

## **MPLS LDP Session Protection**

The MPLS LDP Session Protection feature provides faster Label Distribution Protocol (LDP) convergence when a link recovers following an outage. MPLS LDP Session Protection protects an LDP session between directly connected neighbors or an LDP session established for a traffic engineering (TE) tunnel.

## **Finding Feature Information**

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <a href="https://www.cisco.com/go/cfn">www.cisco.com/go/cfn</a>. An account on Cisco.com is not required.

# **Prerequisites for MPLS LDP Session Protection**

Label switch routers (LSRs) must be able to respond to Label Distribution Protocol (LDP) targeted hellos. Otherwise, the LSRs cannot establish a targeted adjacency. All devices that participate in MPLS LDP Session Protection must be enabled to respond to targeted hellos. Both neighbor devices must be configured for session protection or one device must be configured for session protection and the other device must be configured to respond to targeted hellos.

## **Restrictions for MPLS LDP Session Protection**

The MPLS LDP Session Protection feature is not supported under the following circumstances:

- · With extended access lists
- With LC-ATM devices
- With Tag Distribution Protocol (TDP) sessions

## Information About MPLS LDP Session Protection

### **How MPLS LDP Session Protection Works**

MPLS LDP Session Protection maintains Label Distribution Protocol (LDP) bindings when a link fails. MPLS LDP sessions are protected through the use of LDP hello messages. When you enable Multiprotocol Label Switching (MPLS) LDP, the label switch routers (LSRs) send messages to find other LSRs with which they can create LDP sessions.

If the LSR is one hop from its neighbor, it is directly connected to its neighbor. The LSR sends out LDP Hello messages as User Datagram Protocol (UDP) packets to all the devices on the subnet. The hello message is called an LDP Link Hello. A neighboring LSR responds to the hello message, and the two devices begin to establish an LDP session.

If the LSR is more than one hop from its neighbor, it is not directly connected to its neighbor. The LSR sends out a directed hello message as a UDP packet but as a unicast message specifically addressed to that specific LSR. The hello message is called an LDP Targeted Hello. The nondirectly connected LSR responds to the Hello message and the two devices establish an LDP session. (If the path between two LSRs has been traffic engineered and has LDP enabled, the LDP session between them is called a targeted session.)

MPLS LDP Session Protection uses LDP Targeted Hellos to protect LDP sessions. For example, two directly connected devices have LDP enabled and can reach each other through alternate IP routes in the network. An LDP session that exists between two devices is called an LDP Link Hello Adjacency. When MPLS LDP Session Protection is enabled, an LDP Targeted Hello Adjacency is also established for the LDP session. If the link between the two devices fails, the LDP Link Adjacency also fails. However, if the LDP peer is still reachable through IP, the LDP session stays up, because the LDP Targeted Hello Adjacency still exists between the devices. When the directly connected link recovers, the session does not need to be reestablished, and LDP bindings for prefixes do not need to be relearned.

### **MPLS LDP Session Protection Customization**

You can modify MPLS LDP Session Protection by using keywords in the **mpls ldp session protection** command. The following sections explain how to customize the feature:

### How Long an LDP Targeted Hello Adjacency Should Be Retained

The default behavior of the **mpls ldp session protection** command allows a Label Distribution Protocol (LDP) Targeted Hello Adjacency to exist indefinitely following the loss of an LDP Link Hello Adjacency. You can

issue the **duration** keyword to specify the number of seconds that the LDP Targeted Hello Adjacency is retained after the loss of the LDP Link Hello Adjacency. When the link is lost, a timer starts. If the timer expires, the LDP Targeted Hello Adjacency is removed.

#### Which Devices Should Have MPLS LDP Session Protection

The default behavior of the **mpls ldp session protection** command allows MPLS LDP Session Protection for all neighbor sessions. You can issue either the **vrf** or **for** keyword to limit the number of neighbor sessions that are protected:

- You can use the vrf keyword to select which virtual routing and forwarding (VRF) instance is to be
  protected if the device is configured with at least one virtual private network (VPN) VRF instance. You
  cannot specify more than one VRF with the mpls ldp session protection command. To specify multiple
  VRFs, issue the command multiple times.
- You can create an access list that includes several peer devices. You can specify that access list with the **for** keyword to enable LDP Session Protection for the peer devices in the access control list.

# **How to Configure MPLS LDP Session Protection**

## **Enabling MPLS LDP Session Protection**

#### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. ip cef [distributed]
- 4. interface loopback number
- 5. ip address prefix mask
- 6. exit
- 7. interface type number
- 8. mpls ip
- 9. mpls label protocol [ldp | tdp | both]
- 10. exit
- 11. mpls ldp session protection [vrf vpn-name] [for acl] [duration {infinite | seconds}]
- **12**. exit

#### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.

	Command or Action	Purpose
		Enter your password if prompted.
	Example:	
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	ip cef [distributed]	Configures distributed Cisco Express Forwarding or Cisco Express Forwarding.
	Example:	
	Device(config)# ip cef distributed	
Step 4	interface loopback number	Configures a loopback interface and enters interface configuration mode.
	Example:	
	Device(config)# interface Loopback 0	
Step 5	ip address prefix mask	Assigns an IP address to the loopback interface.
	Example:	
	Device(config-if)# ip address 10.25.0.11 255.255.255	
Step 6	exit	Returns to global configuration mode.
	Example:	
	Device(config-if) exit	
Step 7	interface type number	Specifies the interface to configure and enters interface configuration mode.
	Example:	
	Device(config)# interface POS 0/3/0	
Step 8	mpls ip	Configures MPLS hop-by-hop forwarding for the specified interface.
	Example:	
	Device(config-if)# mpls ip	
Step 9	mpls label protocol [ldp   tdp   both]	Configures the use of LDP on a specific interface or on all interfaces.

	Command or Action	Purpose
	<pre>Example:    Device(config-if) # mpls label protocol    ldp</pre>	<ul> <li>The keywords that are available depend on the hardware platform.</li> <li>If you set all interfaces globally to LDP, you can override specific interfaces with either the tdp or both keyword by specifying the command in interface configuration mode.</li> </ul>
Step 10	<pre>exit  Example: Device(config-if)# exit</pre>	Returns to global configuration mode.
Step 11	<pre>mpls ldp session protection [vrf vpn-name] [for acl] [duration {infinite   seconds}]  Example:  Device (config) # mpls ldp session protection</pre>	<ul> <li>Enables MPLS LDP session protection.</li> <li>The vrf vpn-name keyword and argument protects Label Distribution Protocol (LDP) sessions for a specified virtual routing and forwarding (VRF) interface.</li> <li>The for acl keyword and argument specifies a standard IP access control list (ACL) of prefixes to be protected.</li> <li>The duration keyword specifies how long the device should retain the LDP Targeted Hello Adjacency following the loss of the LDP Link Hello Adjacency.</li> <li>The infinite keyword specifies that the LDP Targeted Hello Adjacency should be retained forever after a link is lost.</li> <li>The seconds argument specifies the time in seconds that the LDP Targeted Hello Adjacency should be retained after a link is lost. The range is 30 to 2,147,483 seconds.</li> <li>The mpls ldp session protection command entered without a keyword protects all LDP sessions.</li> </ul>
Step 12	<pre>exit  Example: Device(config)# exit</pre>	Returns to privileged EXEC mode.

### **Troubleshooting Tips**

Use the **clear mpls ldp neighbor** command if you need to terminate a Label Distribution Protocol (LDP) session after a link goes down. This is useful for situations where the link needs to be taken out of service or needs to be connected to a different neighbor.

To enable the display of events related to MPLS LDP Session Protection, use the **debug mpls ldp session protection** command.

## **Verifying MPLS LDP Session Protection**

#### **SUMMARY STEPS**

- 1. enable
- 2. show mpls ldp discovery
- 3. show mpls ldp neighbor
- 4. show mpls ldp neighbor detail
- 5. exit

#### **DETAILED STEPS**

#### Step 1 enable

Enables privileged EXEC mode. Enter your password, if prompted.

#### **Example:**

Device> enable Device#

#### Step 2 show mpls ldp discovery

Verifies that the output contains the term xmit/recv for the peer device.

#### Example:

#### Device# show mpls ldp discovery

```
Local LDP Identifier:
10.0.0.5:0
Discovery Sources:
Interfaces:
ATM50/1/0.5 (ldp): xmit/recv
LDP Id: 10.0.0.1:0
Targeted Hellos:
10.0.0.5 -> 10.0.0.3 (ldp): active, xmit/recv
LDP Id: 10.0.0.3:0
```

#### Step 3 show mpls ldp neighbor

Verifies that the targeted hellos are active.

#### **Example:**

#### Device# show mpls ldp neighbor

```
Peer LDP Ident: 10.0.0.3:0; Local LDP Ident 10.0.0.5:0 TCP connection: 10.0.0.3.646 - 10.0.0.5.11005 State: Oper; Msgs sent/rcvd: 1453/1464; Downstream Up time: 21:09:56 LDP discovery sources: Targeted Hello 10.0.0.5 -> 10.0.0.3, active Addresses bound to peer LDP Ident: 10.3.104.3 10.0.0.2 10.0.0.3
```

#### Step 4 show mpls ldp neighbor detail

Verifies that the MPLS LDP Session Protection state is Ready or Protecting. If the second last line of the output shows Incomplete, the Targeted Hello Adjacency is not up yet.

#### **Example:**

```
Device# show mpls ldp neighbor detail
```

```
Peer LDP Ident: 10.16.16.16.0; Local LDP Ident 10.15.15.15:0

TCP connection: 10.16.16.16.11013 - 10.15.15.15.646

State: Oper; Msgs sent/rcvd: 53/51; Downstream; Last TIB rev sent 74

Up time: 00:11:32; UID: 1; Peer Id 0;

LDP discovery sources:

Targeted Hello 10.15.15.15 -> 10.16.16.16, active, passive;

holdtime: infinite, hello interval: 10000 ms

Addresses bound to peer LDP Ident:

10.0.0.2 10.16.16.16 10.101.101.101 11.0.0.1

Peer holdtime: 180000 ms; KA interval: 60000 ms; Peer state: estab Clients: Dir Adj Client

LDP Session Protection enabled, state: Protecting duration: infinite
```

#### Step 5 exit

Returns to user EXEC mode.

#### **Example:**

Device# exit
Device>

# **Configuration Examples for MPLS LDP Session Protection**

## **Example: Configuring MPLS LDP Session Protection**

The figure below shows a sample configuration for MPLS LDP Session Protection.

Figure 1: MPLS LDP Session Protection Example

The following configuration examples for R1, R2, and R3 are based on the figure above.

#### R1

# **Feature Information for MPLS LDP Session Protection**

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <a href="https://www.cisco.com/go/cfn">www.cisco.com/go/cfn</a>. An account on Cisco.com is not required.

**Table 1: Feature Information for MPLS LDP Session Protection** 

Feature Name	Releases	Feature Information
MPLS LDP Session Protection	12.0(30)S 12.2(27)SBA	The MPLS LDP Session Protection feature provides faster Label Distribution Protocol (LDP)
	12.2(33)SRA	convergence when a link recovers following an outage. MPLS LDP
	12.2(33)SXH 12.3(14)T	Session Protection protects an LDP
	Cisco IOS XE Release 2.1 neighb establic	ession between directly connected eighbors or an LDP session stablished for a traffic engineering $\Gamma$ E) tunnel.
		In Cisco IOS Release 12.0(30)S, this feature was introduced on the Cisco 7200 series routers.
		In Cisco IOS Release 12.2(27)SBA, this feature was implemented on the Cisco 10000 and 7500 series routers.
		In Cisco IOS Release 12.2(33)SRA, this feature was implemented on the Cisco 7600 series routers.
		In Cisco IOS Release 12.2(33)SXH, this feature was implemented on the Cisco 6500 series routers.
		In Cisco IOS Release 12.3(14)T, this feature was integrated.
		In Cisco IOS XE Release 2.1, this feature was introduced on the Cisco ASR 1000 Series Aggregation Services Routers.
		The following commands were introduced or modified: debug mpls ldp session protection, mpls ldp session protection, show mpls ldp neighbor.
