

Configuring NetFlow

This chapter describes how to configure the NetFlow feature on Cisco NX-OS devices.

This chapter contains the following sections:

- About NetFlow, on page 1
- Prerequisites for NetFlow, on page 4
- Guidelines and Limitations for NetFlow, on page 4
- Configuring NetFlow, on page 8
- Verifying the NetFlow Configuration, on page 18
- Monitoring NetFlow, on page 19
- Display Example for NetFlow, on page 19
- Configuration Example for NetFlow, on page 19

About NetFlow

NetFlow identifies packet flows for ingress IP packets and provides statistics based on these packet flows. NetFlow does not require any change to either the packets themselves or to any networking device.

NetFlow uses flows to provide statistics for accounting, network monitoring, and network planning. A flow is a unidirectional stream of packets that arrives on a source interface (or VLAN) and has the same values for the keys. A key is an identified value for a field within the packet. You create a flow using a flow record to define the unique keys for your flow.

Cisco NX-OS supports the flexible NetFlow feature that enables enhanced network anomalies and security detection. Flexible NetFlow allows you to define an optimal flow record for a particular application by selecting the keys from a large collection of predefined fields.

All key values must match for the packet to count in a given flow. A flow might gather other fields of interest, depending on the export record version that you configure. Flows are stored in the NetFlow cache.

You can export the data that NetFlow gathers for your flow by using a flow exporter and export this data to a remote NetFlow Collector, such as Cisco Stealthwatch. Cisco NX-OS exports a flow as part of a NetFlow export User Datagram Protocol (UDP) datagram under the following circumstances:

- Flows are exported periodically as per the flow timeout value, which defaults to 10 seconds if not configured.
- You have forced the flow to export.

The flow record determines the size of the data to be collected for a flow. The flow monitor combines the flow record and flow exporter with the NetFlow cache information.

Cisco NX-OS can gather NetFlow statistics and analyze all packets on the interface or subinterface.

Dual-Layer NetFlow Implementation

Unlike other Cisco Nexus platforms, Cisco Nexus 9000 Series switches separate NetFlow processing into two layers:

- The first layer supports per-packet visibility for line-rate traffic. Packets do not need to be sampled and statistically analyzed. Instead, the packets can be processed and aggregated at line rate.
- The second layer enables the gathering of flows at scale. It can maintain hundreds of thousands of flows without losing any flows and periodically exports them to an external collector.

Flow Records

A flow record defines the keys that NetFlow uses to identify packets and other fields of interest that NetFlow gathers for the flow. You can define a flow record with any combination of keys and fields of interest. Cisco NX-OS supports a rich set of keys. A flow record also defines the types of counters gathered per flow. You can configure 32- or 64-bit packet or byte counters.

The key fields are specified with the **match** keyword. The fields of interest and counters are specified under the **collect** keyword.

Cisco NX-OS enables the following match fields as the defaults when you create a flow record:

- match interface input
- · match flow direction

Flow Exporters

A flow exporter contains network layer and transport layer details for the NetFlow export packet. You can configure the following information in a flow exporter:

- Export destination IP address
- Source interface
- UDP port number (where the NetFlow Collector is listening for NetFlow packets)—The default value is 9995.

Note

NetFlow export packets use the IP address that is assigned to the source interface. If the source interface does not have an IP address assigned to it, the flow exporter drops flows that were meant to be exported. The Netflow Exporter source interface and destination IP must use the same VRF.

Cisco NX-OS exports data to the NetFlow Collector whenever a timeout occurs. You can configure a flush cache timeout (using the **flow timeout** command) to flush the cache and force a flow export.

Export Format

Cisco NX-OS supports the Version 9 export format. This format supports a more efficient network utilization than the older Version 5 export format and supports IPv6 and Layer 2 fields. In addition, the Version 9 export format supports the full 32-bit SNMP ifIndex values at the NetFlow Collector.

Layer 2 NetFlow Keys

You can define Layer 2 keys in flexible NetFlow records that you can use to capture flows in Layer 2 interfaces. The Layer 2 keys are as follows:

- Source and destination MAC addresses
- Source VLAN ID
- EtherType from the Ethernet frame

You can apply Layer 2 NetFlow to the following interfaces for the ingress direction:

- Switch ports in access mode
- Switch ports in trunk mode
- · Layer 2 port channels

Note

You cannot apply Layer 2 NetFlow to VLANs, egress interfaces, or Layer 3 interfaces such as VLAN interfaces.

Flow Monitors

A flow monitor references the flow record and flow exporter. You apply a flow monitor to an interface.

NetFlow Output Interface

The NetFlow output interface on Cisco Nexus switches have the following features:

- NetFlow in the show flow cache command displays output_if_id and exports output interface to the collector.
- The NetFlow output interface for Cisco Nexus platform switches supports both IPv4 and IPv6 traffic flows. However, the NetFlow output interface for Cisco Nexus 9500 platform switches is supported only for IPv4 traffic flows and is not supported for IPv6 traffic flows.
- The **show flow cache** command displays <code>output_if_id</code> as <code>0x0</code>. However, beginning with Cisco NX-OS Release 10.3(3)F, the **show flow cache** command displays <code>output_if_id</code> as <code>0x0</code> only if the destination IP address cannot be resolved or is not installed in the routing table or the packet received is control packet.
- NetFlow supports exporting output interface to the collector for IPv4/IPv6 incoming traffic flows, which have Next-Hop as destination interface. The NetFlow export format for InputInt and OutputInt support the full 32-bit SNMP ifIndex values at the NetFlow Collector.

- The NetFlow output interface is not supported for tunnel traffic flows such as MPLS, VXLAN, and GRE.
- For more information on examples for NetFlow output interface, see the Display Example for NetFlow, on page 19.

High Availability

Cisco NX-OS supports stateful restarts for NetFlow. After a reboot, Cisco NX-OS applies the running configuration.

The flow cache is not preserved across restarts, and packets that come to the software during restarts cannot be processed.

Prerequisites for NetFlow

NetFlow has the following prerequisites:

 Make sure that you understand the resources required on your device because NetFlow consumes memory and CPU resources.

Guidelines and Limitations for NetFlow

Note

For scale information, see the release-specific Cisco Nexus 9000 Series NX-OS Verified Scalability Guide.

NetFlow has the following configuration guidelines and limitations:

- For Cisco Nexus 9300-FX platform switches only, if you add a member to a port channel that is already configured for Layer 2 NetFlow, its NetFlow configuration is removed and the Layer 2 configuration of the port channel is added to it.
- NetFlow is not supported on tunnel interfaces.
- NetFlow is not supported for CPU-transmitted packets.
- Only ingress NetFlow is supported. Egress NetFlow is not supported.
- Flow cache can be cleared per flow type, such as Layer 2, IPv4, and IPv6. It cannot be cleared per flow monitor.
- Flow collection is not performed for ARP traffic.
- You must configure a source interface for the NetFlow Data Export (NDE). If you do not configure a source interface, the flow exporter drops flows that were meant to be exported.
- Layer 2 switched flow monitors are applied only to Layer 2 interfaces. IP and IPv6 flow monitors can be applied to VLANs, SVIs, Layer 3 routed interfaces, or subinterfaces.
- If you change a Layer 2 interface to a Layer 3 interface, or a Layer 3 interface to a Layer 2 interface, the software removes the Layer 2 NetFlow configuration from the interface.

- The same flow monitor cannot be shared with a VLAN and Layer 3 interfaces (for example, physical Layer 3 interface, SVI interface, or Layer 3 subinterface). You must distinguish a VLAN and Layer 3 interface since the ACL is different and cannot be shared. They must be treated as two different profiles.
- A rollback fails if you try to modify a record that is programmed in the hardware during a rollback.
- The limitations of the NetFlow feature are as follows:
 - NetFlow for MPLS/VXLAN datapath is not supported
 - NetFlow is not supported on loopback and switch management interfaces.
- The following guidelines and limitations are applicable to Netflow in a VXLAN environment:
 - NetFlow is supported on SVI and non-uplink L3 Interfaces of a VXLAN VTEP. This does not
 include the L3VNI SVI.
 - NetFlow is not supported on uplink interfaces on a VXLAN VTEP.
 - NetFlow on Multisite Border Gateways is not supported.
 - A NetFlow Collector that is reachable over the VXLAN fabric is supported.
- Beginning with Cisco NX-OS Release 9.2(1):
 - NetFlow for FEX Layer 3 ports is supported on Cisco Nexus 9300-EX and 9300-FX platform switches.
 - NetFlow CE is supported on the Cisco Nexus 9300-EX platform switches.

Note

All EX type platform switches, including the Cisco Nexus 9700-EX line cards, CE NetFlow only captures CE flow records for non-IPv4 and IPv6 traffic flows. Whereas for FX and FX2 type platform switches and line cards, we can capture CE flow data for IP flows as long as **mac packet-classify** is applied on the interface.

- Beginning with Cisco NX-OS Release 9.2(2), the Cisco Nexus 9300-FX switch supports collecting the OUTPUT_SNMP field for NetFlow Data Export (NDE). No other Cisco Nexus 9000 platform switch or Cisco Nexus line card supports collecting the OUTPUT_SNMP field.
- Beginning with Cisco NX-OS Release 9.2(2), NetFlow is supported on Cisco Nexus 9500 platform switches with Cisco Nexus 9700-EX line cards and FM-E modules.
- NetFlow is not supported on Cisco Nexus 92348GC-X platform switch.
- For Cisco Nexus 9300-EX platform switches, a flow monitor applied on a VLAN or SVI can collect flows for both switched and routed traffic. For Cisco Nexus 9300-FX platform switches, NetFlow VLANs are supported for switched traffic only, and NetFlow SVIs are supported for routed traffic only.
- The Cisco Nexus 9300-EX platform switch supports NetFlow and SPAN on the same interface at the same time. This functionality is a viable alternative to using SPAN and sFlow.
- On Cisco Nexus 9300-EX/FX platform switches, and Cisco Nexus 9500 platform switches with EX/FX modules, SPAN, and sFlow cannot both be enabled simultaneously. If one is active, the other cannot be enabled. However, on the Cisco Nexus 9300-EX/FX/FX2 and the Cisco Nexus 9500 platform switches

with EX modules, both NetFlow and SPAN can be enabled simultaneously, providing a viable alternative to using sFlow and SPAN.

Note

Cisco Nexus 9300-FX2 platform switches support sFlow and SPAN coexistence.

- For Cisco Nexus 9300-EX platform switches, the same flow monitor cannot be attached to a VLAN and an SVI at the same time.
- The Cisco Nexus 9300-EX platform switches have dedicated TCAM and do not require carving.
- TCAM carving configuration of the ing-netflow region can be performed on FX line cards. EX line cards have a default ing-netflow region TCAM carving of 1024 and cannot be configured otherwise. For ports on the EX and FX line cards, the suggested maximum for the ing-netflow region is 1024.
- The ToS field is not exported for Cisco Nexus 9300-EX platform switches.
- Record match that is based on IP ToS, is not supported for IPv6 flow monitors. The ToS value is collected on the collector as 0x0 irrespective of the value the traffic holds.

This limitation is applicable for the following platform switch families:

- Cisco Nexus 9300-EX
- Cisco Nexus 9300-FX
- Cisco Nexus 9300-FX2
- Cisco Nexus 9300-FX3
- Cisco Nexus 9300-GX
- Cisco Nexus 9500 with EX and FX line cards
- The following guideline applies to all Cisco Nexus 9500 platform switches with EX and FX line cards:

Configuring an EX port as a trunk when FX ports are trunks with NetFlow configurations already applied, does not remove the unsupported EX NetFlow configuration from the FX port trunks. For example, if you apply more than two different IPv4 flow monitors to FX port trunks and if EX ports are added to the same trunks, the configuration on the trunks beyond the two monitors is not automatically removed, since it's only an EX port limitation. Since this configuration will not report flows beyond two monitors for EX trunk ports, we recommend that you use only two monitors per protocol (v4/v6/CE) on modular switches that could potentially have both EX and FX ports in the same trunk.

- Commands record netflow ipv4 original-input, record netflow ipv4 original-output, and record netflow layer2-switched input are not supported in Cisco NX-OS Release 9.3(1).
- Beginning with Cisco NX-OS Release 9.3(3), the following Non-Disruptive In-Service Software Upgrade (ND ISSU) limitations about NetFlow apply for all Cisco Nexus 9000 Series switches:
 - While performing an ND ISSU, a two-minute export loss is expected.
 - During an ND ISSU, an exporter with a management interface source port is not supported. Export loss is expected until the management interface comes up.

- Beginning with Cisco NX-OS Release 9.3(3), ingress NetFlow is supported on Cisco Nexus 9300-GX platform switch.
- Beginning with Cisco NX-OS Release 9.3(4), the following RTP/NetFlow monitoring limitation exists:

The RTP monitoring feature enables a monitor of RTP flows on all interfaces of a switch and reports them in the **show flow rtp detail** command output. An RTP flow is any UDP flow with a source port within the range of 16384-32767. If a NetFlow monitor is attached to a switch interface with RTP monitoring enabled, then all the traffic/flows (including the RTP flows) on that interface are reported in the output of the **show flow cache** command. The RTP flows will no longer be shown in the output of the **show flow rtp detail** command. When the attached monitor is removed, the RTP flows are reported again in the **show flow rtp detail** command output.

This limitation impacts the following switches:

- Cisco Nexus 9336C-FX2
- Cisco Nexus 93240YC-FX2
- Cisco Nexus 9348GC-FXP
- Cisco Nexus 93180YC-FX
- Cisco Nexus 93108TC-FX
- Cisco Nexus 9316D-GX
- Cisco Nexus 93600CD-GX
- Cisco Nexus 9364C-GX
- Cisco Nexus 9504, 9508, and 9516 with the 9736C-FX line card
- Cisco Nexus 9500 platform switches with FM-E, FM-E2, and FM-E3 modules and Cisco Nexus 9300-FX/FX3 switches support the NetFlow output interface feature. However, output interface is not supported on 9300-EX and 9500-EX platform switches.
- NetFlow is supported on Cisco Nexus 9500 platform switches with EX, FX, and GX mixed chassis. You can use SPAN simultaneously with NetFlow on the Cisco Nexus 9500 platform switches with EX, FX, and GX mixed chassis. Cisco Nexus 9500-GX platform switches does not support SPAN with sFlow feature mix.
- The Cisco Nexus 3232C and 3264Q switches do not support NetFlow.
- Beginning with Cisco NX-OS Release 10.1(2), Netflow is supported on N9K-X9716D-GX line card.
- Enable NetFlow only on platforms that support this feature.
- The **match ip tos** command is present in flow record configuration options, but the functionality is not supported.
- Beginning with Cisco NX-OS Release 10.2(1)F, Layer 3 NetFlow on Layer 2 interfaces is supported on Cisco Nexus 9300-EX, 9300-FX, 9300-FX2, 9300-FX3, 9300-GX, and 9300-GX2 platform switches, and on 9500-EX LC and 9500-FX LC. Few guidelines and limitations are as follows:
 - You can attach either Layer 3 flow monitor or Layer 2 flow monitor to Layer 2 interface, not both.
 - If a flow monitor is already attached to Layer 3 interface, then the same flow monitor cannot be attached to Layer 2 interface.

- The **mac-packet-classify** command is not supported, when Layer 3 flow monitor is applied on Layer 2 interface.
- Beginning with Cisco NX-OS Release 10.3(3)F, Netflow Output_if_id is supported on Cisco Nexus 9300-FX2, 9300-GX, and 9300-GX2 switches and 9500-GX Line Cards.
 - If output_if_id is shown as 0x0, it means that the destination IP is not resolved or not available in the routing table or the ARP table.
 - The output_if_id is shown as 0x0 for control packets received on ingress interface (such as BGP/PIM/OSPF/Ping packets received).
 - For IPv6 flows on Cisco Nexus 9500 Line Cards, output_if_id is shown as Unsupported due to hardware limitations.

Note

For verified NetFlow scalability numbers, see the Cisco Nexus 9000 Series NX-OS Verified Scalability Guide.

Configuring NetFlow

Follow these steps to configure NetFlow:

Procedure

- **Step 1** Enable the NetFlow feature.
- **Step 2** Define a flow record by specifying keys and fields to the flow.
- **Step 3** Define an optional flow exporter by specifying the export format, protocol, destination, and other parameters.
- **Step 4** Define a flow monitor based on the flow record and flow exporter.
- **Step 5** Apply the flow monitor to a source interface, subinterface, or VLAN interface.

Enabling the NetFlow Feature

You must globally enable NetFlow before you can configure any flows.

	Command or Action	Purpose
Step 1	configure terminal	Enters global configuration mode.
	Example:	
	<pre>switch# configure terminal switch(config)#</pre>	

	Command or Action	Purpose
Step 2	[no] feature netflow	Enables or disables the NetFlow feature. The
	Example:	default is disabled.
	switch(config)# feature netflow	Note The Cisco Nexus 9500 platform switches with N9K-T2 EoR do not support NetFlow.
Step 3	(Optional) copy running-config startup-config	Copies the running configuration to the startu
	Example:	configuration.
	<pre>switch(config)# copy running-config startup-config</pre>	

Creating a Flow Record

You can create a flow record and add keys to match on and nonkey fields to collect in the flow.

	Command or Action	Purpose	
Step 1	configure terminal	Enters global configuration mode.	
	Example:		
	<pre>switch# configure terminal switch(config)#</pre>		
Step 2	flow record name	Creates a flow record and enters flow record	
	<pre>Example: switch(config)# flow record Test switch(config-flow-record)#</pre>	configuration mode. You can enter up to 63 alphanumeric characters for the flow record name.	
Step 3	(Optional) description string	Describes this flow record as a maximum	
	Example:	63-character string.	
	switch(config-flow-record)# description IPv4Flow		
Step 4	(Optional) match type	Specifies a match key. For more information,	
	Example:	see Specifying the Match Parameters, on page 10.	
	<pre>switch(config-flow-record)# match transport destination-port</pre>	Note The match transport destination-port and match ip protocol commands are required to export Layer 4 port data.	
Step 5	(Optional) collect type	Specifies the collection field. For more	
	Example:	information, see Specifying the Collect Parameters, on page 11.	
	<pre>switch(config-flow-record)# collect counter packets</pre>	Tarameters, on page 11.	

	Command or Action	Purpose
Step 6	(Optional) show flow record [name] [record-name] {netflow-original netflow protocol-port netflow {ipv4 ipv6} {original-input original-output}}	Displays information about NetFlow flow records. You can enter up to 63 alphanumeric characters for the flow record name.
	Example:	
	<pre>switch(config-flow-record)# show flow record netflow protocol-port</pre>	
Step 7	(Optional) copy running-config startup-config	
	Example:	configuration.
	<pre>switch(config-flow-record)# copy running-config startup-config</pre>	

Specifying the Match Parameters

You must configure at least one of the following match parameters for flow records:

Command	Purpose
match datalink {mac source-address mac destination-address ethertype vlan}	Specifies the Layer 2 attribute as a key.
Example:	
$\verb switch(config-flow-record) \# \verb match datalink ethertyp $	pe
match ip {protocol tos}	Specifies the IP protocol or ToS fields as keys.
<pre>Example: switch(config-flow-record) # match ip protocol</pre>	Note The match transport destination-port and match ip protocol commands are required to export Layer 4 port data.
	The data is collected and displayed in the output of the show hardware flow ip command but is not collected and exported until you configure both commands.
match ipv4 {destination address source address} Example:	Specifies the IPv4 source or destination address as a key.
<pre>switch(config-flow-record)# match ipv4 destination address</pre>	no
match ipv6 {destination address source address flow-label options}	Specifies the IPv6 key.
Example:	
<pre>switch(config-flow-record)# match ipv6 flow-label</pre>	

Command	Purpose	,
match transport {destination-port source-port} Example:	Specifies the transport source or destination port as a key.	
<pre>switch(config-flow-record)# match transport destination-port</pre>	Note The match transport destination-port and match ip protocol commands are require to export Layer 4 port data.	
		The data is collected and displayed in the output of the show hardware flow ip command but is not collected and exported until you configure both commands.

Specifying the Collect Parameters

You must configure at least one of the following collect parameters for flow records:

Command	Purpose
<pre>collect counter {bytes packets} [long] Example: switch(config-flow-record) # collect counter packets</pre>	Collects either packet-based or byte counters from the flow. You can optionally specify that 64-bit counters are used.
collect ip version	Collects the IP version for the flow.
Example:	
switch(config-flow-record)# collect ip version	
collect timestamp sys-uptime {first last}	Collects the system up time for the first or las packet in the flow.
Example:	
<pre>switch(config-flow-record)# collect timestamp sys-uptime last</pre>	
collect transport tcp flags	Collects the TCP transport layer flags for the
Example:	packets in the flow.
<pre>switch(config-flow-record)# collect transport tcp flags</pre>	

Creating a Flow Exporter

The flow exporter configuration defines the export parameters for a flow and specifies reachability information for the remote NetFlow Collector.

	Command or Action	Purpose	
Step 1	configure terminal	Enters global configuration mode.	
	Example:		
	<pre>switch# configure terminal switch(config)#</pre>		
Step 2	flow exporter name	Creates a flow exporter and enters flow	
	Example:	exporter configuration mode. You can enter up to 63 alphanumeric characters for the flow	
	<pre>switch(config)# flow exporter flow-exporter-one switch(config-flow-exporter)#</pre>	exporter name.	
Step 3	destination {ipv4-address ipv6-address}	Sets the destination IPv4 or IPv6 address for	
	[use-vrf name]	this flow exporter. You can optionally configure the VRF to use to reach the NetFlow	
	Example:	Collector. You can enter up to 32 alphanumeric	
	<pre>switch(config-flow-exporter)# destination 192.0.2.1</pre>	characters for the VRF name.	
Step 4 source interface-type name/port Spe	Specifies the interface to use to reach the		
	Example:	NetFlow Collector at the configured destination.	
switch(config-flow-exporter) # source ethernet 2/1	destination.		
Step 5	(Optional) description string	Describes this flow exporter. You can enter u	
	Example:	to 63 alphanumeric characters for the description.	
	<pre>switch(config-flow-exporter)# description exportversion9</pre>		
Step 6	(Optional) dscp value	Specifies the differentiated services codepoin value. The range is from 0 to 63.	
	Example:		
	switch(config-flow-exporter)# dscp 0		
Step 7	(Optional) transport udp port	Specifies the UDP port to use to reach the	
	Example:	NetFlow Collector. The range is from 0 to 65535.	
	switch(config-flow-exporter)# transport		
	uup 200	port, 9995 is selected as the default.	
Step 8	version 9	Specifies the NetFlow export version. Choose	
	Example:	version 9 to enter the flow exporter version 9 configuration submode.	
	switch(config-flow-exporter)# version	Configuration submode.	
	9 switch(config-flow-exporter-version-9)#	<u> </u>	
		1	

	Command or Action	Purpose
Step 9	(Optional) option {exporter-stats interface-table} timeout seconds	Sets the flow exporter statistics resend timer. The range is from 1 to 86400 seconds.
	Example:	
	<pre>switch(config-flow-exporter-version-9)# option exporter-stats timeout 1200</pre>	
Step 10	(Optional) template data timeout seconds Example: switch(config-flow-exporter-version-9) # template data timeout 1200	Sets the template data resend timer. The range is from 1 to 86400 seconds.
Step 11	(Optional) copy running-config startup-config	Copies the running configuration to the startup configuration.
	Example:	
	<pre>switch(config-flow-exporter-version-9)# copy running-config startup-config</pre>	

Creating a Flow Monitor

You can create a flow monitor and associate it with a flow record and a flow exporter. All of the flows that belong to a monitor use the associated flow record to match on the different fields, and the data is exported to the specified flow exporter.

	Command or Action	Purpose
Step 1	configure terminal	Enters global configuration mode.
	Example:	
	<pre>switch# configure terminal switch(config)#</pre>	
Step 2	flow monitor name	Creates a flow monitor and enters flow monitor
	Example:	configuration mode. You can enter up to 63 alphanumeric characters for the flow monitor
	<pre>switch(config) # flow monitor flow-monitor-one switch(config-flow-monitor) #</pre>	name.
Step 3	(Optional) description string	Describes this flow monitor. You can enter up
	Example:	to 63 alphanumeric characters for the description.
	<pre>switch(config-flow-monitor)# description IPv4Monitor</pre>	
Step 4	(Optional) exporter name	Associates a flow exporter with this flow
	Example:	monitor. You can enter up to 63 alphanumeric characters for the exporter name.
	switch(config-flow-monitor)# export v9	

	Command or Action	Purpose	
Step 5	record name [netflow-original netflow protocol-port netflow {ipv4 ipv6} {original-input original-output}]	Associates a flow record with the specified flow monitor. You can enter up to 63 alphanumeric characters for the record name.	
	Example:	Note record netflow ipv4	
	switch(config-flow-monitor)# record IPv4Flow	original-input, record netflow ipv4 original-output, and record netflow layer2-switched input are not supported in Cisco NX-OS Release 9.3(1).	
Step 6	(Optional) copy running-config startup-config		
	Example:	configuration.	
	<pre>switch(config-flow-monitor)# copy running-config startup-config</pre>		

Applying a Flow Monitor to an Interface

You can apply a flow monitor to an ingress interface. Egress Netflow is not supported.

	Command or Action	Purpose
Step 1	configure terminal	Enters global configuration mode.
	Example:	
	<pre>switch# configure terminal switch(config)#</pre>	
Step 2	interface vlan vlan-id	Configures a VLAN interface and enters
	Example:	interface configuration mode.
	<pre>switch(config)# interface vlan 10 switch(config-if)#</pre>	
Step 3	ip flow monitor {ipv4 ipv6 layer-2-switched} input	Associates an IPv4, IPv6, or Layer 2-switched flow monitor to the interface for input packets.
	Example:	
	<pre>switch(config-if)# ip flow monitor ipv4 input</pre>	
Step 4	(Optional) copy running-config startup-config	
	Example:	configuration.
	<pre>switch(config-if)# copy running-config startup-config</pre>	

Configuring Bridged NetFlow on a VLAN

You can apply a flow monitor to a VLAN in order to gather Layer 3 data over Layer 2 switched packets in a VLAN.

Procedure

	Command or Action	Purpose		
Step 1	configure terminal	Enters global configuration mode.		
	Example:			
	<pre>switch# configure terminal switch(config)#</pre>			
Step 2	vlan configuration vlan-id	Enters VLAN configuration mode. The VLAN		
	Example:	ID range is from 1 to 3967 or from 4048 to 4093		
	<pre>switch(config)# vlan configuration 30 switch(config-vlan-config)#</pre>	Note VLAN configuration mode enables you to configure VLANs independently of their creation, which is required for VTP client support.		
Step 3	<pre>{ip ipv6} flow monitor name Example: switch(config-vlan-config) # ip flow monitor testmonitor</pre>	Associates a flow monitor to the VLAN for input packets. You can enter up to 63 alphanumeric characters for the flow monitor name.		
Step 4	(Optional) copy running-config startup-config Example: switch(config-vlan-config) # copy running-config startup-config	Copies the running configuration to the startup configuration.		

Configuring Layer 2 NetFlow Keys

You can define Layer 2 keys in flexible NetFlow records that you can use to capture flows in Layer 2 interfaces.

	Command or Action	Purpose
Step 1	configure terminal	Enters global configuration mode.
	Example:	
	<pre>switch# configure terminal switch(config)#</pre>	
Step 2	flow record name	Enters flow record configuration mode. For
	Example:	more information about configuring flow

	Command or Action	Purpose		
	<pre>switch(config)# flow record L2_record switch(config-flow-record)#</pre>	records, see Creating a Flow Record, on page 9.		
Step 3	match datalink {mac source-address mac destination-address ethertype vlan}	Specifies the Layer 2 attribute as a key.		
	Example:			
	<pre>switch(config-flow-record)# match datalink ethertype</pre>			
Step 4	exit	Exits flow record configuration mode.		
	Example:			
	<pre>switch(config-flow-record)# exit switch(config)#</pre>			
Step 5	<pre>interface {ethernet slot/port port-channel number}</pre>	Enters interface configuration mode. The interface type can be a physical Ethernet port		
	Example:	or a port channel.		
	<pre>switch(config)# interface Ethernet 6/3 switch(config-if#)</pre>			
Step 6	switchport	Changes the interface to a Layer 2 physical		
	Example:	interface. For information on configuring switch ports, see the Cisco Nexus 9000 Series		
	switch(config-if)# switchport	NX-OS Layer 2 Switching Configuration Guide.		
Step 7	mac packet-classify	Forces MAC classification of packets.		
	<pre>Example: switch(config-if) # mac packet-classify</pre>	For more information on using this command, see the Cisco Nexus 9000 Series NX-OS Security Configuration Guide.		
		Note You must use this command to capture flows.		
Step 8	layer2-switched flow monitor flow-name input	Associates a flow monitor to the switch port input packets. You can enter up to 63 alphanumeric characters for the flow monitor		
	Example:			
	<pre>switch(config-if)# layer2-switched flow monitor L2_monitor input</pre>	name.		
Step 9	(Optional) show flow record netflow layer2-switched input	Displays information about the Layer 2 NetFlow default record.		
	Example:			
	switch(config-if)# show flow record netflow layer2-switched input			

	Command or Action	Purpose	
Step 10	(Optional) copy running-config startup-config	Copies the running configuration to the startup configuration.	
	Example:		
	<pre>switch(config-if)# copy running-config startup-config</pre>		

Configuring Layer 3 NetFlow on Layer 2 Interfaces

You can define Layer 3 flow monitors on Layer 2 interfaces to capture Layer 3 flow information on Layer 2 interfaces.

	Command or Action	Purpose		
Step 1	configure terminal	Enters global configuration mode.		
	Example:			
	<pre>switch# configure terminal switch(config)#</pre>			
Step 2	flow record name	Enters flow record configuration mode. For		
	Example:	more information about configuring flow		
	switch(config)# flow record L3_record switch(config-flow-record)#	records, see Creating a Flow Record, on page 9.		
Step 3	<pre>interface {ethernet slot/port port-channel number}</pre>	Enters interface configuration mode. The interface type can be a physical Ethernet port		
	Example:	or a port channel.		
	switch(config)# interface Ethernet 6/3 switch(config-if#)			
Step 4	switchport	Changes the interface to a Layer 2 mode. For		
	Example:	information on configuring switch ports, se		
	switch(config-if)# switchport	the Cisco Nexus 9000 Series NX-OS Layer 2 Switching Configuration Guide.		
Step 5	ip flow monitor flow-name input	Associates an IPv4 flow monitor to the switch port input packets. You can enter up to 63 alphanumeric characters for the flow monitor		
	Example:			
	<pre>switch(config-if)# ip flow monitor v41 input</pre>	name.		
Step 6	ipv6 flow monitor flow-name input	Associates an IPv6 flow monitor to the switch		
	Example:	port input packets. You can enter up to 63 alphanumeric characters for the flow moni name.		
	<pre>switch(config-if)# ipv6 flow monitor v61 input</pre>			

	Command or Action	Purpose	
Step 7	(Optional) copy running-config startup-config		
	Example:	configuration.	
	<pre>switch(config-if)# copy running-config startup-config</pre>		

Configuring NetFlow Timeouts

You can optionally configure global NetFlow timeouts that apply to all flows in the system.

Procedure

	Command or Action	Purpose
Step 1	configure terminal	Enters global configuration mode.
	Example:	
	<pre>switch# configure terminal switch(config)#</pre>	
Step 2	flow timeout seconds	Sets the flush timeout value in seconds. The
	Example:	range is from 5 to 60 seconds. The default values 10 seconds.
	switch(config)# flow timeout 30	is to seconds.
Step 3	(Optional) copy running-config startup-config	Copies the running configuration to the startup
	Example:	configuration.
	<pre>switch(config)# copy running-config startup-config</pre>	

Verifying the NetFlow Configuration

To display the NetFlow configuration, perform one of the following tasks:

Command	Purpose
show flow cache [ipv4 ipv6 ce]	Displays information about NetFlow IP flows.
show flow exporter [name]	Displays information about NetFlow flow exporters and statistics. You can enter up to 63 alphanumeric characters for the flow exporter name.
show flow interface [interface-type slot/port]	Displays information about NetFlow interfaces.
show flow record [name]	Displays information about NetFlow flow records. You can enter up to 63 alphanumeric characters for the flow record name.

Command	Purpose	
show flow record netflow layer2-switched input	Displays information about the Layer 2 NetFlow configuration.	
show running-config netflow	Displays the NetFlow configuration that is currently on your device.	

Monitoring NetFlow

Use the **show flow exporter** command to display NetFlow statistics. Use the **clear flow exporter** command to clear NetFlow flow exporter statistics.

Display Example for NetFlow

The output of the **show flow cache** command for IPv4 displays:

show flow cache					
IPV4 Entries					
SIP DIP	BD ID S-Po	rt D-Port Protoco	l Byte Count	Packet Count	TCP FLAGS
TOS if_id out	out_if_id flow	Start flowEnd			
10.10.30.4 30.33.1.3	1480 3000	00 17998 17	683751850	471553	0x0

10.10.49.4 30.33.1.3	1499 3000	0 17998 17	683753300	471554	0x0
0x0 0x90105db 0x	la005000 140	96486 14153827			

Configuration Example for NetFlow

This example shows how to configure a NetFlow exporter configuration for IPv4:

```
feature netflow
flow exporter ee
destination 171.70.242.48 use-vrf management
source mgmt0
version 9
template data timeout 20
flow record rr
match ipv4 source address
match ipv4 destination address
collect counter bytes
collect counter packets
flow monitor foo
record rr
exporter ee
```

Configuration Example for NetFlow

interface Ethernet2/45
 ip flow monitor foo input
 ip address 10.20.1.1/24
 no shutdown
