

BGP-MVPN SAFI 129 IPv6

Subsequent Address Family Identifier (SAFI) 129, known as VPN Multicast SAFI, provides the capability to support multicast routing in the service provider's core IPv6 network.

Border Gateway Protocol (BGP) Multicast Virtual Private Network (MVPN) provides a means for service providers to use different encapsulation methods (generic routing encapsulation [GRE], Multicast Label Distribution Protocol [MLDP], and ingress replication) for forwarding MVPN multicast data traffic in the service provider network.

The BGP-MVPN SAFI 129 IPv6 feature is required to support BGP-based MVPNs.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for BGP-MVPN SAFI 129 IPv6

- Before you configure a SAFI 129 IPv6-related address family, the **ipv6 unicast-routing** command must be configured on the device.

- To create a multicast IPv6 VRF address family under BGP, IPv6 must first be activated on the VRF itself.

Note There is no separate multicast configuration on the VRF. Configuring the **address-family ipv6** command on the VRF will enable both unicast and multicast topologies.

- If you want prefixes to be installed into the Routing Information Base (RIB), you must configure the **pim** command on a VRF interface.

Information About BGP-MVPN SAFI 129 IPv6

Overview of BGP-MVPN SAFI 129 IPv6

MVPN utilizes the existing VPN infrastructure to allow multicast traffic to pass through the provider space. Information derived from VPN routes is one of the components needed to set up tunnels within the core. Currently, multicast traffic will derive this information from the unicast VPNv6 tables, which forces multicast traffic to be dependent on unicast topologies.

For scenarios in which multicast and unicast traffic would be better suited with separate topologies, the customer edge (CE) router may advertise a special set of routes to be used exclusively for multicast VPNs. Multicast routes learned from the CE router can be propagated to remote provider edge (PE) routers via SAFI 129. Multicast routes learned from the CE router or multicast VPN routes learned from remote PE routers can now be installed directly into the multicast RIB, instead of using replicated routes from the unicast RIB. Maintaining separate routes and entries for unicast and multicast allows you to create differing topologies for each service within the core.

How to Configure BGP-MVPN SAFI 129 IPv6

Configuring BGP-MVPN SAFI 129 IPv6

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vrf definition** *vrf1*
4. **rd** *route-distinguisher*
5. **route-target export** *route-target-ext-community*
6. **route-target import** *route-target-ext-community*
7. **address-family ipv6**
8. **mdt default** *group-address*
9. **exit**
10. **exit**
11. **router bgp** *autonomous-system-number*
12. **address-family vpnv6 multicast**
13. **neighbor** *peer-group-name* **send-community extended**
14. **neighbor** {*ip-address* | *peer-group-name* | *ipv6-address %*} **activate**
15. **address-family ipv6 multicast vrf** *vrf-name*
16. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	vrf definition <i>vrf1</i> Example: Device(config)# vrf definition vrf1	Defines a VRF instance and enters VRF configuration mode.

	Command or Action	Purpose
Step 4	rd <i>route-distinguisher</i> Example: Device(config-vrf)# rd 1:1	Specifies a route distinguisher (RD) for a VRF instance.
Step 5	route-target export <i>route-target-ext-community</i> Example: Device(config-vrf)# route-target export 1:1	Creates a route target export extended community for a VRF instance.
Step 6	route-target import <i>route-target-ext-community</i> Example: Device(config-vrf)# route-target import 1:1	Creates a route target import extended community for a VRF instance.
Step 7	address-family ipv6 Example: Device(config-vrf)# address-family ipv6	Configures a routing session using IPv6 address prefixes and enters address family configuration mode.
Step 8	mdt default <i>group-address</i> Example: Device(config-vrf-af)# mdt default 239.0.0.1	Configures a default multicast distribution tree (MDT) group for a VRF instance.
Step 9	exit Example: Device(config-vrf-af)# exit	Exits address family configuration mode and enters VRF configuration mode.
Step 10	exit Example: Device(config-vrf)# exit	Exits VRF configuration mode and enters global configuration mode.
Step 11	router bgp <i>autonomous-system-number</i> Example: Device(config)# router bgp 50000	Configures a BGP routing process and enters router configuration mode.

	Command or Action	Purpose
Step 12	address-family vpv6 multicast Example: <pre>Device(config-router)# address-family vpv6 multicast</pre>	Configures a routing session using VPN Version 6 multicast address prefixes and enters address family configuration mode.
Step 13	neighbor peer-group-name send-community extended Example: <pre>Device(config-router-af)# neighbor client1 send-community extended</pre>	Specifies that a communities attribute should be sent to a BGP neighbor.
Step 14	neighbor {ip-address peer-group-name ipv6-address %} activate Example: <pre>Router(config-router-af)# neighbor 2001:DB8:0:CC00::1 % activate</pre>	Enables the neighbor to exchange prefixes for the specified family type with the neighbor and the local router.
Step 15	address-family ipv6 multicast vrf vrf-name Example: <pre>Device(config-router-af)# address-family ipv6 multicast vrf vrfl</pre>	Configures a routing session using IPv6 multicast address prefixes for a VRF instance.
Step 16	end Example: <pre>Device(config-router-af)# end</pre>	Exits address family configuration mode and returns to privileged EXEC mode.

Configuration Examples for BGP-MVPN SAFI 129 IPv6

Example: Configuring BGP-MVPN SAFI 129 IPv6

The example below shows the configuration for a PE router:

```
hostname PE1
!
!
vrf definition blue
 rd 55:1111
 route-target export 55:1111
 route-target import 55:1111
!
```

```

address-family ipv6
  mdt default 232.1.1.1
  mdt data 232.1.200.0 0.0.0.0
exit-address-family
!
!ip multicast-routing

Feature Information for BGP-MVPN SAFI 129 IPv6

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for BGP—MVPN SAFI 129 IPv6

Feature Name	Releases	Feature Information
BGP—MVPN SAFI 129 IPv6	15.2(4)S Cisco IOS XE Release 3.7S 15.3(1)T	SAFI 129 , known as VPN Multicast SAFI, provides the capability to support multicast routing in the service provider's core IPv6 network. The following commands were introduced or modified: address-family ipv6 , address-family vpnv6 , and show bgp vpnv6 multicast .
