAAS Central Manager requests a full update from the device, the WAAS Central Manager settings will overwrite the local device settings.

Examples

The following example shows how to back up the cms database management tables on the WAAS Central Manager named waas-cm:

```
waas-cm# cms database backup
creating backup file with label `backup'
backup file local1/acns-db-9-22-2002-17-36.dump is ready. use `copy' commands to move the
backup file to a remote host.
```

The following example shows how to validate the cms database management tables on the WAAS Central Manager named waas-cm:

```
waas-cm# cms database validate
Management tables are valid
```

Related Commands

[\(config\) cms](#)

[show cms](#)

cms secure-store

To configure secure store encryption, use the **cms secure-store** EXEC commands.

cms secure-store {init | open | change | clear}

Syntax Description	init	Initializes secure store encryption on the WAAS device. Secure store encryption is not active until you execute the cms secure-store open command. On the Central Manager, this command prompts you to enter the secure store encryption pass phrase.
	open	Activates secure store encryption (the WAAS device encrypts the stored data using secure store encryption). Secure store encryption must already be initialized using the cms secure-store init command. On the Central Manager, this command prompts you to enter the secure store encryption pass phrase.
	change	Changes the secure store encryption pass phrase and encryption key. On the Central Manager this command prompts you to enter and confirm the new pass phrase. The WAAS device uses the pass phrase to generate the encryption key for secure disk encryption.
	clear	Disables secure store encryption.

Defaults	The standard encryption and key management is the default.
----------	--

Command Modes	EXEC
---------------	------

Device Modes	application-accelerator central-manager
--------------	--

Usage Guidelines	Secure store encryption provides stronger encryption and key management for your WAAS system. The WAAS Central Manager and WAE devices use secure store encryption for handling passwords, managing encryption keys, and for data encryption.
------------------	---

When you use the **cms secure-store** EXEC command to enable secure store on the Central Manager, or a WAE device, the WAAS system uses strong encryption algorithms and key management policies to protect certain data on the system. This data includes encryption keys used by applications in the WAAS system, CIFS passwords, and user login passwords.

When you enable secure store on Central Manager, the data is encrypted using a key encryption key generated from the pass phrase you enter with SHA-1 hashing and an AES 256-bit algorithm. When you enable secure store on a WAE device, the data is encrypted using a 256-bit key encryption key generated by SecureRandom, a cryptographically strong pseudorandom number. You must enter a password to enable secure store. When you reboot the Central Manager, you must manually restart secure store using the **cms secure-store open** command.

When you enable secure store on a WAE, the WAE initializes and retrieves a new encryption key from the Central Manager. The WAE uses this key to encrypt WAFS password credentials stored on the WAE and to encrypt the disk if disk encryption is also enabled. When you reboot the WAE after enabling secure store, the WAE retrieves the key from the Central Manager automatically, allowing normal access to the data that is stored in the WAAS persistent storage.

If you have made any other CLI configuration changes on a WAE within the datafeed poll rate time interval (5 minutes by default) before you entered the **cms secure-store** command, you will lose those prior configuration changes and you will need to redo them.

Examples

The following example shows how to initialize and activate secure store encryption on the WAAS Central Manager:

```
waas-cm# cms secure-store init
enter pass-phrase(case-sensitive, no less than 8 characters)*****
re-enter pass-phrase*****
successfully initialized secure-store.

waas-cm# cms secure-store open
Stopping CM.
Stopping key manager.
enter pass-phrase: *****
successfully updated cifs password in database.
***** WARNING : REBOOTING CM REQUIRES RE-OPENING SECURE STORE MANUALLY. AFTER REBOOT, DISK
ENCRYPTION AND CIFS PREPOSITION FEATURES ON REMOTE WAE(S) WILL NOT OPERATE PROPERLY UNTIL
USER RE-OPENS SECURE STORE ON CM BY INPUTTING THE PASSPHRASE *****
successfully opened secure-store.
Starting cms.
Starting key manager.
waas-cm#
```

The following example shows how to deactivates secure store encryption:

```
waas-cm# cms secure-store clear
stopping cms..stopped
stopping keymgr..stopped.
successfully updated cifs password in database.
secure-store clear
starting cms..started.
starting keymgr..started.
waas-cm#
```

Related Commands

copy cdrom

To copy software release files from a CD-ROM, use the **copy cdrom** EXEC command.

copy cdrom install *filedir filename*

Syntax Description	cdrom	Copies a file from the CD-ROM.
	install <i>filedir filename</i>	Installs the software release from the directory location and filename specified.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Examples The following example shows how to copy a software release file from a CD-ROM:

```
WAE# copy cdrom install
```

Related Commands [install](#)

copy cdrom wow-recovery

To recover Windows on a virtual blade without reloading the software, use the **copy cdrom wow-recovery** EXEC command.

copy cdrom wow-recover install *filedir filename*

Syntax Description	cdrom	Copies the Windows system files from the CD-ROM.
	wow-recovery	Recovers the Windows operating system.
	install <i>filedir filename</i>	Installs the Windows operating system on the virtual blade from the directory location and Windows filename.
Defaults	No default behaviors or values.	
Command Modes	EXEC	
Device Modes	application-accelerator central-manager	
Usage Guidelines	Use the copy cdrom wow-recovery EXEC command to recover the Windows system files of a virtual blade. This command allows you to recover Windows on your virtual blade while the WAAS is running, without having to restart your WAE device.	
Examples	The following example shows how to recover Windows on a virtual blade: WAE# copy cdrom wow-recovery install	
Related Commands	copy ftp wow-recovery copy cdrom virtual-blade (config) virtual-blade	

copy compactflash

To copy software release files from a CompactFlash card, use the **copy compactflash** EXEC command.

copy compactflash *install filename*

Syntax Description

compactflash	Copies a file from the CompactFlash card.
install <i>filename</i>	Installs a software release from an image filename.

Defaults

No default behaviors or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Examples

The following example shows how to copy a software release file from a CompactFlash card:

```
WAE# copy compactflash install
```

copy disk

To copy the configuration or image data from a disk to a remote location using FTP or to the startup configuration, use the **copy disk** EXEC command.

```
copy disk {ftp {hostname | ip-address} remotefiledir remotefilename localfilename |  
startup-config filename}
```

Syntax Description	disk	Copies a local disk file.
	ftp	Copies to a file on an FTP server.
	<i>hostname</i>	Hostname of the FTP server.
	<i>ip-address</i>	IP address of the FTP server.
	<i>remotefiledir</i>	Directory on the FTP server to which the local file is copied.
	<i>remotefilename</i>	Name of the local file once it has been copied to the FTP server.
	<i>localfilename</i>	Name of the local file to be copied.
	startup-config <i>filename</i>	Copies the existing configuration file from the disk to the startup configuration (NVRAM).

Defaults No default behaviors or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines Use the **copy disk ftp** EXEC command to copy files from a SYSFS partition to an FTP server. Use the **copy disk startup-config** EXEC command to copy a startup-configuration file to NVRAM.

Examples The following example shows how to copy a startup-configuration file to NVRAM:

```
WAE# copy disk startup-config
```

Related Commands [install](#)

copy ftp

To copy software configuration or image data from an FTP server, use the **copy ftp** EXEC command.

copy ftp central {*hostname* | *ip-address*} *remotefiledir remotefilename slotnumber* [**username** *username password*]

copy ftp proxy {*hostname* | *ip-address*} *proxy_portnum* [**username** *username password*]

copy ftp port *port-num*

copy ftp md5 *md5sum*

copy ftp disk {*hostname* | *ip-address*} *remotefiledir remotefilename localfilename*

copy ftp install {*hostname* | *ip-address*} *remotefiledir remotefilename*

Syntax Description

ftp	Copies a file from an FTP server.
central	Copies a file to the software upgrade image repository.
<i>hostname</i>	Hostname of the specific server.
<i>ip-address</i>	IP address of the specific server.
<i>remotefiledir</i>	Directory on the FTP server where the image file to be copied is located.
<i>remotefilename</i>	Name of the file to be copied.
<i>slotnumber</i>	Slot location (1–5) into which the upgrade image is to be copied.
username <i>username password</i>	(Optional) Specifies the server authentication username and password for authentication.
proxy	(Optional) Specifies the proxy address.
<i>proxy_portnum</i>	(Optional) Port number on the proxy server.
port <i>port-num</i>	(Optional) Specifies the port to connect to the FTP server.
md5 <i>md5sum</i>	(Optional) Specifies the MD5 signature of the file being copied.
disk	Copies a file to a local disk.
<i>localfilename</i>	(Optional) Name of the copied file as it appears on the local disk.
install	(Optional) Copies the file from an FTP server and installs the software release file to the local device.

Defaults

No default behaviors or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

Use the **copy ftp disk** EXEC command to copy a file from an FTP server to a SYSFS partition on the WAAS device.

Use the **copy ftp install** EXEC command to install an image file from an FTP server on a WAAS device. Part of the image goes to a disk and part goes to flash memory. Use the **copy ftp central** EXEC command to download a software image into the repository from an FTP server.

You can also use the **copy ftp install** EXEC command to redirect your transfer to a different location. A username and a password have to be authenticated with a primary domain controller (PDC) before the transfer of the software release file to the WAAS device is allowed.

Upgrading the BIOS

You can remotely upgrade the BIOS on the WAE-511, WAE-512, WAE-611, WAE-612, and the WAE-7326. All computer hardware has to work with the software through an interface. The Basic Input Output System (BIOS) provides a computer a built-in starter kit to run the rest of the software from the hard disk drive. The BIOS is responsible for booting the computer by providing a basic set of instructions, performs all the tasks that need to be done at start-up time, such as Power-On Self Test (POST) operations and booting the operating system from the hard disk drive, and provides an interface between the hardware and the operating system in the form of a library of interrupt handlers.

Each time that a key is pressed, the CPU performs an interrupt to read that key, which is similar for other input/output devices, such as serial and parallel ports, video cards, sound cards, hard disk controllers, and so forth. Some older PCs cannot interoperate with all the modern hardware because their BIOS does not support that hardware; the operating system cannot call a BIOS routine to use it. You can solve this problem by replacing the BIOS with a newer one that does support your new hardware or by installing a device driver for the hardware.

All BIOS files needed for a particular hardware model BIOS update are available on Cisco.com as a single *.bin* package file. This file is a special *<WAAS-installable>.bin* file that you can install by using the normal software update procedure.

To update the BIOS version on a WAAS device that supports BIOS version updates, you need the following items:

- FTP server with the software files
- Network connectivity between the device to be updated and the server hosting the update files
- Appropriate *.bin* BIOS update file:
 - 511_bios.bin
 - 611_bios.bin
 - 7326_bios.bin

**Caution**

Be *extraordinarily* careful when upgrading a Flash BIOS. Make *absolutely* sure that the BIOS upgrade patch is the exact one required. If you apply the wrong patch, you can render the system unbootable, making it difficult or impossible to recover even by reapplying the proper patch.

**Caution**

Never update a Flash BIOS without first connecting the system to an uninterruptible power supply (UPS). A failed Flash BIOS update can have dire results.

To remotely install a BIOS update file, use the **copy ftp install** EXEC command as follows:

```
WAE# copy ftp install ftp-server remote_file_dir 7326_bios.bin
```

After the BIOS update file is copied to your system, use the **reload EXEC** command to reboot as follows:

```
WAE# reload
```

The new BIOS takes effect after the system reboots.

Examples

The following example shows how to copy an image file from an FTP server and install the file on the local device:

```
WAE# copy ftp install 10.1.1.1 //ftp-sj.cisco.com/cisco/waas/4.0 WAAS-4.0.0-k9.bin

copy ftp wow-recovery

To recover Windows on a virtual blade without reloading the software, use the **copy ftp wow-recovery EXEC** command.

copy ftp wow-recovery *ip-address remotefiledir remotefilename*

Syntax Description

ftp	Copies a file from an FTP server.
wow-recovery	Recovers the Windows operating system for use on a virtual blade.
<i>ip-address</i>	IP address of the FTP server.
<i>remotefiledir</i>	Directory on the FTP server where the image file to be copied is located.
<i>remotefilename</i>	Name of the file to be copied to the image repository.

Defaults

No default behaviors or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

Use the **copy ftp wow-recovery EXEC** command to copy a Windows operating system image from an FTP server to a virtual blade partition on the WAAS device.

Examples

The following example shows how to copy a Windows image file from an FTP server and install the file on the virtual blade:

```
WAE# copy ftp wow-recovery 10.1.1.1 //ftp-sj.cisco.com/cisco/waas/windows.iso
Enter username for remote ftp server:biff
Enter password for remote ftp server:*****
Initiating FTP download...
```

Related Commands

[copy cdrom wow-recovery](#)
[copy ftp](#)
[virtual-blade](#)
[\(config\) virtual-blade](#)

copy http

To copy configuration or image files from an HTTP server to the WAAS device, use the **copy http** EXEC command.

copy http install {*hostname* | *ip-address*} *remotefile*dir *remotefile*name [**port** *portnum*] [**proxy** *proxy_portnum*] [**username** *username* *password*]

Syntax Description		
http		Copies the file from an HTTP server.
install		Copies the file from an HTTP server and installs the software release file to the local device.
<i>hostname</i>		Name of the HTTP server.
<i>ip-address</i>		IP address of the HTTP server.
<i>remotefile</i> dir		Remote file directory.
<i>remotefile</i> name		Remote filename.
port <i>portnum</i>		(Optional) Port number (1–65535) to connect to the HTTP server (the default is 80).
proxy <i>proxy_portnum</i>		(Optional) Allows the request to be redirected to an HTTP proxy server. HTTP proxy server port number (1–65535).
username <i>username</i> <i>password</i>		(Optional) Username and password to access the HTTP proxy server.

Defaults HTTP server port: 80

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines Use the **copy http install** EXEC command to install an image file from an HTTP server and install it on a WAAS device. It transfers the image from an HTTP server to the WAAS device using HTTP as the transport protocol and installs the software on the device. Part of the image goes to a disk and part goes to flash memory. Use the **copy http central** EXEC command to download a software image into the repository from an HTTP server.

You can also use the **copy http install** EXEC commands to redirect your transfer to a different location or HTTP proxy server by specifying the **proxy** *hostname* | *ip-address* option. A username and a password have to be authenticated with a primary domain controller (PDC) before the transfer of the software release file to the WAAS device is allowed.

Upgrading the BIOS

You can remotely upgrade the BIOS on the WAE-511, WAE-512, WAE-611, WAE-612, and the WAE-7326. All computer hardware has to work with the software through an interface. The Basic Input Output System (BIOS) provides a computer a built-in starter kit to run the rest of the software from the hard disk drive. The BIOS is responsible for booting the computer by providing a basic set of instructions, performs all the tasks that need to be done at start-up time, such as Power-On Self Test (POST) operations and booting the operating system from the hard disk drive, and provides an interface between the hardware and the operating system in the form of a library of interrupt handlers.

Each time that a key is pressed, the CPU performs an interrupt to read that key, which is similar for other input/output devices, such as serial and parallel ports, video cards, sound cards, hard disk controllers, and so forth. Some older PCs cannot interoperate with all the modern hardware because their BIOS does not support that hardware; the operating system cannot call a BIOS routine to use it. You can solve this problem by replacing the BIOS with a newer one that does support your new hardware or by installing a device driver for the hardware.

All BIOS files needed for a particular hardware model BIOS update are available on Cisco.com as a single *.bin* package file. This file is a special *<WAAS-installable>.bin* file that you can install by using the normal software update procedure.

To update the BIOS version on a WAAS device that supports BIOS version updates, you need the following items:

- HTTP server with the software files
- Network connectivity between the device to be updated and the server hosting the update files
- Appropriate *.bin* BIOS update file:
 - 511_bios.bin
 - 611_bios.bin
 - 7326_bios.bin

**Caution**

Be *extraordinarily* careful when upgrading a Flash BIOS. Make *absolutely* sure that the BIOS upgrade patch is the exact one required. If you apply the wrong patch, you can render the system unbootable, making it difficult or impossible to recover even by reapplying the proper patch.

**Caution**

Never update a Flash BIOS without first connecting the system to an uninterruptible power supply (UPS). A failed Flash BIOS update can have dire results.

To install the BIOS update file on a WAAS device, use the **copy http install EXEC** command as follows:

```
WAE# copy http install http-server remote_file_dir 7326_bios.bin  
[portnumber]
```

After the BIOS update file is copied to your system, use the **reload EXEC** command to reboot the WAAS device as follows:

```
WAE# reload
```

The new BIOS takes effect after the system reboots.

Examples

The following example shows how to copy an image file from an HTTP server and install the file on the WAAS device:

```
WAE# copy http install 10.1.1.1 //ftp-sj.cisco.com/cisco/waas/4.0 WAAS-4.0.0-k9.bin

copy running-config

To copy a configuration or image data from the current configuration, use the **copy running-config** EXEC command.

```
copy running-config { disk filename | startup-config | tftp { hostname | ip-address }
                        remotefilename }
```

Syntax Description	running-config	Copies the current system configuration.
	disk <i>filename</i>	Copies the current system configuration to a disk file. Specify the name of the file to be created on a disk.
	startup-config	Copies the running configuration to startup configuration (NVRAM).
	tftp	Copies the running configuration to a file on a TFTP server.
	<i>hostname</i>	Hostname of the TFTP server.
	<i>ip-address</i>	IP address of the TFTP server.
	<i>remotefilename</i>	Remote filename of the configuration file to be created on the TFTP server. Use the complete pathname.

Defaults No default behaviors or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines Use the **copy running-config** EXEC command to copy the running system configuration of the WAAS device to a SYSFS partition, flash memory, or TFTP server. The **copy running-config startup-config** EXEC command is equivalent to the **write memory** EXEC command.

Examples The following example shows how to copy the current system configuration to startup configuration (NVRAM):

```
WAE# copy running-config startup-config
```

Related Commands [install](#)

copy startup-config

To copy configuration or image data from the startup configuration, use the **copy startup-config** EXEC command.

```
copy startup-config {disk filename | running-config | tftp {hostname | ip-address}
                        remotefilename}
```

Syntax Description	startup-config	Copies the startup configuration.
	disk <i>filename</i>	Copies the startup configuration to a disk file. Specify the name of the startup configuration file to be copied to the local disk.
	running-config	Copies the startup configuration to running configuration.
	tftp	Copies the startup configuration to a file on a TFTP server.
	<i>hostname</i>	Hostname of the TFTP server.
	<i>ip-address</i>	IP address of the TFTP server.
	<i>remotefilename</i>	Remote filename of the startup configuration file to be created on the TFTP server. Use the complete pathname.

Defaults No default behaviors or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines Use the **copy startup-config** EXEC command to copy the startup configuration file to a TFTP server or to a SYSFS partition.

Examples The following example shows how to copy the startup configuration file to the running configuration:

```
WAE# copy startup-config running-config
```

Related Commands

copy sysreport

To copy system troubleshooting information from the device, use the **copy sysreport EXEC** command.

copy sysreport disk *filename*

copy sysreport ftp {*hostname* | *ip-address*} *remotedirectory remotefilename*

copy sysreport tftp {*hostname* | *ip-address*} *remotefilename* [**start-date** {*day month* | *month day*} *year* [**end-date** {*day month* | *month day*} *year*]]

Syntax Description

sysreport	Generates and saves a report containing WAAS system information in a file.
disk <i>filename</i>	Copies system information to a disk file. Specify the name of the file to be created on a disk. Note that .tar.gz is appended to the filename that you specify.
ftp	Copies system information to a FTP server.
<i>hostname</i>	Hostname of the server.
<i>ip-address</i>	IP address of the server.
<i>remotedirectory</i>	Remote directory where the system information file is to be created on the FTP server.
<i>remotefilename</i>	Remote filename of the system information file to be created on the FTP server.
tftp	Copies system information to a TFTP server.
<i>remotefilename</i>	Remote filename of the system information file to be created on the TFTP server. Use the complete pathname.
start-date	(Optional) Start date of the information in the generated system report.
<i>day month</i>	Start date day of the month (1–31) and month of the year (January, February, March, April, May, June, July, August, September, October, November, December). You can alternately specify the month first, followed by the day.
<i>year</i>	Start date year (1993–2035).
end-date	(Optional) End date of information in the generated system report. If omitted, this date defaults to today. The report includes files through the end of this day.
<i>day month</i>	End date day of the month (1–31) and month of the year (January, February, March, April, May, June, July, August, September, October, November, December). You can alternately specify the month first, followed by the day.
<i>year</i>	End date year (1993–2035).

Defaults

If **end-date** is not specified, today is used.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

The **copy sysreport** command consumes significant CPU and disk resources and can adversely affect system performance while it is running.

Examples

The following example shows how to copy system information to the file mysysinfo on the local WAAS device:

```
WAE# copy sysreport disk mysysinfo start-date 1 April 2006 end-date April 30 2006
```

The following example shows how to copy system information by FTP to the file foo in the root directory of the FTP server named myserver:

```
WAE# copy sysreport ftp myserver / foo start-date 1 April 2006 end-date April 30 2006
```

copy system-status

To copy status information from the system for debugging, use the **copy system-status** EXEC command.

copy system-status disk *filename*

Syntax Description	system-status	Copies the system status to a disk file.
	disk <i>filename</i>	Name of the file to be created on the disk.

Defaults	No default behaviors or values.
----------	---------------------------------

Command Modes	EXEC
---------------	------

Device Modes	application-accelerator central-manager
--------------	--

Usage Guidelines	Use the copy system-status EXEC command to create a file on a SYSFS partition that contains hardware and software status information.
------------------	--

Examples	The following example shows how to copy the system status to a disk file: WAE# copy system-status disk file1
----------	--

Related Commands	install reload show running-config show startup-config wafs write
------------------	--

copy tech-support

To copy the configuration or image data from the system to use when working with Cisco TAC, use the **copy tech-support** EXEC command.

```
copy tech-support {disk filename | ftp {hostname | ip-address} remotedirectory remotefilename |  
tftp {hostname | ip-address} remotefilename}
```

Syntax Description		
tech-support		Copies system information for technical support.
disk <i>filename</i>		Copies system information for technical support to a disk file. Specify the name of the file to be created on disk.
ftp		Copies system information for technical support to an FTP server.
<i>hostname</i>		Hostname of the FTP server.
<i>ip-address</i>		IP address of the FTP server.
<i>remotedirectory</i>		Remote directory of the system information file to be created on the FTP server. Use the complete pathname.
<i>remotefilename</i>		Remote filename of the system information file to be created on the FTP server.
tftp		Copies system information for technical support to a TFTP server.
<i>hostname</i>		Hostname of the TFTP server.
<i>ip-address</i>		IP address of the TFTP server.
<i>remotefilename</i>		Remote filename of the system information file to be created on the TFTP server. Use the complete pathname.

Defaults No default behaviors or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines Use the **copy tech-support tftp** EXEC command to copy technical support information to a TFTP server or to a SYSFS partition.

Examples The following example shows how to copy system information for tech support to a disk file:

```
WAE# copy tech-support disk file1
```

write

copy tftp

To copy configuration or image data from a TFTP server, use the **copy tftp** EXEC command.

copy tftp disk {*hostname* | *ip-address*} *remotefilename* *localfilename*

copy tftp running-config {*hostname* | *ip-address*} *remotefilename*

copy tftp startup-config {*hostname* | *ip-address*} *remotefilename*

Syntax Description		
tftp		Copies an image from a TFTP server.
disk		Copies an image from a TFTP server to a disk file.
<i>hostname</i>		Hostname of the TFTP server.
<i>ip-address</i>		IP address of the TFTP server.
<i>remotefilename</i>		Name of the remote image file to be copied from the TFTP server. Use the complete pathname.
<i>localfilename</i>		Name of the image file to be created on the local disk.
running-config		Copies an image from a TFTP server to the running configuration.
startup-config		Copies an image from a TFTP server to the startup configuration.

Defaults No default behaviors or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Examples The following example shows how to copy configuration or image data from a TFTP server to the running configuration:

```
WAE# copy tftp running-config
```

cpfile

To make a copy of a file, use the **cpfile** EXEC command.

cpfile *oldfilename newfilename*

Syntax Description	<i>oldfilename</i>	Name of the file to copy.
	<i>newfilename</i>	Name of the copy to be created.

Defaults	No default behavior or values.
----------	--------------------------------

Command Modes	EXEC
---------------	------

Device Modes	application-accelerator central-manager
--------------	--

Usage Guidelines	Only SYSFS files can be copied.
------------------	---------------------------------

Examples	The following example shows how to create a copy of a file: WAE# cpfile fe511-194616.bin fd511-194618.bin
----------	---

Related Commands	deltree dir lls ls mkdir pwd rename
------------------	---

debug aaa accounting

To monitor and record AAA accounting debugging, use the **debug aaa accounting** EXEC command. To disable debugging, use the **undebug** form of this command.

debug aaa accounting

undebug aaa accounting

Syntax Description

aaa accounting	(Optional) Enables AAA accounting actions.
-----------------------	--

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

Because the performance of the WAAS device degrades when you use the **debug** command, we recommend that you use this command only at the direction of Cisco TAC. For more information, see the [“Obtaining Documentation and Submitting a Service Request”](#) section on page xviii.

If the watchdog utility is not running, the message “WAAS is not running” appears.

Use the **show debugging** command to display enabled **debug** options.

The output associated with the **debug** command is written to either the syslog file in /local1/syslog.txt or the debug log associated with the module in the file /local1/errorlog/module_name-errorlog.current.

The debug log file associated with a module will be rotated to a backup file when the current file reaches its maximum size. The backup files are named as follows: *name-errorlog.#*, where # is the backup file number.

For any **debug** command, system logging must be enabled. The command to enable logging is the **logging disk enable** global configuration command, which is enabled by default.

If a **debug** command module uses the syslog for debug output, then you must use the **logging disk priority debug** global configuration command (the default is **logging disk priority notice**).

If a **debug** command module uses the debug log for output, then the output can be filtered based on the priority level configuration for the four different levels of debug log output, as follows:

- For filtering on critical debug messages only, use the **logging disk priority critical** global configuration command.
- For filtering on critical and error level debug messages, use the **logging disk priority error** global configuration command.
- For filtering on critical, error, and trace debug level debug messages, use the **logging disk priority debug** global configuration command.

- For seeing all debug log messages, which include critical, error, trace and detail messages, use the **logging disk priority detail** global configuration command.

Regardless of the priority level configuration, any syslog messages at the LOG_ERROR or higher priority will be automatically written to the debug log associated with a module.

We recommend that you use the **debug** and **undebug** commands only at the direction of Cisco Systems technical support personnel.

Examples

The following example shows how to enable AAA accounting debug monitoring:

```
WAE# debug aaa accounting
```

Related Commands

debug accelerator

To monitor and record accelerator debugging, use the **debug accelerator** EXEC command. To disable debugging, use the **undebug** form of this command.

debug accelerator cifs {shell | all}

undebug accelerator cifs {shell | all}

debug accelerator generic {connection | misc | shell | stats | all}

undebug accelerator generic {connection | misc | shell | stats | all}

debug accelerator http {cli | connection | shell | all}

undebug accelerator http {cli | connection | shell | all}

debug accelerator mapi {all}

undebug accelerator mapi {all}

debug accelerator nfs {shell | all}

undebug accelerator nfs {shell | all}

**debug accelerator video {all | gateway | shell | windows-media
{client-ip *ip-addr* | server-ip *ip-addr*}}**

**undebug accelerator video {all | gateway | shell | windows-media
{client-ip *ip-addr* | server-ip *ip-addr*}}**

Syntax Description

accelerator	Enables accelerator debugging.
cifs	(Optional) Enables CIFS accelerator debugging.
shell	Enables accelerator shell debugging.
all	Enables all accelerator debugging of a specified type.
generic	Enables generic accelerator debugging.
connection	Enables accelerator connection debugging.
misc	Enables generic accelerator miscellaneous debugging.
stats	Enables generic accelerator statistics debugging.
http	Enables HTTP accelerator debugging.
cli	Enables configuration CLI debugging.
mapi	Enables MAPI accelerator debugging.
nfs	Enables NFS accelerator debugging.
video	Enables video accelerator debugging.

gateway	Enables debugging of the media independent gateway module of the video accelerator.
windows-media	Enables debugging of the Windows Media module of the video accelerator.
client-ip <i>ip-addr</i>	Specifies the client IP address.
server-ip <i>ip-addr</i>	Specifies the server IP address.

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

The output associated with the **debug accelerator** *name module* command for an application accelerator is written to the file *name*ao-errorlog.current, where *name* is the accelerator name. The accelerator information manager debug output is written to the file aoim-errorlog.current.

Because the performance of the WAAS device degrades when you use the **debug** command, we recommend that you use this command only at the direction of Cisco TAC. For more information, see the [“Obtaining Documentation and Submitting a Service Request”](#) section on page xviii.

If the watchdog utility is not running, the message “WAAS is not running” appears.

Use the **show debugging** command to display enabled **debug** options.

The output associated with the **debug** command is written to either the syslog file in /local1/syslog.txt or the debug log associated with the module in the file /local1/errorlog/module_name-errorlog.current.

The debug log file associated with a module will be rotated to a backup file when the current file reaches its maximum size. The backup files are named as follows: *name*-errorlog.#, where # is the backup file number.

For any **debug** command, system logging must be enabled. The command to enable logging is the **logging disk enable** global configuration command, which is enabled by default.

If a **debug** command module uses the syslog for debug output, then you must use the **logging disk priority debug** global configuration command (the default is **logging disk priority notice**).

If a **debug** command module uses the debug log for output, then the output can be filtered based on the priority level configuration for the four different levels of debug log output, as follows:

- For filtering on critical debug messages only, use the **logging disk priority critical** global configuration command.
- For filtering on critical and error level debug messages, use the **logging disk priority error** global configuration command.
- For filtering on critical, error, and trace debug level debug messages, use the **logging disk priority debug** global configuration command.

- For seeing all debug log messages, which include critical, error, trace and detail messages, use the **logging disk priority detail** global configuration command.

Regardless of the priority level configuration, any syslog messages at the LOG_ERROR or higher priority will be automatically written to the debug log associated with a module.

We recommend that you use the **debug** and **undebug** commands only at the direction of Cisco Systems technical support personnel.

Examples

The following example shows how to enable all accelerator debug monitoring:

```
WAE# debug accelerator all
```

[show debugging](#)

debug dre

To monitor and record DRE debugging, use the **debug dre** EXEC command. To disable debugging, use the **undebug** form of this command.

```
debug dre {aggregation | all | cache | connection {aggregation [acl] | cache [acl] | core [acl] |
message [acl] | misc [acl] | acl} | core | lz | message | misc}
```

```
undebug dre {aggregation | all | cache | connection {aggregation [acl] | cache [acl] | core [acl] |
message [acl] | misc [acl] | acl} | core | lz | message | misc}
```

Syntax Description	
dre	(Optional) Enables DRE debugging.
aggregation	Enables DRE chunk-aggregation debugging.
all	Enables the debugging of all DRE commands.
cache	Enables DRE cache debugging.
connection	Enables DRE connection debugging.
<i>acl</i>	ACL to limit connections traced.
message	Enables DRE message debugging for a specified connection.
misc	Enables DRE other debugging for a specified connection.
core	Enables DRE core debugging.
lz	Enables DRE lz debugging.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator

Usage Guidelines Because the performance of the WAAS device degrades when you use the **debug** command, we recommend that you use this command only at the direction of Cisco TAC. For more information, see the [“Obtaining Documentation and Submitting a Service Request”](#) section on page xviii.

If the watchdog utility is not running, the message “WAAS is not running” appears.

Use the **show debugging** command to display enabled **debug** options.

The output associated with the **debug** command is written to either the syslog file in /local1/syslog.txt or the debug log associated with the module in the file /local1/errorlog/module_name-errorlog.current.

The debug log file associated with a module will be rotated to a backup file when the current file reaches its maximum size. The backup files are named as follows: *name-errorlog.#*, where # is the backup file number.

For any **debug** command, system logging must be enabled. The command to enable logging is the **logging disk enable** global configuration command, which is enabled by default.

If a **debug** command module uses the syslog for debug output, then you must use the **logging disk priority debug** global configuration command (the default is **logging disk priority notice**).

If a **debug** command module uses the debug log for output, then the output can be filtered based on the priority level configuration for the four different levels of debug log output, as follows:

- For filtering on critical debug messages only, use the **logging disk priority critical** global configuration command.
- For filtering on critical and error level debug messages, use the **logging disk priority error** global configuration command.
- For filtering on critical, error, and trace debug level debug messages, use the **logging disk priority debug** global configuration command.
- For seeing all debug log messages, which include critical, error, trace and detail messages, use the **logging disk priority detail** global configuration command.

Regardless of the priority level configuration, any syslog messages at the LOG_ERROR or higher priority will be automatically written to the debug log associated with a module.

We recommend that you use the **debug** and **undebug** commands only at the direction of Cisco Systems technical support personnel.

Examples

The following example shows how to enable all DRE debug monitoring:

```
WAE# debug dre all
```

For filtering on critical and error level debug messages, use the logging disk priority error global configuration command. For filtering on critical, error, and trace debug level debug messages, use the logging disk priority debug global configuration command.
-------------------------	--

- For seeing all debug log messages, which include critical, error, trace and detail messages, use the **logging disk priority detail** global configuration command.

Regardless of the priority level configuration, any syslog messages at the LOG_ERROR or higher priority will be automatically written to the debug log associated with a module.

We recommend that you use the **debug** and **undebug** commands only at the direction of Cisco Systems technical support personnel.

Examples

The following example shows how to enable RPC detail debug monitoring:

```
WAE# debug rpd detail
```

Related Commands

[show debugging](#)

debug snmp

To monitor and record SNMP debugging, use the **debug snmp** EXEC command. To disable debugging, use the **undebug** form of this command.

debug snmp {all | cli | main | mib | traps}

undebug snmp {all | cli | main | mib | traps}

Syntax Description	snmp	(Optional) Enables SNMP debugging.
	all	Enables all SNMP debug commands.
	cli	Enables SNMP CLI debugging.
	main	Enables SNMP main debugging.
	mib	Enables SNMP MIB debugging.
	traps	Enables SNMP trap debugging.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines Because the performance of the WAAS device degrades when you use the **debug** command, we recommend that you use this command only at the direction of Cisco TAC. For more information, see the [“Obtaining Documentation and Submitting a Service Request”](#) section on page xviii.

If the watchdog utility is not running, the message “WAAS is not running” appears.

Use the **show debugging** command to display enabled **debug** options.

The output associated with the **debug** command is written to either the syslog file in /local1/syslog.txt or the debug log associated with the module in the file /local1/errorlog/module_name-errorlog.current.

The debug log file associated with a module will be rotated to a backup file when the current file reaches its maximum size. The backup files are named as follows: *name-errorlog.#*, where # is the backup file number.

For any **debug** command, system logging must be enabled. The command to enable logging is the **logging disk enable** global configuration command, which is enabled by default.

If a **debug** command module uses the syslog for debug output, then you must use the **logging disk priority debug** global configuration command (the default is **logging disk priority notice**).

If a **debug** command module uses the debug log for output, then the output can be filtered based on the priority level configuration for the four different levels of debug log output, as follows:

- For filtering on critical debug messages only, use the **logging disk priority critical** global configuration command.
- For filtering on critical and error level debug messages, use the **logging disk priority error** global configuration command.
- For filtering on critical, error, and trace debug level debug messages, use the **logging disk priority debug** global configuration command.
- For seeing all debug log messages, which include critical, error, trace and detail messages, use the **logging disk priority detail** global configuration command.

Regardless of the priority level configuration, any syslog messages at the LOG_ERROR or higher priority will be automatically written to the debug log associated with a module.

We recommend that you use the **debug** and **undebug** commands only at the direction of Cisco Systems technical support personnel.

Examples

The following example shows how to enable all SNMP debug monitoring:

```
WAE# debug snmp all
```

debug stats

To monitor and record statistics debugging, use the **debug stats** EXEC command. To disable debugging, use the **undebug** form of this command.

debug stats {all | collections | computation | history}

undebug stats {all | collections | computation | history}

Syntax Description	stats	(Optional) Enables statistics debugging.
	all	Enables all statistics debug commands.
	collection	Enables collection statistics debugging.
	computation	Enables computation statistics debugging.
	history	Enables history statistics debugging.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines Because the performance of the WAAS device degrades when you use the **debug** command, we recommend that you use this command only at the direction of Cisco TAC. For more information, see the [“Obtaining Documentation and Submitting a Service Request”](#) section on page xviii.

If the watchdog utility is not running, the message “WAAS is not running” appears.

Use the **show debugging** command to display enabled **debug** options.

The output associated with the **debug** command is written to either the syslog file in /local1/syslog.txt or the debug log associated with the module in the file /local1/errorlog/module_name-errorlog.current.

The debug log file associated with a module will be rotated to a backup file when the current file reaches its maximum size. The backup files are named as follows: *name-errorlog.#*, where # is the backup file number.

For any **debug** command, system logging must be enabled. The command to enable logging is the **logging disk enable** global configuration command, which is enabled by default.

If a **debug** command module uses the syslog for debug output, then you must use the **logging disk priority debug** global configuration command (the default is **logging disk priority notice**).

If a **debug** command module uses the debug log for output, then the output can be filtered based on the priority level configuration for the four different levels of debug log output, as follows:

- For filtering on critical debug messages only, use the **logging disk priority critical** global configuration command.

- For filtering on critical and error level debug messages, use the **logging disk priority error** global configuration command.
- For filtering on critical, error, and trace debug level debug messages, use the **logging disk priority debug** global configuration command.
- For seeing all debug log messages, which include critical, error, trace and detail messages, use the **logging disk priority detail** global configuration command.

debug tfo

To monitor and record TFO flow optimization debugging, use the **debug tfo** EXEC command. To disable debugging, use the **undebug** form of this command.

```
debug tfo { buffer-mgr | connection [auto-discovery | comp-mgr [acl] | conn-mgr [acl] |
    egress-method [acl] | filtering [acl] | netio-engine [acl] | policy-engine [acl] |
    synq [acl] | acl] | stat-mgr | translog }
```

```
undebug tfo { buffer-mgr | connection [auto-discovery [acl] | comp-mgr [acl] | conn-mgr [acl] |
    egress-method [acl] | filtering [acl] | netio-engine [acl] | policy-engine [acl] | synq [acl] | acl]
    | stat-mgr | translog }
```

Syntax Description		
buffer-mgr		Enables TFO flow optimization debugging.
connection		Enables TFO connection debugging.
auto-discovery		(Optional) Enables TFO connection debugging for the auto-discovery module.
<i>acl</i>		(Optional) ACL to limit TFO connections.
comp-mgr		Enables TFO connection debugging for the compression module.
conn-mgr		Enables TFO connection debugging for the connection manager.
egress-method		Enables TFO connection debugging for the connection egress method.
filtering		Enables TFO connection debugging for the filtering module.
netio-engine		Enables TFO connection debugging for the network input/output module.
policy-engine		Enables TFO connection debugging of application policies.
synq		Enables TFO connection debugging for the SynQ module.
stat-mgr		Enables TFO statistics manager debugging.
translog		Enables TFO transaction log debugging.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator

Usage Guidelines Because the performance of the WAAS device degrades when you use the **debug** command, we recommend that you use this command only at the direction of Cisco TAC. For more information, see the [“Obtaining Documentation and Submitting a Service Request”](#) section on page xviii.

debug wafs

To set the log level of WAFS running components, use the **debug wafs** EXEC command. To disable debugging, use the **undebug** form of this command.

```
debug wafs {{all | core-fe | edge-fe | manager | utilities} {debug | error | info | warn}}
```

```
undebug wafs {{all | core-fe | edge-fe | manager | utilities} {debug | error | info | warn}}
```

Syntax Description		
wafs		(Optional) Unsets the notification level (debug, info, warn, error) at which messages from the WAAS software component and utilities are logged.
all		Unsets the logging level for all software components and utilities at once.
core-fe		Unsets the logging level for WAFs acting as a core File Engine.
edge-fe		Unsets the logging level for WAFs acting as an edge File Engine.
manager		Unsets the logging level for the Device Manager.
utilities		Unsets the logging level for WAAS utilities.
debug		Specifies debug.
error		Specifies error.
info		Specifies info.
warn		Specifies warn.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator

Usage Guidelines Because the performance of the WAAS device degrades when you use the **debug** command, we recommend that you use this command only at the direction of Cisco TAC. For more information, see the [“Obtaining Documentation and Submitting a Service Request”](#) section on page xviii.

If the watchdog utility is not running, the message “WAAS is not running” appears.

Use the **show debugging** command to display enabled **debug** options.

The output associated with the **debug** command is written to either the syslog file in /local1/syslog.txt or the debug log associated with the module in the file /local1/errorlog/module_name-errorlog.current.

The debug log file associated with a module will be rotated to a backup file when the current file reaches its maximum size. The backup files are named as follows: *name-errorlog.#*, where # is the backup file number.

For any **debug** command, system logging must be enabled. The command to enable logging is the **logging disk enable** global configuration command, which is enabled by default.

If a **debug** command module uses the syslog for debug output, then you must use the **logging disk priority debug** global configuration command (the default is **logging disk priority notice**).

dbug wccp

To monitor and record WCCP information debugging, use the **debug wccp** EXEC command. To disable debugging, use the **undebug** form of this command.

debug wccp { **all** | **detail** | **error** | **events** | **keepalive** | **packets** | **slowstart** }

undebug wccp { **all** | **detail** | **error** | **events** | **keepalive** | **packets** | **slowstart** }

Syntax Description	wccp	(Optional) Enables the WCCP information debugging.
	all	Enables all WCCP debugging functions.
	detail	Enables the WCCP detail debugging.
	error	Enables the WCCP error debugging.
	events	Enables the WCCP events debugging.
	keepalive	Enables the debugging for WCCP keepalives that are sent to the applications.
	packets	Enables the WCCP packet-related information debugging.
	slowstart	Enables the WCCP slow-start debugging.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator

Usage Guidelines Because the performance of the WAAS device degrades when you use the **debug** command, we recommend that you use this command only at the direction of Cisco TAC. For more information, see the [“Obtaining Documentation and Submitting a Service Request”](#) section on page xviii.

If the watchdog utility is not running, the message “WAAS is not running” appears.

Use the **show debugging** command to display enabled **debug** options.

The output associated with the **debug** command is written to either the syslog file in /local1/syslog.txt or the debug log associated with the module in the file /local1/errorlog/module_name-errorlog.current.

The debug log file associated with a module will be rotated to a backup file when the current file reaches its maximum size. The backup files are named as follows: *name-errorlog.#*, where # is the backup file number.

For any **debug** command, system logging must be enabled. The command to enable logging is the **logging disk enable** global configuration command, which is enabled by default.

If a **debug** command module uses the syslog for debug output, then you must use the **logging disk priority debug** global configuration command (the default is **logging disk priority notice**).

If a **debug** command module uses the debug log for output, then the output can be filtered based on the priority level configuration for the four different levels of debug log output, as follows:

- For filtering on critical debug messages only, use the **logging disk priority critical** global configuration command.
- For filtering on critical and error level debug messages, use the **logging disk priority error** global configuration command.
- For filtering on critical, error, and trace debug level debug messages, use the **logging disk priority debug** global configuration command.
- For seeing all debug log messages, which include critical, error, trace and detail messages, use the **logging disk priority detail** global configuration command.

Regardless of the priority level configuration, any syslog messages at the LOG_ERROR or higher priority will be automatically written to the debug log associated with a module.

We recommend that you use the **debug** and **undebug** commands only at the direction of Cisco Systems technical support personnel.

Examples

```
WAE# debug wccp all
```

Related Commands

[show debugging](#)

delfile

To delete a file from the current directory, use the **delfile** EXEC command.

delfile *filename*

Syntax Description	<i>filename</i> Name of the file to delete.
Defaults	No default behavior or values.
Command Modes	EXEC
Device Modes	application-accelerator central-manager
Usage Guidelines	Use the delfile EXEC command to remove a file from a SYSFS partition on the disk drive of the WAAS device.
Examples	<p>The following example shows how to delete a temporary file from the <i>/local1</i> directory using an absolute path:</p> <pre>WAE# delfile /local1/tempfile</pre>
Related Commands	cpfile dir lls ls mkdir pwd rename

deltree

To remove a directory with all of its subdirectories and files, use the **deltree** EXEC command.

deltree *directory*

Syntax Description	<i>directory</i> Name of the directory tree to delete.
Defaults	No default behavior or values.
Command Modes	EXEC
Device Modes	application-accelerator central-manager
Usage Guidelines	Use the deltree EXEC command to remove a directory and all files within the directory from the WAAS SYSFS file system. No warning is given that you are removing the subdirectories and files.
 Note	Make sure that you do not remove files or directories required for the WAAS device to function properly.
Examples	The following example shows how to delete the <i>testdir</i> directory from the <i>//local1</i> directory: WAE# deltree /local1/testdir
Related Commands	cpfile dir lls ls mkdir pwd rename

dir

To view details of one file or all files in a directory, use the **dir** EXEC command.

dir [*directory*]

Syntax Description	<i>directory</i> (Optional) Name of the directory to list.
Defaults	No default behavior or values.
Command Modes	EXEC
Device Modes	application-accelerator central-manager
Usage Guidelines	Use the dir EXEC command to view a detailed list of files contained within the working directory, including information about the file name, size, and time created. The lls EXEC command produces the same output.
Examples	The following example shows how to create a detailed list of all the files for the current directory:

```
WAE# dir
size          time of last change          name
-----
 4096   Fri Feb 24 14:40:00 2006   <DIR>   actona

Related Commands[lls](#)[ls](#)

disable

To turn off privileged EXEC commands, use the **disable** EXEC command.

disable

Syntax Description	This command has no arguments or keywords.
---------------------------	--

Defaults	No default behavior or values.
-----------------	--------------------------------

Command Modes	EXEC
----------------------	------

Device Modes	application-accelerator central-manager
---------------------	--

Usage Guidelines	Use the WAAS software CLI EXEC mode for setting, viewing, and testing system operations. This command mode is divided into two access levels, user and privileged. To access privileged-level EXEC mode, enter the enable EXEC command at the user access level prompt and specify a privileged EXEC password (superuser or admin-equivalent password) when prompted for a password.
-------------------------	---

```
WAE> enable
Password:
```

The **disable** command places you in the user-level EXEC shell (notice the prompt change).

Examples	The following example shows how to enter the user-level EXEC mode from the privileged EXEC mode:
-----------------	--

```
WAE# disable
WAE>
```

Related Commands	enable
-------------------------	------------------------

disk

To configure disks on a WAAS device, use the **disk EXEC** command.

disk delete-partitions *diskname*

disk disk-name diskxx replace

disk insert *diskname*

disk recreate-raid

disk reformat *diskname*

disk scan-errors *diskname*

Syntax Description		
delete-partitions <i>diskname</i>		Deletes data on the specified logical disk drive. After using this command, the WAAS software treats the specified disk drive as blank. All previous data on the drive is inaccessible. Specify the name of the disk from which to delete partitions (disk00, disk01). For RAID-5 systems, this option is not available because only one logical drive is available.
disk-name diskxx replace		Shuts down the physical disk with the name diskxx (disk00, disk01, etc.) so that it can be replaced in the RAID-5 array. Note This option is available only on RAID-5 systems.
insert <i>diskname</i>		Instructs the SCSI host to rescan the bus to detect and mount the newly inserted disk. Specify the name of the disk to be inserted (disk00, disk01). Note This option is available only on WAE-612 and WAE-7326 models.
recreate-raid		Recreates the RAID-5 array. Note This option is available only on RAID-5 systems.
reformat <i>diskname</i>		Performs a low-level reformatting of a SCSI disk drive and remaps bad sectors. Specify the name of the disk to be reformatted (disk00, disk01).  Caution Use the reformat and <i>diskname</i> keyword and argument with extreme caution to avoid the loss of data. Note This option is not available on RAID-5 systems.
scan-errors <i>diskname</i>		Scans SCSI or IDE disks for errors and remaps the bad sectors if they are unused. Specify the name of the disk to be reformatted (disk00, disk01). For RAID-5 systems, this command scans the logical RAID device for errors. On these systems, there is no <i>diskname</i> option.

Defaults

No default behavior or values.

Command Modes EXEC**Device Modes** application-accelerator
central-manager**Usage Guidelines**

The WAAS software supports hot-swap functionality for both failed disk replacement and scheduled disk maintenance. On the WAE-612 and WAE-7326, use the **disk disk-name diskxx shutdown** global configuration command to shut down a disk for scheduled disk maintenance. On the WAE-7341 and WAE-7371, use the **disk disk-name diskxx replace** EXEC command to shut down a disk. (For the scheduled disk maintenance procedure, see the *Cisco Wide Area Application Services Configuration Guide*, Chapter 14.)

The disk hot-swap functionality automatically disables a failed disk if the system detects one critical disk alarm. The software removes the failed disk automatically regardless of the setting for **disk error-handling**.

For WAE-7341 and WAE-7371 models, when you replace a failed disk that was automatically disabled by the software, the disk automatically returns to service. For WAE-612 and WAE-7326 models, when you replace a failed disk that was automatically disabled by the software, use the **disk insert** EXEC command to bring the disk back into service. For all other models, see the (config) **disk disk-name** command section.

To identify which disks have been identified as failed or bad, use the **show disks failed-disk-id** EXEC command. Do not reinsert any disk with a serial number shown in this list.

**Note**

The **show disks failed-disk-id** command is not available on WAE-7341 and WAE-7371 models.

Use the **disk reformat** EXEC command to reformat a SCSI disk drive on a WAAS device. The SCSI drive cannot be in use when you execute this command.

**Caution**

To avoid loss of data, use the **disk reformat** command and keyword with extreme caution.

**Note**

This command is available only on WAE-612 systems with SCSI drives.

Use the **disk delete-partitions** EXEC command to remove all disk partitions on a single disk drive on a WAAS device or to remove the disk partition on the logical drive for RAID-5 systems.

**Caution**

Be careful when using the **disk delete-partitions** EXEC command because the WAAS software treats the specified disk drive as blank. All previous data on the drive will become inaccessible.

**Note**

When you use the **disk delete-partitions** EXEC command on the WAE-7341 or WAE-7371 models, the command deletes the entire logical volume. The individual disk name option is not available on these platforms.

Examples

The following example shows how to recreate the RAID-5 array:

```
WAE# disk recreate-raid
```

Device Modes	application-accelerator central-manager
--------------	--

Examples	The following examples show how the dnslookup command is used to resolve the hostname <i>myhost</i> to IP address 172.31.69.11, <i>abd.com</i> to IP address 192.168.219.25, and an IP address used as a hostname to 10.0.11.0:
----------	--

```
WAE# dnslookup myhost
official hostname: myhost.abc.com
address: 172.31.69.11
```

```
WAE# dnslookup abc.com
official hostname: abc.com
address: 192.168.219.25
```

```
WAE# dnslookup 10.0.11.0
official hostname: 10.0.11.0
address: 10.0.11.0
```

Related Commands

enable

To access privileged EXEC commands, use the **enable** EXEC command.

enable

Syntax Description	This command has no arguments or keywords.
---------------------------	--

Defaults	No default behavior or values.
-----------------	--------------------------------

Command Modes	EXEC
----------------------	------

Device Modes	application-accelerator central-manager
---------------------	--

Usage Guidelines	Use the WAAS software CLI EXEC mode for setting, viewing, and testing system operations. This command mode is divided into two access levels: user and privileged. To access privileged-level EXEC mode, enter the enable EXEC command at the user access level prompt and specify a privileged EXEC password (superuser or admin-equivalent password) when prompted for a password.
-------------------------	---

In TACACS+, there is an enable password feature that allows an administrator to define a different enable password for each administrative-level user. If an administrative-level user logs in to the WAAS device with a normal-level user account (privilege level of 0) instead of an admin or admin-equivalent user account (privilege level of 15), that user must enter the admin password to access privileged-level EXEC mode:

```
WAE> enable
Password:
```

**Note**

The above behavior occurs even if the WAAS users are using TACACS+ for login authentication.

The **disable** command takes you from privileged EXEC mode to user EXEC mode.

Examples	The following example shows how to access privileged EXEC mode:
-----------------	---

```
WAE> enable
WAE#
```

Related Commands	disable exit
-------------------------	---

exit

To terminate privileged-level EXEC mode and return to the user-level EXEC mode, use the **exit** command.

exit

Syntax Description

This command has no arguments or keywords.

Defaults

No default behavior or values.

Command Modes

All modes

Device Modes

application-accelerator
central-manager

Usage Guidelines

The **exit** EXEC command is equivalent to pressing **Ctrl-Z** or entering the **end** command. Entering the **exit** command in the user level EXEC shell terminates the console or Telnet session.

Examples

The following example shows how to terminate privileged-level EXEC mode and return to the user-level EXEC mode:

```
WAE# exit  
WAE>
```

Related Commands

(**config**) **exit**

find-pattern

To search for a particular pattern in a file, use the **find-pattern** command in EXEC mode.

find-pattern { **binary** *reg-express filename* | **count** *reg-express filename* | **lineno** *reg-express filename* | **match** *reg-express filename* | **nomatch** *reg-express filename* | **recursive** *reg-express filename* }

find-pattern case { **binary** *reg-express filename* | **count** *reg-express filename* | **lineno** *reg-express filename* | **match** *reg-express filename* | **nomatch** *reg-express filename* | **recursive** *reg-express filename* }

Syntax Description	binary <i>reg-express filename</i>	Does not suppress the binary output. Specifies the regular expression to be matched and the filename.
	count <i>reg-express filename</i>	Prints the number of matching lines. Specifies the regular expression to be matched and the filename.
	lineno <i>reg-express filename</i>	Prints the line number with output. Specifies the regular expression to be matched and the filename.
	match <i>reg-express filename</i>	Prints the matching lines. Specifies the regular expression to be matched and the filename.
	nomatch <i>reg-express filename</i>	Prints the nonmatching lines. Specifies the regular expression to be matched and the filename.
	recursive <i>reg-express filename</i>	Searches a directory recursively. Specifies the regular expression to be matched and the filename.
	case	Matches a case-sensitive pattern.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Examples The following example shows how to search a file recursively for a case-sensitive pattern:

```
WAE# find-pattern case recursive admin removed_core
-rw----- 1 admin root 95600640 Oct 12 10:27 /local/local1/core_dir/
core.3.0.0.b5.eh.2796
-rw----- 1 admin root 97054720 Jan 11 11:31 /local/local1/core_dir/
core.cache.3.0.0.b131.cnbuild.14086
-rw----- 1 admin root 96845824 Jan 11 11:32 /local/local1/core_dir/
core.cache.3.0.0.b131.cnbuild.14823
-rw----- 1 admin root 101580800 Jan 11 12:01 /local/local1/core_dir/
core.cache.3.0.0.b131.cnbuild.15134
-rw----- 1 admin root 96759808 Jan 11 12:59 /local/local1/core_dir/
```

```
core.cache.3.0.0.b131.cnbuild.20016
-rw----- 1 admin root 97124352 Jan 11 13:26 /local/local1/core_dir/
core.cache.3.0.0.b131.cnbuild.8095
```

The following example shows how to search a file for a pattern and print the matching lines:

```
WAE# find-pattern match 10 removed_core
Tue Oct 12 10:30:03 UTC 2004
-rw----- 1 admin root 95600640 Oct 12 10:27 /local/local1/core_dir/
core.3.0.0.b5.eh.2796
-rw----- 1 admin root 101580800 Jan 11 12:01 /local/local1/core_dir/
core.cache.3.0.0.b131.cnbuild.15134
```

The following example shows how to search a file for a pattern and print the number of matching lines:

```
WAE# find-pattern count 10 removed_core
3
```

help

To obtain online help for the command-line interface, use the **help** EXEC command.

help

Syntax Description

This command has no arguments or keywords.

Defaults

No default behavior or values.

Command Modes

EXEC and global configuration

Device Modes

application-accelerator
central-manager

Usage Guidelines

You can obtain help at any point in a command by entering a question mark (?). If nothing matches, the help list will be empty, and you must back up until entering a ? shows the available options.

Two styles of help are provided:

- Full help is available when you are ready to enter a command argument (for example, **show ?**) and describes each possible argument.
- Partial help is provided when you enter an abbreviated command and you want to know what arguments match the input (for example, **show stat?**).

Examples

The following example shows how to display the output of the **help** EXEC command:

```
WAE# help
```

```
Help may be requested at any point in a command by entering a question mark '?'. If
nothing matches, the help list will be empty and you must backup until entering a '?'
shows the available options.
```

```
Two styles of help are provided:
```

1. Full help is available when you are ready to enter a command argument.
2. Partial help is provided when an abbreviated argument is entered.

Related Commands

(config) help

install

To install a new software image (such as the WAAS software) into flash on the WAAS device, use the **install** EXEC command.

install *imagefilename*

Syntax Description

imagefilename Name of the *.bin* file you want to install.

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

The **install** command loads the system image into flash memory and copies components of the optional software to the software file system (swfs) partition.

Note

If you are installing a system image that contains optional software, make sure that an SWFS partition is mounted on disk00.

To install a system image, copy the image file to the SYSFS directory *local1*. Before executing the **install** command, change the present working directory to the directory where the system image resides. When the **install** command is executed, the image file is expanded. The expanded files overwrite the existing files on the WAAS device. The newly installed version takes effect after the system image is reloaded.

Note

The **install** command does not accept *.pax* files. Files should be of the type *.bin* (for example, *cache-sw.bin*). Also, if the release being installed does not require a new system image, then it may not be necessary to write to flash memory. If the newer version has changes that require a new system image to be installed, then the **install** command may result in a write to flash memory.

Close your browser and restart the browser session to the WAAS Central Manager, if you installed a new software image to the primary WAAS Central Manager.

Examples

The following example shows how to load the system image contained in the *wae511-cache-300.bin* file:

```
WAE# install wae511-cache-300.bin
```

Related Commands[copy disk](#)[reload](#)

less

To display a file using the Less application, use the **less** EXEC command.

less *file_name*

Syntax Description	<i>file_name</i> Name of the file to be displayed.
Defaults	No default behavior or values.
Command Modes	EXEC
Device Modes	application-accelerator central-manager
Usage Guidelines	<p>Less is a pager application that displays text files one page at a time. You can use Less to view the contents of a file, but not edit it. Less offers some additional features when compared to conventional text file viewer applications such as Type. These features include the following:</p> <ul style="list-style-type: none">• Backward movement—Allows you to move backward in the displayed text. Use k, Ctrl-k, y, or Ctrl-y to move backward. See the summary of Less commands for more details; to view the summary, press h or H while displaying a file in Less.• Searching and highlighting—Allows you to search for text in the file that you are viewing. You can search forward and backward. Less highlights the text that matches your search to make it easy to see where the match is.• Multiple file support—Allows you to switch between different files, remembering your position in each file. You can also do a search that spans all the files you are working with.
Examples	<p>The following example shows how to display the text of the <i>syslog.txt</i> file using the Less application:</p> <pre>WAE# less syslog.txt</pre>
Related Commands	type

license add

To add a software license to a device, use the **license add** EXEC command.

license add *license-name*

Syntax Description	<i>license-name</i> Name of the software license to add. The following license names are supported: <ul style="list-style-type: none"> • Transport—Enables basic DRE, TFO, and LZ optimization. • Enterprise—Enables the EPM, HTTP, MAPI, NFS, CIFS (WAFS), and Windows Print application accelerators, the WAAS Central Manager, and basic DRE, TFO, and LZ optimization. • Video—Enables the video application accelerator. Requires the Enterprise license to be configured first. • Virtual-Blade—Enables the virtualization feature. Requires the Enterprise license to be configured first.
Defaults	No default behavior or values.
Command Modes	EXEC
Device Modes	application-accelerator central-manager
Examples	The following example shows how to install the enterprise license: <pre>WAE# license add Enterprise</pre>
Related Commands	clear arp-cache license show license

lls

To view a long list of directory names, use the **lls** EXEC command.

lls [*directory*]

Syntax Description	<i>directory</i> (Optional) Name of the directory for which you want a long list of files.
Defaults	No default behavior or values.
Command Modes	EXEC
Device Modes	application-accelerator central-manager
Usage Guidelines	The lls command provides detailed information about files and subdirectories stored in the present working directory (including the size, date, time of creation, SYSFS name, and long name of the file). This information can also be viewed with the dir command.
Examples	The following example shows how to display a detailed list of the files in the current directory:

```
WAE# lls
size          time of last change          name
-----
    4096  Fri Feb 24 14:40:00 2006  <DIR>  actona
    4096  Tue Mar 28 14:42:44 2006  <DIR>  core_dir
    4096  Wed Apr 12 20:23:10 2006  <DIR>  crash
    4506  Tue Apr 11 13:52:45 2006          dbupgrade.log

- [ls](#)

ls

To view a list of files or subdirectory names within a directory, use the **ls** EXEC command.

ls [*directory*]

Syntax Description	<i>directory</i> (Optional) Name of the directory for which you want a list of files.
Defaults	No default behavior or values.
Command Modes	EXEC
Device Modes	application-accelerator central-manager
Usage Guidelines	<p>Use the ls <i>directory</i> command to list the filenames and subdirectories within a particular directory.</p> <p>Use the ls command to list the filenames and subdirectories of the current working directory.</p> <p>Use the pwd command to view the present working directory.</p>
Examples	<p>The following example shows how to display the files and subdirectories that are listed within the root directory:</p> <pre>WAE# ls actona core_dir crash dbupgrade.log downgrade errorlog logs lost+found sa service_logs spool syslog.txt syslog.txt.1 syslog.txt.2 syslog.txt.3 var wdd.sh.signed</pre>
Related Commands	dir lls

ls

pwd

mkdir

To create a directory, use the **mkdir** EXEC command.

mkdir *directory*

Syntax Description	<i>directory</i> Name of the directory to create.
Defaults	No default behavior or values.
Command Modes	EXEC
Device Modes	application-accelerator central-manager
Examples	The following example shows how to create a new directory, <i>oldpaxfiles</i> : WAE# mkdir /oldpaxfiles
Related Commands	cpfile dir lls ls pwd rename rmdir

mkfile

To create a new file, use the **mkfile** EXEC command.

mkfile *filename*

Syntax Description

<i>filename</i>	Name of the file that you want to create.
-----------------	---

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

Use the **mkfile** EXEC command to create a new file in any directory of the WAAS device.

Examples

The following example shows how to create a new file, *traceinfo*, in the root directory:

```
WAE# mkfile traceinfo
```

ntpdate

To set the software clock (time and date) on a WAAS device using an NTP server, use the **ntpdate** EXEC command.

ntpdate { *hostname* | *ip-address* } [**key** { *authentication-key* }]

Syntax Description

<i>hostname</i>	NTP hostname.
<i>ip-address</i>	NTP server IP address.
key	(Optional) Specifies to use authentication with the NTP server.
<i>authentication-key</i>	Authentication key string to use with the NTP server authentication. This value must be between 0 and 4294967295.

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

Use the **ntpdate** command to find the current time of day and set the current time on the WAAS device to match. You must save the time to the hardware clock using the **clock save** command if you want to restore the time after a reload.

Examples

The following example shows how to set the software clock on the WAAS device using a NTP server:

```
WAE# ntpdate 10.11.23.40
```

Related Commands

[clock](#)
[\(config\) clock](#)
[\(config\) ntp](#)
[show clock](#)
[show ntp](#)

ping

To send echo packets for diagnosing basic network connectivity on networks, use the **ping** EXEC command.

ping {*hostname* | *ip-address*}

Syntax Description

<i>hostname</i>	Hostname of system to ping.
<i>ip-address</i>	IP address of system to ping.

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

To use the **ping** command with the *hostname* argument, make sure that DNS functionality is configured on the WAAS device. To force the timeout of a nonresponsive host, or to eliminate a loop cycle, press **Ctrl-C**.

Examples

The following example shows how to send echo packets to a machine with address 172.19.131.189 to verify its availability on the network:

```
WAE# ping 172.19.131.189
PING 172.19.131.189 (172.19.131.189) from 10.1.1.21 : 56(84) bytes of
data.
64 bytes from 172.19.131.189: icmp_seq=0 ttl=249 time=613 usec
64 bytes from 172.19.131.189: icmp_seq=1 ttl=249 time=485 usec
64 bytes from 172.19.131.189: icmp_seq=2 ttl=249 time=494 usec
64 bytes from 172.19.131.189: icmp_seq=3 ttl=249 time=510 usec
64 bytes from 172.19.131.189: icmp_seq=4 ttl=249 time=493 usec

--- 172.19.131.189 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max/mdev = 0.485/0.519/0.613/0.047 ms
WAE#
```

pwd

To view the present working directory on a WAAS device, use the **pwd** EXEC command.

pwd

Syntax Description	This command has no arguments or keywords.
---------------------------	--

Defaults	No default behavior or values.
-----------------	--------------------------------

Command Modes	EXEC
----------------------	------

Device Modes	application-accelerator central-manager
---------------------	--

Examples	The following example shows how to display the current working directory:
-----------------	---

```
WAE# pwd  
/local1
```

Related Commands	cd dir lls ls
-------------------------	--

reload

To halt the operation and perform a cold restart on a WAAS device, use the **reload** EXEC command.

reload [**force** | **in** *m* | **cancel**]

Syntax Description	force	(Optional) Forces a reboot without further prompting.
	in <i>m</i>	(Optional) Schedules a reboot after a specified interval (1-10080 minutes).
	cancel	(Optional) Cancels a scheduled reboot.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines To reboot a WAAS device, use the **reload** command. If no configurations are saved to flash memory, you are prompted to enter configuration parameters upon a restart. Any open connections are dropped after you enter the **reload** command, and the file system is reformatted upon restart.

The **reload** command can include the option to schedule a reload of the software to take effect in a specified number of minutes. After entering this command, you are asked to confirm the reload by typing *y* and then confirm WCCP shutdown by typing *y* again (if WCCP is active).

You can use the **cancel** option to cancel a scheduled reload.

Examples The following example shows how to halt the operation of the WAAS device and reboot with the configuration saved in flash memory. You are not prompted for confirmations during the process.

```
WAE# reload force
```

Related Commands [write](#)

rename

To rename a file on a WAAS device, use the **rename** EXEC command.

rename *oldfilename newfilename*

Syntax Description	<i>oldfilename</i>	Original filename.
	<i>newfilename</i>	New filename.
Defaults	No default behavior or values.	
Command Modes	EXEC	
Device Modes	application-accelerator central-manager	
Usage Guidelines	Use the rename command to rename any SYSFS file without making a copy of the file.	
Examples	The following example shows how to rename the <i>errlog.txt</i> file to <i>old_errlog.txt</i> : WAE# rename errlog.txt old_errlog.txt	
Related Commands	cpfile	

restore

To restore the device to its manufactured default status by removing the user data from the disk and flash memory, use the **restore** EXEC command.

restore { **factory-default** [**preserve basic-config**] | **rollback** }

Syntax Description

factory-default	Resets the device configuration and data to their manufactured default status.
preserve	(Optional) Preserves certain configurations and data on the device.
basic-config	(Optional) Selects basic network configurations.
rollback	Rolls back the configuration to the last functional software and device configuration.

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

Use the **restore** EXEC command to restore data on a disk and in flash memory to the factory default, while preserving particular time-stamp evaluation data, or to roll back the configuration to the last functional data and device configuration.

This command erases all existing content on the device; however, your network settings are preserved and the device is accessible through a Telnet and Secure Shell (SSH) session after it reboots.

Backing up the Central Manager Database

Before you use the **restore factory-default** command on your primary WAAS Central Manager or change over from the primary to a standby WAAS Central Manager, make sure that you back up the WAAS Central Manager database and copy the backup file to a safe location that is separate from the WAAS Central Manager. You must halt the operation of the WAAS Central Manager before you enter the **backup** and **restore** commands.

Caution

The **restore** command erases user-specified configuration information stored in the flash image and removes data from a disk, user-defined disk partitions, and the entire Central Manager database. User-defined disk partitions that are removed include the SYSFS, WAAS, and PRINTSPOOLFS partitions. The configuration that is removed includes the starting configuration of the device.

By removing the WAAS Central Manager database, all configuration records for the entire WAAS network are deleted. If you do not have a valid backup file or a standby WAAS Central Manager, you must reregister every WAE with the WAAS Central Manager because all previously configured data is lost.

If you used your standby WAAS Central Manager to store the database while you reconfigured the primary, you can register the former primary as a new standby WAAS Central Manager.

If you created a backup file while you configured the primary WAAS Central Manager, you can copy the backup file to this newly reconfigured WAAS Central Manager.

Rolling Back the Configuration

You can roll back the software and configuration of a WAAS device to a previous version using the **restore rollback** command. You would roll back the software only in cases in which a newly installed version of the WAAS software is not functioning properly.

The **restore rollback** command installs the last saved WAAS.bin image on the system disk. A WAAS.bin image is created during software installation and stored on the system disk. If the WAAS device does not have a saved version, the software is not rolled back.

Note

WAFS to WAAS migration is supported. Rollback from WAAS to WAFS is not supported.

Examples

The following examples show how to use the **restore factory-default** and **restore factory-default preserve basic-config** commands. Because configuration parameters and data are lost, prompts are given before initiating the restore operation to ensure that you want to proceed.

```
WAE# restore factory-default
```

This command will wipe out all of data on the disks and wipe out WAAS CLI configurations you have ever made. If the box is in evaluation period of certain product, the evaluation process will not be affected though.

It is highly recommended that you stop all active services before this command is run.

```
Are you sure you want to go ahead?[yes/no]
```

```
WAE# restore factory-default preserve basic-config
```

This command will wipe out all of data on the disks and all of WAAS CLI configurations except basic network configurations for keeping the device online. The to-be-preserved configurations are network interfaces, default gateway, domain name, name server and hostname. If the box is in evaluation period of certain product, the evaluation process will not be affected.

It is highly recommended that you stop all active services before this command is run.

```
Are you sure you want to go ahead?[yes/no]
```

Note

You can enter basic configuration parameters (such as the IP address, hostname, and name server) at this point, or you can enter these parameters later through entries in the command-line interface.

The following example shows how to verify that the **restore** command has removed data from the SYSFS, WAAS, and PRINTSPOOLFS partitioned file systems:

WAE# **show disks details**

Physical disk information:

```
disk00: Normal          (h00 c00 i00 100 - DAS)    140011MB(136.7GB)
disk01: Normal          (h00 c00 i01 100 - DAS)    140011MB(136.7GB)
```

Mounted filesystems:

MOUNT POINT	TYPE	DEVICE	SIZE	INUSE	FREE	USE%
/	root	/dev/root	35MB	30MB	5MB	85%
/swstore	internal	/dev/md1	991MB	333MB	658MB	33%
/state	internal	/dev/md2	3967MB	83MB	3884MB	2%
/disk00-04	CONTENT	/dev/md4	122764MB	33MB	122731MB	0%
/local/local1	SYSFS	/dev/md5	3967MB	271MB	3696MB	6%
.../local1/spool	PRINTSPOOL	/dev/md6	991MB	16MB	975MB	1%
/sw	internal	/dev/md0	991MB	424MB	567MB	42%

Software RAID devices:

DEVICE NAME	TYPE	STATUS	PHYSICAL DEVICES AND STATUS
/dev/md0	RAID-1	NORMAL OPERATION	disk00/00[GOOD] disk01/00[GOOD]
/dev/md1	RAID-1	NORMAL OPERATION	disk00/01[GOOD] disk01/01[GOOD]
/dev/md2	RAID-1	NORMAL OPERATION	disk00/02[GOOD] disk01/02[GOOD]
/dev/md3	RAID-1	NORMAL OPERATION	disk00/03[GOOD] disk01/03[GOOD]
/dev/md4	RAID-1	NORMAL OPERATION	disk00/04[GOOD] disk01/04[GOOD]
/dev/md5	RAID-1	NORMAL OPERATION	disk00/05[GOOD] disk01/05[GOOD]
/dev/md6	RAID-1	NORMAL OPERATION	disk00/06[GOOD] disk01/06[GOOD]

Currently content-filesystems RAID level is not configured to change.

The following example shows how to upgrade or restore an older version of the WAAS software. In the example, version Y of the software is installed (using the **copy** command), but the administrator has not switched over to it yet, so the current version is still version X. The system is then reloaded (using the **reload** command), and it verifies that version Y is the current version running.

The following example shows how to roll back the software to version X (using the **restore rollback** command), and reload the software:

```
WAE# copy ftp install server path waas.versionY.bin
WAE# show version
Cisco Wide Area Application Services Software (WAAS)
Copyright (c) 1999-2006 by Cisco Systems, Inc.
Cisco Wide Area Application Services Software Release 4.0.0 (build b340 Mar 25 2
006)
Version: fe611-4.0.0.340
```

Compiled 17:26:17 Mar 25 2006 by cnbuild

System was restarted on Mon Mar 27 15:25:02 2006.

The system has been up for 3 days, 21 hours, 9 minutes, 17 seconds.

```
WAE# show version last
Nothing is displayed.
WAE# show version pending
WAAS 4.0.1 Version Y
WAE# reload
..... reloading .....
WAE# show version
Cisco Wide Area Application Services Software (WAAS)
...
WAE# restore rollback
```

```
WAE# reload
..... reloading .....
```

Because flash memory configurations were removed after the **restore** command was used, the **show startup-config** command does not return any flash memory data. The **show running-config** command returns the default running configurations.

rmdir

To delete a directory on a WAAS device, use the **rmdir** EXEC command.

rmdir *directory*

Syntax Description	<i>directory</i> Name of the directory that you want to delete.
Defaults	No default behavior or values.
Command Modes	EXEC
Device Modes	application-accelerator central-manager
Usage Guidelines	Use the rmdir EXEC command to remove any directory from the WAAS file system. The rmdir command only removes empty directories.
Examples	The following example shows how to delete the <i>oldfiles</i> directory from the <i>local1</i> directory: WAE# rmdir /local1/oldfiles
Related Commands	cpfile dir lls ls mkdir pwd rename

scp

To copy files between network hosts, use the **scp** command.

```
scp [4][6][B][C][p][q][r][v] [c cipher] [F config-file] [i id-file] [o ssh_option] [P port] [S program]
[[user @] host : file] [...] [[user-n @] host-n : file-n]
```

Syntax Description

4	(Optional) Forces this command to use only IPv4 addresses.
6	(Optional) Forces this command to use only IPv6 addresses.
B	(Optional) Specifies the batch mode. In this mode, the scp command does not ask for passwords or passphrases.
C	(Optional) Enables compression. The scp command passes this option to the ssh command to enable compression.
p	(Optional) Preserves the following information from the source file: modification times, access times, and modes.
q	(Optional) Disables the display of progress information.
r	(Optional) Recursively copies directories and their contents.
v	(Optional) Specifies the verbose mode. Causes the scp and ssh commands to print debugging messages about their progress. This option can be helpful when troubleshooting connection, authentication, and configuration problems.
c <i>cipher</i>	(Optional) Specifies the cipher to use for encrypting the data being copied. The scp command directly passes this option to the ssh command.
F <i>config-file</i>	(Optional) Specifies an alternative per-user configuration file for Secure Shell (SSH). The scp command directly passes this option to the ssh command.
i <i>id-file</i>	(Optional) Specifies the file containing the private key for RSA authentication. The scp command directly passes this information to the ssh command.
o <i>ssh_option</i>	(Optional) Passes options to the ssh command in the format used in <code>ssh_config5</code> . See the ssh command for more information about the possible options.
P <i>port</i>	(Optional) Specifies the port to connect to on the remote host.
S <i>program</i>	(Optional) Specifies the program to use for the encrypted connection.
<i>user</i>	(Optional) Username.
<i>host</i>	(Optional) Hostname.
<i>file</i>	(Optional) Name of the file to copy.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

The **scp** command uses SSH for transferring data between hosts.

This command prompts you for passwords or pass phrases when needed for authentication.

Related Commands

[ssh](#)

script

To execute a script provided by Cisco or check the script for errors, use the **script EXEC** command.

script {**check** | **execute**} *file_name*

Syntax Description	check	Checks the validity of the script.
	execute	Executes the script. The script file must be a SYSFS file in the current directory.
	<i>file_name</i>	Name of the script file.
Defaults	No default behavior or values.	
Command Modes	EXEC	
Device Modes	application-accelerator central-manager	
Usage Guidelines	<p>The script EXEC command opens the script utility, which allows you to execute Cisco-supplied scripts or check errors in those scripts. The script utility can read standard terminal input from the user if the script you run requires input from the user.</p> <div>Note The script utility is designed to run only Cisco-supplied scripts. You cannot execute script files that lack Cisco signatures or that have been corrupted or modified.</div>	
Examples	<p>The following example shows how to check for errors in the script file <i>test_script.pl</i>:</p> <pre>WAE# script check test_script.pl</pre>	

setup

To configure basic configuration settings (general settings, device network settings, interception type, disk configuration, and licenses) on the WAAS device or to complete basic configuration after upgrading to the WAAS software, use the **setup** EXEC command.

setup

Syntax Description

This command has no arguments or keywords.

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

For instructions on using the **setup** command, see the *Cisco Wide Area Application Services Quick Configuration Guide*.

Examples

The following example shows how to access the first screen of the wizard when you enter the **setup** EXEC command on a WAAS device that is running the WAAS software:

```
WAE# setup
Step 1: The following defaults can be configured:
Device mode: Application-accelerator
Interception Method: Inline
Management Interface: InlineGroup 1/1
Autosense: yes
Timezone: UTC 0 0
```

To keep above defaults and continue configuration, press 'y'.
To change above defaults and continue configuration, press 'n' [y]:

show aaa accounting

To display the AAA accounting configuration information for a WAAS device, use the **show aaa accounting EXEC** command.

show aaa accounting

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

Use the **show aaa accounting EXEC** command to display configuration information for the following AAA accounting types:

- Exec shell
- Command (for normal users and superusers)
- System

Examples

Table 3-1 describes the fields shown in the **show aaa accounting** command display.

Table 3-1 Field Descriptions for the show aaa accounting Command

Field	Description
Accounting Type	AAA accounting configuration for the following types of user accounts: <ul style="list-style-type: none">• Exec• Command level 0• Command level 15• System
Record Event(s)	Configuration of the AAA accounting notice that is sent to the accounting server.
stop-only	WAAS device that sends a stop record accounting notice at the end of the specified activity or event to the TACACS+ accounting server.
start-stop	WAAS device that sends a start record accounting notice at the beginning of an event and a stop record at the end of the event to the TACACS+ accounting server. The start accounting record is sent in the background. The requested user service begins regardless of whether the start accounting record was acknowledged by the TACACS+ accounting server.

Table 3-1 **Field Descriptions for the show aaa accounting Command (continued)**

Field	Description
wait-start	WAAS device that sends both a start and a stop accounting record to the TACACS+ accounting server. The requested user service does not begin until the start accounting record is acknowledged. A stop accounting record is also sent.
disabled	Accounting that is disabled for the specified event.
Protocol	Accounting protocol that is configured.

Related Commands [\(config\) aaa accounting](#)

show accelerator

To display the status and configuration of the application accelerators, use the **show accelerator** EXEC command.

show accelerator [{ **cifs** | **detail** | **epm** | **http** | **mapi** | **nfs** | **video** }]

Syntax Description	cifs	(Optional) Displays the status for the CIFS application accelerator.
	detail	Displays the license information, enables the configuration state and operation state for all accelerators, and additional accelerator and policy engine configuration.
	epm	(Optional) Displays the status for the EPM application accelerator.
	http	(Optional) Displays the status for the HTTP application accelerator.
	mapi	(Optional) Displays the status for the MAPI application accelerator.
	nfs	(Optional) Displays the status for the NFS application accelerator.
	video	(Optional) Displays the status for the video application accelerator.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator

Examples [Table 3-2](#) describes the fields shown in the **show accelerator** command display for all application accelerators. Specific application accelerators display additional configuration status information.

Table 3-2 Field Description for the show accelerator Command

Field	Description
Accelerator	Name of the accelerator.
Licensed	Yes or No.
Config State	Accelerator is Enabled or Disabled.
Operational State	Shutdown, Initializing, Running, Cleaning Up, or Expired License.
Policy Engine Config Item: State	Registered (policy engine is communicating with the accelerator) or Not Registered (policy engine is not communicating with the accelerator; seen when the accelerator is disabled).
Policy Engine Config Item: Default Action	Drop or Use. Default policy action specifies whether the TFO action is configured for mapping (Use Policy), or the SYN should be dropped.

Table 3-2 *Field Description for the show accelerator Command (continued)*

Field	Description
Policy Engine Config Item: Connection Limit	Connection limit. The limit configured by the accelerator which states how many connections may be handled before new connection requests are rejected.
Policy Engine Config Item: Effective Limit	Effective connection limit. The dynamic limit relating to how many connections may be handled before new connection requests are rejected. This limit is affected by resources that have been reserved, but not yet used.
Policy Engine Config Item: Keepalive timeout	Connection keepalive timeout in seconds. Keepalive messages are sent by each AO.

show alarms

To display information about various types of alarms, their status, and history on a WAAS device, use the **show alarms EXEC** command.

show alarms critical [**detail** [**support**]]

show alarms detail [**support**]

show alarms history [*start_num* [*end_num* [**detail** [**support**]]]] | **critical** [*start_num* [*end_num* [**detail** [**support**]]]]

show alarms major [*start_num* [*end_num* [**detail** [**support**]]]]

show alarms minor [*start_num* [*end_num* [**detail** [**support**]]]]

show alarms status

Syntax Description	
critical	Displays critical alarm information.
detail	(Optional) Displays detailed information for each alarm.
support	(Optional) Displays additional information about each alarm.
history	Displays information about the history of various alarms.
<i>start_num</i>	(Optional) Alarm number that appears first in the alarm history.
<i>end_num</i>	(Optional) Alarm number that appears last in the alarm history.
major	Displays information about major alarms.
minor	Displays information about minor alarms.
status	Displays the status of various alarms and alarm overload settings.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines The Node Health Manager in the WAAS software enables WAAS applications to raise alarms to draw attention in error/significant conditions. The Node Health Manager, which is the data repository for such alarms, aggregates the health and alarm information for the applications, services, and resources (for example, disk drives) that are being monitored on the WAAS device. For example, this feature gives you a mechanism to determine if a WAE is receiving overwhelming number of alarms. These alarms are referred to as WAAS software alarms.

The WAAS software uses SNMP to report error conditions by generating SNMP traps. The following WAAS applications can generate a WAAS software alarm:

- Node Health Manager (alarm overload condition)
- System Monitor (sysmon) for disk failures

The three levels of alarms in the WAAS software are as follows:

- Critical—Alarms that affect the existing traffic through the WAE and are considered fatal (the WAE cannot recover and continue to process traffic).
- Major—Alarms that indicate a major service (for example, the cache service) has been damaged or lost. Urgent action is necessary to restore this service. However, other node components are fully functional and the existing service should be minimally impacted.
- Minor—Alarms that indicate that a condition that will not affect a service has occurred, but that corrective action is required to prevent a serious fault from occurring.

You can configure alarms using the **snmp-server enable traps alarms** global configuration command.

Use the **show alarms critical** EXEC command to display the current critical alarms being generated by WAAS software applications. Use the **show alarms critical detail** EXEC command to display additional details for each of the critical alarms being generated. Use the **show alarms critical detail support** EXEC command to display an explanation about the condition that triggered the alarm and how you can find out the cause of the problem. Similarly, you can use the **show alarms major** and **show alarms minor** EXEC commands to display the details of major and minor alarms.

Use the **show alarms history** EXEC command to display a history of alarms that have been raised and cleared by the WAAS software on the WAAS device since the last software reload. The WAAS software retains the last 100 alarm raise and clear events only.

Use the **show alarms status** EXEC command to display the status of current alarms and the alarm overload status of the WAAS device and alarm overload configuration.

Examples

Table 3-3 describes the fields shown in the **show alarms history** command display.

Table 3-3 Field Descriptions for the **show alarms history** Command

Field	Description
Op	Operation status of the alarm. Values are R–Raised or C–Cleared.
Sev	Severity of the alarm. Values are Cr–Critical, Ma–Major, or Mi–Minor.
Alarm ID	Type of event that caused the alarm. For example: wafs_edge_down or wafs_core_down.
Module/Submodule	Software module affected. For example: wafs
Instance	Object that this alarm event is associated with. For example, for an alarm event with the Alarm ID disk_failed, the instance would be the name of the disk that failed. The Instance field does not have predefined values and is application specific.

Table 3-4 describes the fields shown in the **show alarms status** command display.

Table 3-4 *Field Descriptions for the show alarms status Command*

Field	Description
Critical Alarms	Number of critical alarms.
Major Alarms	Number of major alarms.
Minor Alarms	Number of minor alarms.
Overall Alarm Status	Aggregate status of alarms.
Device is NOT in alarm overload state.	Status of the device alarm overload state.
Device enters alarm overload state @ 999 alarms/sec.	Threshold number of alarms per second at which the device enters the alarm overload state.
Device exits alarm overload state @ 99 alarms/sec.	Threshold number of alarms per second at which the device exits the alarm overload state.
Overload detection is ENABLED.	Status of whether overload detection is enabled on the device.

Related Commands[\(config\) alarm overload-detect](#)[\(config\) snmp-server enable traps](#)

show arp

To display the ARP table for a WAAS device, use the **show arp** EXEC command.

show arp

Syntax Description

This command has no arguments or keywords.

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

Use the **show arp** command to display the Internet-to-Ethernet address translation tables of the Address Resolution Protocol. Without flags, the current ARP entry for the host name is displayed.

Examples

[Table 3-5](#) describes the fields shown in the **show arp** command display.

Table 3-5 Field Descriptions for the show arp Command

Field	Description
Protocol	Type of protocol.
Address	IP address of the hostname.
Flags	Current ARP flag status.
Hardware Addr	Hardware IP address given as six hexadecimal bytes separated by colons.
Type	Type of wide-area network.
Interface	Name and slot/port information for the interface.

show authentication

To display the authentication configuration for a WAAS device, use the **show authentication EXEC** command.

show authentication {user | content-request}

Syntax Descriptions

user	Displays authentication configuration for user login to the system.
content-request	Displays content request authentication configuration information in the disconnected mode.

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

When the WAAS device authenticates a user through an NTLM, LDAP, TACACS+, RADIUS, or Windows domain server, a record of the authentication is stored locally. As long as the entry is stored, subsequent attempts to access restricted Internet content by the same user do not require additional server lookups. To display the local and remote authentication configuration for user login, use the **show authentication user EXEC** command.

To display the content request authentication configuration information in the disconnected mode, use the **show authentication content-request EXEC** command.

Examples

[Table 3-6](#) describes the fields shown in the **show authentication user** command display.

Table 3-6 Field Descriptions for the show authentication user Command

Field	Description
Login Authentication: Console/Telnet/Ftp/SSH Session	Authentication service that is enabled for login authentication and the configured status of the service.
Windows domain	Operation status of the authentication service. Values are enabled or disabled.
RADIUS	
TACACS+	
Local	Priority status of each authentication service. Values are primary, secondary, or tertiary.
Configuration Authentication: Console/Telnet/Ftp/SSH Session	Authentication service that is enabled for configuration authentication and the configured status of the service.

Table 3-6 *Field Descriptions for the show authentication user Command (continued)*

Field	Description
Windows domain	Operation status of the authentication service. Values are enabled or disabled. Priority status of each authentication service. Values are primary, secondary, or tertiary.
RADIUS	
TACACS+	
Local	

[Table 3-7](#) describes the field in the **show authentication content-request** command display.

Table 3-7 *Field Description for the show authentication content-request Command*

Field	Description
The content request authentication in disconnected mode is XXX.	Operation status of content request authentication in disconnected mode. Values are enabled or disabled.

Related Commands

[\(config\) authentication configuration](#)

show auto-discovery

To display Traffic Flow Optimization (TFO) auto-discovery information for a WAE, use the **show auto-discovery EXEC** command.

```
show auto-discovery { blacklist [netmask netmask] | list [| { begin regex [regex] | exclude regex [regex] | include regex [regex] } ] }
```

Syntax Description		
blacklist		Displays the entries in the blacklist server table.
netmask <i>netmask</i>		(Optional) Displays the network mask to filter the table output (A.B.C.D/).
list		Lists TCP flows that the WAE is currently optimizing or passing through.
		(Optional) Specifies the output modifier.
begin <i>regex</i>		Begins with the line that matches the regular expression. You can enter multiple expressions.
exclude <i>regex</i>		Excludes lines that match the regular expression. You can enter multiple expressions.
include <i>regex</i>		Includes lines that match the regular expression. You can enter multiple expressions.

Command Modes EXEC

Device Modes application-accelerator

Examples The following is sample output from the **show auto-discovery list** command:

```
WAE# show auto-discovery list
```

```
E: Established, S: Syn, A: Ack, F: Fin, R: Reset  
s: sent, r: received, O: Options, P: Passthrough
```

```
Src-IP:Port          Dst-IP:Port          Orig-St  Term-St
```

Related Commands

show auto-register

To display the status of the automatic registration feature on a WAE, use the **show auto-register** EXEC command.

show auto-register

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator

Examples [Table 3-8](#) describes the output in the **show auto-register** command display.

Table 3-8 *Field Description for the show auto-register Command*

Field	Description
Auto registration is enabled.	Configuration status of the autoregistration feature.
Auto registration is disabled.	Configuration status of the autoregistration feature.

Related Commands [\(config\) auto-register](#)

show banner

To display the message of the day (MOTD), login, and EXEC banner settings, use the **show banner EXEC** command.

show banner

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Examples [Table 3-9](#) describes the fields shown in the **show banner** command display.

Table 3-9 *Field Descriptions for the show banner Command*

Field	Description
Banner is enabled	Configuration status of the banner feature.
MOTD banner is: abc	Configured message of the day.
Login banner is: acb	Configured login banner.
Exec banner is: abc	Configured EXEC banner.

Related Commands [\(config\) auto-register](#)

show bypass

To display static bypass configuration information for a WAE, use the **show bypass EXEC** command.

show bypass list

Syntax Description	list	Displays the bypass list entries. You can have a maximum of 50 entries.
---------------------------	-------------	---

Defaults	No default behavior or values.
-----------------	--------------------------------

Command Modes	EXEC
----------------------	------

Device Modes	application-accelerator
---------------------	-------------------------

Examples	Table 3-10 describes the fields shown in the show bypass list command display.
-----------------	---

Table 3-10 Field Descriptions for the show bypass list Command

Field	Description
Client	IP address and port of the client. For any client with this IP address, the WAE will not process the packet, but will bypass it and send it back to the router.
Server	IP address and port of the server.
Entry type	Type of bypass list entry. The Entry type field contains one of the following values: static-config, auth-traffic, server-error, or accept. A static-config entry is a bypass list entry that is configured by the user. An auth-traffic entry is a type of dynamic entry that the internal software adds automatically when the server requests authentication.

Related Commands	(config) bypass
-------------------------	---------------------------------

show cdp

To display CDP configuration information, use the **show cdp** EXEC command.

show cdp entry neighbor [**protocol** | **version** [**protocol**]

show cdp holdtime | **run** | **timer** | **traffic**

show cdp interface [**FastEthernet** *slot/port* | **GigabitEthernet** *slot/port*]

show cdp neighbors [**detail** | **FastEthernet** *slot/port* [**detail**] | **GigabitEthernet** *slot/port* [**detail**]]

Syntax Description		
entry neighbor	(Optional)	Displays information for a specific CDP neighbor entry.
protocol	(Optional)	Displays the CDP protocol information.
version	(Optional)	Displays the CDP version.
holdtime		Displays the length of time that CDP information is held by neighbors.
run		Displays the CDP process status.
timer		Displays the time when CDP information is resent to neighbors.
traffic		Displays CDP statistical information.
interface		Displays interface status and configuration.
FastEthernet <i>slot/port</i>	(Optional)	Displays Fast Ethernet configuration (slot 0–3 and port number).
GigabitEthernet <i>slot/port</i>	(Optional)	Displays Gigabit Ethernet configuration (slot 1–2 and port number).
neighbors		Displays CDP neighbor entries.
detail	(Optional)	Displays detailed neighbor entry information.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines The **show cdp** command displays information about how frequently CDP packets are resent to neighbors, the length of time that CDP packets are held by neighbors, the disabled status of CDP Version 2 multicast advertisements, CDP Ethernet interface ports, and general CDP traffic information.

Examples [Table 3-11](#) describes the fields shown in the **show cdp** command display.

Table 3-11 Field Descriptions for the *show cdp* Command

Field	Description
Sending CDP packets every XX seconds	Interval (in seconds) between transmissions of CDP advertisements. This field is controlled by the cdp timer command.
Sending a holdtime value of XX seconds	Time (in seconds) that the device directs the neighbor to hold a CDP advertisement before discarding it. This field is controlled by the cdp holdtime command.
Sending CDPv2 advertisements is XX	Transmission status for sending CDP Version-2 type advertisements. Possible values are enabled or disabled.

Table 3-12 describes the fields shown in the **show cdp entry neighbor** command display.

Table 3-12 Field Descriptions for the *show cdp entry* Command

Field	Description
Device ID	Name of the neighbor device and either the MAC address or the serial number of this device.
Entry address(es)	
IP address	IP address of the neighbor device.
CLNS address	Non-IP network address. The field depends on the type of neighbor.
DECnet address	Non-IP network address. The field depends on the type of neighbor.
Platform	Product name and number of the neighbor device.
Interface	Protocol being used by the connectivity media.
Port ID (outgoing port)	Port number of the port on the neighbor device.
Capabilities	Capability code discovered on the neighbor device. This is the type of the device listed in the CDP Neighbors table. Possible values are as follows: R—Router T—Transparent bridge B—Source-routing bridge S—Switch H—Host I—IGMP device r—Repeater
Holdtime	Time (in seconds) that the current device will hold the CDP advertisement from a transmitting router before discarding it.
Version	Software version running on the neighbor device.

Table 3-13 describes the fields shown in the **show cdp entry neighbor protocol** command display.

Table 3-13 *Field Descriptions for the show cdp entry protocol Command*

Field	Description
Protocol information for XX	Name or identifier of the neighbor device.
IP address	IP address of the neighbor device.
CLNS address	Non-IP network address. The field depends on the type of neighbor.
DECnet address	Non-IP network address. The field depends on the type of neighbor.

Table 3-14 describes the fields shown in the **show cdp entry neighbor version** command display.

Table 3-14 *Field Descriptions for the show cdp entry version Command*

Field	Description
Version information for XX	Name or identifier of the neighbor device.
Software, Version	Software and version running on the neighbor device.
Copyright	Copyright information for the neighbor device.

Table 3-15 describes the field in the **show cdp holdtime** command display.

Table 3-15 *Field Descriptions for the show cdp holdtime Command*

Field	Description
XX seconds	Time, in seconds, that the current device will hold the CDP advertisement from a transmitting router before discarding it.

Table 3-16 describes the fields shown in the **show cdp interface** command display.

Table 3-16 *Field Descriptions for the show cdp interface Command*

Field	Description
Interface_slot/port is XX	Operation status of the CDP interface. Values are up or down.
CDP protocol is XX	Protocol being used by the connectivity media.

Table 3-17 describes the fields shown in the **show cdp neighbors** command display.

Table 3-17 *Field Descriptions for the show cdp neighbors Command*

Field	Description
Device ID	Configured ID (name), MAC address, or serial number of the neighbor device.
Local Intrfce	(Local Interface) Protocol being used by the connectivity media.
Holdtime	Time, in seconds, that the current device will hold the CDP advertisement from a transmitting router before discarding it.

Table 3-17 *Field Descriptions for the show cdp neighbors Command (continued)*

Field	Description
Capability	Capability code discovered on the device. This is the type of the device listed in the CDP Neighbors table. Possible values are as follows: R—Router T—Transparent bridge B—Source-routing bridge S—Switch H—Host I—IGMP device r—Repeater
Platform	Product number of the device.
Port ID (outgoing port)	Port number of the device.

Table 3-18 describes the fields shown in the **show cdp neighbors detail** command display.

Table 3-18 *Field Descriptions for the show cdp neighbors detail Command*

Field	Description
Device ID	Configured ID (name), MAC address, or serial number of the neighbor device.
Entry address (es)	List of network addresses of neighbor devices.
Platform	Product name and number of the neighbor device.
Capabilities	Device type of the neighbor. This device can be a router, a bridge, a transparent bridge, a source-routing bridge, a switch, a host, an IGMP device, or a repeater.
Interface	Protocol being used by the connectivity media.
Port ID (outgoing port)	Port number of the port on the neighbor device.
Holdtime	Time, in seconds, that the current device will hold the CDP advertisement from a transmitting router before discarding it.
Version	Software version running on the neighbor device.
Copyright	Copyright information for the neighbor device.
advertisement version	Version of CDP being used for CDP advertisements.
VTP Management Domain	VLAN trunk protocol management domain. The VLAN information is distributed to all switches that are part of the same domain.
Native VLAN	VLAN to which the neighbor interface belongs.

Table 3-19 describes the field in the **show cdp run** command display.

Table 3-19 *Field Description for the show cdp run Command*

Field	Description
CDP is XX.	Whether CDP is enabled or disabled.

Table 3-20 describes the field in the **show cdp timer** command display.

Table 3-20 *Field Description for the show cdp timer Command*

Field	Description
cdp timer XX	Time when CDP information is resent to neighbors.

Table 3-21 describes the fields shown in the **show cdp traffic** command display.

Table 3-21 *Field Descriptions for the show cdp traffic Command*

Field	Description
Total packets Output	(Total number of packets sent) Number of CDP advertisements sent by the local device. This value is the sum of the CDP Version 1 advertisements output and CDP Version 2 advertisements output fields.
Input	(Total number of packets received) Number of CDP advertisements received by the local device. This value is the sum of the CDP Version-1 advertisements input and CDP Version 2 advertisements input fields.
Hdr syntax	(Header Syntax) Number of CDP advertisements with bad headers received by the local device.
Chksum error	(Checksum Error) Number of times that the checksum (verifying) operation failed on incoming CDP advertisements.
Encaps failed	(Encapsulations Failed) Number of times that CDP failed to transmit advertisements on an interface because of a failure caused by the bridge port of the local device.
No memory	Number of times that the local device did not have enough memory to store the CDP advertisements in the advertisement cache table when the device was attempting to assemble advertisement packets for transmission and parse them when receiving them.
Invalid packet	Number of invalid CDP advertisements received and sent by the local device.
Fragmented	Number of times fragments or portions of a single CDP advertisement were received by the local device instead of the complete advertisement.
CDP version 1 advertisements Output	Number of CDP Version 1 advertisements sent by the local device.
Input	Number of CDP Version 1 advertisements received by the local device.
CDP version 2 advertisements Output	Number of CDP Version 2 advertisements sent by the local device.
Input	Number of CDP Version 2 advertisements received by the local device.

 show cdp

Related Commands[\(config\) cdp](#)[\(config-if\) cdp](#)[clear arp-cache](#)

show cifs

To display CIFS run-time information, use the **show cifs** EXEC command.

show cifs auto-discovery [enabled | host-db | last]

show cifs cache {disk-use | entry-count}

show cifs connectivity peers

show cifs mss

show cifs requests {count | waiting}

show cifs sessions {count | list}

Syntax Description		
auto-discovery		Displays the CIFS auto-discovery status and run-time data.
enabled		(Optional) Displays current state of CIFS auto-discovery.
host-db		(Optional) Displays currently known hosts.
last		(Optional) Displays last auto-discovered entries.
cache		Displays CIFS cache information.
disk-use		Displays the total disk usage for CIFS cache.
entry-count		Displays the count of internal cache resources used for cached files.
connectivity		Displays Run-time information on Edge-Core connectivity.
peers		Displays a list of connected Cores.
mss		Displays the TCP maximum segment size (MSS) for the CIFS adapter. The segment size range is 512–1460.
requests		Displays run-time information on active CIFS requests.
count		Displays the number of pending CIFS requests.
waiting		Displays the number of waiting CIFS requests.
sessions		Displays run-time information on active CIFS sessions.
count		Displays the connected session count.
list		Displays the list of connected CIFS sessions.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator

Usage Guidelines The **show cifs** command operates on legacy mode WAFS. For information on the transparent CIFS accelerator, use the **show accelerator** or **show statistics accelerator** commands.

Use the **show cifs cache** command to view information about caching efficiency. You might use this command to determine if the cache contains sufficient space or if more space is needed. If you have a performance issue, you might use this command to see whether or not the cache is full.

Use the **show cifs connectivity peers** command to validate the WAN link state and the Edge to Core connectivity. This command is useful for general monitoring and debugging.

Use the **show cifs requests count** or **show cifs requests waiting** command to monitor the load for CIFS traffic. You might also use this command for debugging purposes to isolate requests that are not processing.

Use the **show cifs sessions count** or **show cifs sessions list** command to view session information. You might use this command to monitor connected users during peak and off-peak hours.

Examples

The following is sample output from the **show cifs connectivity peers** command:

```
WAE# show cifs connectivity peers
In_533202151_2.43.60.38
```

show clock

To display information about the system clock on a WAAS device, use the **show clock** EXEC command.

show clock [**detail** | **standard-timezones** {**all** | **details** *timezone* | **regions** | **zones** *region-name*}]

Syntax Description	detail	(Optional) Displays detailed information; indicates the clock source (NTP) and the current summer time setting (if any).
	standard-timezones	(Optional) Displays information about the standard time zones.
	all	Displays all of the standard time zones (approximately 1500 time zones). Each time zone is listed on a separate line.
	details <i>timezone</i>	Displays detailed information for the specified time zone.
	regions	Displays the region name of all the standard time zones. All 1500 time zones are organized into directories by region.
	zones <i>region-name</i>	Displays the name of every time zone that is within the specified region.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines The WAAS device has several predefined standard time zones. Some of these time zones have built-in summer time information while others do not. For example, if you are in an eastern region of the United States (US), you must use the US/Eastern time zone that includes summer time information for the system clock to adjust automatically every April and October. There are about 1500 standard time zone names.

Strict checking disables the **clock summertime** command when you configure a standard time zone is configured. You can configure summer time only if the time zone is not a standard time zone (that is, if the time zone is a customized zone).

The **show clock standard-timezones all** EXEC command enables you to browse through all standard timezones and choose from these predefined time zones so that you can choose a customized name that does not conflict with the predefined names of the standard time zones. Most predefined names of the standard time zones have two components, a region name and a zone name. You can list time zones by several criteria, such as regions and zones. To display all first level time zone names organized into directories by region, use the **show clock standard-timezones region** EXEC command.

The **show clock** command displays the local date and time information and the **show clock detail** command shows optional detailed date and time information.

Examples

[Table 3-22](#) describes the field in the **show clock** command display.

Table 3-22 *Field Description for the show clock Command*

Field	Description
Local time	Day of the week, month, date, time (hh:mm:ss), and year in local time relative to the UTC offset.

[Table 3-23](#) describes the fields shown in the **show clock detail** command display.

Table 3-23 *Field Descriptions for the show clock detail Command*

Field	Description
Local time	Local time relative to UTC.
UTC time	Universal time clock date and time.
Epoch	Number of seconds since Jan. 1, 1970.
UTC offset	UTC offset in seconds, hours, and minutes.

Related Commands

[clock](#)

[\(config\) clock](#)

show cms

To display Centralized Management System (CMS) embedded database content and maintenance status and other information for a WAAS device, use the **show cms** EXEC command.

show cms {database content {dump filename | text | xml} | info | secure-store}

Syntax Description	
database	Displays embedded database maintenance information.
content	Writes the database content to a file.
dump filename	Dumps all database content to a text file. Specifies the name of the file to be saved under local1 directory.
text	Writes the database content to a file in text format.
xml	Writes the database content to a file in XML format.
info	Displays CMS application information.
secure-store	Displays the status of the CMS secure store.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Examples [Table 3-24](#) describes the fields shown in the **show cms info** command display for WAAS application engines.

Table 3-24 Field Descriptions for the show cms info Command for WAAS Application Engines

Field	Description
Device registration information	
Device Id	Unique identifier given to the device by the Central Manager at registration, which is used to manage the device.
Device registered as	Type of device used during registration: WAAS Application Engine or WAAS Central Manager.
Current WAAS Central Manager	Address of the Central Manager as currently configured in the central-manager address global configuration command. This address may differ from the registered address if a standby Central Manager is managing the device instead of the primary Central Manager with which the device is registered.
Registered with WAAS Central Manager	Address of the Central Manager with which the device is registered.

Table 3-24 Field Descriptions for the show cms info Command for WAAS Application Engines

Field	Description
Status	Connection status of the device to the Central Manager. This field may contain one of three values: online, offline, or pending.
Time of last config-sync	Time when the device management service last contacted the Central Manager for updates.
CMS services information	
Service cms_ce is running	Status of the WAE device management service (running or not running). This field is specific to the WAE only.

Table 3-25 describes the fields shown in the **show cms info** command display for WAAS Central Managers.

Table 3-25 Field Descriptions for the show cms info Command for WAAS Central Managers

Field	Description
Device registration information	
Device Id	Unique identifier given to the device by the Central Manager at registration, which is used to manage the device.
Device registered as	Type of device used during registration: WAAS Application Engine or WAAS Central Manager.
Current WAAS Central Manager role	Role of the current Central Manager: Primary or Standby. Note The output for primary and standby Central Manager devices is different. On a standby, the output includes the following additional information: Current WAAS Central Manager and Registered with WAAS Central Manager.
Current WAAS Central Manager	Address of the standby Central Manager as currently configured in the central-manager address global configuration command.
Registered with WAAS Central Manager	Address of the standby Central Manager with which the device is registered.
CMS services information	
Service cms_httpd is running	Status of the management service (running or not running). This field is specific to the Central Manager only.
Service cms_cdm is running	Status of the management service (running or not running). This field is specific to the Central Manager only.

Table 3-26 describes the field in the **show cms database content text** command display.

Table 3-26 Field Description for the **show cms database content text** Command

Field	Description
Database content can be found in /local1/cms-db-12-12-2002-17:06:08:070.txt.	Name and location of the database content text file. The show cms database content text command requests the management service to write its current configuration to an automatically generated file in text format.

Table 3-27 describes the field in the **show cms database content xml** command display.

Table 3-27 Field Description for the **show cms database content xml** Command

Field	Description
Database content can be found in /local1/cms-db-12-12-2002-17:07:11:629.xml.	Name and location of the database content XML file. The show cms database content xml command requests the management service to write its current configuration to an automatically generated file in XML format.

Related Commands

[cms](#)

[\(config\) cms](#)

show cms secure-store

To display secure disk encryption status, use the **show cms secure-store** EXEC command.

show cms secure-store

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines The **show cms secure-store** command will display one of the following status messages ([Table 3-28](#)):

Table 3-28 Status Messages for the show cms secure-store Command

Message	Description
secure-store not initialized	Secure disk encryption is not initialized.
secure-store initialized. Use secure-store open command to open	Secure disk encryption is initialized but not open.
secure-store initialized and open	Secure disk encryption is initialized and open.

Examples The following is sample output from the **show cms secure-store** command:

```
WAE# show cms secure-store
secure-store initialized and open
```

Related Commands [cms secure-store](#)

show debugging

To display the state of each debugging option that was previously enabled on a WAAS device, use the **show debugging EXEC** command.

show debugging

Syntax Description

This command has no arguments or keywords.

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

The **show debugging** command shows which debug options have been enabled or disabled. If there are no debug options configured, the **show debugging** command shows no output.

The **dre**, **epm**, **flow**, **print-spooler**, **rbcp**, **tfo**, **translog**, **wafs**, and **wccp** command options are supported in the application-accelerator device mode only. The **emdb** and **rpc** command options are supported in the central manager device mode only.

The **show debugging** command displays only the type of debugging enabled, not the specific subset of the command.

Examples

The following is sample output from the **show debugging** command:

```
WAE# debug tfo buffer-mgr
WAE# debug tfo connection
WAE# show debugging
tfo bufmgr debugging is on
tfo compmgr debugging is on
tfo connmgr debugging is on
tfo netio debugging is on
tfo statmgr debugging is on
tfo translog debugging is on
```

In this example, the **debug tfo buffer-mgr** and the **debug tfo connection** commands coupled with the **show debugging** command display the states of **tfo buffer-mgr** and **tfo connection** debugging options.

Related Commands

[debug all](#)

show device-mode

To display the configured or current device mode of a WAAS device, use the **show device-mode EXEC** command.

show device-mode {configured | current}

Syntax Description	configured	Displays the configured device mode, which has not taken effect yet.
	current	Displays the current device mode.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines To display the configured device mode that has not yet taken effect, enter the **show device-mode configured EXEC** command. For example, if you had entered the **device mode central-manager** global configuration command on a WAAS device to change its device mode to central manager but have not yet entered the **copy run start EXEC** command to save the running configuration on the device, then if you were to enter the **show device-mode configured** command on the WAAS device, the command output would indicate that the configured device mode is central-manager.

Examples The following is sample output from the **show device mode** command. It displays the current mode in which the WAAS device is operating.

```
WAE# show device-mode current
```

```
Current device mode: application-accelerator
```

[Table 3-29](#) describes the field in the **show device-mode current** command display.

Table 3-29 Field Description for the show device-mode current Command

Field	Description
Current device mode	Current mode in which the WAAS device is operating.

The following is sample output from the **show device configured** command. It displays the configured device mode that has not yet taken effect.

```
WAE# show device-mode configured
```

```
Configured device mode: central-manager
```

Table 3-30 describes the field in the **show device-mode configured** command display.

Table 3-30 *Field Description for the show device-mode configured Command*

Field	Description
Configured device mode	Device mode that has been configured, but has not yet taken effect.

Related Commands

(config) device mode

show directed-mode

To view the status and port assigned to directed mode on a device, use the **show directed-mode** EXEC command.

show directed-mode

Syntax Description	This command has no arguments or keywords.
---------------------------	--

Defaults	No default behavior or values.
-----------------	--------------------------------

Command Modes	EXEC
----------------------	------

Device Modes	application-accelerator
---------------------	-------------------------

Examples	The following is sample output from the show directed-mode EXEC command:
-----------------	---

```
WAE# show directed-mode
```

```
Configuration Status: Enabled
Config Item           Mode           Value
-----
UDP port              Default        4050
```

This example shows that directed mode is enabled and it is using UDP port 4050.

Related Commands	show statistics directed-mode show statistics connection closed (config) directed-mode
-------------------------	--

show disks

To view information about the WAAS device disks, use the **show disks** EXEC command.

show disks { **details** | **failed-disk-id** | **failed-sectors** [*disk_name*] | **tech-support** [**details**] }

Syntax Description		
details		Displays currently effective configurations with more details.
failed-disk-id		Displays a list of disk serial numbers that have been identified as failed.
	Note	This option is not available on WAE-7341 and WAE-7371 models.
failed-sectors		Displays a list of failed sectors on all the disks.
<i>disk_name</i>		(Optional) Name of the disk for which failed sectors are displayed (disk00 or disk01).
tech-support		Displays hard drive diagnostic information and information about impending disk failures.
		Displays all available information from the RAID controller, including disk status (logical and physical), disk vendor ID, and serial numbers.
		This command replaces the show disk smart-info EXEC command.
details		(Optional) Displays more detailed SMART disk monitoring information.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines The **show disks details** EXEC command displays the percentage or amount of disk space allocated to each file system, and the operational status of the disk drives, after reboot.

The WAAS software supports filtering of multiple syslog messages for a single, failed section on IDE, SCSI, and SATA disks.

Proactively Monitoring Disk Health with SMART

The ability to proactively monitor the health of disks is available using SMART. SMART provides you with hard drive diagnostic information and information about impending disk failures.

SMART is supported by most disk vendors and is a standard method used to determine how healthy a disk is. SMART attributes include several read-only attributes (for example, the power on hours attribute, the load and unload count attribute) that provide the WAAS software with information regarding the operating and environmental conditions that may indicate an impending disk failure.

SMART support is vendor and drive technology (IDE, SCSI, and Serial Advanced Technology Attachment [SATA] disk drive) dependent. Each disk vendor has a different set of supported SMART attributes.

Even though SMART attributes are vendor dependent there is a common way of interpreting most SMART attributes. Each SMART attribute has a normalized current value and a threshold value. When the current value exceeds the threshold value, the disk is considered to have “failed.” The WAAS software monitors the SMART attributes and reports any impending failure through syslog messages, SNMP traps, and alarms.

To display SMART information, use the **show disks tech-support** EXEC command. To display more detailed SMART information, enter the **show disks tech-support details** EXEC command. The output from the **show tech-support** EXEC command also includes SMART information.

Examples

The following is sample output from the **show disks failed-sectors** command. It displays a list of failed sectors on all disk drives.

```
WAE# show disks failed-sectors
disk00
=====
89923
9232112

disk01
=====
(None)
```

The following is sample output from the **show disks failed-sectors** command when you specify a disk drive. It displays a list of failed sectors for disk01.

```
WAE# show disks failed-sectors disk01
disk01
=====
(None)
```

If there are disk failures, a message is displayed, notifying you about this situation when you log in.

[Table 3-31](#) describes the fields shown in the **show disks failed-disk-id** command display.

Table 3-31 Field Description for the **show disks failed-disk-id** Command

Field	Description
Diskxx	Number and location of the physical disk.
Alpha-numeric string	Serial number of the disk.

[Table 3-32](#) describes the fields shown in the **show disks details** command display.

Table 3-32 Field Descriptions for the **show disks details** Command

Field	Description
Physical disk information	Lists the disks by number. WAE 7300 series appliances show information for 6 disk drives and WAE 500 and 600 series appliances show information for 2 disk drives.
disk00	Availability of the disk: Present, Not present or Not responding, or Not used (*). Disk identification number and type, for example: (h00 c00i00 100 - DAS). Disk size in megabytes and gigabytes, for example: 140011MB (136.7GB).
disk01	Same type of information is shown for each disk.
Mounted filesystems	Table containing the following column heads:
Mount point	Mount point for the file system. For example, the mount point for SYSFS is /local/local1.
Type	Type of the file system. Values include root, internal, CONTENT, SYSFS, and PRINTSPOOL.
Device	Path to the partition on the disk.
Size	Total size of the file system in megabytes.
Inuse	Amount of disk space being used by the file system.
Free	Amount of unused disk space for the file system.
Use%	Percentage of the total available disk space being used by the file system.
Software RAID devices	If present, lists the software RAID devices and provides the following information for each:
Device name	Path to the partition on the disk. The partition name “md1” indicates that the partition is a RAIDed partition and that the RAID type is RAID-1.
Type	Type of RAID, for example RAID-1.
Status	Operational status of the RAID device. Status may contain NORMAL OPERATION or REBUILDING.
Physical devices and status	Disk number and operational status of the disk, such as [GOOD] or [BAD].

The following is sample output from the **show disks tech-support** command. The output shows that partition 04 and partition 05 on disks disk00 and disk01 are GOOD, and the RAIDed partitions /dev/md4 & /dev/md5 are in NORMAL OPERATION. However, the RAIDed partition /dev/md8 has an issue with one of the drives. Disk04 with partition 00 is GOOD, but the status shows ONE OR MORE DRIVES ABNORMAL because there is no pair on this partition.

```
WAE# show disks tech-support
/dev/md4      RAID-1    NORMAL OPERATION    disk00/04 [GOOD]
disk01/04 [GOOD]
/dev/md5      RAID-1    NORMAL OPERATION    disk00/05 [GOOD]
disk01/05 [GOOD]
```

```
...
/dev/md8      RAID-1    ONE OR MORE DRIVES ABNORMAL  disk04/00 [GOOD]
```

Table 3-33 describes some typical fields in the **show disks tech-support** command display for a RAID-1 appliance that supports SMART. SMART attributes are vendor dependent; each disk vendor has a different set of supported SMART attributes.

Table 3-33 Field Descriptions for the **show disks tech-support** Command (RAID-1)

Field	Description
disk00—disk05	WAE 7300 series appliances show information for 6 disk drives, and WAE 500 and 600 series appliances show information for 2 disk drives.
Device	Vendor number and version number of the disk.
Serial Number	Serial number for the disk.
Device type	Type of device is disk.
Transport protocol	Physical layer connector information, for example: Parallel SCSI (SPI-4).
Local time is	Day of the week, month, date, time hh:mm:ss, year, clock standard. For example, Mon Mar 19 23:33:12 2007 UTC.
Device supports SMART and is Enabled	Status of SMART support: Enabled or Disabled.
Temperature Warning Enabled	Temperature warning status: Enabled or Disabled.
SMART Health Status:	Health status of the disk: OK or Failed.

Table 3-34 describes the fields shown in the **show disks tech-support** command display for a RAID-5 appliance.

Table 3-34 Field Descriptions for the **show disks tech-support** Command (RAID-5)

Field	Description
Controllers found	Number of RAID controllers found.
Controller information	
Controller Status	Functional status of the controller.
Channel description	Description of the channel transport protocols.
Controller Model	Make and model of the controller.
Controller Serial Number	Serial number of the ServeRAID controller.
Physical Slot	Slot number.
Installed memory	Amount of memory for the disk.
Copyback	Status of whether copyback is enabled or disabled.
Data scrubbing	Status of whether data scrubbing is enabled or disabled.
Defunct disk drive count	Number of defunct disk drives.
Logical drives/Offline/Critical	Number of logical drives, number of drives that are offline, and number of critical alarms.
Controller Version Information	

Table 3-34 Field Descriptions for the *show disks tech-support* Command (RAID-5)

Field	Description
BIOS	Version number of the BIOS.
Firmware	Version number of the Firmware.
Driver	Version number of the Driver.
Boot Flash	Version number of the Boot Flash.
Controller Battery Information	
Status	Functional status of the controller battery.
Over temperature	Over temperature condition of the battery.
Capacity remaining	Percent of remaining battery capacity.
Time remaining (at current draw)	Number of days, hours, and minutes of battery life remaining based on the current draw.
Controller Vital Product Data	
VPD Assigned#	Number assigned to the controller vital product data (VPD).
EC Version#	Version number.
Controller FRU#	Number assigned to the controller field-replaceable part.
Battery FRU#	Number assigned to the battery field-replaceable part.
Logical drive information	
Logical drive number	Number identifying the logical drive to which the information applies.
Logical drive name	Name of the logical drive.
RAID level	RAID level of the logical drive.
Status of logical drive	Functional status of the logical drive.
Size	Size (in megabytes) of the logical drive.
Read-cache mode	Configuration status of read-cache mode: Enabled or Disabled.
Write-cache mode	Configuration status of write-cache mode for write-back: Enabled or Disabled.
Write-cache setting	Configuration status of the write-cache setting for write-back: Enabled or Disabled.
Partitioned	Partition state. Values are Yes or No.
Number of chunks	Number of disks participating in the RAID-5 array.
Stripe-unit size	Amount of data storage per stripe unit. The default is 256 KB per disk in the logical array. This parameter is not configurable.
Stripe order (Channel,Device)	Order in which data is striped across a group of physical drives that are grouped in a RAID array.
Bad stripes	Flag for bad stripes. Flag values are Yes or No.
Physical drive information	
Device #	Device number for which the information applies.
Device is a xxxx	Type of device.
State	State of the device: Online or Offline.

Table 3-34 Field Descriptions for the **show disks tech-support Command (RAID-5)**

Field	Description
Supported	Status showing if the device is supported.
Transfer Speed	Device transfer speed.
Reported Channel,Device	Provides channel information for all the disks participating in the RAID-5 array.
Reported Enclosure,Slot	Device number and slot number.
Vendor	Vendor identification number.
Model	Model number.
Firmware	Firmware number.
Serial number	Serial number.
Size	Size (in megabytes) of the physical drive.
Write Cache	Status of whether the write cache is enabled.
FRU	Field Replaceable Unit number. A RAID defunct drive FRU event occurs when a specified hard disk drive with the provided FRU number fails in a RAID configuration. The default value for this field is NONE.
PFA	Predictive Failure Analysis flag. The flag default value is No. If the RAID predicts a drive failure, this field is set to Yes and a critical alarm is raised on the WAE.

Table 3-35 describes the fields in the **show disks tech-support details** command display for a RAID-1 appliance that supports SMART. Details in this display depend on the drive manufacturer and vary between drives.

Table 3-35 Field Descriptions for the **show disks tech-support details Command**

Field	Description
disk00—disk05	WAE 7300 series appliances show information for 6 disk drives and WAE 500 and 600 series appliances show information for 2 disk drives.
Device	Vendor number and version number of the disk.
Serial Number	Serial number for the disk.
Device type	Type of device is disk.
Transport protocol	Physical layer connector information, for example: Parallel SCSI (SPI-4).
Local time is	Day of the week, month, date, time hh:mm:ss, year, clock standard. For example, Mon Mar 19 23:33:12 2007 UTC.
Device supports SMART and is Enabled	Status of SMART support: Enabled or Disabled.
Temperature Warning Enabled	Temperature warning status: Enabled or Disabled.
SMART Health Status:	Health status of the disk: OK or Failed.
Current Drive Temperature	Temperature of the drive in degrees Celsius.

Table 3-35 *Field Descriptions for the show disks tech-support details Command (continued)*

Field	Description
Manufactured in week XX of year	Manufacturing details.
Current start stop count	Number of times the device has stopped or started.
Recommended maximum start stop count	Maximum recommended count used to gauge the life expectancy of the disk.
Error counter log	Table displaying the error counter log. Counters for various types of disk errors.

show egress-methods

To view the egress method that is configured and that is being used on a particular WAE, use the **show egress-methods** EXEC command.

show egress-methods

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator

Examples [Table 3-36](#) describes the fields shown in the **show egress-methods** command display.

Table 3-36 *Field Descriptions for the show egress-methods Command*

Field	Description
Intercept method	Intercept method used by router to send packets to the WAE.
TCP Promiscuous 61 or 62	WCCP service number.
WCCP negotiated return method	WCCP return method being used by the router. Values include WCCP_GRE, WCCP_L2, NEG_RTN_PENDING (negotiation is pending), and UNKNOWN.
Destination	This value is not configurable. The value of this field is always ANY.
Egress Method Configured	Egress method configured in the CLI.
Egress Method Used	Egress method being used.

Related Commands [show tfo tcp](#)
[\(config\) egress-method](#)

show filtering list

To display information about the incoming and outgoing TFO flows that the WAE currently has, use the **show filtering list EXEC** command.

```
show filtering list [| { begin regex [regex] | exclude regex [regex] | include regex [regex] } ] [| { begin regex [regex] | exclude regex [regex] | include regex [regex] } ]
```

Syntax Description	list	(Optional) Lists TCP flows that the WAE is currently optimizing or passing through.
	 	(Optional) Output modifier.
	begin <i>regex</i>	Begins with the line that matches the regular expression. You can enter multiple expressions.
	exclude <i>regex</i>	Excludes lines that match the regular expression. You can enter multiple expressions.
	include <i>regex</i>	Includes lines that match the regular expression. You can enter multiple expressions.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator

Usage Guidelines The **show filtering list** command lists TCP flows that the WAE is currently optimizing. It also includes TCP flows that are not being optimized but that are being passed through by the WAE. A “P” in the State column indicates a passed through flow.

Examples The following is sample output from the **show filtering list** command. It displays TFO connection information for the WAE.

```
WAE# show tfo filtering list
```

```
E: Established, S: Syn, A: Ack, F: Fin, R: Reset
```

```
s: sent, r: received, O: Options, P: Passthrough
```

```
B: Bypass, T: Timedout, C: Closed
```

show flash

To display the flash memory version and usage information for a WAAS device, use the **show flash EXEC** command.

show flash

Syntax Description	This command has no arguments or keywords.
---------------------------	--

Defaults	No default behavior or values.
-----------------	--------------------------------

Command Modes	EXEC
----------------------	------

Device Modes	application-accelerator central-manager
---------------------	--

Examples	Table 3-37 describes the fields shown in the show flash command display.
-----------------	---

Table 3-37 Field Descriptions for the show flash Command

Field	Description
WAAS software version (disk-based code)	WAAS software version and build number that is running on the device.
System image on flash:	
Version	Version and build number of the software that is stored in flash memory.
System flash directory:	
System image	Number of sectors used by the system image.
Bootloader, rescue image, and other reserved areas	Number of sectors used by the bootloader, rescue image, and other reserved areas.
XX sectors total, XX sectors free	Total number of sectors. Number of free sectors.

show hardware

To display system hardware status for a WAAS device, use the **show hardware** EXEC command.

show hardware

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines The **show hardware** command lists the system hardware status, including the version number, the startup date and time, the run time since startup, the microprocessor type and speed, the amount of physical memory available, and a list of disk drives.

Examples [Table 3-38](#) describes the fields shown in the **show hardware** command display.

Table 3-38 *Field Descriptions for the show hardware Command*

Field	Description
Cisco Wide Area Application Services Software (WAAS) Copyright (c) year by Cisco Systems, Inc. Cisco Wide Area Application Services Software Release XXX (build bXXX month day year)	Software application, copyright, release, and build information.
Version	Version number of the software that is running on the device.
Compiled hour:minute:second month day year by cnbuild	Compile information for the software build.
System was restarted on day of week month day hour:minute:second year	Date and time that the system was last restarted.
The system has been up for X hours, X minutes, X seconds	Length of time the system has been running since the last reboot.
CPU 0 is	CPU manufacturer information.
Total X CPU	Number of CPUs on the device.

Table 3-38 **Field Descriptions for the show hardware Command (continued)**

Field	Description
XXXX Mbytes of Physical memory	Number of megabytes of physical memory on the device.
X CD ROM drive	Number of CD-ROM drives on the device.
X GigabitEthernet interfaces	Number of Gigabit Ethernet interfaces on the device.
X InlineGroup interfaces	Number of InlineGroup interfaces on the device.
X Console interface	Number of console interfaces on the device.
Manufactured As	Product identification information.
BIOS Information	Information about the BIOS.
Vendor	Name of the BIOS vendor.
Version	BIOS version number.
Rel. Date	(Release date) Date that the BIOS was released.
Cookie info	
SerialNumber	Serial number of the WAE.
SerialNumber (raw)	Serial number of the WAE as an ASCII value.
TestDate	Date that the WAE was tested.
ExtModel	Hardware model of the device, for example WAE612.
ModelNum (raw)	Internal model number (ASCII value) that corresponds to the ExtModel number.
HWVersion	Number of the current hardware version.
PartNumber	Not implemented.
BoardRevision	Number of revisions for the current system board.
ChipRev	Number of revisions for the current chipset.
VendID	Vendor ID of the cookie.
CookieVer	Version number of the cookie.
Chksum	Checksum of the cookie. showing whether the cookie is valid.
List of all disk drives	
Physical disk information	Disks listed by number. WAE 7300 series appliances show information for 6 disk drives and WAE 500 and 600 series appliances show information for 2 disk drives.
disk00	Availability of the disk: Present, Not present or not responding, or Not used (*). Disk identification number and type, for example:(h00 c00i00 100 - DAS). Disk size in megabytes and gigabytes, for example: 140011MB (136.7GB).
disk01	Same type of information is shown for each disk.
Mounted filesystems	Table containing the following column heads:
Mount point	Mount point for the file system. For example the mount point for SYSFS is /local/local1.

Table 3-38 *Field Descriptions for the show hardware Command (continued)*

Field	Description
Type	Type of the file system. Values include root, internal, CONTENT, SYSFS, and PRINTSPOOL.
Device	Path to the partition on the disk.
Size	Total size of the file system in megabytes.
Inuse	Amount of disk space being used by the file system.
Free	Amount of unused disk space for the file system.
Use%	Percentage of the total available disk space being used by the file system.
Software RAID devices	If present, lists the software RAID devices and provides the following information for each:
Device name	Path to the partition on the disk. The partition name “md1” indicates that the partition is a raided partition and that the RAID type is RAID-1. (RAID-1 is the only RAID type supported in WAAS.)
Type	Type of RAID, for example RAID-1.
Status	Operational status of the RAID device. Status may contain NORMAL OPERATION or REBUILDING.
Physical devices and status	Disk number and operational status of the disk, such as [GOOD] or [BAD].

Related Commands[show disks](#)[show version](#)

show hosts

To view the hosts on a WAAS device, use the **show hosts** EXEC command.

show hosts

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines The **show hosts** command lists the name servers and their corresponding IP addresses. It also lists the hostnames, their corresponding IP addresses, and their corresponding aliases (if applicable) in a host table summary.

Examples [Table 3-39](#) describes the fields shown in the **show hosts** command display.

Table 3-39 *field Descriptions for the show hosts Command*

Field	Description
Domain names	Domain names used by the WAE to resolve the IP address.
Name Server(s)	IP address of the DNS name server or servers.
Host Table	
hostname	FQDN (hostname and domain) of the current device.
inet address	IP address of the current host device.
aliases	Name configured for the current device based on the host global configuration command.

Related Commands [\(config\) ip hosts](#)

show inetd

To display the status of TCP/IP services on a WAAS device, use the **show inetd** EXEC command.

show inetd

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines The **show inetd** EXEC command displays the enabled or disabled status of TCP/IP services on the WAAS device. You can ignore the TFTP service status because TFTP is not supported on WAAS.

Examples [Table 3-40](#) describes the fields shown in the **show inetd** command display.

Table 3-40 Field Descriptions for the show inetd Command

Field	Description
Inetd service configurations:	
ftp	Status of whether the FTP service is enabled or disabled.
rcp	Status of whether the RCP service is enabled or disabled.
tftp	Status of whether the TFTP service is enabled or disabled.

Related Commands [\(config\) inetd](#)

show interface

To display the hardware interface information for a WAAS device, use the **show interface** EXEC command.

```
show interface { GigabitEthernet slot/port } | { ide control_num } | { InlineGroup slot/grpnumber }
| { InlinePort slot/grpnumber / { lan | wan } } | { PortChannel port-num } | { scsi device_num }
| { Standby group_num | usb }
```

Syntax Description		
GigabitEthernet <i>slot/port</i>		Displays the Gigabit Ethernet interface device information (only on suitably equipped systems). Slot and port number for the Gigabit Ethernet interface. The slot range is 0–3; the port range is 0–3. The slot number and port number are separated with a forward slash character (/).
ide <i>control_num</i>		Displays the IDE interface device information (controller number 0–1).
InlineGroup <i>slot/grpnumber</i>		Displays the inline group information. Slot and inline group number for the selected interface.
InlinePort		Displays the inline port information. Slot and inline group number for the selected interface.
lan		Displays the inline port information for the LAN port.
wan		Displays the inline port information for the WAN port.
PortChannel <i>port-num</i>		Displays the port channel interface device information (number 1–2).
scsi <i>device_num</i>		Displays the SCSI interface device information (number 0–7).
Standby <i>group_num</i>		Displays the standby group information (number 1–4).
usb		Displays the USB interface device information.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Examples The following is sample output from the **show interface** command. It displays information for inlineGroup 0 in slot 1 configured on the WAE inline network adapter.

```
WAE612# show interface inlineGroup 1/0
Interface is in intercept operating mode.
Standard NIC mode is off.
Disable bypass mode is off.
VLAN IDs configured for inline interception: All
Watchdog timer is enabled.
Timer frequency: 1600 ms.
Autoreset frequency 500 ms.
The watchdog timer will expire in 1221 ms.
```

Table 3-41 describes the fields shown in the **show interface GigabitEthernet** command display.

Table 3-41 Field Descriptions for the show interface GigabitEthernet Command

Field	Description
Description	Description of the device, as configured by using the description option of the interface global configuration command.
Type	Type of interface. Always Ethernet.
Ethernet address	Layer-2 MAC address.
Internet address	Internet IP address configured for this interface.
Broadcast address	Broadcast address configured for this interface.
Netmask	Netmask configured for this interface.
Maximum Transfer Unit Size	Current configured MTU value.
Metric	Metric setting for the interface. The default is 1. The routing metric is used by the routing protocol to determine the most favorable route. Metrics are counted as additional hops to the destination network or host; the higher the metric value, the less favorable the route.
Packets Received	Total number of packets received by this interface.
Input Errors	Number of incoming errors on this interface.
Input Packets Dropped	Number of incoming packets that were dropped on this interface.
Input Packets Overruns	Number of incoming packet overrun errors.
Input Packets Frames	Number of incoming packet frame errors.
Packet Sent	Total number of packets sent from this interface.
Output Errors	Number of outgoing packet errors.
Output Packets Dropped	Number of outgoing packets that were dropped by this interface.
Output Packets Overruns	Number of outgoing packet overrun errors.
Output Packets Carrier	Number of outgoing packet carrier errors.
Output Queue Length	Output queue length in bytes.
Collisions	Number of packet collisions at this interface.
Interrupts	Number of packet interrupts at this interface.
Base address	Base address. hexadecimal value.
Flags	Interface status indicators. Values include Up, Broadcast, Running, and Multicast.
Mode	Speed setting, transmission mode, and transmission speed for this interface.

Table 3-42 describes the fields shown in the **show interface InlinePort** command display.

Table 3-42 *Field Descriptions for the show interface InlinePort Command*

Field	Description
Device name	Number identifier for this inlineport interface, such as eth0, eth1, and so forth.
Packets Received	Total number of packets received on this inlineport interface.
Packets Intercepted	Total number of packets intercepted. (Only TCP packets are intercepted.)
Packets Bridged	Number of packets that are bridged. Packets which are not intercepted are bridged.
Packets Forwarded	Number of packets sent from the inline interface.
Packets Dropped	Number of packets dropped.
Packets Received on native	Number of packets forwarded by the inline module that are received on the native (GigabitEthernet 1/0) interface.
<i>n</i> flows through this interface	Number of active TCP connections on this inlineport interface.
Ethernet Driver Status	
Type	Type of interface. Always Ethernet.
Ethernet address	Layer-2 MAC address.
Internet address	IP address (for WAN port only).
Broadcast address	Broadcast address (for WAN port only).
Netmask	Subnet mask (for WAN port only).
Maximum Transfer Unit Size	Current configured MTU value.
Metric	Metric setting for the interface. The default is 1. The routing metric is used by the routing protocol to determine the most favorable route. Metrics are counted as additional hops to the destination network or host; the higher the metric value, the less favorable the route.
Packets Received	Total number of packets received by this interface.
Input Errors	Number of incoming errors on this interface.
Input Packets Dropped	Number of incoming packets that were dropped on this interface.
Input Packets Overruns	Number of incoming packet overrun errors.
Input Packets Frames	Number of incoming packet frame errors.
Packet Sent	Total number of packets sent from this interface.
Output Errors	Number of outgoing packet errors.
Output Packets Dropped	Number of outgoing packets that were dropped by this interface.
Output Packets Overruns	Number of outgoing packet overrun errors.
Output Packets Carrier	Number of outgoing packet carrier errors.
Output Queue Length	Output queue length in bytes.
Collisions	Number of packet collisions at this interface.

Table 3-42 *Field Descriptions for the show interface InlinePort Command (continued)*

Field	Description
Base address	Base address. hexadecimal value.
Flags	Interface status indicators. Values include Up, Broadcast, Running, and Multicast.
Mode	Speed setting, transmission mode, and transmission speed for this interface.

Table 3-43 describes the fields shown in the **show interface PortChannel** command display.

Table 3-43 *Field descriptions for the show interface PortChannel Command*

Field	Description
Type	Type of interface. Always Ethernet.
Ethernet address	Layer-2 MAC address.
Maximum Transfer Unit Size	Current configured MTU value.
Metric	Metric setting for the interface. The default is 1. The routing metric is used by the routing protocol. Higher metrics have the effect of making a route less favorable; metrics are counted as addition hops to the destination network or host.
Packets Received	Total number of packets received by this interface.
Input Errors	Number of incoming errors on this interface.
Input Packets Dropped	Number of incoming packets that were dropped on this interface.
Input Packets Overruns	Number of incoming packet overrun errors.
Input Packets Frames	Number of incoming packet frame errors.
Packet Sent	Total number of packets sent from this interface.
Output Errors	Number of outgoing packet errors.
Output Packets Dropped	Number of outgoing packets that were dropped by this interface.
Output Packets Overruns	Number of outgoing packet overrun errors.
Output Packets Carrier	Number of outgoing packet carrier errors.
Output Queue Length	Output queue length in bytes.
Collisions	Number of packet collisions at this interface.
Flags	Interface status indicators. Values include Up, Broadcast, Running, and Multicast.

Table 3-44 describes the field shown in the **show interface scsi** command display.

Table 3-44 Field Description for the **show interface scsi** Command

Field	Description
SCSI interface X	Information for SCSI device number X. Shows the make, device ID number, model number, and type of SCSI device.

Table 3-45 describes the fields shown in the **show interface standby** command display.

Table 3-45 Field Descriptions for the **show interface standby** Command

Field	Description
Standby Group	Number that identifies the standby group.
Description	Description of the device, as configured by using the description option of the interface global configuration command.
IP address, netmask	IP address and netmask of the standby group.
Member interfaces	Member interfaces of the standby group. Shows which physical interfaces are part of the standby group. Shows the interface definition, such as GigabitEthernet 1/0.
Active interface	Interfaces that are currently active in the standby group.

Related Commands

(config) interface GigabitEthernet

show running-config

show startup-config

show inventory

To display the system inventory information for a WAAS device, use the **show inventory EXEC** command.

show inventory

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines The **show inventory EXEC** command allows you to view the UDI for a WAAS device. This identity information is stored in the nonvolatile memory of the WAAS device.

The UDI is electronically accessed by the product operating system or network management application to enable identification of unique hardware devices. The data integrity of the UDI is vital to customers. The UDI that is programmed into the nonvolatile memory of the WAAS device is equivalent to the UDI that is printed on the product label and on the carton label. This UDI is also equivalent to the UDI that can be viewed through any electronic means and in all customer-facing systems and tools. Currently, there is only CLI access to the UDI; there is no SNMP access to the UDI information.

You can also use the **show tech-support EXEC** command to display the WAAS device UDI.

Examples [Table 3-46](#) describes the fields shown in the **show inventory** command display.

Table 3-46 Field Descriptions for the show inventory Command

Field	Description
PID	Product identification (ID) number of the device.
VID	Version ID number of the device. Displays as 0 if the version number is not available.
SN	Serial number of the device.

Related Commands [show tech-support](#)

show ip access-list

To display the access lists that are defined and applied to specific interfaces or applications on a WAAS device, use the **show ip access-list EXEC** command.

show ip access-list [*acl-name* | *acl-num*]

Syntax Description	<i>acl-name</i>	(Optional) Information for a specific access list, using an alphanumeric identifier up to 30 characters, beginning with a letter.
	<i>acl-num</i>	(Optional) Information for a specific access list, using a numeric identifier (0–99 for standard access lists and 100–199 for extended access lists).

Defaults	Displays information about all defined access lists.
-----------------	--

Command Modes	EXEC
----------------------	------

Device Modes	application-accelerator central-manager
---------------------	--

Usage Guidelines	Use the show ip access-list EXEC command to display the access lists that have been defined on the WAAS device. Unless you identify a specific access list by name or number, the system displays information about all the defined access lists, including the following sections:
-------------------------	--

- Available space for new lists and conditions
- Defined access lists
- References by interface and application

Examples	Table 3-47 describes the fields shown in the show ip access-list command display.
-----------------	--

Table 3-47 Field Descriptions for the show ip access-list Command

Field	Description
Space available:	
XX access lists	Number of access lists remaining out of 50 maximum lists allowed.
XXX access list conditions	Number of access list conditions remaining out of 500 maximum conditions allowed.
Standard IP access list	Name of a configured standard IP access list. Displays a list of the conditions configured for this list.

Table 3-47 Field Descriptions for the show ip access-list Command (continued)

Field	Description
Extended IP access list	Name of a configured extended IP access list. Displays a list of the conditions configured for this list.
Interface access list references	List of interfaces and the access lists with which they are associated, displayed in the following format: <i>interface slot/port</i> <i>interface direction</i> <i>access list number</i>
Application access list references	List of applications and the access lists with which they are associated, displayed in the following format: <i>application type</i> <i>access list type and number</i> <i>associated port</i>

Related Commands

show ip routes

To display the IP routing table for a WAAS device, use the **show ip routes** EXEC command.

show ip routes

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines The **show ip routes** command displays the IP route table, which lists all of the different routes that are configured on the WAE. The WAE uses this table to determine the next hop. This table includes routes from three sources: the WAE GigabitEthernet interfaces, any user-configured static routes, and the default gateway. The last line in this table shows the default route.

Examples [Table 3-48](#) describes the fields shown in the **show ip routes** command display.

Table 3-48 Field Descriptions for the show ip routes Command

Field	Description
Destination	Destination IP addresses for each route.
Gateway	Gateway addresses for each route.
Netmask	Netmasks for each route.
Number of route cache entries	Number of entries in the route cache. The route cache is a separate entity and this field is not associated with the entries in the IP route table. The number of entries in the route cache can vary depending on the number of connections that are open.

Related Commands [\(config\) ip](#)
[\(config-if\) ip](#)

show kdump

To display the kernel crash dump information for a WAAS device, use the **show kdump EXEC** command.

show kdump

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Examples [Table 3-49](#) describes the fields shown in the **show kdump** command display.

Table 3-49 *Field Descriptions for the show kdump Command*

Field	Description
Kdump state	Enabled or not enabled.
Kdump operation	Operational or not operational.
Kdump crashkernel	Crash kernel information (Memory @ Base Address).

Related Commands [clear arp-cache](#)
[\(config\) logging console](#)

show kerberos

To display the Kerberos authentication configuration for a WAAS device, use the **show kerberos** EXEC command.

show kerberos

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Examples [Table 3-50](#) describes the fields shown in the **show kerberos** command display.

Table 3-50 Field Descriptions for the show kerberos Command

Field	Description
Kerberos Configuration	
Local Realm	Local realm name.
DNS suffix	DNS suffix for the realm.
Realm for DNS suffix	DNS addresses of the computers that are part of this realm.
Name of host running KDC for realm	Name of the host running the Key Distribution Center for the realm.
Master KDC	Primary or main Key Distribution Center.
Port	Port that the Kerberos server is using for incoming requests from clients. The default is port 88.

Related Commands [clear arp-cache](#)

show license

To display license information for a WAAS device, use the **show license** EXEC command.

show license

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Examples The following is sample output from the **show license** command. It lists the WAAS licenses, giving the name, status, date applied, and the name of the user that applied the license for each active license.

```
WAE# show license
License Name      Status      Activation Date      Activated by
-----
Transport         not active
Enterprise         active      11/12/2008          admin
Video             not active
Virtual-Blade     not active
```

Related Commands [clear arp-cache](#)

show logging

To display the system message log configuration for a WAAS device, use the **show logging** EXEC command.

show logging

Syntax Description

This command has no arguments or keywords.

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

Use the system message log to view information about events that have occurred on a WAAS device. The *syslog.txt* file is contained in the */local1* directory.

Examples

The following is sample output from the **show logging** command. It displays the syslog host configuration on a WAAS device.

```
WAE# show logging
Syslog to host is disabled
Priority for host logging is set to: warning

Syslog to console is disabled
Priority for console logging is set to: warning

Syslog to disk is enabled
Priority for disk logging is set to: notice
Filename for disk logging is set to: /local1/syslog.txt

Syslog facility is set to *

Syslog disk file recycle size is set to 1000000
```

Related Commands

[clear arp-cache](#)
[\(config\) logging console](#)
[show sysfs volumes](#)

show memory

To display memory blocks and statistics for a WAAS device, use the **show memory** EXEC command.

show memory

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Examples [Table 3-51](#) describes the fields shown in the **show memory** command display.

Table 3-51 Field Descriptions for the show memory Command

Field	Description
Total physical memory	Total amount of physical memory in kilobytes (KB).
Total free memory	Total available memory (in kilobytes).
Total buffer memory	Total amount of memory (in kilobytes) in the memory buffer.
Total cached memory	Total amount of memory (in kilobytes) in the memory cache.
Total swap	Total amount of memory (in kilobytes) for swap purposes.
Total free swap	Total available memory (in kilobytes) for swap purposes.

show ntp

To display the NTP parameters for a WAAS device, use the **show ntp EXEC** command.

show ntp status

Syntax Description	status Displays NTP status.
Defaults	No default behavior or values.
Command Modes	EXEC
Device Modes	application-accelerator central-manager

Examples [Table 3-52](#) describes the fields shown in the **show ntp status** command display.

Table 3-52 Field Descriptions for the show ntp status Command

Field	Description
NTP	Indicates whether NTP is enabled or disabled.
server list	NTP server IP and subnet addresses.
remote	Name (first 15 characters) of remote NTP server.
*	In the remote column, identifies the system peer to which the clock is synchronized.
+	In the remote column, identifies a valid or eligible peer for NTP synchronization.
space	In the remote column, indicates that the peer was rejected. (The peer could not be reached or excessive delay occurred in reaching the NTP server.)
x	In the remote column, indicates a false tick and is ignored by the NTP server.
-	In the remote column, indicates a reading outside the clock tolerance limits and is ignored by the NTP server.
refid	Clock reference ID to which the remote NTP server is synchronized.
st	Clock server stratum or layer. In this example, stratum 1 is the top layer.
t	Type of peer (l ocal, u nicast, m ulticast, or b roadcast).
when	Indicates when the last packet was received from the server in seconds.
poll	Time check or correlation polling interval in seconds.
reach	8-bit reachability register. If the server was reachable during the last polling interval, a 1 is recorded; otherwise, a 0 is recorded. Octal values 377 and above indicate that every polling attempt reached the server.
delay	Estimated delay (in milliseconds) between the requester and the server.

Table 3-52 *Field Descriptions for the show ntp status Command (continued)*

Field	Description
offset	Clock offset relative to the server.
jitter	Clock jitter.

Related Commands[clock](#)[\(config\) clock](#)[\(config\) ntp](#)

show policy-engine application

To display application policy information for a WAE, use the **show policy-engine application EXEC** command.

show policy-engine application { **classifier** [*app-classifier*] | **dynamic** | **name** }

Syntax Description	classifier	Displays information about the specified application classifier. If no classifier is specified, the show policy-engine applicaion command displays information about all classifiers. Every application classifier with a single match is displayed in one line.
	<i>app-classifier</i>	(Optional) Name of an application classifier. The name should not exceed 30 characters.
	dynamic	Shows the application dynamic match information.
	name	Shows the application names list.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator

Usage Guidelines Use the **show policy-engine application dynamic** command to display auto-discovered CIFS file servers that are added to the list (for WAFS legacy mode only). The servers are visible in the dynamic listing for a limited time (3 minutes by default) after any activity stops, and then they are dropped from the dynamic list until another client request causes them to be auto-discovered again.

Examples [Table 3-53](#) describes the fields shown in the **show policy-engine application classifier** command display.

Table 3-53 Field Descriptions for the show policy-engine application classifier Command

Field	Description
Number of Application Classifiers:	Number of application classifiers configured.
0 to <i>N</i>	Numbered list that includes the application name and the match statement that defines which traffic is interesting. For example: 0) AFS match dst port range 7000 7009 1) Altiris-CarbonCopy match dst port eq 1680

Table 3-54 describes the fields shown in the **show policy-engine application dynamic** command display.

Table 3-54 *Field Descriptions for the show policy-engine application dynamic Command*

Field	Description
Dynamic Match Freelist Information	
Allocated	Total number dynamic policies that can be allocated.
In Use	Number of dynamic matches that are currently in use.
Max In Use	Maximum number of dynamic matches that have been used since the last reboot.
Allocations	Number times that the dynamic match entries have been added.
Individual Dynamic Match Information:	Displays the internally-configured match values for dynamic applications. Dynamic applications do not use statically assigned ports, but they negotiate for a port to handle that application traffic.
Number	Number of the match condition in the list.
Type	Type of traffic to match. For example, Any-->Local tests traffic from any source to the local WAE.
User Id	Name of the accelerator that inserted the entry.
Src	Value for the source match condition. Values can be ANY, LOCAL, an IP address, or a port to which the application applies.
Dst	Value for the destination match condition. Values can be ANY, LOCAL, an IP address, or a port to which the application applies.
Map Name	Policy engine application map that is invoked if the dynamic match entry matches a connection.
Flags	Operation flags specifying different connection handling options.
Seconds	Number of seconds specified as the time limit for the dynamic match entry to exist.
Remaining	Number of seconds remaining before the dynamic match entry expires and is deleted.
Hits	Number of connections that have matched.

Table 3-55 describes the fields shown in the **show policy-engine application name** command display.

Table 3-55 Field Descriptions for the show policy-engine application name Command

Field	Description
Number of Applications: X	Number of applications defined on the WAE, including all of the default applications. WAAS includes over 150 default application policies. (For a list of default application policies, see the <i>Cisco Wide Area Application Services Configuration Guide</i> , Appendix A. The display next lists each application that is defined on the WAE by name:
1) Authentication (15)	Name of the application and its internal numerical identifier, which is used to manage the application name in the policy engine.
2) Backup (18)	
3) Call-Management (17)	
4) Conferencing (8)	
5) Console (4)	
6) Content-Management (21)	
7) Directory-Services (6)	
8) Email-and-Messaging (12)	
9) Enterprise-Applications (13)	
10) File-System (2)	
11) File-Transfer (16)	
12) Instant-Messaging (22)	
13) Name-Services (25)	
14) Network-Analysis (26)	
15) P2P (7)	
16) Printing (14)	
17) Remote-Desktop (5)	
18) Replication (20)	
19) SQL (1)	
20) SSH (24)	
21) Storage (27)	
22) Streaming (11)	
23) Systems-Management (3)	
24) VPN (23)	
25) Version-Management (9)	
26) WAFS (10)	
27) Web (19)	
28) Other (0)

show policy-engine status

To display high-level information about a WAE policy engine, use the **show policy-engine status** EXEC command.

show policy-engine status

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator

Usage Guidelines The **show policy-engine status** command displays information including the usage of the available resources, which include application names, classifiers, conditions, and service classes.

Examples [Table 3-56](#) describes the fields shown in the **show policy-engine status** command display.

Table 3-56 Field Descriptions for the show policy-engine status Command

Field	Description
Policy-engine resources usage:	Table columns are Total, Used, and Available.
Application names	Total number of application names. Number of application names being used. Number of application names available.
Classifiers	Total number of classifiers configured. Number of classifiers being used. Number of classifiers available. The maximum number of classifiers allowed is 512.
Conditions	Total number of conditions configured. Number of conditions being used. Number of conditions available. The maximum number of match conditions allowed is 1024.
Policies	Total number of policies configured. Number of policies being used. Number of policies available. The maximum number of policies allowed is 512.
Service-Classes	Total number of service classes configured. Number of service classes being used. Number of service classes available. The maximum number of service classes allowed is 256.

show print-services

To display administrative users who have access to configuration privileges, print services, or print service processes on a WAAS device, use the **show print-services EXEC** command.

show print-services {drivers user *username* | process}

Syntax Description	drivers	Displays printer drivers on this print server.
	user <i>username</i>	Specifies a username that belongs to the print admin group.
	process	Displays information about the print server and print spooler.

Defaults	No default behavior or values.
-----------------	--------------------------------

Command Modes	EXEC
----------------------	------

Device Modes	application-accelerator
	central-manager

Examples	Table 3-57 describes the fields shown in the show print-services process command display.
-----------------	--

Table 3-57 Field Descriptions for the show print-services process Command

Field	Description
Print server is running.	Operation status of the print server.
Print spooler is running.	Operation status of the print spooler.
Print Server Status	
Samba version 3.0.20	Samba version being used.
PID	Process ID. Process identification number of the Samba process on the WAE Linux appliance.
Username	UNIX user that has started the Samba process.
Group	UNIX group to which the user belongs.
Machine	Machine name and IP address. The machine name is the same as the NetBIOS name.
Service	Remote procedure call (RPC) port that is used by clients to connect to the print server. Value is always IPC\$.
pid	Process ID. Process identification number of the Samba process on the WAE Linux appliance.
machine	Machine name.
Connected at	Date and time of connection to the print server.

Table 3-57 *Field Descriptions for the show print-services process Command (continued)*

Field	Description
No locked files	Comment line.
Print Spooler Status	
scheduler is running	Operation status of the print spooler scheduler.
system default destination	Default print destination for WAAS (VistaPrinterOnWAAS).
device for (VistaPrinterOnWAAS)	Socket address for the system default print destination.
(VistaPrinterOnWAAS) accepting requests	Availability status of the system default print destination.
printer (VistaPrinterOnWAAS) is idle. enabled	Operation status of the system default printer.

show processes

To display CPU or memory processes for a WAAS device, use the **show processes EXEC** command.

show processes [**cpu** | **debug** *pid* | **memory** | **system** [**delay** *secs* | **count** *num*]]

Syntax Description	cpu	(Optional) Displays CPU utilization.
	debug <i>pid</i>	(Optional) Prints the system call and signal traces for a specified process identifier to display system progress.
	memory	(Optional) Displays memory allocation processes.
	system	(Optional) Displays system load information in terms of updates.
	delay <i>secs</i>	(Optional) Specifies the delay between updates, in seconds (1–60).
	count <i>num</i>	(Optional) Specifies the number of updates that are displayed (1–100).

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines Use the EXEC commands shown in this section to track and analyze system CPU utilization.

The **show processes debug** command displays extensive internal system call information and a detailed account of each system call (along with arguments) made by each process and the signals it has received.

Use the **show processes system** command to display system load information in terms of updates. The **delay** option specifies the delay between updates, in seconds. The **count** option specifies the number of updates that are displayed. The **show processes debug** command displays these items:

- A list of all processes in wide format.
- Two tables listing the processes that utilize CPU resources. The first table displays the list of processes in descending order of utilization of CPU resources based on a snapshot taken after the processes system (ps) output is displayed. The second table displays the same processes based on a snapshot taken 5 seconds after the first snapshot.
- Virtual memory used by the corresponding processes in a series of five snapshots, each separated by 1 second.

Note

CPU utilization and system performance are severely affected when you use these commands. We therefore recommend that you avoid using these commands, especially the **show processes debug** command, unless it is absolutely necessary.

Examples

Table 3-58 describes the fields shown in the **show processes** command display.

Table 3-58 *Field Descriptions for the show processes Command*

Field	Description
CPU Usage	CPU utilization as a percentage for user, system overhead, and idle.
PID	Process identifier.
STATE	Current state of corresponding processes. R = running S = sleeping in an interruptible wait D = sleeping in an uninterruptible wait or swapping Z = zombie T = traced or stopped on a signal
PRI	Priority of processes.
User T	User time utilization in seconds.
Sys T	System time utilization in seconds.
COMMAND	Process command.
Total	Total available memory in bytes.
Used	Memory currently used in bytes.
Free	Free memory available in bytes.
Shared	Shared memory currently used in bytes.
Buffers	Buffer memory currently used in bytes.
Cached	Cache memory currently used in bytes.
SwapTotal	Total available memory in bytes for swap purposes.

show radius-server

To display RADIUS configuration information for a WAAS device, use the **show radius-server** EXEC command.

show radius-server

Syntax Description	This command has no arguments or keywords.
---------------------------	--

Defaults	No default behavior or values.
-----------------	--------------------------------

Command Modes	EXEC
----------------------	------

Device Modes	application-accelerator central-manager
---------------------	--

Examples	Table 3-59 describes the fields shown in the show radius-server command display.
-----------------	---

Table 3-59 Field Descriptions for the show radius-server Command

Field	Description
Login Authentication for Console/Telnet Session	Indicates whether a RADIUS server is enabled for login authentication.
Configuration Authentication for Console/Telnet Session	Indicates whether a RADIUS server is enabled for authorization or configuration authentication.
Authentication scheme fail-over reason	Indicates whether the WAAS devices fail over to the secondary method of administrative login authentication whenever the primary administrative login authentication method.
RADIUS Configuration	RADIUS authentication settings.
Key	Key used to encrypt and authenticate all communication between the RADIUS client (the WAAS device) and the RADIUS server.
Timeout	Number of seconds that the WAAS device waits for a response from the specified RADIUS authentication server before declaring a timeout.
Servers	RADIUS servers that the WAAS device is to use for RADIUS authentication.
IP	Hostname or IP address of the RADIUS server.
Port	Port number on which the RADIUS server is listening.

 show radius-server

Related Commands [\(config\) radius-server](#)

show running-config

To display a WAAS device current running configuration on the terminal, use the **show running-config EXEC** command. The **show running-config** command replaces the **write terminal** command.

show running-config [no-policy]

Syntax Description

no-policy	(Optional) Does not display policy engine configuration.
------------------	--

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

Use this EXEC command in conjunction with the **show startup-config** command to compare the information in running memory to the startup configuration used during bootup.

Examples

The following is sample output from the **show running-config** command. It displays the currently running configuration of a WAAS device.

```
WAE# show running-config
! WAAS version 4.0.0
!
device mode central-manager
!
!
hostname waas-cm
!
!
!
!
exec-timeout 60
!
!
primary-interface GigabitEthernet 1/0
!
!
...
```

Related Commands

copy startup-config

show services

To display services-related information for a WAAS device, use the **show services** EXEC command.

show services { **ports** [*port-num*] | **summary** }

Syntax Description	ports	Displays services by port number.
	<i>port-num</i>	(Optional) Up to 8 port numbers (1–65535).
	summary	Displays the services summary.

Defaults	No default behavior or values.
----------	--------------------------------

Command Modes	EXEC
---------------	------

Device Modes	application-accelerator central-manager
--------------	--

Examples	The following is sample output from the show services command. It displays a summary of the services.
----------	--

WAE# **show services summary**

Service	Ports
CMS	1100 5256
NLM	4045
WAFS	1099
emdb	5432
MOUNT	3058

WAFS_tunnel	4050
CMS_db_vacuum	5257

show smb-conf

To view the current values of the Samba configuration file, *smb.conf*, on a WAAS device, use the **show smb-conf** EXEC command.

show smb-conf

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines The **show smb-conf** command displays the global, print\$, and printers parameters values of the *smb.conf* file for troubleshooting purposes. For a description of these parameters and their values, see the [\(config\) smb-conf](#) command.

Examples The following is sample output from the **show smb-conf** command. It displays all of the parameter values for the current configuration.

```
WAE# show smb-conf

Current smb-conf configurations -->

smb-conf section "global" name "ldap ssl" value "start_tls"
smb-conf section "printers" name "printer admin" value "root"

Output of current smb.conf file on disk -->

show snmp

To check the status of SNMP communications for a WAAS device, use the **show snmp** EXEC command.

show snmp {**alarm-history** | **engine ID** | **event** | **group** | **stats** | **user**}

Syntax Description	alarm-history	Displays SNMP alarm history information.
	engineID	Displays local SNMP engine identifier.
	event	Displays events configured through the Event MIB.
	group	Displays SNMP groups.
	stats	Displays SNMP statistics.
	user	Displays SNMP users.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines The **show snmp alarm-history** command provides information on various SNMP variables and statistics on SNMP operations.

Examples [Table 3-60](#) describes the fields shown in the **show snmp alarm-history** command display.

Table 3-60 Field Descriptions for the show snmp alarm-history Command

Field	Description
Index	Displays serial number of the listed alarms.
Type	Indicates whether the alarm has been Raised (R) or Cleared (C).
Sev	Levels of alarm severity: Critical (Cr), Major (Ma), or Minor (Mi).
Alarm ID	Traps sent by a WAE contain numeric alarm IDs.
ModuleID	Traps sent by a WAE contain numeric module IDs. (See the table below to map module names to module IDs.)
Category	Traps sent by a WAE contain numeric category IDs. (See the table below to map category names to category IDs.)
Descr	Provides description of the WAAS software alarm and the application that generated the alarm.

Table 3-61 summarizes the mapping of module names to module IDs.

Table 3-61 Summary of Module Names to ID Numbers

Module Name	Module ID
AD_DATABASE	8000
NHM	1
NHM/NHM	2500
nodemgr	2000
standby	4000
sysmon	1000
UNICAST_DATA_RECEIVER	5000
UNICAST_DATA_SENDER	6000

Table 3-62 summarizes the mapping of category names to category IDs.

Table 3-62 Summary of Category Names to ID Numbers

Category Name	Category ID
Communications	1
Service Quality	2
Processing Error	3
Equipment	4
Environment	5
Content	6

Table 3-63 describes the fields shown in the **show snmp engineID** command display.

Table 3-63 Field Descriptions for the show snmp engineID

Field	Description
Local SNMP Engine ID	String that identifies the copy of SNMP on the local device.

Table 3-64 describes the fields shown in the **show snmp event** command display. The **show snmp event** command displays information about the SNMP events that were set using the **snmp trigger** command:

Table 3-64 Field Descriptions for the show snmp event Command

Field	Description
Mgmt Triggers	Output for management triggers, which are numbered 1, 2, 3, and so on in the output.
(1): Owner:	Name of the person who configured the trigger. “CLI” is the default owner; the system has a default trigger configured.

Table 3-64 Field Descriptions for the **show snmp event** Command (continued)

Field	Description
(1):	Name for the trigger. This name is locally-unique and administratively assigned. For example, this field might contain the “isValid” trigger name. Numbering indicates that this is the first management trigger listed in the show output.
Comment:	Description of the trigger function and use. For example: WAFS license file is not valid.
Sample:	Basis on which the test sample is being evaluated. For example: Abs (Absolute) or Delta.
Freq:	Frequency. Number of seconds to wait between trigger samplings. To encourage consistency in sampling, the interval is measured from the beginning of one check to the beginning of the next and the timer is restarted immediately when it expires, not when the check completes.
Test:	Type of trigger test to perform based on the SNMP trigger configured. The Test field may contain the following types of tests: Absent—Absent existence of a test Boolean—Boolean value test Equal—Equality threshold test Falling—Falling threshold test Greater-than—Greater-than threshold test Less-than—Less-than threshold test On-change—Changed existence test Present—Present present test Rising—Rising threshold test
ObjectOwner:	Name of the object owner who created the trigger using the snmp trigger create global configuration command or by using an SNMP interface. “CLI” is the default owner.
Object:	String identifying the object.
Boolean Entry:	
Value:	Object identifier of the MIB object to sample to see whether the trigger should fire.
Cmp:	Comparison. Type of boolean comparison to perform. The numbers 1–6 correspond to these Boolean comparisons: unequal (1) equal (2) less (3) lessOrEqual (4) greater (5) greaterOrEqual (6)

Table 3-64 Field Descriptions for the **show snmp event** Command (continued)

Field	Description
Start:	Starting value for which this instance will be triggered.
ObjOwn:	Object owner.
Obj:	Object.
EveOwn:	Event owner.
Eve:	Event. Type of SNMP event. For example: CLI_EVENT.
Delta Value Table:	Table containing trigger information for delta sampling.
(0):	
Thresh:	Threshold value to check against if the trigger type is threshold.
Exis:	Type of existence test to perform. Values are 1 or 0.
Read:	Indicates whether the MIB instance has been queried or not.
OID:	Object ID (Same as MIB instance).
val:	Value ID.
(2):	MIB instance on which the trigger is configured. This is the second management trigger listed in the show output. The fields are repeated for each instance listed in this show command.

Table 3-65 describes the fields shown in the **show snmp group** command display.

Table 3-65 Field Descriptions for the **show snmp group** Command

Field	Description
groupname	Name of the SNMP group, or collection of users who have a common access policy.
security_model	Security model used by the group (either v1, v2c, or v3).
readview	String identifying the read view of the group.
writeview	String identifying the write view of the group.
notifyview	string identifying the notify view of the group.

Table 3-66 describes the fields shown in the **show snmp stats** command display.

Table 3-66 Field Descriptions for the **show snmp stats** Command

Field	Description
SNMP packets input	Total number of SNMP packets input.
Bad SNMP version errors	Number of packets with an invalid SNMP version.
Unknown community name	Number of SNMP packets with an unknown community name.
Illegal operation for community name supplied	Number of packets requesting an operation not allowed for that community.
Encoding errors	Number of SNMP packets that were improperly encoded.

Table 3-66 *Field Descriptions for the show snmp stats Command (continued)*

Field	Description
Number of requested variables	Number of variables requested by SNMP managers.
Number of altered variables	Number of variables altered by SNMP managers.
Get-request PDUs	Number of GET requests received.
Get-next PDUs	Number of GET-NEXT requests received.
Set-request PDUs	Number of SET requests received.
SNMP packets output	Total number of SNMP packets sent by the router.
Too big errors	Number of SNMP packets that were larger than the maximum packet size.
Maximum packet size	Maximum size of SNMP packets.
No such name errors	Number of SNMP requests that specified a MIB object that does not exist.
Bad values errors	Number of SNMP SET requests that specified an invalid value for a MIB object.
General errors	Number of SNMP SET requests that failed because of some other error. (It was not a No such name error, Bad values error, or any of the other specific errors.)
Response PDUs	Number of responses sent in reply to requests.
Trap PDUs	Number of SNMP traps sent.

Table 3-67 describes the fields shown in the **show snmp user** command display.

Table 3-67 *Field Descriptions for the show snmp user Command*

Field	Description
User name	String identifying the name of the SNMP user.
Engine ID	String identifying the name of the copy of SNMP on the device.
Group Name	Name of the SNMP group, or collection of users who have a common access policy.

show ssh

To display the status and configuration information of the Secure Shell (SSH) service for a WAAS device, use the **show ssh** EXEC command.

show ssh

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Examples [Table 3-68](#) describes the fields shown in the **show ssh** command display.

Table 3-68 *Field Descriptions for the show ssh Command*

Field	Description
SSH server supports SSH2 protocol (SSH1 compatible).	Protocol support statement.
SSH service is not enabled.	Status of whether the SSH service is enabled or not enabled.
Currently there are no active SSH sessions.	Number of active SSH sessions.
Number of successful SSH sessions since last reboot:	Number of successful SSH sessions since last reboot.
Number of failed SSH sessions since last reboot:	Number of failed SSH sessions since last reboot.
SSH key has not been generated or previous key has been removed.	Status of the SSH key.
SSH login grace time value is 300 seconds.	Time allowed for login.
Allow 3 password guess(es).	Number of password guesses allowed.

Related Commands [\(config\) ssh-key-generate](#)
[\(config\) sshd](#)

show standby

To display information about a standby interface on a WAAS device, use the **show standby** EXEC command.

show standby

Syntax Description

This command has no arguments or keywords.

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

To display information about a specific standby group configuration, enter the **show interface standby standby group_num** EXEC command.

Examples

[Table 3-69](#) describes the fields shown in the **show standby** command display.

Table 3-69 Field Descriptions for the show standby Command

Field	Description
Standby Group	Number that identifies the standby group.
Description	Description of the device, as configured by using the description option of the interface global configuration command.
IP address	IP address of the standby group.
netmask	Netmask of the standby group.
Member interfaces	Member interfaces of the standby group. Shows which physical interfaces are part of the standby group. Shows the interface definition, such as GigabitEthernet 1/0.
priority	Priority status of each interface.
Active interface	Interfaces that are currently active in the standby group.
Maximum errors allowed on the active interface	Maximum number of errors allowed on the active interface.

Related Commands

[show interface](#)

show running-config

show startup-config

(config-if) standby

show startup-config

To display the startup configuration for a WAAS device, use the **show startup-config** EXEC command.

show startup-config

Syntax Description	This command has no arguments or keywords.
Defaults	No default behavior or values.
Command Modes	EXEC
Device Modes	application-accelerator central-manager
Usage Guidelines	Use this EXEC command to display the configuration used during an initial bootup, stored in NVRAM. Note the difference between the output of this command versus the show running-config command.
Examples	<p>The following is sample output from the show startup-config command. It displays the configuration saved for use on startup of the WAAS device.</p> <pre>WAE# show startup-config ! WAAS version 4.0.0 ! device mode central-manager ! ! hostname Edge-WAE1 ! ! ! ! ! exec-timeout 60 ! ! primary-interface GigabitEthernet 1/0 ! ! ! interface GigabitEthernet 1/0 ip address 10.10.10.33 255.255.255.0 exit interface GigabitEthernet 2/0 shutdown ...</pre>

 show startup-config

Related Commands[configure](#)[copy running-config](#)[show running-config](#)

show statistics accelerator

To display application accelerator general statistics for a WAAS device, use the **show statistics accelerator** EXEC command.

show statistics accelerator cifs [**detail** | **expert** *mbean attrib*]

show statistics accelerator detail

show statistics accelerator epm [**detail**]

show statistics accelerator generic {**connections** {**cifs** | **epm** | **http** | **mapi** | **nfs** | **video**}| **detail**}

show statistics accelerator http [**detail**]

show statistics accelerator mapi [**detail**]

show statistics accelerator nfs [**detail**]

show statistics accelerator video [**detail**]

Syntax Description		
cifs		Displays statistics for the CIFS application accelerator.
detail		Displays detailed statistics.
expert <i>mbean attrib</i>		Displays CIFS accelerator expert mode attributes. Mbean name and Mbean attribute name.
epm		Displays statistics for the EPM application accelerator.
generic		Displays statistics for the generic application accelerator.
connections		Displays generic connection statistics.
http		Displays statistics for the HTTP application accelerator.
mapi		Displays statistics for the MAPI application accelerator.
nfs		Displays statistics for the NFS application accelerator.
video		Displays statistics for the video application accelerator.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator

Usage Guidelines Using the **show statistics accelerator** command with no options displays a summary of the statistical information for all application accelerators. To obtain detailed statistics for an application accelerator, use the command options to filter the results.

Examples

[Table 3-70](#) describes the fields shown in the **show statistics accelerator epm detail** command display.

Table 3-70 *Field Descriptions for the show statistics accelerator epm Command*

Field	Description
Global TCP AO connection statistics	
Time Accelerator was started	Time that the accelerator was started.
Time Statistics were Last Reset/Cleared	Time that the statistics were last reset or cleared.
Total Handled Connections	Total connections handled.
Total Optimized Connections	Total optimized connections.
Total Pushed Down Connections	Total pushed down connections.
Total Dropped Connections	Total dropped connections.
Current Active Connections	Current active connections.
Current Pending Connections	Current pending connections.
Maximum Active Connections	Maximum active connections.
Total Requests	Total requests.
Total Requests Successfully Parsed	Total requests successfully parsed.
Total Request Errors	Total request errors.
Total Responses	Total responses.
Total Responses Successfully Parsed	Total responses successfully parsed.
Total Service-unavailable Responses	Total service-unavailable responses.
Total Requests for UUID not in Policy Engine Map	Total requests for UUID not in policy engine map.
Total Response Errors	Total response errors.

[Table 3-71](#) describes the fields shown in the **show statistics accelerator generic connections detail** command display. This command shows the aggregated statistics for all connections.

Table 3-71 *Field Descriptions for the show statistics accelerator generic Command*

Field	Description
Time elapsed since "clear statistics"	Time that has elapsed since the statistics were last reset.
Time Accelerator was started	Local time accelerator was started or restarted.
Time Statistics were Last Reset/Cleared	Local time accelerator was last started or restarted, or the clear statistics command was executed since accelerator was last started or restarted.

Table 3-71 Field Descriptions for the *show statistics accelerator generic* Command (continued)

Field	Description
Total Handled Connections	<p>Connections handled since the accelerator was started or its statistics last reset. Incremented when a connection is accepted or reused. Never decremented.</p> <p>This value will always be greater than or equal to the Current Active Connections statistic. Includes all connections accepted by the accelerator even if later pushed down to generic optimization, dropped, or handed-off to another accelerator.</p> <p>Total Handled Connections = Total Optimized Connections + Total Pushed Down Connections + Total Dropped Connections.</p>
Total Optimized Connections	Connections previously and currently optimized by the accelerator. This includes: Current Active Connections + Total Fast Connections + Fast connections initiated by peer.
Total Connections Handed-off with Compression Policies Unchanged	Connections initially accepted by accelerator, but later handed off to generic optimization without policy changes so the current negotiated policies for compression (DRE/LZ) will be used.
Total Dropped Connections	Connections dropped for any reason other than client/server socket errors or close (for instance, out of resources).
Current Active Connections	<p>Number of WAN side connections currently established and either in use or free for fast connection use.</p> <p>WAN side connections currently established and in use can be calculated as follows: Current Active Connections - Total Active Connections Free For Fast Connection Use Not cleared using clear statistics accelerator command.</p>
Current Pending Connections	Number of SYN requests queued waiting for for accelerator to accept.
Maximum Active Connections	Highest number of active connections since accelerator was last started/restarted. Not cleared using the clear statistics accelerator command.
Global Generic AO Connection Statistics	
Total number of connections handled	<p>Connections handled since the accelerator was started or its statistics last reset. Incremented when a connection is accepted or reused. Never decremented.</p> <p>This value will always be greater than or equal to the Current Active Connections statistic. Includes all connections accepted by the accelerator even if later pushed down to generic optimization, dropped, or handed-off to another accelerator.</p> <p>Total Handled Connections = Total Optimized Connections + Total Pushed Down Connections + Total Dropped Connections.</p>
Total number of active connections	Total number of hits that represent either active connections using the accelerator application.
Total number of bytes transferred from client	Total number of bytes transferred from the client side.

Table 3-71 *Field Descriptions for the show statistics accelerator generic Command (continued)*

Field	Description
Total number of bytes transferred from server	Total number of bytes transferred from the server side.
Policy Engine Statistics	
Session timeouts	The number of times the accelerator application did not issue a keepalive to the Policy Engine in a timely manner. A session refers to the particular registration of the accelerator application within the Policy Engine.
Total timeouts	The total number of times the accelerator application did not issue a keepalive to the Policy Engine in a timely manner. This may encompass multiple registrations.
Last keepalive received	The amount of time since the last keepalive (seconds).
Last registration occurred	The amount of time since the accelerator application registered with the Policy Engine (seconds). Most likely causes are: <ul style="list-style-type: none"> • WAE was rebooted • Configuration change with the accelerator application enabled • Restart of the accelerator application by the Node Manager
Hits	Number of connections that had a configured policy which specified the use of the accelerator application.
Updated Released	Number of hits that were released during Auto-Discovery and did not make use of the accelerator application.
Active Connections	Number of hits that represent either active connections using the accelerator application or connections that are still in the process of performing Auto-Discovery.
Completed Connections	Number of hits that have made use of the accelerator application and have completed.
Drops	Number of hits that attempted use of the accelerator application but were rejected for some reason. A separate hit and drop will be tallied for each TCP SYN packet received for a connection. This includes the original SYN and any retries.

Table 3-71 Field Descriptions for the **show statistics accelerator generic** Command (continued)

Field	Description
Rejected Connection Counts Due To: (Total:)	<ul style="list-style-type: none"> The number of all of the reject reasons which represent hits that were not able to use the accelerator applications. Reject reasons include the following: Not registered Keepalive timeout No license Load level not within range Connection limit exceeded Rate limit exceeded (a new connection exceeded the number of connections allowed within the time window) Minimum TFO not available Resource manager (minimum resources not available) Global config optimization disabled TFO limit exceeded (systemwide connection limit reached) Server-side invoked DM deny (Policy Engine dynamic match deny rule matched) No DM accept was matched
Auto-Discovery Statistics	
Connections queued for accept	Number of connections added to the AO connection accept queue by Auto Discovery.
Accept queue add failures	Number of connections that could not be added to the AO connection accept queue due to a failure. The failure could possibly be due to AO not being present, or a queue overflow.
AO discovery successful	For the AOs that work in dual-ended mode, AO discovery (as part of Auto Discovery) is performed. This counter indicates the number of times AO discovery was successful.
AO discovery failure	The number of times AO discovery failed. Possible reasons include AO not being enabled or running on the peer WAE, or the license not configured for the AO.

[Table 3-72](#) describes the fields shown in the **show statistics accelerator http** command display.

Table 3-72 Field Descriptions for the **show statistics accelerator http** Command

Field	Description
Time Accelerator was started	Local time accelerator was started or restarted.
Time Statistics were Last Reset/Cleared	Local time accelerator was last started or restarted, or the clear statistics accelerator [http all] command was executed since accelerator was last started or restarted.

Table 3-72 **Field Descriptions for the show statistics accelerator http Command (continued)**

Field	Description
Total Handled Connections	<p>Connections handled since the accelerator was started or its statistics last reset. Incremented when a connection is accepted or reused. Never decremented.</p> <p>This value will always be greater than or equal to the Current Active Connections statistic. Includes all connections accepted by the accelerator even if later pushed down to generic optimization, dropped, or handed-off to another accelerator.</p> <p>Total Handled Connections = Total Optimized Connections + Total Pushed Down Connections + Total Dropped Connections.</p>
Total Optimized Connections	Connections previously and currently optimized by the HTTP Accelerator. This includes: Current Active Connections + Total Fast Connections + Fast connections initiated by peer.
Total Connections Handed-off with Compression Policies Unchanged	Connections initially accepted by accelerator, but later handed off to generic optimization without policy changes so the current negotiated policies for compression (DRE/LZ) will be used.
Total Dropped Connections	Connections dropped for any reason other than client/server socket errors or close (for instance, out of resources).
Current Active Connections.	<p>Number of WAN side connections currently established and either in use or free for fast connection use.</p> <p>WAN side connections currently established and in use can be calculated as follows: Current Active Connections - Total Active Connections Free For Fast Connection Use</p> <p>Not cleared using clear statistics accelerator [http all] command.</p>
Current Pending Connections	Number of SYN requests queued waiting for for accelerator to accept.
Maximum Active Connections	Highest number of active connections since accelerator was last started/restarted. Not cleared using the clear statistics accelerator [http all] command.
Total Time Saved (ms)	Total time saved in milliseconds. Incremented on client side WAE by 1 RTT whenever an idle fast connection is reused instead of establishing a new WAN connection.
Current Active Connections Free for Fast Connection Use	<p>Number of Current Active Connections that are idle and available for reuse as a fast connection. Incremented when an in-use active connection becomes idle and is available for reuse as a fast connection.</p> <p>Decrementd when an available idle active connection is reused or its idle timeout (5 secs) is reached. Not cleared using the clear statistics accelerator [http all] command.</p>

Table 3-72 Field Descriptions for the *show statistics accelerator http* Command (continued)

Field	Description
Total Connections Handed-off	Total Pushed Down Connections + Total Connections Handed-off with Compression Policies Disabled.
Total Connections Handed-off with Compression Policies Disabled	Total number of connections handed off to generic optimization with compression policies disabled. This statistic includes handoffs for SSL CONNECT requests received by the HTTP Accelerator.
Total Fast Connections	Total number of times a client side idle active WAN connection was able to be reused instead of establishing a new WAN connection.
Maximum Fast Connections on a Single Connection	Maximum number of times a single connection was reused. This is the “best case” of number of reuses on a single connection. Limited to be less than maximum session reuse count (currently defined as 100 - an arbitrary max).
Percentage of connection time saved	$(\text{Total Time Saved} / (\text{Total Time Saved} + \text{Total Round Trip Time For All Connections})) * 100$.
Total Round Trip Time for All Connections (ms)	Total RTT for all WAN connections that have been established.
Total Fast Connections Initiated by Peer	Total number of times the server side WAN connection was a fast connection initiated by the client side peer. This statistic should match the Total Fast Connections on the peer WAE.
Policy Engine Statistics	
Session timeouts	The number of times the accelerator application did not issue a keepalive to the Policy Engine in a timely manner. A session refers to the particular registration of the accelerator application within the Policy Engine.
Total timeouts	The total number of times the accelerator application did not issue a keepalive to the Policy Engine in a timely manner. This may encompass multiple registrations.
Last keepalive received	The amount of time since the last keepalive (seconds).
Last registration occurred	The amount of time since the accelerator application registered with the Policy Engine (seconds). Most likely causes are: <ul style="list-style-type: none"> • WAE was rebooted • Configuration change with the accelerator application enabled • Restart of the accelerator application by the Node Manager
Hits	Number of connections that had a configured policy which specified the use of the accelerator application.

Table 3-72 **Field Descriptions for the show statistics accelerator http Command (continued)**

Field	Description
Updated Released	Number of hits that were released during Auto-Discovery and did not make use of the accelerator application.
Active Connections	Number of hits that represent either active connections using the accelerator application or connections that are still in the process of performing Auto-Discovery.
Completed Connections	Number of hits that have made use of the accelerator application and have completed.
Drops	Number of hits that attempted use of the accelerator application but were rejected for some reason. A separate hit and drop will be tallied for each TCP SYN packet received for a connection. This includes the original SYN and any retries.
Rejected Connection Counts Due To: (Total:)	<ul style="list-style-type: none"> • The number of all of the reject reasons which represent hits that were not able to use the accelerator applications. Reject reasons include the following: • Not registered • Keepalive timeout • No license • Load level not within range • Connection limit exceeded • Rate limit exceeded (a new connection exceeded the number of connections allowed within the time window) • Minimum TFO not available • Resource manager (minimum resources not available) • Global config optimization disabled • TFO limit exceeded (systemwide connection limit reached) • Server-side invoked • DM deny (Policy Engine dynamic match deny rule matched) • No DM accept was matched
Auto-Discovery Statistics	
Connections queued for accept	Number of connections added to the AO connection accept queue by Auto Discovery.
Accept queue add failures	Number of connections that could not be added to the AO connection accept queue due to a failure. The failure could possibly be due to AO not being present, or a queue overflow.

Table 3-72 Field Descriptions for the *show statistics accelerator http* Command (continued)

Field	Description
AO discovery successful	For the AOs that work in dual-ended mode, AO discovery (as part of Auto Discovery) is performed. This counter indicates the number of times AO discovery was successful.
AO discovery failure	The number of times AO discovery failed. Possible reasons include AO not being enabled or running on the peer WAE, or the license not configured for the AO.

[Table 3-73](#) describes the fields shown in the **show statistics accelerator mapi** command display.

Table 3-73 Field Descriptions for the *show statistics accelerator mapi* Command

Field	Description
Time Accelerator was started	Time that the accelerator was started.
Time statistics were Last Reset/Cleared	Time that the statistics were last reset.
Total Handled Connections	Number of connections handled since the accelerator was started.
Total Optimized Connections	Number of connections handled since the accelerator was started, from start to finish.
Total Pushed Down Connections	Number of connections received by the accelerator but to which only generic optimizations were done (no acceleration).
Total Dropped Connections	Number of connections dropped for reasons other than client/server socket errors or close.
Current Active Connections	Number of connections currently being handled by the accelerator.
Current Pending Connections	Number of connections pending to be accepted.
Maximum Active Connections	Maximum number of simultaneous connections handled by the accelerator.
Number of synch get buffer	Number of MAPI SyncGetBuffer calls made. Each call downloads a chunk of data from a cached folder.
Minimum Synch Get Buffer Size	Minimum chunk size downloaded by the MAPI SyncGetBuffer call.
Maximum Synch Get Buffer Size	Maximum chunk size downloaded by the MAPI SyncGetBuffer call.
Average Synch Get Buffer Size	Average chunk size downloaded by the MAPI SyncGetBuffer call.
Read stream Number	Number of MAPI ReadStream calls made. Each call downloads a chunk of data from a noncached folder.
Minimum read stream Buffer Size	Minimum chunk size downloaded by the MAPI ReadStream call.
Maximum read stream Buffer Size	Maximum chunk size downloaded by the MAPI ReadStream call.

Table 3-73 *Field Descriptions for the show statistics accelerator mapi Command (continued)*

Field	Description
Average read stream Buffer Size	Average chunk size downloaded by the MAPI ReadStream call.
Minimum accumulated read ahead data Size	Minimum data size for MAPI read ahead.
Maximum accumulated read ahead data Size	Maximum data size for MAPI read ahead.
Average accumulated read ahead data Size	Average data size for MAPI read ahead.
Local response number	Number of local MAPI command responses sent to the client without waiting for a response from the peer WAE.
Average local response time	Average time used for local responses, in microseconds.
Remote response number	Number of MAPI commands forwarded to the Exchange server for a response.
Average remote response time	Average time used for remote responses, in microseconds.
Current 2K Accelerated Connections	Number of accelerated connections to Outlook 2000 clients. Sessions (users), not TCP connections.
Current 2K3 Accelerated Connections	Number of accelerated connections to Outlook 2003 clients. Sessions (users), not TCP connections.
Current 2K7 Accelerated Connections	Number of accelerated connections to Outlook 2007 clients. Sessions (users), not TCP connections.
Secured Connections	Number of connections to Outlook clients that use encryption. Such connections are not accelerated by the MAPI accelerator.
Lower than 2K Connections	Number of connections to clients using a version of Outlook lower than Outlook 2000. Such connections are not accelerated by the MAPI accelerator.
Higher than 2K7 Connections	Number of connections to clients using a version of Outlook higher than Outlook 2007. Such connections are not accelerated by the MAPI accelerator.
Policy Engine Statistics	
Session timeouts	The number of times the accelerator application did not issue a keepalive to the Policy Engine in a timely manner. A session refers to the particular registration of the accelerator application within the Policy Engine.
Total timeouts	The total number of times the accelerator application did not issue a keepalive to the Policy Engine in a timely manner. This may encompass multiple registrations.
Last keepalive received	The amount of time since the last keepalive (seconds).

Table 3-73 Field Descriptions for the *show statistics accelerator mapi* Command (continued)

Field	Description
Last registration occurred	The amount of time since the accelerator application registered with the Policy Engine (seconds). Most likely causes are: <ul style="list-style-type: none"> • WAE was rebooted • Configuration change with the accelerator application enabled • Restart of the accelerator application by the Node Manager
Hits	Number of connections that had a configured policy which specified the use of the accelerator application.
Updated Released	Number of hits that were released during Auto-Discovery and did not make use of the accelerator application.
Active Connections	Number of hits that represent either active connections using the accelerator application or connections that are still in the process of performing Auto-Discovery.
Completed Connections	Number of hits that have made use of the accelerator application and have completed.
Drops	Number of hits that attempted use of the accelerator application but were rejected for some reason. A separate hit and drop will be tallied for each TCP SYN packet received for a connection. This includes the original SYN and any retries.

Table 3-73 *Field Descriptions for the show statistics accelerator mapi Command (continued)*

Field	Description
Rejected Connection Counts Due To: (Total:)	<ul style="list-style-type: none"> • The number of all of the reject reasons which represent hits that were not able to use the accelerator applications. Reject reasons include the following: • Not registered • Keepalive timeout • No license • Load level not within range • Connection limit exceeded • Rate limit exceeded (a new connection exceeded the number of connections allowed within the time window) • Minimum TFO not available • Resource manager (minimum resources not available) • Global config optimization disabled • TFO limit exceeded (systemwide connection limit reached) • Server-side invoked • DM deny (Policy Engine dynamic match deny rule matched) • No DM accept was matched
Auto-Discovery Statistics	
Connections queued for accept	Number of connections added to the AO connection accept queue by Auto Discovery.
Accept queue add failures	Number of connections that could not be added to the AO connection accept queue due to a failure. The failure could possibly be due to AO not being present, or a queue overflow.
AO discovery successful	For the AOs that work in dual-ended mode, AO discovery (as part of Auto Discovery) is performed. This counter indicates the number of times AO discovery was successful.
AO discovery failure	The number of times AO discovery failed. Possible reasons include AO not being enabled or running on the peer WAE, or the license not configured for the AO.

[Table 3-74](#) describes the fields shown in the **show statistics accelerator nfs** command display.

Table 3-74 *Field Descriptions for the show statistics accelerator nfs Command*

Field	Description
Time AO was started	Time that the accelerator was started.
Time global statistics were last reset/cleared	Time that the statistics were last reset.
Connections handled since the AO was started	Number of connections handled since the accelerator was started.
Connections optimized by the AO from start to finish	Number of connections optimized by the accelerator.
Connections received and pushed down by the AO	Number of connections received by the accelerator but to which only generic optimizations were done (no acceleration).
Connections dropped by the AO due to unknown reasons	Number of connections dropped for reasons other than client/server socket errors or close.
Connections currently being handled by the AO	Number of connections currently being handled by the accelerator.
The maximum count of active connections	Maximum number of simultaneous connections handled by the accelerator.
The number of RPC calls per Authentication flavor	Array of the number of RPC calls for each NFS authentication type.
The number of RPC calls with unknown Authentication flavor	Number of RPC calls with an unknown authentication type.
The number of RPC calls per NFS version	Array of the number of RPC calls for each NFS version.
The number of RPC calls with unknown NFS version	Number of RPC calls with an unknown NFS version.
The total number of NFS requests we've seen so far	Total number of NFS requests received.
Number of local reply generating requests	Number of requests that resulted in WAAS generating a local reply.
The percentage of requests that were served locally	Percentage of requests served locally by the WAAS device.
The percentage of requests that were served remotely	Percentage of requests served remotely by the NFS server.
Average time to generate a local READ reply (msec)	Average time to generate a local read reply, in milliseconds.
Average time to generate a local READ reply (msec)	Average time to generate a local write reply, in milliseconds.
Average time to receive a remote reply (msec)	Average time to receive a remote reply from the NFS server, in milliseconds.
Policy Engine Statistics	

Table 3-74 **Field Descriptions for the show statistics accelerator nfs Command (continued)**

Field	Description
Session timeouts	The number of times the accelerator application did not issue a keepalive to the Policy Engine in a timely manner. A session refers to the particular registration of the accelerator application within the Policy Engine.
Total timeouts	The total number of times the accelerator application did not issue a keepalive to the Policy Engine in a timely manner. This may encompass multiple registrations.
Last keepalive received	The amount of time since the last keepalive (seconds).
Last registration occurred	The amount of time since the accelerator application registered with the Policy Engine (seconds). Most likely causes are: <ul style="list-style-type: none"> • WAE was rebooted • Configuration change with the accelerator application enabled • Restart of the accelerator application by the Node Manager
Hits	Number of connections that had a configured policy which specified the use of the accelerator application.
Updated Released	Number of hits that were released during Auto-Discovery and did not make use of the accelerator application.
Active Connections	Number of hits that represent either active connections using the accelerator application or connections that are still in the process of performing Auto-Discovery.
Completed Connections	Number of hits that have made use of the accelerator application and have completed.
Drops	Number of hits that attempted use of the accelerator application but were rejected for some reason. A separate hit and drop will be tallied for each TCP SYN packet received for a connection. This includes the original SYN and any retries.

Table 3-74 Field Descriptions for the **show statistics accelerator nfs** Command (continued)

Field	Description
Rejected Connection Counts Due To: (Total:)	<ul style="list-style-type: none"> • The number of all of the reject reasons which represent hits that were not able to use the accelerator applications. Reject reasons include the following: • Not registered • Keepalive timeout • No license • Load level not within range • Connection limit exceeded • Rate limit exceeded (a new connection exceeded the number of connections allowed within the time window) • Minimum TFO not available • Resource manager (minimum resources not available) • Global config optimization disabled • TFO limit exceeded (systemwide connection limit reached) • Server-side invoked • DM deny (Policy Engine dynamic match deny rule matched) • No DM accept was matched
Auto-Discovery Statistics	
Connections queued for accept	Number of connections added to the AO connection accept queue by Auto Discovery.
Accept queue add failures	Number of connections that could not be added to the AO connection accept queue due to a failure. The failure could possibly be due to AO not being present, or a queue overflow.
AO discovery successful	For the AOs that work in dual-ended mode, AO discovery (as part of Auto Discovery) is performed. This counter indicates the number of times AO discovery was successful.
AO discovery failure	The number of times AO discovery failed. Possible reasons include AO not being enabled or running on the peer WAE, or the license not configured for the AO.

Table 3-75 describes the fields shown in the **show statistics accelerator video detail** command display.

Table 3-75 **Field Descriptions for the show statistics accelerator video detail Command**

Field	Description
Time elapsed since “clear statistics”	Time elapsed since the statistics were last reset.
Connections handled	
Total handled	Number and percentage of connections handled.
Windows-media live accelerated	Number and percentage of accelerated connections.
Unaccelerated pipethru	Number and percentage of connections passed through the video accelerator but not accelerated.
Unaccelerated dropped due to config	Number and percentage of connections dropped because the video accelerator detected that the connection could not be accelerated and was configured to drop unaccelerated video traffic. See the fields in the Unaccelerated Connections section for the reasons that the video accelerator cannot accelerate a connection.
Error dropped connections	Number and percentage of dropped connections due to errors.
Windows-media active sessions	
Outgoing (client) sessions	Current and maximum number of active Windows Media sessions with clients.
Incoming (server) sessions	Current and maximum number of active Windows Media sessions with servers.
Unaccelerated Connections	
Total Unaccelerated	Number of unaccelerated connections.
Unsupported player	Number of unaccelerated connections due to an unsupported player.
Unsupported transport	Number of unaccelerated connections due to an unsupported transport.
Unsupported protocol	Number of unaccelerated connections due to an unsupported protocol.
Windows-media VoD	Number of unaccelerated connections due to client requesting a video on demand stream.
Max stream bitrate overload	Number of unaccelerated connections due to stream bit-rate overload.
Max aggregate bitrate overload	Number of unaccelerated connections due to aggregate bit-rate overload.
Max concurrent sessions overload	Number of unaccelerated connections due to client session overload.
Other	Number of unaccelerated connections due to other causes.
Error dropped connections	
Total errors	Total number of dropped connections due to errors.
Client timeouts	Number of client timeouts.

Table 3-75 *Field Descriptions for the show statistics accelerator video detail Command*

Field	Description
Server timeouts	Number of server timeouts.
Client stream errors	Number of client stream errors.
Server stream errors	Number of server stream errors.
Other errors	Number of other errors.
Windows-media byte savings	
% Bytes saved	Percentage of bytes saved by the video accelerator.
Incoming (server) bytes	Number of incoming bytes.
Outgoing (client) bytes	Number of outgoing bytes.
Windows-media aggregate bitrate	
Total bitrate	Total current and maximum bit rate, including both incoming and outgoing traffic.
Outgoing (client) bitrate	Current and maximum bit rate to clients.
Incoming (server) bitrate	Current and maximum bit rate from servers.
Policy Engine Statistics	
Session timeouts	The number of times the accelerator application did not issue a keepalive to the Policy Engine in a timely manner. A session refers to the particular registration of the accelerator application within the Policy Engine.
Total timeouts	The total number of times the accelerator application did not issue a keepalive to the Policy Engine in a timely manner. This may encompass multiple registrations.
Last keepalive received	The amount of time since the last keepalive (seconds).
Last registration occurred	The amount of time since the accelerator application registered with the Policy Engine (seconds). Most likely causes are: <ul style="list-style-type: none"> • WAE was rebooted • Configuration change with the accelerator application enabled • Restart of the accelerator application by the Node Manager
Hits	Number of connections that had a configured policy which specified the use of the accelerator application.
Updated Released	Number of hits that were released during Auto-Discovery and did not make use of the accelerator application.
Active Connections	Number of hits that represent either active connections using the accelerator application or connections that are still in the process of performing Auto-Discovery.
Completed Connections	Number of hits that have made use of the accelerator application and have completed.

Table 3-75 **Field Descriptions for the show statistics accelerator video detail Command**

Field	Description
Drops	Number of hits that attempted use of the video accelerator application but were dropped by the Policy Engine because it detected an overload condition and the video accelerator was configured to drop unaccelerated video traffic due to overload conditions. A separate hit and drop will be tallied for each TCP SYN packet received for a connection. This includes the original SYN and any retries.
Rejected Connection Counts Due To: (Total:)	<ul style="list-style-type: none"> • The number of all of the reject reasons which represent hits that were not able to use the accelerator applications. Reject reasons include the following: • Not registered • Keepalive timeout • No license • Load level not within range • Connection limit exceeded • Rate limit exceeded (a new connection exceeded the number of connections allowed within the time window) • Minimum TFO not available • Resource manager (minimum resources not available) • Global config optimization disabled • TFO limit exceeded (systemwide connection limit reached) • Server-side invoked • DM deny (Policy Engine dynamic match deny rule matched) • No DM accept was matched
Auto-Discovery Statistics	
Connections queued for accept	Number of connections added to the AO connection accept queue by Auto Discovery.
Accept queue add failures	Number of connections that could not be added to the AO connection accept queue due to a failure. The failure could possibly be due to AO not being present, or a queue overflow.

Table 3-75 *Field Descriptions for the show statistics accelerator video detail Command*

Field	Description
AO discovery successful	For the AOs that work in dual-ended mode, AO discovery (as part of Auto Discovery) is performed. This counter indicates the number of times AO discovery was successful.
AO discovery failure	The number of times AO discovery failed. Possible reasons include AO not being enabled or running on the peer WAE, or the license not configured for the AO.

Related Commands[clear arp-cache](#)[show accelerator](#)[show statistics connection closed](#)

show statistics application

To view the performance statistics for applications running on your WAAS device, use the **show statistics application** EXEC command.

show statistics application [*app_name* | **savings** *app_name*]

Syntax Description

<i>app_name</i>	Displays the statistics for the name of the application.
savings <i>app_name</i>	Displays savings statistics for the name of the application.

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

The **show statistics application** command displays statistics for all of the application traffic running on your network. To view the statistics for one specific class of applications only, use the *app_name* variable.

[Table 3-76](#) lists the valid *app_name* values you can use with the **show statistics application** EXEC command. For a description of the applications supported by WAAS, see [Appendix A, “Default Application Policies”](#) in the *Cisco Wide Area Application Services Configuration Guide*.

Table 3-76 *app_name* Variable Values for the show statistics application Command

app_name Values			
authentication	backup	cad	call-management
conferencing	console	content-management	directory-services
email-and-messaging	enterprise-applications	file-system	file-transfer
instant-messaging	name-services	other	p2p
printing	remote-desktop	replication	sql
ssh	storage	streaming	systems-management
version-management	vpn	wafs	web

Examples

[Table 3-77](#) describes the statistics for each class of application that are displayed by the **show statistics application** EXEC command.

Table 3-77 *Statistic Descriptions for the show statistics application Command*

Statistic	Description
Internal Client	Traffic initiated by the WAE device
Internal Server	Traffic terminated by the WAE device
Opt Preposition	Optimized traffic on the WAN side, initiated by the WAE device for preposition purposes
Opt TCP Only	Optimized traffic on the WAN side, optimized at the TFO level only
Opt TCP Plus	Optimized traffic on the WAN side, optimized at the TFO and DRE/LZ/AO levels
Orig Preposition	Original traffic (unoptimized) on the LAN side, initiated by the WAE device for preposition purposes
Orig TCP Only	Original traffic on the LAN side, optimized at the TFO level only
Orig TCP Plus	Original traffic on the LAN side, optimized at the TFO and DRE/LZ/AO levels
Overall	Combined TCP only, TCP plus, and preposition traffic together
Preposition	Traffic initiated by the WAE device for preposition purposes
PT Client	Pass-through traffic going from the client to the server
PT Config	Traffic that was passed through because of a defined policy
PT Intermediate	Traffic that was passed through because the WAE device is between two other WAE devices
PT No Peer	Traffic that was passed through because there was no peer WAAS device
PT Server	Pass-through traffic going from the server to the client
PT_Other	Traffic that was passed through because of WAAS device overload, asymmetric routing, blacklisting, or several other reasons
TCP Only	Traffic that is optimized at the TFO level only
TCP Plus	Traffic that is optimized at the TFO and DRE/LZ/AO levels

Table 3-78 describes the result values shown for the statistics in the **show statistics application** command display.

Table 3-78 *Result Value Descriptions for the show statistics application Command*

Result	Description
Bytes	The amount of traffic shown as a count of the number of bytes
Packets	The amount of traffic shown as a count of the number of packets
Inbound	Traffic received by the WAE device
Outbound	Traffic sent by the WAE device
Active	The number of connections that are active
Completed	The number of connection that have been completed
Compression Ratio	The amount of compressed traffic compared to the amount of original, uncompressed traffic

■ show statistics application

Related Commands [show statistics](#)

show statistics authentication

To display authentication statistics for a WAAS device, use the **show statistics authentication** EXEC command.

show statistics authentication

Syntax Description	This command has no arguments or keywords.
---------------------------	--

Defaults	No default behavior or values.
-----------------	--------------------------------

Command Modes	EXEC
----------------------	------

Device Modes	application-accelerator central-manager
---------------------	--

Usage Guidelines	Use the show statistics authentication command to display the number of authentication access requests, denials, and allowances recorded.
-------------------------	--

Examples	The following is sample output from the show statistics authentication command. It displays the statistics related to authentication on the WAAS device.
-----------------	---

```
WAE# show statistics authentication
Authentication Statistics
-----
Number of access requests:      115
Number of access deny responses: 12
Number of access allow responses: 103
```

Related Commands	(config) authentication configuration clear arp-cache show authentication
-------------------------	---

show statistics auto-discovery

To display Traffic Flow Optimization (TFO) auto-discovery statistics for a WAE, use the **show statistics auto-discovery** EXEC command.

show statistics auto-discovery [blacklist]

Syntax Description	blacklist (Optional) Displays the blacklist server statistics.
Defaults	No default behavior or values.
Command Modes	EXEC
Device Modes	application-accelerator

Examples [Table 3-79](#) describes the result values shown for the statistics in the **show statistics application** command display.

Table 3-79 Result Value Descriptions for the show statistics auto-discovery Command

Result	Description
Auto discovery structure	
Allocation Failure	Number of auto-discovery allocation failures.
Allocation Success	Number of auto-discovery allocation successes.
Deallocations	Number of auto-discovery connections that were deallocated.
Timed Out	Number of autodiscovery allocations that timed out.
Auto discovery table	
Bucket Overflows	Number of auto-discovery table buffer overflows.
Table Overflows	Number of auto-discovery table overflows.
Entry Adds	Number of auto-discovery table option additions.
Entry Drops	Number of auto-discovery table option deletions.
Entry Count	Total number of auto-discovery table option entries.
Lookups	Number of auto-discovery table lookups performed.
Bind hash add failures	Number of hash table binds that failed.
Flow creation failures	Number of flow creation attempts that failed.
Route Lookup	
Failures	Number of route table lookups that failed.
Success	Number of route table lookups that succeeded.

Table 3-79 **Result Value Descriptions for the show statistics auto-discovery Command**

Result	Description
Socket	
Allocation failures	Number of socket allocations that failed.
Accept pair allocation failures	Number of socket pair allocations that failed.
Unix allocation failures	Number of Unix socket allocations that failed.
Connect lookup failures	Number of socket connection lookups that failed.
Packets	
Memory allocation failures	Number of packet memory allocations that failed.
Total Sent	Total number of auto-discovery packets sent.
Total Received	Total number of auto-discovery packets received.
Incorrect length or checksum received	Number of packets received with an incorrect length or checksum.
Invalid filtering tuple received	Number of packets received with an incorrect filtering tuple.
Received for dead connection	Number of packets received for invalid connections.
Ack dropped in synack received state	Number of acknowledgement packets dropped that were in the synchronize acknowledgement state.
Non Syn dropped in nostate state	Number on non-SYN packets dropped that were in the nostate state.
Syn-ack packets to int. client dropped	Number of synack packets dropped when being sent to internal client.
Packets dropped state already exists	Number of packets for which the dropped state already exists.
Auto discovery failure	
No peer or asymmetric route	Auto-discovery failed because no peer was found, or asymmetric routing configuration was indicated.
Insufficient option space	Auto-discovery failed because there was not enough space to add options.
Invalid option content	Auto-discovery failed because the content of an option was invalid.
Invalid connection state	Auto-discovery failed because the connection state was invalid.
Missing Ack conf	Auto-discovery failed because of missing auto discovery options that were sent from the edge WAE sends to the core WAE on the ack packet.
Intermediate device	Auto-discovery failed because a device was discovered between the WAEs.
Version mismatch	Auto-discovery failed because the WAAS software versions did not match.
Auto discovery success TO	
Internal server	The address of the internal server.

Table 3-79 **Result Value Descriptions for the show statistics auto-discovery Command**

Result	Description
External server	The address of the external server.
Auto discovery success FOR	
Internal client	The address of the internal client.
External client	The address of the external client.
Auto discovery success SYN retransmission	
Zero retransmit	No retransmissions were required for auto-discovery SYN success.
One retransmit	One retransmission were required for auto-discovery SYN success.
Two+ retransmit	Two or more retransmissions were required for auto-discovery SYN success.
AO discovery	
AO discovery successful	Auto-discovery of an application optimizer was successful.
AO discovery failure	Auto-discovery of an application optimizer was not successful.
Auto discovery Miscellaneous	
RST received	Number of resets received.
SYNs found with our device id	SYN packets received indicating WAEs device ID.
SYN retransmit count resets	Number of resets to the SYN retransmission count.

show statistics cifs

To display the CIFS statistics information, use the **show statistics cifs** EXEC command.

show statistics cifs {cache eviction | requests}

Syntax Description	cache	Statistics for CIFS cache.
	eviction	Status of CIFS cache eviction.
	requests	Statistics for CIFS requests.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator

Usage Guidelines Use the **show statistics cifs** EXEC command to view the CIFS traffic details itemized by request type. The **show statistics cifs** command is useful when you want to understand how the system is being used. For example, are requests mostly for data transfer, browsing, database activity, or for some other purpose? You might correlate these statistics with performance issues for troubleshooting purposes, or you may use them to determine what specific performance optimizations to configure.

Examples [Table 3-80](#) describes the fields in the **show statistics cifs requests** command display.

Table 3-80 Field Descriptions for the show statistics cifs requests Command

Field	Description
Statistics gathering period	Number of hours, minutes, seconds, and milliseconds of the statistics gathering period.
Total	Total number of CIFS requests.
Remote	Number of CIFS requests that were not handled from the local cache.
ALL_COMMANDS	Alias for all of the CIFS commands shown.
total	Total number of requests for all commands.
remote	Number of remote requests for all commands.
async	Number of async requests for all commands.
avg local	Average local request time in milliseconds for all commands.
avg remote	Average remote request time in milliseconds for all commands.

Table 3-80 *Field Descriptions for the show statistics cifs requests Command (continued)*

Field	Description
CONNECT	Connection check command.
total	Total number of requests for this command.
remote	Number of remote requests for this command.
async	Number of async requests for this command.
avg local	Average local request time in milliseconds for this command.
avg remote	Average remote request time in milliseconds for this command.
NB_SESSION_REQ	NetBIOS session request command.
VFN_LIVELINESS	Liveliness check command.

Related Commands[cifs](#)[show cifs](#)

show statistics connection all

To display all connection statistics for a WAAS device, use the **show statistics connection all** EXEC command.

show statistics connection all

client-ip {*ip_address* | *hostname*} | **client-port** *port* |

detail [**client-ip** {*ip_address* | *hostname*} | **client-port** *port* | **peer-id** *peer_id* | **server-ip** {*ip_address* | *hostname*} | **server-port** *port*] |

peer-id *peer_id* | **server-ip** {*ip_address* | *hostname*} | **server-port** *port*] | **conn-id** *connection_id*

Syntax Description		
all		(Optional) Displays all the connection statistics for connections of the filtered type.
client-ip		(Optional) Displays the closed connection statistics for the client with the specified IP address or hostname.
<i>ip_address</i>		IP address of a client or server.
<i>hostname</i>		Hostname of a client or server.
client-port <i>port</i>		(Optional) Displays the closed connection statistics for the client with the specified port number (1–65535).
detail		(Optional) Displays detailed closed connection statistics for connections optimized by the video application accelerator for Windows Media streams.
peer-id <i>peer_id</i>		(Optional) Displays the connection statistics for the peer with the specified identifier. Number from 0 to 4294967295 identifying a peer.
server-ip		(Optional) Displays the connection statistics for the server with the specified IP address or hostname.
server-port <i>port</i>		(Optional) Displays the connection statistics for the server with the specified port number (1–65535).
conn-id <i>connection_id</i>		(Optional) Displays closed connection statistics for the connection with the specified identifier.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator

Usage Guidelines The **show statistics connection all** command displays the statistics for individual TCP connections. This information is updated in real time.

Using the **show statistics connection all** command with only the **all** option displays a one-line summary of all the TCP connections on the WAE. To obtain detailed statistics for a connection, use the command options to filter the connection. While most filters show detail statistics, some filters (such as peer-id) show summary information and not details.

Examples

Table 3-81 describes the fields shown in the **show statistics connection all** command display.

Table 3-81 *Field Descriptions for the show statistics connection all Command*

Field	Description
ConnID	Identification number assigned to the connection.
Source IP:Port	IP address and port of the incoming source connection.
Dest IP:Port	IP address and port of the outgoing destination connection.
PeerID	The MAC address of the peer device.
Accel	Types of acceleration in use on the connection. D = DRE, L = LZ, T = TCP optimization, C = CIFS, E = EPM, G = generic, H = HTTP, M = MAPI, N = NFS, V = video
Local IP:Port	IP address and port of the incoming local connection.
Remote IP:Port	IP address and port of the outgoing remote connection.
ConnType	Type and status of the connection, for example pass-through or optimized.

{detail}}}} | dre {all | savings | {cifs | epm | http | mapi | nfs | tfo | video}}
```

Syntax	Description
closed	(Optional) Displays closed connection statistics for optimized connections.
client-ip	(Optional) Displays the closed connection statistics for the client with the specified IP address or hostname.
<i>ip_address</i>	IP address of a client or server.
<i>hostname</i>	Hostname of a client or server.
client-port port	(Optional) Displays the closed connection statistics for the client with the specified port number (1–65535).
conn-id connection_id	(Optional) Displays closed connection statistics for the connection with the specified identifier.
peer-id peer_id	(Optional) Displays the closed connection statistics for the peer with the specified identifier. Number from 0 to 4294967295 identifying a peer.
server-ip	(Optional) Displays the connection statistics for the server with the specified IP address or hostname.
server-port port	(Optional) Displays the connection statistics for the server with the specified port number (1–65535).
cifs	(Optional) Displays closed connection statistics for connections optimized by the CIFS application accelerator.
http	(Optional) Displays closed connection statistics for connections optimized by the HTTP application accelerator.
mapi	(Optional) Displays closed connection statistics for connections optimized by the MAPI application accelerator.
nfs	(Optional) Displays closed connection statistics for connections optimized by the NFS application accelerator.
video	(Optional) Displays closed connection statistics for connections optimized by the video application accelerator.
detail	(Optional) Displays detailed closed connection statistics for connections optimized by the video application accelerator for Windows Media streams.
windows-media	(Optional) Displays active connection statistics for connections optimized by the video application accelerator for Windows Media streams.
incoming	(Optional) Displays active incoming connection statistics for connections optimized by the video application accelerator for Windows Media streams.
outgoing	(Optional) Displays active outgoing connection statistics for connections optimized by the video application accelerator for Windows Media streams.
dre	(Optional) Displays closed connection statistics for connections optimized by the DRE feature.

all	(Optional) Displays all the connection statistics for connections of the filtered type.
savings	(Optional) Displays the savings connection statistics for connections of the filtered type.
epm	(Optional) Displays closed connection statistics for connections optimized by the EPM application accelerator.
tfo	(Optional) Displays closed connection statistics for connections optimized by the TFO application accelerator.

-------------------------	--

Examples	Table 3-80 describes the fields shown in the show statistics connection conn-id command display.
-----------------	---

Table 3-83 Field Descriptions for the show statistics connection conn-id Command

Field	Description
Connection Information	
Peer ID	MAC address of the peer device.
Connection Type	Type of connection established with the peer.
Start Time	Date and time connection started.
Source IP Address	IP address of the connection source.
Source Port Number	Port number of the connection source.
Destination IP Address	IP address of the connection destination.
Destination Port Number	Port number of the connection destination.
Application Name	Name of the application traffic on the connection.
Classifier Name	Name of the application classifier on the connection.
Map Name	Name of the policy engine application map.

Table 3-83 *Field Descriptions for the show statistics connection conn-id Command (continued)*

Field	Description
Directed Mode	State of directed mode: true (on) or false (off).
Configured Policy	Name of the configured application policy.
Derived Policy	Named of the derived application policy.
Peer Policy	Name of the application policy on the peer side.
Negotiated Policy	Name the negotiated application acceleration policy.
Accelerators	Accelerators currently in use on the connection.
Original and Optimized Bytes Read/Written	Number of bytes that have been rear and written on the original (incoming) side and the optimized (outgoing) side.
DRE Stats	
Encode	Statistics for compressed messages.
Overall: [msg in out ratio]	Aggregated statistics for compressed messages. msg = Total number of messages. in = Number of bytes before decompression. out = Number of bytes after decompression. ratio = Percentage of the total number of bytes that were compressed.
DRE: [msg in out ratio]	Number of DRE messages.
DRE Bypass: [msg in]	Number of DRE messages that were bypassed for compression.
LZ: [msg in out ratio]	Number of LZ messages.
Avg Latency	Average latency (transmission delay) of the DRE traffic.
Encode Th-put	Speed of DRE traffic throughput, in kilobytes per second.
Message Size Distribution	Percentage of total messages that fall within indicated size ranges.
Connection Details	
Chunks	Number of chunks encoded, decode, and anchored (forced).
Total Messages	Total number of messages processed and the number of blocks used per message.
Ack [msg size]	Number and size of acknowledgement messages.
Encode Bypass Due To	Reason for previous traffic encoding bypass.
Nack	Number and size of negative acknowledgement messages.
R-tx	Number of ready-to-transmit messages.
Aggregation Encode/Decode	Aggregated statistics for compressed messages.
TFO Stats	
Conn-Type	Type of connection.
Policy	Policy in use on connection.
EOT State [write req ack read ack]	End of transmission state for data written and read.

Table 3-83 Field Descriptions for the *show statistics connection conn-id* Command (continued)

Field	Description
Socket States	Socket states, including read-shut , write-shut , close , choke , and envoy .
DRE Hints [local remote active]	Number of DRE hints sent for the local, remote, and active connections.
Read Encode/Decode Flows	Number of encode and decode messages, and total bytes used.
Decoder Pending Queue	Size of the messages waiting in the decode queue, including maximum size, current size, average size, and the number of flow-control stop messages.
Encode/Decode	Number of calls encoded and decoded, the message latency (in ms), and the number of transmitted data/acknowledgment frames.
Writer Pending Queue	Size of the messages waiting in the write queue, including maximum size, current size, average size, and the number of flow-control stop messages.
Write	The size of the messages written, total number of messages, the average size, and the message latency (in ms).

show statistics connection egress-methods

To display detailed egress method-related information about the connection segments for a WAE, use the **show statistics connection egress-methods** EXEC command.

show statistics connection egress-methods

client-ip {*ip_address* | *hostname*} | **client-port** *port* | **peer-id** *peer_id* |
server-ip {*ip_address* | *hostname*} | **server-port** *port*

Syntax	Description
client-ip	(Optional) Displays the closed connection statistics for the client with the specified IP address or hostname.
<i>ip_address</i>	IP address of a client or server.
<i>hostname</i>	Hostname of a client or server.
client-port <i>port</i>	(Optional) Displays the closed connection statistics for the client with the specified port number (1–65535).
peer-id <i>peer_id</i>	(Optional) Displays the connection statistics for the peer with the specified identifier. Number from 0 to 4294967295 identifying a peer.
server-ip	(Optional) Displays the connection statistics for the server with the specified IP address or hostname.
server-port <i>port</i>	(Optional) Displays the connection statistics for the server with the specified port number (1–65535).

Defaults	No default behavior or values.
----------	--------------------------------

Command Modes	EXEC
---------------	------

Device Modes	application-accelerator
--------------	-------------------------

Usage Guidelines	Using the show statistics connection egress-methods command without options displays detailed information about each of the TFO connections for a WAE.
------------------	---

The **show statistics connection egress-methods** command displays egress method-related information about connection segments in an environment where the data flow from start-point to end-point is being transparently intercepted by multiple devices. A connection tuple represents one segment of an end-to-end connection that is intercepted by a WAAS device (WAE) for processing.

For example, a single client-server connection may have three segments (see [Figure 3-1](#)):

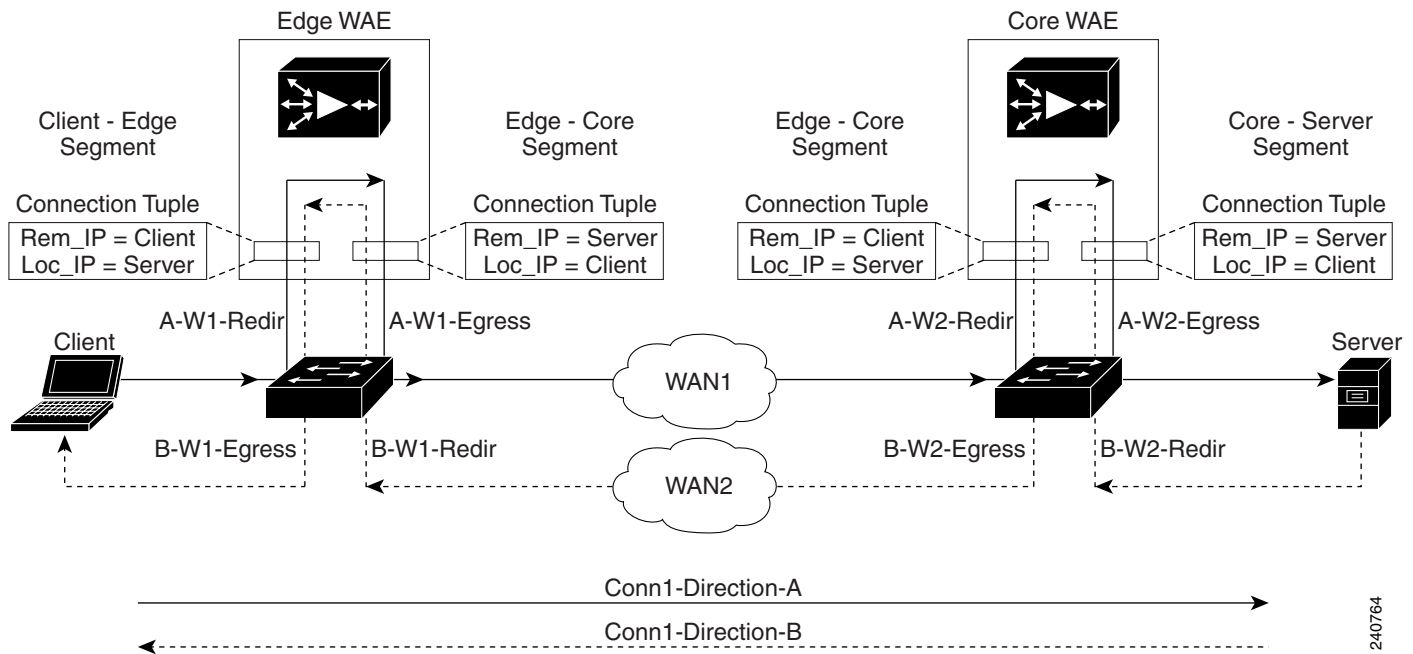

- Between the client and the Edge WAE
- Between the Edge WAE and the Core WAE
- Between the Core WAE and the server

In this example, the Edge WAE has two connection tuples for the two segments that it participates in the following:

- One connection tuple to represent the Client—Edge segment
- One connection tuple to represent the Edge—Core segment

In the **show** output, these two connection tuples appear as TUPLE and MATE. (See [Table 3-84](#).) The important information to view is the local and remote IP address of the connection tuple and not whether it is marked as TUPLE or MATE.

Figure 3-1 Topology with Three Segments and Corresponding Connection Tuples

Because the WAAS device is transparent to both the client-end of the connection and the server-end of the connection, the local IP address for a connection tuple depends on the segment in the end-to-end topology.

For example, when WAAS intercepts a packet from the client, this packet enters the connection tuple that represents the Client—Edge segment. On this tuple, the WAAS device appears to the client as though it were the server: the local IP address in this connection tuple is the IP address of the server, while the remote IP address in this connection tuple is that of the client. Similarly, when the Edge WAE sends data to the client, the packet egresses from this connection tuple as though it were coming from the server.

When WAAS sends a packet to the server, the packet egresses from the connection tuple that represents the Edge—Core segment. On this tuple, the WAAS device appears to the server as though it were the client: the local IP address in the connection tuple is the IP address of the client, while the remote IP address in this connection tuple is that of the server. Similarly, when the Edge WAE intercepts a packet from the Core WAE, the data in this connection tuple appears to be coming from the server.

Examples

[Table 3-84](#) describes the fields shown in the **show tfo egress-methods connection** command display.

Table 3-84 Field Descriptions for the show tfo egress-methods connection Command

Field	Description
TUPLE	
Client-IP:Port	IP address and port number of the client device in the connection tuple.
Server-IP:Port	IP address and port number of the server device in the connection tuple.
MATE	
Client-IP:Port	IP address and port number of the client device in the mate connection tuple.
Server-IP:Port	IP address and port number of the server device in the mate connection tuple.
Egress method	Egress method being used.
WCCP Service Bucket	WCCP service number and bucket number for the connection tuple and mate connection tuple.
Tuple Flags	Flags for intercept method and intercept mechanism. This field may contain the following values: WCCP or NON-WCCP as the intercept method; L2 or GRE as the intercept mechanism; or PROT showing whether this tuple is receiving packets through the flow protection mechanism.
Intercepting device (ID)	
ID IP address	IP address of the intercepting device.
ID MAC address	MAC address of the intercepting device.
ID IP address updates	Number of IP address changes for the intercepting device.
ID MAC address updates	Number of MAC address changes for the intercepting device.
Memory address	Memory address.

Each time a packet enters the connection tuple, the intercepting device IP address or MAC address is recorded. The updates field in the command output indicates whether the intercepting device IP address or intercepting device MAC address has been recorded. If, for example, the ID MAC address updates field is zero (0), the MAC address was not recorded, and the ID MAC address field will be blank. The recorded intercepting device information is used when a packet egresses from the WAE.

If the egress method for the connection tuple is IP forwarding, the updates fields are always zero (0) because the intercepting device information is neither required nor recorded for the IP forwarding egress method.

If the intercept method is WCCP GRE redirect and the egress method is WCCP GRE, only the IP address field is updated and recorded. The MAC address information is neither required nor recorded because the destination address in the GRE header only accepts an IP address.

If the intercept method is WCCP L2 redirect and the egress method is WCCP GRE, both the MAC address and the IP address fields are updated and recorded because incoming WCCP L2 packets contain only a MAC header. The MAC address is recorded and the intercepting device IP address is derived from

a reverse ARP lookup and is then recorded, also. When packets egress the connection tuple in this scenario, they will have a GRE header with the destination IP address of the intercepting device that was recorded.

The updates count may be greater than 1 in certain topologies. For example, in a redundant router topology, where for the same direction of the same connection between two hosts, packets may be coming in from different intercepting routers. Each time a packet comes in, the intercepting device MAC or IP address is compared against the last recorded address. If the MAC or IP address has changed, the updates field is incremented and the new MAC or IP address is recorded.

show statistics connection optimized

To display optimized connection statistics for a WAAS device, use the **show statistics connection optimized** EXEC command.

show statistics connection optimized

```
client-ip {ip_address | hostname} | client-port port | peer-id peer_id | server-ip {ip_address |
hostname} | server-port port |
{cifs | http | mapi | nfs | video {detail | windows-media {incoming | outgoing} | dre { all |
savings | {cifs | http | mapi | nfs | video} } ] }
```

Syntax Description

optimized	(Optional) Displays active connection statistics for optimized connections.
client-ip	(Optional) Displays the closed connection statistics for the client with the specified IP address or hostname.
<i>ip_address</i>	IP address of a client or server.
<i>hostname</i>	Hostname of a client or server.
client-port port	(Optional) Displays the closed connection statistics for the client with the specified port number (1–65535).
peer-id peer_id	(Optional) Displays the connection statistics for the peer with the specified identifier. Number from 0 to 4294967295 identifying a peer.
server-ip	(Optional) Displays the connection statistics for the server with the specified IP address or hostname.
server-port port	(Optional) Displays the connection statistics for the server with the specified port number (1–65535).
cifs	(Optional) Displays closed connection statistics for connections optimized by the CIFS application accelerator.
http	(Optional) Displays closed connection statistics for connections optimized by the HTTP application accelerator.
mapi	(Optional) Displays closed connection statistics for connections optimized by the MAPI application accelerator.
nfs	(Optional) Displays closed connection statistics for connections optimized by the NFS application accelerator.
video	(Optional) Displays closed connection statistics for connections optimized by the video application accelerator.
detail	(Optional) Displays detailed closed connection statistics for connections optimized by the video application accelerator for Windows Media streams.
windows-media	(Optional) Displays active connection statistics for connections optimized by the video application accelerator for Windows Media streams.
incoming	(Optional) Displays active incoming connection statistics for connections optimized by the video application accelerator for Windows Media streams.
outgoing	(Optional) Displays active outgoing connection statistics for connections optimized by the video application accelerator for Windows Media streams.
dre	(Optional) Displays closed connection statistics for connections optimized by the DRE feature.

all	(Optional) Displays all the connection statistics for connections of the filtered type.
savings	(Optional) Displays the savings connection statistics for connections of the filtered type.

Defaults No default behavior or values.

Total outgoing packets encapsulated	Number of outgoing packets encapsulated.
Total incoming packets de-capsulated	Number of incoming packets decapsulated.
Total RST+OPT packets recieved and dropped	Number of RST packets with option 33 set that are received and dropped.
Outgoing packet encapsulation failed	Number of outgoing packet encapsulation failures.
Invalid incoming packets received	Number of invalid incoming packets.
Invalid packet length received	Number of incoming packets with an invalid length.
Incoming packet pullups needed	Number of incoming packets that were fragmented and needed copying from data fragments.
Incoming packets with inner fragments	Number of incoming packets with inner fragments.

show statistics dre

To display Data Redundancy Elimination (DRE) general statistics for a WAE, use the **show statistics dre** EXEC command,

show statistics dre [detail]

Syntax Description	detail (Optional) Specifies to show detail.
Defaults	No default behavior or values.
Command Modes	EXEC
Device Modes	application-accelerator

Examples [Table 3-88](#) describes the fields shown in the **show statistics directed-mode** command display. This command shows the aggregated statistics for all connections.

Table 3-88 Field Descriptions for the show statistics dre Command

Field	Description
Cache	Aggregated DRE cache data statistics.
Status	Current DRE status. Status values include: Initializing, Usable, and Fail.
Oldest Data (age)	Time that the DRE data has been in the cache in days (d), hours (h), minutes (m), and seconds (s). For example, "1d1h" means 1 day, 1 hour.
Total usable disk size	Total disk space allocated to the DRE cache.
Used (%)	Percentage of the total DRE cache disk space being used.
Hash table RAM size	Amount of memory allocated for the DRE hash table.
Used (%)	Percentage of allocated memory being used for the DRE hash table.
Connections	
Total (cumulative)	Total cumulative connections.
Encode	
Overall: msg, in, out, ratio	All messages coming coming to DRE components. Number of messages, input bytes, output bytes, compression ratio (in less out, divided by in).

Table 3-88 **Field Descriptions for the show statistics dre Command**

Field	Description
DRE: msg, in, out, ratio	All messages handled by DRE compression. Number of DRE compressed messages, input bytes, output bytes, compression ratio (in less out, divided by in).
DRE Bypass: msg, in	Number of messages bypassed by DRE. Number of messages, number of bytes.
LZ: msg, in, out, ratio	All messages handled by LZ. Number of messages, input bytes, output bytes, compression ratio (in less out, divided by in).
LZ: bypass: msg, in	Number of messages bypassed by LZ. Number of messages, number of bytes.
Avg latency: ms, Delayed msg	Average latency introduced to compress a message.
Encode th-put	Average message size.
Message size distribution	Message sizes divided into six size groups. Number of message fails into each group and distribution.
Decode	
Overall: msg, in, out, ratio	All messages coming coming to DRE components. Number of messages, input bytes, output bytes, compression ratio (in less out, divided by in).
DRE: msg, in, out, ratio	All messages handled by DRE compression. Number of DRE compressed messages, input bytes, output bytes, compression ratio (in less out, divided by in).
LZ: msg, in, out, ratio	Number of messages bypassed by DRE. Number of messages, number of bytes.
LZ: bypass: msg, in	All messages handled by LZ. Number of messages, input bytes, output bytes, compression ratio (in less out, divided by in).
Avg latency: ms, Delayed msg	Average latency introduced to compress a message.
Decode th-put:	Average message size.
Message size distribution	Message sizes divided into six size groups. Number of message fails into each group and distribution.

Related Commands [show statistics peer](#)

show statistics filtering

To display statistics about the incoming and outgoing TFO flows that the WAE currently has, use the **show statistics filtering EXEC** command.

show statistics filtering

Syntax Description	This command has no arguments or keywords.
Defaults	No default behavior or values.
Command Modes	EXEC
Device Modes	application-accelerator
Usage Guidelines	The show statistics filtering command displays statistics about the TCP flows that the WAE is handling.
Examples	<p>The following is sample output from the show statistics filtering command. It displays TFO connection statistics for the WAE.</p> <pre>WAE# show statistics filtering Number of filtering tuples: 1 Packets dropped due to ttl expiry: 0 Packets dropped due to bad route: 0 Syn packets dropped with our own id in the options: 0 Internal client syn packets dropped: 0 Syn packets received and dropped on estab. conn: 0 Syn-Ack packets received and dropped on estab. conn: 0 Packets recvd on in progress conn. and not handled: 0 Packets dropped due to peer connection alive: 0 Packets dropped due to invalid TCP flags: 0 Packets dropped by FB packet input notifier: 0 Packets dropped by FB packet output notifier: 0 Number of errors by FB tuple create notifier: 0 Number of errors by FB tuple delete notifier: 0 Dropped WCCP GRE packets due to invalid WCCP service: 0 Dropped WCCP L2 packets due to invalid WCCP service: 0</pre>
Related Commands	<p>show filtering list</p> <p>show statistics auto-discovery</p> <p>show statistics connection closed</p>

show statistics flow

To display flow statistics for a WAAS device, use the **show statistics flow** EXEC command.

show statistics flow { filters | monitor tcpstat-v1 }

Syntax Description	filters	Displays flow filter statistics.
	monitor	Displays flow performance statistics.
	tcpstat-v1	Displays tcpstat-v1 collector statistics.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator

Examples [Table 3-89](#) describes the fields shown in the **show statistics flow filters** command display.

Table 3-89 Field Descriptions for the show statistics flow filters Command

Field	Description
Number of Filters	Number of filters.
Status	Status of whether the filters are enabled or disabled.
Capture Mode	Operation of the filter. Values include FILTER or PROMISCUOUS. The promiscuous operation is not available in WAAS.
Server	IP address list of the servers for which flows are being monitored.
Flow Hits	Number of flow hits for each server.
Flags	Flags identifying the flows. CSN: Client-Side Non-Optimized (Edge) SSO: Server-Side Optimized (Edge) CSO: Client-Side Optimized (Core) SSN: Server-Side Non-Optimized (Core) PT: Pass Through (Edge/Core/Intermediate) IC: Internal Client

Table 3-90 describes the fields shown in the **show statistics flow monitor** command display.

Table 3-90 *Field Descriptions for the show statistics flow monitor Command*

Field	Description
Host Connection	
Configured host address	IP address of the tcpstat-v1 console for the connection.
Connection State	State of the connection.
Connection Attempts	Number of connection attempts.
Connection Failures	Number of connection failures.
Last connection failure	Date and time of the last connection failure.
Last configuration check sent	Date and time that the last configuration check was sent.
Last registration occurred	Date and time that the last registration occurred.
Host Version	Version number of the tcpstat-v1 console for the connection.
Collector Connection	
Collector host address:port	IP address and port number of the tcpstat-v1 aggregator identified through the host connection.
Connection State	State of the connection.
Connection Attempts	Number of connection attempts.
Connection Failures	Number of connection failures.
Last connection failure	Date and time of the last connection failure.
Last configuration check sent	Date and time that the last configuration check was sent.
Last update sent	Date and time that the last update was sent.
Updates sent	Number of updates sent.
Summaries discarded	Number of summaries that were discarded because disk space allocated for storage has reached its limit. The numbers in this field indicate when summaries are being collected faster than they are able to be transferred to the collector. Counters in this field generate a data_update alarm.
Last registration occurred	Date and time that the last registration occurred.
Host Version	Version number of the tcpstat-v1 aggregator for the connection.
Collection Statistics	
Collection State	State of the summary collection operation.
Summaries collected	Number of summaries collected. Summaries are packet digests of the traffic that is being monitored.
Summaries dropped	Total number of summaries dropped. This is the sum of the following subcategories.
Dropped by TFO	Number of packets that were dropped by TFO because of an error, such as not being able to allocate memory.

Table 3-90 *Field Descriptions for the show statistics flow monitor Command (continued)*

Field	Description
Dropped due to backlog	Number of packets that were dropped because the queue limit has been reached. This counter indicates whether the flow monitor application can keep up with the number of summaries being received.
Summary backlog	Number of packets that are waiting in the queue to be read by the collector module on the WAE.
Last drop occurred	Date and time that the last packet drop occurred.

Related Commands [clear arp-cache](#)

show statistics generic-gre

To view the GRE tunnel statistics for each intercepting router, use the **show statistics generic-gre** EXEC command.

show statistics generic-gre

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator

Usage Guidelines Use the **clear statistics generic-gre** EXEC command to clear the generic GRE statistics.

Examples [Table 3-91](#) describes the fields shown in the **show statistics generic-gre** command display.

Table 3-91 Field Descriptions for the show statistics generic-gre Command

Field	Description
Intercepting router	IP address of the intercepting router.
Tunnel Destination	IP address of the GRE tunnel destination.
Packets Sent	Number of generic GRE packets sent.
Output Packets Dropped	Number of outgoing generic GRE packets dropped.
Output Packets Fragmented	Number of outgoing generic GRE packets fragmented.

show statistics icmp

To display ICMP statistics for a WAAS device, use the **show statistics icmp** EXEC command.

show statistics icmp

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Examples [Table 3-92](#) describes the fields shown in the **show statistics icmp** command display.

Table 3-92 Field Descriptions for the show statistics icmp Command

Field	Description
ICMP messages received	Total number of Internet Control Message Protocol (ICMP) messages which the entity received, including all those counted as ICMP input errors.
ICMP messages receive failed	Number of ICMP messages which the entity received but determined as having ICMP-specific errors, such as bad ICMP checksums, bad length, and so forth.
Destination unreachable	Number of ICMP messages of this type received.
Timeout in transit	Number of ICMP messages of this type received.
Wrong parameters	Number of ICMP messages of this type received.
Source quenches	Number of ICMP messages of this type received.
Redirects	Number of ICMP messages of this type received.
Echo requests	Number of ICMP messages of this type received.
Echo replies	Number of ICMP messages of this type received.
Timestamp requests	Number of ICMP messages of this type received.
Timestamp replies	Number of ICMP messages of this type received.
Address mask requests	Number of ICMP messages of this type received.
Address mask replies	Number of ICMP messages of this type received.

Table 3-92 *Field Descriptions for the show statistics icmp Command (continued)*

Field	Description
ICMP messages sent	Total total number of ICMP messages which this entity attempted to send. This counter includes all those counted as ICMP output errors.
ICMP messages send failed	Number of number of ICMP messages which this entity did not send because of problems discovered within ICMP, such as a lack of buffers.
Destination unreachable	Number of ICMP messages of this type sent out.
Time exceeded	Number of ICMP messages of this type sent out.
Wrong parameters	Number of ICMP messages of this type sent out.
Source quenches	Number of ICMP messages of this type sent out.
Redirects	Number of ICMP messages of this type sent out.
Echo requests	Number of ICMP messages of this type sent out.
Echo replies	Number of ICMP messages of this type sent out.
Timestamp requests	Number of ICMP messages of this type sent out.
Timestamp replies	Number of ICMP messages of this type sent out.
Address mask requests	Number of ICMP messages of this type sent out.
Address mask replies	Number of ICMP messages of this type sent out.

Related Commands [clear arp-cache](#)

show statistics ip

To display IP statistics for a WAAS device, use the **show statistics ip** EXEC command.

show statistics ip

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Examples [Table 3-93](#) describes the fields shown in the **show statistics ip** command display.

Table 3-93 Field Descriptions for the show statistics ip Command

Field	Description
IP statistics	
Total packets in	Total number of input datagrams received from interfaces, including all those counted as input errors.
with invalid address	Number of input datagrams discarded because the IP address in their IP header destination field was not a valid address to be received at this entity. This count includes invalid addresses (such as 0.0.0.0) and addresses of unsupported classes (such as Class E). For entities that are not IP gateways and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.
with invalid header	Number of input datagrams discarded because of errors in their IP headers, including bad checksums, version number mismatches other format errors, time-to-live exceeded errors, and errors discovered in processing their IP options.
forwarded	Number of input datagrams for which this entity was not their final IP destination, and as a result, an attempt was made to find a route to forward them to that final destination. In entities which do not act as IP gateways, this counter includes only those packets which were source-routed by way of this entity, and the source-route option processing was successful.

Table 3-93 *Field Descriptions for the show statistics ip Command (continued)*

Field	Description
unknown protocol	Number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.
discarded	Number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (such as, for lack of buffer space). This counter does not include any datagrams discarded while awaiting reassembly.
delivered	Total number of input datagrams successfully delivered to IP user protocols (including ICMP).
Total packets out	Total number of IP datagrams which local IP user protocols (including ICMP) supplied to IP in requests for transmission. This counter does not include any datagrams counted in the forwarded field.
dropped	Number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (such as, for lack of buffer space). This counter includes datagrams counted in the forwarded field if any such packets meet this (discretionary) discard criterion.
dropped (no route)	Number of IP datagrams discarded because no route could be found to transmit them to their destination. This counter includes any packets counted in the forwarded field which meet this no-route criterion, including any datagrams that a host cannot route because all of its default gateways are down.
Fragments dropped after timeout	Maximum number of seconds that received fragments are held while they are awaiting reassembly at this entity.
Reassemblies required	Number of IP fragments received which needed to be reassembled at this entity.
Packets reassembled	Number of IP datagrams successfully reassembled.
Packets reassemble failed	Number of number of failures detected by the IP reassembly algorithm (for whatever reason: timed out, errors, and so forth). This count is not necessarily a count of discarded IP fragments because some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.
Fragments received	Total number of IP datagrams that have been successfully fragmented at this entity.
Fragments failed	Number of IP datagrams that have been discarded because they needed to be fragmented at this entity but could not be fragmented because their Don't Fragment flag was set.
Fragments created	Number of IP datagram fragments that have been generated as a result of fragmentation at this entity.

show statistics netstat

To display Internet socket connection statistics for a WAAS device, use the **show statistics netstat EXEC** command.

show statistics netstat

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Examples [Table 3-94](#) describes the fields shown in the **show statistics netstat** command display.

Table 3-94 Field Descriptions for the show statistics netstat Command

Field	Description
Active Internet connections (w/o servers)	The following output prints the list of all open Internet connections to and from this WAE.
Proto	Layer 4 protocol used on the Internet connection, such as, TCP, UDP, and so forth.
Recv-Q	Amount of data buffered by the Layer 4 protocol stack in the receive direction on a connection.
Send-Q	Amount of data buffered by the Layer 4 precool stack in the send direction on a connection.
Local Address	IP address and Layer 4 port used at the WAE end point of a connection.
Foreign Address	IP address and Layer 4 port used at the remote end point of a connection.
State	Layer 4 state of a connection. TCP states include the following: ESTABLISHED, TIME-WAIT, LAST-ACK, CLOSED, CLOSED-WAIT, SYN-SENT, SYN-RCVD, SYN-SENT, SYN-ACK-SENT, and LISTEN.

show statistics peer

To display peer Data Redundancy Elimination (DRE) statistics for a WAE, use the **show statistics peer EXEC** command.

show statistics peer

show statistics peer dre [**context** *context-value* | **peer-id** *peer-id* | **peer-ip** *ip-address* | **peer-no** *peer-no*]

show statistics peer dre detail [**context** *context-value* | **peer-id** *peer-id* | **peer-ip** *ip-address* | **peer-no** *peer-no*]]

Syntax Description	context <i>context-value</i>	Displays peer statistics for the specified context (0–4294967295).
	peer-id <i>peer-id</i>	(Optional) Specifies the MAC address of the peer (0–4294967295).
	peer-ip <i>ip_address</i>	(Optional) Specifies the IP address of the peer.
	peer-no <i>peer-no</i>	(Optional) Specifies the peer number.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator

Examples [Table 3-95](#) describes the fields shown in the **show statistics peer dre** command display. This command shows the peer DRE device connection information.

Table 3-95 Field Descriptions for the show statistics peer dre Command

Field	Description
Peer-No	Number assigned to the peer compression device.
Context	Context ID for the DRE debugging trace.
Peer-ID	MAC address of the peer device.
Hostname	Hostname of the peer device.
Cache	DRE cache data statistics as shown by the peer.
Used disk:	Number of megabytes (MB) used on the disk for the DRE cache.
Age:	Time that the DRE data has been in the cache in days (d), hours (h), minutes (m), and seconds (s).
Connections:	
Total (cumulative):	Number of cumulative connections that have been processed.

Table 3-95 *Field Descriptions for the show statistics peer dre Command (continued)*

Field	Description
Active:	Number of connections that are still open.
Concurrent connections (Last 2 min):	
max	Maximum number of concurrent connections in the last two minutes.
avg	Average number of concurrent connections in the last two minutes.
Encode	Statistics for compressed messages.
Overall: [msg in out ratio]	Aggregated statistics for compressed messages. msg = Total number of messages. in = Number of bytes before decompression. out = Number of bytes after decompression. ratio = Percentage of the total number of bytes that were compressed.
DRE: [msg in out ratio]	Number of DRE messages.
DRE Bypass: [msg in]	Number of DRE messages that were bypassed for compression.
LZ: [msg in out ratio]	Number of LZ messages.
LZ Bypass: [msg in]	Number of LZ messages that were bypassed for compression.
Message size distribution	Percentage of messages that fall into each size grouping. (The message size field is divided into 6 size groups.)
Decode	Statistics for decompressed messages.
Overall: [msg in out ratio]	Aggregated statistics for decompressed messages. msg = Total number of messages. in = Number of bytes before decompression. out = Number of bytes after decompression. ratio = Percentage of the total number of bytes that were decompressed.
DRE: [msg in out ratio]	Number of DRE messages.
DRE Bypass: [msg in]	Number of DRE messages that were bypassed for decompression.
LZ: [msg in out ratio]	Number of LZ messages.
LZ Bypass: [msg in]	Number of LZ messages that were bypassed for decompression.
Latency (Last 3 sec): [max avg]	Maximum time to decompress one message for both DRE and LZ in milliseconds (ms). Average time to decompress one message for both DRE and LZ in milliseconds (ms).
Message size distribution	Percentage of messages that fall into each size grouping. (The message size field is divided into 6 size groups.)

show statistics radius

To display RADIUS authentication statistics for a WAAS device, use the **show statistics radius** EXEC command.

show statistics radius

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Examples [Table 3-96](#) describes the fields shown in the **show statistics radius** command display.

Table 3-96 Field Descriptions for the show statistics radius Command

Field	Description
RADIUS Statistics	
Authentication	
Number of access requests	Number of access requests.
Number of access deny responses	Number of access deny responses.
Number of access allow responses	Number of access allow responses.
Authorization	
Number of authorization requests	Number of authorization requests.
Number of authorization failure responses	Number of authorization failure responses.
Number of authorization success responses	Number of authorization success responses.
Accounting	
Number of accounting requests	Number of accounting requests.

Table 3-96 *Field Descriptions for the show statistics radius Command (continued)*

Field	Description
Number of accounting failure responses	Number of accounting failure responses.
Number of accounting success responses	Number of accounting success responses.

show statistics services

To display services statistics for a WAAS device, use the **show statistics services** EXEC command.

show statistics services

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Examples [Table 3-97](#) describes the fields shown in the **show statistics services** command display.

Table 3-97 Field Descriptions for the show statistics services Command

Field	Description
Port Statistics	Service-related statistics for each port on the WAAS device.
Port	Port number.
Total Connections	Number of total connections.

Related Commands [show services](#)

show statistics snmp

To display SNMP statistics for a WAAS device, use the **show statistics snmp** EXEC command.

show statistics snmp

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Examples [Table 3-98](#) describes the fields shown in the **show statistics snmp** command display.

Table 3-98 Field Descriptions for the show statistics snmp Command

Field	Description
SNMP packets input	Total number of SNMP packets input.
Bad SNMP version errors	Number of packets with an invalid SNMP version.
Unknown community name	Number of SNMP packets with an unknown community name.
Illegal operation for community name supplied	Number of packets requesting an operation not allowed for that community.
Encoding errors	Number of SNMP packets that were improperly encoded.
Number of requested variables	Number of variables requested by SNMP managers.
Number of altered variables	Number of variables altered by SNMP managers.
Get-request PDUs	Number of GET requests received.
Get-next PDUs	Number of GET-NEXT requests received.
Set-request PDUs	Number of SET requests received.
SNMP packets output	Total number of SNMP packets sent by the router.
Too big errors	Number of SNMP packets that were larger than the maximum packet size.
Maximum packet size	Maximum size of SNMP packets.
No such name errors	Number of SNMP requests that specified a MIB object that does not exist.

Table 3-98 *Field Descriptions for the show statistics snmp Command (continued)*

Field	Description
Bad values errors	Number of SNMP SET requests that specified an invalid value for a MIB object.
General errors	Number of SNMP SET requests that failed because of some other error. (It was not a No such name error, Bad values error, or any of the other specific errors.)
Response PDUs	Number of responses sent in reply to requests.
Trap PDUs	Number of SNMP traps sent.

show statistics synq

To display the cumulative statistics for the SynQ module, use the **show statistics synq** EXEC command.

show statistics synq

Syntax Description	This command has no arguments or keywords.
Defaults	No default behavior or values.
Command Modes	EXEC
Device Modes	application-accelerator
Usage Guidelines	Use the show statistics synq command to display statistics for the SynQ module.

Examples The following is sample output from the **show statistics synq** command:

```
WWAE# show statistics synq
Synq structures allocations success:          0
Synq structures allocations failure:          0
Synq structures deallocations:               0
Synq table entry adds:                       0
Synq table entry drops:                      0
Synq table entry lookups:                    0
Synq table overflows:                        0
Synq table entry count:                      0
Packets received by synq:                    0
Packets received with invalid filtering tuple: 0
Non-syn packets received:                    0
Locally originated/terminating syn packets received: 0
Retransmitted syn packets received while in Synq: 0
Synq user structure allocations success:      0
Synq user structure allocations failure:      0
Synq user structure deallocations:           0
```

Related Commands [show synq list](#)

show statistics tacacs

To display TACACS+ authentication and authorization statistics for a WAAS device, use the **show statistics tacacs EXEC** command.

show statistics tacacs

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Examples [Table 3-99](#) describes the fields shown in the **show statistics tacacs** command display.

Table 3-99 Field Descriptions for the show statistics tacacs Command

Field	Description
TACACS+ Statistics	
Authentication	
Number of access requests	Number of access requests.
Number of access deny responses	Number of access deny responses.
Number of access allow responses	Number of access allow responses.
Authorization	
Number of authorization requests	Number of authorization requests.
Number of authorization failure responses	Number of authorization failure responses.
Number of authorization success responses	Number of authorization success responses.
Accounting	
Number of accounting requests	Number of accounting requests.

Table 3-99 *Field Descriptions for the show statistics tacacs Command (continued)*

Field	Description
Number of accounting failure responses	Number of accounting failure responses.
Number of accounting success responses	Number of accounting success responses.

Related Commands[clear arp-cache](#)[\(config\) tacacs](#)[show tacacs](#)

show statistics tcp

To display TCP statistics for a WAAS device, use the **show statistics tcp** EXEC command.

show statistics tcp

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Examples [Table 3-100](#) describes the fields shown in the **show statistics tcp** command display.

Table 3-100 Field Descriptions for the show statistics tcp Command

Field	Description
TCP statistics	
Server connection openings	Number of times that TCP connections have made a direct transition to the SYN-SENT state from the CLOSED state.
Client connection openings	Number of times that TCP connections have made a direct transition to the SYN-RCVD state from the LISTEN state.
Failed connection attempts	Number of times TCP connections have made a direct transition to the CLOSED state from either the SYN-SENT state or the SYN-RCVD state, plus the number of times TCP connections have made a direct transition to the LISTEN state from the SYN-RCVD state.
Connections established	Number of TCP connections for which the current state is either ESTABLISHED or CLOSE-WAIT.
Connections resets received	Number of times TCP connections have made a direct transition to the CLOSED state from either the ESTABLISHED state or the CLOSE-WAIT state.
Connection resets sent	Number of TCP segments sent containing the RST flag.
Segments received	Total number of segments received, including those received in error. This count includes segments received on currently established connections.

Table 3-100 Field Descriptions for the *show statistics tcp* Command (continued)

Field	Description
Segments sent	Total number of segments sent, including those on current connections but excluding those containing only retransmitted octets.
Bad segments received	Number of bad segments received.
Segments retransmitted	Total number of segments retransmitted, that is, the number of TCP segments transmitted containing one or more previously transmitted octets.
TCP memory usage (KB)	TCP memory usage.
TCP extended statistics	
Sync cookies sent	Number of SYN-ACK packets sent with SYN cookies in response to SYN packets.
Sync cookies received	Number of ACK packets received with the correct SYN cookie that was sent in the SYN-ACK packet by the device.
Sync cookies failed	Number of ACK packets received with the incorrect SYN cookie that was sent in the SYN-ACK packet by the device.
Embryonic connection resets	Number of times TCP connections have made a direct transition to the CLOSED state from either the SYN-RCVD state, the SYN-SENT state, or the SYN-ACK-SENT state.
Prune message called	Number of times that the device exceeded the memory pool allocated for the connection.
Packets pruned from receive queue	Number of packets dropped from the receive queue of the connection because of a memory overrun.
Out-of-order-queue pruned	Number of times that the out-of-order queue was pruned because of a memory overrun.
Out-of-window Icmp messages	Number of ICMP packets received on a TCP connection that were out of the received window.
Lock dropped Icmp messages	Number of ICMP packets dropped because the socket is busy.
Arp filter	Number of ICMP responses dropped because of the ARP filter.
Time-wait sockets	Number of times that the TCP connection made a transition to the CLOSED state from the TIME-WAIT state.
Time-wait sockets recycled	Number of times that the TCP connection made a transition to the CLOSED state from the TIME-WAIT state.
Time-wait sockets killed	Number of times that the TCP connection made a transition to the CLOSED state from TIME-WAIT state.
PAWS passive	Number of incoming SYN packets dropped because of a PAWS check failure.
PAWS active	Number of incoming SYN-ACK packets dropped because of a PAWS check failure.
PAWS established	Number of packets dropped in ESTABLISHED state because of a PAWS check failure.
Delayed acks sent	Number of delayed ACKs sent.

Table 3-100 Field Descriptions for the *show statistics tcp* Command (continued)

Field	Description
Delayed acks blocked by socket lock	Number of delayed ACKs postponed because the socket is busy.
Delayed acks lost	Number of delayed ACKs lost.
Listen queue overflows	Number of incoming TCP connections dropped because of a listening server queue overflow.
Connections dropped by listen queue	Number of incoming TCP connections dropped because of an internal error.
TCP packets queued to prequeue	Number of incoming TCP packets prequeued to a process.
TCP packets directly copied from backlog	Number of incoming TCP packets copied from the backlog queue directly to a process.
TCP packets directly copied from prequeue	Number of incoming TCP packets copied from the prequeue directly to a process.
TCP prequeue dropped packets	Number of packets removed from the TCP prequeue.
TCP header predicted packets	Number of TCP header-predicted packets.
Packets header predicted and queued to user	Number of TCP packets header-predicted and queued to the user.
TCP pure ack packets	Number of ACK packets received with no data.
TCP header predicted acks	Number of header-predicted TCP ACK packets.
TCP Reno recoveries	Number of TCP Reno recoveries.
TCP SACK recoveries	Number of TCP SACK recoveries.
TCP SACK reneging	Number of TCP SACK reneging.
TCP FACK reorders	Number of TCP FACK reorders.
TCP SACK reorders	Number of TCP SACK reorders.
TCP Reno reorders	Number of TCP Reno reorders.
TCP TimeStamp reorders	Number of TCP TimeStamp reorders.
TCP full undos	Number of TCP full undos.
TCP partial undos	Number of TCP partial undos.
TCP DSACK undos	Number of TCP DSACK undos.
TCP loss undos	Number of TCP loss undos.
TCP losses	Number of TCP losses.
TCP lost retransmit	Number of TCP lost retransmit.
TCP Reno failures	Number of TCP Reno failures.
TCP SACK failures	Number of TCP SACK failures.
TCP loss failures	Number of TCP loss failures.
TCP fast retransmissions	Number of TCP fast retransmissions.
TCP forward retransmissions	Number of TCP forward retransmissions.
TCP slowstart retransmissions	Number of TCP slow start retransmissions.
TCP Timeouts	Number of TCP timeouts.

Table 3-100 Field Descriptions for the show statistics tcp Command (continued)

Field	Description
TCP Reno recovery fail	Number of TCP Reno recovery fail.
TCP Sack recovery fail	Number of TCP Sack recovery failures.
TCP scheduler failed	Number of TCP scheduler failures.
TCP receiver collapsed	Number of TCP receiver collapsed failures.
TCP DSACK old packets sent	Number of TCP DSACK old packets sent.
TCP DSACK out-of-order packets sent	Number of TCP DSACK out-of-order packets sent.
TCP DSACK packets received	Number of TCP DSACK packets received.
TCP DSACK out-of-order packets received	Number of TCP DSACK out-of-order packets received.
TCP connections abort on sync	Number of TCP connections aborted on sync.
TCP connections abort on data	Number of TCP connections aborted on data.
TCP connections abort on close	Number of TCP connections aborted on close.
TCP connections abort on memory	Number of TCP connections aborted on memory.
TCP connections abort on timeout	Number of TCP connections aborted on timeout.
TCP connections abort on linger	Number of TCP connections aborted on linger.
TCP connections abort failed	Number of TCP connections abort failed.
TCP memory pressures	Number of times the device approaches the allocated memory pool for the TCP stack.

Related Commands[clear arp-cache](#)[show tcp](#)[\(config\) tcp](#)

show statistics tfo

To display Traffic Flow Optimization (TFO) statistics for a WAE, use the **show statistics tfo** EXEC command.

show statistics tfo [**connection** | **detail**]

show statistics tfo peer [**peer-id** *peer-id* | **peer-ip** *peer-ip* | **peer-no** *peer-no*]

Syntax Description	connection	(Optional) Displays aggregated TFO connection statistics.
	detail	(Optional) Displays detailed TFO statistics.
	peer	(Optional) Displays DRE peer statistics.
	peer-id <i>peer-id</i>	(Optional) Displays peer statistics for peer ID.
	peer-ip <i>peer-ip</i>	(Optional) Displays peer statistics for peer IP.
	peer-no <i>peer-no</i>	(Optional) Displays peer statistics for peer number.

Command Modes EXEC

Device Modes application-accelerator

Examples [Table 3-101](#) describes the fields shown in the **show statistics tfo** command.

Table 3-101 Field Descriptions for the show statistics tfo Command

Field	Description
Total number of optimized connections	Total number of TCP connections that were optimized since the last TFO statistics reset.
No. of active connections	Total number of TCP optimized connections.
No. of pending (to be accepted) connections	Number of TCP connections that will be optimized but are currently in the setup stage.
No. of connections closed normally	Number of optimized connections closed without any issues using TCP FIN.
No. of connections closed with error	Number of optimized connection closed with some issues or using TCP RST.
Total number of peers	Number of active peer WAEs. (Every connection is optimized between two WAEs: this one and a peer WAE.)
No. of entries into overload mode	Number of times the WAE entered into an overload state. (In the overload state, new connections are set to pass-through. This state occurs for various reasons, such as reaching the maximum number of concurrent connections.
No. of connections reset due to	Details for number of connections closed with error.
Socket write failure	Failed to write on a socket (either on the LAN or WAN side).

Table 3-101 Field Descriptions for the *show statistics tfo* Command (continued)

Field	Description
Socket read failure	Failed to read from a socket (either LAN or WAN side).
Opt socket close while waiting to write	The socket between two WAEs (WAN socket) closed before completing writing into it.
Unopt socket close while waiting to write	The socket between the WAE and the client/server (LAN socket) closed before completing writing into it.
Opt socket error close while waiting to read	The socket between two WAEs (WAN socket) closed before completing reading from it.
Unopt socket error close while waiting to read	The socket between the WAE and the client/server (LAN socket) closed before completing reading from it.
DRE decode failure	DRE internal error while decoding data. (Should not happen.)
DRE encode failure	DRE internal error while encoding data. (Should not happen.)
Connection init failure	Failed to setup the connection although auto-discovery finished successfully.
Opt socket unexpected close while waiting to read	The socket between two WAEs (WAN socket) closed before completing reading from it.
Exceeded maximum number of supported connections	Connection closed ungracefully because the WAE reached its scalability limit.
Buffer allocation or manipulation failed	Internal memory allocation failure. (Should not happen.)
Peer received reset from end host	TCP RST sent by the server or client. (Can be normal behavior and does not necessarily indicate a problem.)
DRE connection state out of sync	DRE internal error. (Should not happen.)
Memory allocation failed for buffer heads	Internal memory allocation failure. (Should not happen.)

Related Commands[show statistics connection closed](#)

show statistics udp

To display User Datagram Protocol (UDP) statistics for a WAAS device, use the **show statistics udp EXEC** command.

show statistics udp

Syntax Description	This command has no arguments or keywords.
---------------------------	--

Defaults	No default behavior or values.
-----------------	--------------------------------

Command Modes	EXEC
----------------------	------

Device Modes	application-accelerator central-manager
---------------------	--

Examples	Table 3-102 describes the fields shown in the show statistics udp command display.
-----------------	---

Table 3-102 Field Descriptions for the show statistics udp Command

Field	Description
UDP statistics	
Packets received	Total number of UDP datagrams delivered to UDP users.
Packets to unknown port received	Total number of received UDP datagrams for which there was no application at the destination port.
Packet receive error	Number of received UDP datagrams that could not be delivered for reasons other than the lack of an application at the destination port.
Packet sent	Total number of UDP datagrams sent from this entity.

show statistics wccp

To display WCCP statistics for a WAE, use the **show statistics wccp EXEC** command.

show statistics wccp gre

Syntax Description	gre Displays WCCP generic routing encapsulation packet-related statistics.
---------------------------	---

Defaults	No default behavior or values.
-----------------	--------------------------------

Command Modes	EXEC
----------------------	------

Device Modes	application-accelerator
---------------------	-------------------------

Usage Guidelines

GRE is a Layer 3 technique that allows datagrams to be encapsulated into IP packets at the WCCP-enabled router and then redirected to a WAE (the transparent proxy server). At this intermediate destination, the datagrams are decapsulated and then routed to an origin server to satisfy the request if a cache miss occurs. In doing so, the trip to the origin server appears to the inner datagrams as one hop. Usually, the redirected traffic using GRE is referred to as GRE tunnel traffic. With GRE, all redirection is handled by the router software.

With WCCP redirection, a Cisco router does not forward the TCP SYN packet to the destination because the router has WCCP enabled on the destination port of the connection. Instead, the WCCP-enabled router encapsulates the packet using GRE tunneling and sends it to the WAE that has been configured to accept redirected packets from this WCCP-enabled router.

After receiving the redirected packet, the WAE does the following:

1. Strips the GRE layer from the packet.
2. Decides whether it should accept this redirected packet and process the request for the content as follows:
 - a. If the WAE accepts the request, it sends a TCP SYN ACK packet to the client. In this response packet, the WAE uses the IP address of the original destination (origin server) that was specified as the source address so that the WAE can be invisible (transparent) to the client; it acts as if it is the destination that the TCP SYN packet of the client was trying to reach.
 - b. If the WAE does not accept the request, it reencapsulates the TCP SYN packet in GRE and sends it back to the WCCP-enabled router. The router identifies that the WAE is not interested in this connection and forwards the packet to its original destination (the origin server).

For example, a WAE would not accept the request because it is configured to bypass requests that originate from a certain set of clients or that are destined to a particular set of servers.

Examples [Table 3-103](#) describes the fields shown in the **show statistics wccp gre** command display.

Table 3-103 *Field Descriptions for the show statistics wccp gre Command*

Field	Description
Transparent GRE packets received	Total number of GRE packets received by the WAE, regardless of whether or not they have been intercepted by WCCP. GRE is a Layer 3 technique that allows packets to reach the WAE, even if there are any number of routers in the path to the WAE.
Transparent non-GRE packets received	Number of non-GRE packets received by the WAE, either using the traffic interception and redirection functions of WCCP in the router hardware at Layer 2 or Layer 4 switching (a Content Switching Module [CSM]) that redirects requests transparently to the WAE.
Transparent non-GRE packets passed through	Number of non-GRE packets transparently intercepted by a Layer 4 switch and redirected to the WAE.
Total packets accepted	Total number of packets that are transparently intercepted and redirected to the WAE to serve client requests for content.
Invalid packets received	Number of packets that are dropped either because the redirected packet is a GRE packet and the WCCP GRE header has invalid data or the IP header of the redirected packet is invalid.
Packets received with invalid service	Number of WCCP version 2 GRE redirected packets that contain an invalid WCCP service number.
Packets received on a disabled service	Number of WCCP version 2 GRE redirected packets that specify the WCCP service number for a service that is not enabled on the WAE. For example, an HTTPS request redirected to the WAE when the HTTPS-caching service (service 70) is not enabled.
Packets received too small	Number of GRE packets redirected to the WAE that do not contain the minimum amount of data required for a WCCP GRE header.
Packets dropped due to zero TTL	Number of GRE packets that are dropped by the WAE because the IP header of the redirected packet has a zero TTL.
Packets dropped due to bad buckets	<p>Number of packets that are dropped by the WAE because the WCCP flow redirection could not be performed due to a bad mask or hash bucket determination.</p> <p>Note A bucket is defined as a certain subsection of the allotted hash assigned to each WAE in a WAE cluster. If only one WAE exists in this environment, it has 256 buckets assigned to it.</p>
Packets dropped due to no redirect address	Number of packets that are dropped because the flow redirection destination IP address could not be determined.
Packets dropped due to loopback redirect	Number of packets that are dropped by the WAE when the destination IP address is the same as the loopback address.
Pass-through pkts dropped on assignment update	Number of packets that were targeted for TFO pass-through, but were dropped instead because the bucket was not owned by the device.

Table 3-103 *Field Descriptions for the show statistics wccp gre Command (continued)*

Field	Description
Connections bypassed due to load	Number of connection flows that are bypassed when the WAE is overloaded. When the overload bypass option is enabled, the WAE bypasses a bucket and reroutes the overload traffic. If the load remains too high, another bucket is bypassed, and so on, until the WAE can handle the load.
Packets sent back to router	Number of requests that are passed back by the WAE to the WCCP-enabled router from which the request was received. The router then sends the flow toward the origin web server directly from the web browser, which bypasses the WAE.
Packets sent to another WAE	Number of packets that are redirected to another WAE in the WCCP service group. Service groups consist of up to 32 WAEs and 32 WCCP-enabled routers. In both packet-forwarding methods, the hash parameters specify how redirected traffic should be load balanced among the WAEs in the various WCCP service groups.
GRE fragments redirected	Number of GRE packets received by the WAE that are fragmented. These packets are redirected back to the router.
GRE encapsulated fragments received	Number of GRE encapsulated fragments received by the WAE. The tcp-promiscuous service does not inspect port information and therefore the router or switch may GRE encapsulate IP fragments and redirect them to the WAE. These fragments are then reassembled into packets before being processed.
Packets failed encapsulated reassembly	Number of reassembled GRE encapsulated packets that were dropped because they failed the reassembly sanity check. Reassembled GRE encapsulated packets are composed of two or more GRE encapsulated fragments. This field is related to the previous statistic.
Packets failed GRE encapsulation	Number of GRE packets that are dropped by the WAE because they could not be redirected due to problems while encapsulating the packet with a GRE header.
Packets dropped due to invalid fwd method	Number of GRE packets that are dropped by the WAE because it was redirected using GRE but the WCCP service was configured for Layer 2 redirection.
Packets dropped due to insufficient memory	Number of GRE packets that are dropped by the WAE due to the failure to allocate additional memory resources required to handle the GRE packet.
Packets bypassed, no conn at all	Number of packets that failed to be associated with an existing flow because no TCP port was listening. WCCP can also handle asymmetric packet flows and always maintains a consistent mapping of web servers to caches regardless of the number of switches or routers used in a WCCP service group (up to 32 routers or switches communicating with up to 32 WAEs in a cluster).
Packets bypassed, no pending connection	Number of packets that failed to be associated with a pending connection because the initial handshake was not completed.

Table 3-103 Field Descriptions for the *show statistics wccp gre* Command (continued)

Field	Description
Packets due to clean wccp shutdown	Number of connection flows that are bypassed due to a clean WCCP shutdown. During a proper shutdown of WCCP, the WAE continues to service the flows it is handling but starts to bypass new flows. When the number of flows goes down to zero, the WAE takes itself out of the cluster by having its buckets reassigned to other WAEs by the lead WAE.
Packets bypassed due to bypass-list lookup	Number of connection flows that are bypassed due to a bypass list entry. When the WAE receives an error response from an origin server, it adds an entry for the server to its bypass list. When it receives subsequent requests for the content residing on the bypassed server, it redirects packets to the bypass gateway. If no bypass gateway is configured, then the packets are returned to the redirecting Layer 4 switch.
Packets received with client IP addresses	Number of packets that are associated to a connection flow that is being spoofed. By spoofing the IP address of a client, the WAE can receive packets with the client IP (which is different from the IP address of the WAE) and send the packet to the correct application that is waiting for the packet.
Conditionally Accepted connections	Number of connection flows that are accepted by the WAE due to the conditional accept feature.
Conditionally Bypassed connections	Number of connection flows that are bypassed by the WAE due to the conditional accept feature.
Packets dropped due to received on loopback	Number of packets that were dropped by the WCCP L2 intercept layer because they were received on the loopback interface but were not destined to a local address of the device. There is no valid or usable route for the packet.
Packets w/WCCP GRE received too small	Number of packets transparently intercepted by the WCCP-enabled router at Layer 2 and sent to the WAE that need to be fragmented for the packets to be redirected using GRE. The WAE drops the packets since it cannot encapsulate the IP header.
Packets dropped due to IP access-list deny	Number of packets that are dropped by the WAE when an IP access list that the WAE applies to WCCP GRE encapsulated packets denies access to WCCP applications (the wccp access-list command).
Packets fragmented for bypass	Number of GRE packets that do not contain enough data to hold an IP header.
Packet pullups needed	Number of times a packet had to be consolidated as part of its processing. Consolidation is required when a packet is received as fragments and the first fragment does not contain all the information needed to process it.
Packets dropped due to no route found	Number of packets that are dropped by the WAE because it cannot find the route.

show statistics windows-domain

To display Windows domain server information for a WAAS device, use the **show statistics windows-domain** EXEC command.

show statistics windows-domain

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines Use the **show statistics windows-domain** EXEC command to view the Windows domain server statistics, then clear the counters for these statistics by entering the **clear statistics windows-domain** EXEC command.

Examples [Table 3-104](#) describes the fields shown in the **show statistics windows-domain** command display.

Table 3-104 Field Descriptions for the show statistics windows-domain Command

Field	Description
Windows Domain Statistics	
Authentication	
Number of access requests	Number of access requests.
Number of access deny responses	Number of access deny responses.
Number of access allow responses	Number of access allow responses.
Authorization	
Number of authorization requests	Number of authorization requests.
Number of authorization failure responses	Number of authorization failure responses.
Number of authorization success responses	Number of authorization success responses.

Table 3-104 *Field Descriptions for the show statistics windows-domain Command (continued)*

Field	Description
Accounting	
Number of accounting requests	Number of accounting requests.
Number of accounting failure responses	Number of accounting failure responses.
Number of accounting success responses	Number of accounting success responses.

Related Commands[windows-domain](#)[\(config\) windows-domain](#)

show statistics windows-print requests

To display Windows print acceleration statistics for a WAE, use the **show statistics windows-print requests** EXEC command.

show statistics windows-print requests

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator

Usage Guidelines Use the **show statistics windows-print requests** command to view the Windows print traffic details.

Examples [Table 3-105](#) describes the fields shown in the **show statistics windows-print requests** command display.

Table 3-105 Field Descriptions for the show statistics windows-print requests Command

Field	Description
Statistics gathering period	Number of hours, minutes, seconds, and milliseconds of the statistics gathering period.
Documents spooled	Number of documents spooled.
Pages spooled	Number of pages spooled.
Total commands	Total number of print commands.
Remote commands	Number of print commands that were not handled from the local cache.
ALL_COMMANDS	All the print commands combined.
total	Total number of requests for all commands.
remote	Number of remote requests for all commands.
async	Number of async requests for all commands.
avg local	Average local request time in milliseconds for all commands.
avg remote	Average remote request time in milliseconds for all commands.
Bind, ClosePrinter, EnumJobs, and so on	Statistics for individual print commands. Each has the same fields as the ALL_COMMANDS section.

show statistics windows-print requests

show synq list

To display the connections for the SynQ module, use the **show synq list** EXEC command.

```
show synq list [| { begin regex [regex] | exclude regex [regex] | include regex [regex] } ] [| { begin regex [regex] | exclude regex [regex] | include regex [regex] } ]
```

Syntax Description

 	(Optional) Output modifier.
begin <i>regex</i>	Begins with the line that matches the regular expression. You can enter multiple expressions.
exclude <i>regex</i>	Excludes lines that match the regular expression. You can enter multiple expressions.
include <i>regex</i>	Includes lines that match the regular expression. You can enter multiple expressions.

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator

Usage Guidelines

Use the **show synq list** command to list connections that are currently being tracked in the SynQ module.

Examples

The following is sample output from the **show synq list** command:

```
WAE# show synq list
Src-IP:Src-Port      Dest-IP:Dest-Port      Timeout(msec)  Rexit cnt
```

Related Commands

[show statistics synq](#)

show sysfs volumes

To display system file system (sysfs) information for a WAAS device, use the **show sysfs volumes** EXEC command.

show sysfs volumes

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines The system file system (sysfs) stores log files, including transaction logs, syslog, and internal debugging logs. It also stores system image files and operating system files.

Examples [Table 3-106](#) describes the fields shown in the **show sysfs volumes** command display.

Table 3-106 Field Descriptions for the show sysfs volumes Command

Field	Description
sysfs 00–04	System file system and disk number.
/local/local1–5	Mount point of the volume.
nnnnnnKB	Size of the volume in kilobytes.
nn% free	Percentage of free space in the SYSFS partition.

Related Commands [disk](#)

show tacacs

To display TACACS+ authentication protocol configuration information for a WAAS device, use the **show tacacs** EXEC command.

show tacacs

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Examples [Table 3-107](#) describes the fields shown in the **show tacacs** command display.

Table 3-107 Field Descriptions for the show tacacs Command

Field	Description
Login Authentication for Console/Telnet Session	Indicates whether TACACS+ server is enabled for login authentication.
Configuration Authentication for Console/Telnet Session	Indicates whether TACACS+ server is enabled for authorization or configuration authentication.
TACACS+ Configuration	TACACS+ server parameters.
TACACS+ Authentication	Indicates whether TACACS+ authentication is enabled on the the WAAS device.
Key	Secret key that the WAE uses to communicate with the TACACS+ server. The maximum number of characters in the TACACS+ key should not exceed 99 printable ASCII characters (except tabs).
Timeout	Number of seconds that the WAAS device waits for a response from the specified TACACS+ authentication server before declaring a timeout.
Retransmit	Number of times that the WAAS device is to retransmit its connection to the TACACS+ if the TACACS+ timeout interval is exceeded.
Password type	Mechanism for password authentication. By default, the Password Authentication Protocol (PAP) is the mechanism for password authentication.

Table 3-107 *Field Descriptions for the show tacacs Command (continued)*

Field	Description
Server	Hostname or IP address of the TACACS+ server.
Status	Indicates whether server is the primary or secondary host.

show tcp

To display TCP configuration information for a WAAS device, use the **show tcp** EXEC command.

show tcp

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Examples [Table 3-108](#) describes the fields shown in the **show tcp** command display. This command displays the settings configured with the **tcp** global configuration command.

Table 3-108 Field Descriptions for the show tcp Command

Field	Description
TCP Configuration	
TCP keepalive timeout XX sec	Length of time that the WAAS device is set to keep a connection open before disconnecting.
TCP keepalive probe count X	Number of times the WAAS device will retry a connection before the connection is considered unsuccessful.
TCP keepalive probe interval XX sec	Length of time (in seconds) that the WAAS device is set to keep an idle connection open.
TCP explicit congestion notification disabled	Configuration status of the TCP explicit congestion notification feature. Values are enabled or disabled.
TCP cwnd base value X	Value (in segments) of the send congestion window.
TCP initial slowstart threshold value X	Threshold (in segments) for slow start.
TCP increase (multiply) retransmit timer by X	Number of times set to increase the length of the retransmit timer base value.
TCP memory_limit	
Low water mark	Lower limit (in MB) of memory pressure mode, below which TCP enters into normal memory allocation mode.
High water mark (pressure)	Upper limit (in MB) of normal memory allocation mode, beyond which TCP enters into memory pressure mode.
High water mark (absolute)	Absolute limit (in MB) on TCP memory usage.

 show tcp

Related Commands[clear arp-cache](#)[show statistics tcp](#)[\(config\) tcp](#)

show tech-support

To view information necessary for Cisco TAC to assist you, use the **show tech-support EXEC** command.

show tech-support [page]

Syntax Description	page (Optional) Displays command output page by page.
Defaults	No default behavior or values.
Command Modes	EXEC
Device Modes	application-accelerator central-manager
Usage Guidelines	Use the show tech-support command to view system information necessary for Cisco TAC to assist you with a WAAS device. We recommend that you log the output to a disk file. (See the (config) logging console command.)
Examples	The following is sample output from the show tech-support command:

Note

Because the **show tech-support** command output can be long, excerpts are shown in this example.

show tfo tcp

To display global Traffic Flow Optimization (TFO) TCP buffer information for a WAE, use the **show tfo tcp** EXEC command.

show tfo tcp

Syntax Descriptions	This command has no arguments or keywords.
----------------------------	--

Defaults	No default behavior or values.
-----------------	--------------------------------

Command Modes	EXEC
----------------------	------

Device Modes	application-accelerator
---------------------	-------------------------

Examples	The following is sample output from the show tfo tcp command. It displays TCP buffer information for the WAE.
-----------------	--

```
WAE# show tfo tcp
Buffer Sizing Status:
Configured:
Adaptive buffer sizing : disabled
Maximum receive buffer size : 4096 KB
Maximum send buffer size : 4096 KB
Fix buffer sizes:
Optimized side receive buffer size : 1024 KB
Optimized side send buffer size : 1024 KB
Original side receive buffer size : 512 KB
Original side send buffer size : 512 KB
Default:
Fixed buffer sizes:
Optimized side receive buffer size : 32 KB
Optimized side send buffer size : 32 KB
Original side receive buffer size : 32 KB
Original side send buffer size : 32 KB
Adaptive buffer sizes :
Maximum receive buffer size : 4096 KB
Maximum send buffer size : 4096 KB
```

Related Commands	show statistics tfo show statistics auto-discovery show statistics connection closed show statistics filtering (config) tfo tcp adaptive-buffer-sizing
-------------------------	--

show transaction-logging

To display the transaction log configuration settings and a list of archived transaction log files for a WAE, use the **show transaction-logging** EXEC command.

show transaction-logging

Syntax Description	This command has no arguments or keywords.
---------------------------	--

Defaults	No default behavior or values.
-----------------	--------------------------------

Command Modes	EXEC
----------------------	------

Device Modes	application-accelerator
---------------------	-------------------------

Usage Guidelines	Use the show transaction-logging EXEC command to display information about the current configuration of transaction logging on a WAE. Transaction log file information is displayed for TFO transactions and video accelerator transactions.
-------------------------	---

**Note**

For security reasons, passwords are never displayed in the output of the **show transaction-logging** EXEC command.

Examples	The following is sample output from the show transaction-logging command. It lists information about the current configuration of transaction logging on a WAE.
-----------------	--

```
WAAE# show transaction-logging
Flow transaction log configuration:
-----
Flow Logging is disabled.
Flow Archive interval: every-day every 1 hour
Flow Maximum size of archive file: 2000000 KB

Exporting files to ftp servers is disabled.
File compression is disabled.
Export interval: every-day every 1 hour
Accelerator video windows-media transaction log configuration:
-----
Accelerator video windows-media logging is disabled.
Accelerator video windows-media archive interval: every-day every 1 hour
Accelerator video windows-media maximum size of archive file: 2000000 KB

Exporting files to ftp servers is disabled.
File compression is disabled.
Export interval: every-day every 1 hour
```

Related Commands[clear arp-cache](#)[transaction-log](#)[\(config\) transaction-logs](#)

show user

To display user identification number and username information for a particular user of a WAAS device, use the **show user** EXEC command.

show user { **uid** *number* | **username** *name* }

Syntax Description

uid <i>number</i>	Displays user information based on the identification number of the user (0–65535).
username <i>name</i>	Displays user information based on the name of the user.

Command Default

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Examples

[Table 3-109](#) describes the fields shown in the **show user** command display.

Table 3-109 Field Descriptions for the show user Command

Field	Description
Uid	User ID number.
Username	Username.
Password	Login password. This field does not display the actual password.
Privilege	Privilege level of the user.
Configured in	Database in which the login authentication is configured.

Related Commands

[clear arp-cache](#)
[show users administrative](#)
[\(config\) username](#)

show users administrative

To display users with administrative privileges to the WAAS device, use the **show users administrative EXEC** command.

show users administrative

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Examples [Table 3-110](#) describes the fields shown in the **show users administrative history** command display.

Table 3-110 Field Descriptions for the show users administrative history Command

Field	Description
Username	Users that have logged in to this appliance CLI during the historical period.
Line	Type of terminal used to access this appliance.
IP address/Host	IP address or hostname of the user that logged in to this appliance.
Loggin details	Day of the week, month, date, time, and whether or not the user is still logged in.

[Table 3-111](#) describes the fields shown in the **show users administrative logged-in** command display.

Table 3-111 Field Descriptions for the show users administrative logged-in Command

Field	Description
Username	Users currently logged in to the appliance CLI.
Line	Type of terminal used to access this appliance.
IP address/Host	IP address or hostname of the user that is logged in to this appliance.
Login details	Day of week, month, date, and time that each user logged in.

 show users administrative

Related Commands [clear arp-cache](#)
 [\(config\) username](#)

show version

To display version information about the WAAS software that is running on the WAAS device, use the **show version EXEC** command.

show version [last | pending]

Syntax Description

last	(Optional) Displays the version information for the last saved image.
pending	(Optional) Displays the version information for the pending upgraded image.

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Examples

[Table 3-112](#) describes the fields shown in the **show version** command display.

Table 3-112 Field Descriptions for the show version Command

Field	Description
Cisco Wide Area Application Services Software (WAAS) Copyright (c) year by Cisco Systems, Inc. Cisco Wide Area Application Services Software Release XXX (build bXXX month day year)	Software application, copyright, release, and build information.
Version	Version number of the software that is running on the device.
Compiled hour:minute:second month day year by cnbuild	Complete information for the software build.
System was restarted on day of week month day hour:minute:second year	Date and time that the system was last restarted.
The system has been up for X hours, X minutes, X seconds	Length of time the system has been running since the last reboot.

show virtual-blade

To display virtual blade information on your WAE device, use the **show virtual-blade** EXEC command.

show virtual-blade [*virtual-blade-number*]

Syntax Description	<i>virtual-blade-number</i> Specifies an individual virtual blade for which to view information.
Command Default	No default behavior or values.
Command Modes	EXEC
Device Modes	application-accelerator
Examples	<p>The following is sample output from the show virtual-blade command. It displays general virtual blade information.</p> <pre>WAAE# show virtual-blade Virtual-blade resources: VB Memory: 200MiB configured, 824MiB available. VB Disk space: 4GiB configured, 117GiB available. /local1/vbs: 128MiB used, 125644MiB available CPU(s) assigned: 2 Virtual-blade(s) state: virtual-blade 1 is stopped</pre> <p>The following is sample output from the show virtual-blade command. It displays information for a specific virtual blade (virtual blade 1 in the example).</p> <pre>WAAE# show virtual-blade 1 virtual-blade 1 config: description Windows 2003 Server memory 200 disk 4 no boot fd-image boot cd-image cd-rom boot from cd-rom interface 1 bridge GigabitEthernet 1/0 mac-address 00:16:3E:97:6F:84 device cpu qemu64 device nic rtl8139 device disk IDE autostart state: stopped</pre>

[Table 3-113](#) describes the fields shown in the **show virtual-blade** command display.

Table 3-113 *Field Descriptions for the show virtual-blade Command*

Field	Description
VB Memory	The amount of WAAS system memory assigned to all virtual blades, and the amount of memory remaining.
VB Disk Space	The amount of WAAS system disk space assigned to all virtual blades, and the amount of disk space remaining.
CPU(s) Assigned	The WAE CPUs assigned for use by the virtual blade.
Virtual Blade State	The state of each defined virtual blade (active or stopped).
Config	Shows the settings for each configuration parameter of an individual virtual blade.

Related Commands

show wccp

To display Web Cache Connection Protocol (WCCP) information for a WAE, use the **show wccp** EXEC command.

show wccp wide-area-engines

show wccp flows {tcp-promiscuous} [summary]

show wccp gre

show wccp masks {tcp-promiscuous} [summary]

show wccp routers

show wccp services [detail]

show wccp status

Syntax	Description
wide-area-engines	Displays which WAEs are seen by which routers.
flows	Displays WCCP packet flows.
tcp-promiscuous	Displays TCP-PROMISCUOUS caching service packet flows.
summary	(Optional) Displays summarized information about TCP-PROMISCUOUS caching service packet flows.
gre	Displays WCCP generic routing encapsulation packet-related information.
masks	Displays WCCP mask assignments for a given service.
routers	Displays routers seen and not seen by this WAE.
services	Displays WCCP services configured.
detail	(Optional) Displays details of services.
status	Displays version of WCCP that is enabled and running.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator

Examples [Table 3-114](#) describes the fields shown in the **show wccp gre** command display.

Table 3-114 **Field Descriptions for the show wccp gre Command**

Field	Description
Transparent GRE packets received	Total number of GRE packets received by the WAE, regardless of whether or not they have been intercepted by WCCP. GRE is a Layer 3 technique that allows packets to reach the WAE, even if there are any number of routers in the path to the WAE.
Transparent non-GRE packets received	Number of non-GRE packets received by the WAE, either using the traffic interception and redirection functions of WCCP in the router hardware at Layer 2 or Layer 4 switching (a Content Switching Module [CSM]) that redirects requests transparently to the WAE.
Transparent non-GRE packets passed through	Number of non-GRE packets transparently intercepted by a Layer 4 switch and redirected to the WAE.
Total packets accepted	Total number of packets that are transparently intercepted and redirected to the WAE to serve client requests for content.
Invalid packets received	Number of packets that are dropped either because the redirected packet is a GRE packet and the WCCP GRE header has invalid data or the IP header of the redirected packet is invalid.
Packets received with invalid service	Number of WCCP version 2 GRE redirected packets that contain an invalid WCCP service number.
Packets received on a disabled service	Number of WCCP version 2 GRE redirected packets that specify the WCCP service number for a service that is not enabled on the WAE. For example, an HTTPS request redirected to the WAE when the HTTPS-caching service (service 70) is not enabled.
Packets received too small	Number of GRE packets redirected to the WAE that do not contain the minimum amount of data required for a WCCP GRE header.
Packets dropped due to zero TTL	Number of GRE packets that are dropped by the WAE because the IP header of the redirected packet has a zero TTL.
Packets dropped due to bad buckets	<p>Number of packets that are dropped by the WAE because the WCCP flow redirection could not be performed due to a bad mask or hash bucket determination.</p> <p>Note A bucket is defined as a certain subsection of the allotted hash assigned to each WAE in a WAE cluster. If only one WAE exists in this environment, it has 256 buckets assigned to it.</p>
Packets dropped due to no redirect address	Number of packets that are dropped because the flow redirection destination IP address could not be determined.
Packets dropped due to loopback redirect	Number of packets that are dropped by the WAE when the destination IP address is the same as the loopback address.
Pass-through pkts dropped on assignment update	Number of packets that were targeted for TFO pass-through, but were dropped instead because the bucket was not owned by the device.

Table 3-114 *Field Descriptions for the show wccp gre Command (continued)*

Field	Description
Connections bypassed due to load	Number of connection flows that are bypassed when the WAE is overloaded. When the overload bypass option is enabled, the WAE bypasses a bucket and reroutes the overload traffic. If the load remains too high, another bucket is bypassed, and so on, until the WAE can handle the load.
Packets sent back to router	Number of requests that are passed back by the WAE to the WCCP-enabled router from which the request was received. The router then sends the flow toward the origin web server directly from the web browser, which bypasses the WAE.
Packets sent to another WAE	Number of packets that are redirected to another WAE in the WCCP service group. Service groups consist of up to 32 WAEs and 32 WCCP-enabled routers. In both packet-forwarding methods, the hash parameters specify how redirected traffic should be load balanced among the WAEs in the various WCCP service groups.
GRE fragments redirected	Number of GRE packets received by the WAE that are fragmented. These packets are redirected back to the router.
GRE encapsulated fragments received	Number of GRE encapsulated fragments received by the WAE. The tcp-promiscuous service does not inspect port information and therefore the router or switch may GRE encapsulate IP fragments and redirect them to the WAE. These fragments are then reassembled into packets before being processed.
Packets failed encapsulated reassembly	Number of reassembled GRE encapsulated packets that were dropped because they failed the reassembly sanity check. Reassembled GRE encapsulated packets are composed of two or more GRE encapsulated fragments. This field is related to the previous statistic.
Packets failed GRE encapsulation	Number of GRE packets that are dropped by the WAE because they could not be redirected due to problems while encapsulating the packet with a GRE header.
Packets dropped due to invalid fwd method	Number of GRE packets that are dropped by the WAE because it was redirected using GRE but the WCCP service was configured for Layer 2 redirection.
Packets dropped due to insufficient memory	Number of GRE packets that are dropped by the WAE due to the failure to allocate additional memory resources required to handle the GRE packet.
Packets bypassed, no conn at all	Number of packets that failed to be associated with an existing flow because no TCP port was listening. WCCP can also handle asymmetric packet flows and always maintains a consistent mapping of web servers to caches regardless of the number of switches or routers used in a WCCP service group (up to 32 routers or switches communicating with up to 32 WAEs in a cluster).
Packets bypassed, no pending connection	Number of packets that failed to be associated with a pending connection because the initial handshake was not completed.

Table 3-114 Field Descriptions for the **show wccp gre** Command (continued)

Field	Description
Packets due to clean wccp shutdown	Number of connection flows that are bypassed due to a clean WCCP shutdown. During a proper shutdown of WCCP, the WAE continues to service the flows it is handling but starts to bypass new flows. When the number of flows goes down to zero, the WAE takes itself out of the cluster by having its buckets reassigned to other WAEs by the lead WAE.
Packets bypassed due to bypass-list lookup	Number of connection flows that are bypassed due to a bypass list entry. When the WAE receives an error response from an origin server, it adds an entry for the server to its bypass list. When it receives subsequent requests for the content residing on the bypassed server, it redirects packets to the bypass gateway. If no bypass gateway is configured, then the packets are returned to the redirecting Layer 4 switch.
Packets received with client IP addresses	Number of packets that are associated to a connection flow that is being spoofed. By spoofing the IP address of a client, the WAE can receive packets with the client IP (which is different from the IP address of the WAE) and send the packet to the correct application that is waiting for the packet.
Conditionally Accepted connections	Number of connection flows that are accepted by the WAE due to the conditional accept feature.
Conditionally Bypassed connections	Number of connection flows that are bypassed by the WAE due to the conditional accept feature.
Packets dropped due to received on loopback	Number of packets that were dropped by the WCCP L2 intercept layer because they were received on the loopback interface but were not destined to a local address of the device. There is no valid or usable route for the packet.
Packets w/WCCP GRE received too small	Number of packets transparently intercepted by the WCCP-enabled router at Layer 2 and sent to the WAE that need to be fragmented for the packets to be redirected using GRE. The WAE drops the packets since it cannot encapsulate the IP header.
Packets dropped due to IP access-list deny	Number of packets that are dropped by the WAE when an IP access list that the WAE applies to WCCP GRE encapsulated packets denies access to WCCP applications (the wccp access-list command).
Packets fragmented for bypass	Number of GRE packets that do not contain enough data to hold an IP header.
Packet pullups needed	Number of times a packet had to be consolidated as part of its processing. Consolidation is required when a packet is received as fragments and the first fragment does not contain all the information needed to process it.
Packets dropped due to no route found	Number of packets that are dropped by the WAE because it cannot find the route.

The following is sample output from the **show wccp services** command:

```
WAE# show wccp services
```

```

Services configured on this File Engine
    TCP Promiscuous 61
    TCP Promiscuous 62

show windows-domain

To display Windows domain configuration information for a WAAS device, use the **show windows-domain** EXEC command.

show windows-domain

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Examples [Table 3-115](#) describes the fields shown in the **show windows-domain** command display.

Table 3-115 Field Descriptions for the show windows-domain Command

Field	Description
Login Authentication for Console/Telnet Session:	Status of the primary login authentication method for the session: enabled or disabled.
Configuration Authentication for Console/Telnet Session: enabled (secondary)	Status of the secondary login authentication method for the session:enabled or disabled.
Windows domain Configuration:	Shows the Windows domain configuration settings.
Workgroup	Workgroup identification string.
Comment	Comment line.
Net BIOS	Windows NetBIOS name for the WAE.
Realm	Kerberos Realm (similar to the Windows domain name, except for Kerberos).
WINS Server	IP address of the WINS server.
Password Server	Kerberos server DNS name.
Security	Type of authentication configured, either “Domain” for NTLM or “ADS” for Kerberos.
Administrative groups	

Table 3-115 *Field Descriptions for the show windows-domain Command (continued)*

Field	Description
Super user group	Active Directory(AD) group name. Users in this group have administrative rights.
Normal user group	AD group name. Users in this group have the normal/default privilege level in the WAE.

Related Commands[windows-domain](#)[\(config\) windows-domain](#)

shutdown

To shut down the WAAS device, use the **shutdown** EXEC command.

shutdown [poweroff]

Syntax Description	poweroff (Optional) Turns off the power after closing all applications and operating system.
Defaults	No default behavior or values.
Command Modes	EXEC
Device Modes	application-accelerator central-manager

Usage Guidelines A controlled shutdown refers to the process of properly shutting down a WAAS device without turning off the power on the device. With a controlled shutdown, all of the application activities and the operating system are properly stopped on a WAE, but the power remains on. Controlled shutdowns of a WAAS device can help you minimize the downtime when the WAAS device is being serviced.

**Caution**

If a controlled shutdown is not performed, the WAAS file system can be corrupted. Rebooting the WAAS device takes longer if it was not properly shut down.

**Note**

A WAAS device cannot be powered on again through the WAAS software after a software poweroff. You must press the power button once on a WAAS device to bring it back online.

The **shutdown** EXEC command facilitates a proper shutdown for WAAS device, and is supported on all WAE hardware models. The **shutdown poweroff** command is also supported by all of the WAE hardware models as they support the ACPI.

The **shutdown** command closes all applications and stops all system activities, but keeps the power on. The fans continue to run and the power LED is on, indicating that the device is still powered on. The device console displays the following menu after the shutdown process is completed:

```
===== SHUTDOWN SHELL =====  
System has been shut down.
```

You can

0. Power down system by pressing and holding power button
 1. Reload system by software
 2. Power down system by software
- [1-2]?

The **shutdown poweroff** command closes all applications and the operating system, stops all system activities, and turn off the power. The fans stop running and the power LED starts flashing, indicating that the device has been powered off.

**Note**

If you use the **shutdown** or **shutdown poweroff** commands, the device does not perform a file system check when you power on and boot the device the next time.

Table 3-116 describes the shutdown-only operation and the shutdown poweroff operation for a WAAS device.

Table 3-116 Description of the shutdown Command Operations

Activity	Process
User performs a shutdown operation on the WAE	Shutdown poweroff WAE# shutdown poweroff
User intervention to bring WAE back online	After a shutdown poweroff, you must press the power button once to bring the WAAS device back online.
File system check	Is <i>not</i> performed after you turn the power on again and reboot the WAAS device.

You can enter the **shutdown EXEC** command from a console session or from a remote session (Telnet or SSH version 1 or SSH version 2) to perform shutdown on a WAAS device.

To perform a shutdown on a WAAS device, enter the **shutdown EXEC** command as follows:

```
WAE# shutdown
```

When you are asked if you want to save the system configuration, enter **yes**.

```
System configuration has been modified. Save?[yes]:yes
```

When you are asked if you want to proceed with the shutdown, press **Enter** to proceed with the shutdown operation.

```
Device can not be powered on again through software after shutdown.
Proceed with shutdown?[confirm]
```

A message appears, reporting that all services are being shut down on this WAE.

```
Shutting down all services, will timeout in 15 minutes.
shutdown in progress ..System halted.
```

After the system is shut down (the system has halted), a WAAS software shutdown shell displays the current state of the system (for example, “System has been shut down”) on the console. You are asked whether you want to perform a software power off (the **Power down system by software** option), or if you want to reload the system through the software.

```
===== SHUTDOWN SHELL =====
System has been shut down.
You can either
    Power down system by pressing and holding power button
or
1. Reload system through software
2. Power down system through software
```

To power down the WAAS device, press and hold the power button on the WAAS device, or use one of the following methods to perform a shutdown poweroff:

- From the console command line, enter **2** when prompted, as follows:

```
===== SHUTDOWN SHELL =====  
System has been shut down.  
You can either  
    Power down system by pressing and holding power button  
or  
1. Reload system through software  
2. Power down system through software
```

- From the WAAS CLI, enter the **shutdown poweroff EXEC** command as follows:

```
WAE# shutdown poweroff
```

When you are asked if you want to save the system configuration, enter **yes**.

```
System configuration has been modified. Save?[yes]:yes
```

When you are asked to confirm your decision, press **Enter**.

```
Device can not be powered on again through software after poweroff.  
Proceed with poweroff?[confirm]  
Shutting down all services, will timeout in 15 minutes.  
poweroff in progress ..Power down.
```

Examples

The following example shows how to close all applications and stop all system activities using the **shutdown** command:

```
WAE1# shutdown  
System configuration has been modified. Save?[yes]:yes  
Device can not be powered on again through software after shutdown.  
Proceed with shutdown?[confirm]  
Shutting down all services, will timeout in 15 minutes.  
shutdown in progress ..System halted.
```

The following example shows how to close all applications, stop all system activities, and then turn off power to the WAAS device using the **shutdown poweroff** command:

```
WAE2# shutdown poweroff  
System configuration has been modified. Save?[yes]:yes  
Device can not be powered on again through software after poweroff.  
Proceed with poweroff?[confirm]  
Shutting down all services, will timeout in 15 minutes.  
poweroff in progress ..Power down.
```

snmp trigger

To configure thresholds for a user-selected MIB object for monitoring purposes on a WAAS device, use the **snmp trigger EXEC** command.

```
snmp trigger {create mibvar [wildcard] [wait-time [
absent [LINE | mibvar1 mibvar1] [LINE | mibvar2 mibvar2] [LINE | mibvar3 mibvar3]

snmp trigger delete mibvar
```

Syntax	Description
create <i>mibvar</i>	Configures a threshold for a MIB object. Specifies the name of the MIB object that you want to monitor or the MIB object for which you want to remove a monitoring threshold.
wildcard	(Optional) Treats the specified MIB variable name as having a wildcard.
<i>wait-time</i>	(Optional) Number of seconds, 60–600, to wait between trigger samples.
absent	(Optional) Applies the absent existence test.
<i>LINE</i>	(Optional) Description of the threshold being created.
mibvar1 <i>mibvar1</i>	(Optional) Adds a MIB object to the notification.
mibvar2 <i>mibvar2</i>	(Optional) Adds a MIB object to the notification.
mibvar3 <i>mibvar3</i>	(Optional) Adds a MIB object to the notification.
equal	Applies the equality threshold test.
absolute <i>value</i>	(Optional) Specifies an absolute value sample type.

delta value	Specifies a delta sample type.
falling	Applies the falling threshold test.
greater-than	Applies the greater-than threshold test.
less-than	Applies the less-than threshold test.
on-change	Applies the changed existence test.
present	Applies the present test.
rising	Applies the rising threshold test.
delete	Removes a threshold for a MIB object.

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

Using the **snmp trigger EXEC** command, you can define additional SNMP traps for other MIB objects of interest to your particular configuration. You can select any MIB object from any of the support MIBs for your trap. The trap can be triggered based on a variety of tests:

- **absent**—A specified MIB object that was present at the last sampling is no longer present as of the current sampling.
- **equal**—The value of the specified MIB object is equal to the specified threshold.
- **falling**—The value of the specified MIB object has fallen below the specified threshold value. After a trap is generated against this condition, another trap for this same condition is not generated until the sampled MIB object value rises above the threshold value and then falls below the falling threshold value again.
- **greater-than**—The value of the specified MIB object is greater than the specified threshold value.
- **less-than**—The value of the specified MIB object is less than the specified threshold value.
- **on-change**—The value of the specified MIB object has changed since the last sampling.
- **present**—A specified MIB object is present as of the current sampling that was not present at the previous sampling.
- **rising**—The value of the specified MIB object has risen above the specified threshold. After a trap is generated against this condition, another trap for this same condition is not generated until the sampled MIB object value falls below the threshold value and then rises above the rising threshold value again.

The threshold value can be based on an *absolute* sample type or on a *delta* sample type. An absolute sample type is one in which the test is evaluated against a fixed integer value between zero and 4294967295. A delta sample type is one in which the test is evaluated against the change in the MIB object value between the current sampling and the previous sampling.

After you configure SNMP traps, you must use the **snmp-server enable traps event** global configuration command for the event traps you just created to be generated. Also, to preserve SNMP trap configuration across a system reboot, you must configure event persistence using the **snmp-server mib persist event** global configuration command, and save the MIB data using the **write mib-data EXEC** command.

Examples

The following example shows how to create a threshold for the MIB object *esConTabIsConnected* so that a trap is sent when the connection from the Edge WAE to the Core WAE is lost:

```
WAE# snmp trigger create esConTabIsConnected ?
<60-600> The number of seconds to wait between trigger sample
wildcard Option to treat the MIB variable as wildcarded
WAE# snmp trigger create esConTabIsConnected wildcard 600 ?
absent Absent existence test
equal Equality threshold test
falling Falling threshold test
greater-than Greater-than threshold test
less-than Less-than threshold test
on-change Changed existence test
present Present present test
rising Rising threshold test
WAE# snmp trigger create esConTabIsConnected wildcard 600 falling ?
absolute Absolute sample type
delta Delta sample type
WAE# snmp trigger create esConTabIsConnected wildcard 600 falling absolute ?
<0-4294967295> Falling threshold value
WAE# snmp trigger create esConTabIsConnected wildcard 600 falling absolute 1 ?
LINE Trigger-comment
mibvar1 Optional mib object to add to the notification
WAE# snmp trigger create esConTabIsConnected wildcard 600 falling absolute 1 "Lost the
connection with the core server."
WAE# configure
WAE(config)# snmp-server enable traps event
```

Once you have configured the WAE to send SNMP traps, you can view the results of these newly created traps using the **show snmp events EXEC** command.

You can also delete user-created SNMP traps. The following example shows how to delete the trap set for *esConTabIsConnected* that we created in the previous example.

```
WAE# snmp trigger delete esConTabIsConnected
```

ssh

To allow secure encrypted communications between an untrusted client machine and a WAAS device over an insecure network, use the **ssh** EXEC command.

ssh *options*

Syntax Description

options

Options to use with the **ssh** EXEC command. For more information about the possible options, see RFC 4254 at <http://www.rfc-archive.org/getrfc.php?rfc=4254>.

Defaults

By default, the Secure Shell (SSH) feature is disabled on a WAAS device.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

SSH consists of a server and a client program. Like Telnet, you can use the client program to remotely log in to a machine that is running the SSH server, but unlike Telnet, messages transported between the client and the server are encrypted. The functionality of SSH includes user authentication, message encryption, and message authentication.

Note

The Telnet daemon can still be used with the WAAS device. SSH does not replace Telnet.

Related Commands

(config) **sshd**
(config) **ssh-key-generate**

tcpdump

To dump network traffic, use the **tcpdump** EXEC command.

tcpdump [*LINE*]

Syntax Description

LINE (Optional) Dump options. For more information see the “Usage Guidelines” section.

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

TCPdump is a utility that allows a user to intercept and capture packets passing through a network interface, making it useful for troubleshooting network applications.

During normal network operation, only the packets which are addressed to a network interface are intercepted and passed on to the upper layers of the TCP/IP protocol layer stack. Packets which are not addressed to the interface are ignored. In Promiscuous mode, the packets which are not intended to be received by the interface are also intercepted and passed on to the higher levels of the protocol stack. TCPdump works by putting the network interface into promiscuous mode. TCPdump uses the free libpcap (packet capture library).

Use the *-h* option to view the options available, as shown in the following example:

```
WAE# tcpdump -h
tcpdump version 3.8.1 (jlemon)
libpcap version 0.8
Usage: tcpdump [-aAdDeflLnNOpgRStuUvxX] [-c count] [ -C file_size ]
               [ -E algo:secret ] [ -F file ] [ -i interface ] [ -r file ]
               [ -s snaplen ] [ -T type ] [ -w file ] [ -y datalinktype ]
               [ expression ]
```

Examples

The following example shows how to start a network traffic dump to a file named *tcpdump.txt*:

```
WAE# tcpdump -w tcpdump.txt
```

Related Commands

[tethereal](#)

traceroute

telnet

To log in to a WAAS device using the Telnet client, use the **telnet** EXEC command.

telnet {*hostname* | *ip-address*} [*portnum*]

Syntax Description

<i>hostname</i>	Hostname of the network device.
<i>ip-address</i>	IP address of the network device.
<i>portnum</i>	(Optional) Port number (1–65535). Default port number is 23.

Defaults

The default port number is 23.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

UNIX shell functions such as **escape** and the **suspend** command are not available in the Telnet client. Multiple Telnet sessions are also not supported. This Telnet client allows you to specify a destination port.

Examples

The following example shows how to log in to a WAAS device using the Telnet client in several ways:

```
WAE# telnet cisco-wae
WAE# telnet 10.168.155.224
WAE# telnet cisco-wae 2048
WAE# telnet 10.168.155.224 2048
```

Related Commands

(config) **telnet enable**

terminal

To set the number of lines displayed in the console window, or to display the current console **debug** command output, use the **terminal EXEC** command.

terminal {**length** *length* | **monitor** [**disable**]}

Syntax Description	length <i>length</i>	Sets the length of the display on the terminal (0–512). Setting the length to 0 means there is no pausing.
	monitor	Copies the debug output to the current terminal.
	disable	(Optional) Disables monitoring at this specified terminal.

Defaults	The default is 24 lines.
-----------------	--------------------------

Command Modes	EXEC
----------------------	------

Device Modes	application-accelerator central-manager
---------------------	--

Usage Guidelines	<p>When 0 is entered as the <i>length</i> parameter, the output to the screen does not pause. For all nonzero values of <i>length</i>, the -More- prompt is displayed when the number of output lines matches the specified <i>length</i> number. The -More- prompt is considered a line of output. To view the next screen, press the Spacebar. To view one line at a time, press the Enter key.</p> <p>The terminal monitor command allows a Telnet session to display the output of the debug commands that appear on the console. Monitoring continues until the Telnet session is terminated.</p>
-------------------------	--

Examples	The following example shows how to set the number of lines to display to 20:
-----------------	--

WAE# **terminal length 20**

The following example shows how to configure the terminal for no pausing:

WAE# **terminal length 0**

Related Commands	All show commands.
-------------------------	---------------------------

test

To perform diagnostic tests and display the results, use the **test** EXEC command.

test self-diagnostic [**system** | **basic** | **connectivity** | **interfaces** | **tfo** | **wccp** | **inline** | **wafs**] | **all**

Syntax Description		
self-diagnostic		Performs self-diagnostics tests.
system		(Optional) Checks the device status, presence of core files, and alarms.
basic		(Optional) Checks the device network configuration.
connectivity		(Optional) Checks if the external hosts required for device operation are reachable by sending ICMP ping packets.
interfaces		(Optional) Checks the operation of physical interfaces, including ports on the Cisco WAE Inline Network Adapter.
tfo		(Optional) Checks the traffic optimization configuration settings and operation. (Applies only to application accelerator devices.)
wccp		(Optional) Checks the WCCP configuration settings and operation. (Applies only to application accelerator devices.)
inline		(Optional) Checks the inline group configuration settings and operation. (Applies only to application accelerator devices that have the Cisco WAE Inline Network Adapter installed.)
wafs		(Optional) Checks the WAFS configuration settings and operation. (Applies only to application accelerator devices.)
all		(Optional) Runs all of the diagnostic tests.

Defaults No default behavior or values.

Command Modes EXEC mode

Device Modes application-accelerator
central-manager

Usage Guidelines If you use the **test self-diagnostic** command with the **all** option, all applicable tests are performed. You can specify one or more test options to perform just those tests.

The last diagnostic test report is stored on the device in the following file: /local1/diagnostic_report.txt.

Examples The following example shows how to perform the basic, connectivity, interfaces, and WCCP tests:

```
WAE# test self-diagnostic basic connectivity interfaces wccp
```

Table 3-117 describes the error messages that can be returned by the **test self-diagnostics** command.

Table 3-117 Error Codes Returned by the test self-diagnostics Command

Test	Error Code	Description
system	HAS_COREDUMP	Core files are present.
	HAS_ALARM	Critical or major alarms are pending.
basic	NO_PRIM_IFACE	The primary interface is not configured.
	NO_PRIM_ADDR	The primary interface has no IP address configured.
	NO_HOSTNAME	The hostname is not configured.
	NO_NAMESERVER	The name servers are not configured.
	NO_DOMAIN	The domain name is not configured.
	NO_DEFAULT_GW	The default gateway is not configured.
	NO_CM_ADDR	The WAAS Central Manager IP address is not configured.
	NO_NTP_CFG	The NTP server is not configured.
connectivity	UNREACHABLE	The default gateway, name servers, NTP servers, authentication servers (RADIUS, TACACS, or Windows domain), or WAAS Central Manager are unreachable.
	UNRESOLVABLE	The fully qualified domain name of the device cannot be resolved.
	WINS_UNAVAILABLE	The WINS server is unreachable or not operational and cannot resolve the device netbios name.
interfaces	IFACE_DOWN	The interface is in shutdown mode. If all interfaces are shut down, the test will fail.
	IFACE_BW	The interface is configured or negotiated to use 10-MB speed instead of a faster speed.
	IFACE_HD	The interface is configured or negotiated to use half duplex instead of full duplex.
	IFACE_ERRORS	The interface has packet errors on more than 1 percent of received or sent packets.
	IFACE_COLLISIONS	The interface has packet collisions on more than 1 percent of sent packets.
tfo	TFO_DISABLED	TFO is disabled.
	TFO_NO_DRE	DRE is disabled.
	TFO_NO_LZ	Compression is disabled.
	TFO_NOAOACCL	An application accelerator in the policy engine is not enabled to accelerate traffic.
	PE_OTHER	Unclassified traffic is configured to pass through.
	TFO_NOPT	Traffic that is configured to be optimized is being passed through.
wccp	NO_RTRCFG	WCCP is enabled but TCP promiscuous mode is not configured.
	NO_RTRLIST	The router list specified in WCCP configuration is not configured.
	UNREACHABLE	Configured WCCP routers are unreachable or other WAEs in the WCCP farm are unreachable.
	NO_WCCP_RTRS	The WAE and WCCP routers cannot communicate with each other.
	NO_INTERCEPT	The WAE is not receiving intercepted traffic.

Table 3-117 **Error Codes Returned by the test self-diagnostics Command (continued)**

Test	Error Code	Description
inline	INLINE_NO_INT	Traffic interception is not configured on the inlineGroup interface.
	INLINE_SHUTDOWN	The inlineGroup interface is shut down.
	INLINE_BYPASS	The inlineGroup interface is in bypass mode.
	INLINE_INTRCPT	The inlineGroup interface is not intercepting traffic.
wafs	NO_CONNECTIVITY	The edge and core WAEs do not have connectivity defined or the peer devices are unreachable.
	UNREACHABLE	The WAFS connectivity peers are unreachable.
	NO_WAFS_CONN	The WAFS transport is not established.

tetherreal

To analyze network traffic from the command line, use the **tetherreal** EXEC command.

tetherreal [*LINE*]

Syntax Description	<i>LINE</i> (Optional) Options. For more information see the “Usage Guidelines” section.
Defaults	No default behavior values.
Command Modes	EXEC
Device Modes	application-accelerator central-manager
Usage Guidelines	Tetherreal is the command-line version of the network traffic analyzer tool Ethereal. Like TCPdump, it also uses the packet capture library (libpcap). Aside from network traffic analysis, Tetherreal also provides facilities for decoding packets.
Examples	<p>The following example shows how to display the options available with the WAAS tetherreal command:</p> <pre>WAE# tetherreal -h This is GNU tetherreal 0.10.6 (C) 1998-2004 Gerald Combs <gerald@ethereal.com> Compiled with GLib 1.2.9, with libpcap 0.6, with libz 1.1.3, without libpcrc, without UCD-SNMP or Net-SNMP, without ADNS. NOTE: this build does not support the "matches" operator for Ethereal filter syntax. Running with libpcap (version unknown) on Linux 2.4.16. tetherreal [-vh] [-DlNpqSVx] [-a <capture autostop condition>] ... [-b <number of ring buffer files>[:<duration>]] [-c <count>] [-d <layer_type>==<selector>,<decode_as_protocol>] ... [-f <capture filter>] [-F <output file type>] [-i <interface>] [-N <resolving>] [-o <preference setting>] ... [-r <infile>] [-R <read filter>] [-s <snaplen>] [-t <time stamp format>] [-T pdml ps psml text] [-w <savefile>] [-y <link type>] [-z <statistics string>] Valid file type arguments to the "-F" flag: libpcap - libpcap (tcpdump, Ethereal, etc.) rh6_1libpcap - RedHat Linux 6.1 libpcap (tcpdump) suse6_3libpcap - SuSE Linux 6.3 libpcap (tcpdump) modlibpcap - modified libpcap (tcpdump) nokialibpcap - Nokia libpcap (tcpdump) lanalyzer - Novell LANalyzer ngsniffer - Network Associates Sniffer (DOS-based) snoop - Sun snoop</pre>

```

niobserverv9 - Network Instruments Observer version 9
default is libpcap
```

Related Commands [tcpdump](#)

traceroute

To trace the route between a WAAS device to a remote host, use the **traceroute** EXEC command.

traceroute {*hostname* | *ip-address*}

Syntax Description	<i>hostname</i>	Name of remote host.
	<i>ip-address</i>	IP address of remote host.

Defaults No default behavior values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines Traceroute is a widely available utility on most operating systems. Much like ping, it is a valuable tool for determining connectivity in a network. Ping allows the user to find out if there is a connection between two end systems. Traceroute does this as well, but also lists the intermediate routers between the two systems. Users can therefore see the possible routes packets can take from one system to another. Use **traceroute** to find the route to a remote host, when either the hostname or the IP address is known.

Examples The following example shows how to trace the route between the WAAS device and a device with an IP address of 10.0.0.0:

```
WAE# traceroute 10.0.0.0
traceroute to 10.0.0.0 (10.0.0.0), 30 hops max, 38 byte packets
 1 sblab2-rtr.abc.com (192.168.10.1) 0.959 ms 0.678 ms 0.531 ms
 2 192.168.1.1 (192.168.1.1) 0.665 ms 0.576 ms 0.492 ms
 3 172.24.115.66 (172.24.115.66) 0.757 ms 0.734 ms 0.833 ms
 4 sjc20-sbb5-gw2.abc.com (192.168.180.93) 0.683 ms 0.644 ms 0.544 ms
 5 sjc20-rbb-gw5.abc.com (192.168.180.9) 0.588 ms 0.611 ms 0.569 ms
 6 sjce-rbb-gw1.abc.com (172.16.7.249) 0.746 ms 0.743 ms 0.737 ms
 7 sj-wall-2.abc.com (172.16.7.178) 1.505 ms 1.101 ms 0.802 ms
 8 * * *
 9 * * *
.
.
.
29 * * *
30 * * *
```

Related Commands [ping](#)

transaction-log

To force the exporting or the archiving of the transaction log, use the **transaction-log EXEC** command.

transaction-log force { archive | export } { flow | accelerator video windows-media }

Syntax Description

archive	Forces the archiving of the transaction log file.
export	Forces the archived transaction log files to be exported.
flow	Forces the archiving or exporting of the Traffic Flow Optimization (TFO) transaction log file.
accelerator video windows-media	Forces the archiving or exporting of the video accelerator transaction log file.

Defaults

No default behavior values.

Command Modes

EXEC

Device Modes

application-accelerator

Examples

The following example shows how to force the archiving of the TFO transaction log file on the WAE:

```
WAE# transaction-log force archive flow
```

The following example shows how to force the exporting of the video transaction file on the WAE:

```
WAE# transaction-log force export accelerator video windows-media
```

Related Commands

[\(config\) transaction-logs](#)
[show transaction-logging](#)

type

To display a file, use the **type** EXEC command.

type *filename*

Syntax Description	<i>filename</i> Name of file.
Defaults	No default behavior or values.
Command Modes	EXEC
Device Modes	application-accelerator central-manager
Usage Guidelines	Use the type command to display the contents of a file within any file directory on a WAAS device. The type command may be used to monitor features such as transaction logging or system logging (syslog).
Examples	The following example shows how to display the contents of the <i>syslog.txt</i> file: WAE# type /local1/syslog.txt
Related Commands	cpfile dir lls ls pwd rename

type-tail

To view a specified number of lines of the end of a log file, to view the end of the file continuously as new lines are added to the file, to start at a particular line in the file, or to include or exclude specific lines in the file, use the **type-tail** EXEC command.

type-tail *filename* [*line* | **follow** | { **begin** *LINE* | **exclude** *LINE* | **include** *LINE* }]

Syntax Description	<i>filename</i>	File to be examined.
	<i>line</i>	(Optional) Number of lines from the end of the file to be displayed (1–65535).
	follow	(Optional) Displays the end of the file continuously as new lines are added to the file.
		(Optional) Displays contents of the file according to the begin , exclude , and include output modifiers.
	begin <i>LINE</i>	Identifies the line at which to begin file display. Specifies a regular expression to match in the file.
	exclude <i>LINE</i>	Indicates lines that are to be excluded from the file display. Specifies a regular expression to match in the file.
	include <i>LINE</i>	Indicates lines that are to be included in the file display. Specifies a regular expression to match in the file.

Defaults The last ten lines are shown.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines The **type-tail** command allows you to monitor a log file by letting you view the end of the file. You can specify the number of lines at the end of the file that you want to view, or you can follow the last line of the file as it continues to log new information. To stop the last line from continuously scrolling as with the **follow** option, use the key sequence **Ctrl-C**.

You can further indicate the type of information to display using the output modifiers. These allow you to include or exclude specific lines or to indicate where to begin displaying the file.

Examples The following example shows how to look for a list of log files in the */local1* directory and then displays the last ten lines of the *syslog.txt* file. In this example, the number of lines to display is not specified, so the default of ten lines is used:

```
WAE# ls /local1
actona
core_dir
crash
```

```

dbupgrade.log
downgrade
errorlog
logs
lost+found
sa
service_logs
spool
syslog.txt
syslog.txt.1
syslog.txt.2
syslog.txt.3
syslog.txt.4
var
wdd.sh.signed

```

WAE# **type-tail /local1/syslog.txt**

```

```

The following example shows how to follow the *syslog.txt* file as it grows:

WAE# **type-tail /local1/syslog.txt follow**

virtual-blade

To change the virtual blade CD-ROM, save or delete the memory state, open or clear a Telnet session, or start and stop a virtual blade, use the **virtual-blade** EXEC command.

virtual-blade {*bladenumber*} {**cd** {**cd-rom** | **disk** *pathname* | **eject**} | **kill-save-state** | **save** | **session** [**clear**] | **start** [*delay*] | **stop** [*timeout*]}

Syntax Description	
<i>bladenumber</i>	Number of the virtual blade. Valid values are 1 through 4.
cd	Changes the virtual blade CD-ROM.
cd-rom	Uses the WAE CD-ROM drive.
disk <i>pathname</i>	Specifies a CD-ROM image file located on the WAE hard drive. This file is located in the <i>/local1/vbs</i> directory.
eject	Ejects the disk from the WAE CD-ROM drive.
kill-save-state	Deletes the saved virtual blade memory state.
save	Saves the current memory state of the virtual blade.
session	Opens a telnet session to the remote host/port.
clear	(Optional) Cancels the telnet session to the remote host/port.
start	Starts the specified virtual blade.
<i>delay</i>	Specifies the startup delay for the virtual blade being started. Valid values are 1 through 60 seconds.
stop	Stops the specified virtual blade.
<i>timeout</i>	Specifies the shutdown timeout delay for the virtual blade being stopped. Valid values are 0 through 900 seconds.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator

Usage Guidelines The **virtual-blade** EXEC command is used to execute general operations on a virtual blade. The **virtual-blade n cd** command changes the source of the virtual blade operating system image or ejects the CD. The **virtual-blade n save** command saves a snapshot of the current virtual blade memory state and saves it to */local1/vbs*. The **virtual-blade n kill-save-state** command deletes the memory snapshot. The **virtual-blade n start** and **virtual-blade n stop** commands allow you to activate and deactivate the virtual blade. Each command has an optional delay.

Examples The following example shows how to start virtual blade 1 immediately:

```
WAE# virtual-blade 1 start
```

The following example shows how to stop virtual blade 1 after a 3 minute timeout period:

```
WAE# virtual-blade 1 stop 180
```

The following example shows how to eject the CD in the WAE CD-ROM drive:

```
WAE# virtual-blade 1 cd eject
```

wafs

To back up, restore, or create a system report about the Wide Area File Services (WAFS)-related network configuration, plus the configurations of file servers, printers, users, and so forth, on a WAE, use the **wafs** EXEC command.

```
wafs { backup-config filename | restore-config filename |
sysreport [filename | date-range from_date end_date filename] }
```

Note

Executing the **wafs sysreport** command can temporarily impact the performance of your WAE.

Syntax Description

backup-config <i>filename</i>	Copies current WAFS-related configuration information to a file. Name of the file, in <i>xxx.tar.gz</i> format, where you want to save the WAFS configuration. This file is saved to the <i>/local/local1</i> directory.
restore-config <i>filename</i>	Loads saved WAFS-related configuration information from a file. Name of the file, in <i>xxx.tar.gz</i> format, where the desired WAFS configuration information has been stored. This file should be in the <i>/local/local1</i> directory.
sysreport	Deprecated; use copy sysreport .
date-range <i>from_date</i> <i>to_date</i> <i>filename</i>	(Optional) Displays the range of time that the system report is to cover. Specifies start date, end date, and name of the file, in <i>xxx.tar.gz</i> format, in which the system information is to be stored.

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator

Usage Guidelines

The **wafs backup-config** EXEC command is used when back up of basic network configuration is not sufficient (performed using the **copy running-config** command), for example, when you want to back up system configurations before making any changes using the WAAS CLI global configuration mode and you want to protect the current configuration from loss of data by erroneous operations.

The **wafs restore-config** automatically performs a reload function. We strongly recommend that you re-register your WAE on completion of this command.

This **wafs** command is also useful when backup and system restoration, or generation of a system report, are not available from the WAAS Central Manager GUI.

Examples

The following example shows how to create a backup file of the WAFS configuration information:

```
WAE# wafs ?
```

```
backup-config  backup system configurations to a file.
restore-config restore system configurations from a file. WARNING: After
               restoring configuration, the system needs to be restarted and
               re-registered.
sysreport      system report to a file
```

```
WAE# wafs backup-config backup.tar.gz
      system configuration is stored in file /local/local1/backup.tar.gz
```

The following example shows how to restore a system with previously saved WAAS configuration information:

```
WAE# wafs restore-config backup.tar.gz
Restoring configurations ...
After upload is completed the File Engine will be reloaded. We strongly recommend you
re-register after the engine is reloaded.
```

whoami

To display the username of the current user, use the **whoami** EXEC command.

whoami

Syntax Description

This command has no arguments or keywords.

Defaults

No default behavior or values.

Command Modes

EXEC

Device Modes

application-accelerator
central-manager

Usage Guidelines

Use the **whoami** command to display the username of the current user.

Examples

The following example shows how to display your username:

```
WAE# whoami  
admin
```

Related Commands

[pwd](#)

windows-domain

To access the Windows domain utilities on a WAAS device, use the **windows-domain EXEC** command.

**windows-domain diagnostics {findsmb | getent | net | nmblookup | smbclient | smbstatus |
smbtree | tdbbackup | tdbdump | testparm | wbinfo }**

Syntax Description		
diagnostics		Enables selection of Windows domain diagnostic utilities.
findsmb		Displays the utility for troubleshooting NetBIOS name resolution and browsing.
getent		Displays the utility to get unified list of both local and PDC users and groups.
net		Displays the utility for administration of remote CIFS servers.
nmblookup		Displays the utility for troubleshooting NetBIOS name resolution and browsing.
smbclient		Displays the utility for troubleshooting the Windows environment and integration.
smbstatus		Displays the utility for inspecting the Samba server status, connected clients, and so on.
smbtree		Displays the utility for inspecting the Windows network neighborhood structure and content.
tdbbackup		Displays the utility for backing up, verifying and restoring Samba database files.
tdbdump		Displays the utility for inspecting the Samba database files.
testparm		Displays the utility to validate <i>smb.conf</i> file correctness.
wbinfo		Displays the utility for Winbind and domain integration troubleshooting.

Defaults No default behavior or values.

Command Modes EXEC

Device Modes application-accelerator
central-manager

Usage Guidelines Use the **windows-domain** command to activate the selected Windows domain diagnostic utility.

Examples The following example shows how to display the options available for the Get Entity utility:

```
WAE# windows-domain diagnostics getent --help
Usage: getent [OPTION...] database [key ...]
getent - get entries from administrative database.
```

```

-s, --service=CONFIG      Service configuration to be used
-?, --help                Give this help list
    --usage                Give a short usage message
-V, --version              Print program version

```

Mandatory or optional arguments to long options are also mandatory or optional for any corresponding short options.

Supported databases:

```

aliases ethers group hosts netgroup networks passwd protocols rpc
services shadow

```

The following example shows how to display the options available for the NMB Lookup Utility for troubleshooting NetBIOS name resolution and browsing:

```

WAE# windows-domain diagnostics nmblookup -h
Usage: [-?TV] [--usage] [-B BROADCAST-ADDRESS] [-f VAL] [-U STRING] [-M VAL]
       [-R VAL] [-S VAL] [-r VAL] [-A VAL] [-d DEBUGLEVEL] [-s CONFIGFILE]
       [-l LOGFILEBASE] [-O SOCKETOPTIONS] [-n NETBIOSNAME] [-W WORKGROUP]
       [-i SCOPE] <NODE> ...

```

The following example shows how to display the options available for the Samba Client Utility for troubleshooting the Windows environment and integration:

```

WAE# windows-domain diagnostics smbclient -h
Usage: [-?EgVNkP] [--usage] [-R NAME-RESOLVE-ORDER] [-M HOST] [-I IP] [-L HOST]
       [-t CODE] [-m LEVEL] [-T <c|x>IXFqgbNan] [-D DIR] [-c STRING] [-b BYTES]
       [-p PORT] [-d DEBUGLEVEL] [-s CONFIGFILE] [-l LOGFILEBASE]
       [-O SOCKETOPTIONS] [-n NETBIOSNAME] [-W WORKGROUP] [-i SCOPE]
       [-U USERNAME] [-A FILE] [-S on|off|required] service <password>

```

The following example shows how to display the options available for the TDB Backup Utility:

```

WAE# windows-domain diagnostics tdbbackup -h
Usage: tdbbackup [options] <fname...>

-h          this help message
-s suffix   set the backup suffix
-v          verify mode (restore if corrupt)

```

The following example shows how to use the -u option of the WinBind Utility to view the information about a user registered in a Windows domain:

```

WAE# windows-domain diagnostics wbinform -u
administrator
guest
user98
tuser1

```

```

WAE# show user username user98
Uid          : 70012
Username     : user98
Password     : *****
Privilege    : super user
Configured in : Windows Domain database

```

```

WAE# show user uid 70012
Uid          : 70012
Username     : user98
Password     : *****
Privilege    : super user
Configured in : Windows Domain database

```

The following example shows how to register a Windows domain:

```
WAE# windows-domain diagnostics
      net join -S<domain server> -U<domain admin username>%<domain admin password>
```

Related Commands [\(config\) windows-domain](#)

write

To save startup configurations on a WAAS device, use the **write** EXEC command.

write [erase | memory | mib-data | terminal]

Syntax Description	<table> <tr> <td>erase</td><td>(Optional) Erases startup configuration from NVRAM.</td></tr> <tr> <td>memory</td><td>(Optional) Writes the configuration to NVRAM. This is the default location for saving startup information.</td></tr> <tr> <td>mib-data</td><td>(Optional) Saves MIB persistent configuration data to disk.</td></tr> <tr> <td>terminal</td><td>(Optional) Writes the configuration to a terminal session.</td></tr> </table>	erase	(Optional) Erases startup configuration from NVRAM.	memory	(Optional) Writes the configuration to NVRAM. This is the default location for saving startup information.	mib-data	(Optional) Saves MIB persistent configuration data to disk.	terminal	(Optional) Writes the configuration to a terminal session.
erase	(Optional) Erases startup configuration from NVRAM.								
memory	(Optional) Writes the configuration to NVRAM. This is the default location for saving startup information.								
mib-data	(Optional) Saves MIB persistent configuration data to disk.								
terminal	(Optional) Writes the configuration to a terminal session.								
Defaults	The configuration is written to NVRAM by default.								
Command Modes	EXEC								
Device Modes	application-accelerator central-manager								
Usage Guidelines	<p>Use the write command to either save running configurations to NVRAM or to erase memory configurations. Following a write erase command, no configuration is held in memory, and a prompt for configuration specifics occurs after you reboot the WAAS device.</p> <p>Use the write terminal command to display the current running configuration in the terminal session window. The equivalent command is show running-config.</p>								
Examples	<p>The following example shows how to save the current startup configuration to memory:</p> <pre>WAE# write memory</pre>								
Related Commands	copy running-config copy startup-config show running-config show startup-config
