Configuring Multicast VPN Extranet Support

The Multicast VPN Extranet Support feature (sometimes referred to as the MVPN Extranet Support feature) enables service providers to distribute IP multicast content originated from one enterprise site to other enterprise sites. This feature enables service providers to offer the next generation of flexible extranet services, helping to enable business partnerships between different enterprise VPN customers.

This module describes the concepts and the tasks related to configuring Multicast VPN Extranet Support.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring Multicast VPN Extranet Support

- You are familiar with IP multicast concepts and configuration tasks.

- You are familiar with Multicast VPN (MVPN) concepts and configuration tasks.

- You are familiar with Multiprotocol Label Switching (MPLS) Layer 3 Virtual Private Network (VPN) concepts and configuration tasks.

Restrictions for Configuring Multicast VPN Extranet Support

- The Multicast VPN Extranet Support feature supports only Protocol Independent Multicast (PIM) sparse mode (PIM-SM) and Source Specific Multicast (SSM) traffic; PIM dense mode (PIM-DM) and bidirectional PIM (bidir-PIM) traffic are not supported.

- When configuring extranet MVPNs in a PIM-SM environment, the source and the rendezvous point (RP) must reside in the same site of the MVPN behind the same provider edge (PE) router.

- It is required to configure either all the Receiver MVRF(s) in Source PE or Source MVRF in all the Receiver PE(s) to deliver the Extranet content.

- IPV6 based MVPN Extranet is *not* supported.

- Only Routed interfaces and Routed interfaces on Port channels are supported towards the core. BDI towards core is *not* supported.

- The scale data for MVPN extranet is as follows:

    ◦ Maximum number of mVRFs supported is 20

    ◦ Maximum number of mroutes supported (Intranet + extranet) is 1000 in case of default template and 2000 in case of Video template.

- PIM-SM and PIM-SSM are supported.

- PIM-DM and bidir-PIM are *not* supported.

- RP must be configured behind the PE router and the source is in the same intranet-MVPN and behind the CE router.

- Static mroute with fallback-lookup option is supported for RPF lookup[2].

- Configuring the Receiver mVRF on the Source PE only to implement MVPN Extranet support is *not* supported.

Information About Multicast VPN Extranet Support

Overview of MVPN Extranet Support

An extranet can be viewed as part of a company's intranet that is extended to users outside the company. It has also been described as a "state of mind" in which a VPN is used as a way to do business with other companies as well as to sell products and content to customers and companies. An extranet is a VPN connecting the corporate site or sites to external business partners or suppliers to securely share part of a business's information or operations among them.

MPLS VPNs inherently provide security, ensuring that users access only appropriate information. MPLS VPN extranet services offer extranet users unicast connectivity without compromising the integrity of their

corporate data. The Multicast VPN Extranet Support feature extends this offer to include multicast connectivity to the extranet community of interest.

The Multicast VPN Extranet Support feature enables service providers to distribute IP multicast content originated from one enterprise site to other enterprise sites. This feature enables service providers to offer the next generation of flexible extranet services, helping to enable business partnerships between different enterprise VPN customers. Using this feature, service providers can offer multicast extranet contracts to meet various business partnership requirements, including short-term, annual, and rolling contracts.

Benefits of MVPN Extranet Support

The Multicast VPN Extranet Support feature can be used to solve such business problems as:

- Efficient content distribution between enterprises

- Efficient content distribution from service providers or content providers to their different enterprise VPN customers

Components of an Extranet MVPN

The figure below illustrates the components that constitute an extranet MVPN.

- **MVRF** --Multicast VPN routing and forwarding (VRF) instance. An MVRF is a multicast-enabled VRF. A VRF consists of an IP routing table, a derived forwarding table, a set of interfaces that use the forwarding table, and a set of rules and routing protocols that determine what goes into the forwarding table. In general, a VRF includes the routing information that defines a customer VPN site that is attached to a provider edge (PE) router.

- **Source MVRF** --An MVRF that can reach the source through a directly connected customer edge (CE) router.

- **Receiver MVRF** --An MVRF to which receivers are connected through one or more CE devices.

- **Source PE** --A PE router that has a multicast source behind a directly connected CE router.

• **Receiver PE** --A PE router that has one or more interested receivers behind a directly connected CE router.

Figure 1: Components of an Extranet MVPN
Solution for MVPN Extranet Support

For unicast, there is no difference between an intranet or extranet from a routing perspective; that is, when a VRF imports a prefix, that prefix is reachable through a label-switched path (LSP). If the enterprise owns the prefix, the prefix is considered a part of the corporate intranet; otherwise, the prefix is considered a part of an extranet. For multicast, however, the reachability of a prefix (especially through an LSP) is not sufficient to build a multicast distribution tree (MDT).

In order to provide support for extranet MVPN services, the same default MDT group must be configured in the source and receiver MVRF. Prior to the introduction of the Multicast VPN Extranet Support feature, there were challenges that prevented service providers from providing extranet MVPN services:

• The source MVRF may not have been configured with a default MDT group, or it may have been configured with a different MDT group as compared to the receiver MVRF. In the former case there was no way for the source MVRF to forward multicast streams to extranet sites, and in the latter case, there was no way for the separate MVRFs to be linked.

• It was not possible to maintain a forwarding table in cases where the RPF interface and outgoing interfaces belong to different VRFs.

The Multicast VPN Extranet Support feature solves these challenges as follows:

• The receiver and source MVRF multicast route (mroute) entries are linked.

• The Reverse Path Forwarding (RPF) check relies on unicast routing information to determine the interface through which the source is reachable. This interface is used as the RPF interface.

Configuration Guidelines for MVPN Extranet Support

Two configuration options are available to provide extranet MVPN services:

- Option 1--Configure the source MVRF on the receiver PE router.

- Option 2--Configure the receiver MVRF on the source PE router.
MVPN Extranet Support Configuration Guidelines for Option 1

To provide extranet MVPN services to enterprise VPN customers by configuring the receiver MVRF on the source PE router (Option 1), you would complete the following procedure:

- For each extranet site, you would configure an additional MVRF on the source PE router, that has the same default MDT group as the receiver MVRF, if the MVRF is not configured on the source PE.

- In the receiver MVRF configuration, you would configure the same unicast routing policy on the source and receiver PE routers to import routes from the source MVRF to the receiver MVRF.

The figure illustrates the flow of multicast traffic in an extranet MVPN topology where a receiver MVRF is configured on the source PE router (Option 1). In the topology, an MVRF is configured for VPN-Green and VPN-Red on PE1, the source PE router. A multicast source behind PE1 is sending out a multicast stream to the MVRF for VPN-Green, and there are interested receivers behind PE2 and PE3, the receiver PE routers for VPN-Red and VPN-Green, respectively. After PE1 receives the packets from the source in the MVRF for VPN-Green, it independently replicates and encapsulates the packets in the MVRF for VPN-Green and VPN-Red and forwards the packets. After receiving the packets from this source, PE2 and PE3 decapsulate and forward the packets to the respective MVRFs.

*Figure 2: Packet Flow for MVPN Extranet Support Configuration Option 1*

MVPN Extranet Support Configuration Guidelines for Option 2

To provide extranet MVPN services to enterprise VPN customers by configuring a source MVRF on a receiver PE router (Option 2), you would complete the following procedure:

- On a receiver PE router that has one or more interested receivers in a extranet site behind a directly connected CE router, configure an additional MVRF that has the same default MDT group as the site connected to the multicast source, if the MVRF is not configured.

- On the receiver PE router, you would configure the same unicast routing policy to import routes from the source MVRF to the receiver MVRF.

The figure illustrates the flow of multicast traffic in an extranet MVPN topology where the source MVRF is configured on a receiver PE router (Option 2). In the topology, an MVRF is configured for VPN-Green and VPN-Red on PE2, a receiver PE router. A multicast source behind PE1, the source PE router, is sending out a multicast stream to the MVRF for VPN-Green, and there are interested receivers behind PE2, the receiver PE router for VPN-Red, and behind PE3, the receiver PE router for VPN-Green. After PE1 receives the packets from the source in the MVRF for VPN-Green, it replicates and forwards the packets to PE2 and PE3, because both routers are connected to receivers in VPN-Green. The packets that originated from VPN-Green are then replicated on PE2 and forwarded to the interested receivers in VPN-Red and are replicated on PE3 and forwarded to the interested receivers in VPN-Green.

Figure 3: Packet Flow for MVPN Extranet Support Configuration Option 2
RPF for MVPN Extranet Support Using Imported Routes

You must configure either the receiver MVRF on the source PE router (Option 1) or the source MVRF on the receiver PE router (Option 2) for extranet links to be created. Once configured, RPF relies on unicast routing information to determine the interface through which the source is reachable. This interface is used as the RPF interface. No additional configuration is required for RPF resolution. The Multicast VPN Extranet

Support feature supports RPF from one VRF to another VRF, from a VRF to the global routing table, and from the global routing table to a VRF.

RPF for MVPN Extranet Support Using Static Mroutes

✎

Note   This capability is not supported for MVPNv6 extranet.

By default, an extranet MVPN relies on unicast routing policies to determine the RPF interface. When the RPF lookup originates in a receiver MVRF, and it finds that the RPF interface does not lie in the same MVRF, the router uses the information in the Border Gateway Protocol (BGP) imported route to determine the source MVRF. The RPF lookup then continues and resolves in the source MVRF. In cases where the multicast and unicast topologies are incongruent, you can override the default behavior by configuring a static mroute in the receiver MVRF to explicitly specify the source MVRF using the **ip mroute** command with the **fallback-lookup** keyword and **vrf** *vrf-name* keyword and argument.

Static mroutes can also be configured to support RPF for extranet MVPN in the case where the source is present in an MVRF and the receiver is in the global table. In this case, because BGP does not allow VPNv4 routes to be imported into the IPv4 routing table, unicast cannot obtain the source MVRF information needed to resolve the RPF lookup. To enable the RPF lookup to be resolved in this case, a static mroute can be configured to explicitly specify the source MVRF using the **ip mroute** command with the **fallback-lookup** keyword and the **global** keyword.

Multicast VPN Extranet VRF Select

The Multicast VPN VRF Select feature is configured by creating group-based VRF selection policies. Group-based VRF selection policies are configured using the **ip multicast rpf select** command. The **ip multicast rpf select**command is used to configure RPF lookups originating in a receiver MVRF or in the global routing table to be resolved in a source MVRF or in the global routing table based on group address. Access Control Lists (ACLs) are used to define the groups to be applied to group-based VRF selection policies.

The figure illustrates an extranet MVPN topology with the Multicast VPN VRF Select feature configured. In this topology, (S, G1) and (S, G2) PIM joins originating from VPN-Green, the receiver VRF, are forwarded

to PE1, the receiver PE. Based on the group-based VRF selection policies configured, PE1 sends the PIM joins to VPN-Red and VPN-Blue for groups G1 and G2, respectively.

Figure 4: RPF Lookups Using Group-Based VRF Selection Policies
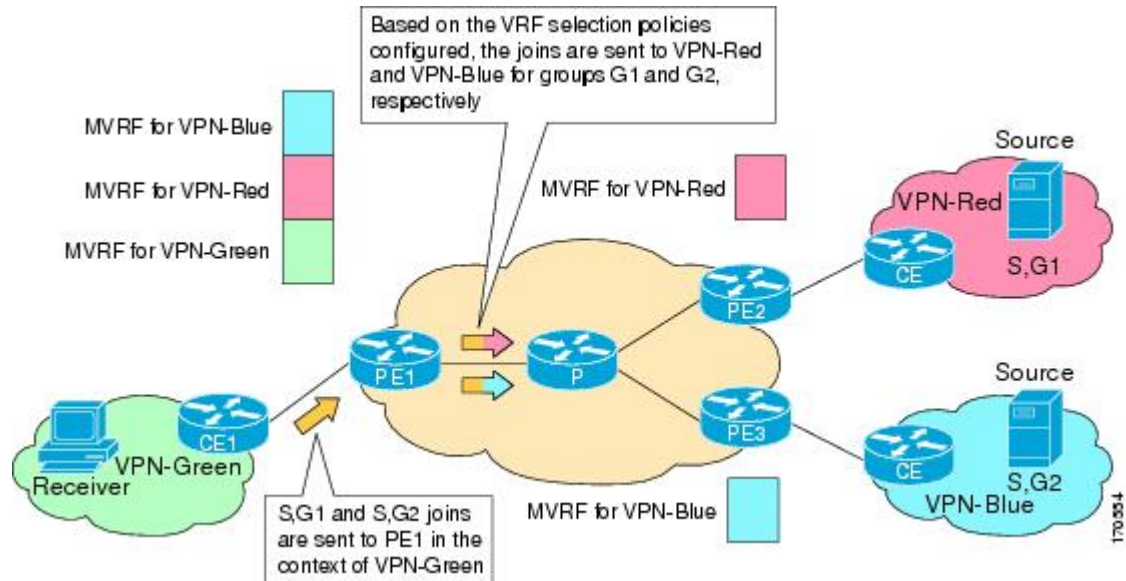

MVPNv6 Extranet

IPv6 Multicast Virtual Private Network (MVPNv6) provides multiple VPN support that enables service providers to provide multicast-enabled private IPv6 networks to their customers using the existing IPv4 back bone. In the MVPNv6 implementation, the IPv6 multicast traffic is carried over the same IPv4-based core network and both the IPv4 and IPv6 VPN traffic are carried over the same tunnels simultaneously. MVPNv6 extranet forwards IPv6 multicast traffic across VRF boundaries on a PE device to connect the service provider to external business partners or suppliers for securely sharing information or operations among them.

Hardware Acceleration for Multicast VPN Extranet Support on Catalyst 6500 Series Switches

Beginning in Cisco IOS Release 12.2(33)SXH, when the Multicast VPN Extranet Support feature is configured on Catalyst 6500 series switches, forwarding entries for source and receiver MVRFs are linked in hardware (similar to how they are linked in software for this feature) and packets are replicated in hardware when being forwarded to extranet MVPN sites. This functionality is referred to as the Hardware Acceleration for Multicast VPN Extranet Support feature.

How to Configure Multicast VPN Extranet Support

Configuring MVPN Support

Perform one of the following tasks to provide extranet MVPN capabilities in an IPv4 core network:

Configuring the Receiver MVRF on the Source PE - Option 1

Perform this task to configure the receiver MVRF on the source PE router (Option 1) and provide support for extranet MVPN services.

In the following figure, the source PE router is PE1. To provide extranet MVPN services from one enterprise VPN site (VPN-Green) to another enterprise VPN site (VPN-Red) using Option 1, configure the receiver MVRF on the source PE router. In the receiver MVRF configuration, the default MDT group must be the same on both the source and receiver PE routers. In addition, you must configure the same unicast routing policy to import routes from the source MVRF (he MVRF for VPN-Green) to the receiver MVRF (the MVRF for VPN-Red).

Figure 5: Topology for MVPN Extranet Support Configuration Option 1

Before You Begin

Intranet VPN in the source and receiver VPNs must be already configured.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip vrf** *vrf-name*
4. **rd** *route-distinguisher*
5. **route-target import** *route-target-ext-community*
6. **mdt default** *group-address*
7. **end**
8. **show ip mroute** [**vrf** *vrf-name*] *group-address*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**ip vrf** *vrf-name* **Example:** `Router(config)# ip vrf VPN-Red`	Defines the VPN routing instance by assigning a VRF name and enters VRF configuration mode. • The *vrf-name* argument is the name assigned to a VRF.

Step 4	**rd** *route-distinguisher*
	
	Example:
	
	`Router(config-vrf)# rd 55:2222`
		Creates routing and forwarding tables.
		
		• Specify the *route-distinguisher* argument to add an 8-byte value to an IPv4 prefix to create a VPN IPv4 prefix. You can enter an RD in either of these formats:
		
		    • 16-bit autonomous system number: your 32-bit number, for example, 101:3
		
		    • 32-bit IP address: your 16-bit number, for example, 192.168.122.15:1

Step 5	**route-target import** *route-target-ext-community*	Creates a route-target extended community for a VRF. • The **import** keyword imports routing information from the target VPN extended community.

|	Command or Action	Purpose
	Example: Router(config-vrf)# route-target import 55:1111	• The *route-target-ext-community* argument adds the route-target extended community attributes to the VRF's list of import, export, or both (import and export) route-target extended communities. **Note** For content to be distributed from the source MVRF to the receiver MVRF, you must configure the same unicast routing policy on the source and receiver PE routers to import routes from the source VRF to the receiver VRF.
Step 6	**mdt default** *group-address* **Example:** Router(config-vrf)# mdt default 232.3.3.3	Configures the multicast group address range for data MDT groups for a VRF. • A tunnel interface is created as a result of this command. • By default, the destination address of the tunnel header is the *group-address* argument.
Step 7	**end** **Example:** Router(config-vrf)# end	Exits VRF configuration mode and returns to privileged EXEC mode.
Step 8	**show ip mroute** [**vrf** *vrf-name*] *group-address* **Example:** Router# show ip mroute 232.3.3.3	(Optional) Displays the contents of the IP multicast mroute table for a specific group address.

Configuring the Source MVRF on the Receiver PE - Option 2

Perform this task to configure the source MVRF on the receiver PE router (Option 2) and provide support for extranet MVPN services.

In the following figure, the receiver PE router is PE2. To provide support for extranet MVPN services from one enterprise VPN site (VPN-Green) to another enterprise VPN site (VPN-Red) using Option 2, configure the source MVRF on the receiver PE router. The MDT group configuration of the source MVRF must be the same on both the source and receiver PE routers. In addition, you must configure the same unicast routing

policy to import routes from the source MVRF (the MVRF for VPN-Green) to the receiver MVRF (the MVRF for VPN-Red).

Figure 6: Topology for MVPN Extranet Support Configuration Option 2
Before You Begin

Intranet VPN in the source and receiver VPNs must be already configured.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip vrf** *vrf-name*
4. **rd** *route-distinguisher*
5. **route-target import** *route-target-ext-community*
6. **mdt default** *group-address*
7. **end**
8. **show ip mroute** [**vrf** *vrf-name*] *group-address*
9. **show mls ip multicast group** *group-address*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.

	Command or Action	Purpose
	Example: Router> enable	• Enter your password if prompted.
Step 2	**configure terminal** **Example:** Router# configure terminal	Enters global configuration mode.
Step 3	**ip vrf** *vrf-name* **Example:** Router(config)# ip vrf VPN-Red	Defines the VPN routing instance by assigning a VRF name and enters VRF configuration mode. • The *vrf-name* argument is the name assigned to a VRF.

Step 4	**rd** *route-distinguisher*
	
	Example:
	
	Router(config-vrf)# rd 55:1111
		Creates routing and forwarding tables.
		
		• The *route-distinguisher* argument adds an 8-byte value to an IPv4 prefix to create a VPN IPv4 prefix. You can enter an RD in either of these formats:
		
		    • 16-bit autonomous system number: your 32-bit number, for example, 101:3
		
		    • 32-bit IP address: your 16-bit number, for example, 192.168.122.15:1

Step 5	**route-target import** *route-target-ext-community* **Example:** Router(config-vrf)# route-target import 55:1111	Creates a route-target extended community for a VRF. • The **import** keyword exports routing information to the target VPN extended community. • The *route-target-ext-community* argument adds the route-target extended community attributes to the VRF's list of import, export, or both (import and export) route-target extended communities. **Note** For content to be distributed from the source MVRF to the receiver MVRF, you must configure the same unicast routing policy on the source and receiver PE routers to import routes from the source VRF to the receiver VRF.
Step 6	**mdt default** *group-address* **Example:** Router(config-vrf)# mdt default 232.1.1.1	Configures the multicast group address range for data MDT groups for a VRF. • A tunnel interface is created as a result of this command. • By default, the destination address of the tunnel header is the *group-address* argument.

	Command or Action	Purpose
Step 7	**end** **Example:** `Router(config-vrf)# end`	Exits VRF configuration mode and returns to privileged EXEC mode.
Step 8	**show ip mroute** [**vrf** *vrf-name*] *group-address* **Example:** `Router# show ip mroute 232.1.1.1`	(Optional) Displays the contents of the IP multicast mroute table for a specific group address.
Step 9	**show mls ip multicast group** *group-address* **Example:** `Router# show mls ip multicast group 232.3.3.3`	(Optional) Displays MLS information related to a specific multicast group.

Configuring RPF for MVPN Extranet Support Using Static Mroutes

Note   This task is not supported for MVPNv6 extranet.

Before You Begin

You must configure support for extranet MVPN services prior to performing this task.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip mroute vrf** *vrf-name* *source-address* *mask* **fallback-lookup** {**global** | **vrf** *vrf-name*} [*distance*]
4. **end**
5. **show ip mroute** [**vrf** *vrf-name*] *group-address*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable**	Enables privileged EXEC mode.

	Command or Action	Purpose
	Example: `Router> enable`	• Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**ip mroute vrf** *vrf-name source-address mask* **fallback-lookup** {**global**	**vrf** *vrf-name*} [*distance*] **Example:** `Router(config)# ip mroute vrf VPN-Red 224.100.0.5 255.255.255.255 fallback-lookup vrf VPN-Green`	(For IPv4 only) Configures the RPF lookup originating in a receiver MVRF to continue and be resolved in a source MVRF or in the global routing table using a static mroute. • The **global** keyword is used to specify that the source MVRF is in the global routing table. • The **vrf** keywordand *vrf-name* argument are used to explicitly specify a VRF as the source MVRF.
Step 4	**end** **Example:** `Router(config)# end`	Exits global configuration mode and enters privileged EXEC mode.
Step 5	**show ip mroute** [**vrf** *vrf-name*] *group-address* **Example:** `Router# show ip mroute 224.100.0.5`	(Optional) Displays the contents of the IP multicast mroute table for a specific group address.

Configuring Group-Based VRF Selection Policies with MVPN

Perform this task to configure group-based VRF selection policies with MVPN .

This task enables RPF lookups to be performed to the same source address in different VRFs using the group address as the VRF selector. This feature enhances extranet MVPNs by enabling service providers to distribute content streams coming in from different MVPNs and redistributing them from there.

Before You Begin

- You must configure support for extranet MVPN services prior to performing this task.

- ACLs are used to define the groups to be applied to group-based VRF selection policies. This task assumes that you have configured the ACLs to be applied to group-based VRF selection policies.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Use the following commands:

   - **ip multicast** [**vrf** *receiver-vrf-name*] **rpf select** {**global** | **vrf** *source-vrf-name*} **group-list** *access-list*

4. Repeat step 3 to create additional group-based VRF selection policies.
5. **end**
6. Use the following commands:

   - **show ip**} **rpf** [**vrf** *vrf-name*] **select**

7. Use one of the following commands:

   - **show ip rpf** [**vrf** *vrf-name*] *source-address* [*group-address*]

DETAILED STEPS

	Command or Action	**Purpose**
Step 1	**enable** **Example:** Router> enable	Enables privileged EXEC mode. - Enter your password if prompted.
Step 2	**configure terminal** **Example:** Router# configure terminal	Enters global configuration mode.
Step 3	Use the following commands: - **ip multicast** [**vrf** *receiver-vrf-name*] **rpf select** {**global**	**vrf** *source-vrf-name*} **group-list** *access-list* **Example:** Router(config)# ip multicast vrf VPN-Green rpf select vrf VPN-Red group-list 1	- (For IPv4 only) Configures RPF lookups originating in a receiver MVRF or in the global routing table to be resolved in a source MVRF or in the global routing table based on group address.
Step 4	Repeat step 3 to create additional group-based VRF selection policies.	--

|	Command or Action	Purpose
Step 5	**end** **Example:** `Router(config)# end`	Exits global configuration mode and enters privileged EXEC mode.
Step 6	Use the following commands: • **show ip} rpf** [**vrf** *vrf-name*] **select** **Example:** `Router# show ip rpf select`	Displays group-to-VRF mapping information.
Step 7	Use one of the following commands: • **show ip rpf** [**vrf** *vrf-name*] *source-address* [*group-address*] **Example:** `Router# show ip rpf 172.16.10.13`	Displays information about how IP multicast routing does RPF. • Use this command after configuring group-based VRF selection policies to confirm that RPF lookups are being performed based on the group address, and to display the VRF where the RPF lookup is being performed.

Configuration Examples for Multicast VPN Extranet Support

Example Configuring the Receiver VRF on the Source PE Router - Option 1

The following example shows the configurations for PE1, the source PE router, and PE2, the receiver PE router, in the figure. In this example, extranet MVPN services are supported between VPN-Green and VPN-Red

by configuring the receiver MVRF for VPN-Red on PE1, the source PE router. The MVRF configuration for VPN-Red is configured to import routes from the MVRF for VPN-Green to the MVRF for VPN-Red.

States in the Global Table on PE1 and PE2 for the MDT Default Group 232.3.3.3 When PE1 and PE2 Are Catalyst 6500 Series Switches Configured for MVPN Extranet Support

The following are sample outputs from the **show ip mroute** on PE1 and PE2, when PE1 and PE2 are Catalyst 6500 series switches that have been configured to support extranet MVPN services. The sample output from the **show ip mroute** command shows the global table for the MDT default group 232.3.3.3 on PE1 and PE2. In the output, the "RPF-MFD" flag indicates that a multicast flow is completely hardware switched and "H" flag indicates that the flow is being hardware switched on an outgoing interface.

```
PE1# show ip mroute 232.3.3.3

States in the VRF Table for VPN-Green on PE1 After Receivers in VPN-Red Join Multicast Group 228.8.8.8

The following is sample output from the **show ip mroute** command on PE1. The sample output shows the state of the VRF table for VPN-Green on PE1 when receivers join the multicast group 228.8.8.8. The output indicates that extranet receivers in VPN-Red are receiving content from a source in VPN-Green that is sending to multicast group 228.8.8.8. The "E" flag in the output indicates that a (*, G) or (S, G) entry in the VRF routing table is a source VRF entry and has extranet receiver MVRF mroute entries linked to it.

Example Configuring the Source VRF on the Receiver PE - Option 2

The following configuration example is based on the extranet MVPN topology illustrated in the figure. This example shows the configurations for PE2, the receiver PE router, and PE1, the source PE router. In this example, extranet MVPN services are supported between VPN-Green and VPN-Red by configuring the source

MVRF for VPN-Green on PE2. The same unicast routing policy is configured to import routes from VPN-Green to VPN-Red.

States in the VRF Table for VPN-Green on PE2 After Receivers in VPN-Red Join Multicast Group 228.8.8.8

The following is sample output from the **show ip mroute** command on PE2. The output shows the state of the VRF table for VPN-Green on PE1 when receivers join the multicast group 228.8.8.8. The output indicates that extranet receivers in VPN-Red are receiving content from the source in VPN-Green that is sending to

multicast group 228.8.8.8. The "E" flag indicates that a (*, G) or (S, G) entry in the VRF routing table is a source VRF entry and has extranet receiver MVRF mroute entries linked to it.

```
PE2# show ip mroute vrf VPN-Green 228.8.8.8

```

Example: Displaying Statistics for MVPN Extranet Support

This example is a stand alone example and does not refer to any other technologies.

The MFIB-based implementation of IP multicast updates counters in source MVRF mroute entries for extranet MVPN. Counters in the source MVRF can be displayed using Cisco IOS commands. Counters in the receiver MVRF mroute entries will remain zero.

Use the **show ip mroute** command to determine the source and receiver MVRFs. The following sample output shows that VRF blue is the source MVRF and VRF red is the receiver MVRF:

```
PE1# show ip mroute vrf blue 228.1.1.1

IP Multicast Routing Table
Flags: D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected,
       L - Local, P - Pruned, R - RP-bit set, F - Register flag,
       T - SPT-bit set, J - Join SPT, M - MSDP created entry, E - Extranet,
       X - Proxy Join Timer Running, A - Candidate for MSDP Advertisement,
       U - URD, I - Received Source Specific Host Report,
       Z - Multicast Tunnel, z - MDT-data group sender,
       Y - Joined MDT-data group, y - Sending to MDT-data group,
       V - RD & Vector, v - Vector
Outgoing interface flags: H - Hardware switched, A - Assert winner
```

```
 Timers: Uptime/Expires
 Interface state: Interface, Next-Hop or VCD, State/Mode
(*, 228.1.1.1), 00:05:48/stopped, RP 202.100.0.5, flags: SE
  Incoming interface: Ethernet3/0, RPF nbr 200.1.1.5
  Outgoing interface list: Null
  Extranet receivers in vrf red:

(220.1.1.200, 228.1.1.1), 00:02:42/00:02:09, flags: TE
  Incoming interface: Ethernet3/0, RPF nbr 200.1.1.5
  Outgoing interface list: Null
  Extranet receivers in vrf red:
  (220.1.1.200, 228.1.1.1), 00:02:42/stopped, OIF count: 1, flags: T

PE1# show ip mroute vrf red 228.1.1.1

IP Multicast Routing Table
Flags: D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected,
       L - Local, P - Pruned, R - RP-bit set, F - Register flag,
       T - SPT-bit set, J - Join SPT, M - MSDP created entry, E - Extranet,
       X - Proxy Join Timer Running, A - Candidate for MSDP Advertisement,
       U - URD, I - Received Source Specific Host Report,
       Z - Multicast Tunnel, z - MDT-data group sender,
       Y - Joined MDT-data group, y - Sending to MDT-data group,
       V - RD & Vector, v - Vector
Outgoing interface flags: H - Hardware switched, A - Assert winner
 Timers: Uptime/Expires
 Interface state: Interface, Next-Hop or VCD, State/Mode
(*, 228.1.1.1), 00:05:55/stopped, RP 202.100.0.5, flags: S
  Incoming interface: Ethernet3/0, RPF nbr 200.1.1.5, using vrf blue
  Outgoing interface list:
    Tunnel16, Forward/Sparse-Dense, 00:05:55/00:03:26
(220.1.1.200, 228.1.1.1), 00:02:49/stopped, flags: T
  Incoming interface: Ethernet3/0, RPF nbr 200.1.1.5, using vrf blue
  Outgoing interface list:
    Tunnel16, Forward/Sparse-Dense, 00:02:49/00:03:26
```

Use the **show ip mfib vrf** *vrf-name* command, with the source MVRF for the *vrf-name* argument, to display statistics.

The following example shows statistics for the source MVRF blue. Inspect the output to ensure that the forwarding statistics in the source MVRF MFIB are correct and that the A and F flags are set in the source MVRF. Notice that there is no indication of extranet forwarding in the MFIB.

```
PE1# show ip mfib vrf blue 228.1.1.1

Entry Flags:    C - Directly Connected, S - Signal, IA - Inherit A
flag,
                ET - Data Rate Exceeds Threshold, K - Keepalive
                DDE - Data Driven Event, HW - Hardware Installed
I/O Item Flags: IC - Internal Copy, NP - Not platform switched,
                NS - Negate Signalling, SP - Signal Present,
                A - Accept, F - Forward, RA - MRIB Accept, RF - MRIB
Forward,
                MA - MFIB Accept
Forwarding Counts: Pkt Count/Pkts per second/Avg Pkt Size/Kbits per
second
Other counts:     Total/RPF failed/Other drops
I/O Item Counts:   FS Pkt Count/PS Pkt Count
VRF blue
(*,228.1.1.1) Flags: C
  SW Forwarding: 1/0/100/0, Other: 0/0/0
  Ethernet3/0 Flags: A
  Tunnel16, MDT/239.3.3.3 Flags: F
    Pkts: 1/0
(220.1.1.200,228.1.1.1) Flags:
  SW Forwarding: 37/0/100/0, Other: 0/0/0
  Ethernet3/0 Flags: A NS
  Tunnel16, MDT/239.3.3.3 Flags: F
    Pkts: 37/0
```

The following example shows the following information for the receiver MVRF red:

- There are no forwarding statistics in the receiver MVRF MFIB because these statistics are collected in the source MVRF.

- The A and F flags are not set because these flags are only set in the source MVRF for MVPN extranet.

- There is no indication of extranet forwarding in the MFIB.

Note   The NS flag in the output is present for the purpose of receiving PIM control traffic in the receiver MVRF.

```
PE1# show ip mfib vrf red 228.1.1.1

Entry Flags:    C - Directly Connected, S - Signal, IA - Inherit A
flag,
                ET - Data Rate Exceeds Threshold, K - Keepalive
                DDE - Data Driven Event, HW - Hardware Installed
I/O Item Flags: IC - Internal Copy, NP - Not platform switched,
                NS - Negate Signalling, SP - Signal Present,
                A - Accept, F - Forward, RA - MRIB Accept, RF - MRIB
Forward,
                MA - MFIB Accept
Forwarding Counts: Pkt Count/Pkts per second/Avg Pkt Size/Kbits per
second
Other counts:     Total/RPF failed/Other drops
I/O Item Counts:  FS Pkt Count/PS Pkt Count
VRF red
(*,228.1.1.1) Flags: C
  SW Forwarding: 0/0/0/0, Other: 0/0/0
  Tunnel16, MDT/239.3.3.3 Flags: NS
(220.1.1.200,228.1.1.1) Flags:
  SW Forwarding: 0/0/0/0, Other: 0/0/0
Tunnel16, MDT/239.3.3.3 Flags: NS
```

You can also use the **show ip mroute count** command to display the extranet MVPN statistics. However, we recommend that you use the **show ip mfib** command instead. If you use the **show ip mroute count**command to display statistics, inspect the output to ensure that the forwarding statistics in the source MVRF are correct and that there are no forwarding statistics in the receiver MVRF.

The following sample output from the **show ip mroute count** command shows statistics for the source MVRF blue:

```
PE1# show ip mroute vrf blue 228.1.1.1 count

Use "show ip mfib count" to get better response time for a large number of
mroutes.

IP Multicast Statistics
3 routes using 1354 bytes of memory
2 groups, 0.50 average sources per group
Forwarding Counts: Pkt Count/Pkts per second/Avg Pkt Size/Kilobits per second
Other counts: Total/RPF failed/Other drops(OIF-null, rate-limit etc)
Group: 228.1.1.1, Source count: 1, Packets forwarded: 38, Packets received: 38
  RP-tree: Forwarding: 1/0/100/0, Other: 1/0/0
  Source: 220.1.1.200/32, Forwarding: 37/0/100/0, Other: 37/0/0
```

The following sample output from the **show ip mroute count** command is for the receiver MVRF red:

```
PE1# show ip mroute vrf red 228.1.1.1 count

Use "show ip mfib count" to get better response time for a large number of
mroutes.

IP Multicast Statistics
3 routes using 1672 bytes of memory
2 groups, 0.50 average sources per group
Forwarding Counts: Pkt Count/Pkts per second/Avg Pkt Size/Kilobits per second
Other counts: Total/RPF failed/Other drops(OIF-null, rate-limit etc)
Group: 228.1.1.1, Source count: 1, Packets forwarded: 0, Packets received: 0
```

```
          RP-tree: Forwarding: 0/0/0/0, Other: 0/0/0
          Source: 220.1.1.200/32, Forwarding: 0/0/0/0, Other: 0/0/0
```

Example Configuring RPF for MVPN Extranet Support Using Static Mroutes

The following example shows how to configure the RPF lookup originating in VPN-Red to be resolved in VPN-Green using the static mroute 192.168.1.1:

```
ip mroute vrf VPN-Red 192.168.1.1 255.255.255.255 fallback-lookup vrf VPN-Green
```

Example Configuring Group-Based VRF Selection Policies with MVPN Extranet Support

The following example shows how to use group-based VRF selection policies to configure RPF lookups originating in VPN-Green to be performed in VPN-Red for group addresses that match ACL 1 and to be performed in VPN-Blue for group addresses that match ACL 2.

```
ip multicast vrf VPN-Green rpf select vrf VPN-Red group-list 1
ip multicast vrf VPN-Green rpf select vrf VPN-Blue group-list 2
!
.
.
.
!
access-list 1 permit 239.0.0.0 0.255.255.255
access-list 2 permit 238.0.0.0 0.255.255.255
!
```

Example: Group-Based VRF Selection Policies with MVPNv6 Extranet

The following example shows how to use a group-based VRF selection policy to configure the RPF lookup for groups that match ACL 1 to be performed in VPN-blue:

```
ipv6 multicast vrf VPN-red rpf select vrf VPN-blue group-range 1
!
.
.
.
!
access-list 1 permit ff02::00 00f0::00
!
```

Technical Assistance

Description	Link
The Cisco Support website provides extensive online resources, including documentation and tools for troubleshooting and resolving technical issues with Cisco products and technologies. To receive security and technical information about your products, you can subscribe to various services, such as the Product Alert Tool (accessed from Field Notices), the Cisco Technical Services Newsletter, and Really Simple Syndication (RSS) Feeds. Access to most tools on the Cisco Support website requires a Cisco.com user ID and password.	http://www.cisco.com/cisco/web/support/index.html

Feature Information for Configuring Multicast VPN Extranet Support

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for Configuring Multicast VPN Extranet Support

Feature Name	Releases	Feature Information
Multicast VPN Extranet Support	12.2(31)SB2 12.2(33)SXH 12.2(33)SRC Cisco IOS XE Release 2.5 15.0(1)M 15.0(1)S Cisco IOS XE Release 3.8S Cisco IOS XE Release 3.9S Cisco IOS Release 15.4(1)T	The Multicast VPN Extranet Support feature enables service providers to distribute IP multicast content originated from one enterprise site to other enterprise sites. This feature enables service providers to offer the next generation of flexible extranet services, helping to enable business partnerships between different enterprise VPN customers. In Cisco IOS XE Release 3.8S, support was added for the Cisco ISR 4400 Series Routers. In Cisco IOS XE Release 3.9S, support was added for the Cisco CSR 1000V. The following commands were introduced or modified by this feature: **ip mroute**, **show ip mroute**.
Multicast VPN Extranet VRF Select	12.2(31)SB2 Cisco IOS XE Release 2.5 15.0(1)M	The Multicast VPN Extranet VRF Select feature provides the capability for RPF lookups to be performed to the same source address in different VRFs using the group address as the VRF selector. This feature enhances extranet MVPNs by enabling service providers to distribute content streams coming in from different MVPNs and redistributing them from there. The following commands were introduced or modified by this feature: **ip multicast rpf select**, **show ip rpf**, **show ip rpf select**.

Feature Name	Releases	Feature Information
Hardware Acceleration for Multicast VPN Extranet Support	12.2(33)SXH	The Hardware Acceleration for Multicast VPN Extranet Support feature introduces the linking of forwarding entries and the replication of packets in hardware for extranet MVPN services on Catalyst 6500 series switches. In 12.2(33)SXH, this feature was introduced on Catalyst 6500 series switches.
MVPNv6 Extranet	15.3(1)S Cisco IOS Release 15.4(1)T	This feature enables service providers to forward IPv6 multicast traffic across VRF boundaries on a PE device. The following commands were introduced or modified by this feature: **ipv6 icast rpf select**, **show ipv6 rpf**.
