# Simple Network Management Protocol

Simple Network Management Protocol (SNMP) is an application-layer protocol that provides a message format for communication between SNMP managers and agents. SNMP provides a standardized framework and a common language that is used for monitoring and managing devices in a network.

This module discusses how to enable an SNMP agent on a Cisco device and how to control the sending of SNMP notifications from the agent. For information about using SNMP management systems, see the appropriate documentation for your network management system (NMS) application.

For a complete description of the device monitoring commands mentioned in this document, see the Cisco Network Management Command Reference. To locate documentation of other commands that appear in this document, use the Cisco IOS Master Command List or search online.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

# Restrictions for SNMP

Not all Cisco platforms are supported on the features described in this module. Use Cisco Feature Navigator to find information about platform support and Cisco software image support.

## Information About Configuring SNMP Support

### Components of SNMP

The Simple Network Management Protocol (SNMP) is an application-layer protocol that provides a message format for communication between SNMP managers and agents. SNMP provides a standardized framework and a common language used for monitoring and managing devices in a network.

The SNMP framework has the following components, which are described in the following sections:

### SNMP Operations

SNMP applications perform the following operations to retrieve data, modify SNMP object variables, and send notifications:

#### SNMP Get

The Simple Network Management Protocol (SNMP) GET operation is performed by a Network Management Server (NMS) to retrieve SNMP object variables. There are three types of GET operations:

- GET—Retrieves the exact object instance from the SNMP agent.
- GETNEXT—Retrieves the next object variable, which is a lexicographical successor to the specified variable.
- GETBULK—Retrieves a large amount of object variable data, without the need for repeated GETNEXT operations.

#### SNMP SET

The Simple Network Management Protocol (SNMP) SET operation is performed by a Network Management Server (NMS) to modify the value of an object variable.

#### SNMP Notifications

A key feature of SNMP is its capability to generate unsolicited notifications from an SNMP agent.

## Traps and Informs

Unsolicited (asynchronous) notifications can be generated as traps or inform requests (informs). Traps are messages alerting the SNMP manager to a condition on the network. Informs are traps that include a request for confirmation of receipt from the SNMP manager. Notifications can indicate improper user authentication, restarts, the closing of a connection, loss of connection to a neighboring device, or other significant events.

Traps are less reliable than informs because the receiver does not send an acknowledgment when it receives a trap. The sender does not know if the trap was received. An SNMP manager that receives an inform, acknowledges the message with an SNMP response protocol data unit (PDU). If the sender never receives a response, the inform can be sent again. Thus, informs are more likely to reach their intended destination.

Traps are often preferred even though they are less reliable because informs consume more resources in the device and in the network. Unlike a trap, which is discarded as soon as it is sent, an inform must be held in memory until a response is received or the request times out. Also, traps are sent only once, whereas an inform may be resent several times. The retries increase traffic and contribute to higher overhead on the network. Use of traps and informs requires a trade-off between reliability and resources. If it is important that the SNMP manager receives every notification, use informs, but if traffic volume or memory usage are concerns and receipt of every notification is not required, use traps.

The following figures illustrate the differences between traps and informs.

The figure below shows that an agent successfully sends a trap to an SNMP manager. Although the manager receives the trap, it does not send an acknowledgment. The agent has no way of knowing that the trap reached its destination.

**Figure 1: Trap Successfully Sent to SNMP Manager**

In the figure below, the agent successfully sends an inform to the manager. When the manager receives the inform, a response is sent to the agent and the agent knows that the inform reached its destination. Notice that in this example, the traffic generated is twice as much as in the interaction shown in the table above.

The figure below shows an agent sending a trap to a manager that the manager does not receive. The agent has no way of knowing that the trap did not reach its destination. The manager never receives the trap because traps are not resent.

**Figure 3: Trap Unsuccessfully Sent to SNMP Manager**

The figure below shows an agent sending an inform to a manager that does not reach the manager. Because the manager did not receive the inform, it does not send a response. After a period of time, the agent resends the inform. The manager receives the inform from the second transmission and replies. In this example, more traffic is generated than in the scenario shown in the table above but the notification reaches the SNMP manager.

## Versions of SNMP

The Cisco IOS software supports the following versions of SNMP:

- **SNMPv1**—Simple Network Management Protocol: a full Internet standard, defined in RFC 1157. (RFC 1157 replaces the earlier versions that were published as RFC 1067 and RFC 1098.) Security is based on community strings.
- **SNMPv2c**—The community string-based Administrative Framework for SNMPv2. SNMPv2c (the “c” is for “community”) is an experimental Internet protocol defined in RFC 1901, RFC 1905, and RFC 1906. SNMPv2c is an update of the protocol operations and data types of SNMPv2p (SNMPv2 Classic) and uses the community-based security model of SNMPv1.
- **SNMPv3**—Version 3 of SNMP. SNMPv3 is an interoperable standards-based protocol defined in RFCs 3413 to 3415. SNMPv3 provides secure access to devices by authenticating and encrypting packets over the network.

The security features provided in SNMPv3 are as follows:

- **Message integrity**—Ensuring that a packet has not been tampered with in transit.
- **Authentication**—Determining that the message is from a valid source.
- **Encryption**—Scrambling the contents of a packet to prevent it from being learned by an unauthorized source.

Both SNMPv1 and SNMPv2c use a community-based form of security. The community of SNMP managers able to access the agent MIB is defined by a community string.

SNMPv2c support includes a bulk retrieval mechanism and detailed error message reporting to management stations. The bulk retrieval mechanism supports the retrieval of tables and large quantities of information,

minimizing the number of round trips required. The SNMPv2c improved error handling support includes expanded error codes that distinguish different types of errors; these conditions are reported through a single error code in SNMPv1. The following three types of exceptions are also reported: no such object, no such instance, and end of MIB view.

SNMPv3 is a security model in which an authentication strategy is set up for a user and the group in which the user resides. A security level is the permitted level of security within a security model. A combination of a security model and a security level determines which security mechanism is employed when handling an SNMP packet.

Three security models are available: SNMPv1, SNMPv2c, and SNMPv3. The table below lists the combinations of security models and levels and their meanings.

**Table 1: SNMP Security Models and Levels**

Model	Level	Authentication	Encryption	What Happens
v1	noAuthNoPriv	Community String	No	Uses a community string match for authentication.
v2c	noAuthNoPriv	Community String	No	Uses a community string match for authentication.
v3	noAuthNoPriv	Username	No	Uses a username match for authentication.
v3	authNoPriv	Message Digest 5 (MD5) or Secure Hash Algorithm (SHA)	No	Provides authentication based on the HMAC-MD5 or HMAC-SHA algorithms.
v3	authPriv	MD5 or SHA	Data Encryption Standard (DES)	Provides authentication based on the HMAC-MD5 or HMAC-SHA algorithms. Provides DES 56-bit encryption in addition to authentication based on the CBC-DES (DES-56) standard.

**Note**

SNMPv2p (SNMPv2 Classic) is not supported in Cisco IOS Release 11.2 and later releases. SNMPv2c replaces the Party-based Administrative and Security Framework of SNMPv2p with a Community-based Administrative Framework. SNMPv2c retained the bulk retrieval and error handling capabilities of SNMPv2p.

You must configure an SNMP agent to use the version of SNMP supported by the management station. An agent can communicate with multiple managers. You can configure the Cisco IOS software to support communications with one management station using the SNMPv1 protocol, one using the SNMPv2c protocol, and another using SNMPv3.

SNMPv3 supports RFCs 1901 to 1908, 2104, 2206, 2213, 2214, and 2271 to 2275. For additional information about SNMPv3, see RFC 2570, *Introduction to Version 3 of the Internet-standard Network Management Framework* (this is not a standards document).

## How to Configure SNMP Support

There is no specific command to enable SNMP. The first **snmp-server** command that you enter enables supported versions of SNMP. All other configurations are optional.

### Configuring System Information

You can set the system contact, location, and serial number of the SNMP agent so that these descriptions can be accessed through the configuration file. Although the configuration steps described in this section are optional, configuring the basic information is recommended because it may be useful when troubleshooting your configuration. In addition, the first **snmp-server** command that you issue enables SNMP on the device.

Perform this task as needed.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **snmp-server contact** *text*
4. **snmp-server location** *text*
5. **snmp-server chassis-id** *number*
6. **end**
7. **show snmp contact**
8. **show snmp location**
9. **show snmp chassis**

#### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>	Enables privileged EXEC mode.

	Command or Action	Purpose
	<b>Example:</b> Device> <b>enable</b>	<ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>snmp-server contact</b> <i>text</i>  <b>Example:</b> Device(config)# <b>snmp-server contact NameOne</b>	Sets the system contact string.
<b>Step 4</b>	<b>snmp-server location</b> <i>text</i>  <b>Example:</b> Device(config)# <b>snmp-server location LocationOne</b>	Sets the system location string.
<b>Step 5</b>	<b>snmp-server chassis-id</b> <i>number</i>  <b>Example:</b> Device(config)# <b>snmp-server chassis-id 015A619T</b>	Sets the system serial number.
<b>Step 6</b>	<b>end</b>  <b>Example:</b> Device(config)# <b>end</b>	Exits global configuration mode.
<b>Step 7</b>	<b>show snmp contact</b>  <b>Example:</b> Device# <b>show snmp contact</b>	(Optional) Displays the contact strings configured for the system.
<b>Step 8</b>	<b>show snmp location</b>  <b>Example:</b> Device# <b>show snmp location</b>	(Optional) Displays the location string configured for the system.
<b>Step 9</b>	<b>show snmp chassis</b>  <b>Example:</b> Device# <b>show snmp chassis</b>	(Optional) Displays the system serial number.

## Enabling the SNMP Agent Shutdown Mechanism

Using SNMP packets, a network management tool can send messages to users on virtual terminals and on the console. This facility operates in a similar fashion to the **send EXEC** command; however, the SNMP request that causes the message to be issued to the users also specifies the action to be taken after the message is delivered. One possible action is a shutdown request. After a system is shut down, typically it is reloaded. Because the ability to cause a reload from the network is a powerful feature, it is protected by the **snmp-server system-shutdown** global configuration command. If you do not issue this command, the shutdown mechanism is not enabled.

Perform this task to enable the SNMP agent shutdown mechanism.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **snmp-server system-shutdown**
4. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>snmp-server system-shutdown</b>  <b>Example:</b> Device (config) # <b>snmp-server system-shutdown</b>	Enables system shutdown using the SNMP message reload feature.
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Device (config) # <b>end</b>	Exits global configuration mode.

## Defining the Maximum SNMP Agent Packet Size

You can define the maximum packet size permitted when the SNMP agent is receiving a request or generating a reply.

Perform this task to set the maximum permitted packet size.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **snmp-server packetsize** *byte-count*
4. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>snmp-server packetsize</b> <i>byte-count</i>  <b>Example:</b> Device (config)# <b>snmp-server packetsize 512</b>	Establishes the maximum packet size.
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Device (config)# <b>end</b>	Exits global configuration mode and returns to privileged EXEC mode.

## Limiting the Number of TFTP Servers Used via SNMP

You can limit the number of TFTP servers used for saving and loading configuration files via SNMP by using an access list. Limiting the use of TFTP servers in this way conserves system resources and centralizes the operation for manageability.

Perform this task to limit the number of TFTP servers.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **snmp-server tftp-server-list *number***
4. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>snmp-server tftp-server-list <i>number</i></b>  <b>Example:</b> Device(config)# <b>snmp-server tftp-server-list 12</b>	Limits the number of TFTP servers used for configuration file copies via SNMP to the servers in an access list.
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Device(config)# <b>end</b>	Exits global configuration mode and returns to privileged EXEC mode.

### Troubleshooting Tips

An alternative to using the ifAlias value for the identification of interfaces across reboots is to use the cciDescr object in the Cisco Circuit Interface MIB (CISCO-CIRCUIT-INTERFACE-MIB.my). This MIB object can

be used only for circuit-based interfaces such as ATM or Frame Relay interfaces. Cisco IOS feature FTS-731 introduced the Circuit Interface Identification Persistence for the Simple Network Management Protocol (SNMP), which maintains the user-defined name of the circuit (defined in the `cciDescr` object) across reboots and allows consistent identification of circuit-based interfaces.

## Configuring SNMP Versions 1 and 2

When you configure SNMP versions 1 and 2, you can optionally create or modify views for community strings to limit which MIB objects an SNMP manager can access.

Perform the following tasks when configuring SNMP version 1 or version 2.

### Creating or Modifying an SNMP View Record

You can assign views to community strings to limit which MIB objects an SNMP manager can access. You can use a predefined view or create your own view. If you are using a predefined view or no view at all, skip this task.

Perform this task to create or modify an SNMP view record.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **snmp-server view** *view-name oid-tree* {**included** | **excluded**}
4. **no snmp-server view** *view-name oid-tree* {**included** | **excluded**}
5. **end**
6. **show snmp view**

#### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
Step 3	<b>snmp-server view</b> <i>view-name oid-tree</i> { <b>included</b>   <b>excluded</b> }	Creates a view record. <ul style="list-style-type: none"> <li>• In this example, the <code>mib2</code> view that includes all objects in the MIB-II subtree is created.</li> </ul>

	Command or Action	Purpose
	<p><b>Example:</b></p> <pre>Device(config)# snmp-server view mib2 mib-2 included</pre>	<p><b>Note</b> You can use this command multiple times to create the same view record. If a view record for the same OID value is created multiple times, the latest entry of the object identifier takes precedence.</p>
<b>Step 4</b>	<p><b>no snmp-server view</b> <i>view-name oid-tree</i> {<b>included</b>   <b>excluded</b>}</p> <p><b>Example:</b></p> <pre>Device(config)# no snmp-server view mib2 mib-2 included</pre>	Removes a server view.
<b>Step 5</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	Exits global configuration mode.
<b>Step 6</b>	<p>show snmp view</p> <p><b>Example:</b></p> <pre>Device# show snmp view</pre>	(Optional) Displays a view of the MIBs associated with SNMP.

## Creating or Modifying Access Control for an SNMP Community

Use an SNMP community string to define the relationship between the SNMP manager and the agent. The community string acts like a password to regulate access to the agent on the device. Optionally, you can specify one or more of the following characteristics associated with the string:

- An access list of IP addresses of the SNMP managers that are permitted to use the community string to gain access to the agent.
- A MIB view, which defines the subset of all MIB objects accessible to the given community.
- Read and write or read-only permission for the MIB objects accessible to the community.

Perform this task to create or modify a community string.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **snmp-server community** *string* [**view** *view-name*] [**ro** | **rw**] [**ipv6 nacl**] [*access-list-number*]
4. **no snmp-server community** *string*
5. **end**
6. **show snmp community**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
Step 3	<b>snmp-server community</b> <i>string</i> [ <b>view</b> <i>view-name</i> ] [ <b>ro</b>   <b>rw</b> ] [ <b>ipv6 nacl</b> ] [ <i>access-list-number</i> ]  <b>Example:</b> Device(config)# <b>snmp-server community comaccess ro 4</b>	Defines the community access string. <ul style="list-style-type: none"> <li>• You can configure one or more community strings.</li> </ul>
Step 4	<b>no snmp-server community</b> <i>string</i>  <b>Example:</b> Device(config)# <b>no snmp-server community comaccess</b>	Removes the community string from the configuration.
Step 5	<b>end</b>  <b>Example:</b> Device(config)# <b>end</b>	Exits global configuration mode.
Step 6	<b>show snmp community</b>  <b>Example:</b> Device# <b>show snmp community</b>	(Optional) Displays the community access strings configured for the system.

## Configuring a Recipient of an SNMP Trap Operation

To enable multiple hosts, you must issue a separate **snmp-server host** command for each host. You can specify multiple notification types in the command for each host.

When multiple **snmp-server host** commands are given for the same host and kind of notification (trap or inform), each succeeding command overwrites the previous command. Only the last **snmp-server host** command will be in effect. For example, if you enter an **snmp-server host inform** command for a host and then enter another **snmp-server host inform** command for the same host, the second command will replace the first.

The **snmp-server host** command is used in conjunction with the **snmp-server enable** command. Use the **snmp-server enable** command to specify which SNMP notifications are sent globally. For a host to receive most notifications, at least one **snmp-server enable** command and the **snmp-server host** command for that host must be enabled.

Some notification types cannot be controlled with the **snmp-server enable** command. For example, some notification types are always enabled and others are enabled by a different command. For example, the linkUpDown notifications are controlled by the **snmp trap link-status** interface configuration command. These notification types do not require an **snmp-server enable** command.

A *notification-type* option's availability depends on the device type and Cisco IOS software features supported on the device. For example, the Cisco IOS software does not support the envmon notification type. To see what notification types are available on your system, use the command help (?) at the end of the **snmp-server host** command.

Perform this task to configure the recipient of an SNMP trap operation.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **snmp-server host** *host-id* [**traps** | **informs**][**version** {1|2c|3 [**auth** | **noauth** | **priv**]}] *community-string* [**udp-port** *port-number*] [*notification-type*]
4. **end**
5. **show snmp host**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>

	Command or Action	Purpose
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>snmp-server host</b> <i>host-id</i> [ <b>traps</b>   <b>informs</b> ][ <b>version</b> { <b>1</b>   <b>2c</b>   <b>3</b> [ <b>auth</b>   <b>noauth</b>   <b>priv</b> ]}] <i>community-string</i> [ <b>udp-port</b> <i>port-number</i> ] [ <i>notification-type</i> ]  <b>Example:</b> Device(config)# <b>snmp-server host 172.16.1.27 version 2c public</b>	Specifies whether you want the SNMP notifications sent as traps or informs, the version of SNMP to use, the security level of the notifications (for SNMPv3), and the recipient (host) of the notifications.
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Device(config)# <b>end</b>	Exits global configuration mode.
<b>Step 5</b>	<b>show snmp host</b>  <b>Example:</b> Device# <b>show snmp host</b>	(Optional) Displays the SNMP notifications sent as traps, the version of SNMP, and the host IP address of the notifications.

## Disabling the SNMP Agent

Perform this task to disable any version of an SNMP agent.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **no snmp-server**
4. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>	Enables privileged EXEC mode.

	Command or Action	Purpose
	<b>Example:</b> Device> <b>enable</b>	<ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>no snmp-server</b>  <b>Example:</b> Device(config)# <b>no snmp-server</b>	Disables SNMP agent operation.
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Device(config)# <b>end</b>	Exits global configuration mode.

## Configuration Examples for SNMP Support

### Example: Configuring SNMPv1 Support

The following example shows how to enable SNMPv1. The configuration permits any SNMP manager to access all objects with read-only permissions using the community string named public. This configuration does not cause the router to send traps.

```
Device(config)# snmp-server community public
```

The following example shows how to permit SNMP access to all objects with read-only permission using the community string named public. The router also will send BGP traps to the hosts 172.16.1.111 and 172.16.1.33 using SNMPv1. The community string named public is sent with the traps.

```
Device(config)# snmp-server community public
Device(config)# snmp-server enable traps bgp
Device(config)# snmp-server host 172.16.1.111 version 1 public
Device(config)# snmp-server host 172.16.1.33 public
```

The following example shows how to send the SNMP and Cisco environmental monitor enterprise-specific traps to address 172.30.2.160:

```
Device(config)# snmp-server enable traps
Device(config)# snmp-server host 172.30.2.160 public snmp envmon
```

The following example shows how to enable the router to send all traps to the host example.com using the community string public:

```
Device(config)# snmp-server enable traps
Device(config)# snmp-server host example.com public
```

The following example shows a configuration in which no traps are sent to a host. The BGP traps are enabled for all hosts, but only the OSPF traps are enabled to be sent to a host.

```
Device(config)# snmp-server enable traps bgp
Device(config)# snmp-server host host1 public ospf
```

The following example shows how to enable a router to send all informs to the host example.com using the community string named public:

```
Device(config)# snmp-server enable traps
Device(config)# snmp-server host example.com informs version 2c public
```

The following example shows how to enable the SNMP manager and set the session timeout to a value greater than the default:

```
Device(config)# snmp-server manager
Device(config)# snmp-server manager session-timeout 1000
```

The following example shows how to enable the SNMP manager to access all objects with read-only permissions. The user is specified as *abcd* and the authentication password is *abcdpasswd*. To obtain the automatically generated default local engine ID, use the **show snmp engineID** command.

```
Device(config)# snmp-server view readview internet included
Device(config)# snmp-server view readview iso included
Device(config)# snmp-server group group1 v3 noauth read readview
Device(config)# snmp-server user abcd group1 v3 auth md5 abcdpasswd
```

## Example: Show SNMP View

The following example shows the SNMP view for the system OID tree:

```
Device> enable
Device# configure terminal
Device(config)# snmp-server view test system included
Device(config)# end
Device# show snmp view

test system - included nonvolatile active
cac_view pimMIB - included read-only active
cac_view msdpMIB - included read-only active
cac_view interfaces - included read-only active
cac_view ip - included read-only active
cac_view ospf - included read-only active
.
.
.
vldefault iso - included permanent active
vldefault internet - included permanent active
vldefault snmpUsmMIB - excluded permanent active
vldefault snmpVacmMIB - excluded permanent active
vldefault snmpCommunityMIB - excluded permanent active
vldefault ciscoIpTapMIB - excluded permanent active
vldefault ciscoMgmt.395 - excluded permanent active
vldefault ciscoTap2MIB - excluded permanent active
.
```

```

:
:

```

## Example Configuring SNMP Community Access Strings

The following example shows the community access strings configured to enable access to the SNMP manager:

```

Device> enable
Device# configure terminal
Device(config)# snmp-server community public ro
Device(config)# snmp-server community private rw
Device(config)# end
Device# show snmp community

Community name: private
Community Index: private
Community SecurityName: private
storage-type: nonvolatile active
Community name: public
Community Index: public
Community SecurityName: public
storage-type: nonvolatile active

```

## Example Configuring Host Information

The following example shows the host information configured for SNMP notifications:

```

Device> enable
Device# configure terminal
Device(config)# snmp-server host 10.2.28.1 inform version 2c public
Device(config)# end
Device# show snmp host

Notification host: 10.2.28.1 udp-port: 162   type: inform
user: public   security model: v2c

```

## Feature Information for Simple Network Management Protocol

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Table 2: Feature Information for Simple Network Management Protocol**

Feature Name	Releases	Feature Information
SNMP (Simple Network Management Protocol)	11.2(1) 15.0(1)S Cisco IOS XE Release 3.3SE	The Simple Network Management Protocol (SNMP) feature provides an application-layer protocol that facilitates the exchange of management information between network devices. SNMP is part of the TCP/IP protocol suite. SNMP enables network administrators to manage network performance, find and solve network problems, and plan for network growth.

## CHAPTER 2

# SNMP Inform Request

---

The Simple Network Management Protocol (SNMP) Inform Requests feature allows devices to send inform requests to SNMP managers.

- [Finding Feature Information, page 23](#)
- [Information About SNMP Inform Requests, page 23](#)
- [How to Configure SNMP Inform Requests, page 24](#)
- [Configuration Examples for SNMP Inform Request, page 26](#)
- [Additional References, page 27](#)
- [Feature Information for SNMP Inform Request, page 29](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

## Information About SNMP Inform Requests

### SNMP Inform Request

The SNMP Inform Request feature supports sending inform requests. SNMP asynchronous notifications are usually sent as SNMP traps.

Traps are less reliable than informs because an acknowledgment is not sent from the receiving end when a trap is received; however, an SNMP manager that receives an inform acknowledges the message with an SNMP response PDU. If the sender does not receive a response for an inform, the inform can be sent again.

# How to Configure SNMP Inform Requests

## Configuring Devices to Send Traps

Perform the following task to configure the device to send traps to a host in global configuration mode:

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `snmp-server host host[version {1|2c}]community-string[udp-port port][notification-type]`
4. `snmp-server enable traps[ notification-type] [notification-option]`
5. `end`

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<code>enable</code>  <b>Example:</b> Device> <code>enable</code>	Enables privileged EXEC mode.  <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<code>configure terminal</code>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 3</b>	<code>snmp-server host host[version {1 2c}]community-string[udp-port port][notification-type]</code>  <b>Example:</b> Device(config)# <code>snmp-server host 10.10.10.10 version 1 public udp-port 2012</code>	Specifies the recipient of the trap message.
<b>Step 4</b>	<code>snmp-server enable traps[ notification-type] [notification-option]</code>  <b>Example:</b> Device(config)# <code>snmp-server enable traps alarms 3</code>	Globally enables the trap production mechanism for the specified traps. <b>Note</b> Some traps are not controlled by the <code>snmp-server enable traps</code> command. These traps are either enabled by default or controlled through other commands. For example, by default, SNMP link traps are sent when an interface goes up or down. For interfaces expected to go up and down during normal usage, such as ISDN interfaces, the output generated by

	Command or Action	Purpose
		these traps may not be useful. Use the <b>nosnmptrapslink-status</b> interface configuration command to disable these traps. In order for a host to receive a trap, an <b>snmp-serverhost</b> command must be configured for that host, and the trap must be enabled globally through the <b>snmp-serverenabletraps</b> command, through a different command, such as <b>snmptrapslink-status</b> , or by default.
<b>Step 5</b>	<b>end</b>  <b>Example:</b> Device(config)# <b>end</b>	Exits global configuration mode.

## Changing Inform Operation Values

Perform the following optional task in global configuration mode to change inform operation values:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **snmp-server informs** [*retries retries*] [*timeout seconds*] [*pending pending*]
4. **snmp-server trap-source** *interface*
5. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>snmp-server informs</b> [ <i>retries retries</i> ] [ <i>timeout seconds</i> ] [ <i>pending pending</i> ]	Configures inform-specific operation values. <ul style="list-style-type: none"> <li>• This example sets the maximum number of times to resend an inform, the number of seconds to wait for an</li> </ul>

	Command or Action	Purpose
	<b>Example:</b> Device(config)# <b>snmp-server informs retries 10 timeout 30 pending 100</b>	acknowledgment before resending, and the maximum number of informs waiting for acknowledgments at any one time.
<b>Step 4</b>	<b>snmp-server trap-source</b> <i>interface</i>  <b>Example:</b> Device(config)# <b>snmp-server trap-source FastEthernet 2/1</b>	This example sets the IP address for the Fast Ethernet interface in slot2, port 1 as the source for all SNMP notifications.
<b>Step 5</b>	<b>end</b>  <b>Example:</b> Device(config)# <b>end</b>	Exits global configuration mode.

## Configuration Examples for SNMP Inform Request

### Example: Configuring SNMP Inform Request

The following configuration example shows how to configure the SNMP Inform Request feature for SNMPv1 or SNMPv2:

The following example sends the SNMP and Cisco environmental monitor enterprise-specific traps to address 172.30.2.160:

```
Device(config)# snmp-server enable traps
Device(config)# snmp-server host 172.30.2.160 public snmp envmon
```

The following example enables the device to send all traps to the host myhost.example.com using the community string public:

```
Device(config)# snmp-server enable traps
Device(config)# snmp-server host myhost.example.com public
```

The following example will not send traps to any host. The BGP traps are enabled for all hosts, but only the ISDN traps are enabled to be sent to a host.

```
Device(config)# snmp-server enable traps bgp
Device(config)# snmp-server host bob public isdn
```

The following example enables the device to send all inform requests to the host myhost.example.com using the community string public:

```
Device(config)# snmp-server enable traps
Device(config)# snmp-server host myhost.example.com informs version 2c public
```

## Feature Information for SNMP Inform Request

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Table 3: Feature Information for SNMP Inform Request**

Feature Name	Releases	Feature Information
SNMP Inform Request	11.3(1)T 12.0(1)T 12.1(3)T 12.1(14) 12.2(8)T 15.0(1)S	The SNMP Inform Request feature supports sending inform requests. SNMP asynchronous notifications are usually sent as SNMP traps. Traps are less reliable than informs because an acknowledgment is not sent from the receiving end when a trap is received; however, an SNMP manager that receives an inform acknowledges the message with an SNMP response PDU. If the sender does not receive a response for an inform, the inform can be sent again.

## SNMPv2c

---

Community-based Simple Network Management Protocol Version 2 (SNMPv2c) is an experimental Internet protocol defined in RFC 1901, RFC 1905, and RFC 1906. SNMPv2c is the community string-based administrative framework for SNMPv2. Community string is a type of password, which is transmitted in cleartext. SNMPv2c is an update of the protocol operations and data types of party-based Simple Network Management Protocol Version 2 (SNMPv2p) and uses the community-based security model of SNMPv1.

- [Finding Feature Information, page 31](#)
- [Information About SNMPv2c, page 32](#)
- [How to Configure SNMPv2c, page 32](#)
- [Configuration Examples for SNMPv2c, page 36](#)
- [Additional References for SNMPv2c, page 36](#)
- [Feature Information for SNMPv2c, page 37](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

# Information About SNMPv2c

## Security Features in SNMPv2c

Community-based Simple Network Management Protocol Version 2 (SNMPv2c) uses a community-based form of security. The community of SNMP managers that are able to access the agent MIB is defined by an IP address access control list (ACL) and password.

The improved error handling support provided by SNMPv2c includes expanded error codes that distinguish different types of errors; all types of errors are reported through a single error code in SNMPv1. The following three types of exceptions are also reported: no such object, no such instance, and end of MIB view. The following are the details of SNMPv2c security model:

- Level of security: noAuthNoPriv
- Authentication method: Community String
- Availability of encryption: No

Depending on your release, the party-based SNMP Version 2 (SNMPv2p), which is another variant of SNMPv2, is not supported. SNMPv2c replaces the party-based administrative and security framework of SNMPv2p with a community-based administrative framework. SNMPv2c retains the bulk retrieval and error handling capabilities of SNMPv2p.

## How to Configure SNMPv2c

### Configuring the SNMP Server for SNMPv2c

To configure a Simple Network Management Protocol (SNMP) server user, specify an SNMP group or a table that maps SNMP users to SNMP views. Then, specify the IP address or port number for the remote SNMP agent of the device where the user resides. Also, before you configure remote users for a particular agent, configure the SNMP engine ID by using the **snmp-server engineID** command for the remote agent. The SNMP engine ID of the remote agent is required to compute the authentication or privacy digests for the SNMP password. If the remote engine ID is not configured first, the configuration command will fail.

SNMP passwords are localized using the SNMP engine ID of the authoritative SNMP engine. For SNMP notifications such as inform requests, the authoritative SNMP agent is the remote agent. You must configure the SNMP engine ID of the remote agent in the SNMP database before you can send proxy requests or inform requests to it.

**Note**

---

An SNMP user cannot be removed if the engine ID is changed after configuring the SNMP user. To remove the user, you must first reconfigure all the SNMP configurations.

---

**Note**

Default values do not exist for authentication or privacy algorithms when you configure the SNMP commands. Also, no default passwords exist. The minimum length for a password is one character, although we recommend that you use at least eight characters for security. If you forget a password, you cannot recover it and must reconfigure the user. You can specify either a plain text password or a localized Message Digest 5 (MD5) digest.

Perform this task to specify an SNMP server group name and to add a new user to an SNMP group.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **snmp-server group** [*group-name* {**v1** | **v2c** | **v3** [**auth** | **noauth** | **priv**]}] [**read** *read-view*] [**write** *write-view*] [**notify** *notify-view*] [**access** *access-list*]
4. **snmp-server engineID** {**local** *engine-id* | **remote** *ip-address* [**udp-port** *udp-port-number*] [**vrf** *vrf-name*] *engine-id-string*}
5. **snmp-server user** *user-name* *group-name* [**remote** *ip-address* [**udp-port** *port*]] {**v1** | **v2c** | **v3** [**encrypted**] [**auth** {**md5** | **sha**} *auth-password*]} [**access** *access-list*]
6. **exit**

**DETAILED STEPS**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> enable	Enables privileged EXEC mode.  • Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>snmp-server group</b> [ <i>group-name</i> { <b>v1</b>   <b>v2c</b>   <b>v3</b> [ <b>auth</b>   <b>noauth</b>   <b>priv</b> ]}] [ <b>read</b> <i>read-view</i> ] [ <b>write</b> <i>write-view</i> ] [ <b>notify</b> <i>notify-view</i> ] [ <b>access</b> <i>access-list</i> ]  <b>Example:</b> Device(config)# snmp-server group group1 v2c auth access lmnop	Configures the SNMP server group to enable authentication for members of a specified named access list.  • In this example, the SNMP server group group1 is configured to enable user authentication for members of the named access list lmnop.
<b>Step 4</b>	<b>snmp-server engineID</b> { <b>local</b> <i>engine-id</i>   <b>remote</b> <i>ip-address</i> [ <b>udp-port</b> <i>udp-port-number</i> ] [ <b>vrf</b> <i>vrf-name</i> ] <i>engine-id-string</i> }	Configures the SNMP engine ID.  • In this example, the SNMP engine ID is configured for a remote user.

	Command or Action	Purpose
	<p><b>Example:</b> Device(config)# snmp-server engineID remote 172.16.15.4 udp-port 120 1a2833c0129a</p>	
<b>Step 5</b>	<p><b>snmp-server user</b> <i>user-name</i> <i>group-name</i> [<b>remote</b> <i>ip-address</i> [<b>udp-port</b> <i>port</i>]] {<b>v1</b>   <b>v2c</b>   <b>v3</b> [<b>encrypted</b>] [<b>auth</b> {<b>md5</b>   <b>sha</b>} <i>auth-password</i>]} [<b>access</b> <i>access-list</i>]</p> <p><b>Example:</b> Device(config)# snmp-server user user1 group1 v2c auth md5 password123</p>	<p>Adds a new user to an SNMPv2c group and configures a plain text password for the user.</p> <p><b>Note</b> For the <i>auth-password</i> argument, the minimum length is one character; the recommended length is at least eight characters, and the password should include both letters and numbers.</p> <p><b>Note</b> If you have the localized MD5 or Secure Hash Algorithm (SHA) digest, you can specify the digest instead of the plain text password. The digest should be formatted as aa:bb:cc:dd, where aa, bb, cc, and dd are hexadecimal values. Also, the digest should be exactly 16 octets in length.</p>
<b>Step 6</b>	<p><b>exit</b></p> <p><b>Example:</b> Device(config)# exit</p>	Exits global configuration mode.

## Verifying SNMPv2c

Perform this task to verify the SNMPv2c configuration. The **show** commands can be entered in any order.

### SUMMARY STEPS

1. **enable**
2. **show snmp group**
3. **show snmp user** [*username*]
4. **show snmp engineID**

### DETAILED STEPS

**Step 1**     **enable**  
Enables privileged EXEC mode.

**Example:**  
Device> **enable**

**Step 2**     **show snmp group**

Displays information about each SNMP group in the network.

**Example:**

```
Device# show snmp group

groupname: V1                                security model:v1
readview : vldefault                          writeview: <no writeview specified>
notifyview: <no notifyview specified>
row status: active
groupname: ILMI                               security model:v1
readview : *ilmi                             writeview: *ilmi
notifyview: <no notifyview specified>
row status: active
groupname: ILMI                               security model:v2c
readview : *ilmi                             writeview: *ilmi
notifyview: <no notifyview specified>
row status: active
groupname: group1                             security model:v1
readview : vldefault                          writeview: <no writeview specified>
notifyview: <no notifyview specified>
row status: active
```

**Step 3** **show snmp user** [*username*]

Displays information about configured characteristics of an SNMP user.

**Example:**

```
Device# show snmp user user1

User name: user1
Engine ID: 00000009020000000C025808
storage-type: nonvolatile          active access-list: 10
Rowstatus: active
Authentication Protocol: MD5
Privacy protocol: DES
Group name: group1
```

**Step 4** **show snmp engineID**

Displays information about the SNMP engine ID that is configured for an SNMP user.

**Example:**

```
Device# show snmp engineID

Local SNMP engineID: 1A2836C0129A
Remote Engine ID      IP-addr      Port
1A2833C0129A         remote  10.2.28.1 120
```

# Configuration Examples for SNMPv2c

## Example: Configuring the SNMP Server for SNMPv2c

The following example shows how to configure SNMPv2c. The configuration permits any SNMP manager to access all objects with read-only permissions by using the community string named “public”. This configuration does not cause the device to send traps.

```
Device(config)# snmp-server community public
```

The following example shows how to configure a remote user to receive traps at the “noAuthNoPriv” security level when the SNMPv2c security model is enabled:

```
Device(config)# snmp-server group group1 v2c noauth
Device(config)# snmp-server user remoteuser1 group1 remote 10.12.8.4
Device(config)# snmp-server host 10.12.8.4 informs version 2c noauth remoteuser config
```

The following example shows how to configure a remote user to receive traps at the “authNoPriv” security level when the SNMPv2c security model is enabled:

```
Device(config)# snmp-server group group2 v2c auth
Device(config)# snmp-server user AuthUser group2 remote 10.12.8.4 v2c auth md5 password1
```

The following example shows how to configure a remote user to receive traps at the “priv” security level when the SNMPv2c security model is enabled:

```
Device(config)# snmp-server group group3 v2c priv
Device(config)# snmp-server user PrivateUser group3 remote 10.12.8.4 v2c auth md5 password1
priv access des56
```

The Cisco Support and Documentation website provides online resources to download documentation, software, and tools. Use these resources to install and configure the software and to troubleshoot and resolve technical issues with Cisco products and technologies. Access to most tools on the Cisco Support and Documentation website requires a Cisco.com user ID and password.	<a href="http://www.cisco.com/cisco/web/support/index.html">http://www.cisco.com/cisco/web/support/index.html</a>

## Feature Information for SNMPv2c

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Table 4: Feature Information for SNMV2c**

Feature Name	Releases	Feature Information
SNMV2c	Cisco IOS XE Release 3.2SE	SNMPv2c feature represents the community string-based administrative framework for SNMPv2. SNMPv2c support includes a bulk retrieval mechanism and detailed error message reporting to management stations.

## SNMP Version 3

---

The SNMP Version 3 feature provides secure access to devices by authenticating and encrypting data packets over the network. Simple Network Management Protocol version 3 (SNMPv3) is an interoperable, standards-based protocol that is defined in RFCs 3413 to 3415. This module discusses the security features provided in SNMPv3 and describes how to configure the security mechanism to handle SNMP packets.

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

### Information About SNMP Version 3

#### Security Features in SNMP Version 3

The security features provided in SNMPv3 are as follows:

- Message integrity—Ensures that a packet has not been tampered with during transit.

- Authentication—Determines that the message is from a valid source.
- Encryption—Scrambles the content of a packet to prevent it from being learned by an unauthorized source.

SNMPv3 is a security model in which an authentication strategy is set up for a user and the group in which the user resides. Security level is the permitted level of security within a security model. A combination of a security model and a security level determines which security mechanism is used when handling an SNMP packet.

The table below describes the combinations of SNMPv3 security models and levels.

**Table 5: SNMP Version 3 Security Levels**

Level	Authentication	Encryption	What Happens
noAuthNoPriv	Username	No	Uses a username match for authentication.
authNoPriv	Message Digest Algorithm 5 (MD5) or Secure Hash Algorithm (SHA)	No	Provides authentication based on the Hashed Message Authentication Code (HMAC)-MD5 or HMAC-SHA algorithms.
authPriv	MD5 or SHA	Data Encryption Standard (DES)	Provides authentication based on the HMAC-MD5 or HMAC-SHA algorithms. In addition to authentication, provides DES 56-bit encryption based on the Cipher Block Chaining (CBC)-DES (DES-56) standard.

SNMPv3 supports RFCs 1901 to 1908, 2104, 2206, 2213, 2214, and 2271 to 2275. For more information about SNMPv3, see *RFC 2570, Introduction to Version 3 of the Internet-standard Network Management Framework* (this document is not a standard).

## Cisco-Specific Error Messages for SNMP Version 3

Simple Network Management Protocol Version 3 (SNMPv3) provides different levels of security. If an authentication or an authorization request fails, a descriptive error message appears to indicate what went wrong. These error messages comply with *RFC 3414, User-based Security Model (USM) for version 3 of the Simple Network Management Protocol (SNMPv3)*.

You can use the **snmp-server usm cisco** command to disable the descriptive messages, thus preventing malicious users from misusing the information shown in the error messages. The table below describes the Cisco-specific error messages shown when the **snmp-server usm cisco** command is used, and the table compares these messages with the corresponding RFC 3414-compliant error messages.

**Table 6: Cisco-Specific Error Messages for SNMPv3**

<b>Configured Security Level</b>	<b>Security Level of Incoming SNMP Message</b>	<b>RFC 3414-Compliant Error Indication</b>	<b>Cisco-Specific Error Messages</b>
noAuthNoPriv	noAuthNoPriv	No error	No error
	authNoPriv	unsupportedSecurityLevel	unknownUserName
	authPriv	unsupportedSecurityLevel	unknownUserName
authNoPriv	noAuthNoPriv	AUTHORIZATION_ERROR	unknownUserName
	authNoPriv with correct authentication password	No error	No error
	authNoPriv with incorrect authentication password	wrongDigests	unknownUserName
	authPriv	unsupportedSecurityLevel	unknownUserName
authPriv	noAuthNoPriv	AUTHORIZATION_ERROR	unknownUserName
	authNoPriv with correct authentication password	AUTHORIZATION_ERROR	unknownUserName
	authNoPriv with incorrect authentication password	AUTHORIZATION_ERROR	unknownUserName
	authPriv with correct authentication password and correct privacy password	No error	No error
	authPriv with correct authentication password and incorrect privacy password	No response	No response
	authPriv with incorrect authentication password and correct privacy password	wrongDigests	unknownUserName
	authPriv with incorrect authentication password and incorrect privacy password	wrongDigests	unknownUserName

**Note**

---

If an SNMP user belonging to an SNMP group is not configured with the password or if the group security level is not the same as the user security level, the error shown is “AUTHORIZATION\_ERROR”. The Cisco-specific error message for this scenario is “unknownUserName”.

---

## How to Configure SNMP Version 3

To configure the Simple Network Management Protocol Version 3 (SNMPv3) security mechanism and to use it to handle SNMP packets, you must configure SNMP groups and users with passwords.

### Configuring the SNMP Server

To configure an SNMP server user, specify an SNMP group or a table that maps SNMP users to SNMP views. Then, specify the IP address or port number for the remote SNMP agent of the device where the user resides. Also, before you configure remote users for a particular agent, configure the SNMP engine ID by using the **snmp-server engineID** command for the remote agent. The SNMP engine ID of the remote agent is required to compute the authentication or privacy digests for the SNMP password. If the remote engine ID is not configured first, the configuration command will fail.

SNMP passwords are localized using the SNMP engine ID of the authoritative SNMP engine. For SNMP notifications such as inform requests, the authoritative SNMP agent is the remote agent. You must configure the SNMP engine ID of the remote agent in the SNMP database before you can send proxy requests or inform requests to it.

**Note**

---

The SNMP user cannot be removed if the engine ID is changed after configuring the SNMP user. To remove the user, you must first reconfigure all the SNMP configurations.

---

**Note**

---

Default values do not exist for authentication or privacy algorithms when you configure the SNMP commands. Also, no default passwords exist. The minimum length for a password is one character, although it is recommended to use at least eight characters for security. If you forget a password, you cannot recover it and must reconfigure the user. You can specify either a plain text password or a localized MD5 digest.

---

Perform this task to specify an SNMP server group name and to add a new user to an SNMP group.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **snmp-server group** [*group-name* {**v1** | **v2c** | **v3** [**auth** | **noauth** | **priv**]}] [**read** *read-view*] [**write** *write-view*] [**notify** *notify-view*] [**access** *access-list*]
4. **snmp-server engineID** {**local** *engine-id* | **remote** *ip-address* [**udp-port** *udp-port-number*] [**vrf** *vrf-name*] *engine-id-string*}
5. **snmp-server user** *user-name* *group-name* [**remote** *ip-address* [**udp-port** *port*]] {**v1** | **v2c** | **v3** [**encrypted**] [**auth** {**md5** | **sha**} *auth-password*]} [**access** *access-list*]
6. **end**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Device> enable	Enables privileged EXEC mode.  • Enter your password if prompted.
Step 2	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
Step 3	<b>snmp-server group</b> [ <i>group-name</i> { <b>v1</b>   <b>v2c</b>   <b>v3</b> [ <b>auth</b>   <b>noauth</b>   <b>priv</b> ]}] [ <b>read</b> <i>read-view</i> ] [ <b>write</b> <i>write-view</i> ] [ <b>notify</b> <i>notify-view</i> ] [ <b>access</b> <i>access-list</i> ]  <b>Example:</b> Device(config)# snmp-server group group1 v3 auth access lmnop	Configures the SNMP server group to enable authentication for members of a specified named access list.  • In this example, the SNMP server group group1 is configured to enable user authentication for members of the named access list lmnop.
Step 4	<b>snmp-server engineID</b> { <b>local</b> <i>engine-id</i>   <b>remote</b> <i>ip-address</i> [ <b>udp-port</b> <i>udp-port-number</i> ] [ <b>vrf</b> <i>vrf-name</i> ] <i>engine-id-string</i> }	Configures the SNMP engine ID.  • In this example, the SNMP engine ID is configured for a remote user.
Step 5	<b>snmp-server user</b> <i>user-name</i> <i>group-name</i> [ <b>remote</b> <i>ip-address</i> [ <b>udp-port</b> <i>port</i> ]] { <b>v1</b>   <b>v2c</b>   <b>v3</b> [ <b>encrypted</b> ] [ <b>auth</b> { <b>md5</b>   <b>sha</b> } <i>auth-password</i> ]} [ <b>access</b> <i>access-list</i> ]	Adds a new user to an SNMPv3 group and configures a plain text password for the user.  <b>Note</b> For the <i>auth-password</i> argument, the minimum length is one character; the recommended length is at least eight characters, and the password should include both letters and numbers.

	Command or Action	Purpose
	<b>Example:</b> Device(config)# snmp-server user user1 group1 v3 auth md5 password123	<b>Note</b> If you have the localized MD5 or SHA digest, you can specify the digest instead of the plain text password. The digest should be formatted as aa:bb:cc:dd, where aa, bb, cc, and dd are hexadecimal values. Also, the digest should be exactly 16 octets in length.
<b>Step 6</b>	<b>end</b>  <b>Example:</b> Device(config)# end	Exits global configuration mode.

## Verifying SNMP Version 3

Perform this task to verify the Simple Network Management Protocol Version 3 (SNMPv3) configuration. The **show** commands can be entered in any order.

### SUMMARY STEPS

1. **enable**
2. **show snmp group**
3. **show snmp user** *[username]*
4. **show snmp engineID**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>show snmp group</b>  <b>Example:</b> Device# <b>show snmp group</b>  <pre> groupname: V1                                security model:v1 readview : vldefault                          writeview: &lt;no writeview specified&gt; notifyview: &lt;no notifyview specified&gt; row status: active groupname: ILMI                                security model:v1 readview : *ilmi                              writeview: *ilmi  notifyview: &lt;no notifyview specified&gt; row status: active           </pre>	Displays information about each SNMP group in the network.  Displays information about each SNMP group in the network.

	Command or Action	Purpose
	<pre> groupname: ILMI                security model:v2c readview : *ilmi              writeview: *ilmi  notifyview: &lt;no notifyview specified&gt; row status: active groupname: group1 readview : vldefault          security model:v1 writeview specified          writeview: &lt;no notifyview: &lt;no notifyview specified&gt; row status: active </pre>	
<b>Step 3</b>	<p><b>show snmp user</b> [<i>username</i>]</p> <p><b>Example:</b></p> <pre> Device# show snmp user user1  User name: user1 Engine ID: 0000000902000000C025808 storage-type: nonvolatile active access-list: 10 Rowstatus: active Authentication Protocol: MD5 Privacy protocol: DES Group name: group1 </pre>	Displays information about configured characteristics of an SNMP user.
<b>Step 4</b>	<p><b>show snmp engineID</b></p> <p><b>Example:</b></p> <pre> Device# show snmp engineID  Local SNMP engineID: 1A2836C0129A Remote Engine ID      IP-addr      Port 1A2833C0129A         remote      10.2.28.1 120 </pre>	Displays information about the SNMP engine ID that is configured for an SNMP user.

## Configuration Examples for SNMP Version 3

### Example: Configuring SNMP Version 3

The following example shows how to enable Simple Network Management Protocol Version 3 (SNMPv3). The configuration permits any SNMP manager to access all objects with read-only permissions using the community string named "public". This configuration does not cause the device to send traps.

```
Device(config)# snmp-server community public
```

The following example shows how to configure a remote user to receive traps at the "noAuthNoPriv" security level when the SNMPv3 security model is enabled:

```
Device(config)# snmp-server group group1 v3 noauth
Device(config)# snmp-server user remoteuser1 group1 remote 10.12.8.4
Device(config)# snmp-server host 10.12.8.4 informs version 3 noauth remoteuser config
```

The following example shows how to configure a remote user to receive traps at the “authNoPriv” security level when the SNMPv3 security model is enabled:

```
Device(config)# snmp-server group group2 v3 auth
Device(config)# snmp-server user AuthUser group2 remote 10.12.8.4 v3 auth md5 password1
```

The following example shows how to configure a remote user to receive traps at the “priv” security level when the SNMPv3 security model is enabled:

```
Device(config)# snmp-server group group3 v3 priv
Device(config)# snmp-server user PrivateUser group3 remote 10.12.8.4 v3 auth md5 password1
priv access des56
```

## Feature Information for SNMP Version 3

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Table 7: Feature Information for SNMP Version 3**

Feature Name	Releases	Feature Information
SNMP Version 3	12.0(3)T 12.0(6)S 12.1(3)T 12.1(14) 12.2(13)T 15.0(1)S	The SNMP Version 3 feature is used to provide secure access to devices by authenticating and encrypting data packets over the network.

Feature Name	Releases	Feature Information
SNMP Version 3 Community MIB Support	12.0(22)S 12.2(4)T 12.2(11)T 12.2(18)S 15.0(1)S Cisco IOS XE Release 3.1.0SG	The SNMP Version 3 Community MIB Support feature implements support for the SNMP Community MIB module (SNMPCOMMUNITY-MIB), defined in RFC 2576, in Cisco IOS software.

## AES and 3-DES Encryption Support for SNMP Version 3

The AES and 3-DES Encryption Support for SNMP Version 3 feature enhances the encryption capabilities of SNMP version 3. This support for Simple Network Management Protocol (SNMP) version 3 User-Based Security Model (USM) is compliant with RFC 3414, which defines DES as the only required method of message encryption for SNMP version 3 authPriv mode.

The AES and 3-DES Encryption Support for SNMP Version 3 feature adds Advanced Encryption Standard (AES) 128-bit encryption in compliance with RFC 3826. RFC 3826 extensions have been included in the SNMP-USM-AES-MIB. In addition, Cisco-specific extensions to support Triple-Data Encryption Algorithm (3-DES) and AES 192-bit and 256-bit encryption have been added to the CISCO-SNMP-USM-MIB. Additional information can be found in the Internet-Draft titled *Extension to the User-Based Security Model (USM) to Support Triple-DES EDE in “Outside” CBC Mode*, which can be found at the following URL: <http://www.snmp.com/eso/draft-reeder-snmpv3-usm-3desede-00.txt>.

- [How to Configure AES and 3-DES Encryption Support for SNMP Version 3, page 51](#)
- [Additional References, page 53](#)
- [Feature Information for AES and 3-DES Encryption Support for SNMP Version 3, page 55](#)

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

# Prerequisites for AES and 3-DES Encryption Support for SNMP Version 3

- The network management station (NMS) must support SNMP version 3 to use this feature of the SNMP agent.
- This feature is available in Cisco IOS XE software images where encryption algorithms are supported.

## Information About AES and 3-DES Encryption Support for SNMP Version 3

### SNMP Architecture

The architecture for describing Internet Management Frameworks contained in RFC 3411 describes the SNMP engine as composed of the following components:

- Dispatcher
- Message Processing Subsystem
- Security Subsystem
- Access Control Subsystem

Applications make use of the services of these subsystems. It is important to understand the SNMP architecture and the terminology of the architecture to understand where the Security Model fits into the architecture and interacts with the other subsystems within the architecture. The information is contained in RFC 3411 and you are encouraged to review this RFC to obtain an understanding of the SNMP architecture and subsystem interactions.

### Encryption Key Support

In the AES and 3-DES Encryption Support for SNMP Version 3 feature the Cipher Block Chaining/Data Encryption Standard (CBC-DES) is the privacy protocol. Originally only DES was supported (as per RFC 3414). This feature adds support for AES-128 (as per RFC 3826) and AES-192, AES-256 and 3-DES (as per CISCO-SNMP-USM-OIDS-MIB).

- AES encryption uses the Cipher Feedback (CFB) mode with encryption key sizes of 128, 192, or 256 bits.
- 3DES encryption uses the 168-bit key size for encryption.

The AES Cipher Algorithm in the SNMP User-based Security Model draft describes the use of AES with 128-bit key size. However, the other options are also implemented with the extension to use the USM. There is currently no standard for generating localized keys for 192- or 256-bit size keys for AES or for 168-bit size key for 3-DES. There is no authentication protocol available with longer keys.

## Management Information Base Support

The AES and 3-DES Encryption Support for SNMP Version 3 AES and 3-DES Encryption Support for SNMP Version 3 feature supports the selection of privacy protocols through the CLI and the Management Information Base (MIB). A new standard MIB, SNMP-USM-AES-MIB, provides support for the 128-bit key in AES. The extended options of AES with 192- or 256-bit keys and 3-DES are supported as extensions to the SNMP-USM-MIB, in the Cisco-specific MIB, CISCO-SNMP-USM-OIDS-MIB.

# How to Configure AES and 3-DES Encryption Support for SNMP Version 3

## Adding a New User to an SNMP Group

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **snmp-server user** *username group-name* [**remote host** [**udp-port port**]] {**v1** | **v2c** | **v3** [**encrypted**] [**auth** {**md5** | **sha**} *auth-password*]} [**priv** {**des** | **3des** | **aes** {**128** | **192** | **256**}} *privpassword*] [**access** [**ipv6 nacl**] {*acl-number* | *acl-name*}]

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enters privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password when prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>snmp-server user</b> <i>username group-name</i> [ <b>remote host</b> [ <b>udp-port port</b> ]] { <b>v1</b>   <b>v2c</b>   <b>v3</b> [ <b>encrypted</b> ] [ <b>auth</b> { <b>md5</b>   <b>sha</b> } <i>auth-password</i> ]} [ <b>priv</b> { <b>des</b>   <b>3des</b>   <b>aes</b> { <b>128</b>   <b>192</b>   <b>256</b> }} <i>privpassword</i> ] [ <b>access</b> [ <b>ipv6 nacl</b> ] { <i>acl-number</i>   <i>acl-name</i> }]	Adds an SNMP user, specifies a group to which the user belongs, specifies the authorization algorithm to be used (MD5 or SHA), specifies the privacy algorithm to be used (DES, 3-DES, AES, AES-192, or AES-256), and specifies the password to be associated with this privacy protocol.

	Command or Action	Purpose
	<p><b>Example:</b></p> <pre>Router(config)# snmp-server user new-user new-group v3 auth md5 secureone priv aes 128 privatetwo access 2</pre>	

## Verifying SNMP User Configuration

To display information about the configured characteristics of Simple Network Management Protocol (SNMP) users, use the **show snmp user** command in privileged EXEC mode.

**Note** The **show snmp user** command displays all the users configured on the router. However, unlike other SNMP configurations, the **snmp-server user** command will not appear on the “show running” output.

### SUMMARY STEPS

1. **enable**
2. **show snmp user** [*username*]

### DETAILED STEPS

**Step 1**     **enable**  
Enters privileged EXEC mode. Enter your password when prompted.

**Step 2**     **show snmp user** [*username*]  
The following example specifies the username as abcd, the engine ID string as 0000000902000000C025808, and the storage type as nonvolatile:

**Example:**

```
Router# show snmp user
abcd
User name: abcd
Engine ID: 0000000902000000C025808
storage-type: nonvolatile          active access-list: 10
Rowstatus: active
Authentication Protocol: MD5
Privacy protocol: 3DES
Group name: VacmGroupName
Group name: VacmGroupName
```

## Feature Information for AES and 3-DES Encryption Support for SNMP Version 3

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Table 8: Feature Information for AES and 3-DES Encryption Support for SNMP Version 3**

Feature Name	Releases	Feature Information
AES and 3-DES Encryption Support for SNMP Version 3	Cisco IOS XE Release 2.1	<p>The AES and 3-DES Encryption Support for SNMP Version 3 feature enhances the encryption capabilities of SNMP version 3. This support for SNMP version 3 USM is compliant with RFC 3414, which defines DES as the only required method of message encryption for SNMP version 3 authPriv mode.</p> <p>The AES and 3-DES Encryption Support for SNMP Version 3 feature adds AES 128-bit encryption in compliance with RFC 3826.</p> <p>The following commands were introduced or modified by this feature:</p> <p><b>show snmp user , snmp-server user</b></p>

## CHAPTER 6

# Cisco Enhanced Image MIB

---

The Cisco Enhanced Image MIB provides information about images running on the system. It has been extended to be useful for modular operating systems.

- [Finding Feature Information, page 57](#)
- [Information About Cisco Enhanced Image MIB, page 57](#)
- [Additional References, page 60](#)
- [Feature Information for Cisco Enhanced Image MIB , page 61](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

## Information About Cisco Enhanced Image MIB

### Cisco Enhanced Image MIB Overview

The CISCO-ENHANCED-IMAGE-MIB is used to obtain information about images running on various entities or nodes on Cisco IOS devices, such as routers and switches. The MIB provides support to query package information on the Cisco IOS XE system for installed images. The MIB supports the following three tables: `ceImageInstallableTable`, `ceImageLocationTable`, and `ceImageTable`.

The three image tables provide information about currently running images on the system. A modular operating system image consists of a base image and all the installables loaded on the base image. The `ceImageInstallableTable` provides a list of all installables installed on base images, the `ceImageLocationTable`

provides a list of all locations where these images are running and also the status of the images at these locations, and the `ceImageTable` provides the base images.

## Image Table

The Cisco Enhanced Image MIB, `ceImageTable`, shows details about the currently running image on the active device. In a stack or a High Availability (HA) scenario, this table includes details about all the members in the stack. The table below describes the image table objects and the values populated for each object.

Image Table Object	Description
<code>ceImageDescription</code>	Description of the running OS image.
<code>ceImageFamily</code>	Name of the family of the running OS image. The image family indicates the platform for which the image is built. Examples of image families are C3640, C7200, and so on.
<code>ceImageFeature</code>	Feature set supported on the running image.
<code>ceImageMedia</code>	Media on which the image represented by this entry is running.
<code>ceImageName</code>	Name of the running OS image on the device.
<code>ceImageVersion</code>	Version of the running OS image.

## Location Table

The Cisco Enhanced Image MIB location table, `ceImageLocationTable`, consists of a list of all locations where the images are running along with the status of images at these locations. The location table is applicable to modular operating systems. The term *location* in `ceImageLocationTable` describes the location on the file system where the installed software is placed. The table below describes the location table objects and the values populated for each object.

Location Table Object	Description
<code>ceImageLocation</code>	Location where the operating system is currently loaded on the system.
<code>ceImageLocationRunningStatus</code>	Status of the image currently running on the system. This object has a value <i>True</i> , if the image from this location is currently running on the system.

## Installable Table

The Cisco Enhanced Image MIB installable table, `csImageInstallableTable`, specifies a list of software installables installed on the system. This table is applicable to operating systems that support installables. A

modular operating system can consist of a base image and installables. Every image has a table of installables. Entries are added in this table when an installable is installed on the image. Entries are deleted from this table when installables are removed or rolled back from the image. The table below describes the installable table objects and the values populated for each object.

Installable Table Object	Description
ceImageInstallableDate	Date on which package was installed
ceImageInstallableMajorVerNumber	Major version number of the software installable. Version is represented as <i>major.minor.maintenance</i> . For example, the major number for version 12.3(18.1)S is 12.
ceImageInstallableMinorVerNumber	Minor version number of the software installable. For example, the minor number for the version 12.3(18.1)S is 3.
ceImageInstallableName	Name of the package.
ceImageInstallableRevisionVerNum	Maintenance version string of the software installable. This string represents incremental change in the image over the minor release number. For example, the revision number for the version 12.3(18.1)S is (18.1)S.
ceImageInstallableRowStatus	Status of the conceptual row. The Simple Network Management Protocol (SNMP) Get operation is the only supported option for this table; so this entry always has a default value of 1.
ceImageInstallableStatus	Status of the software installable.
ceImageInstallableType	Type of the software package.

## Sample Output from Cisco Enhanced Image MIB Query

The output obtained from the MIB query is as follows:

```
/opt/cisco-net-snmp/bin/snmpwalk -v2c -c public 172.16.0.1 1.3.6.1.4.1.9.9.249

## Feature Information for Cisco Enhanced Image MIB

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Table 9: Feature Information for Cisco Enhanced Image MIB**

Feature Name	Releases	Feature Information
Cisco Enhanced Image MIB	15.3(1)S 15.3(1)S Cisco IOS XE Release 3.8S	The CISCO-ENHANCED-IMAGE-MIB provides information about events running on the system and has been extended to be useful for modular operating systems.  No commands were introduced or modified for this feature.
