

PKI Trustpool Management

The PKI Trustpool Management feature is used to authenticate sessions, such as HTTPS, that occur between devices by using commonly recognized trusted agents called certificate authorities (CAs).

Trustpool certificates are well-known CA certificates with which you can establish trust. IOS PKI has both built-in CAs and also has an option to download trustpool bundle. Built-in CA certificates are used to verify PKCS7 signature of downloaded trustpool bundle. You can download the trustpool bundle if signature verification fails. You can delete Built-in trustpool certificates. Trustpool certificates are used by applications such as SSLVPN, PnP, Smart License, MacSec and so on.

This feature, which is enabled by default, is used to create a scheme to provision, store, and manage a pool of certificates from known CAs in a way similar to the services a browser provides for securing sessions.

Note

A new root certificate is included in the built-in certificates for Cisco Plug and Play application.

Note

Effective with Cisco IOS XE Denali 16.3, the way PKI Trustpools are managed have changed. If you are planning to upgrade to this release, please review the changes to the feature captured below as part of *PKI Trustpool Enhancements* section.

- [Prerequisites for PKI Trustpool Management, on page 1](#)
- [Restrictions for PKI Trustpool Management, on page 2](#)
- [Information About PKI Trustpool Management, on page 2](#)
- [How to Configure PKI Trustpool Management, on page 4](#)
- [Configuration examples for PKI Trustpool Management, on page 9](#)
- [Additional References for PKI Trustpool Management, on page 13](#)
- [Feature Information for PKI Trustpool Management, on page 14](#)

Prerequisites for PKI Trustpool Management

The use of certificates requires that a crypto subsystem is included in the Cisco IOS software image.

Restrictions for PKI Trustpool Management

Device certificates that use CA certificates cannot be enrolled in a PKI trustpool.

You can download only a Cisco signed PKCS7 certificate through the trustpool URL.

Information About PKI Trustpool Management

CA Certificate Storage in a PKI Trustpool

The router uses a built-in CA certificate bundle that is contained in a special certificate store called a PKI trustpool, which is updated automatically from Cisco. This PKI trustpool is known by Cisco and other vendors. A CA certificate bundle can be in the following formats:

- X.509 certificates in Distinguished Encoding Rules (DER) binary format enveloped within a public-key cryptographic message syntax standard 7 (pkcs7), which is used to sign and encrypt messages under a PKI. An X.509 certificate is a PKI and Privilege Management Infrastructure (PMI) standard that specifies, among other things, standard formats for public key certificates, certificate revocation lists, attribute certificates, and a certification path validation algorithm.
- A file containing concatenated X.509 certificates in Privacy Enhanced Mail (PEM) format with PEM headers.

**Note**

Flash can also be used as the storage location for the bundles instead of NVRAM.

PKI Trustpool Updating

The PKI trustpool is treated as a single entity that needs to be updated when the following conditions occur:

- A certificate in the PKI trustpool is due to expire or has been reissued.
- The published CA certificate bundle contains additional trusted certificates that are needed by a given application.
- The configuration has been corrupted.

**Note**

A built-in certificate in the PKI trustpool cannot be physically replaced. However, a built-in certificate is rendered inactive after an update if its X.509 subject-name attribute matches the certificate in the CA certificate bundle.

The PKI trustpool can be updated automatically or manually. The PKI trustpool may be used by certificate validation depending upon the application using it. See the "Manually Updating Certificates in the PKI Trustpool" and "Configuring Optional PKI Trustpool Policy Parameters" sections for more information.

Note During auto-update all the existing downloaded trustpool certificates must be deleted.

The PKI trustpool timer matches the CA certificate with the earliest expiration time. If the timer is running and a bundle location is not configured and not explicitly disabled, syslog warnings are issued to alert the administrator that the PKI trustpool policy option is not set.

Automatic PKI trustpool updates use the configured URL.

When the PKI trustpool expires, the policy is read, the bundle is loaded, and the PKI trustpool is replaced. If the automatic PKI trustpool update encounters problems when initiating, then the following schedule is used to initiate the update until the download is successful: 20 days, 15 days, 10 days, 5 days, 4 days, 3 days, 2 days, 1 day, and then once every hour.

CA Handling in Both PKI Trustpool and Trustpoint

There may be circumstances where a CA resides in both PKI trustpool and trustpoint; for example, a trustpoint uses a CA and a CA bundle is downloaded later with the same CA inside. In this scenario, the CA in the trustpoint and the policy of this trustpoint is considered before the CA in the PKI trustpool or PKI trustpool policy to ensure that any current behavior is not altered when the PKI Trustpool Management feature is implemented on the router.

PKI Trustpool Enhancements

In releases earlier than Cisco IOS XE Denali 16.3, the trustpool consists of built-in certificates deployed with every Cisco box and downloaded CA certificates from published bundles. The downloaded certificates are saved in NVRAM, by default. The certificates from the downloaded trustpool bundle would be extracted and stored in the running configuration which was inefficient and utilized too much space.

From Cisco IOS XE Denali 16.3, the PKI trustpool enhancements stores the bundles in the same downloaded bundle format as one file in the storage location (default is NVRAM) instead of individual certificates like in the previous releases. This helps in saving storage memory as the file is in compressed format. Also, the certificates are not displayed individually in the running configuration. On every reboot the bundles are read from the storage location and individual certificates are installed in the database.

This feature removes the current downloaded certificates from the running configuration. The **crypto pki certificate pool** will not have the DER format certificates because these certificates are incompatible with the old NVRAM file and the new images. During upgrade, the trustpool certificates in DER format are lost and the bundles must be reinstalled again in the storage. This is indicated by a syslog during reboot in case of old NVRAM files. The **show crypto pki trustpool** command indicates that the configuration has been removed. Before you upgrade, use the **show crypto pki trustpool** command to verify that the certificates are available.

The following steps must be followed before upgrading to Cisco IOS XE Denali 16.3 :

- Remove the downloaded trustpool certificates using the **crypto pki trustpool clean** command
- Use the **write memory** command
- Reboot the device
- Download the trustpool bundles using the **crypto pki trustpool import url** command

If you are using trustpool certificates to log into SSH, then you need to follow additional steps to transfer that specific certificate from bundle to a trustpoint. See *Example: Using PKI Trustpool for SSH Connection During Upgrade* for more information.

**Note**

From Cisco IOS XE Gibraltar 16.10 release onwards, when you configure the **match crlsign** command under trustpoint, the crlsign will be cross checked while validating.

How to Configure PKI Trustpool Management

Manually Updating Certificates in the PKI Trustpool

The PKI Trustpool Management feature is enabled by default and uses the built-in CA certificate bundle in the PKI trustpool, which receives automatic updates from Cisco. Perform this task to manually update certificates in the PKI trustpool if they are not current, are corrupt, or if certain certificates need to be updated.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpool import clean** [**terminal** | **url url**]
4. **crypto pki trustpool import** {**terminal**} {**url url** | **ca-bundle**} {**vrf vrf-name** | **source interface interface-name**}
5. **exit**
6. **show crypto pki trustpool**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	crypto pki trustpool import clean [terminal url url] Example: Device(config)# crypto pki trustpool import clean	(Optional) Manually removes all downloaded PKI CA certificates. • The clean keyword specifies the removal of the downloaded PKI trustpool certificates before the new certificates are downloaded.

	Command or Action	Purpose
		- The terminal keyword removes the existing CA certificate bundle terminal setting. - The url keyword and <i>url</i> argument removes the existing URL file system setting.
Step 4	crypto pki trustpool import {terminal} {url url ca-bundle} {vrf vrf-name source interface interface-name} Example: <pre>Device(config)# crypto pki trustpool import url http://www.cisco.com/security/pki/trs/ios.p7b</pre>	Manually imports (downloads) the CA certificate bundle into the PKI trustpool to update or replace the existing CA certificate bundle. - The terminal keyword specifies the importation of a CA certificate bundle through the terminal (cut-and-paste) in PEM format. - The url keyword with the <i>url</i> argument specifies the importation of a CA certificate bundle through a URL. This URL can be through a variety of URL file systems such as HTTP. See the <i>PKI Trustpool Updating</i> section for more information. In CA bundle, you can use the crypto pki trustpool import command to pass the traffic through global VRF. Also, the traffic will not divert through a VRF, when you configure the crypto pki trustpool policy command specifying the VRF and source interface.
Step 5	exit Example: <pre>Device(config)# exit</pre>	Exits global configuration mode.
Step 6	show crypto pki trustpool Example: <pre>Device(config)# show crypto pki trustpool</pre>	Displays the PKI trustpool certificates of the router in a verbose format.

Configuring Optional PKI Trustpool Policy Parameters

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpool policy**
4. **cabundle url {url | none}**
5. **chain-validation**
6. **crl {cache {delete-after {minutes | none} | query url}}**
7. **default command-name**

8. **match certificate** *certificate-map-name* [**allow expired-certificate** | **override** {**cdp directory** *ldap-location* | **ocsp** {*number url url* | **trustpool name number url url} | **sia number url} | **skip** [**revocation-check** | **authorization-check**]]****
9. **ocsp** {**disable-nonce** | **url url**}
10. **revocation-check** *method1* [*method2* [*method3*]]
11. **source interface** *name number*
12. **storage** *location*
13. **vrf** *vrf-name*
14. **show**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	crypto pki trustpool policy Example: Device(config)# crypto pki trustpool policy Device(ca-trustpool)#	Enters ca-trustpool configuration mode where commands can be accessed to configure CA PKI trustpool policy parameters. The trustpool policy only affects the crl retrieval process and has no effect on trustpool import process.
Step 4	cabundle url { <i>url</i> none } Example: Device(ca-trustpool)# cabundle url http://www.cisco.com/security/pki/crl/crca2048.crl	Specifies the URL from which the PKI trustpool certificate authority CA certificate bundle is downloaded . • The <i>url</i> argument is the URL of the CA certificate bundle. • The none keyword specifies that autoupdates of the PKI trustpool CA are not permitted.
Step 5	chain-validation Example: Device(ca-trustpool)# chain-validation	Enables chain validation from the peer's certificate to the root CA certificate in the PKI trustpool. The default has validation stopping at the peer certificate's issuer.
Step 6	crl { cache { delete-after { <i>minutes</i> none } query url } Example: Device(ca-trustpool)# crl query http://www.cisco.com/security/pki/crl/crca2048.crl	Specifies the certificate revocation list (CRL) query and CRL cache options for the PKI trustpool. • The cache keyword specifies CRL cache options. • The delete-after keyword removes the CRL from the cache after a timeout.

	Command or Action	Purpose
		- The <i>minutes</i> argument is the number of minutes from 1 to 43,200 to wait before deleting the CRL from the cache. - The none keyword specifies that CRLs are not cached. - The query keyword with the <i>url</i> argument specifies the URL published by the CA server to query the CRL.
Step 7	default <i>command-name</i> Example: Device(ca-trustpool)# default crl query http://www.cisco.com/security/pki/crl/crca2048.crl	Resets the value of a ca-trustpool configuration subcommand to its default . The <i>command-name</i> argument is the ca-trustpool configuration mode command with its applicable keywords.
Step 8	match certificate <i>certificate-map-name</i> [allow expired-certificate override { cdp directory <i>ldap-location</i> ocsp { <i>number</i> url <i>url</i> trustpool <i>name</i> <i>number</i> url <i>url</i> } sia <i>number</i> <i>url</i> } skip [revocation-check authorization-check]] Example: match certificate mycert override ocsp 1 url http://ocspts.identrust.com	Enables the use of certificate maps for the PKI trustpool. - The <i>certificate-map-name</i> argument matches the certificate map name. - The optional allow expired-certificate keyword ignores expired certificates. Note If this keyword is not configured, the router does not ignore expired certificates. - The override keyword overrides the online certificate status protocol (OCSP) or SubjectInfoAccess (SIA) attribute fields in a certificate that is in the PKI trustpool. - The cdp keyword overrides the certificate distribution point (CDP) in a certificate. - The directory keyword and <i>ldap-location</i> specifies the CDP in either the http: or ldap: URL, or LDAP directory to override in the certificate. - The ocsp keyword and <i>number</i> argument and url keyword and <i>url</i> argument specifies the OCSP sequence number from 0 to 10000 and URL to override in the certificate. - The trustpool keyword and <i>name</i> and <i>number</i> arguments with the url keyword and <i>url</i> argument override the PKI trustpool for verifying the OCSP certificate by specifying the PKI trustpool name, sequence number, and URL.

	Command or Action	Purpose
		- The sia keyword and <i>number</i> and <i>url</i> arguments override the SIA URL in a certificate by specifying the SIA sequence number and URL. - The optional skip revocation-check keyword combination allows the PKI trustpool to enforce certificate revocation lists (CRLs) except for specific certificates. Note If this keyword combination is not configured, then the PKI trustpool enforces CRLs for all certificates. - The optional skip authorization-check keyword combination skips the authentication, authorization, and accounting (AAA) check of a certificate when public key infrastructure (PKI) integration with an AAA server is configured. Note If this keyword combination is not configured, and PKI integration with an AAA server is configured, then the AAA checking of a certificate is done.
Step 9	ocsp {disable-nonce url url} Example: <pre>Device(ca-trustpool)# ocsp url http://ocspts.identrust.com</pre>	Specifies OCSP settings for the PKI trustpool. - The disable-nonce keyword disables the OCSP Nonce extension. - The url keyword and <i>url</i> argument specify the OCSP server URL to override (if one exists) in the Authority Info Access (AIA) extension of the certificate. All certificates associated with a configured PKI trustpool are checked by the OCSP server at the specified HTTP URL. The URL can be a hostname, IPv4 address, or an IPv6 address.
Step 10	revocation-check method1 [method2 [method3]] Example: <pre>Device(ca-trustpool)# revocation-check ocsp crl none</pre>	Disables revocation checking when the PKI trustpool policy is being used. The <i>method</i> argument is used by the router to check the revocation status of the certificate. Available keywords are as follows: - The crl keyword performs certificate checking by a certificate revocation list (CRL). This is the default behavior. - The none keyword does not require a certificate checking. - The ocsp keyword performs certificate checking by an online certificate status protocol (OCSP) server.

	Command or Action	Purpose
		If a second and third method are specified, each method is used only if the previous method returns an error, such as a server being down.
Step 11	source interface <i>name number</i> Example: Device(ca-trustpool)# source interface tunnel 1	Specifies the source interface to be used for CRL retrieval, OCSP status, or the downloading of a CA certificate bundle for the PKI trustpool . The <i>name</i> and <i>number</i> arguments are for the interface type and number used as the source address for the PKI trustpool.
Step 12	storage <i>location</i> Example: Device(ca-trustpool)# storage storage disk0:crca2048.crl	Specifies a file system location where PKI trustpool certificates are stored on the router. The <i>location</i> is the file system location where the PKI trustpool certificates are stored. The types of file system locations are disk0:, disk1:, nvram:, unix:, or a named file system.
Step 13	vrf <i>vrf-name</i> Example: Device(ca-trustpool)# vrf myvrf	Specifies the VPN routing and forwarding (VRF) instance to be used for enrolment, CRL retrieval, and OCSP status.
Step 14	show Example: Device(ca-trustpool)# show Chain validation will stop at the first CA certificate in the pool Trustpool CA certificates will expire 12:58:31 PST Apr 5 2012 Trustpool policy revocation order: crl Certificate matching is disabled Policy Overrides:	Displays the PKI trustpool policy of the router.

Configuration examples for PKI Trustpool Management

Example: Configuring PKI Trustpool Management

The following **show crypto pki trustpool** command output displays the certificates in PKI trustpool:

Note

The command output in this example is abridged because it is verbose.

```
Device# show crypto pki trustpool
```

```

CA Certificate
Status: Available
Version: 3
Certificate Serial Number (hex): 00D01E474000000111C38A964400000002

Technical Assistance

Description	Link
The Cisco Support and Documentation website provides online resources to download documentation, software, and tools. Use these resources to install and configure the software and to troubleshoot and resolve technical issues with Cisco products and technologies. Access to most tools on the Cisco Support and Documentation website requires a Cisco.com user ID and password.	http://www.cisco.com/cisco/web/support/index.html

Feature Information for PKI Trustpool Management

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for PKI Trustpool Management

Feature Name	Releases	Feature Information
PKI Trustpool Management		The PKI Trustpool Management feature is used to authenticate sessions, such as HTTPS, that occur between devices by using commonly recognized trusted agents called certificate authorities (CAs). The following commands were introduced or modified: cabundle url, chain-validation (ca-trustpool), crypto pki trustpool import, crypto pki trustpool policy, crl, default (ca-trustpool), match certificate (ca-trustpool), ocsp, show (ca-trustpool), show crypto pki trustpool, source interface (ca-trustpool), storage, vrf (ca-trustpool), show crypto pki trustpool built-in, crypto pki trustpool import clean ca-bundle.
