

Configuring TrustSec DMVPN Inline Tagging Support

The TrustSec DMVPN Inline Tagging Support feature enables IPsec to carry the Cisco TrustSec (CTS) Security Group Tag (SGT) between IPsec peers.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring TrustSec DMVPN Inline Tagging Support

Internet Key Exchange Version 2 (IKEv2) and IPsec must be configured on the router. For more information, see the [“Configuring Internet Key Exchange Version 2 and FlexVPN Site-to-Site”](#) and [“Configuring Security for VPNs with IPsec”](#) modules.

This feature is supported only on the Cisco ISR G2 890, 1900, 2900, 3900, and 3900E routers.

Restrictions for Configuring TrustSec DMVPN Inline Tagging Support

The TrustSec DMVPN Inline Tagging Support feature can be negotiated only with IKEv2 and supports the following with IKEv2:

- DMVPN
- Dynamic Virtual Tunnel Interface (dVTI)
- GRE with Tunnel Protection
- Site-to-site VPNs
- Static crypto maps
- Static Virtual Tunnel Interface (sVTI)

The TrustSec DMVPN Inline Tagging Support feature does not support the following:

- Cisco AnyConnect
- Cisco VPNClient
- DMVPN with IKEv1
- EasyVPN
- FlexVPN
- GetVPN
- IKEv1 IPsec methods
- SSLVPN

Information About Configuring TrustSec DMVPN Inline Tagging Support

Cisco TrustSec

The Cisco TrustSec (CTS) architecture helps to build secure networks by establishing a domain of trusted network devices by combining identity, trust, and policy to protect user transactions and enforce role-based policies. CTS uses the user and the device identification information acquired during the authentication phase to classify packets as they enter the network. CTS maintains a classification of each packet by tagging packets on ingress to the CTS network so that they can be properly identified for applying security and other policy criteria along the data path. The packets or frames are tagged using the Security Group Tag (SGT), which allows network intermediaries such as switches and firewalls, to enforce an access control policy based on the classification.

The IPsec Inline Tagging for TrustSec feature is used to propagate the SGT to other network devices.

**Note**

If this feature is not supported, you can use the SGT Exchange Protocol over TCP (SXP) feature.

For more information on CTS and SXP, see the [Cisco TrustSec Switch Configuration Guide](#).

SGT and IPsec

IPsec uses the IKE protocol for negotiating algorithms, keys, and capabilities. IKEv2 is used to negotiate and inform IPsec about the SGT capability. Once the peers acknowledge the SGT tagging capability, an SGT tag number (a 16-bit) is added as the SGT Cisco Meta Data (CMD) payload into IPsec and sent to the receiving peer.

The access layer device authenticates the incoming packets. The access layer device receives an SGT from the authentication server and assigns the SGT along with an IP address to the incoming packets. In other words, an IP address is bound to an SGT. This IP address/SGT binding is propagated to upstream devices to enforce SGT-based policy and inline tagging.

If IKEv2 is configured to negotiate the SGT capability in the initiator, the initiator proposes the SGT capability information in the SA_INIT request. If IKEv2 is configured to negotiate the SGT capability in the responder, the responder acknowledges in the SA_INIT response and the initiator and the responder inform IPsec to use inline tagging for all packets to the peer.

During egress, IPsec adds the SGT capability and prefixes to the IPsec payload if the peer supports inline tagging; otherwise the packet is not tagged.

During ingress, IPsec inspects the packet for the SGT capability. If a tag is available, IPsec extracts the tag information and passes the information to the device only if inline tagging is negotiated. If there is no tag, IPsec processes the packet as a normal packet.

The tables below describe how IPsec behaves during egress and ingress.

Table 1: IPsec Behavior on the Egress Path

Inline Tagging Negotiated	CTS Provides SGT	IPsec Behavior
Yes	Yes	An SGT CMD is added to the packet.
Yes	No	The packet is sent without the SGT CMD.
No	Yes or no	The packet is sent without the SGT CMD.

Table 2: IPsec Behavior on the Ingress Path

Packet Is Tagged	Inline Tagging Negotiated	IPsec Behavior
Yes	Yes	The SGT CMD in the packet is processed.
Yes	No	The SGT CMD in the packet is not processed.
No	Yes or no	The packet is processed as a normal IPsec packet.

SGT on the IKEv2 Initiator and Responder

To enable SGT on an IKEv2 session, the SGT capability support must be sent to the peers using the **crypto ikev2 cts** command. SGT is a Cisco proprietary capability; hence, it is sent as a Vendor ID (VID) payload in the SA_INIT exchange.

The table below explains the scenarios when SGT capability is configured on the initiator and the responder:

Table 3: SGT Capability on IKEv2 Initiator and Responder

SGT Enabled on Initiator	SGT Enabled on Responder	What Happens . . .
Yes	Yes	The VID is exchanged between the initiator and the responder, and IPsec SA is enabled with the SGT inline tagging capability.
Yes	No	The initiator proposes the VID, but the responder ignores the VID. IPsec SA is not enabled with the SGT inline tagging capability.

SGT Enabled on Initiator	SGT Enabled on Responder	What Happens . . .
No	Yes	The initiator does not propose the VID, and the responder does not send the VID payload. IPsec SA is not enabled with the SGT inline tagging capability.
No	No	The initiator does not propose the VID, and responder also does not send the VID payload. IPsec SA is not enabled with the SGT inline tagging capability.

Handling Fragmentation

Fragmentation is handled in the following two ways:

- Fragmentation before IPsec—If IPsec receives fragmented packets, each fragment is tagged.
- Fragmentation after IPsec—If IPsec packets are fragmented after encryption, the first fragment will be tagged.

How to Configure TrustSec DMVPN Inline Tagging Support

Enabling IPsec Inline Tagging

Before You Begin

IKEv2 and IPsec must be configured.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `crypto ikev2 cts sgt`
4. `exit`

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	crypto ikev2 cts sgt Example: Device(config)# crypto ikev2 cts sgt	Enables SGT IPsec inline tagging globally. Note This command applies to all sessions on the Device. If the IPsec Inline Tagging for TrustSec feature is disabled, then the new negotiated sessions do not negotiate the VID. However, the current SA and the subsequent SA rekey is enabled with the feature until the lifetime of the SA. This applies to the new IPsec SA and the rekey of IPsec SA established using the parent or rekeyed IKE SA.
Step 4	exit Example: Device(config)# exit	Exits global configuration mode.

Monitoring and Verifying TrustSec DMVPN Inline Tagging Support

To monitor and verify the TrustSec DMVPN Inline Tagging Support configuration, perform the following steps.

SUMMARY STEPS

1. enable
2. debug crypto ipsec metadata sgt
3. debug crypto ikev2 internal
4. show crypto ikev2 sa detailed
5. show crypto ipsec sa detail
6. show platform hardware qfp active feature cts datapath statistics
7. debug platform hardware qfp active feature cts datapath input

DETAILED STEPS

Step 1 enable

Example:

```
Device> enable
Enables privileged EXEC mode.
```

Step 2 **debug crypto ipsec metadata sgt****Example:**

```
Device# debug crypto ipsec metadata sgt

*Oct 17 05:29:17.067: IPsec SGT:: extracted SGT = 400 for src ip 10.0.0.1
*Oct 17 05:29:17.067: IPsec SGT:: inserted SGT = 333 for src ip 3.3.3.1
Use this command to verify whether packets from an IP address is tagged correctly.
```

Step 3 **debug crypto ikev2 internal****Example:**

```
Device# debug crypto ikev2 internal

Mar 28 06:11:19.159:
*Mar 28 06:11:19.159: IKEv2:Construct Vendor Specific Payload: DELETE-REASON
*Mar 28 06:11:19.159: IKEv2:(1): Sending custom vendor id : CISCO-CTS-SGT
*Mar 28 06:11:19.159: IKEv2:Construct Vendor Specific Payload: (CUSTOM)
Mar 28 06:11:19.203:
*Mar 28 06:11:19.203: IKEv2:(1): Received custom vendor id : CISCO-CTS-SGT
*Mar 28 06:11:19.203: IKEv2:(1): SM Trace-> SA: I_SPI=89D5FB4E99C03FC1 R_SPI=8
Use this command to log the IKEv2 events. The presence of the Vendor ID payload for the SGT capability in SA_INIT exchange indicates the proposal or acceptance of the feature.
```

Step 4 **show crypto ikev2 sa detailed****Example:**

```
Device# show crypto ikev2 sa detailed

IPv4 Crypto IKEv2 SA
Tunnel-id Local Remote fvrf/ivrf Status
1 1.1.1.1/500 1.1.1.2/500 none/none READY
Encr: 3DES, Hash: SHA96, DH Grp:1, Auth sign: PSK, Auth verify: PSK
Life/Active Time: 120/12 sec
CE id: 1001, Session-id: 1
Status Description: Negotiation done
Local spi: 2BD8B64C579F0C6E Remote spi: 2CC7EB7D1862500F
Local id: 1.1.1.1
Remote id: 1.1.1.2
Local req msg id: 2 Remote req msg id: 0
Local next msg id: 2 Remote next msg id: 0
Local req queued: 2 Remote req queued: 0
Local window: 5 Remote window: 5
DPD configured for 0 seconds, retry 0
NAT-T is not detected
Cisco Trust Security SGT is enabled
```

Use this command to display the status of the SGT capability.

Step 5 **show crypto ipsec sa detail****Example:**

```
Device# show crypto ipsec sa detail

interface: GigabitEthernet0/0
Crypto map tag: cmap, local addr 10.1.1.2

protected vrf: (none)

Displays the settings used by current security associations (SAs).

Step 6 show platform hardware qfp active feature cts datapath statistics

Example:

```
Device# show platform hardware qfp active feature cts datapath statistics
```

```

Tagged Packets rcv: 346          xmt: 352          Def tag: 0
          Unknown SGT: 6857      Unknown DGT: 0
Invalid tags (drop): 754      Bad format (drop): 0
No xmt buffer: 0
IPSec SGT tagged packets received: 0
IPSec Invalid SGT tagged packets received: 0

```

Displays the updated tagged packet counters in the datapath.

Step 7 debug platform hardware qfp active feature cts datapath input

Example:

```
Device# debug platform hardware qfp active feature cts datapath input
```

```

CPP CTS DP logs debugging is on
Enables debugging logs.

```

Configuration Examples for TrustSec DMVPN Inline Tagging Support

Example: Enabling IPsec Inline Tagging

The following example shows how to enable IPsec inline tagging on a static VTI initiator and dynamic VTI responder. You can use this configuration for configuring crypto maps and VTIs.

Static VTI Initiator Configuration

```

crypto ikev2 proposal p1
  encryption 3des
  integrity md5
  group 2
!
crypto ikev2 policy policy1
  proposal p1

```

```

!
!!
control-plane

Feature Information for TrustSec DMVPN Inline Tagging Support

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 4: Feature Information for Configuring TrustSec DMVPN Inline Tagging Support

Feature Name	Releases	Feature Information
TrustSec DMVPN Inline Tagging Support	15.4(3)M	<p>The TrustSec DMVPN Inline Tagging Support feature enables IPsec to carry Cisco Trust Sec (CTS) Security Group Tag (SGT) between IPsec peers.</p> <p>The following commands were introduced or modified: crypto ikev2 cts sgt, debug crypto ikev2 detail, debug crypto ipsec, show crypto ipsec sa.</p>
