

Configuring the VRF-Aware Software Infrastructure Scale

Last Updated: January 20, 2012

This module describes how to configure the VRF-Aware Software Infrastructure Scale feature. The VRF-Aware Software Infrastructure (VASI) Scale feature allows you to apply services such as access control lists (ACLs), Network Address Translation (NAT), policing, and zone-based firewalls to traffic that is flowing across two different Virtual Routing and Forwarding (VRF) instances. The VASI interfaces support redundancy of the Route Processor (RP) and Forwarding Processor (FP). This feature supports Multiprotocol Label Switching (MPLS) traffic over VASI interfaces and IPv4 and IPv6 unicast traffic on VASI interfaces.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

I

Restrictions for Configuring the VRF-Aware Software Infrastructure Scale

VASI interfaces do not support the attachment of queue-based features. The following commands are not supported on a modular quality of service (QoS) CLI (MQC) policy that is attached to VASI interfaces:

- bandwidth (policy-map class)
- fair-queue
- priority
- queue-limit
- random-detect
- shape

Information About Configuring the VRF-Aware Software Infrastructure Scale

• VASI Overview, page 2

VASI Overview

VASI is implemented by using virtual interface pairs, where each of the interfaces in the pair is associated with a different VRF. The VASI virtual interface is the next hop interface for any packet that needs to be switched between these two VRFs. VASI interfaces provide the framework necessary to configure a firewall or a NAT between VRF instances.

Each interface pair is associated with two different VRF instances. The two virtual interfaces, called vasileft and vasiright, in a pair are logically wired back-to-back and are completely symmetrical. Each interface has an index. The association of the pairing is done automatically based on the two interface indexes such that vasileft automatically gets paired to vasiright. You can configure either static routing or dynamic routing with Border Gateway Protocol (BGP), Enhanced Interior Gateway Routing Protocol (EIGRP), or Open Shortest Path First (OSPF). BGP dynamic routing protocol restrictions and configuration are valid for BGP routing configurations between VASI interfaces.

How to Configure VASI

• Configuring the VASI Interface, page 2

Configuring the VASI Interface

VASI must be enabled on both interfaces of the VASI pair (vasileft and vasiright). You can configure VRF on any VASI interface. Perform the following task to configure the VASI interfaces.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- **3.** interface vasileft *number*
- 4. vrf forwarding table-name [downstream table-name]
- 5. ip address {*ip-address mask* [secondary] | pool pool-name}
- 6. exit
- 7. interface vasiright number
- 8. vrf forwarding table-name [downstream
- 9. ip address {*ip-address mask* [secondary] | pool pool-name}

10. exit

11. ip route [**vrf** *vrf-name*] *destination-prefix destination-prefix-mask*{**vasileft** | **vasiright**} *number* **12. end**

DETAILED STEPS

I

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
		• Enter your password if prompted.
	Example:	
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	interface vasileft number	Configures the vasileft interface and enters interface configuration mode.
	Example:	• <i>number</i> A number for the vasileft interface. Range is from 1 to 1000.
	Router(config)# interface vasileft 200	
Step 4	vrf forwarding table-name [downstream table-name]	Configures the VRF table.
	Example:	Note You can configure VRF forwarding on any VASI interface. It is not mandatory to configure VRF instances on both VASI interfaces.
	Router(config-if)# vrf forwarding table1	

1

	Command or Action	Purpose Configures a primary or secondary IP address for an interface.		
Step 5	<pre>ip address {ip-address mask [secondary] pool pool- name}</pre>			
	Example:			
	Router(config-if)# ip address 192.168.0.1 255.255.255.0			
Step 6	exit	Exits interface configuration mode and enters global configuration mode.		
	Example:			
	Router(config-if)# exit			
Step 7	interface vasiright number	Configures the vasiright interface and enters interface configuration mode.		
	Example:	• <i>number</i> A number for the vasiright interface. Range is from 1 to 1000.		
	Router(config)# interface vasiright 200			
Step 8	vrf forwarding table-name [downstream	Configures the VRF table.		
	Example:			
	table-name			
	Example:			
	Router(config-if)# vrf forwarding table			
Step 9	<pre>ip address {ip-address mask [secondary] pool pool- name}</pre>	Configures a primary or secondary IP address for an interface.		
	Example:			
	Router(config-if)# ip address 192.168.1.1 255.255.255.0			
Step 10	exit	Exits interface configuration mode and enters global configuration mode.		
	Example:			
	Router(config-if)# exit			

	Command or Action	Purpose		
Step 11	ip route [vrf <i>vrf-name</i>] <i>destination-prefix destination-prefix</i> <i>mask</i> { vasileft vasiright } <i>number</i>	Establishes static routes for a VRF instance and VASI interface.		
	Example:	Note If you want to add an IP route for a VRF instance, you must specify the vrf keyword.		
	Router(config)# ip route vrf t1 10.0.0.1 255.255.0.0 vasileft 200			
Step 12	end	Exits global configuration mode.		
	Example:			
	Router(config)# end			

Configuration Examples for VASI

• Example Configuring the VASI Interface, page 5

Example Configuring the VASI Interface

The following example shows how to configure the VASI interface. VASI must be enabled for each interface of the VASI pair (vasileft and vasiright). You can configure VRF on any VASI interface. See the Configuring the VASI Interface section for configuration information.

```
Router(config)# interface vasileft 200
Router(config-if)# vrf forwarding table1
Router(config-if)# ip address 192.168.0.1 255.255.255.0
Router(config)# ip route vrf t1 10.0.0.1 255.255.0.0 vasileft 200
Router(config)# interface vasiright 200
Router(config-if)# vrf forwarding table2
Router(config-if)# ip address 192.168.1.1 255.255.255.0
Router(config-if)# exit
Router(config-if)# exit
Router(config-if)# ip route 10.0.0.2 255.255.0 vasiright 200
```

Feature Information for Configuring VRF-Aware Software Infrastructure Scale

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Feature Name	Releases	Feature Information
Configuring VRF-Aware Software Infrastructure Scale	Cisco IOS XE Release 2.6	The VRF-Aware Software Infrastructure (VASI) Scale feature allows you to apply services such as ACLs, NAT, policing, and zone-based firewalls to traffic that is flowing across two different VRF instances. The VASI interfaces support redundancy of the RP and FP. This feature supports MPLS traffic over VASI interfaces and IPv4 and IPv6 multicast and unicast traffic on VASI interfaces.
		The following sections provide information about this feature:

Table 1 Feature Information for Configuring the VRF-Aware Software Infrastructure Scale

Feature Name	Releases	Feature Information	
VASI (VRF-Aware Software Infrastructure) Enhancements	Cisco IOS XE Release 3.1S	This feature provides the following enhancements to VASI:	
Phase I		 Support for 500 VASI interfaces. Support for BGP dynamic routing between VASI interfaces. 	
VASI (VRF-Aware Software Infrastructure) Enhancements	Cisco IOS XE Release 3.2S	This feature provides the following enhancements to VASI:	
Phase II		 Support for IPv6 unicast traffic over VASI interfaces. Support for OSPF and EIGRP dynamic routing between VASI interfaces. 	
VASI (VRF-Aware Software Infrastructure) Scale	Cisco IOS XE Release 3.3S	This feature provides support for 1000 VASI interfaces.	
		The following commands were introduced or modified: interface (VASI).
