Organization Mapping

This chapter contains the following sections:

Organization Mapping

To organize and manage devices via the Plug-In, the administrator needs to map the FindIT Network Manager sites to Kaseya Organizations/Groups. This allows the administrator to manage the devices and perform actions through the single interface of the Kaseya VSA.

Perform the following steps to create a mapping for each site to be managed by the plug-in.

1. Select an appropriate Kaseya Organization/Group. This allows network devices to be filtered and searched by organization or group, and Kaseya functions such as Alarms will be associated to the correct Kaseya organization.

2. Create (or select an existing) Kaseya Discovery Network. Kaseya Networks are created to associate network devices from Kaseya's own discovery process. This creates an explicit connection between a group of devices known in Kaseya and those known in FindIT Manager.

3. Optionally select a Kaseya Agent as a 'probe' and schedule a Kaseya discovery process.

4. Click **Submit**. The FindIT site is now mapped and can be seen in the **Mapped** tab

Selecting the **Un-map** button, will remove the relationship to the Kaseya objects and place the FindIT site back in the 'Un-mapped' pool.

You may also select **Ignore** to remove the FindIT site from mapping consideration in the future by being placed in the **Ignored** tab. The administrator can return the FindIT Site to the **Un-mapped** pool by clicking **Un-ignore**.
