

Storing PKI Credentials

Last Updated: July 18, 2012

Public key infrastructure (PKI) credentials, such as Rivest, Shamir, and Adleman (RSA) keys and certificates can be stored in a specific location on the device, such as NVRAM and flash memory or on a USB eToken 64 KB smart card. USB tokens provide secure configuration distribution, RSA operations such as on-token key generation, signing, and authentication, and the storage of Virtual Private Network (VPN) credentials for deployment.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Storing PKI Credentials

Before you can specify the local certificate storage location, your system should meet the following requirements:

- A platform that supports storing PKI credentials as separate files.
- A configuration that contains at least one certificate.
- An accessible local file system.

Americas Headquarters:
Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA

- A Cisco supported USB token (Safenet/Aladdin eToken PRO 32 KB or 64 KB)
- To use the Cisco supported USB token, you must have Cisco IOS XE Release 3.6 or later installed on your router.

Restrictions for Storing PKI Credentials

When storing certificates to a local storage location, the following restrictions are applicable:

- Only local file systems may be used. An error message will be displayed if a remote file system is selected, and the command will not take effect.
- A subdirectory may be specified if supported by the local file system. NVRAM does not support subdirectories.

Information About Storing PKI Credentials

- [Storing Certificates to a Local Storage Location, page 2](#)
- [PKI Credentials and USB Tokens, page 2](#)

Storing Certificates to a Local Storage Location

Certificates are stored to NVRAM by default; however, some routers do not have the required amount of NVRAM to successfully store certificates.

All Cisco platforms support NVRAM and flash local storage. Depending on your platform, you may have other supported local storage options including bootflash, slot, disk, USB flash, or USB token.

During run time, you can specify what active local storage device you would like to use to store certificates.

PKI Credentials and USB Tokens

To use a secure USB token on your router, you should understand the following concepts:

- [How a USB Token Works, page 2](#)
- [How RSA Keys are Used with a USB Token, page 3](#)
- [Benefits of USB Tokens, page 3](#)

How a USB Token Works

A smart card is a small plastic card, containing a microprocessor and memory that allows you to store and process data. A USB token is a smart card with a USB interface. The token can securely store any type of file within its available storage space (32 KB). Configuration files that are stored on the USB token can be encrypted and accessed only via a user PIN. The device does not load the configuration file unless the proper PIN has been configured for secure deployment of device configuration files.

After you plug the USB token into the device, you must log into the USB token; thereafter, you can change default settings, such as the user PIN (default: 1234567890) and the allowed number of failed login attempts (default: 15 attempts) before future logins are refused. For more information on accessing and configuring the USB token, see the section “Logging Into and Setting Up the USB Token.”

After you have successfully logged into the USB token, you can copy files from the device on to the USB token via the **copy** command. USB token RSA keys and associated IPsec tunnels remain available until the device is reloaded. To specify the length of time before the keys are removed and the IPsec tunnels are torn down, issue the **crypto pki token removal timeout** command. The default timeout is zero, which causes the RSA keys to be removed automatically after the eToken is removed from the device. The default appears in the running configuration as:

```
crypto pki token default removal timeout 0
```

The table below highlights the capabilities of the USB token.

Table 1 *Functionality Highlights for USB Tokens*

Function	USB Token
Accessibility	Used to securely store and transfer digital certificates, preshared keys, and device configurations from the USB token to the device.
Storage Size	32 KB or 64 KB
File Types	<ul style="list-style-type: none"> Typically used to store digital certificates, preshared keys, and device configurations for IPsec VPNs. USB tokens cannot store Cisco IOS images.
Security	<ul style="list-style-type: none"> Files can be encrypted and accessed only with a user PIN. Files can also be stored in a nonsecure format.
Boot Configurations	<ul style="list-style-type: none"> The device can use the configuration stored in the USB token during boot time. The device can use the secondary configuration stored in the USB token during boot time. (A secondary configuration allows users to load their IPsec configuration.)

How RSA Keys are Used with a USB Token

- RSA keys are loaded after the USB token is successfully logged into the router.
- By default, newly generated RSA keys are stored on the most recently inserted USB token. Regenerated keys should be stored in the same location where the original RSA key was generated.

Benefits of USB Tokens

USB token support on a Cisco router provides the following application benefits:

Removable Credentials: Provide or Store VPN Credentials on an External Device for Deployment

A USB token can use smart card technology to store a digital certificate and configuration for IPsec VPN deployment. This ability enhances the capability of the router to generate RSA public keys to authenticate

at least one IPsec tunnel. (Because a router can initiate multiple IPsec tunnels, the USB token can contain several certificates, as appropriate.)

Storing VPN credentials on an external device reduces the threat of compromising secure data.

PIN Configuration for Secure File Deployment

A USB token can store a configuration file that can be used for enabling encryption on the router via a user-configured PIN. (That is, no digital certificates, preshared keys, or VPNs are used.)

Touchless or Low Touch Configuration

The USB token can provide remote software configuration and provisioning with little or no human interaction. Configuration is set up as an automated process. That is, the USB token can store a bootstrap configuration that the router can use to boot from after the USB token has been inserted into the router. The bootstrap configuration connects the router to a TFTP server, which contains a configuration that completely configures the router.

RSA Operations

A USB token may be used as a cryptographic device in addition to a storage device. Using a USB token as a cryptographic device allows RSA operations such as key generation, signing, and authentication to be performed on the token.

General-purpose, special-usage, encryption, or signature RSA key pairs with a modulus of 2048 bits or less may be generated from credentials located on your token storage device. Private keys are not distributed and remain on the token by default, however you may configure the private key storage location.

Keys that reside on a USB token are saved to persistent token storage when they are generated. Key deletion will remove the keys stored on the token from persistent storage immediately. (Keys that do not reside on a token are saved to or deleted from non-token storage locations when the **write memory** or a similar command is issued.)

Remote Device Configuration and Provisioning in a Secure Device Provisioning (SDP) Environment

SDP may be used to configure a USB token. The configured USB token may be transported to provision a device at a remote location. That is, a USB token may be used to transfer cryptographic information from one network device to another remote network device providing a solution for a staged USB token deployment.

For information about using USB tokens with SDP, see document titles in the “Additional References” section.

How to Configure PKI Storage

- [Specifying a Local Storage Location for Certificates, page 5](#)
- [Setting Up and Using USB Tokens on Cisco Devices, page 6](#)
- [Troubleshooting USB Tokens, page 16](#)

Specifying a Local Storage Location for Certificates

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki certificate storage** *location-name*
4. **exit**
5. **copy** *source-url destination-url*
6. **show crypto pki certificates storage**

DETAILED STEPS

Command or Action	Purpose
<p>Step 1 enable</p> <p>Example:</p> <pre>Device> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> • Enter your password if prompted.
<p>Step 2 configure terminal</p> <p>Example:</p> <pre>Device# configure terminal</pre>	<p>Enters global configuration mode.</p>
<p>Step 3 crypto pki certificate storage <i>location-name</i></p> <p>Example:</p> <pre>Device(config)# crypto pki certificate storage flash:/certs</pre>	<p>Specifies the local storage location for certificates.</p>
<p>Step 4 exit</p> <p>Example:</p> <pre>Device(config)# exit</pre>	<p>Exits global configuration mode.</p>
<p>Step 5 copy <i>source-url destination-url</i></p> <p>Example:</p> <pre>Device# copy system:running-config nvram:startup-config</pre>	<p>(Optional) Saves the running configuration to the startup configuration.</p> <p>Note Settings will only take effect when the running configuration is saved to the startup configuration.</p>

Command or Action	Purpose
Step 6 <code>show crypto pki certificates storage</code> Example: Device# <code>show crypto pki certificates storage</code>	(Optional) Displays the current setting for the PKI certificate storage location.

Example

The following is sample output from the `show crypto pki certificates storage` command, which shows that the certificates are stored in the `certs` subdirectory of `disk0`:

```
Device# show crypto pki certificates storage
Certificates will be stored in disk0:/certs/
```

Setting Up and Using USB Tokens on Cisco Devices

- [Storing the Configuration on a USB Token, page 6](#)
- [Logging Into and Setting Up the USB Token, page 7](#)
- [Configuring the USB Token, page 9](#)
- [Setting Administrative Functions on the USB Token, page 13](#)

Storing the Configuration on a USB Token

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `boot config usbtoken[0-9]:filename`

DETAILED STEPS

Command or Action	Purpose
Step 1 <code>enable</code> Example: Device> <code>enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2 <code>configure terminal</code> Example: Device# <code>configure terminal</code>	Enters global configuration mode.

Command or Action	Purpose
Step 3 <code>boot config usbtoken[0-9]:filename</code> Example: Device(config)# boot config usbtoken0:file	Specifies that the startup configuration file is stored in a secure USB token.

Logging Into and Setting Up the USB Token

- [Configuring the Device for Automatic Login, page 7](#)
- [Configuring the Device for Manual Login, page 8](#)
- [What to Do Next, page 9](#)

Configuring the Device for Automatic Login

The automatic login allows the device to completely come back up without any user or operator intervention. The PIN is stored in the private NVRAM, so it is not visible in the startup or running configuration.

Note

A hand-generated startup configuration can contain the automatic login command for deployment purposes, but the **copy system:running-config nvram: startup-config** command must be issued to put the hand-generated configuration in the private configuration.

Perform this task to configure the automatic login on the device

Note

Either the manual or automatic login is required.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki token *token-name* user-pin [*pin*]**
4. **exit**
5. **show usbtoken0-9:filename**

DETAILED STEPS

Command or Action	Purpose
Step 1 enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2 configure terminal Example: Device# configure terminal	Enters global configuration mode, which allows you to configure automatic USB token login.
Step 3 crypto pki token <i>token-name</i> user-pin [<i>pin</i>] Example: Device(config)# crypto pki token usbtok00 user-pin 1234	Configures the device to log in to the token automatically, using the specified PIN at device startup or when the USB token is inserted into a USB slot. The PIN is encrypted and stored in NVRAM. Note You will be asked to enter your passphrase.
Step 4 exit Example: Device(config)# exit	Exits global configuration mode.
Step 5 show usbtok0-9:filename Example: Device# show usbtok0:usbfile	(Optional) Verifies whether the USB token has been logged on to the device.

Configuring the Device for Manual Login

Unlike automatic login, manual login requires that the user know the actual USB token PIN.

**Note**

Either the manual or automatic login is required.

Manual login can be used when storing a PIN on the device is not desirable. Manual login may also be suitable for some initial deployment or hardware replacement scenarios for which the device is obtained from the local supplier or drop-shipped to the remote site. Manual login can be executed with or without privileges, and it creates files and RSA keys on the USB token available to the Cisco IOS software. If a secondary configuration file is configured, it is executed only with the privileges of the user who is performing the login. Thus, if you want to use manual login and set up the secondary configuration on the USB token to perform anything useful, you need to enable privileges.

Manual login can also be used in recovery scenarios for which the device configuration has been lost. If the scenario contains a remote site that normally connects to the core network with a VPN, the loss of the

configuration and RSA keys requires out-of-band services that the USB token can provide. The USB token can contain a boot configuration, a secondary configuration, or both, and RSA keys to authenticate the connection.

SUMMARY STEPS

1. **enable**
2. **crypto pki token** *token-name* [**admin**] **login** [*pin*]
3. **show usbtoken** *0-9:filename*

DETAILED STEPS

Command or Action	Purpose
Step 1 enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2 crypto pki token <i>token-name</i> [admin] login [<i>pin</i>] Example: Device# crypto pki token usbtoken0 admin login 5678	Manually logs into the USB token. If the admin keyword is not specified initially you can re-enter the crypto pki token command again with this keyword option.
Step 3 show usbtoken <i>0-9:filename</i> Example: Device# show usbtoken0:usbfile	(Optional) Verifies whether the USB token has been logged on to the device.

What to Do Next

After you have logged into the USB token, it is available for use.

- To further configure the USB token, see the “Configuring the USB Token” section.
- To perform USB token administrative tasks, such as changing the user PIN, copying files from the router to the USB token set key storage location, and changing USB tokens, see the “Setting Administrative Functions on the USB Token” section.

Configuring the USB Token

After you have set up automatic login, you may perform this task to further configure the USB token.

- [PINs and Passphrases, page 10](#)
- [Unlocking and Locking the USB Token, page 10](#)
- [Secondary Configuration and Unconfiguration Files, page 10](#)
- [What to Do Next, page 12](#)

PINs and Passphrases

For additional PIN security with automatic login, you may encrypt your PIN stored in NVRAM and set up a passphrase for your USB token. Establishing a passphrase allows you to keep your PIN secure; another user needs only to know the passphrase, not the PIN.

When the USB token is inserted into the device, the passphrase is needed to decrypt the PIN. Once the PIN is decrypted, the device can then use the PIN to log in to the USB token.

**Note**

The user needs a privilege level of 1 to log in.

Unlocking and Locking the USB Token

The USB token itself can be locked (encrypted) or unlocked (decrypted).

Unlocking the USB token allows it to be used. Once unlocked, Cisco IOS software treats the token as if it were automatically logged in. Any keys on the USB token are loaded, and if a secondary configuration file is on the token, it is executed with full user privileges (privilege level 15) independent of the privilege level of the logged-in user.

Locking the token, unlike logging out of the token, deletes any RSA keys loaded from the token and runs the secondary unconfiguration file, if configured.

Secondary Configuration and Unconfiguration Files

Configuration files that exist on a USB token are called secondary configuration files. If you create and configure a secondary configuration file, it is executed after the token is logged in. The existence of a secondary configuration file is determined by the presence of a secondary configuration file option in the Cisco IOS configuration stored in NVRAM. When the token is removed or logged out and the removal timer expires, a separate secondary unconfiguration file is processed to remove all secondary configuration elements from the running configuration. Secondary configuration and secondary unconfiguration files are executed at privilege level 15 and are not dependent on the level of the user logged in.

SUMMARY STEPS

1. **enable**
2. **crypto pki token** *token-name* **unlock** [*pin*]
3. **configure terminal**
4. **crypto pki token** *token-name* **encrypted-user-pin** [**write**]
5. **crypto pki token** *token-name* **secondary unconfig** *file*
6. **exit**
7. **crypto pki token** *token-name* **lock** [*pin*]

DETAILED STEPS

Command or Action	Purpose
<p>Step 1 <code>enable</code></p> <p>Example:</p> <pre>Device> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> • Enter your password if prompted.
<p>Step 2 <code>crypto pki token <i>token-name</i> unlock [<i>pin</i>]</code></p> <p>Example:</p> <pre>Device# crypto pki token mytoken unlock mypin</pre>	<p>(Optional) Allows the token to be used if the USB token has been locked.</p> <p>Once unlocked, Cisco IOS software treats the token as if it has been automatically logged in. Any keys on the token are loaded and if a secondary configuration file exists, it is executed.</p>
<p>Step 3 <code>configure terminal</code></p> <p>Example:</p> <pre>Device# configure terminal</pre>	<p>Enters global configuration mode.</p>
<p>Step 4 <code>crypto pki token <i>token-name</i> encrypted-user-pin [write]</code></p> <p>Example:</p> <pre>Device(config)# crypto pki token mytoken encrypted-user-pin write</pre>	<p>(Optional) Encrypts the stored PIN in NVRAM.</p>
<p>Step 5 <code>crypto pki token <i>token-name</i> secondary unconfig <i>file</i></code></p> <p>Example:</p> <pre>Device(config)# crypto pki token mytoken secondary unconfig configs/myunconfigfile.cfg</pre>	<p>(Optional) Specifies the secondary configuration file and its location.</p>
<p>Step 6 <code>exit</code></p> <p>Example:</p> <pre>Device(config)# exit</pre>	<p>Enters privileged EXEC mode.</p>
<p>Step 7 <code>crypto pki token <i>token-name</i> lock [<i>pin</i>]</code></p> <p>Example:</p> <pre>Device# crypto pki token mytoken lock mypin</pre>	<p>(Optional) Deletes any RSA keys loaded from the token and runs the secondary unconfiguration file, if it exists.</p>

Examples

The following example shows both the configuration and encryption of a user PIN and then the device reloading and the user PIN being unlocked:

```
! Configuring the user PIN

Enter configuration commands, one per line. End with CNTL/Z.

Device(config)# crypto pki token usbtoken0: userpin

Enter password: mypassword

! Encrypt the user PIN

Device(config)# crypto pki token usbtoken0: encrypted-user-pin

Enter passphrase: my passphrase

Device(config)# exit

Device#

Sep 20 21:51:38.076: %SYS-5-CONFIG_I: Configured from console by console

Device# show running config

crypto pki token usbtoken0 user-pin *encrypted*

! Reloading the router.

Device> enable

Password:

! Decrypting the user pin.

Device# crypto pki token usbtoken0: unlock

Token eToken is usbtoken0

Enter passphrase: my passphrase

Token login to usbtoken0(eToken) successful

Device#

Sep 20 22:31:13.128: %CRYPTO-6-TOKENLOGIN: Cryptographic Token eToken

Login Successful
```

The following example shows how a secondary unconfiguration file might be used to remove secondary configuration elements from the running configuration. For example, a secondary configuration file might be used to set up a PKI trustpoint. A corresponding unconfiguration file, named `mysecondaryunconfigfile.cfg`, might contain this command line:

```
no crypto pki trustpoint token-tp
```

If the token were removed and the following commands executed, the trustpoint and associated certificates would be removed from the device's running configuration:

```
Device# configure terminal
Device(config)# no crypto pki token mytoken secondary unconfig mysecondaryunconfigfile.cfg
```

What to Do Next

After you have logged into and configured the USB token, it is available for use. If you want to perform USB token administrative tasks, such as changing the user PIN, copying files from the router to the USB token set key storage location, and changing USB tokens, see the “Setting Administrative Functions on the USB Token” section.

Setting Administrative Functions on the USB Token

Perform this task to change default settings, such as the user PIN, the maximum number of failed attempts on the USB token, or the credential storage location.

SUMMARY STEPS

1. **enable**
2. **crypto pki token** *token-name* **admin**] **change-pin** [*pin*]
3. **crypto pki token** *token-name* *device-name*: **label** *token-label*
4. **configure terminal**
5. **crypto key storage** *device-name*:
6. **crypto key generate rsa** [**general-keys** | **usage-keys** | **signature** | **encryption**] [**label** *key-label*] [**exportable**] [**modulus** *modulus-size*] [**storage** *device-name*:] [**redundancy**] [**on** *device-name*]:
7. **crypto key move rsa** *keylabel* [**non-exportable** | [**on** | **storage**]] *location*
8. **crypto pki token** {*token-name* | **default**} **removal timeout** [*seconds*]
9. **crypto pki token** {*token-name* | **default**} **max-retries** [*number*]
10. **exit**
11. **copy usbflash**[*0-9*]:*filename* *destination-url*
12. **show usbtokens**[*0-9*]:*filename*
13. **crypto pki token** *token-name* **logout**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	crypto pki token <i>token-name</i> admin] change-pin [<i>pin</i>] Example: Device# crypto pki token usbtokens0 admin change-pin	(Optional) Changes the user PIN number on the USB token. <ul style="list-style-type: none"> • If the PIN is not changed, the default PIN 1234567890 is used. Note After the PIN has been changed, you must reset the login failure count to zero (via the crypto pki token max-retries command). The maximum number of allowable login failures is set (by default) to 15.
Step 3	crypto pki token <i>token-name</i> <i>device-name</i> : label <i>token-label</i> Example: Device# crypto pki token mytoken usb0: label newlabel	(Optional) Sets or changes the name of the USB token. <ul style="list-style-type: none"> • The value of the <i>token-label</i> argument may be up to 31 alphanumeric characters in length including dashes and underscores. Tip This command is useful when configuring multiple USB tokens for automatic login, secondary configuration files, or other token specific settings.

Command or Action	Purpose
<p>Step 4 <code>configure terminal</code></p> <p>Example:</p> <pre>Device# configure terminal</pre>	<p>Enters global configuration mode.</p>
<p>Step 5 <code>crypto key storage device-name:</code></p> <p>Example:</p> <pre>Device(config)# crypto key storage usbtoken0:</pre>	<p>(Optional) Sets the default RSA key storage location for newly created keys.</p> <p>Note Regardless of configuration settings, existing keys are stored on the device from where they were originally loaded.</p>
<p>Step 6 <code>crypto key generate rsa [general-keys usage-keys signature encryption] [label key-label] [exportable] [modulus modulus-size] [storage device-name:] [redundancy] [on device-name]:</code></p> <p>Example:</p> <pre>Device(config)# crypto key generate rsa label tokenkey1 storage usbtoken0:</pre>	<p>(Optional) Generates the RSA key pair for the certificate server.</p> <ul style="list-style-type: none"> The storage keyword specifies the key storage location. When specifying a label name by specifying the <i>key-label</i> argument, you must use the same name for the label that you plan to use for the certificate server (through the crypto pki server cs-label command). If a <i>key-label</i> argument is not specified, the default value, which is the fully qualified domain name (FQDN) of the device, is used. <p>If the exportable RSA key pair is manually generated after the CA certificate has been generated, and before issuing the no shutdown command, then use the crypto ca export pkcs12 command to export a PKCS12 file that contains the certificate server certificate and the private key.</p> <ul style="list-style-type: none"> By default, the modulus size of a CA key is 1024 bits. The recommended modulus for a CA key is 2048 bits. The range for a modulus size of a CA key is from 350 to 4096 bits. The on keyword specifies that the RSA key pair is created on the specified device, including a Universal Serial Bus (USB) token, local disk, or NVRAM. The name of the device is followed by a colon (:). <p>Note Keys created on a USB token must be 2048 bits or less.</p>

Command or Action	Purpose
<p>Step 7 <code>crypto key move rsa <i>keylabel</i> [non-exportable [on storage]] <i>location</i></code></p> <p>Example:</p> <pre>Device(config)# crypto key move rsa keypairname non-exportable on token</pre>	<p>(Optional) Moves existing Cisco IOS credentials from the current storage location to the specified storage location.</p> <p>By default, the RSA key pair remains stored on the current device.</p> <p>Generating the key on the device and moving it to the token takes less than a minute. Generating a key on the token, using the on keyword could take five to ten minutes, and is dependent on hardware key generation routines available on the USB token.</p> <p>When an existing RSA key pair is generated in Cisco IOS, stored on a USB token, and used for an enrollment, it may be necessary to move those existing RSA key pairs to an alternate location for permanent storage.</p> <p>This command is useful when using SDP with USB tokens to deploy credentials.</p>
<p>Step 8 <code>crypto pki token {<i>token-name</i> default} removal timeout [<i>seconds</i>]</code></p> <p>Example:</p> <pre>Device(config)# crypto pki token usbtoken0 removal timeout 60</pre>	<p>(Optional) Sets the time interval, in seconds, that the device waits before removing the RSA keys that are stored in the USB token after the USB token has been removed from the device.</p> <p>Note If this command is not issued, all RSA keys and IPsec tunnels associated with the USB token are torn down immediately after the USB token is removed from the device.</p>
<p>Step 9 <code>crypto pki token {<i>token-name</i> default} max-retries [<i>number</i>]</code></p> <p>Example:</p> <pre>Device(config)# crypto pki token usbtoken0 max-retries 20</pre>	<p>(Optional) Sets the maximum number of consecutive failed login attempts allowed before access to the USB token is denied.</p> <ul style="list-style-type: none"> By default, the value is set at 15.
<p>Step 10 <code>exit</code></p> <p>Example:</p> <pre>Device(config)# exit</pre>	<p>Exits global configuration mode.</p>
<p>Step 11 <code>copy usbflash[0-9]:<i>filename</i> <i>destination-url</i></code></p> <p>Example:</p> <pre>Device# copy usbflash0:file1 nvram:</pre>	<p>Copies files from USB token to the device.</p> <ul style="list-style-type: none"> <i>destination-url</i>—See the copy command page documentation for a list of supported options.

Command or Action	Purpose
<p>Step 12 <code>show usbtoken[0-9];filename</code></p> <p>Example:</p> <pre>Device# show usbtoken:usbfile</pre>	<p>(Optional) Displays information about the USB token. You can use this command to verify whether the USB token has been logged in to the device.</p>
<p>Step 13 <code>crypto pki token token-name logout</code></p> <p>Example:</p> <pre>Device# crypto pki token usbtoken0 logout</pre>	<p>Logs the device out of the USB token.</p> <p>Note If you want to save any data to the USB token, you must log back into the token.</p>

Troubleshooting USB Tokens

This section contains descriptions of the following Cisco IOS commands that can be used to help troubleshoot possible problems that may arise while using a USB token:

- [Troubleshooting the USB Port Connection, page 16](#)
- [Determining USB Token Support Connectivity, page 17](#)
- [Displaying USB Token Information, page 17](#)

Troubleshooting the USB Port Connection

Use the **show file systems** command to determine whether the router recognizes that there is a USB module plugged into a USB port. The USB module should appear on the list of file systems. If the module does not appear on the list, it can indicate any of the following problems:

- A connection problem with the USB module.
- The Cisco IOS image running on the router does not support a USB module.
- A hardware problem with the USB module itself.

Sample output from the **show file systems** command showing a USB token appears below. The USB module listing appears in the last line of the examples.

```
Device# show file systems
File Systems:
  Size(b)      Free(b)      Type  Flags  Prefixes
  -          -          opaque rw  archive:
  -          -          opaque rw  system:
  -          -          opaque rw  null:
  -          -          network rw  tftp:
* 129880064    69414912    disk  rw  flash:#

```

Determining USB Token Support Connectivity

Use the **show usb-devices summary** command to determine if a USB token device is supported by Cisco (see the text in bold).

```

Device# show usb-devices summary

USB Device: OHCI Host Controller
Bus: 03 Port: 00 Cnt: 00 Speed: 12
Vendor: 1d6b ProdID: 0001 Rev: 2.06
Serial Number: 0001:01:11.1

USB Device: OHCI Host Controller
Bus: 02 Port: 00 Cnt: 00 Speed: 12
Vendor: 1d6b ProdID: 0001 Rev: 2.06
Serial Number: 0001:01:11.0

USB Device: Token 4.28.1.1 2.7.195
Bus: 02 Port: 00 Cnt: 01 Speed: 12
Vendor: 0529 ProdID: 0600 Rev: 1.00
Serial Number:

USB Device: EHCI Host Controller
Bus: 01 Port: 00 Cnt: 00 Speed: 480
Vendor: 1d6b ProdID: 0002 Rev: 2.06
Serial Number: 0001:01:11.2

USB Device: eUSB
Bus: 01 Port: 03 Cnt: 01 Speed: 480
Vendor: 0e39 ProdID: 2b00 Rev: b9.00
Serial Number: 1E884812183636210510

```

Displaying USB Token Information

Use the **dir** command with the **filesystem** keyword option **usbtoken0-9:** to display all files, directories, and their permission strings on the USB token.

The following sample output displays directory information for the USB token:

```

Device# dir usbtoken1:
Directory of usbtoken1:/
 2 d---          64 Dec 22 2032 05:23:40 +00:00 1000
 5 d---        4096 Dec 22 2032 05:23:40 +00:00 1001
 8 d---          0 Dec 22 2032 05:23:40 +00:00 1002
10 d---         512 Dec 22 2032 05:23:42 +00:00 1003
12 d---          0 Dec 22 2032 05:23:42 +00:00 5000
13 d---          0 Dec 22 2032 05:23:42 +00:00 6000
14 d---          0 Dec 22 2032 05:23:42 +00:00 7000
15 ----         940 Jun 27 1992 12:50:42 +00:00 mystartup-config

! The certificate files are now on disk0/certs:

```

Example: Logging Into a USB Token and Saving RSA Keys to the USB Token

The following configuration example shows to how log in to the USB token, generate RSA keys, and store the RSA keys on the USB token:

```

! Configure the router to automatically log into the eToken
configure terminal
 crypto pki token default user-pin 0 1234567890
! Generate RSA keys and enroll certificates with the CA.
crypto pki trustpoint IOSCA
 enrollment url http://10.23.2.2
 exit
crypto ca authenticate IOSCA
Certificate has the following attributes:
  Fingerprint MD5:23272BD4 37E3D9A4 236F7E1A F534444E
  Fingerprint SHA1:D1B4D9F8 D603249A 793B3CAF 8342E1FE 3934EB7A
% Do you accept this certificate? [yes/no]:yes
Trustpoint CA certificate accepted.
crypto pki enroll
crypto pki enroll IOSCA
%
% Start certificate enrollment ..
% Create a challenge password. You will need to verbally provide this
password to the CA Administrator in order to revoke your certificate.
For security reasons your password will not be saved in the configuration.
Please make a note of it.
Password:
Re-enter password:
% The subject name in the certificate will include:c2851-27.cisco.com
% Include the router serial number in the subject name? [yes/no]:no
% Include an IP address in the subject name? [no]:no
Request certificate from CA? [yes/no]:yes
% Certificate request sent to Certificate Authority
% The 'show crypto ca certificate IOSCA verbose' command will show the fingerprint.
*Jan 13 06:47:19.413:CRYPTO_PKI: Certificate Request Fingerprint MD5:E6DDAB1B

*Jan 13 06:47:21.021:%PKI-6-CERTRET:Certificate received from Certificate Authority
! Issue the write memory command, which will automatically save the RSA keys to the
eToken ! instead of private NVRAM.
Router# write memory
Building configuration...
[OK]
*Jan 13 06:47:29.481:%CRYPTO-6-TOKENSTOREKEY:Key c2851-27.cisco.com stored on
Cryptographic Token eToken Successfully

```

The following sample output from the **show crypto key mypubkey rsa** command displays stored credentials after they are successfully loaded from the USB token. Credentials that are stored on the USB token are in the protected area. When storing the credentials on the USB token, the files are stored in a directory called /keystore. However, the key files are hidden from the command-line interface (CLI).

```

Router#
show crypto key mypubkey rsa

Technical Assistance

Description	Link
The Cisco Support and Documentation website provides online resources to download documentation, software, and tools. Use these resources to install and configure the software and to troubleshoot and resolve technical issues with Cisco products and technologies. Access to most tools on the Cisco Support and Documentation website requires a Cisco.com user ID and password.	http://www.cisco.com/cisco/web/support/index.html

Feature Information for Storing PKI Credentials

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 2 Feature Information for Storing PKI Credentials

Feature Name	Releases	Feature Information
Certificate—Storage Location Specification	Cisco IOS XE Release 2.1	<p>This feature allows you to specify the storage location of local certificates for platforms that support storing certificates as separate files. All Cisco platforms support NVRAM, which is the default location, and flash local storage. Depending on your platform, you may have other supported local storage options including bootflash, slot, disk, or USB flash.</p> <p>The following commands were introduced by this feature: crypto pki certificate storage, show crypto pki certificates storage</p>

Feature Name	Releases	Feature Information
USB eToken 64KB Smart Card Support	Cisco IOS XE Release 3.6	<p>This feature allows USB eToken 64 KB smart card support for RSA key and certificate storage location. USB tokens provide secure configuration distribution, RSA operations such as on-token key generation, signing, and authentication, and the storage of Virtual Private Network (VPN) credentials for deployment.</p> <p>The following commands were introduced by this feature: binary file, crypto key move rsa, crypto key storage, crypto pki token change-pin, crypto pki token encrypted-user-pin, crypto pki token label, crypto pki token lock, crypto pki token login, crypto pki token logout, crypto pki token max-retries, crypto pki token removal timeout, crypto pki token secondary config, crypto pki token unlock, crypto pki token user-pin, show usb-devices summary, show usb driver, show usbtoken, template file.</p>
