

Implementing Traffic Filters and Firewalls for IPv6 Security

Last Updated: December 19, 2011

This module describes how to configure Cisco IOS IPv6 traffic filter and firewall features for your Cisco networking devices. These security features can protect your network from degradation or failure and also from data loss or compromised security resulting from intentional attacks and from unintended but damaging mistakes by well-meaning network users.

- Finding Feature Information, page 1
- Restrictions for Implementing Traffic Filters and Firewalls for IPv6 Security, page 1
- Information About Implementing Traffic Filters and Firewalls for IPv6 Security, page 2
- How to Implement Traffic Filters and Firewalls for IPv6 Security, page 5
- Configuration Examples for Implementing Traffic Filters and Firewalls for IPv6 Security, page 36
- Additional References, page 39
- Feature Information for Implementing Traffic Filters and Firewalls for IPv6 Security, page 41

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Implementing Traffic Filters and Firewalls for IPv6 Security

Cisco IOS Release 12.2(2)T through Cisco IOS Release 12.2(13)T and Cisco IOS Release 12.0(22)S and later releases support only standard IPv6 access control list (ACL) functionality. In Cisco IOS Release 12.0(23)S and 12.2(13)T or later releases, the standard IPv6 ACL functionality is extended to support

traffic filtering based on IPv6 option headers and optional, upper-layer protocol type information for finer granularity of control (functionality similar to extended ACLs in IPv4).

Information About Implementing Traffic Filters and Firewalls for IPv6 Security

- Access Control Lists for IPv6 Traffic Filtering, page 2
- Cisco IOS Firewall for IPv6, page 3
- Cisco IOS Zone-Based Firewall for IPv6, page 4
- ACL--Hardware and Software Counters Granularity for IPv4 and IPv6 ACL Statistics, page 4

Access Control Lists for IPv6 Traffic Filtering

The standard ACL functionality in IPv6 is similar to standard ACLs in IPv4. Access lists determine what traffic is blocked and what traffic is forwarded at router interfaces and allow filtering based on source and destination addresses, inbound and outbound to a specific interface. Each access list has an implicit deny statement at the end. IPv6 ACLs are defined and their deny and permit conditions are set using the **ipv6** access-listcommand with the **deny** and **permit** keywords in global configuration mode.

In Cisco IOS Release 12.0(23)S and 12.2(13)T or later releases, the standard IPv6 ACL functionality is extended to support traffic filtering based on IPv6 option headers and optional, upper-layer protocol type information for finer granularity of control (functionality similar to extended ACLs in IPv4).

- IPv6 ACL Extensions for IPsec Authentication Header, page 2
- Access Class Filtering in IPv6, page 2
- Tunneling Support, page 3
- Virtual Fragment Reassembly, page 3

IPv6 ACL Extensions for IPsec Authentication Header

This feature provides the ability to match on the upper layer protocol (ULP) (for example, TCP, User Datagram Protocol [UDP], ICMP, SCTP) regardless of whether an authentication header (AH) is present or absent.

TCP or UDP traffic can be matched to the upper-layer protocol (ULP) (for example, TCP, UDP, ICMP, SCTP) if an AH is present or absent. Before this feature was introduced, this function was only available if an AH was absent.

This feature introduces the keyword **auth** to the **permit** and **deny** commands. The **auth** keyword allows matching traffic against the presence of the authentication header in combination with the specified protocol; that is, TCP or UDP.

IPv6 traffic can be matched to a ULP when an AH header is present. To perform this function, enter the **ahp** option for the *protocol* argument when using the **permit** or **deny** command.

Access Class Filtering in IPv6

Filtering incoming and outgoing connections to and from the router based on an IPv6 ACL is performed using the **ipv6 access-class** command in line configuration mode. The **ipv6 access-class** command is similar to the **access-class** command, except the IPv6 ACLs are defined by a name. If the IPv6 ACL is

applied to inbound traffic, the source address in the ACL is matched against the incoming connection source address and the destination address in the ACL is matched against the local router address on the interface. If the IPv6 ACL is applied to outbound traffic, the source address in the ACL is matched against the local router address on the interface and the destination address in the ACL is matched against the outgoing connection source address. We recommend that identical restrictions are set on all the virtual terminal lines because a user can attempt to connect to any of them.

Tunneling Support

IPv6 packets tunneled in IPv4 are not inspected. If a tunnel terminates on a router, and IPv6 traffic exiting the tunnel is nonterminating, then the traffic is inspected.

Virtual Fragment Reassembly

When VFR is enabled, VFR processing begins after ACL input lists are checked against incoming packets. The incoming packets are tagged with the appropriate VFR information.

Cisco IOS Firewall for IPv6

The Cisco IOS Firewall feature provides advanced traffic filtering functionality as an integral part of a network's firewall. Cisco IOS Firewall for IPv6 enables you to implement Cisco IOS Firewall in IPv6 networks. Cisco IOS Firewall coexists with Cisco IOS Firewall for IPv4 networks and is supported on all dual-stack routers.

Cisco IOS Firewall for IPv6 features are as follows:

- Fragmented packet inspection--The fragment header is used to trigger fragment processing. Cisco IOS Firewall virtual fragment reassembly (VFR) examines out-of-sequence fragments and switches the packets into correct order, examines the number of fragments from a single IP given a unique identifier (Denial of Service [DoS] attack), and performs virtual reassembly to move packets to upper-layer protocols.
- IPv6 DoS attack mitigation--Mitigation mechanisms have been implemented in the same fashion as for IPv4 implementation, including SYN half-open connections.
- Tunneled packet inspection--Tunneled IPv6 packets terminated at a Cisco IOS firewall router can be inspected by the Cisco IOS Firewall for IPv6.
- Stateful packet inspection--The feature provides stateful packet inspection of TCP, UDP, Internet Control Message Protocol version 6 (ICMPv6), and FTP sessions.
- Stateful inspection of packets originating from the IPv4 network and terminating in an IPv6 environment--This feature uses IPv4-to-IPv6 translation services.
- Interpretation or recognition of most IPv6 extension header information--The feature provides IPv6
 extension header information including routing header, hop-by-hop options header, and fragment
 header is interpreted or recognized.
- Port-to-application mapping (PAM)--Cisco IOS Firewall for IPv6 includes PAM.
- PAM in Cisco IOS Firewall for IPv6, page 3
- Cisco IOS Firewall Alerts Audit Trails and System Logging, page 4
- IPv6 Packet Inspection, page 4
- Cisco IOS Firewall Restrictions, page 4

PAM in Cisco IOS Firewall for IPv6

PAM allows you to customize TCP or UDP port numbers for network services or applications. PAM uses this information to support network environments that run services using ports that are different from the registered or well-known ports associated with an application.

Using the port information, PAM establishes a table of default port-to-application mapping information at the firewall. The information in the PAM table enables Context-based Access Control (CBAC) supported services to run on nonstandard ports. CBAC is limited to inspecting traffic using only the well-known or registered ports associated with an application, whereas PAM allows network administrators to customize network access control for specific applications and services.

PAM also supports host- or subnet-specific port mapping, which allows you to apply PAM to a single host or subnet using standard ACLs. Host- or subnet-specific port mapping is done using standard ACLs.

Cisco IOS Firewall Alerts Audit Trails and System Logging

Cisco IOS Firewall generates real-time alerts and audit trails based on events tracked by the firewall. Enhanced audit trail features use system logging to track all network transactions; to record time stamps, source host, destination host, and ports used; and to record the total number of transmitted bytes for advanced, session-based reporting. Real-time alerts send system logging error messages to central management consoles when the system detects suspicious activity. Using Cisco IOS Firewall inspection rules, you can configure alerts and audit trail information on a per-application protocol basis. For example, if you want to generate audit trail information for TCP traffic, you can specify the generation of this information in the Cisco IOS Firewall rule that defines TCP inspection.

The Cisco IOS Firewall provides audit trail messages to record details about inspected sessions. Audit trail information is configurable on a per-application basis using the CBAC inspection rules. To determine which protocol was inspected, use the port number associated with the responder. The port number appears immediately after the address.

IPv6 Packet Inspection

The following header fields are all used for IPv6 inspection--traffic class, flow label, payload length, next header, hop limit, and source or destination address. For further information on and descriptions of the IPv6 header fields, see RFC 2474.

Cisco IOS Firewall Restrictions

Cisco IOS Intrusion Detection System (IDS) is not supported for IPv6.

Cisco IOS Zone-Based Firewall for IPv6

Cisco IOS Zone-Based Firewall for IPv6 coexists with Cisco IOS Zone-Based Firewall for IPv4 in order to support IPv6 traffic. The feature provides MIB support for TCP, UDP, ICMPv6, and FTP sessions.

For further information about Zone-Based Firewall, see "Zone-Based Policy Firewall" in *Cisco IOS Security Configuration Guide: Securing the Data Plane*.

ACL--Hardware and Software Counters Granularity for IPv4 and IPv6 ACL Statistics

Each IPv6 and IPv4 ACL entry maintains a global counter per entry for the number of matches applied to the ACL entry. The counters reflect all matches applied to the ACL, regardless of where the match was

applied (such as on the platform or in the software feature path). This feature allows both IPv4 and IPv6 ACLs on the Cisco Catalyst 6500 platform to update the ACL entry statistics with a platform entry count.

How to Implement Traffic Filters and Firewalls for IPv6 Security

- Configuring IPv6 Traffic Filtering, page 5
- Controlling Access to a vty, page 9
- Configuring TCP or UDP Matching, page 12
- Creating an IPv6 ACL for Traffic Filtering in Cisco IOS Release 12.2(11)T 12.0(22)S or Earlier Releases, page 13
- Configuring the Cisco IOS Firewall for IPv6, page 16
- Configuring Zone-Based Firewall in IPv6, page 22
- Configuring ACL Hardware and Software Counters Granularity for IPv4 and IPv6 ACL Statistics, page 27
- Verifying IPv6 Security Configuration and Operation, page 28
- Troubleshooting IPv6 Security Configuration and Operation, page 30

Configuring IPv6 Traffic Filtering

If you are running Cisco IOS Release 12.2(13)T, 12.0(23)S, or later releases, proceed to the Creating and Configuring an IPv6 ACL for Traffic Filtering, page 5 section. If you are running Cisco IOS Release 12.2(11)T, 12.0(22)S, or earlier releases, proceed to the Creating an IPv6 ACL for Traffic Filtering in Cisco IOS Release 12.2(11)T 12.0(22)S or Earlier Releases, page 13 section.

- Creating and Configuring an IPv6 ACL for Traffic Filtering, page 5
- Applying the IPv6 ACL to an Interface, page 8

Creating and Configuring an IPv6 ACL for Traffic Filtering

This section describes how to configure your networking devices to filter traffic, function as a firewall, or detect potential viruses. Perform this task to create an IPv6 ACL and configure the IPv6 ACL to filter traffic in Cisco IOS Release 12.2(13)T and 12.0(23)S or later releases.

In Cisco IOS Release 12.2(13)T and 12.0(23)S or later releases, for backward compatibility, the **ipv6 access-list**command with the **deny** and **permit** keywords in global configuration mode is still supported; however, an IPv6 ACL defined with deny and permit conditions in global configuration mode is translated to IPv6 access list configuration mode. See the Examples Creating and Applying IPv6 ACLs, page 36 section for an example of a translated IPv6 ACL configuration.

- Each IPv6 ACL contains implicit permit rules to enable IPv6 neighbor discovery. These rules can be overridden by the user by placing a deny ipv6 any any statement within an ACL. The IPv6 neighbor discovery process makes use of the IPv6 network layer service; therefore, by default, IPv6 ACLs implicitly allow IPv6 neighbor discovery packets to be sent and received on an interface. In IPv4, the Address Resolution Protocol (ARP), which is equivalent to the IPv6 neighbor discovery process, makes use of a separate data link layer protocol; therefore, by default, IPv4 ACLs implicitly allow ARP packets to be sent and received on an interface.
- Time-based and reflexive ACLs are not supported for IPv4 or IPv6 on the Cisco 12000 series platform. The **reflect**, **timeout**, and **time-range** keywords of the **permit** command in IPv6 are excluded on the Cisco 12000 series.

>

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. ipv6 access-list access-list-name
- **4.** Do one of the following:
 - permit protocol {source-ipv6-prefix | prefix-length | any | host source-ipv6-address | auth} [operator [port-number]] {destination-ipv6-prefix | prefix-length | any | host destination-ipv6-address | auth} [operator [port-number]] [dest-option-type [doh-number | doh-type]] [dscp value] [flow-label value] [fragments] [log] [log-input] [mobility] [mobility-type [mh-number | mh-type]] [reflect name [timeout value]] [routing] [routing-type routing-number] [sequence value] [time-range name]

•

deny protocol {source-ipv6-prefix / prefix-length | any | host source-ipv6-address / auth} [operator port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address / auth} [operator [port-number]] [dest-option-type [doh-number | doh-type]] [dscp value] [flow-label value] [fragments] [log] [log-input] [mobility] [mobility-type [mh-number | mh-type]] [routing] [routing-type routing-number] [sequence value] [time-range name] [undetermined-transport]

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
		Enter your password if prompted.
	Example:	
	Router> enable	

	Command or Action	Purpose
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	ipv6 access-list access-list-name	Defines an IPv6 ACL, and enters IPv6 access list configuration mode.
	Example:	• The <i>access-list name</i> argument specifies the name of the IPv6 ACL.
	Router(config)# ipv6 access-list outbound	IPv6 ACL names cannot contain a space or quotation mark, or begin with a numeral.

Step 4

Command or Action	Purpose
Do one of the following:	Specifies permit or deny conditions for an
• permit protocol {source-ipv6-prefix prefix-length any host source-ipv6-address auth} [operator [port-number]] {destination-ipv6-prefix prefix-length any host destination-ipv6-address auth} [operator [port-number]] [dest-option-type [doh-number doh-type]] [dscp value] [flow-label value] [fragments] [log] [log-input] [mobility] [mobility-type [mh-number mh-type]] [reflect name [timeout value]] [routing] [routing-type routing-number] [sequence value] [time-range name]	IPv6 ACL.
• deny protocol {source-ipv6-prefix prefix-length any host source-ipv6-address auth} [operator port-number]] {destination-ipv6-prefix prefix-length any host destination-ipv6-address auth} [operator [port-number]] [dest-option-type [doh-number doh-type]] [dscp value] [flow-label value] [fragments] [log] [log-input] [mobility] [mobility-type [mh-number mh-type]] [routing] [routing-type routing-number] [sequence value] [time-range name] [undetermined-transport]	
Example:	
<pre>Router(config-ipv6-acl)# permit tcp 2001:DB8:0300:0201::/32 eq telnet any reflect reflectout</pre>	
Example:	
Example:	
Example:	
Router(config-ipv6-acl)# deny tcp host 2001:DB8:1::1 any log-input	

Applying the IPv6 ACL to an Interface

Perform this task to apply the IPv6 ACL to an interface in Cisco IOS Release 12.2(13)T and 12.0(23)S or later releases.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- **3**. **interface** *type number*
- 4. ipv6 traffic-filter access-list-name {in| out}

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
		Enter your password if prompted.
	Example:	
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	interface type number	Specifies the interface type and number, and enters interface configuration mode.
	Example:	
	Router(config)# interface ethernet 0	
Step 4	ipv6 traffic-filter access-list-name {in out}	Applies the specified IPv6 access list to the interface specified in the previous step.
	Example:	
	Router(config-if)# ipv6 traffic-filter outbound out	

Controlling Access to a vty

- Creating an IPv6 ACL to Provide Access Class Filtering, page 9
- Applying an IPv6 ACL to the Virtual Terminal Line, page 11

Creating an IPv6 ACL to Provide Access Class Filtering

Perform this task to control access to a vty on a router by creating an IPv6 ACL to provide access class filtering.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. ipv6 access-list access-list-name
- **4.** Do one of the following:
 - permit protocol {source-ipv6-prefix | prefix-length | any | host source-ipv6-address | auth} [operator [port-number]] {destination-ipv6-prefix | prefix-length | any | host destination-ipv6-address | auth} [operator [port-number]] [dest-option-type [doh-number | doh-type]] [dscp value] [flow-label value] [fragments] [log] [log-input] [mobility] [mobility-type [mh-number | mh-type]] [reflect name [timeout value]] [routing] [routing-type routing-number] [sequence value] [time-range name]

deny protocol {source-ipv6-prefix / prefix-length | any| host source-ipv6-address / auth} [operator[port-number]] {destination-ipv6-prefix/prefix-length | any| host destination-ipv6-address | auth} [operator [port-number]] [dest-option-type [doh-number | doh-type]] [dscp value] [flow-label value] [fragments] [log] [log-input] [mobility] [mobility-type [mh-number | mh-type]] [routing] [routing-type routing-number] [sequence value] [time-range name] [undetermined-transport]

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	ipv6 access-list access-list-name	Defines an IPv6 ACL, and enters IPv6 access list configuration mode.
	Example:	mode.
	Router(config)# ipv6 access-list cisco	

Command or Action	Purpose
• permit protocol {source-ipv6-prefix prefix-length address auth} [operator [port-number]] {destination any host destination-ipv6-address auth} [operator type [doh-number doh-type]] [dscp value] [flow-labe [log-input] [mobility] [mobility-type [mh-number n [timeout value]] [routing] [routing-type routing-num [time-range name]	n-ipv6-prefix prefix-length [port-number]] [dest-option- el value] [fragments] [log] mh-type]] [reflect name
• deny protocol {source-ipv6-prefix prefix-length an auth} [operator[port-number]] {destination-ipv6-predestination-ipv6-address auth} [operator [port-num [doh-number doh-type]] [dscp value] [flow-label vainput] [mobility] [mobility-type [mh-number mh-tyrouting-number] [sequence value] [time-range name]	efix/prefix-length any host aber]] [dest-option-type elue] [fragments] [log] [log- eype]] [routing] [routing-type
Example:	
Router(config-ipv6-acl)# permit ipv6 host 2001:DE	B8:0:4::32 any eq telnet
Example:	
Example:	
	:0:6::6/32 any

Applying an IPv6 ACL to the Virtual Terminal Line

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. line [aux| console| tty| vty] line-number[ending-line-number]
- **4. ipv6 access-class** *ipv6-access-list-name* {**in**| **out**}

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
		Enter your password if prompted.
	Example:	
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	line [aux console tty vty] line-number[ending-line-number]	Identifies a specific line for configuration and enters line configuration mode.
	Example:	• In this example, the vty keyword is used to specify the virtual terminal lines for remote console access.
	Router(config)# line vty 0 4	
Step 4	ipv6 access-class ipv6-access-list-name {in out}	Filters incoming and outgoing connections to and from the router based on an IPv6 ACL.
	Example:	
	Router(config-line)# ipv6 access-class cisco in	

Configuring TCP or UDP Matching

TCP or UDP traffic can be matched to the ULP (for example, TCP, UDP, ICMP, SCTP) if an AH is present or absent. Before this feature was introduced, this function was only available if an AH was absent.

Use of the keyword **auth** with the **permit icmp** and **deny icmp** commands allows TCP or UDP traffic to be matched to the ULP if an AH is present. TCP or UDP traffic without an AH will not be matched.

IPv6 traffic can be matched to a ULP when an AH header is present. To perform this function, enter the **ahp** option for the *protocol* argument when using the **permit** or **deny** command.

Perform this task to allow TCP or UDP traffic to be matched to the ULP if an AH is present.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. ipv6 access-list access-list-name
- 4. permit icmp auth

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
		Enter your password if prompted.
	Example:	
	Router# enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	ipv6 access-list access-list-name	Defines an IPv6 access list and places the router in IPv6 access list configuration mode.
	Example:	
	Router(config)# ipv6 access-list list1	
Step 4	permit icmp auth	Specifies permit or deny conditions for an IPv6 ACL using the auth keyword, which is used to match against the presence of the AH.
	Example:	
	Example:	
	•	
	or	
	Example:	
	deny icmp auth	
	Example:	
	Router(config-ipv6-acl)# permit icmp auth	

Creating an IPv6 ACL for Traffic Filtering in Cisco IOS Release 12.2(11)T 12.0(22)S or Earlier Releases

Perform the following tasks to create and apply ACLs in Cisco IOS Release 12.2(11)T, 12.0(22)S, or earlier releases.

• Creating an IPv6 ACL in Cisco IOS Release 12.2(11)T 12.0(22)S or Earlier Releases, page 14

• Applying the IPv6 ACL to an Interface in Cisco IOS Release 12.2(11)T 12.0(22)S or Earlier Releases, page 15

Creating an IPv6 ACL in Cisco IOS Release 12.2(11)T 12.0(22)S or Earlier Releases

Perform this task to create an IPv6 ACL and configure the IPv6 ACL to pass or block traffic in Cisco IOS Release 12.2(11)T, 12.0(22)S, or earlier releases.

- The *source-ipv6-prefix* argument filters traffic by packet source address, and the *destination-ipv6-prefix* argument filters traffic by packet destination address.
- The Cisco IOS software compares an IPv6 prefix against the permit and deny condition statements in
 the access list. Every IPv6 access list, including access lists that do not have any permit and deny
 condition statements, has an implicit deny any any statement as its last match condition. The priority
 or sequence value applied to each condition statement dictates the order in which the statement is
 applied in the access list.

>

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- **3. ipv6 access-list** *access-list-name* {**permit** | **deny**} {*source-ipv6-prefix* / *prefix-length*| **any**} {*destination-ipv6-prefix* / *prefix-length*| **any**} [**priority** *value*]

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
		Enter your password if prompted.
	Example:	
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	

	Command or Action	Purpose
Step 3	ipv6 access-list access-list-name {permit deny} {source-ipv6-prefix prefix-length any} {destination-ipv6-prefix prefix-length any} [priority value]	Creates an IPv6 ACL and sets deny or permit conditions for the ACL.
	Example:	
	Router(config)# ipv6 access-list list2 deny fec0:0:0:2::/64 any	

Applying the IPv6 ACL to an Interface in Cisco IOS Release 12.2(11)T 12.0(22)S or Earlier Releases

Perform this task to apply the IPv6 ACL to an interface in Cisco IOS Release 12.2(11)T, 12.0(22)S, or earlier releases.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- **3. interface** *type number*
- **4. ipv6 traffic-filter** *access-list-name* {**in**| **out**}

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
		Enter your password if prompted.
	Example:	
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	interface type number	Specifies the interface type and number, and enters interface configuration mode.
	Example:	
	Router(config)# interface ethernet 0	

	Command or Action	Purpose
Step 4	ipv6 traffic-filter access-list-name {in out}	Applies the specified IPv6 access list to the interface specified in the previous step.
	Example:	
	Router(config-if)# ipv6 traffic-filter list2 out	

Configuring the Cisco IOS Firewall for IPv6

This configuration scenario uses both packet inspection and ACLs.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. ipv6 unicast-routing
- **4. ipv6 inspect name** *inspection-name protocol* [**alert** {**on** | **off**}] [**audit-trail**{**on** | **off**}] [**timeout** *seconds*]
- **5. interface** *type number*
- **6. ipv6 address** { *ipv6-address | prefix-length | prefix-name sub-bits | prefix-length*
- 7. ipv6 enable
- 8. ipv6 traffic-filter access-list-name {in | out
- **9.** ipv6 inspect inspection-name {in | out

10. ipv6 access-list access-list-name

- **11.** Do one of the following:
 - permit protocol {source-ipv6-prefix/prefix-length | any | host source-ipv6-address | auth} [operator [port-number]] {destination-ipv6-prefix | prefix-length | any | host destination-ipv6-address | auth} [operator [port-number]] [dest-option-type [doh-number | doh-type]] [dscp value] [flow-label value] [fragments] [log] [log-input] [mobility] [mobility-type [mh-number | mh-type]] [reflect name [timeout value]] [routing] [routing-type routing-number] [sequence value] [time-range name]
 - •
 - deny protocol {source-ipv6-prefix / prefix-length | any | host source-ipv6-address / auth} [operator[port-number]] {destination-ipv6-prefix/prefix-length | any | host | destination-ipv6-address / auth} [operator [port-number]] [dest-option-type [doh-number | doh-type]] [dscp | value] [flow-label | value] [fragments] [log] [log-input] [mobility] [mobility-type [mh-number | mh-type]] [routing] [routing-type | routing-number] [sequence | value] [time-range | name] [undetermined-transport]

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
		Enter your password if prompted.
	Example:	
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	ipv6 unicast-routing	Enables IPv6 unicast routing.
	Example:	
Cton /	Router(config)# ipv6 unicast-routing	Defines a set of IDv6 insmedian rules for
Step 4	ipv6 inspect name inspection-name protocol [alert {on off}] [audit-trail{on off}] [timeout seconds]	Defines a set of IPv6 inspection rules for the firewall.
	Example:	
	Router(config)# ipv6 inspect name ipv6_test icmp timeout 60	
Step 5	interface type number	Specifies the interface on which the inspection will occur.
	Example:	
	Router(config)# interface FastEthernet0/0	
Step 6	ipv6 address { ipv6-address / prefix-length prefix-name sub-bits / prefix-length	Provides the address for the inspection interface.
	Example:	
	Router(config-if)# ipv6 address 3FFE:C000:0:7::/64 eui-64	
Step 7	ipv6 enable	Enables IPv6 routing.
		Note This step is optional if the IPv6 address is specified in step 6.
	Example:	address is specified in step 0.
	Router(config-if)# ipv6 enable	

	Command or Action	Purpose
Step 8	ipv6 traffic-filter access-list-name {in out	Applies the specified IPv6 access list to the interface specified in the previous step.
	Example:	
	Router(config-if)# ipv6 traffic-filter outbound out	
Step 9	ipv6 inspect inspection-name {in out	Applies the set of inspection rules.
	Example:	
	Router(config)# ipv6 inspect ipv6_test in	
Step 10	ipv6 access-list access-list-name	Defines an IPv6 ACL and enters IPv6 access list configuration mode. The router prompt changes to Router(config-
	Example:	ipv6-acl)#.
	Router(config)# ipv6 access-list outbound	

_	Command or Action	Purpose
p 11	 permit protocol {source-ipv6-prefix/prefix-length any host source-ipv6-address auth} [operator [port-number]] {destination-ipv6-prefix prefix-length any host destination-ipv6-address auth} [operator [port-number]] [dest-option-type [doh-number doh-type]] [dscp value] [flow-label value] [fragments] [log] [log-input] [mobility] [mobility-type [mh-number mh-type]] [reflect name [timeout value]] [routing] [routing-type routing-number] [sequence value] [time-range name] 	Specifies permit or deny conditions for an IPv6 ACL.
	 deny protocol {source-ipv6-prefix prefix-length any host source-ipv6-address auth } [operator[port-number]] {destination-ipv6-prefix/prefix-length any host destination-ipv6-address auth } [operator [port-number]] [dest-option-type [doh-number doh-type]] [dscp value] [flow-label value] [fragments] [log] [log-input] [mobility] [mobility-type [mh-number mh-type]] [routing] [routing-type routing-number] [sequence value] [time-range name] [undetermined-transport] 	
	Example:	
	Router(config-ipv6-acl)# permit tcp 2001:DB8:0300:0201::/32 any reflect reflectout	
	Example:	
	Example:	
	Router(config-ipv6-acl)# deny tcp fec0:0:0:0201::/64 any	

• Configuring PAM for IPv6, page 19

Configuring PAM for IPv6

- Creating an IPv6 Access Class Filter for PAM, page 19
- Applying the IPv6 Access Class Filter to PAM, page 21

Creating an IPv6 Access Class Filter for PAM

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. ipv6 access-list access-list-name
- **4.** Do one of the following:
 - permit protocol {source-ipv6-prefix/prefix-length | any | hostsource-ipv6-address | auth} [operator [port-number]] {destination-ipv6-prefix | prefix-length | any | hostdestination-ipv6-address | auth} [operator [port-number]] [dest-option-type [doh-number | doh-type]] [dscpvalue] [flow-label value] [fragments] [log] [log-input] [mobility] [mobility-type [mh-number | mh-type]] [reflect name [timeout value]] [routing] [routing-type routing-number] [sequence value] [time-range name]

_

• deny protocol source-ipv6-prefix | prefix-length | any | host source-ipv6-address | auth } [operator port-number]] destination-ipv6-prefix/prefix-length any host destination-ipv6-address | auth } [operator port-number]] dest-option-type [doh-number | doh-type]] [dscp value flow-label value fragments log log-input] [mobility] [mobility-type [mh-number | mh-type]] [routing] [routing-type routing-number] [sequence value] [time-range name undetermined-transport]

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	ipv6 access-list access-list-name	Defines an IPv6 ACL and enters IPv6 access list configuration mode.
	Example:	
	Router(config)# ipv6 access-list outbound	

C	ommand or Action	Purpose
4 D	o one of the following:	Specifies permit or deny
	permit protocol {source-ipv6-prefix/prefix-length any hostsource-ipv6-address auth} [operator [port-number]] {destination-ipv6-prefix prefix-length any hostdestination-ipv6-address auth} [operator [port-number]] [dest-option-type [doh-number doh-type]] [dscpvalue] [flow-label value] [fragments] [log] [log-input] [mobility] [mobility-type [mh-number mh-type]] [reflect name [timeout value]] [routing] [routing-type routing-number] [sequence value] [time-range name]	conditions for an IPv6 ACL
	deny protocol source-ipv6-prefix prefix-length any host source-ipv6-address auth [operator port-number]] destination-ipv6-prefix/prefix-length any host destination-ipv6-address auth [operator port-number]] dest-option-type [dohnumber doh-type]] [dscp value flow-label value fragments log log-input] [mobility-type [mh-number mh-type]] [routing] [routing-type routing-number] [sequence value] [time-range name undetermined-transport	
E	xample:	
	outer(config-ipv6-acl)# permit tcp 2001:DB8:0300:0201::/32 any reflect eflectout

	xample:	
E		

Applying the IPv6 Access Class Filter to PAM

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. ipv6 port-map application-name port port-num [list acl-name

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
		Enter your password if prompted.
	Example:	
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	ipv6 port-map application-name port port-num [list acl-name	Establishes PAM for the system.
	Example:	
	Router(config)# ipv6 port-map ftp port 8090 list PAMACL	

Configuring Zone-Based Firewall in IPv6

- Configuring an Inspect-Type Parameter Map, page 22
- Creating and Using an Inspect-Type Class Map, page 23
- Creating and Using an Inspect-Type Policy Map, page 25
- Creating Security Zones and Zone Pairs, page 26

Configuring an Inspect-Type Parameter Map

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- $\textbf{3. parameter-} map \ type \ inspect \ \{\textit{parameter-} map\textit{-} name \ | \ \textbf{global} \ | \ \textbf{default} \}$
- 4. sessions maximum sessions
- ${\bf 5.}\ \ ipv {\bf 6}\ routing\text{-}enforcement\text{-}header\ loose$

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
		Enter your password if prompted.
	Example:	
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	<pre>parameter-map type inspect {parameter-map-name global default}</pre>	Configures an inspect type parameter map for connecting thresholds, timeouts, and other parameters pertaining to the inspect action, and places the router in parameter map configuration mode.
	Example:	
	Router(config)# parameter-map type inspect v6-param-map	
Step 4	sessions maximum sessions	Sets the maximum number of allowed sessions that can exist on a zone pair.
	Example:	
	Router(config-profile)# sessions maximum 10000	
Step 5	ipv6 routing-enforcement-header loose	Provides backward compatibility with legacy IPv6 inspection.
	Example:	
	Router(config-profile)# ipv6 routing-enforcement- header loose	

Creating and Using an Inspect-Type Class Map

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 4. match protocol tcp
- 5. match protocol udp
- 6. match protocol icmp
- 7. match protocol ftp

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
		Enter your password if prompted.
	Example:	
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	class-map type inspect {match-any match-all} class-map-name	Create an inspect type class map, and places the router in lass-map configuration mode.
	Example:	
	Router(config-profile)# class-map type inspect matchany v6-class $% \left(\frac{1}{2}\right) =\frac{1}{2}\left(\frac{1}{2}\right) +\frac{1}{2}\left($	
Step 4	match protocol tcp	Configures the match criterion for a class map based on TCP.
	Example:	
	Router(config-cmap)# match protocol tcp	
Step 5	match protocol udp	Configures the match criterion for a class map based on UDP.
	Example:	
	Router(config-cmap)# match protocol udp	

	Command or Action	Purpose
Step 6	match protocol icmp	Configures the match criterion for a class map based on ICMP.
	Example:	
	Router(config-cmap)# match protocol icmp	
Step 7	match protocol ftp	Configures the match criterion for a class map based on FTP.
	Example:	
	Router(config-cmap)# match protocol ftp	

Creating and Using an Inspect-Type Policy Map

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- **3.** policy-map type inspect policy-map-name
- **4.** class type inspect class-map-name
- **5. inspect** [parameter-map-name]

	Command or Action	Purpose	
Step 1	enable	Enables privileged EXEC mode.	
		Enter your password if prompted.	
	Example:		
	Router> enable		
Step 2	configure terminal	Enters global configuration mode.	
	Example:		
	Router# configure terminal		
Step 3	policy-map type inspect policy-map-name	Creates an inspect-type policy map, and places the router in policy-map configuration mode.	
	Example:		
	Router(config)# policy-map type inspect v6-policy		
	Configure terminal Example: Router# configure terminal policy-map type inspect policy-map-name Example:	Enters global configuration mode. Creates an inspect-type policy map, and places the router in	

	Command or Action	Purpose
Step 4	class type inspect class-map-name	Specifies the traffic (class) on which an action is to be performed.
	Example:	
	Router(config-pmap)# class type inspect v6-class	
Step 5	inspect [parameter-map-name]	Enables Cisco IOS stateful packet inspection.
	Example:	
	Router(config-pmap)# inspect	

Creating Security Zones and Zone Pairs

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- **3. zone security** {*zone-name* | **default**}
- **4. zone security** {*zone-name* | **default**}
- **5. zone-pair security** *zone-pair-name* **source** {*source-zone-name* | **self** | **default**} **destination** {*destination-zone-name* | **self** | **default**}
- **6. service-policy type inspect** *policy-map-name*

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
		Enter your password if prompted.
	Example:	
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	

	Command or Action	Purpose
Step 3	zone security {zone-name default}	Creates a security zone.
	Example:	Cisco recommends that you create at least two security zones so that you can create a zone pair.
	Router(config)# zone security 1	
Step 4	zone security {zone-name default}	Creates a security zone.
	Example:	Cisco recommends that you create at least two security zones so that you can create a zone pair.
	Router(config)# zone security 2	
Step 5	zone-pair security zone-pair-name source {source-zone-name self default} destination {destination-zone-name self default}	Creates a zone pair, and places the router in zone-pair configuration mode.
	Example:	
	Router(config)# zone-pair security zp source z1 destination z2	
Step 6	service-policy type inspect policy-map-name	Attaches a firewall policy map to a zone pair.
	Example:	
	Router(config-sec-zone-pair)# service-policy type inspect v6-policy	

Configuring ACL Hardware and Software Counters Granularity for IPv4 and IPv6 ACL Statistics

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. ipv6 access-list access-list-name
- 4. hardware statistics

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
		Enter your password if prompted.
	Example:	
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	ipv6 access-list access-list-name	Defines an IPv6 ACL and enters IPv6 access list configuration mode.
	Example:	
	Router(config)# ipv6 access-list outbound	
Step 4	hardware statistics	Enables the collection of hardware statistics.
	Example:	
	Router(config-ipv6-acl)# hardware statistics	

Verifying IPv6 Security Configuration and Operation

SUMMARY STEPS

- 1. show crypto ipsec sa [map map-name | address | identity | interface interface-type interface-number | peer [vrf fvrf-name] address | vrf ivrf-name | ipv6 [interface-type interface-number]] [detail
- 2. show crypto isakmp peer [config | detail]
- 3. show crypto isakmp profile
- 4. show crypto isakmp sa [active | standby | detail | nat
- **5. show ipv6 access-list** [access-list-name]
- 6. show ipv6 inspect {name inspection-name | config | interfaces | session [detail] | all}
- 7. **show ipv6 port-map** [application | **port** port-number
- 8. show ipv6 prefix-list [detail | summary] [list-name
- 9. show ipv6 virtual-reassembly interface interface-type
- **10.** show logging [slot slot-number | summary

	Command or Action	Purpose
Step 1	show crypto ipsec sa [map map-name address identity interface interface-type interface-number peer [vrf fvrf-name] address vrf ivrf-name ipv6 [interface-type interface-number]] [detail	Displays the settings used by current SAs.
	Example:	
	Router# show crypto ipsec sa ipv6	
Step 2	show crypto isakmp peer [config detail]	Displays peer descriptions.
	F	
	Example:	
	Router# show crypto isakmp peer	
Step 3	show crypto isakmp profile	Lists all the ISAKMP profiles that are defined on a router.
	Example:	
	Router# show crypto isakmp profile	
Step 4	show crypto isakmp sa [active standby detail nat	Displays current IKE SAs.
	Example:	
	Router# show crypto isakmp sa	
Step 5	show ipv6 access-list [access-list-name]	Displays the contents of all current IPv6 access lists.
	Example:	
	Router# show ipv6 access-list	
Step 6	show ipv6 inspect {name inspection-name config interfaces session [detail] all}	Displays CBAC configuration and session information.
	Evernoles	
	Example:	
	Router# show ipv6 inspect interfaces	

	Command or Action	Purpose
Step 7	show ipv6 port-map [application port port-number	Displays PAM configuration.
	Example:	
	Router# show ipv6 port-map ftp	
Step 8	show ipv6 prefix-list [detail summary] [list-name	Displays information about an IPv6 prefix list or IPv6 prefix list entries.
	Example:	
	Router# show ipv6 prefix-list	
Step 9	show ipv6 virtual-reassembly interface interface-type	Displays configuration and statistical information of VFR.
	Example:	
	Router# show ipv6 virtual-reassembly interface e1/1	
Step 10	show logging [slot slot-number summary	Displays the state of system logging (syslog) and the contents of the standard system logging buffer.
	Example: Router# show logging	Access list entries with the log or log- inputkeywords will be logged when a packet matches the access list entry.
		matches the access list entry.

Troubleshooting IPv6 Security Configuration and Operation

SUMMARY STEPS

- 1. enable
- **2.** clear ipv6 access-list [access-list-name]
- **3. clea r ipv6 inspect** {**session** *session-number* | all}
- **4. clear ipv6 prefix-list** [prefix-list-name] [ipv6-prefix | prefix-length
- 5. debug crypto ipsec
- 6. debug crypto engine packet [detail
- 7. debug ipv6 inspect {function-trace | object-creation | object-deletion | events | timers | protocol | detailed
- 8. debug ipv6 packet [access-list access-list-name] [detail]

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
		Enter your password if prompted.
	Example:	
	Router# enable	
Step 2	clear ipv6 access-list [access-list-name]	Resets the IPv6 access list match counters.
	Example:	
	Router# clear ipv6 access-list tin	
Step 3	clea r ipv6 inspect {session session-number all}	Removes a specific IPv6 session or all IPv6 inspection sessions.
	Example:	
	Router# clear ipv6 inspect all	
Step 4	clear ipv6 prefix-list [prefix-list-name] [ipv6-prefix / prefix-length	Resets the hit count of the IPv6 prefix list entries.
	Example:	
	Router# clear ipv6 prefix-list	
Step 5	debug crypto ipsec	Displays IPsec network events.
	Example:	
	Router# debug crypto ipsec	
Step 6	debug crypto engine packet [detail	Displays the contents of IPv6 packets.
		Caution Using this command could flood the system and increase CPU usage if several packets
	Example:	are being encrypted.
	Router# debug crypto engine packet	
Step 7	debug ipv6 inspect {function-trace object-creation object-deletion events timers protocol detailed	Displays messages about Cisco IOS Firewall events.
	English	
	Example:	
	Router# debug ipv6 inspect timers	

	Command or Action	Purpose
Step 8	debug ipv6 packet [access-list access-list-name] [detail]	Displays debugging messages for IPv6 packets.
	Example:	
	Router# debug ipv6 packet access-list PAK-ACL	

• Examples, page 32

Examples

Sample Output from the show crypto ipsec sa ipv6 Command

The following is sample output from the **show crypto ipsec sa ipv6** command:

```
Router# show crypto ipsec sa ipv6

Sample Output from the show crypto isakmp peer Command

The following sample output shows peer descriptions on an IPv6 router:

```
Router# show crypto isakmp peer detail
Peer: 2001:DB8:0:1::1 Port: 500 Local: 2001:DB8:0:2::1
Phasel id: 2001:DB8:0:1::1
flags:
NAS Port: 0 (Normal)
IKE SAs: 1 IPsec SA bundles: 1
last_locker: 0x141A188, last_last_locker: 0x0
last_unlocker: 0x0, last_last_unlocker: 0x0
```

Sample Output from the show crypto isakmp profile Command

The following sample output shows the ISAKMP profiles that are defined on an IPv6 router:

```
Router# show crypto isakmp profile
ISAKMP PROFILE tom
Identities matched are:
ipv6-address 2001:DB8:0:1::1/32
Certificate maps matched are:
Identity presented is: ipv6-address fqdn
keyring(s): <none>
trustpoint(s): <all>
```

Sample Output from the show crypto isakmp sa Command

The following sample output shows the SAs of an active IPv6 device. The IPv4 device is inactive:

Router# show crypto isakmp sa detail

```
Codes: C - IKE configuration mode, D - Dead Peer Detection
       K - Keepalives, N - NAT-traversal

```

Sample Output from the show ipv6 access-list Command

In the following example, the **show ipv6 access-list**command is used to verify that IPv6 ACLs are configured correctly:

```
Router> show ipv6 access-list IPv6 access list inbound
```

```
permit tcp any any eq bgp reflect tcptraffic (8 matches) sequence 10 permit tcp any any eq telnet reflect tcptraffic (15 matches) sequence 20 permit udp any any reflect udptraffic sequence 30

IPv6 access list tcptraffic (reflexive) (per-user) permit tcp host 2001:DB8:1::32 eq bgp host 2001:DB8:2::32 eq 11000 timeout 300

(time left 243) sequence 1 permit tcp host 2001:DB8:1::32 eq telnet host 2001:DB8:2::32 eq 11001 timeout 300

(time left 296) sequence 2

IPv6 access list outbound evaluate udptraffic evaluate tcptraffic
```

Sample Output from the show ipv6 prefix-list Command

The following example shows the output of the **show ipv6 prefix-list** command with the **detail** keyword:

```
Router# show ipv6 prefix-list detail
Prefix-list with the last deletion/insertion: bgp-in
ipv6 prefix-list 6to4:
   count: 1, range entries: 0, sequences: 5 - 5, refcount: 2
   seg 5 permit 2001:DB8::/32 (hit count: 313, refcount: 1)
ipv6 prefix-list aggregate:
   count: 2, range entries: 2, sequences: 5 - 10, refcount: 30
   seq 5 deny 3FFE:C00::/24 ge 25 (hit count: 568, refcount: 1)
   seq 10 permit ::/0 le 48 (hit count: 31310, refcount: 1)
ipv6 prefix-list bgp-in:
   count: 6, range entries: 3, sequences: 5 - 30, refcount: 31
   seg 5 deny 5F00::/8 le 128 (hit count: 0, refcount: 1)
   seq 10 deny ::/0 (hit count: 0, refcount: 1)
   seq 15 deny ::/1 (hit count: 0, refcount:
                                             1)
   seq 20 deny ::/2 (hit count: 0, refcount: 1)
   seq 25 deny ::/3 ge 4 (hit count: 0, refcount: 1)
   seq 30 permit ::/0 le 128 (hit count: 240664, refcount: 0)
```

Sample Output from the show ipv6 virtual-reassembly Command

The following example shows the output of the **show ipv6 virtual-reassembly**command with the **interface**keyword:

Sample Output from the show logging Command

In the following example, the **show logging**command is used to display logging entries that match the first line (sequence 10) of the access list named list1:

```
Router> show logging 00:00:36: %IPV6-6-ACCESSLOGP: list list1/10 permitted tcp 2001:DB8:1::1(11001) (Ethernet0/0) -> 2001:DB8:1::2(179), 1 packet
```

Sample Output from the clear ipv6 access-list Command

In the following example, the **show ipv6 access-list**command is used to display some match counters for the access list named list1. The **clear ipv6 access-list**command is issued to reset the match counters for the

access list named list1. The **show ipv6 access-list**command is used again to show that the match counters have been reset.

```
Router> show ipv6 access-list list1

IPv6 access list list1

permit tcp any any log-input (6 matches) sequence 10

permit icmp any any echo-request log-input sequence 20

permit icmp any any echo-reply log-input sequence 30

Router# clear ipv6 access-list list1

Router# show ipv6 access-list list1

IPv6 access list list1

permit tcp any any log-input sequence 10

permit icmp any any echo-request log-input sequence 20

permit icmp any any echo-reply log-input sequence 30
```

Examples Creating and Applying IPv6 ACLs

- Example Creating and Applying an IPv6 ACL for Release 12.2(13)T or 12.0(23)S, page 36
- Example Creating and Applying an IPv6 ACL for 12.2(11)T 12.0(22)S or Earlier Releases, page 37

Example Creating and Applying an IPv6 ACL for Release 12.2(13)T or 12.0(23)S

The following example is from a router running Cisco IOS Release 12.2(13)T.

The example configures two IPv6 ACLs named OUTBOUND and INBOUND and applies both ACLs to outbound and inbound traffic on Ethernet interface 0. The first and second permit entries in the OUTBOUND list permit all TCP and User Datagram Protocol (UDP) packets from network 2001:DB8:0300:0201::/32 to exit out of Ethernet interface 0. The entries also configure the temporary IPv6 reflexive ACL named REFLECTOUT to filter returning (incoming) TCP and UDP packets on Ethernet interface 0. The first deny entry in the OUTBOUND list keeps all packets from the network fec0:0:0:0201::/64 (packets that have the site-local prefix fec0:0:0:0201 as the first 64 bits of their source IPv6 address) from exiting out of Ethernet interface 0.

The **evaluate** command in the INBOUND list applies the temporary IPv6 reflexive ACL named REFLECTOUT to inbound TCP and UDP packets on Ethernet interface 0. When outgoing TCP or UDP packets are permitted on Ethernet interface 0 by the OUTBOUND list, the INBOUND list uses the REFLECTOUT list to match (evaluate) the returning (incoming) TCP and UDP packets.

```
ipv6 access-list OUTBOUND
  permit tcp 2001:DB8:0300:0201::/32 any reflect REFLECTOUT
  permit udp 2001:DB8:0300:0201::/32 any reflect REFLECTOUT
  deny fec0:0:0:0201::/64 any
  ipv6 access-list INBOUND
```

```
evaluate REFLECTOUT
interface ethernet 0
ipv6 traffic-filter OUTBOUND out
ipv6 traffic-filter INBOUND in
```

Given that a **permit any any** statement is not included as the last entry in the OUTBOUND or INBOUND ACL, only TCP and UDP packets matching the configured permit entries in the ACL and ICMP packets matching the implicit permit conditions in the ACL are permitted out of and in to Ethernet interface 0 (the implicit deny all condition at the end of the ACL denies all other packet types on the interface).

The following example can be run on a router running Cisco IOS Release 12.2(13)T or 12.0(23)S.

The example configures HTTP access to be restricted to certain hours during the day, and to log any activity outside of the permitted hours:

```
time-range lunchtime
periodic weekdays 12:00 to 13:00
ipv6 access-list OUTBOUND
permit tcp any any eq www time-range lunchtime
deny tcp any any eq www log-input
permit tcp 2001:DB8::/32 any
permit udp 2001:DB8::/32 any
```

Example Creating and Applying an IPv6 ACL for 12.2(11)T 12.0(22)S or Earlier Releases

The following example is from a router running Cisco IOS Release 12.2(11)T, 12.0(22)S, or earlier releases.

The example configures the IPv6 ACL named list2 and applies the ACL to outbound traffic on Ethernet interface 0. Specifically, the first ACL entry keeps all packets from the network fec0:0:0:2::/64 (packets that have the site-local prefix fec0:0:0:2 as the first 64 bits of their source IPv6 address) from exiting out of Ethernet interface 0. The second entry in the ACL permits all other traffic to exit out of Ethernet interface 0. The second entry is necessary because an implicit deny all condition is at the end of each IPv6 ACL.

```
ipv6 access-list list2 deny fec0:0:0:2::/64 any
ipv6 access-list list2 permit any any
interface ethernet 0
  ipv6 traffic-filter list2 out
```

If the same configuration was used on a router running Cisco IOS Release 12.2(13)T, 12.0(23)S, or later releases, the configuration would be translated into IPv6 access list configuration mode as follows:

```
ipv6 access-list list2
  deny ipv6 fec0:0:0:2::/64 any
  permit ipv6 any any
interface ethernet 0
  ipv6 traffic-filter list2 out
```

IPv6 is automatically configured as the protocol type in **permit any any** and **deny any any** statements that are translated from global configuration mode to IPv6 access list configuration mode.

Example Controlling Access to a vty

In the following example, incoming connections to the virtual terminal lines 0 to 4 are filtered based on the IPv6 access list named acl1:

```
ipv6 access-list acl1
  permit ipv6 host 2001:DB8:0:4::2/32 any!
line vty 0 4
  ipv6 access-class acl1 in
```

Example Configuring TCP or UDP Matching

The following example allows any TCP traffic regardless of whether or not an AH is present:

```
IPv6 access list example1 permit tcp any any
```

The following example allows TCP or UDP parsing only when an AH header is present. TCP or UDP traffic without an AH will not be matched:

```
IPv6 access list example2
deny tcp host 2001::1 any log sequence 5
permit tcp any any auth sequence 10
permit udp any any auth sequence 20
```

The following example allows any IPv6 traffic containing an authentication header:

```
IPv6 access list example3 permit ahp any any
```

Example Configuring Cisco IOS Firewall for IPv6

This Cisco IOS Firewall configuration example uses inbound and outbound filters for inspection and makes use of access lists to manage the traffic. The inspect mechanism is the method of permitting return traffic based upon a packet being valid for an existing session for which the state is being maintained:

```
enable
configure terminal
 ipv6 unicast-routing
  ipv6 inspect name ipv6_test icmp timeout 60
  ipv6 inspect name ipv6_test tcp timeout 60
  ipv6 inspect name ipv6_test udp timeout 60
interface FastEthernet0/0
  ipv6 address 3FFE:C000:0:7::/64 eui-64
  ipv6 enable
  ipv6 traffic-filter INBOUND out
  ipv6 inspect ipv6_test in
interface FastEthernet0/1
  ipv6 address 3FFE:C000:1:7::/64 eui-64
  ipv6 enable
  ipv6 traffic-filter OUTBOUND in
! This is used for 3745b connection to tftpboot server
interface FastEthernet4/0
  ip address 192.168.17.33 255.255.255.0
  duplex auto
  speed 100
ip default-gateway 192.168.17.8
```

```
! end of tftpboot server config

! Access-lists to deny everything except for Neighbor Discovery ICMP messages ipv6 access-list INBOUND permit icmp any any nd-na permit icmp any any nd-ns deny ipv6 any any log

ipv6 access-list OUTBOUND permit icmp any any nd-na permit icmp any any nd-na permit icmp any any nd-ns deny ipv6 any any log
```

Example Configuring Cisco IOS Zone-Based Firewall for IPv6

The following example shows how to enable the zone-based firewall, enabling inspection of IPv6 traffic flowing through the router.

```
parameter-map type inspect v6-param-map sessions maximum 10000 ipv6 routing-header-enforcement loose!
!
!
class-map type inspect match-any v6-class match protocol tcp match protocol udp match protocol icmp match protocol ftp!
!
policy-map type inspect v6-policy class type inspect v6-class inspect!
zone security z1 zone security z2
! zone-pair security zp source z1 destination z2 service-policy type inspect v6-policy
```

Feature Information for Implementing Traffic Filters and Firewalls for IPv6 Security

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1 Feature Information for Implementing Traffic Filters and Firewalls for IPv6 Security

Feature Name	Releases	Feature Information
ACLHardware and Software Counters Granularity for IPv4 and IPv6 ACL Statistics	12.2(50)SY	This feature allows both IPv4 and IPv6 ACLs on the Cisco Catalyst 6500 platform to update the ACL entry statistics with a platform entry count.
IOS Zone-Based Firewall	15.1(2)T	Cisco IOS Zone-Based Firewall for IPv6 coexists with Cisco IOS Zone-Based Firewall for IPv4 in order to support IPv6 traffic.
IPv6 ACL Extensions for IPsec Authentication Header	12.4(20)T	The IPv6 ACL extensions for IPsec authentication headers feature allows TCP or UDP parsing when an IPv6 IPsec authentication header is present.

Feature Name	Releases	Feature Information
IPv6 ServicesExtended Access Control Lists [‡]	12.0(23)S 12.2(14)S 12.2(28)SB 12.2(25)SG 12.2(33)SRA 12.2(17a)SX112.2(13)T 12.3 12.3(2)T 12.4 12.4(2)T 15.0(1)S	Standard IPv6 ACL functionality was extended to support traffic filtering based on IPv6 option headers and optional, upper-layer protocol type information for finer granularity of control.
IPv6 ServicesIPv6 IOS Firewall	12.3(7)T 12.4 12.4(2)T	This feature provides advanced traffic filtering functionality as an integral part of a network's firewall.
IPv6 ServicesIPv6 IOS Firewall FTP Application Support	12.3(11)T 12.4 12.4(2)T	IPv6 supports this feature.
IPv6 ServicesStandard Access Control Lists	12.0(22)S 12.2(14)S 12.2(28)SB 12.2(25)SG 12.2(33)SRA 12.2(17a)SX1 12.2(2)T 12.3 12.3(2)T 12.4 12.4(2)T 15.0(1)S	Access lists determine what traffic is blocked and what traffic is forwarded at router interfaces and allow filtering based on source and destination addresses, inbound and outbound to a specific interface.
