

## Configuring AAA for VPDNs

---

This module describes how to configure authentication, authorization, and accounting (AAA) for virtual private dialup networks (VPDNs).

- [Finding Feature Information, page 1](#)
- [Prerequisites for Configuring AAA for VPDNs, page 1](#)
- [Information About Configuring AAA for VPDNs, page 2](#)
- [How to Configure AAA for VPDNs, page 13](#)
- [Configuration Examples for AAA for VPDNs, page 80](#)
- [Where to Go Next, page 97](#)
- [Additional References, page 97](#)
- [Feature Information for AAA for VPDNs, page 99](#)

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

### Prerequisites for Configuring AAA for VPDNs

- Before configuring AAA for VPDNs, you should understand the concepts in the *VPDN Technology Overview* module.
- You must identify the VPDN architecture you plan to implement.
- You must identify the tunneling protocol you will use.

- If you plan to configure remote AAA, you should understand the concepts in the Authentication, Authorization, and Accounting (AAA) and Security Server Protocols modules.
- If you plan to configure Layer 2 Tunneling Protocol (L2TP) Forwarding of Point-to-Point over Ethernet (PPPoE) Tagging Information, it is recommended that you be familiar with RFC 2516 and DSL Forum TR-101 before configuring this feature.
- If you plan to configure L2TP Domain Screening, you must configure the L2TP access concentrator (LAC) to request authentication of a complete username before making a forwarding decision for dial-in L2TP. In other words, the LAC preauthenticates *username@domain* to find the correct L2TP tunnel for the user session.
- You can configure VPDN preauthentication to occur globally or per VPDN group. For global VPDN preauthentication, authentication and authorization should be done using an authentication server. For per-VPDN group-level preauthentication, authentication and authorization should be done locally.

## Information About Configuring AAA for VPDNs

### VPDN Tunnel Authorization Search Order

When a call to a network access server (NAS) is to be tunneled to a tunnel server, the NAS must identify which tunnel server to forward the call to. The router can authorize users and select the outgoing tunnel based on the domain portion of the username, the Dialed Number Identification Service (DNIS) number, the multihop hostname, or any combination of these three parameters in a specified order. The default search order for VPDN tunnel authorization is to first search by DNIS, then by domain.

These sections contain information on VPDN tunnel lookup criteria:

#### VPDN Tunnel Lookup Based on Domain Name

When a NAS is configured to forward VPDN calls on the basis of the user domain name, the user must use a username of the form *username@domain*. The NAS then compares the user domain name to the domain names it is configured to search for. When the NAS finds a match, it forwards the user call to the proper tunnel server.

#### VPDN Tunnel Lookup Based on L2TP Domain Screening

You can modify the domain portion of the username seamlessly when you enter into a virtual private network (VPN) service. The L2TP Domain Screening feature ensures that the appropriate domain has been screened before access is allowed to an L2TP tunnel for the user session.

For additional information on configuring L2TP Domain Screening tunnel authentication into a VPN, refer to the [L2TP Domain Screening](#), on page 3.

#### VPDN Tunnel Lookup Based on DNIS Information

When a NAS is configured to forward VPDN calls on the basis of the user DNIS information, the NAS identifies the user DNIS information, which is provided on ISDN lines, and then forwards the call to the proper tunnel server.

The ability to select a tunnel on the basis of DNIS information provides additional flexibility to network service providers that offer VPDN services and to the companies that use the services. Instead of using only the domain name for tunnel selection, the NAS can use dialed number information for tunnel selection.

With this feature, a company--which might have only one domain name--can provide multiple specific phone numbers for users to dial in to the NAS at the service provider point of presence (POP). The service provider can select the tunnel to the appropriate services or portion of the company network on the basis of the dialed number.

## VPDN Tunnel Lookup Based on Both Domain Name and DNIS Information

When a service provider has multiple AAA servers configured, VPDN tunnel authorization searches based on domain name can be time consuming and might cause the client session to time out.

To provide more flexibility, service providers can configure the NAS to perform tunnel authorization searches by domain name only, by DNIS only, or by both in a specified order.

## VPDN Tunnel Lookup Based on the Multihop Hostname

If a device will function as a multihop tunnel switch, tunnel authorization searches can be performed based on the multihop hostname. Configuring a multihop hostname on a tunnel switch allows authorization searches to be based on the identity of the peer device that initiated the tunnel. The multihop hostname can be the hostname of the remote peer that initiated the ingress tunnel, or the tunnel ID associated with the ingress tunnel.

A multihop tunnel switch can be configured to perform authorization searches by multihop hostname only, by domain name only, by DNIS only, or by any combination of these searches in a specified order.

## L2TP Domain Screening

The L2TP Domain Screening feature provides a flexible mechanism for controlling session access to an L2TP tunnel. This feature provides the ability to modify the domain portion of the username seamlessly when a subscriber enters into a virtual private network (VPN) service. The L2TP Domain Screening feature allows per-user L2TP tunnel setup by combining these features:

- User preauthentication using the **vpdn authen-before-forward** command
- Modifying the domain portion of the username using the **vpn service** command to bind an incoming session to a certain L2TP tunnel

These two commands work together in the L2TP Domain Screening feature to make sure that the appropriate domain has been screened before access is allowed to an L2TP tunnel for the user session.

You can modify the domain portion of the username seamlessly when you enter into a VPN service. The L2TP Domain Screening, Rules Based feature allows per-user L2TP tunnel setup by creating customized Policy Manager match rules. For more information on the L2TP Domain Screening, Rules Based, see the [L2TP Domain Screening Rules Based](#), on page 4.

## L2TP Tunnel Authentication

The general process flow for tunnel authentication begins when the vpdn authen-before-forward process is called if necessary to authenticate the username and domain name to find the correct L2TP tunnel for the

session. If no authentication is required, the tunnel match for the domain name is found for the session. In either case, the original username with the original domain is used for session authentication at the L2TP network server (LNS).

For instances with the VPN service applied to the configuration. Just as before, if the `vpdn` `authen-before-forward` process determines that the session must be locally authenticated before being placed into the correct tunnel, authentication proceeds as normal. However, with the `vpn` service statement applied, the session is placed into the appropriate tunnel for the VPN domain.

The full VPN service application flow. If local authentication at the LAC is required and a VPN service is configured, a local authentication is done with the username provided and the domain of the VPN service provider. This step returns the necessary L2TP tunnel for this VPN session. If VPN service is not configured, local authentication is provided on the username and domain name provided by the subscriber.

If the session does not require local authentication but there is a configured VPN service, the session is placed into the L2TP tunnel for the VPN service provider. Otherwise, the session will be placed into the tunnel for the specified domain name.

In any of these scenarios, the username and domain name for the subscriber session stay the same at the L2TP network server (LNS). This allows a wholesale provider to dedicate a service provider for providing all VPN services to its subscribers without the need for complex configuration for each VPN.

The `vpn service` command binds a physical incoming interface to a certain tunnel. The result is that no matter what username or domain is presented, the user is always forwarded to the specified tunnel configured by the `vpn service` command.

## L2TP Domain Screening Rules Based

You can modify the domain portion of the username seamlessly when you enter into a VPN service. The L2TP Domain Screening, Rules Based feature allows per-user L2TP tunnel setup by creating customized Policy Manager match rules. The L2TP Domain Screening, Rules Based feature allows you to construct rules to customize specific policy behavior. You can use the following commands to construct specific policy behavior.

- Collect and cache the unauthenticated user name using the `set variable` command
- Replace the domain portion of the cached username using the `substitute` command and authenticate using the new altered domain name
- Authenticate the name specified using the `authenticate` command and send the authenticated name to policy manager

These commands work together in the L2TP Domain Screening, Rules Based feature to make sure that the appropriate domain has been screened before access is allowed to an L2TP tunnel for the user session.

## Per-User VPDN AAA

If remote AAA is used for VPDN, the NAS that receives the call from a user forwards information about that user to its remote AAA server. With basic VPDN, the NAS sends the user domain name when performing authentication based on domain name or the telephone number the user dialed in from when performing authentication based on DNIS.

When per-user VPDN is configured, the entire structured username is sent to a RADIUS AAA server the first time the router contacts the AAA server. This enables the software to customize tunnel attributes for individual users that use a common domain name or DNIS.

Without VPDN per-user configuration, the software sends only the domain name or DNIS to determine VPDN tunnel attribute information. Then, if no VPDN tunnel attributes are returned, the software sends the entire username string.

## VPDN Authorization for Directed Request Users

Directed requests allow users logging in to a NAS to select a RADIUS server for authorization. With directed requests enabled, only the portion of the username before the “@” symbol is sent to the host specified after the “@” symbol. Using directed requests, authorization requests can be directed to any of the configured servers, and only the username is sent to the specified server.

## Domain Name Prefix and Suffix Stripping

When a user connects to a NAS configured to use a remote server for AAA, the NAS forwards the username to the remote AAA server. Some RADIUS or TACACS+ servers require the username to be in a particular format, which might be different from the format of the full username. For example, the remote AAA server might require the username to be in the format `user@domain.com`, but the full username could be `prefix/user@domain.com@suffix`. Configuring domain name stripping allows the NAS to strip incompatible portions from the full username before forwarding the reformatted username to the remote AAA server.

The NAS can be configured to perform in these ways:

- Strip generic suffixes from the full username using the suffix delimiter character @. Any portion of the full username that follows the first delimiter that is parsed will be stripped.
- Use a different character or set of characters as the suffix delimiter.
- Strip both suffixes and prefixes from the full username. The NAS can also be configured to strip only specified suffixes instead of performing generic suffix stripping.

## VPDN Tunnel Authentication

VPDN tunnel authentication enables routers to authenticate the other tunnel endpoint before establishing a VPDN tunnel. VPDN tunnel authentication is optional for L2TP tunnels.

For additional information on configuring VPDN tunnel authentication for client-initiated VPDN tunneling deployments, see the "Configuring VPDN Tunnel Authentication" section.

VPDN tunnel authentication can be performed in these ways:

- Using local AAA on both the NAS and the tunnel server
- Using a remote RADIUS AAA server on the NAS and local AAA on the tunnel server
- Using a remote TACACS+ AAA server on the NAS and local AAA on the tunnel server

For L2TP tunnels only, a remote RADIUS AAA server can be used to perform VPDN tunnel authentication on the VPDN tunnel terminator as follows:

- Using a remote RADIUS AAA server on the tunnel server for dial-in VPDNs
- Using a remote RADIUS AAA server on the NAS for dial-out VPDNs

For detailed information on configuring remote RADIUS or TACACS+ servers, see the "Additional References section."

## RADIUS Tunnel Accounting for L2TP VPDNs

RADIUS tunnel accounting for VPDNs is supported by RFC 2867, which introduces six new RADIUS accounting types. Without RADIUS tunnel accounting support, VPDN with network accounting will not report all possible attributes to the accounting record file. RADIUS tunnel accounting support allows users to determine tunnel-link status changes. Because all possible attributes can be displayed, users can better verify accounting records with their Internet service providers (ISPs).

Enabling tunnel type accounting records allows the router to send tunnel and tunnel-link accounting records to the RADIUS server. The two types of accounting records allow the identification of VPDN tunneling events as described next.

### Tunnel-Type Accounting Records

AAA sends Tunnel-Start, Tunnel-Stop, or Tunnel-Reject accounting records to the RADIUS server to identify these events:

- A VPDN tunnel is brought up or destroyed.
- A request to create a VPDN tunnel is rejected.

### Tunnel-Link-Type Accounting Records

AAA sends Tunnel-Link-Start, Tunnel-Link-Stop, or Tunnel-Link-Reject accounting records to the RADIUS server to identify these events:

- A user session within a VPDN tunnel is brought up or brought down.
- A user session create request is rejected.

## Suppressing EXEC Accounting Record

You can suppress an EXEC accounting record when you configure autoselection during login for the dial-in clients. Normally when you configure autoselection during-login, two accounting start and stop records (one for the EXEC\_service and the other for FRAMED\_service) are sent if PPP is autoselected for the user. Though it is the expected behavior, it can lead to additional billing on the server. Use the **aaa accounting nested suppress stop** command to prevent the generation of EXEC-stop accounting records.

## VPDN-Specific Remote RADIUS AAA Server Configurations

The RADIUS attributes are specific to VPDN configurations. For detailed information on configuring remote RADIUS or TACACS+ servers, see the Additional References section.

VPDN-specific RADIUS attributes provide this functionality:

- Tunnel server load balancing and failover--The NAS remote RADIUS AAA server can be configured to forward the NAS information about tunnel server priorities.
- DNS name support--The NAS AAA server can be configured to resolve Domain Name System (DNS) names and translate them into IP addresses.
- Tunnel assignments--The NAS AAA server can be configured to group users from different per-user or domain RADIUS profiles into the same active VPDN tunnel when the tunnel type and tunnel endpoint are identical.
- L2TP tunnel connection speed labeling--The NAS AAA server can be configured to perform an authentication check based on the user's connection speed.
- Authentication names for NAS-initiated tunnels--The NAS AAA server can be configured with authentication names other than the default names for the NAS and the NAS AAA server.

## L2TP Tunnel Server Load Balancing and Failover Using the RADIUS Tunnel Preference Attribute

In a multivendor network environment, using a VSA on a RADIUS server can cause interoperability issues among NASs manufactured by different vendors. Even though some RADIUS server implementations can send VSAs that the requesting NAS can understand, the user still must maintain different VSAs for the same purpose in a single-service profile.

A consensus regarding the tunnel attributes that are to be used in a multivendor network environment is defined in RFC 2868. In RFC 2868, Tunnel-Server-Endpoint specifies the address to which the NAS should initiate a new session. If multiple Tunnel-Server-Endpoint attributes are defined in one tagged attribute group, they are interpreted as equal-cost load-balancing tunnel servers.

The Tunnel-Preference attribute defined in RFC 2868 can be used to form load balancing and failover tunnel server groups. When the Tunnel-Preference values of different tagged attribute groups are the same, the Tunnel-Server-Endpoint of those attribute groups is considered to have the same priority unless otherwise specified. When the Tunnel-Preference values of some attribute groups are higher (they have a lower preference) than other attribute groups, their Tunnel-Server-Endpoint attributes will have higher priority values. When an attribute group has a higher priority value, that attribute group will be used for failover in case the attribute groups with lower priority values are unavailable for the connections.

**Note**

Support for the Tunnel-Preference attribute was introduced on Cisco access server platforms in Cisco IOS Release 12.2(11)T.

The RADIUS Tunnel-Preference attribute is useful for large multivendor networks that use VPDN Layer 2 tunnels over WAN links such as ATM and Ethernet. The NAS uses tunnel profiles downloaded from the RADIUS server to establish load balancing and failover priorities for VPDN Layer 2 tunnels. The Point-to-Point over Ethernet (PPPoE) protocol is used as the client to generate PPP sessions.

When multiple tunnel servers of the same priority are configured, the NAS will select the tunnel server with the lowest number of active sessions. If several tunnel servers have the same number of active sessions, the NAS must use a tie-breaking mechanism to determine which to select.

The NAS uses a round-robin selection as the tie-breaking mechanism. Because each NAS is aware only of its own session load, multiple NASs using the same round-robin algorithm might unevenly distribute sessions across the tunnel servers (session bunching). Each NAS selects the same tunnel server in the case of a tie because the round-robin tie-breaking mechanism always resolves to the same tunnel server. Session bunching is especially prominent when there is a very low number of sessions on each NAS.

The NAS uses a new tie-breaking algorithm. A random selection is made among all peer tunnel servers carrying the same session load. This improved algorithm results in a more even distribution of sessions across tunnel servers, reducing the occurrence of session bunching.

## Shell-Based Authentication of VPDN Users

The NAS and tunnel server can be configured to perform shell-based authentication of VPDN users. Shell-based authentication of VPDN users provides terminal services (shell login or exec login) for VPDN users to support rollout of wholesale dial networks. Authentication of users occurs via shell or exec login at the NAS before PPP starts and the tunnel is established.

A character-mode login dialog is provided before PPP starts, and the login dialog supports schemes such as token-card synchronization and initialization, challenge-based password, and so on. After a user is authenticated in this way, the connection changes from character mode to PPP mode to connect the user to the desired destination. The AAA server that authenticates the login user can be selected based on the dialed DNIS or the domain-name part of the username.

VPDN profiles can be kept by a Resource Pool Manager Server (RPMS), RADIUS-based AAA server, or on the NAS.

Enabling shell-based authentication of VPDN users provides these capabilities:

- Authentication of a dial-in user session occurs at the NAS before PPP is started or a tunnel is established. If authentication fails, the user session can be terminated before tunneling resources are used.
- Authentication of a PPP user can be performed using authentication methods other than CHAP and Password Authentication Protocol (PAP). A character-mode login dialog such as username/password or username/challenge/password, Secure ID, or Safeword can be used. PPP authentication data is preconfigured or entered before PPP starts. Authentication is completed without any further input from the user.

For the NAS to perform shell-based VPDN authentication, it must be configured for AAA, PPP must be configured to bypass authentication, and DNIS must be enabled.

## L2TP Forwarding of PPPoE Tagging Information

The L2TP Forwarding of PPPoE Tag Information feature allows you to transfer DSL line information from the L2TP access concentrator (LAC) to the L2TP network server (LNS). For example, the LAC transports the actual-rate-up and the actual-rate-down PPPoE tag information to the LNS, which learns about the actual PPPoE transfer speeds that are negotiated by the customer premise equipment (CPE) and the digital subscriber line access multiplexer (DSLAM). The DSLAM inserts the PPPoE tag values for the rate up and the rate down and signals this information during PPPoE establishment with the LAC, which in turn, sends this information to the LNS.

By using the L2TP Forwarding of PPPoE Tag Information feature, you can also override the nas-port-id, or calling-station-id VSAs, or both, on the LNS with the Circuit-ID and Remote-ID VSA respectively.

When you configure the **dsl-line-info-forwarding** command in VPDN group or VPDN-template configuration mode, and when the LNS receives one of the specified AV pairs, the LNS sends a matching VSA to the RADIUS server as a AAA request. The associated AAA attributes are:

- AAA\_CIRCUIT\_ID (RADIUS attribute 87)
- AAA\_REMOTE\_ID (RADIUS attribute 31)

- DSL Sync Rate VSAs

Enter the **radius-server attribute 87 circuit-id** command to override the nas-port-id with the CIRCUIT\_ID VSA. Enter the **radius-server attribute 31 remote-id** command to override the calling-station-id with the REMOTE\_ID VSA.

In accordance with DSL Forum 2004-71, the DSL uses the Vendor Specific tag for line identification. The first two octets (TAG\_TYPE) are PPPOE\_TAG\_VENDSPEC (0x0105). The next two octets (TAG\_LENGTH) contain the total length including Suboptions, Suboption-lengths, and Tag-values. The first four octets of the TAG\_VALUE contain the vendor ID. The next octet contains suboption for Agent Remote ID (0x02). Following octet contains total length of Suboption-tag in bytes.

The maximum length for the Remote-ID tag is 63 bytes. The Remote-ID tag contains an operator administered string that uniquely identifies the subscriber on the associated DSL line. The Remote-ID tag can be a phone number, an e-mail address, a billing account number, or any other string that can be used by service providers as a tracking mechanism.

If the discovery frame has the suboption 0x01, it indicates the presence of the Circuit-ID tag. A single frame supports Circuit-ID, Remote-ID, or both. If Circuit-ID is present in the same frame, it sends to the RADIUS server through the Nas-Port-ID attribute.

The following example shows an access and accounting request sent to the RADIUS server with remote-ID tag and DSL-Sync-Rate tags:

```
01:24:52: RADIUS/ENCODE: Best Local IP-Address 10.0.73.20 for Radius-Server 128.107.164.254

01:24:57: RADIUS: Received from id 1646/4 192.107.164.254:1646, Accounting-response, len
20

```

The LAC sends the indicated AV pairs containing the DSL line information to the LNS, which sends them through AAA to the RADIUS server. The RADIUS server uses the DSL line identification when processing AAA requests.

**Note**

The LNS must reply with the same attribute-value pairs (AVPs) that it receives from the LAC. For example, if the LAC sends only Cisco AVPs, the LNS must reply with Cisco AVPs and no others.

**Note**

Configuring two-way CHAP authentication on a forwarded PPP session is not supported, except when you configure the **ppp direction callin** command on the LAC PPPoE to override the default direction of the PPP connection. This causes the LAC to forward the call instead of responding to the peer (client) challenge. The LNS is held in the authentication phase until the client times out and resends the challenge, which, because the call has been forwarded, is handled by the LNS. Authentication then proceeds.

If you plan to configure L2TP Forwarding of PPPoE Tagging Information, it is recommended that you be familiar with RFC 2516 and DSL Forum TR-101 before configuring this feature.

## DSL Sync-Rate VSAs

The DSL uses PPPoE Vendor Specific tags for Sync-Rate tag information. DSL Sync-Rates are encoded as 32-bit binary values, describing the rate in Kbps. The tag length is 4 bytes. The table below shows the mandatory DSL Sync-Rate tags and their associated RADIUS VSA.

**Table 1: Required DSL Sync-Rate Tags**

DSL Line Information	RADIUS VSA	Description
DSL Line Actual-Data-Rate-Upstream AVP	AAA_AT_ACTUAL_RATE_UP	Actual data rate upstream in kbps.
DSL Line Actual-Data-Rate-Downstream AVP	AAA_AT_ACTUAL_RATE_DOWN	Actual data rate downstream in kbps.
DSL Line Minimum-Data-Rate-Upstream AVP	AAA_AT_MIN_RATE_UP	Minimum data rate upstream in kbps.

DSL Line Information	RADIUS VSA	Description
DSL Line Minimum-Data-Rate-Downstream AVP	AAA_AT_MIN_RATE_DOWN	Minimum data rate downstream in kbps.

PADI/PADR frames might contain an optional DSL Sync-Rate tag. The table below shows DSL line information and their associated RADIUS VSA for the optional DSL Sync-Rate tags.

**Table 2: Optional DSL Sync-Rate Tags**

DSL Line Information	RADIUS VSA	Description
DSL Line Attainable-Data-Rate-Upstream AVP	AAA_AT_ATTAINABLE_RATE_UP	Attainable data rate upstream in kbps.
DSL Line Attainable-Data-Rate-Downstream AVP	AAA_AT_ATTAINABLE_RATE_DOWN	Attainable data rate downstream in kbps.
DSL Line Maximum-Data-Rate-Upstream AVP	AAA_AT_MAX_RATE_UP	Maximum data rate upstream in kbps.
DSL Line Maximum-Data-Rate-Downstream AVP	AAA_AT_MAX_RATE_DOWN	Maximum data rate downstream in kbps.
DSL Line Minimum-Data-Rate-Upstream -Low-Power AVP	AAA_AT_MIN_RATE_UP_LOW_POWER	Minimum data rate upstream in low power state in kbps.
DSL Line Minimum-Data-Rate-Downstream -Low-Power AVP	AAA_AT_MIN_RATE_DOWN_LOW_POWER	Minimum data rate downstream in low power state in kbps.
DSL Line Maximum-Interleaving-Delay-UpStream AVP	AAA_AT_MAX_INTER_DELAY_UP	Maximum interleaving delay upstream in ms.
DSL Line Maximum-Interleaving-Delay-DownStream AVP	AAA_AT_MAX_INTER_DELAY_DOWN	Maximum interleaving delay downstream in ms.
DSL Line Actual-Interleaving-Delay-Upstream AVP	AAA_AT_ACTUAL_INTER_DELAY_UP	Actual interleaving delay upstream in kbps.
DSL Line Actual-Interleaving-Delay-Downstream AVP	AAA_AT_ACTUAL_INTER_DELAY_DOWN	Actual interleaving delay downstream in kbps.
DSL Access Line IWF-Session AVP	AAA_AT_IWF_TAG	Indicates if an Interworking Function has been performed with respect to the session of the subscriber.

## LNS Address Checking

### Benefits of LNS Address Checking

The LNS Address Checking feature allows a LAC to check the IP address of the LNS sending traffic to it during the setup of an L2TP tunnel, thus providing a check for uplink and downlink traffic arriving from different interfaces.

The benefit of the LNS Address Checking feature is avoiding the loss of revenue from users sending back traffic through an alternate network.

### LNS Address Checking Using a RADIUS Server

Use the Cisco attribute-value pair (AVP), downloaded from a RADIUS server during authentication, to enable IP address checking at the LAC.

The Cisco AVP is:

```
l2tp-security-ip-address-check=yes
```

The following RADIUS profile example shows the LNS address checking enabled:

```
example.com Password="example"
Service-Type=Outbound
Cisco-Avpair="vpdn:tunnel-id=tunnel"
Cisco-Avpair="vpdn:tunnel-type=l2tp"
Cisco-Avpair=":ip-address=10.10.10.1"
Cisco-Avpair="vpdn:l2tp-tunnel-password=example"
Cisco-Avpair="vpdn:l2tp-security-ip-address-check=yes"
```

### Debugging Dropped Control Packets

Use the LNS Address Checking feature to help troubleshoot dropped control packets. If you configure the **debug vpdn 12x-error** command, informational messages display for each control packet that is dropped in the following format:

```
Tnl <tunnel-ID>
L2TP: Drop <L2TP-packet-name>
from y.y.y.y (attempted) x.x.x.x
```

## Modified LNS Dead-Cache Handling

The Modified LNS Dead-Cache Handling feature allows you to display and clear (restart) any Layer 2 Tunnel Protocol (L2TP) Network Server (LNS) entry in a dead-cache (DOWN) state. You can use this feature to generate a Simple Network Management Protocol (SNMP) or system message log (syslog) event when an LNS enters or exits a dead-cache state. Once an LNS exits the dead-cache state, the LNS is able to establish new sessions.

Prior to Cisco IOS Release 12.2(31)ZV, networks could not identify the status of a Load Sharing Group (LSG) on a LAC. As a result, it was not possible to know if an LNS is not responding (dead-cache state). An LNS in a dead-cache state causes an LSG to reject a call from an LAC.

Networks also have no method of logging, either through a syslog or SNMP event, when an LNS enters, or is cleared from a dead-cache state.

The Modified LNS Dead-Cache Handling feature allows you to view (identify) and clear (restart) one or more LNS entries in a dead-cache (DOWN) state, and generate either a syslog or SNMP event when an LNS exits or enters a dead-cache state. Once an LNS clears a dead-cache state, the LNS is active and available for new call-session establishments.

## How to Configure AAA for VPDNs

### Enabling VPDN on the NAS and the Tunnel Server

Before performing any VPDN configuration tasks, you must enable VPDN on the NAS and the tunnel server. If you are deploying a multihop VPDN tunnel switching architecture, VPDN must be enabled on the tunnel switch as well.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vpdn enable**

#### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>vpdn enable</b>  <b>Example:</b> Router(config)# vpdn enable	Enables VPDN on the router.

## Configuring the VPDN Tunnel Authorization Search Order

Perform this task on the NAS or the tunnel switch to configure the VPDN tunnel authorization search order if you prefer to use an order other than the default order. The default search order for VPDN tunnel authorization is to first search by DNIS, then by domain.

### Before You Begin

You must perform the task in the "Enabling VPDN on the NAS and the Tunnel Server" section.

#### Note

Tunnel authorization searches based on the multihop hostname are supported only for multihop tunnel switching deployments.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vpdn search-order {dnis [domain] [multihop-hostname] | domain [dnis] [multihop-hostname] | multihop-hostname [dnis] [domain]}**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>vpdn search-order {dnis [domain] [multihop-hostname]   domain [dnis] [multihop-hostname]   multihop-hostname [dnis] [domain]}</b>  <b>Example:</b> Router(config)# vpdn search-order domain dnis	Specifies how the service provider NAS or tunnel switch is to perform VPDN tunnel authorization searches. <ul style="list-style-type: none"> <li>• At least one search parameter keyword must be specified. You can specify multiple search parameter keywords in any order to define the desired order in which searches will be performed.</li> </ul> <p><b>Note</b> The <b>multihop-hostname</b> keyword is used only on a device configured as a tunnel switch.</p>

## Configuring L2TP Domain Screening

To configure L2TP Domain Screening, enable VPN service and VPDN preauthentication on the LAC. You can enable VPDN preauthentication globally or for specific VPDN groups.

This section contains these procedures:

### Configuring L2TP Domain Screening with Global Preauthentication

To configure L2TP Domain Screening with global preauthentication, enable VPN service and enable VPDN preauthorization globally. RADIUS authentication and authorization are required for per-user tunnels.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **aaa authentication ppp** {default | list-name} method1 [method2...]
5. **aaa authorization** {network | exec | commands level | reverse-access | configuration} {default | list-name} method1 [method2...]
6. **radius-server host** {hostname | ip-address} [auth-port port-number] [acct-port port-number]
7. **radius-server key** {0 string | 7 string | string}
8. **vpdn enable**
9. **vpdn authen-before-forward**
10. **interface atm** interface-number
11. **ip address** ip-address mask
12. **pvc** vpi / vci
13. **encapsulation aal5snap**
14. **protocol pppoe**
15. **vpn service** domain-name [replace-authen-domain]
16. **end**

#### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>

	Command or Action	Purpose
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>aaa new-model</b>  <b>Example:</b> Router(config)# aaa new-model	Enables the authentication, authorization, and accounting (AAA) access control system.
<b>Step 4</b>	<b>aaa authentication ppp</b> {default   <i>list-name</i> } <i>method1</i> [ <i>method2...</i> ]  <b>Example:</b> Router(config)# aaa authentication ppp default group radius	Specifies the use of RADIUS authentication for PPP authentication.
<b>Step 5</b>	<b>aaa authorization</b> {network   exec   commands <i>level</i>   reverse-access   configuration} {default   <i>list-name</i> } <i>method1</i> [ <i>method2...</i> ]  <b>Example:</b> Router(config)# aaa authorization network default group radius	<p>Specifies that authorization be run for all network-related service requests and uses <b>group radius</b> as the default method for authorization.</p> <p>This command is required for the AAA server to provide VPDN attributes.</p>
<b>Step 6</b>	<b>radius-server host</b> { <i>hostname</i>   <i>ip-address</i> } [ <b>auth-port</b> <i>port-number</i> ] [ <b>acct-port</b> <i>port-number</i> ]  <b>Example:</b> Router(config)# radius-server host 10.1.10.1 auth-port 1645 acct-port 1646	Specifies the AAA server that will supply the network access server or L2TP access concentrator (LAC) with the VPDN attributes for the user.
<b>Step 7</b>	<b>radius-server key</b> {0 <i>string</i>   7 <i>string</i>   <i>string</i> }  <b>Example:</b> Router(config)# radius-server key cisco	Sets the authentication and encryption key for all RADIUS communications between the router and the RADIUS daemon.
<b>Step 8</b>	<b>vpdn enable</b>  <b>Example:</b> Router(config)# vpdn enable	Enables virtual private dialup networking on the router and informs the router to look for tunnel definitions in a local database or on a remote authorization server (home gateway), if one is present.

	Command or Action	Purpose
<b>Step 9</b>	<p><b>vpdn authen-before-forward</b></p> <p><b>Example:</b></p> <pre>Router(config)# vpdn authen-before-forward</pre>	Enables authentication of all dial-in L2TP sessions before the sessions are forwarded to the tunnel server (global preauthentication).
<b>Step 10</b>	<p><b>interface atm <i>interface-number</i></b></p> <p><b>Example:</b></p> <pre>Router(config)# interface atm 4/0</pre>	Defines an ATM interface.
<b>Step 11</b>	<p><b>ip address <i>ip-address mask</i></b></p> <p><b>Example:</b></p> <pre>Router(config-if)# ip address 10.0.0.2 255.255.0.0</pre>	Sets the primary IP address for this interface.
<b>Step 12</b>	<p><b>pvc <i>vpi / vci</i></b></p> <p><b>Example:</b></p> <pre>Router(config-if)# pvc 1/20</pre>	Enters ATM VC configuration mode for the interface identified by this virtual path identifier/virtual channel identifier pair.
<b>Step 13</b>	<p><b>encapsulation aal5snap</b></p> <p><b>Example:</b></p> <pre>Router(config-if-atm-vc)# encapsulation aal5snap</pre>	Configures the encapsulation type for this PVC range. The global default encapsulation option is <b>aal5snap</b> .
<b>Step 14</b>	<p><b>protocol pppoe</b></p> <p><b>Example:</b></p> <pre>Router(config-if-atm-vc)# protocol pppoe</pre>	Enables PPP over Ethernet sessions for this PVC.
<b>Step 15</b>	<p><b>vpn service <i>domain-name [replace-authen-domain]</i></b></p> <p><b>Example:</b></p> <pre>Router(config-if-atm-vc)# vpn service example.com replace-authen-domain</pre>	Replaces the domain field with the domain name during preauthentication.
<b>Step 16</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Router(config-if-atm-vc)# end</pre>	Ends the current configuration session and returns to privileged EXEC mode.

## Configuring L2TP Domain Screening with per-VPDN Group Preauthentication

To configure L2TP Domain Screening with per-VPDN group preauthentication, enable VPN service and enable VPDN preauthentication by specific VPDN group.

### Note

- The **show running-config** command does not display the configured domain name and virtual template, unless you configure the **protocol l2tp** command.
- When you unconfigure the **protocol l2tp** command, the configured domain name and virtual template are automatically removed. When you reconfigure the **protocol l2tp** command, the domain name and virtual template need to be explicitly added again.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **aaa authentication ppp** {default | list-name} method1 [method2...]
5. **aaa authorization** {network | exec | commands level | reverse-access | configuration} {default | list-name} method1 [method2...]
6. **vpdn enable**
7. **vpdn-group** name
8. **request-dialin**
9. **protocol l2tp**
10. **domain** domain-name
11. **exit**
12. **authen-before-forward**
13. **initiate-to ip** ip-address
14. **end**
15. **configure terminal**
16. **interface atm** interface-number
17. **ip address** ip-address mask
18. **pvc** vpi / vci
19. **encapsulation aal5snap**
20. **protocol pppoe**
21. **vpn service** domain-name [replace-authen-domain]
22. **end**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<p><b>enable</b></p> <p><b>Example:</b></p> <pre>Router&gt; enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Router# configure terminal</pre>	<p>Enters global configuration mode.</p>
Step 3	<p><b>aaa new-model</b></p> <p><b>Example:</b></p> <pre>Router(config)# aaa new-model</pre>	<p>Enables the AAA access control system.</p>
Step 4	<p><b>aaa authentication ppp {default   list-name} method1 [method2...]</b></p> <p><b>Example:</b></p> <pre>Router(config)# aaa authentication ppp default local</pre>	<p>Specifies the use of local authentication for PPP authentication.</p>
Step 5	<p><b>aaa authorization {network   exec   commands level   reverse-access   configuration} {default   list-name} method1 [method2...]</b></p> <p><b>Example:</b></p> <pre>Router(config)# aaa authorization network default local</pre>	<p>Specifies that authorization be run for all network-related service requests and uses local authentication as the default method for authorization.</p> <p>This command is required for the AAA server to provide VPDN attributes.</p>
Step 6	<p><b>vpdn enable</b></p> <p><b>Example:</b></p> <pre>Router(config)# vpdn enable</pre>	<p>Enables virtual private dialup networking on the router and informs the router to look for tunnel definitions in a local database or on a remote authorization server (home gateway), if one is present.</p>
Step 7	<p><b>vpdn-group name</b></p> <p><b>Example:</b></p> <pre>Router(config)# vpdn-group l2tp</pre>	<p>Creates a VPDN group and enters VPDN group configuration mode.</p>

	Command or Action	Purpose
<b>Step 8</b>	<b>request-dialin</b>  <b>Example:</b> Router(config-vpdn)# request-dialin	Configures the VPDN group to request an L2TP dial-in tunnel.
<b>Step 9</b>	<b>protocol l2tp</b>  <b>Example:</b> Router(config-vpdn-req-in)# protocol l2tp	Specifies the tunneling protocol to be used by the VPDN group.
<b>Step 10</b>	<b>domain domain-name</b>  <b>Example:</b> Router(config-vpdn-req-in)# domain example.com	Specifies the domain name of users that will be forwarded to the tunnel server.
<b>Step 11</b>	<b>exit</b>  <b>Example:</b> Router(config-vpdn-req-in)# exit	Returns to VPDN configuration mode.
<b>Step 12</b>	<b>authen-before-forward</b>  <b>Example:</b> Router(config-vpdn)# authen-before-forward	Enables authentication of dial-in L2TP sessions associated with this VPDN group before the sessions are forwarded to the tunnel server (per-VPDN group preauthentication).
<b>Step 13</b>	<b>initiate-to ip ip-address</b>  <b>Example:</b> Router(config-vpdn)# initiate-to ip 10.2.2.2	Specifies an IP address to be used for L2TP tunneling.
<b>Step 14</b>	<b>end</b>  <b>Example:</b> Router(config-vpdn)# end	Returns to privileged EXEC mode.
<b>Step 15</b>	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 16</b>	<b>interface atm</b> <i>interface-number</i>  <b>Example:</b> Router(config)# interface atm 4/0	Defines an ATM interface.
<b>Step 17</b>	<b>ip address</b> <i>ip-address mask</i>  <b>Example:</b> Router(config-if)# ip address 10.0.0.2 255.255.0.0	Sets the primary IP address for this interface.
<b>Step 18</b>	<b>pvc</b> <i>vpi / vci</i>  <b>Example:</b> Router(config-if)# pvc 1/20	Enters ATM VC configuration mode for the interface identified by this virtual path identifier/virtual channel identifier pair.
<b>Step 19</b>	<b>encapsulation aal5snap</b>  <b>Example:</b> Router(config-if-atm-vc)# encapsulation aal5snap	Configures the encapsulation type for this PVC range. The global default encapsulation option is <b>aal5snap</b> .
<b>Step 20</b>	<b>protocol pppoe</b>  <b>Example:</b> Router(config-if-atm-vc)# protocol pppoe	Enables PPP over Ethernet sessions for this PVC.
<b>Step 21</b>	<b>vpn service</b> <i>domain-name</i> [ <b>replace-authen-domain</b> ]  <b>Example:</b> Router(config-if-atm-vc)# vpn service example.com replace-authen-domain	Replaces the domain field with the domain name during preauthentication.
<b>Step 22</b>	<b>end</b>  <b>Example:</b> Router(config-if-atm-vc)# end	Ends the current configuration session and returns to privileged EXEC mode.

## Configuring L2TP Domain Screening Rules Based

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **policy-map** [type {stack | access-control | port-filter | queue-threshold | logging *log-policy*}] *policy-map-name*
4. **class-map** [type {stack | access-control | port-filter | queue-threshold | logging *log class*}] [match-all | match-any] *class-map-name*
5. *action-number* **collect** [aaa list *list-name*] **identifier** {authen-status | authenticated-domain | authenticated-username | dnis | media | mlp-negotiated | nas-port | no-username | protocol | service-name | source-ip-address | timer | tunnel-name | unauthenticated-domain | unauthenticated-username}
6. *action-number* **set** [*variable-name*] [**identifier**] [*type*]
7. *action-number* **substitute** [*variable-name*] [*matching-pattern*] [*rewrite-pattern*]
8. *action-number* **authenticate** aaa list *list-name*
9. **exit**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>policy-map</b> [type {stack   access-control   port-filter   queue-threshold   logging <i>log-policy</i> }] <i>policy-map-name</i>  <b>Example:</b> Router(config)# policy-map type control start-up-ppp	Creates or modifies a control policy map, which is used to define a control policy.
Step 4	<b>class-map</b> [type {stack   access-control   port-filter   queue-threshold   logging <i>log class</i> }] [match-all   match-any] <i>class-map-name</i>	Specifies a control class for which actions can be configured. <ul style="list-style-type: none"> <li>• A policy rule for which the control class is <b>always</b> will always be treated as the lowest priority rule within the control policy map.</li> </ul>

	Command or Action	Purpose
	<p><b>Example:</b></p> <pre>Router(config-control-policymap)# class type control always event session-start</pre>	
<b>Step 5</b>	<p><b>action-number collect</b> [aaa list <i>list-name</i>] <b>identifier</b>  {<b>authen-status</b>   <b>authenticated-domain</b>    <b>authenticated-username</b>   <b>dnis</b>   <b>media</b>   <b>mlp-negotiated</b>    <b>nas-port</b>   <b>no-username</b>   <b>protocol</b>   <b>service-name</b>    <b>source-ip-address</b>   <b>timer</b>   <b>tunnel-name</b>    <b>unauthenticated-domain</b>   <b>unauthenticated-username</b>}</p> <p><b>Example:</b></p> <pre>Router(config-control-policymap-class-control)# 1 collect identifier unauthenticated-username</pre>	(Optional) Collects the specified subscriber identifier from the access protocol.
<b>Step 6</b>	<p><b>action-number set</b> [<i>variable-name</i>] [<b>identifier</b>] [<i>type</i>]</p> <p><b>Example:</b></p> <pre>Router(config-control-policymap-class-control)# 2 set NAME identifier unauthenticated-username</pre>	Creates a temporary memory space to hold values received by policy manager on the identifier type.
<b>Step 7</b>	<p><b>action-number substitute</b> [<i>variable-name</i>] [<i>matching-pattern</i>]  [<i>rewrite-pattern</i>]</p> <p><b>Example:</b></p> <pre>Router(config-control-policymap-class-control)# 3 substitute NEWNAME</pre>	Matches the contents of <i>variable-name</i> using <i>matching-pattern</i> and perform the substitution defined in <i>rewrite-pattern</i> .
<b>Step 8</b>	<p><b>action-number authenticate</b> <b>aaa list</b> <i>list-name</i></p> <p><b>Example:</b></p> <pre>Router(config-control-policymap-class-control)# 1 authenticate aaa list LIST1</pre>	Initiates an authentication request using the contents of <i>variable-name</i> instead of the default unauthenticated-username.
<b>Step 9</b>	<p><b>exit</b></p> <p><b>Example:</b></p> <pre>Router(config-control-policymap-class-control)# exit</pre>	Exits the current configuration mode.

## Configuring per-User VPDN on the NAS

Per-user VPDN can be configured globally, or for individual VPDN groups. The VPDN group configuration will take precedence over the global configuration.

Perform one of these tasks on the NAS to configure per-user VPDN:

### Prerequisites

The NAS remote RADIUS server must be configured for AAA. See the "Additional References" section.

### Restrictions

- Per-user VPDN configuration supports only RADIUS as the AAA protocol.
- This task is compatible only with NAS-initiated dial-in VPDN scenarios.

### Configuring Global per-User VPDN

Configuring per-user VPDN on a NAS causes the NAS to send the entire structured username of the user to a RADIUS AAA server the first time the NAS contacts the AAA server. Per-user VPDN can be configured globally, or for individual VPDN groups. Configuring per-user VPDN globally will apply per-user VPDN to all request-dialin VPDN groups configured on the NAS.

Perform this task on the NAS to configure global per-user VPDN.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vpdn authen-before-forward**

#### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 3</b>	<b>vpdn authen-before-forward</b>  <b>Example:</b> Router(config)# vpdn authen-before-forward	Configures a NAS to request authentication of a complete username before making a forwarding decision for dial-in tunnels.

## Configuring per-User VPDN for a VPDN Group

Configuring per-user VPDN on a NAS causes the NAS to send the entire structured username of the user to a RADIUS AAA server the first time the NAS contacts the AAA server. Per-user VPDN can be configured globally, or for individual VPDN groups. Configuring per-user VPDN at the VPDN group level will apply per-user VPDN only to calls associated with that specific VPDN group.

Perform this task on the NAS to configure per-user VPDN for a specific VPDN group.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vpdn-group *name***
4. **request-dialin**
5. **protocol {l2f | l2tp | any}**
6. **exit**
7. **authen-before-forward**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 3</b>	<b>vpdn-group</b> <i>name</i>  <b>Example:</b> Router(config)# vpdn-group 1	Creates a VPDN group and enters VPDN group configuration mode.
<b>Step 4</b>	<b>request-dialin</b>  <b>Example:</b> Router(config-vpdn)# request-dialin	Configures a NAS to request the establishment of an L2F or L2TP tunnel to a tunnel server, creates a request-dialin VPDN subgroup, and enters VPDN request dial-in subgroup configuration mode.
<b>Step 5</b>	<b>protocol</b> {l2f   l2tp   any}  <b>Example:</b> Router(config-vpdn-req-in)# protocol l2tp	Specifies the Layer 2 protocol that the VPDN group will use. <ul style="list-style-type: none"> <li>• L2TP and L2F are the only valid tunneling protocols for dial-in VPDNs. The <b>any</b> keyword can be used to specify that both L2TP and L2F tunnels can be established.</li> </ul>
<b>Step 6</b>	<b>exit</b>  <b>Example:</b> Router(config-vpdn-req-in)# exit	Exits to VPDN group configuration mode.
<b>Step 7</b>	<b>authen-before-forward</b>  <b>Example:</b> Router(config-vpdn)# authen-before-forward	Configures a NAS to request authentication of a complete username before making a forwarding decision for dial-in L2TP or L2F tunnels belonging to a VPDN group.

## Configuring AAA on the NAS and the Tunnel Server

For NAS-initiated dial-in VPDN tunneling and L2TP dial-out tunneling deployments, perform this task on the NAS and the tunnel server.

For client-initiated dial-in VPDN tunneling, perform this task on the tunnel server.

### Before You Begin

- You must perform the task in the [Enabling VPDN on the NAS and the Tunnel Server](#), on page 13.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **aaa authentication login** {default | list-name} method1 [method2...]
5. **aaa authentication ppp** {default | list-name} method1 [method2...]
6. **aaa authorization** {network | exec | commands level | reverse-access | configuration} {default | list-name} [method1 [method2...]]
7. **vpdn aaa attribute** {nas-ip-address {vpdn-nas | vpdn-tunnel-client} | nas-port {physical-channel-id | vpdn-nas}}

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> <pre>Router&gt; enable</pre>	Enables privileged EXEC mode.  <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> <pre>Router# configure terminal</pre>	Enters global configuration mode.
<b>Step 3</b>	<b>aaa new-model</b>  <b>Example:</b> <pre>Router(config)# aaa new model</pre>	Enables the AAA access control model.
<b>Step 4</b>	<b>aaa authentication login</b> {default   list-name} method1 [method2...]  <b>Example:</b> <pre>Router(config)# aaa authentication login default local</pre>	Sets AAA authentication at login.
<b>Step 5</b>	<b>aaa authentication ppp</b> {default   list-name} method1 [method2...]  <b>Example:</b> <pre>Router(config)# aaa authentication ppp default radius</pre>	Specifies one or more AAA authentication methods for use on serial interfaces that are running PPP.  <b>Note</b> This command must be configured with the <b>if-needed</b> option for the <i>method1</i> argument if you are configuring shell-based authentication for VPDNs. This configures PPP to bypass user authentication if the user has been authenticated at the login prompt.

	Command or Action	Purpose
<b>Step 6</b>	<p><b>aaa authorization</b> {network   exec   commands <i>level</i>   reverse-access   configuration} {default   list-name} [<i>method1</i> [<i>method2...</i>]]</p> <p><b>Example:</b></p> <pre>Router(config)# aaa authorization network default radius</pre>	Sets parameters that restrict user access to a network.
<b>Step 7</b>	<p><b>vpdn aaa attribute</b> {nas-ip-address {vpdn-nas   vpdn-tunnel-client}   nas-port {physical-channel-id   vpdn-nas}}</p> <p><b>Example:</b></p> <pre>Router(config)# vpdn aaa attribute nas-ip-address vpdn-nas</pre>	<p>(Optional) Enables AAA attributes related to a VPDN that will be reported to the AAA server in accounting records.</p> <p><b>Note</b> Configure this command only on the tunnel server when remote AAA accounting will be enabled on the NAS.</p>

## Configuring Remote AAA for VPDNs

A remote RADIUS or TACACS+ AAA server can be used for tunnel authentication. For detailed information on configuring remote RADIUS or TACACS+ servers, see the "Additional References" section.

Remote AAA authentication can be configured on the NAS or the tunnel server in these ways:

### Dial-In Configurations

- The NAS can be configured to use a remote AAA server.
- The tunnel server, functioning as the tunnel terminator, can be configured to use a remote AAA server for L2TP tunnels only.

### Dial-Out Configurations

- The NAS, functioning as the tunnel terminator, can be configured to use a remote AAA server for L2TP tunnels only.

Perform one of these tasks to configure remote AAA for VPDNs:

## Configuring the NAS for Remote AAA for Dial-In VPDNs

Perform this task to configure the NAS to use a remote RADIUS or TACACS+ server for tunnel authentication. This task applies only to dial-in VPDN configurations.

**Before You Begin**

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. Do one of the following:
  - **radius-server host** {hostname | ip-address} [auth-port port-number] [acct-port port-number] [timeout seconds] [retransmit retries] [key string] [alias {hostname | ip-address}]
  - **tacacs-server host** {host-name | host-ip-address} [key string] [nat] [port [integer]] [single-connection] [timeout [integer]]
4. Do one of the following:
  - **aaa group server radius** group-name
  - **aaa group server tacacs+** group-name
5. Do one of the following:
  - **server** ip-address [auth-port port-number] [acct-port port-number]
  - **server** ip-address

**DETAILED STEPS**

	Command or Action	Purpose
<b>Step 1</b>	<p><b>enable</b></p> <p><b>Example:</b></p> <pre>Router&gt; enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Router# configure terminal</pre>	<p>Enters global configuration mode.</p>
<b>Step 3</b>	<p>Do one of the following:</p> <ul style="list-style-type: none"> <li>• <b>radius-server host</b> {hostname   ip-address} [auth-port port-number] [acct-port port-number] [timeout seconds] [retransmit retries] [key string] [alias {hostname   ip-address}]</li> <li>• <b>tacacs-server host</b> {host-name   host-ip-address} [key string] [nat] [port [integer]] [single-connection] [timeout [integer]]</li> </ul>	<p>Specifies a RADIUS server host.</p> <p><b>Note</b> This command is required if you will be performing the task in the Configuring the NAS for Shell-Based Authentication of VPDN Users section.</p> <p>or</p> <p>Specifies a TACACS+ host.</p>

	Command or Action	Purpose
	<p><b>Example:</b></p> <pre>Router(config)# radius-server host 10.1.1.1</pre> <p><b>Example:</b></p> <pre>Router(config)# tacacs-server host 10.2.2.2</pre>	
<b>Step 4</b>	<p>Do one of the following:</p> <ul style="list-style-type: none"> <li>• <b>aaa group server radius</b> <i>group-name</i></li> <li>• <b>aaa group server tacacs+</b> <i>group-name</i></li> </ul> <p><b>Example:</b></p> <pre>Router(config)# aaa group server radius group1</pre> <p><b>Example:</b></p> <pre>Router(config)# aaa group server tacacs+ group7</pre>	<p>(Optional) Groups different RADIUS server hosts into distinct lists and distinct methods and enters RADIUS server group configuration mode.</p> <p>or</p> <p>(Optional) Groups different TACACS+ server hosts into distinct lists and distinct methods and enters RADIUS server group configuration mode.</p>
<b>Step 5</b>	<p>Do one of the following:</p> <ul style="list-style-type: none"> <li>• <b>server</b> <i>ip-address</i> [<b>auth-port</b> <i>port-number</i>] [<b>acct-port</b> <i>port-number</i>]</li> <li>• <b>server</b> <i>ip-address</i></li> </ul> <p><b>Example:</b></p> <pre>Router(config-sg-radius)# server 10.1.1.1 auth-port 1000 acct-port 1646</pre> <p><b>Example:</b></p> <pre>Router(config-sg-radius)# server 10.2.2.2</pre>	<p>(Optional) Configures the IP address of the RADIUS server for the group server.</p> <p>or</p> <p>(Optional) Configures the IP address of the TACACS+ server for the group server.</p> <p><b>Note</b> Perform this step multiple times to configure multiple RADIUS or TACACS+ servers as part of the server group.</p>

## What to Do Next

You must perform the process in the [Configuring VPDN Tunnel Authentication](#), on page 47.

## Configuring the Tunnel Terminator for Remote RADIUS AAA for L2TP Tunnels

You can configure the device that terminates the L2TP VPDN tunnel to perform remote RADIUS AAA. Without this functionality, the tunnel terminator can only perform L2TP authentication locally. Local authentication requires that data about the corresponding tunnel endpoint be configured within a VPDN group. This mechanism does not scale well because the information stored in the VPDN groups on each device must be updated independently.

Remote RADIUS authentication allows users to store configurations on the RADIUS server, avoiding the need to store information locally. New information can be added to the RADIUS server as needed, and a group of tunnel terminators can access a common database on the RADIUS server.

Perform this task to configure remote RADIUS AAA for L2TP tunnels on the tunnel terminator. This task can be performed on the tunnel server for dial-in VPDN tunnels, or on the NAS for dial-out VPDN tunnels.

### Before You Begin

- The remote RADIUS AAA server must be configured. For more information on configuring remote RADIUS AAA servers, see the "Additional References" section.
- AAA must be enabled. To enable AAA, perform the task in the "Configuring AAA on the NAS and the Tunnel Server" section.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **radius-server host** *{hostname | ip-address}* [**auth-port** *port-number*] [**acct-port** *port-number*] [**timeout** *seconds*] [**retransmit** *retries*] [**key string**] [**alias** *{hostname | ip-address}*]
4. **aaa group server radius** *group-name*
5. **server** *ip-address* [**auth-port** *port-number*] [**acct-port** *port-number*]
6. **exit**
7. **vpdn tunnel authorization network** *{list-name | default}*
8. **vpdn tunnel authorization virtual-template** *vtemplate-number*
9. **vpdn tunnel authorization password** *password*

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode.  • Enter your password if prompted.

	Command or Action	Purpose
Step 2	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	<p><b>radius-server host</b> {hostname   ip-address} [auth-port port-number] [acct-port port-number] [timeout seconds] [retransmit retries] [key string] [alias {hostname   ip-address}]</p> <p><b>Example:</b></p> <pre>Router(config)# radius-server host 10.1.1.1</pre>	Specifies a RADIUS server host.
Step 4	<p><b>aaa group server radius</b> group-name</p> <p><b>Example:</b></p> <pre>Router(config)# aaa group server radius group1</pre>	Groups different RADIUS server hosts into distinct lists and distinct methods and enters RADIUS server group configuration mode.
Step 5	<p><b>server</b> ip-address [auth-port port-number] [acct-port port-number]</p> <p><b>Example:</b></p> <pre>Router(config-sg-radius)# server 10.1.1.1 auth-port 1000 acct-port 1646</pre>	<p>Configures the IP address of the RADIUS server for the group server.</p> <p><b>Note</b> Perform this step multiple times to configure multiple RADIUS or TACACS+ servers as part of the server group.</p>
Step 6	<p><b>exit</b></p> <p><b>Example:</b></p> <pre>Router(config-sg-radius)# exit</pre>	Exits RADIUS server group configuration mode.
Step 7	<p><b>vpdn tunnel authorization network</b> {list-name   default}</p> <p><b>Example:</b></p> <pre>Router(config)# vpdn tunnel authorization network default</pre>	<p>Specifies the AAA authorization method list that will be used for remote tunnel hostname-based authorization.</p> <ul style="list-style-type: none"> <li>• If the <i>list-name</i> argument was specified in the <b>aaa authorization</b> command, you must use that list name.</li> <li>• If the default keyword was specified in the <b>aaa authorization</b> command, you must use that keyword.</li> </ul>
Step 8	<p><b>vpdn tunnel authorization virtual-template</b> vtemplate-number</p> <p><b>Example:</b></p> <pre>Router(config)# vpdn tunnel authorization virtual-template 3</pre>	(Optional) Selects the default virtual template from which to clone virtual access interfaces.

	Command or Action	Purpose
<b>Step 9</b>	<b>vpdn tunnel authorization password</b> <i>password</i>  <b>Example:</b> <pre>Router(config)# vpdn tunnel authorization password my-secret</pre>	(Optional) Configures a false password for the RADIUS authorization request to retrieve the tunnel configuration that is based on the remote tunnel hostname.  <b>Note</b> If this command is not enabled, the password will always be "cisco."

### What to Do Next

You must perform these tasks in these sections:

- Configuring VPDN Tunnel Authentication
- Configuring Authentication of L2TP Tunnels at the Tunnel Terminator Remote RADIUS AAA Server

## Verifying and Troubleshooting Remote AAA Configurations

### Verifying that the VPDN Tunnel Is Up

#### SUMMARY STEPS

1. **enable**
2. **show vpdn tunnel**

#### DETAILED STEPS

##### Step 1

**enable**

Enter this command to enable privileged EXEC mode. Enter your password if prompted:

**Example:**

```
Router> enable
```

##### Step 2

**show vpdn tunnel**

Enter this command to display information about active VPDN tunnels. At least one tunnel and one session must be set up.

**Example:**

```
Router# show vpdn tunnel
L2TP Tunnel and Session Information Total tunnels 1 sessions 1
LocID RemID Remote Name State Remote Address Port Sessions VPDN Group
4571 61568 csidtw13 est 10.0.195.4 1701 1 ?
```

```

LocID RemID TunID Intf      Username      State  Last Chg
4      11      4571  Vi4.1      csidtw9@cisco.com  est   00:02:29
%No active PPPoE tunnels

```

---

## Verifying the Remote RADIUS AAA Server Configuration

Perform this task to verify that the remote AAA authorization server is configured on the tunnel endpoint and that the tunnel endpoint can receive attributes 90 and 69 from the RADIUS server.

In this example the steps are performed on the tunnel server, which is performing remote RADIUS AAA as a tunnel terminator. These steps can also be performed on the NAS when remote RADIUS AAA is being performed on the NAS as a tunnel initiator for dial-in VPDNs or as a tunnel terminator for dial-out VPDNs.

### SUMMARY STEPS

1. **enable**
2. **debug radius**
3. **show logging**

### DETAILED STEPS

---

**Step 1**     **enable**  
Enter this command to enable privileged EXEC mode. Enter your password if prompted:

**Example:**

```
Router> enable
```

**Step 2**     **debug radius**  
Enter this command on the tunnel server to display RADIUS debugging messages.

**Example:**

```
Router# debug radius
```

**Step 3**     **show logging**  
Enter this command on the tunnel server to display the contents of the standard system logging message buffer. Ensure that "access-accept" is in the output and that attributes 90 and 69 can be seen in the RADIUS reply, as shown in bold.

**Example:**

```

Router# show logging
00:32:56: RADIUS: Received from id 21645/5 172.19.192.50:1645, Access-Accept
, len 81
00:32:56: RADIUS:  authenticator 73 2B 1B C2 33 71 93 19 - 62 AC 3E BE 0D 13 14 85
00:32:56: RADIUS:  Service-Type      [6] 6  Outbound                [5]
00:32:56: RADIUS:  Tunnel-Type      [64] 6  00:L2TP                  [3]
00:32:56: RADIUS:  Tunnel-Medium-Type [65] 6  00:IPv4                   [1]
00:32:56: RADIUS: Tunnel-Client-Auth-I[90]

```

```

6 00:"csidtwl3"
00:32:56: RADIUS: Tunnel-Password [69]
8 *
00:32:56: RADIUS: Vendor, Cisco [26] 29
00:32:56: RADIUS: Cisco AVpair [1] 23 "vpdn:vpdn-vtemplate=1"

```

---

## Verifying the Remote TACACS+ AAA Server Configuration on the NAS

Perform this task on the NAS to verify that the remote TACACS+ AAA server is properly configured.

### Before You Begin

Enable these debug commands before performing this task:

- **debug aaa accounting** --Displays information on accountable events as they occur.
- **debug aaa authentication** --Displays information on AAA TACACS+ authentication.
- **debug aaa authorization** --Displays information on AAA TACACS+ authorization.
- **debug tacacs** --Displays information associated with TACACS+.
- **debug vpdn error** --Displays information about Layer 2 protocol-independent errors that occur.
- **debug vpdn events** --Displays information about Layer 2 protocol-independent events that are part of normal tunnel establishment or shutdown.
- **debug vpdn l2x-errors** --Displays information about Layer 2 protocol-specific errors that are part of normal PPP tunnel establishment or shutdown.
- **debug vpdn l2x-events** --Displays information about Layer 2 protocol-specific events that are part of normal PPP tunnel establishment or shutdown.
- **debug vpdn l2x-packets** --Displays information about Layer 2 protocol-specific
- **debug vtemplate** --Displays cloning information for a virtual access interface from the time it is cloned from a virtual template to the time the virtual access interface comes down when the call ends.

### SUMMARY STEPS

1. **enable**
2. **show debugging**
3. Examine the debug output.

### DETAILED STEPS

#### Step 1

**enable**

Enter this command to enable privileged EXEC mode. Enter your password if prompted:

**Example:**

```
Router> enable
```

**Step 2** **show debugging**

Enter this command to display information about the types of debugging that are enabled for your router.

**Example:**

```
Router# show debugging
General OS:
AAA Authentication debugging is on
AAA Authorization debugging is on
AAA Accounting debugging is on
VPN:
L2X protocol events debugging is on
L2X protocol errors debugging is on
VPDN events debugging is on
VPDN errors debugging is on
VTEMPLATE:
Virtual Template debugging is on
!
```

**Step 3** Examine the debug output.

The following example shows complete debug output from the NAS for successful VPDN tunnel establishment using remote TACACS+ AAA authentication at the NAS:

**Example:**

```

## Verifying the Remote TACACS+ AAA Server Configuration on the Tunnel Server

Perform this task on the tunnel server to verify that the remote TACACS+ AAA server is properly configured.

### Before You Begin

Enable these debug commands before performing this task:

- **debug aaa authentication** --Displays information on AAA authentication.
- **debug aaa authorization** --Displays information on AAA authorization.
- **debug aaa accounting** --Displays information on accountable events as they occur. The information displayed by this command is independent of the accounting protocol used to transfer the accounting information to a server.
- **debug tacacs+** --Displays detailed debugging information associated with TACACS+.
- **debug vtemplate** --Displays cloning information for a virtual access interface from the time it is cloned from a virtual template to the time the virtual access interface comes down when the call ends.
- **debug vpdn error** --Displays errors that prevent a PPP tunnel from being established or errors that cause an established tunnel to be closed.
- **debug vpdn events** --Displays messages about events that are part of normal PPP tunnel establishment or shutdown.
- **debug vpdn l2x-errors** --Displays messages about events that are part of normal PPP tunnel establishment or shutdown.
- **debug vpdn l2x-events** --Displays messages about events that are part of normal PPP tunnel establishment or shutdown for Layer 2.

### SUMMARY STEPS

1. **enable**
2. **show debugging**
3. Examine the debug output.

### DETAILED STEPS

---

**Step 1**      **enable**

Enter this command to enable privileged EXEC mode. Enter your password if prompted:

**Example:**

```
Router> enable
```

**Step 2** **show debugging**

Enter this command to display information about the types of debugging that are enabled for your router.

**Example:**

```
Router# show debugging
General OS:
AAA Authentication debugging is on
AAA Authorization debugging is on
AAA Accounting debugging is on
VPN:
L2X protocol events debugging is on
L2X protocol errors debugging is on
VPDN events debugging is on
VPDN errors debugging is on
VTEMPLATE:
Virtual Template debugging is on
```

**Step 3**

Examine the debug output.

The following example shows complete debug output from the tunnel server for successful VPDN tunnel establishment using remote TACACS+ AAA authentication at the NAS:

**Example:**

```
Jan 30 12:17:09: L2TP: I SCCRQ from rtp_tunnel tnl 74
Jan 30 12:17:09: Tnl 56 L2TP: New tunnel created for remote

## Verifying L2TP Tunnel Establishment PPP Negotiations and Authentication with the Remote Client

Perform this task to verify that the L2TP tunnel has been established and that the tunnel server can perform PPP negotiation and authentication with the remote client.

In this example the steps are performed on the tunnel server, which is performing remote AAA as a tunnel terminator. These steps can also be performed on the NAS when remote AAA is being performed on the NAS as a tunnel initiator for dial-in VPDNs or as a tunnel terminator for dial-out VPDNs.

### SUMMARY STEPS

1. **enable**
2. **debug ppp negotiation**
3. **debug ppp authentication**
4. **show logging**

## DETAILED STEPS

### Step 1 enable

Enter this command to enable privileged EXEC mode. Enter your password if prompted:

#### Example:

```
Router> enable
```

### Step 2 debug ppp negotiation

Enter this command on the tunnel server to display PPP negotiation debugging messages.

#### Example:

```
Router# debug ppp negotiation
```

### Step 3 debug ppp authentication

Enter this command on the tunnel server to display PPP authentication debugging messages.

#### Example:

```
Router# debug ppp authentication
```

### Step 4 show logging

Enter this command on the tunnel server to display the contents of the standard system logging message buffer. Observe that the tunnel server receives a PPP Challenge Handshake Authentication Protocol (CHAP) challenge and then sends a PPP CHAP "SUCCESS" to the client.

#### Example:

```
00:38:50: ppp3 PPP: Received LOGIN Response from AAA = PASS
00:38:50: ppp3 PPP: Phase is FORWARDING, Attempting Forward
00:38:50: Vi4.1 Tnl/Sn4571/4 L2TP: Session state change from wait-for-service-selection to established
00:38:50: Vi4.1 PPP: Phase is AUTHENTICATING, Authenticated User
00:38:50: Vi4.1 CHAP: O SUCCESS id 1 len 4
```

After PPP authentication is successful, observe from the debug output that PPP negotiation has started, that the tunnel server has received Link Control Protocol (LCP) IP Control Protocol (IPCP) packets, and that negotiation is successful.

#### Example:

```
00:38:50: Vi4.1 IPCP: State is Open
00:38:50: Vi4.1 IPCP: Install route to 10.1.1.4
```

## Configuring Directed Request Authorization of VPDN Users

Directed request authorization of VPDN users can be configured on the NAS or on the tunnel server. The directed request configuration is performed on the device that ultimately performs the authentication. Directed requests are most commonly configured on the tunnel server.

Perform one of these tasks to enable directed request authorization of VPDN users.

## Configuring Directed Request Authorization of VPDN Users on the Tunnel Server

Perform this task on the tunnel server to configure directed request authorization of VPDN users when the tunnel server performs authentication.

### Before You Begin

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip host** {*name* | *t modem-telephone-number*} [*tcp-port-number*] *address1* [*address2...address8*]
4. Do one of the following:
  - **radius-server directed-request** [**restricted**]
  - **tacacs-server directed-request** [**restricted**] [**no-truncate**]
5. **vpdn authorize directed-request**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>ip host</b> { <i>name</i>   <i>t modem-telephone-number</i> } [ <i>tcp-port-number</i> ] <i>address1</i> [ <i>address2...address8</i> ]  <b>Example:</b> Router(config)# ip host example.com 10.3.3.3	Specifies or modifies the hostname for the network server.  <b>Note</b> The IP address specified with the <b>ip host</b> command must match the IP address you configured with the <b>radius-server host</b> or <b>tacacs-server host</b> command when performing the task in the <a href="#">Configuring Remote AAA for VPDNs</a> , on page 28.
<b>Step 4</b>	Do one of the following: <ul style="list-style-type: none"> <li>• <b>radius-server directed-request</b> [<b>restricted</b>]</li> <li>• <b>tacacs-server directed-request</b> [<b>restricted</b>] [<b>no-truncate</b>]</li> </ul>	Allows users logging in to a NAS to select a RADIUS server for authentication.  or  Allows users logging in to a NAS to select a TACACS+ server for authentication.

	Command or Action	Purpose
	<p><b>Example:</b></p> <pre>Router(config)# radius-server directed-request</pre> <p><b>Example:</b></p> <pre>Router(config)# tacacs-server directed-request</pre>	
<b>Step 5</b>	<p><b>vpdn authorize directed-request</b></p> <p><b>Example:</b></p> <pre>Router(config)# vpdn authorize directed-request</pre>	Enables VPDN authorization for directed request users.

### What to Do Next

You must perform the process in the [Configuring VPDN Tunnel Authentication](#), on page 47.

## Configuring Directed Request Authorization of VPDN Users on the NAS

Perform this task on the NAS to configure directed request authorization of VPDN users when the NAS performs authentication.

### Before You Begin

You must perform the task in the "Remote AAA for VPDNs" section.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip host** {*name* | *t modem-telephone-number*} [*tcp-port-number*] *address1* [*address2...address8*]
4. Do one of the following:
  - **radius-server directed-request** [*restricted*]
  - **tacacs-server directed-request** [*restricted*] [*no-truncate*]
5. **vpdn authorize directed-request**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode.  <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>ip host</b> {name   t modem-telephone-number} [ <i>tcp-port-number</i> ] address1 [ <i>address2...address8</i> ]  <b>Example:</b> Router(config)# ip host example.com 10.3.3.3	Specifies or modifies the hostname for the network server.  <b>Note</b> The IP address specified with the <b>ip host</b> command must match the IP address you configured with the <b>radius-server host</b> or <b>tacacs-server host</b> command when performing the task in the <a href="#">Configuring Remote AAA for VPDNs</a> , on page 28.
<b>Step 4</b>	Do one of the following: <ul style="list-style-type: none"> <li>• <b>radius-server directed-request</b> [restricted]</li> <li>• <b>tacacs-server directed-request</b> [restricted] [no-truncate]</li> </ul> <b>Example:</b> Router(config)# radius-server directed-request  <b>Example:</b> Router(config)# tacacs-server directed-request	Allows users logging in to a NAS to select a RADIUS server for authentication.  or  Allows users logging in to a NAS to select a TACACS+ server for authentication.
<b>Step 5</b>	<b>vpdn authorize directed-request</b>  <b>Example:</b> Router(config)# vpdn authorize directed-request	Enables VPDN authorization for directed request users.

## What to Do Next

You must perform the process in the [Configuring VPDN Tunnel Authentication](#), on page 47.

## Configuring Domain Name Prefix and Suffix Stripping

A single set of stripping rules can be configured globally. An independent set of stripping rules can be configured for each virtual private network (VPN) routing and forwarding (VRF) instance.

Global stripping rules are applied to all usernames, and per-VRF rules are applied only to usernames associated with the specified VRF. If a per-VRF rule is configured, it will take precedence over the global rule for usernames associated with that VRF.

Perform this task on the NAS to configure a set of global or per-VRF stripping rules.

### Before You Begin

- You must be running Cisco IOS 12.2(13)T or a later release to configure generic suffix stripping using the suffix delimiter @ for usernames forwarded to a remote RADIUS AAA server.
- You must be running Cisco IOS 12.3(4)T or a later release to configure a suffix delimiter or a set of suffix delimiters for usernames forwarded to a remote RADIUS AAA server.
- You must be running Cisco IOS 12.4(4)T or a later release to configure suffix stripping for usernames forwarded to a remote TACACS+ AAA server.
- You must be running Cisco IOS 12.4(4)T or a later release to configure prefix stripping or per-suffix stripping.
- AAA must be enabled on the NAS. Perform the task in the [Configuring AAA on the NAS and the Tunnel Server](#), on page 26.
- You must understand the usage guidelines for the **radius-server domain-stripping** command as described in the VPDN command reference.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Do one of the following:
  - **radius-server domain-stripping** [right-to-left] [prefix-delimiter *character* [*character2...character7*]] [delimiter *character* [*character2...character7*]] [vrf *vrf-name*]
  - **tacacs-server domain-stripping** [right-to-left] [prefix-delimiter *character* [*character2...character7*]] [delimiter *character* [*character2...character7*]] [vrf *vrf-name*]
4. Do one of the following:
  - **radius-server domain-stripping strip-suffix** *suffix* [vrf *vrf-name*]
  - **tacacs-server domain-stripping strip-suffix** *suffix* [vrf *vrf-name*]

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<p><b>enable</b></p> <p><b>Example:</b></p> <pre>Router&gt; enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Router# configure terminal</pre>	<p>Enters global configuration mode.</p>
<b>Step 3</b>	<p>Do one of the following:</p> <ul style="list-style-type: none"> <li>• <b>radius-server domain-stripping</b> <b>[right-to-left]</b> <b>[prefix-delimiter</b> <i>character</i> <b>[</b><i>character2...character7</i><b>]]</b> <b>[delimiter</b> <i>character</i> <b>[</b><i>character2...character7</i><b>]]</b> <b>[vrf</b> <i>vrf-name</i><b>]</b></li> <li>• <b>tacacs-server domain-stripping</b> <b>[right-to-left]</b> <b>[prefix-delimiter</b> <i>character</i> <b>[</b><i>character2...character7</i><b>]]</b> <b>[delimiter</b> <i>character</i> <b>[</b><i>character2...character7</i><b>]]</b> <b>[vrf</b> <i>vrf-name</i><b>]</b></li> </ul> <p><b>Example:</b></p> <pre>Router(config)# radius-server domain-stripping prefix-delimiter %&amp;\ delimiter @/</pre> <p><b>Example:</b></p> <pre>Router(config)# tacacs-server domain-stripping prefix-delimiter %\\$ vrf myvrf</pre>	<p>(Optional) Configures a router to strip suffixes, or both suffixes and prefixes, from the username before forwarding the username to the RADIUS server.</p> <p>or</p> <p>(Optional) Configures a router to strip suffixes, or both suffixes and prefixes, from the username before forwarding the username to the TACACS+ server.</p> <ul style="list-style-type: none"> <li>• <b>right-to-left</b> --Configures the router to parse the username for a delimiter from right to left, rather than in the default direction of left to right. The prefix or suffix will be stripped at the first valid delimiter character detected by the router. Changing the direction that the router parses the username will control the portion of the username that is stripped if multiple valid delimiters are present.</li> </ul> <p><b>Note</b> Only one parse direction can be configured per set of global or per-VRF rules. The router cannot be configured to parse for prefixes in one direction, and parse for suffixes in the other direction.</p> <ul style="list-style-type: none"> <li>• <b>prefix-delimiter</b> <i>character</i> <b>[</b><i>character2...character7</i><b>]</b>--Enables prefix stripping and specifies the character or characters that will be recognized as a prefix delimiter. Valid values for the <i>character</i> argument are @, /, \$, %, \, #, and -. Multiple characters can be entered without intervening spaces. Up to seven characters can be defined as prefix delimiters, which is the maximum number of valid characters. If a \ is entered as the final or only value for the <i>character</i> argument, it must be entered as \.</li> </ul> <p><b>Note</b> Enabling prefix stripping will automatically enable suffix stripping using the default suffix delimiter @, unless a different suffix delimiter is configured using the <b>delimiter</b> <i>character</i> keyword and argument.</p> <ul style="list-style-type: none"> <li>• <b>delimiter</b> <i>character</i> <b>[</b><i>character2...character7</i><b>]</b>--Specifies the character or characters that will be recognized as a suffix delimiter. Valid values for the <i>character</i> argument are @, /, \$, %, \, #, and -. Multiple characters can be entered without intervening spaces. Up to seven characters can be defined as prefix delimiters, which is the maximum number of valid characters. If a \ is entered as the final or only value for the <i>character</i> argument, it must be entered as \.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <b>vrf</b> <i>vrf-name</i> --Restricts the stripping configuration to a VRF instance. The <i>vrf-name</i> argument specifies the name of a configured VRF.</li> </ul>
<b>Step 4</b>	<p>Do one of the following:</p> <ul style="list-style-type: none"> <li>• <b>radius-server domain-stripping strip-suffix</b> <i>suffix</i> [<i>vrf vrf-name</i>]</li> <li>• <b>tacacs-server domain-stripping strip-suffix</b> <i>suffix</i> [<i>vrf vrf-name</i>]</li> </ul> <p><b>Example:</b></p> <pre>Router(config)# radius-server domain-stripping strip-suffix cisco.com</pre> <p><b>Example:</b></p> <pre>Router(config)# tacacs-server domain-stripping strip-suffix cisco.net vrf myvrf</pre>	<p>(Optional) Configures a router to strip a specific suffix from the username before forwarding the username to the RADIUS server.</p> <p>or</p> <p>(Optional) Configures a router to strip a specific suffix from the username before forwarding the username to the TACACS+ server.</p> <ul style="list-style-type: none"> <li>• <b>strip-suffix</b> <i>suffix</i> --Enables per-suffix stripping and specifies the string that must be matched for the suffix to be stripped.</li> </ul> <p><b>Note</b> Both the suffix delimiter and the suffix must match for the suffix to be stripped from the full username. The default suffix delimiter of @ will be used if you do not specify a different suffix delimiter or set of suffix delimiters in <a href="#">Configuring Domain Name Prefix and Suffix Stripping</a>.</p> <ul style="list-style-type: none"> <li>• <b>vrf</b> <i>vrf-name</i> --Restricts the per-suffix stripping configuration to a VRF instance. The <i>vrf-name</i> argument specifies the name of a VRF.</li> </ul> <p><b>Note</b> You can configure a single ruleset to strip multiple specific suffixes by performing this step multiple times.</p>

## What to Do Next

You must perform the process in the [Configuring VPDN Tunnel Authentication](#), on page 47.

## Configuring VPDN Tunnel Authentication

VPDN tunnel authentication enables routers to authenticate the other tunnel endpoint before establishing a VPDN tunnel. VPDN tunnel authentication is required for L2F tunnels; it is optional but highly recommended for L2TP, L2TPv3, and PPTP tunnels.

By default, the router will use the hostname as the tunnel name in VPDN tunnel authentication. If a local name is configured under a VPDN group, the router will use the local name when negotiating authentication for tunnels belonging to that VPDN group.

For NAS-initiated VPDN deployments and dial-out VPDN deployments, tunnel authentication requires that a single shared secret be configured on both the NAS and the tunnel server. The password can be configured using the hostname or local name for L2F tunnels. For L2TP tunnels, the password can be configured using the hostname, the local name, or the L2TP tunnel password.

For client-initiated VPDN tunneling deployments, tunnel authentication requires that a single shared secret be configured on both the client and the tunnel server. The available authentication configuration options depend on the tunneling protocol being used.

For L2TPv3 client-initiated VPDN tunnels, the shared secret can be configured on the local peer router and the tunnel server in either of these ways:

- In an L2TP class configuration. Perform the task [Configuring L2TP Control Channel Authentication Parameters](#).
- Using the hostname of the router as described in the process documented in this section.

For L2TP client-initiated VPDN tunnels, the shared secret can be configured on the tunnel server using the hostname, the local name, or the L2TP tunnel password as described the process documented in this section. The shared secret can be configured on the local peer router in either of these ways:

- In an L2TP class configuration. Perform the task [Configuring L2TP Control Channel Authentication Parameters](#). Using the hostname of the router as described in the process documented in this section.

For PPTP client-initiated VPDN tunnels, authentication parameters can be configured using the hostname or the local name as described in the process documented in this section.

#### Note

If you plan to implement shell-based authentication of VPDN users, it is highly recommended that a separate VPDN group with a distinct local name be created on the tunnel server for users that are authenticated using terminal services, so that only exec VPDN sessions are accepted without authentication.

To configure VPDN tunnel authentication, you must perform one of the following tasks on the NAS and the tunnel server as required. You need not choose the same method to configure the secret on the NAS and the tunnel server. However, the configured password must be the same on both devices.

VPDN tunnel authentication is optional for L2TP tunnels. Perform the following task on the NAS and the tunnel server if you want to disable VPDN tunnel authentication:

## Prerequisites

AAA must be enabled. See the [Configuring AAA on the NAS and the Tunnel Server](#) section.

## Configuring VPDN Tunnel Authentication Using the Hostname

Perform this task on the NAS or tunnel server to configure VPDN tunnel authentication using the hostname.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **hostname** *name*
4. **username** *name* **password** *secret*

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>	Enables privileged EXEC mode.

	Command or Action	Purpose
	<b>Example:</b> <pre>Router&gt; enable</pre>	<ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> <pre>Router# configure terminal</pre>	Enters global configuration mode.
<b>Step 3</b>	<b>hostname <i>name</i></b>  <b>Example:</b> <pre>Router(config)# hostname tunnelserver12</pre>	Specifies or modifies the hostname for the network server.
<b>Step 4</b>	<b>username <i>name</i> password <i>secret</i></b>  <b>Example:</b> <pre>Router(config)# username nas4 password mysecret</pre>	Establishes a username-based authentication system. <ul style="list-style-type: none"> <li>• The specified username must be the name of the remote router.</li> <li>• The secret password must be the same on both routers.</li> </ul>

### What to Do Next

- Once you have configured a secret password on one tunnel endpoint, you must configure the same tunnel secret on the corresponding tunnel endpoint.
- If you are configuring shell-based authentication of VPDN tunnels, you must perform the task in the [Configuring the NAS for Shell-Based Authentication of VPDN Users](#), on page 67.

## Configuring VPDN Tunnel Authentication Using the Local Name

Perform this task on the NAS or tunnel server to configure VPDN tunnel authentication using the local name.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vpdn-group *name***
4. **local name *host-name***
5. **exit**
6. **username *name* password *secret***

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>vpdn-group name</b>  <b>Example:</b> Router(config)# vpdn-group mygroup	Creates a VPDN group and enters VPDN group configuration mode.
<b>Step 4</b>	<b>local name host-name</b>  <b>Example:</b> Router(config-vpdn)# local name tunnelserver2	Specifies a local hostname that the tunnel will use to identify itself.
<b>Step 5</b>	<b>exit</b>  <b>Example:</b> Router(config-vpdn)# exit	Exits VPDN group configuration mode.
<b>Step 6</b>	<b>username name password secret</b>  <b>Example:</b> Router(config)# username nas7 password mysecret	Establishes a username-based authentication system. <ul style="list-style-type: none"> <li>• The specified username must be the name of the remote router.</li> <li>• The secret password must be the same on both routers.</li> </ul>

## What to Do Next

- Once you have configured a secret password on one tunnel endpoint, you must configure the same tunnel secret on the corresponding tunnel endpoint.
- If you are configuring shell-based authentication of VPDN tunnels, you must perform the task in the [Configuring the NAS for Shell-Based Authentication of VPDN Users](#), on page 67.

## Configuring VPDN Tunnel Authentication Using the L2TP Tunnel Password

Perform this task on the NAS or tunnel server to configure VPDN tunnel authentication using the L2TP tunnel password. This task can be used only for VPDN tunnel authentication of L2TP tunnels.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vpdn-group** *name*
4. **l2tp tunnel password** *password*
5. **local name** *host-name*
6. **exit**
7. **username** *name* **password** *secret*

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode.  • Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>vpdn-group</b> <i>name</i>  <b>Example:</b> Router(config)# vpdn-group mygroup	Creates a VPDN group and enters VPDN group configuration mode.
<b>Step 4</b>	<b>l2tp tunnel password</b> <i>password</i>  <b>Example:</b> Router(config- <i>vpdn</i> )# l2tp tunnel password mysecret	Sets the password that the router will use to authenticate the tunnel.
<b>Step 5</b>	<b>local name</b> <i>host-name</i>  <b>Example:</b> Router(config- <i>vpdn</i> )# local name tunnelserver2	(Optional) Specifies a local hostname that the tunnel will use to identify itself.  • You must perform this step if the remote router does not use the L2TP tunnel password.

	Command or Action	Purpose
<b>Step 6</b>	<b>exit</b>  <b>Example:</b> Router(config-vpdn) # exit	(Optional) Exits VPDN group configuration mode. <ul style="list-style-type: none"> <li>You must perform this step only if the remote router does not use the L2TP tunnel password method of VPDN tunnel authentication.</li> </ul>
<b>Step 7</b>	<b>username name password secret</b>  <b>Example:</b> Router(config) # username nas64 password mysecret	(Optional) Establishes a username-based authentication system. <ul style="list-style-type: none"> <li>You need to perform this step only if the remote router does not use the L2TP tunnel password method of VPDN tunnel authentication.</li> <li>The specified username must be the name of the remote router.</li> <li>The password must be the same on both routers.</li> </ul>

### What to Do Next

- Once you have configured a secret password on one tunnel endpoint, you must configure the same tunnel secret on the corresponding tunnel endpoint.
- If you are configuring shell-based authentication of VPDN tunnels, you must perform the task in the [Configuring the NAS for Shell-Based Authentication of VPDN Users](#), on page 67.

## Disabling VPDN Tunnel Authentication for L2TP Tunnels

Perform this task to disable VPDN tunnel authentication for L2TP tunnels. You must perform this task on both the NAS and the tunnel server to disable VPDN tunnel authentication.

### SUMMARY STEPS

- enable
- configure terminal
- vpdn-group *name*
- no l2tp tunnel authentication

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	enable	Enables privileged EXEC mode.

	Command or Action	Purpose
	<b>Example:</b> Router> enable	<ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>vpdn-group name</b>  <b>Example:</b> Router(config)# vpdn-group mygroup	Creates a VPDN group and enters VPDN group configuration mode.
<b>Step 4</b>	<b>no l2tp tunnel authentication</b>  <b>Example:</b> Router(config-vpdn)# no l2tp tunnel authentication	Disables L2TP tunnel authentication.

### What to Do Next

- If you are configuring shell-based authentication of VPDN tunnels, you must perform the task in the [Configuring the NAS for Shell-Based Authentication of VPDN Users](#), on page 67.

## Configuring RADIUS Tunnel Accounting for L2TP VPDNs

The new RADIUS tunnel accounting types are used with the RADIUS accounting attribute Acct-Status-Type (attribute 40), which indicates whether an accounting request marks the beginning of user service (start) or the end (stop).

Perform this task to configure a NAS or tunnel server to send tunnel and tunnel-link accounting records to the remote RADIUS server.

### Before You Begin

- You must perform the tasks in the [Configuring AAA on the NAS and the Tunnel Server](#), on page 26.
- You must configure the router to use a remote RADIUS AAA server as described in the [Configuring Remote AAA for VPDNs](#), on page 28.
- You must perform the tasks in the "Configuring VPDN Tunnel Authentication" section.

**Note**

RADIUS tunnel accounting is supported only for VPDNs using the L2TP protocol.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **aaa accounting network default** *list-name* {**start-stop** | **stop-only** | **wait-start** | **none** **group** *groupname*
4. **vpdn tunnel accounting network** *list-name*
5. **vpdn session accounting network** *list-name*

**DETAILED STEPS**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>aaa accounting network default</b> <i>list-name</i> { <b>start-stop</b>   <b>stop-only</b>   <b>wait-start</b>   <b>none</b> <b>group</b> <i>groupname</i>  <b>Example:</b> Router(config)# aaa accounting network list1 start-stop group radius	Enables network accounting. <ul style="list-style-type: none"> <li>• <b>default</b> --If the default network accounting method-list is configured and no additional accounting configurations are enabled on the interface, network accounting is enabled by default. If either the <b>vpdn session accounting network</b> command or the <b>vpdn tunnel accounting network</b> command is linked to the <b>default</b> method-list, all tunnel and tunnel-link accounting records are enabled for those sessions.</li> <li>• <b>list-name</b> --The <i>list-name</i> defined in the <b>aaa accounting</b> command must be the same as the <i>list-name</i> defined in the VPDN command; otherwise, accounting will not occur.</li> </ul>
<b>Step 4</b>	<b>vpdn tunnel accounting network</b> <i>list-name</i>  <b>Example:</b> Router(config)# vpdn tunnel accounting network list1	Enables Tunnel-Start, Tunnel-Stop, and Tunnel-Reject accounting records. <ul style="list-style-type: none"> <li>• <b>list-name</b> --The <i>list-name</i> must match the <i>list-name</i> defined in the <b>aaa accounting</b> command; otherwise, network accounting will not occur.</li> </ul>

	Command or Action	Purpose
<b>Step 5</b>	<b>vpdn session accounting network</b> <i>list-name</i>  <b>Example:</b> <pre>Router(config)# vpdn session accounting network list1</pre>	Enables Tunnel-Link-Start, Tunnel-Link-Stop, and Tunnel-Link-Reject accounting records. <ul style="list-style-type: none"> <li>• <i>list-name</i> --The <i>list-name</i> must match the <i>list-name</i> defined in the <b>aaa accounting</b> command; otherwise, network accounting will not occur.</li> </ul>

## Configuring Suppression of EXEC Records

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa accounting nested suppress stop**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> <pre>Router&gt; enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> <pre>Router# configure terminal</pre>	Enters global configuration mode.
<b>Step 3</b>	<b>aaa accounting nested suppress stop</b>  <b>Example:</b> <pre>Router(config)# aaa accounting nested suppress stop</pre>	Stops the generation of EXEC-stop accounting records.

## Configuring Authentication of L2TP Tunnels at the Tunnel Terminator Remote RADIUS AAA Server

For L2TP tunnels, you can configure the device that terminates the VPN tunnel to perform remote RADIUS AAA. A remote RADIUS AAA server can be used to perform VPN tunnel authentication on the tunnel terminator as follows:

- Using a remote RADIUS AAA server on the tunnel server for dial-in VPNs
- Using a remote RADIUS AAA server on the NAS for dial-out VPNs

Perform this task on the remote RADIUS AAA server to configure the RADIUS server to authenticate VPN tunnels at the device that terminates the tunnel.

### Before You Begin

- The RADIUS server must be configured for AAA. For more information on configuring remote RADIUS AAA servers, see the "Additional References" section.
- The service type in the RADIUS user profile for the tunnel initiator should always be set to "Outbound."

#### Note

This task applies only when the device that terminates the VPN tunnel is performing remote RADIUS AAA. To configure the tunnel terminator to perform remote RADIUS AAA, perform the task in the "Configuring the Tunnel Terminator for Remote RADIUS AAA for L2TP Tunnels" section.

### SUMMARY STEPS

1. `service type = Outbound`
2. `tunnel-type = protocol`
3. `Cisco:Cisco-Avpair = vpdn:dout-dialer = NAS-dialer-number`
4. `Cisco:Cisco-Avpair = vpdn:vpdn-vtemplate = vtemplate-number`

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>service type = Outbound</code>  <b>Example:</b> <code>service type = Outbound</code>	Specifies the service type.
Step 2	<code>tunnel-type = protocol</code>  <b>Example:</b> <code>tunnel-type = l2tp</code>	Specifies the tunneling protocol.  <b>Note</b> L2TP is the only valid protocol for this task.

	Command or Action	Purpose
<b>Step 3</b>	<p><b>Cisco: Cisco-Avpair = vpdn:dout-dialer =</b> <i>NAS-dialer-number</i></p> <p><b>Example:</b></p> <pre>Cisco: Cisco-Avpair = vpdn:dout-dialer = 2</pre>	<p>Specifies which dialer to use on the NAS for dial-out configuration.</p> <p><b>Note</b> Perform this step only for dial-out configurations.</p>
<b>Step 4</b>	<p><b>Cisco: Cisco-Avpair = vpdn:vpdn-vtemplate =</b> <i>vtemplate-number</i></p> <p><b>Example:</b></p> <pre>Cisco: Cisco-Avpair = vpdn:vpdn-vtemplate = 1</pre>	<p>Specifies the virtual template number to use on the tunnel server for dial-in configuration.</p> <p><b>Note</b> Perform this step only for dial-in configurations.</p> <p><b>Note</b> This configuration is optional if the <b>vpdn tunnel authorization virtual-template</b> command is used in the task in the <a href="#">Configuring the Tunnel Terminator for Remote RADIUS AAA for L2TP Tunnels</a>, on page 31.</p>

## Configuring DNS Name Support on the NAS Remote RADIUS AAA Server

NAS remote AAA servers can resolve DNS names and translate them into IP addresses. The server will first look up the name in its name cache. If the name is not in the name cache, the server will resolve the name by using a DNS server.

Perform this task on the NAS remote RADIUS AAA server.

### Before You Begin

The RADIUS server must be configured for AAA.

### SUMMARY STEPS

1. **l2tp-tunnel-password** = *password*
2. **tunnel-type** = *protocol*
3. **ip-addresses** = *DNS-name*

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<p><b>l2tp-tunnel-password</b> = <i>password</i></p> <p><b>Example:</b></p> <pre>l2tp-tunnel-password = cisco123</pre>	Specifies the password for the VPDN tunnel.

	Command or Action	Purpose
<b>Step 2</b>	<p><code>tunnel-type = <i>protocol</i></code></p> <p><b>Example:</b></p> <pre>tunnel-type = l2tp</pre>	Specifies the tunneling protocol.
<b>Step 3</b>	<p><code>ip-addresses = <i>DNS-name</i></code></p> <p><b>Example:</b></p> <pre>ip-addresses = cisco</pre>	Instructs the RADIUS server to resolve the DNS name and tunnel calls to the appropriate IP address.

## Configuring L2TP Tunnel Server Load Balancing and Failover on the NAS Remote RADIUS AAA Server

Perform one of the tasks on the NAS remote RADIUS AAA server to configure tunnel server load balancing and failover. For release prior to Cisco IOS Release 12.2(4)T, perform the Cisco proprietary VSA task. For Cisco IOS Release 12.2(4)T and later releases, perform the RADIUS tunnel preference attribute task:

### Configuring L2TP Tunnel Server Load Balancing and Failover Using the Cisco Proprietary VSA

Until Cisco IOS Release 12.2(4)T, load balancing and failover functionality for L2TP tunnel servers was provided by the Cisco proprietary Vendor Specific Attribute (VSA). A specially formatted string would be transported within a Cisco VSA “vpdn:ip-addresses” string from the RADIUS server to a NAS for the purpose of tunnel server load balancing and failover. For example, 10.0.0.1 10.0.0.2 10.0.0.3/10.0.0.4 10.0.0.5 would be interpreted as IP addresses 10.0.0.1, 10.0.0.2, and 10.0.0.3 for the first group for load balancing. New sessions are projected to these three addresses based on the least-load-first algorithm. This algorithm uses its local knowledge to select a tunnel server that has the least load to initiate the new session. In this example, the addresses 10.0.0.4 and 10.0.0.5 in the second group have a lower priority and are applicable only when all tunnel servers specified in the first group fail to respond to the new connection request, thereby making 10.0.0.4 and 10.0.0.5 the failover addresses.

Perform this task on the NAS remote RADIUS server to assign tunnel server priorities for load balancing and failover.

#### Prerequisites

Perform this task on the NAS remote RADIUS server to assign tunnel server priorities for load balancing and failover.

#### Before You Begin

- The RADIUS server must be configured for AAA.

**SUMMARY STEPS**

1. `ip-addresses = {ip-address | dns-name} {,|/} {ip-address | dns-name} {,|/} [ip-address | dns-name]...`

**DETAILED STEPS**

	Command or Action	Purpose
<b>Step 1</b>	<p><code>ip-addresses = {ip-address   dns-name} {, /} {ip-address   dns-name} {, /} [ip-address   dns-name]...</code></p> <p><b>Example:</b></p> <pre>ip-addresses = 172.16.171.11, 172.16.171.12, 172.16.171.13/mydomain</pre>	<p>Configures the IP addresses of the tunnel servers that the load will be balanced over.</p> <ul style="list-style-type: none"> <li>• Separating the IP addresses with a spaces or a comma specifies that the load will be equally balanced over the tunnel servers.</li> <li>• Using a slash to separate IP addresses specifies that the IP addresses after the slash will be contacted only if the other specified tunnel servers are unavailable.</li> <li>• A DNS name can be used in place of an IP address.</li> </ul>

**Configuring L2TP Tunnel Server Load Balancing and Failover Using the RADIUS Tunnel Preference Attribute**

Perform this task on the NAS remote RADIUS server to assign a priority value to each tunnel server for load balancing and failover.

**Before You Begin**

- The NAS must be running Cisco IOS Release 12.2(4)T or a later release.
- On Cisco access server platforms, you must be running Cisco IOS Release 12.2(11)T or a later release.
- The RADIUS server must be configured for AAA.

**Note**

- Dial-out VPDN deployments are not supported.
- The maximum number of tunnel servers allowed in the network is 1550, which is 50 per tagged attribute group with a limit of 31 tags.
- This feature requires a RADIUS server implementation that supports RFC 2868.

**SUMMARY STEPS**

1. `Tunnel-Server-Endpoint = : tag : " ip-address "`,
2. `Tunnel-Preference = : priority : tag ,`

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>Tunnel-Server-Endpoint = : tag : " ip-address "</b> ,  <b>Example:</b> Tunnel-Server-Endpoint = :0:"10.1.1.1",	Specifies the IP address of a tunnel server.
Step 2	<b>Tunnel-Preference = : priority : tag ,</b>  <b>Example:</b> Tunnel-Preference = :0:1,	Specifies the priority of the tunnel server for load balancing and failover. <ul style="list-style-type: none"> <li>• A lower value for the <i>priority</i> argument gives a higher priority to the tunnel server.</li> </ul>

## Configuring Tunnel Assignments on the NAS Remote RADIUS AAA Server

Tunnel assignments allow the grouping of users from different per-user or domain RADIUS profiles into the same active tunnel. This functionality prevents the establishment of duplicate tunnels when the tunnel type, tunnel endpoints, and tunnel assignment ID are identical.

Perform this task on the NAS remote RADIUS AAA server for each user and domain that you want to group into the same tunnel.

### Before You Begin

The RADIUS server must be configured for AAA.

### SUMMARY STEPS

1. Do one of the following:
  - `user @ domain.com Password = " secret " Service-Type = Outbound`
  - `user.domain.com Password = " secret " Service-Type = Outbound`
2. `tunnel-type = protocol`
3. `tunnel-server-endpoint = ip-address`
4. `tunnel-assignment-id = name`

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	Do one of the following: <ul style="list-style-type: none"> <li>• <code>user @ domain.com Password = " secret " Service-Type = Outbound</code></li> <li>• <code>user.domain.com Password = " secret " Service-Type = Outbound</code></li> </ul> <p><b>Example:</b></p> <pre>user@cisco.com Password = "cisco" Service-Type = Outbound</pre> <p><b>Example:</b></p> <pre>user.cisco.com Password = "cisco" Service-Type = Outbound</pre>	Specifies the user or domain, the tunnel password, and the service type.
<b>Step 2</b>	<p><code>tunnel-type = protocol</code></p> <p><b>Example:</b></p> <pre>tunnel-type = l2tp</pre>	Specifies the tunneling protocol used. <ul style="list-style-type: none"> <li>• The tunnel type must be identical for users to be grouped into the same tunnel.</li> </ul>
<b>Step 3</b>	<p><code>tunnel-server-endpoint = ip-address</code></p> <p><b>Example:</b></p> <pre>tunnel-server-endpoint = 10.1.1.1</pre>	Specifies the IP address of the tunnel server that calls from the specified user or domain are tunneled to. <ul style="list-style-type: none"> <li>• The tunnel server endpoint must be identical for users to be grouped into the same tunnel.</li> </ul>
<b>Step 4</b>	<p><code>tunnel-assignment-id = name</code></p> <p><b>Example:</b></p> <pre>tunnel-assignment-id = group1</pre>	Specifies the tunnel ID that calls from the specified user or domain are assigned. <ul style="list-style-type: none"> <li>• The tunnel assignment ID must be identical for users to be grouped into the same tunnel.</li> </ul>

## Configuring L2TP Tunnel Connection Speed Labeling on the Remote ARS RADIUS AAA Server and the Tunnel Server

Tunnel connection speed labeling allows L2TP sessions to be accepted or denied based on the allowed connection speed that is configured on the Cisco Access Registrar (ARS) RADIUS server for that user. The administrator can configure an ARS RADIUS server to authorize users based on their Service Level Agreement (SLA). Tunnel connection speed information is forwarded to the ARS RADIUS server by default.

Perform these tasks to configure tunnel connection speed labeling:

## Restrictions

- This feature can be used only with the ARS RADIUS server.
- This feature can be used only with the L2TP tunneling protocol.

## Configuring User Profiles on the ARS RADIUS Server for L2TP Tunnel Connection Speed Labeling

By default, the L2TP tunnel server will forward connection speed information to the AR RADIUS server for authentication. For the AR RADIUS server to perform authentication based on tunnel connection speed information, the user profiles on the ARS RADIUS server must be configured with the allowed connection speed.

Perform this task on the ARS RADIUS server to configure connection speed information in user profiles.

### Before You Begin

- The ARS RADIUS server must be configured for AAA. For more information on configuring remote RADIUS AAA servers, see the "Additional References."

### SUMMARY STEPS

1. `user @ example . com`
2. `userdefined 1 = [TX: speed [- maxspeed]] [:] [RX: speed[- maxspeed]]`

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<code>user @ example . com</code>  <b>Example:</b> <code>user@example.com</code>	Specifies the user that the profile is for.
<b>Step 2</b>	<code>userdefined 1 = [TX: speed [- maxspeed]] [:] [RX: speed[- maxspeed]]</code>  <b>Example:</b> <code>userdefined1 = TX:102400000:RX:96000000-200000000</code>	Specifies the allowable transmission and receiving connection speeds. <ul style="list-style-type: none"> <li>• A range of connection speeds can be specified.</li> <li>• If no connection speed is specified, any speed will be allowed.</li> </ul>

## What to Do Next

- If the inclusion of RADIUS attribute 77 in authentication requests has previously been disabled on the tunnel server, you must perform the task in the [Configuring L2TP Tunnel Connection Speed Labeling on the Tunnel Server](#), on page 64.

## Disabling L2TP Tunnel Connection Speed Labeling on the Tunnel Server

By default, the L2TP tunnel server will forward connection speed information to the RADIUS server for authentication. To disable authentication based on connection speeds, you must choose to not include RADIUS attribute 77 in the access request.

Perform this task on the tunnel server to disable authentication based on connection speeds.

### Before You Begin

- You must first perform the tasks in the [Configuring AAA on the NAS and the Tunnel Server](#), on page 26 and the [Configuring VPDN Tunnel Authentication](#), on page 47.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **no radius-server attribute 77 include-in-access-req**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>no radius-server attribute 77 include-in-access-req</b>  <b>Example:</b> Router(config)# no radius-server attribute 77 include-in-access-req	Disables the sending of connection speed information to the RADIUS server in the access request.

## Configuring L2TP Tunnel Connection Speed Labeling on the Tunnel Server

Perform this task on the L2TP tunnel server to enable authentication based on connection speeds if it has been previously disabled.

### Before You Begin

- You must first perform the tasks in the Configuring AAA on the NAS and the Tunnel Server section and the Configuring VPDN Tunnel Authentication section.

### SUMMARY STEPS

- enable
- configure terminal
- radius-server attribute 77 include-in-access-req

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<p><b>enable</b></p> <p><b>Example:</b></p> <pre>Router&gt; enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Router# configure terminal</pre>	<p>Enters global configuration mode.</p>
Step 3	<p><b>radius-server attribute 77 include-in-access-req</b></p> <p><b>Example:</b></p> <pre>Router(config)# radius-server attribute 77 include-in-access-req</pre>	<p>Sends connection speed information to the RADIUS server in the access request.</p> <p><b>Note</b> The <b>radius-server attribute 77 include-in-access-req</b> command is enabled by default. You need to perform this task only if you have previously disabled the <b>radius-server attribute 77 include-in-access-req</b> command.</p> <p><b>Note</b> When the <b>radius-server attribute 77 include-in-access-req</b> command is enabled, it is not visible in NVGEN. This is because the <b>radius-server attribute 77 include-in-access-req</b> command is enabled by default.</p>

## Configuring L2TP Tunnel Connection Speed Labeling for a Tunnel Switch

Perform this task on the tunnel switch to enable L2TP tunnel connection speed labeling for a tunnel switch node. This configuration allows the access request to be sent to the RADIUS server before the tunnel switch forwards the session to the next hop.

### Before You Begin

- You must first perform the tasks in the [Configuring AAA on the NAS and the Tunnel Server](#), on page 26 and the [Configuring VPDN Tunnel Authentication](#), on page 47.

### SUMMARY STEPS

- enable
- configure terminal
- vpdn authen-before-forward

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<p><b>enable</b></p> <p><b>Example:</b></p> <pre>Router&gt; enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Router# configure terminal</pre>	<p>Enters global configuration mode.</p>
Step 3	<p><b>vpdn authen-before-forward</b></p> <p><b>Example:</b></p> <pre>Router(config)# vpdn authen-before-forward</pre>	<p>Requests authentication and authorization of an L2TP tunnel before it is forwarded to the tunnel server.</p>

## Configuring Secure Tunnel Authentication Names on the NAS Remote RADIUS AAA Server

The NAS AAA server can be configured with authentication names other than the default names for the NAS and the NAS AAA server, providing a higher level of security during VPDN tunnel establishment.

RADIUS tunnel authentication name attributes allows you to specify a name other than the default name for the tunnel initiator and for the tunnel terminator. These authentication names are specified using RADIUS tunnel attributes 90 and 91.

Perform this task on the remote RADIUS AAA server. This task applies to NAS-initiated tunnels using either L2TP or L2F.

### Before You Begin

- The RADIUS server must be configured for AAA.
- The NAS must be able to recognize RADIUS attributes 90 and 91.
- The RADIUS server must support tagged attributes to use RADIUS tunnel attributes 90 and 91. Tagged attributes are defined in RFC 2868, *RADIUS Tunnel Authentication Attributes*.

### SUMMARY STEPS

1. Do one of the following:
  - `user @ example.com Password = " secret " Service-Type = Outbound`
  - `user.example.com Password = " secret " Service-Type = Outbound`
2. `tunnel-client-auth-id = {:1 | :2}: " NAS-name "`
3. `tunnel-server-auth-id = {:1 | :2}: " tunnel-server-name "`

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>Do one of the following:</p> <ul style="list-style-type: none"> <li>• <code>user @ example.com Password = " secret " Service-Type = Outbound</code></li> <li>• <code>user.example.com Password = " secret " Service-Type = Outbound</code></li> </ul> <p><b>Example:</b></p> <pre>user@cisco.com Password = "cisco" Service-Type = Outbound</pre> <p><b>Example:</b></p> <pre>user.cisco.com Password = "cisco" Service-Type = Outbound</pre>	Specifies the user or domain, the tunnel password, and the service type.

	Command or Action	Purpose
Step 2	<p><b>tunnel-client-auth-id = { :1   :2 } : " NAS-name "</b></p> <p><b>Example:</b></p> <pre>tunnel-client-auth-id = :2:NAS36</pre>	<p>Specifies the name used by the NAS when it authenticates tunnel setup with the tunnel server.</p> <ul style="list-style-type: none"> <li>• <b>:1</b> --Specifies L2F tunnels.</li> <li>• <b>:2</b> --Specifies L2TP tunnels.</li> </ul>
Step 3	<p><b>tunnel-server-auth-id = { :1   :2 } : " tunnel-server-name "</b></p> <p><b>Example:</b></p> <pre>tunnel-server-auth-id = :2:TS14</pre>	<p>Specifies the name used by the tunnel server when it authenticates tunnel setup with the NAS.</p> <ul style="list-style-type: none"> <li>• <b>:1</b> --Specifies L2F tunnels.</li> <li>• <b>:2</b> --Specifies L2TP tunnels.</li> </ul>

## Configuring the NAS for Shell-Based Authentication of VPDN Users

Shell-based authentication of VPDN users provides terminal services (shell login or exec login) for VPDN users. With shell-based authentication enabled, when clients dial in to the NAS, authentication occurs in character mode. Once authentication is complete, PPP starts and a tunnel is established based on either DNIS or domain.

Perform this task to configure the NAS for shell-based authentication of VPDN users.

### Before You Begin

- The dialup line interface can be configured with the **autoselect during-login** command to allow smooth login terminal services.
- The dialup line interface can be configured with the **autocommand ppp** command. This denies the PPP user access to the exec shell, but allows entry to tunneled PPP.
- RPMS can be configured.
- Multilink PPP (MLP) can be configured.
- You must perform the task in the Configuring AAA on the NAS and the Tunnel Server section.
- You must perform the task in the Configuring the NAS for Remote AAA for Dial-In VPDNs section.
- You must perform the task in the Configuring VPDN Tunnel Authentication section. It is highly recommended that a separate VPDN group with a distinct local name be created on the tunnel server for users that are authenticated using terminal services, so that only the exec VPDN sessions are accepted without authentication.
- The remote RADIUS server must be configured for AAA. For detailed information about configuring remote RADIUS servers, see the Additional References section.
- For increased security, it is recommended that you provide additional protection of the L2TP tunnel using L2TP security. For information on configuring L2TP security, see the Configuring Additional VPDN Features module

- To use the **aaa dnis map authentication group** *aaa-server-group* configuration command, you must first enable AAA, define a AAA server group, and enable DNIS mapping.

**Note**

- Per-user virtual profiles on the tunnel server are not supported.
- Callback is not supported.
- Only those login schemes supported by the NAS exec login features are supported.
- If VPDN fails to be established (for example, Resource Pool Manager Server (RPMS) denies the session), the dialup call is terminated. An exec PPP session is not terminated locally on the NAS if the desired VPDN session fails to be established because the user was presumed authenticated by an AAA server at the remote enterprise.
- Although an exec VPDN tunnel server accepts a tunneled PPP session without authenticating the PPP clients, the tunnel itself must be mutually authenticated by both the NAS and the tunnel server. To further reduce security risks, create a separate VPDN group with a distinct local name on the tunnel server so that only the exec VPDN sessions are accepted without authentication.
- If a DNIS is mapped to a AAA server, the DNIS should also be mapped to a corresponding tunnel server in the VPDN configuration.
- The AAA server and the tunnel server, both of which can be mapped to by either a DNIS or domain name, must belong to the same enterprise and must be accessible to the NAS.
- When configuring AAA authentication at login, do not use “local” as a value for the *method-name* argument of the **aaa authentication login** command. Specifying “local” as a *method-name* would allow an end user to tunnel to a remote tunnel server after local authentication.
- The AAA server group mapped to by the DNIS is intended to authenticate users that are to be connected to the tunnel server network, and thus must not be used for authenticating local users.
- The **ppp dnis** command must not be used on the exec VPDN dialup interface.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **aaa dnis map enable**
4. **aaa dnis map** *dnis-number* **authentication login group** *server-group-name*

**DETAILED STEPS**

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>

	Command or Action	Purpose
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>aaa dnis map enable</b>  <b>Example:</b> Router(config)# aaa dnis map enable	Enables DNIS mapping for locating a AAA server.
<b>Step 4</b>	<b>aaa dnis map <i>dnis-number</i> authentication login group <i>server-group-name</i></b>  <b>Example:</b> Router(config)# aaa dnis map 7777 authentication login group EXEC-VPDN-login-servers	Maps a DNIS number to a particular authentication server group (this server group is used for AAA authentication).

## Configuring L2TP Forwarding of PPPoE Tagging Information

### Configuring L2TP Forwarding of the PPPoE Tagging Information

On the LAC, perform these steps to configure L2TP Forwarding of PPPoE Tagging Information to populate the circuit-id tag in the nas-port-id attribute and the remote-id tag in the calling-station-id attribute on the LNS.

#### SUMMARY STEPS

1. enable
2. configure terminal
3. vpdn-group *name*
4. dsl-line-info-forwarding
5. exit

#### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>	Enables privileged EXEC mode.

	Command or Action	Purpose
	<b>Example:</b> Router> enable	<ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>vpdn-group name</b>  <b>Example:</b> Router(config)# vpdn-group pppoe-group	Creates a VPDN group and enters VPDN group configuration mode.
<b>Step 4</b>	<b>dsl-line-info-forwarding</b>  <b>Example:</b> Router(config-vpdn)# dsl-line-info-forwarding	Enables the processing of the received PPPoE Vendor-Specific tag in the PADR packet, and sends a matching VSA to the AAA server in RADIUS access and accounting requests.
<b>Step 5</b>	<b>exit</b>  <b>Example:</b> Router(config-vpdn)# exit	Exits VPDN group configuration mode.

## Overriding L2TP Forwarding of PPPoE Tag Information

You can configure the L2TP Forwarding of PPPoE Tagging Information feature to override the following VSA:

### Overriding nas-port VSA with circuit-id

To override the population of the circuit-id tag in the nas-port-id attribute on the LNS, perform these steps on the LNS.

### SUMMARY STEPS

- enable
- configure terminal
- radius-server attribute 87 circuit-id
- exit

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>radius-server attribute 87 circuit-id</b>  <b>Example:</b> Router(config)# radius-server attribute 87 circuit-id	Overrides the NAS-Port-Id attribute with the Circuit-ID attribute in RADIUS access and accounting requests.
<b>Step 4</b>	<b>exit</b>  <b>Example:</b> Router(config)# exit	Exits the current mode.

**Overriding calling-station-id VSA with remote-id**

To override the calling-station-id VSA with the remote-id on the LNS, perform these steps:

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **radius-server attribute 31 remote-id**
4. **exit**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>

	Command or Action	Purpose
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Router # configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>radius-server attribute 31 remote-id</b>  <b>Example:</b> Router(config)# radius-server attribute 31 remote-id	Overrides the calling-station-id attribute with Remote-ID attribute in RADIUS access and accounting requests.
<b>Step 4</b>	<b>exit</b>  <b>Example:</b> Router(config)# exit	Exits the current mode.

## Removing L2TP Forwarding of PPPoE Tag Information

Outgoing PADO and PADS packets will have the DSLAM-inserted Vendor-Specific Line-Id tag, and DSLAM must strip the Circuit-Id tag from the packets. If the DSLAM cannot strip the tag, the BRAS must remove it before sending out the packets. This task is accomplished through configuration of the **vendor-tag remote-id strip** command under BBA group configuration mode.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **bba-group pppoe *group-name***
4. **vendor-tag remote-id strip**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>

	Command or Action	Purpose
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>bba-group pppoe group-name</b>  <b>Example:</b> Router(config)# bba-group pppoe pppoe-group	Defines a PPPoE profile and enters BBA group configuration mode.
Step 4	<b>vendor-tag remote-id strip</b>  <b>Example:</b> Router(config-bba-group)# vendor-tag remote-id strip	Enables the BRAS to strip off incoming Vendor-Specific Remote-Id tags from outgoing PADO and PADS packets.

## Displaying the Session Activity Log

When the **radius-server attribute nas-port format d** global configuration command is added to the PPPoE Circuit-Id Tag Processing feature configuration on the BRAS (see the [Examples Configuring the VPDN Tunnel Authorization Search Order, on page 80](#) for an example), the report from the **debug radius** privileged EXEC command will include information about the incoming access interface, where discovery frames are received, and about the session being established in PPPoE extended NAS-Port format (format d).

### SUMMARY STEPS

1. Enable the **debug radius** command to display a report of session activity. In the example shown in this section:

### DETAILED STEPS

Enable the **debug radius** command to display a report of session activity. In the example shown in this section:

- The `acct_session_id` is 79 or 4F in hexadecimal format.
- In the message *Acct-session-id pre-pended with Nas Port = 0/0/0/200*, the interface on which the PPPoE discovery frames arrived is FastEthernet0/0.200. The 0/0/0 is Cisco format for slot/subslot/port.
- The Acct-Session-Id vendor-specific attribute 44 contains the string *0/0/0/200\_0000004F*, which is a combination of the ingress interface and the session identifier.

**Note** Strings of interest in the **debug radius** output log are presented in bold text for purpose of example only.

**Example:**

```

Router# debug radius
02:10:49: RADIUS(0000003F): Config NAS IP: 0.0.0.0
02:10:49: RADIUS/ENCODE(0000003F): acct_session_id: 79
02:10:49: RADIUS(0000003F): sending

```

## Configuring LNS Address Checking

To allow a LAC to check the IP address of the LNS sending traffic to it during the setup of an L2TP tunnel, thus providing a check for uplink and downlink traffic arriving from different interfaces, follow this procedure.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vpdn enable**
4. **vpdn-group *name***
5. **l2tp security ip address-check**
6. **exit**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode.  • Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>vpdn enable</b>  <b>Example:</b> Router(config)# vpdn enable	Enables virtual private dialup networking on the router and informs the router to look for tunnel definitions in a local database or on a remote authorization server (home gateway), if one is present.
<b>Step 4</b>	<b>vpdn-group <i>name</i></b>  <b>Example:</b> Router(config)# vpdn-group example	Creates a VPDN group and enters VPDN group configuration mode.
<b>Step 5</b>	<b>l2tp security ip address-check</b>  <b>Example:</b> Router(config-vpdn)# l2tp security ip address-check	Configures the LNS to compare the IP addresses contained in the inbound and outbound message to ensure they are identical. If the IP addresses do not match, the L2TP tunnel is not established.
<b>Step 6</b>	<b>exit</b>  <b>Example:</b> Router(config-vpdn)# exit	Exits VPDN group configuration mode.

## Configuring Modified LNS Dead-Cache Handling

### Identifying an LNS in a Dead-Cache State

With the Modified LNS Dead-Cache Handling feature, you can use the **show vpdn dead-cache** command to display the status of an LNS in an LSG on a LAC and determine if an LNS is not responding (dead-cache state). The **show vpdn dead-cache** command displays the IP address of the nonresponding LNS, and a time entry showing how long the LNS has been down.

This procedure shows how to use the **show vpdn dead-cache** command to display the status of an LNS to determine if it is in a dead-cache state. An LNS in a dead-cache state cannot establish new sessions or calls.

#### SUMMARY STEPS

1. **enable**
2. **show vpdn dead-cache {group name | all}**
3. **exit**

#### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>show vpdn dead-cache {group name   all}</b>  <b>Example:</b> Router# show vpdn dead-cache all	Displays the status of any LNS in a dead-cache state, including how long the entry has been in the dead-cache state.
Step 3	<b>exit</b>  <b>Example:</b> Router# exit	Exits privileged EXEC mode.

### Clearing an LNS in a Dead-Cache State

With the Modified LNS Dead-Cache Handling feature, you can use the **clear vpdn dead-cache** command to clear an LNS entry in the dead-cache based on the IP address of the LNS, clear all LNS dead-cache states in a VPDN group, or clear all dead-cache LNS entries. If you clear an LNS based on its IP address, and the LNS is associated with more than one VPDN group, the LNS is cleared in all the associated VPDN groups.

This procedure shows how to clear an LNS in a dead-cache state. Once an entry clears from the dead-cache state, the entry is available for new session establishments and calls.

### Before You Begin

Perform this procedure on the LAC.

### SUMMARY STEPS

1. enable
2. clear vpdn dead-cache {group name | ip-address ip-address | all}
3. exit

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<p><b>enable</b></p> <p><b>Example:</b></p> <pre>Router&gt; enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<p><b>clear vpdn dead-cache {group name   ip-address ip-address   all}</b></p> <p><b>Example:</b></p> <pre>Router# clear vpdn dead-cache ip-address 10.10.10.1</pre>	<p>Clears the designated LNS from the dead-cache state.</p>
<b>Step 3</b>	<p><b>exit</b></p> <p><b>Example:</b></p> <pre>Router# exit</pre>	<p>Exits privileged EXEC mode.</p>

## Generating an SNMP Event for a Dead-Cache Entry

If you are a manager responsible for a large number of devices, and each device has a large number of objects, it is impractical for you to poll or request information from every object on every device. SNMP trap-directed notification alerts you without solicitation, by sending a message known as a trap of the event. After you receive the event, you can display it and can choose to take an appropriate action based on the event.

To generate an SNMP event when an LNS exits or enters the dead-cache state, follow this procedure.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **snmp-server enable traps vpdn dead-cache**
4. **exit**

**DETAILED STEPS**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>snmp-server enable traps vpdn dead-cache</b>  <b>Example:</b> Router(config)# snmp-server enable traps vpdn dead-cache	Enables the generation of an SNMP event whenever an LNS enters or exits the dead-cache state.
<b>Step 4</b>	<b>exit</b>  <b>Example:</b> Router(config)# exit	Exits global configuration mode.

**Generating a Syslog Event for a Dead-Cache Entry**

To view a syslog event when an LNS is added, deleted, or cleared from a dead-cache state, configure the **vpdn logging dead-cache** command. You can use syslog events to help troubleshoot networks.

The table below summarizes the syslog messages generated by using the **vpdn logging dead-cache** command.

**Table 3: VPDN Logging Dead-Cache Events**

<b>Syslog Message</b>	<b>Description</b>
MM:DD:hh:mm:ss %VPDN-6-VPDN_DEADCACHE_EVENT: LSG dead cache entry <ip-address> added	Added--An entry in the LSG table enters DOWN status, which marks it a dead-cache entry.

Syslog Message	Description
MM:DD:hh:mm:ss %VPDN-6-VPDN_DEADCACHE_EVENT: LSG dead cache entry <ip-address> deleted	Deleted--An entry in the LSG table is removed from DOWN status, which deletes its dead-cache entry from the table.
MM:DD:hh:mm:ss %VPDN-6-VPDN_DEADCACHE_EVENT: LSG dead cache entry <ip-address> cleared	Cleared--An entry in the LSG table is manually cleared.

To generate a syslog event when an LNS enters or exits the dead-cache state, follow this procedure.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vpdn logging dead-cache**
4. **exit**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode.  • Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>vpdn logging dead-cache</b>  <b>Example:</b> Router(config)# vpdn logging dead-cache	Enables the generation of a syslog event when an LNS enters or exits the dead-cache state.
<b>Step 4</b>	<b>exit</b>  <b>Example:</b> Router(config)# exit	Exits global configuration mode.

# Configuration Examples for AAA for VPDNs

## Examples Configuring the VPDN Tunnel Authorization Search Order

The following configuration example enables VPDN and configures a tunnel authorization search order that will be used instead of the default search order of DNIS number, then domain.

```
vpdn enable
vpdn search-order domain dnis
```

The following example enables VPDN and multihop, and configures a tunnel authorization search order of multihop hostname first, then domain, then DNIS number. This configuration is used only on a tunnel switch.

```
vpdn enable
vpdn multihop
vpdn search-order multihop-hostname domain dnis
```

## Example Configuring L2TP Domain Screening Rules Based

The following example shows a policy map configuration for L2TP domain screening, rules based:

```
policy-map type control REPLACE_WITH_example.com
class type control always event session-start
  1 collect identifier unauthenticated-username
  2 set NEWNAME identifier unauthenticated-username
  3 substitute NEWNAME "(.*@).*" "\1example.com"
  4 authenticate variable NEWNAME aaa list EXAMPLE
  5 service-policy type service name example
policy-map type service abc
service vpdn group 1
bba-group pppoe global
virtual-template 1
!
interface Virtual-Template1
service-policy type control REPLACE_WITH_example.com
```

## Examples Configuring per-User VPDN on the NAS

The following example enables VPDN and configures global per-user VPDN on the NAS for all dial-in VPDN tunnels. The first time the NAS contacts the remote RADIUS AAA server, the entire structured username will be sent rather than just the domain name or DNIS number.

```
vpdn enable
vpdn authen-before-forward
```

The following example enables VPDN and configures per-user VPDN on the NAS for dial-in VPDN tunnels belonging to the VPDN group named cisco1. The first time the NAS contacts the remote RADIUS AAA server, the entire structured username will be sent rather than just the domain name or DNIS number.

```
vpdn enable
vpdn-group cisco1
request-dialin
protocol l2tp
exit
authen-before-forward
```

## Examples Configuring AAA on the NAS and the Tunnel Server

The following example enables VPDN and local authentication and authorization on the NAS or the tunnel server:

```
vpdn enable
!
aaa new-model
aaa authentication login default local
aaa authentication ppp default local
aaa authorization network default local
```

The following examples enables VPDN and configures the NAS and the tunnel server for dial-in VPDN tunnels when remote RADIUS AAA authentication occurs at the NAS:

### NAS Configuration

```
vpdn enable
!
aaa new-model
aaa authentication login default radius
aaa authentication ppp default radius
aaa authorization network default radius
aaa accounting network default start-stop radius
radius-server host 10.1.1.1 auth-port 1939 acct-port 1443
vpdn aaa untagged
```

### Tunnel Server Configuration

```
vpdn enable
!
aaa new-model
aaa authentication login default radius
aaa authentication ppp default radius
aaa authorization network default radius
aaa accounting network default start-stop radius
vpdn aaa attribute nas-ip-address vpdn-nas
vpdn aaa untagged
```

The [Basic TACACS+ Configuration Example](#) document provides a basic configuration of TACACS+ for user dialup authentication to a NAS.

## Examples Configuring Remote AAA for VPDNs on the L2TP Tunnel Terminator

The following example enables VPDN and configures the NAS and the tunnel server for dial-in VPDN tunnels with remote RADIUS AAA authentication occurring at the tunnel server. A sample RADIUS user profile for the remote RADIUS AAA server is also shown.

### NAS Configuration

```
vpdn enable
!
aaa new-model
aaa authentication login default radius
aaa authentication ppp default radius
aaa authorization network default radius
aaa accounting network default start-stop radius
radius-server host 10.1.1.1 auth-port 1939 acct-port 1443
vpdn aaa untagged
```

### Tunnel Server Configuration

```

vpdn enable
!
aaa new-model
aaa authentication login default radius
aaa authentication ppp default radius
aaa authorization network default mymethodlist group myvpdngroup
radius-server host 10.2.2.2 auth-port 1939 acct-port 1443
aaa group server radius myvpdngroup
  server 10.2.2.2 auth-port 1939 acct-port 1443
!
vpdn tunnel authorization network mymethodlist
vpdn tunnel authorization virtual-template 1

```

### RADIUS User Profile

```

csidtw13 Password = "cisco"
      Service-Type = Outbound,
      Tunnel-Type = :0:L2TP,
      Tunnel-Medium-Type = :0:IP,
      Tunnel-Client-Auth-ID = :0:"csidtw13",
      Tunnel-Password = :0:"cisco"
      Cisco:Cisco-Avpair = "vpdn:vpdn-vtemplate=1"

```

## Examples Configuring Directed Request Authorization of VPDN Users

The following example enables VPDN and configures remote RADIUS AAA with VPDN authentication of directed request users on the tunnel server:

```

vpdn enable
!
aaa new-model
aaa authentication login default radius
aaa authentication ppp default radius
aaa authorization network default mymethodlist group myvpdngroup
radius-server host 10.3.3.3 auth-port 1939 acct-port 1443
aaa group server radius myvpdngroup
  server 10.3.3.3 auth-port 1939 acct-port 1443
!
ip host example.com 10.3.3.3
radius-server directed-request
vpdn authorize directed-request

```

The following example enables VPDN and configures per-user VPDN, remote TACACS+ AAA, and VPDN authentication of directed request users on the NAS:

```

vpdn enable
vpdn-group 1
  request-dialin
  protocol l2tp
  domain example.com
!
  initiate-to 10.3.3.3
  local name local1
  authen-before-forward
!
aaa new-model
aaa authentication login default tacacs
aaa authentication ppp default tacacs
aaa authorization network default mymethod group mygroup
radius-server host 10.4.4.4 auth-port 1201 acct-port 1450
aaa group server tacacs mygroup
  server 10.3.3.3 auth-port 1201 acct-port 1450
!

```

```
ip host example.com 10.3.3.3
radius-server directed-request
vpdn authorize directed-request
```

## Examples Configuring Domain Name Prefix and Suffix Stripping

The following example configures the router to parse the username from right to left and sets the valid suffix delimiter characters as @, \, and \$. If the full username is `cisco/user@cisco.com$Cisco.net`, the username `/user@cisco.com` will be forwarded to the RADIUS server because the \$ character is the first valid delimiter encountered by the NAS when parsing the username from right to left.

```
radius-server domain-stripping right-to-left delimiter @\$$
```

The following example configures the router to strip the domain name from usernames only for users associated with the VRF instance named `abc`. The default suffix delimiter @ will be used for generic suffix stripping.

```
radius-server domain-stripping vrf abc
```

The following example enables prefix stripping using the character / as the prefix delimiter. The default suffix delimiter character @ will be used for generic suffix stripping. If the full username is `cisco/user@cisco.com`, the username `user` will be forwarded to the TACACS+ server.

```
tacacs-server domain-stripping prefix-delimiter /
```

The following example enables prefix stripping, specifies the character / as the prefix delimiter, and specifies the character # as the suffix delimiter. If the full username is `cisco/user@cisco.com#Cisco.net`, the username `user@cisco.com` will be forwarded to the RADIUS server.

```
radius-server domain-stripping prefix-delimiter / delimiter #
```

The following example enables prefix stripping, configures the character / as the prefix delimiter, configures the characters \$, @, and # as suffix delimiters, and configures per-suffix stripping of the suffix `cisco.com`. If the full username is `cisco/user@cisco.com`, the username `user` will be forwarded to the TACACS+ server. If the full username is `cisco/user@cisco.com#Cisco.com`, the username “`user@cisco.com`” will be forwarded.

```
tacacs-server domain-stripping prefix-delimiter / delimiter $@#
tacacs-server domain-stripping strip-suffix cisco.com
```

The following example configures the router to parse the username from right to left and enables suffix stripping for usernames with the suffix `cisco.com`. If the full username is `cisco/user@cisco.net@cisco.com`, the username `cisco/user@cisco.net` will be forwarded to the RADIUS server. If the full username is `cisco/user@cisco.com@cisco.net`, the full username will be forwarded.

```
radius-server domain-stripping right-to-left
radius-server domain-stripping strip-suffix cisco.com
```

The following example configures a set of global stripping rules that will strip the suffix `cisco.com` using the delimiter @, and a different set of stripping rules for usernames associated with the VRF named `myvrf`.

```
radius-server domain-stripping strip-suffix cisco.com
!
radius-server domain-stripping prefix-delimiter # vrf myvrf
radius-server domain-stripping strip-suffix cisco.net vrf myvrf
```

## Examples Configuring VPDN Tunnel Authentication

The following example configures VPDN tunnel authentication using the hostname on a NAS and the local name on the tunnel server. Note that the secret password configured for each device matches.

**NAS Configuration**

```
hostname NAS1
username tunnelserver1 password supersecret
```

**Tunnel Server Configuration**

```
vpdn-group 1
 local name tunnelserver1
 exit
username NAS1 password supersecret
```

The following example configures VPDN tunnel authentication using the local name on the NAS and the L2TP tunnel password on the tunnel server. Note that the secret password configured for each device matches.

**NAS Configuration**

```
vpdn-group 2
 local name NAS6
 !
username tunnelserver12 password verysecret
```

**Tunnel Server Configuration**

```
vpdn-group 4
 l2tp tunnel password verysecret
 local name tunnelserver12
 exit
username NAS6 password verysecret
```

The following example configures VPDN tunnel authentication using the L2TP tunnel password on both the NAS and the tunnel server. Note that the secret password configured for each device matches.

**NAS Configuration**

```
vpdn-group l2tp
 l2tp tunnel password rathersecret
```

**Tunnel Server Configuration**

```
vpdn-group 46
 l2tp tunnel password rathersecret
```

## Examples Configuring L2TP Domain Screening

### Examples Configuring L2TP Domain Screening with Global Preauthentication

Global preauthentication for L2TP domain screening requires RADIUS authentication and authorization. Each user must have a RADIUS user profile that enables per-user L2TP tunneling.

The following example shows a user profile for user-1@example.net; the IP address in the profile is the LNS interface connected to the LAC.

```
[ /Radius/UserLists/Default/user-1@example.net ]
 Name = user_1@example1.net
 Description = TEST
```

```

    Password = <encrypted>
    Enabled = TRUE
cisco-avpair = vpdn:tunnel-type=l2tp
  cisco-avpair = vpdn:l2tp-tunnel-password=tunnel
  cisco-avpair = vpdn:l2tp-hello-interval=60
  cisco-avpair = vpdn:ip-addresses=10.1.1.1
  cisco-avpair = vpdn:tunnel-id=LAC1-1
  Framed-protocol = PPP
  Service-Type = Outbound

```

The following partial sample configuration shows the L2TP Domain Screening feature with global preauthentication.

```

Router# show running-config
!
.
.
.
hostname esrl-client
.
.
.
aaa new-model

!
radius-server host 172.16.192.80 auth-port 1645 acct-port 1646 key rad123
radius-server retransmit 3
call rsvp-sync

```

## Example Configuring DNS Name Support on the NAS Remote RADIUS AAA Server

The following AV pair instructs the RADIUS server to resolve the DNS name cisco and tunnel calls to the appropriate IP addresses:

```
9,1="vpdn:ip-addresses = cisco"
```

## Examples Configuring L2TP Tunnel Server Load Balancing and Failover Using the Cisco Proprietary VSA

The following example shows a RADIUS profile that will equally balance the load between three tunnel servers:

```

user = cisco.com
profile_id = 29
profile_cycle = 7
radius=Cisco

```

```

check_items=
2=cisco
reply_attributes= {
9,1="vpdn:l2tp-tunnel-password=cisco123"
9,1="vpdn:tunnel-type=l2tp"
9,1="vpdn:ip-addresses=172.16.171.11 172.16.171.12 172.16.171.13"
9,1="vpdn:tunnel-id=tunnel"
}
}
}

```

The following example shows a RADIUS profile that will equally balance calls between 172.16.171.11 and 172.16.171.12. If both of those tunnel servers are unavailable, the RADIUS server will tunnel calls to 172.16.171.13.

```

user = cisco.com
profile_id = 29
profile_cycle = 7
radius=Cisco
check_items=
2=cisco
reply_attributes= {
9,1="vpdn:l2tp-tunnel-password=cisco123"
9,1="vpdn:tunnel-type=l2tp"
9,1="vpdn:ip-addresses=172.16.171.11 172.16.171.12/172.16.171.13"
9,1="vpdn:tunnel-id=tunnel"
}
}

```

## Example Configuring L2TP Tunnel Server Load Balancing and Failover using the RADIUS Tunnel Preference Attribute

The following RADIUS configuration specifies four tunnel server profiles with different priority values specified in the Tunnel-Preference attribute field. The NAS will preferentially initiate L2TP tunnels to the tunnel server with the lowest configured priority value. If two tunnel server profiles have the same priority value configured, they will be considered equal and load balancing will occur between them.

```

net3 Password = "cisco" Service-Type = Outbound
Tunnel-Type = :0:L2TP,
Tunnel-Medium-Type = :0:IP,
Tunnel-Server-Endpoint = :0:"10.1.3.1",
Tunnel-Assignment-Id = :0:"1",
Tunnel-Preference = :0:1,
Tunnel-Password = :0:"secret"
Tunnel-Type = :1:L2TP,
Tunnel-Medium-Type = :1:IP,
Tunnel-Server-Endpoint = :1:"10.1.5.1",
Tunnel-Assignment-Id = :1:"1",
Tunnel-Preference = :1:1,
Tunnel-Password = :1:"secret"
Tunnel-Type = :2:L2TP,
Tunnel-Medium-Type = :2:IP,
Tunnel-Server-Endpoint = :2:"10.1.4.1",
Tunnel-Assignment-Id = :2:"1",
Tunnel-Preference = :2:1,
Tunnel-Password = :2:"secret"
Tunnel-Type = :3:L2TP,
Tunnel-Medium-Type = :3:IP,
Tunnel-Server-Endpoint = :3:"10.1.6.1",
Tunnel-Assignment-Id = :3:"1",
Tunnel-Preference = :3:1,
Tunnel-Password = :3:"secret"

```

## Examples Configuring Tunnel Assignments on the NAS RADIUS AAA Server

The following examples configure the RADIUS server to group sessions in a tunnel:

### Per-User Configuration

```
user@cisco.com Password = "cisco" Service-Type = Outbound,
    tunnel-type = :1:L2TP,
    tunnel-server-endpoint = :1:"10.14.10.54",
    tunnel-assignment-Id = :1:"router"
client@cisco.com Password = "cisco" Service-Type = Outbound,
    tunnel-type = :1:L2TP,
    tunnel-server-endpoint = :1:"10.14.10.54",
    tunnel-assignment-Id = :1:"router"
```

### Domain Configuration

```
eng.cisco.com Password = "cisco" Service-Type = Outbound,
    tunnel-type = :1:L2TP,
    tunnel-server-endpoint = :1:"10.14.10.54",
    tunnel-assignment-Id = :1:"router"
sales.cisco.com Password = "cisco" Service-Type = Outbound,
    tunnel-type = :1:L2TP,
    tunnel-server-endpoint = :1:"10.14.10.54",
    tunnel-assignment-Id = :1:"router"
```

## Examples Configuring L2TP Tunnel Connection Speed Labeling

The following example shows an ARS RADIUS server profile configuration for three users of the service cisco.com. Each user has a different configuration for allowable connection speeds.

```
# cisco.com/
# Name = cisco.com
# Description = Domain
# Password = <encrypted>
# AllowNullPassword = FALSE
# Enabled = TRUE
# Group~ =
# BaseProfile~ =
# AuthenticationScript~ =
# AuthorizationScript~ =
# UserDefined1 =
# Attributes/
#   cisco-avpair = vpdn:tunnel-id=aaa_lac
#   cisco-avpair = vpdn:tunnel-type=l2tp
#   cisco-avpair = vpdn:ip-addresses=10.1.1.3
#   cisco-avpair = vpdn:l2tp-tunnel-password=lab
#   service-type = outbound
# CheckItems/
# Euser1@cisco.com/
# Name = Euser1@cisco.com
# Description = PPPoE-Only-Tx-Accept
# Password = <encrypted>
# AllowNullPassword = FALSE
# Enabled = TRUE
# Group~ =
# BaseProfile~ =
# AuthenticationScript~ =
# AuthorizationScript~ =
# UserDefined1 = TX:102400000
# Attributes/
# CheckItems/
```

```

#
# Euser11@cisco.com/
#   Name = Euser11@cisco.com
#   Description = PPPoE-Range-RX-Accept
#   Password = <encrypted>
#   AllowNullPassword = FALSE
#   Enabled = TRUE
#   Group~ =
#   BaseProfile~ =
#   AuthenticationScript~ =
#   AuthorizationScript~ =
#   UserDefined1 = RX:96000000-200000000
#   Attributes/
#   CheckItems/
#
# Euser8@cisco.com/
#   Name = Euser8@cisco.com
#   Description = PPPoE-Both-TXRX-Reject
#   Password = <encrypted>
#   AllowNullPassword = FALSE
#   Enabled = TRUE
#   Group~ =
#   BaseProfile~ =
#   AuthenticationScript~ =
#   AuthorizationScript~ =
#   UserDefined1 = TX:5600000:RX:64000000
#   Attributes/
#   CheckItems/

```

The following example configures the .tcl script to be the OutgoingScript of the service that has been created:

```

Name = check-info
Description =
Type = local
IncomingScript~ =
OutgoingScript~ = checkConnect-Info
OutagePolicy~ = RejectAll
OutageScript~ =
UserList = dialin-users

```

Connection speed information is forwarded by the tunnel server to the RADIUS AAA server for authentication by default. The following example disables the forwarding of connection speed information to the RADIUS AAA server:

```
Router(config)# no radius-server attribute 77 include-in-access-req
```

The following example enables the forwarding of connection speed information to the RADIUS AAA server from the tunnel server if it has been previously disabled:

```
Router(config)# radius-server attribute 77 include-in-access-req
```

The following example enables the forwarding of connection speed information to the RADIUS AAA server from a tunnel switch before the session is forwarded to the next hop:

```
Router(config)# vpdn authen-before-forward
```

## Example Configuring Secure Authentication Names

The following is an example of a RADIUS user profile that includes RADIUS tunneling attributes 90 and 91. This entry supports two tunnels, one for L2F and the other for L2TP. The tag entries with :1 support L2F tunnels, and the tag entries with :2 support L2TP tunnels.

```

cisco.com Password = "cisco", Service-Type = Outbound
Service-Type = Outbound,
Tunnel-Type = :1:L2F,

```

```

Tunnel-Medium-Type = :1:IP,
Tunnel-Client-Endpoint = :1:"10.0.0.2",
Tunnel-Server-Endpoint = :1:"10.0.0.3",
Tunnel-Client-Auth-Id = :1:"12f-cli-auth-id",
Tunnel-Server-Auth-Id = :1:"12f-svr-auth-id",
Tunnel-Assignment-Id = :1:"12f-assignment-id",
Cisco-Avpair = "vpdn:nas-password=12f-cli-pass",
Cisco-Avpair = "vpdn:gw-password=12f-svr-pass",
Tunnel-Preference = :1:1,
Tunnel-Type = :2:L2TP,
Tunnel-Medium-Type = :2:IP,
Tunnel-Client-Endpoint = :2:"10.0.0.2",
Tunnel-Server-Endpoint = :2:"10.0.0.3",
Tunnel-Client-Auth-Id = :2:"12tp-cli-auth-id",
Tunnel-Server-Auth-Id = :2:"12tp-svr-auth-id",
Tunnel-Assignment-Id = :2:"12tp-assignment-id",
Cisco-Avpair = "vpdn:l2tp-tunnel-password=12tp-tnl-pass",
Tunnel-Preference = :2:2

```

## Examples Configuring Shell-Based Authentication of VPDN Users

The following example configures dial-in lines 1 through 8 on the NAS to support shell-based authentication of VPDN users:

```

line 1 8
!assuming all logins on lines 1-8 is to be authenticated at 172.69.71.85
 login authentication ExecVPDN-Login
 autoselect during-login
 autocommand ppp
 modem InOut
 transport input all
 transport output none
 stopbits 1
 speed 115200

```

The following example configures a NAS for shell-based authentication of VPDN users based on DNIS information:

```

vpdn enable
vpdn search-order dnis
!
aaa new-model
aaa authentication login Exec-VPDN-login group Exec-VPDN-Login-Servers
aaa authentication ppp Exec-VPDN-ppp if-needed group Exec-VPDN-Login-Servers
aaa authorization network default group Exec-VPDN-Login-Servers
aaa authorization network no_author none
!
!The following configuration creates a RADIUS server group named Exec-VPDN-Login Servers.
radius-server host 172.69.69.72 auth-port 1645 acct-port 1646
aaa group server radius Exec-VPDN-Login-Servers
 server 171.69.69.72 auth-port 1645 acct-port 1646
!
!The following configuration maps DNIS 7777 to the RADIUS server group named !Exec-VPDN-Login
Servers. Authentication requests from users at DNIS 7777 will be !forwarded to the RADIUS
server at 10.1.10.1.
aaa dnis map enable
aaa dnis map 7777 authentication ppp group ExecVPDN-Login-Servers
aaa dnis map 7777 authentication login group ExecVPDN-Login-Servers

```

The following example uses the global RADIUS server definition list for PPP authentication on the NAS if authentication is needed:

```

aaa authentication ppp ExecVPDN-ppp if-needed group radius
!PPP config for line 1
int async 1
ip unnumbered e0
encap ppp

```

```

async mode interactive
ppp authentication pap ExecVPDN-ppp

```

The following example configures the tunnel server to accept VPDN tunnels without performing PPP authentication:

```

vpdn-group 1
  accept-dialin
  protocol l2tp
  virtual-template 1
  terminate-from hostname host1_no_authen
  l2tp tunnel authentication
  l2tp password no_authen_secret
  local name host2_no_authen
!
interface Virtual-Templat1
  ip unnumbered Ethernet0/0
  no keepalive
  ppp authorization no_author
!

```

The following example configures the tunnel server to accept VPDN tunnels with PPP authentication enabled:

```

vpdn-group 2
  accept-dialin
  protocol l2tp
  virtual-template 2
  terminate-from hostname authen_on
  l2tp tunnel authentication
  l2tp password no_authen_secret
  local name host2_autne_on
!
interface Virtual-Templat1
  ip unnumbered Ethernet0/0
  no keepalive
  ppp authentication pap

```

## Examples Configuring LNS Address Checking

The following shows an example configuration for the client router.

```

hostname Client
!
enable password example
!
no aaa new-model
!
vpdn enable
!
bba-group pppoe 1
  virtual-template 1
!
interface <interface toward LAC>
  pppoe enable group 1
!
interface Virtual-Template 1
  ip unnumbered <interface>
  ppp pap sent-username@example.com
!
end

```

The following shows an example configuration for the LAC.

```

hostname LAC
!
enable password example
!
no aaa new-model
!

```

```

vpdn enable
!
vpdn-group 1
  request-dialin
  protocol l2tp
  domain example.com
  initiate-to ip <lms 1 IP address>
  l2tp tunnel password 0 example
!
bba-group pppoe 1
  virtual-template 1
!
interface Virtual-Template 1
  no ip address
  ppp authentication pap
!
interface <interface>
  pppoe enable group 1
!
end

```

The following shows an example configuration for the LNS 1.

```

hostname LNS1
!
enable password example
!
aaa authentication ppp default local
!
vpdn enable
!
vpdn-group 1
!Default L2TP VPDN group
  accept-dialin
  protocol l2tp
  virtual-template 1
  l2tp tunnel password 0 example
!
vpdn-group 2
  request-dialin
  protocol l2tp
  domain example.com
  initiate-to ip <lms 2 IP address>
  l2tp tunnel password 0 example
!
interface Virtual-Template 1
  ip unnumbered <interface>
  ppp authentication pap
!
end

```

## Examples Configuring Modified LNS Dead-Cache Handling

The following show an example configuration from the **show vpdn dead-cache all** command:

```

Router> enable
Router# show vpdn dead-cache all
vpdn-group  ip address  down time
exampleA    192.168.2.2   00:10:23
exampleB    192.168.4.2   00:10:16
exampleB    192.168.4.3   00:10:15
exampleB    192.168.4.4   00:10:12

```

The following shows an example configuration to clear an LNS, based on its IP address, from the dead-cache state:

```

Router# clear vpdn dead-cache ip-address 192.168.4.4
Router#

```

```
*Sept. 30 22:58:32 %VPDN-6-VPDN_DEADCACHE_CHANGE: LSG dead cache entry 192.168.4.4 cleared
LAC# show vpdn dead-cache all
vpdn-group      ip address      down time
exampleA        192.168.2.2      00:10:28
exampleB        192.168.4.2      00:10:21
exampleB        192.168.4.3      00:10:20
```

The following shows an example configuration to clear an LNS group from the dead-cache state:

```
Router# clear vpdn dead-cache group exampleB
Router#
*Sept. 30 22:58:32 %VPDN-6-VPDN_DEADCACHE_CHANGE: LSG dead cache entry 192.168.4.2 cleared
*Sept. 30 22:58:32 %VPDN-6-VPDN_DEADCACHE_CHANGE: LSG dead cache entry 192.168.4.3 cleared
Router# show vpdn dead-cache all
vpdn-group      ip address      down time
exampleA        192.168.2.2      00:10:31
```

## Where to Go Next

Depending on the type of VPDN deployment you are configuring, you should perform the tasks in one of these modules:

- To configure a client-initiated tunneling deployment, proceed to the Configuring Client-Initiated Dial-In VPDN Tunneling module.
- To configure a NAS-initiated tunneling deployment, proceed to the Configuring NAS-Initiated Dial-In VPDN Tunneling module.
- To configure a dial-out VPDN tunneling deployment, proceed to the Configuring Additional VPDN Features module.
- To configure a multihop MMP or multihop tunnel switching VPDN deployment, proceed to the Configuring Multihop VPDN module.

Description	Link
The Cisco Support and Documentation website provides online resources to download documentation, software, and tools. Use these resources to install and configure the software and to troubleshoot and resolve technical issues with Cisco products and technologies. Access to most tools on the Cisco Support and Documentation website requires a Cisco.com user ID and password.	<a href="http://www.cisco.com/cisco/web/support/index.html">http://www.cisco.com/cisco/web/support/index.html</a>

## Feature Information for AAA for VPDNs

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [http://www.cisco.com/go/featurenavigator](#). An account on Cisco.com is not required.

**Table 4: Feature Information for AAA for VPDNs**

Feature Name	Releases	Feature Information
Configurable Domain Name Prefix and Suffix Stripping	12.3(4)T 12.2(33)SRE	<p>This feature allows the NAS to be configured to strip prefixes, suffixes, or both from the full username. The reformatted username is then forwarded to the remote AAA server.</p> <p>The following commands were introduced or modified by this feature: <b>radius-server domain-stripping</b>, <b>tacacs-server domain-stripping</b>.</p>
Suppressing EXEC Accounting Record	12.4(11)T 12.2(33)SRE	<p>This feature suppresses EXEC accounting records when you configure autoselection during-login for the dial-in clients.</p> <p>The following command was introduced or modified by this feature: <b>aaa accounting nested</b>.</p>

Feature Name	Releases	Feature Information
L2TP Domain Screening, Rules Based	12.2(31)SB2	<p>This feature allows per-user L2TP tunnel setup by creating customized Policy Manager match rules.</p> <p>The L2TP Domain Screening, Rules Based feature allows per-user L2TP tunnel setup by creating customized Policy Manager match rules by combining these features:</p> <ul style="list-style-type: none"> <li>• Create a temporary memory to hold the value of identifier types received by policy manager, using the <b>set variable</b> command in <code>configuration-control-policy-map-class</code> mode</li> <li>• Match the contents, stored in temporary memory of identifier types received by policy manager, against a specified <i>matching-pattern</i> and perform the substitution defined in <i>rewrite-pattern</i>, using the <b>substitute</b> command in <code>configuration-control-policy-map-class</code> mode</li> <li>• Authenticate a request for an Intelligent Service Gateway (ISG) subscriber session, using the <b>authenticate</b> command in <code>control policy-map class</code> configuration mode</li> </ul> <p>These three commands work together to allow you to construct rules to customize specific policy behavior to allow an L2TP tunnel setup by creating customized Policy Manager match rules.</p>

Feature Name	Releases	Feature Information
L2TP Tunnel Selection Load Balancing with Random Algorithm	12.2(31)SB2	<p>This feature allows the NAS to use a new tie-breaking algorithm and is transparent to any user. A random selection is made among all peer tunnel servers carrying the same session load. This improved algorithm results in a more even distribution of sessions across tunnel servers, reducing the occurrence of session bunching.</p>
L2TP Domain Screening	12.2(28)SB	<p>This feature introduces the ability to modify the domain portion of the username seamlessly when you enter into a virtual private network (VPN) service.</p> <p>The L2TP Domain Screening feature allows per-user L2TP tunnel setup by combining these features:</p> <ul style="list-style-type: none"> <li>• User preauthentication using the <b>vpdn authen-before-forward</b> command</li> <li>• Modifying the domain portion of the username using the <b>vpn service</b> command to bind an incoming session to a certain L2TP tunnel</li> </ul> <p>These two commands work together to make sure that the appropriate domain has been screened before access is allowed to an L2TP tunnel for the user session.</p>
L2TP Tunnel Connection Speed Labeling	12.3(4)T	<p>This feature introduces the ability to accept or deny an L2TP session based on the allowed connection speed that is configured on the Cisco ARS RADIUS server for that user. The RADIUS server can authorize users based on their SLA.</p> <p>No commands were introduced or modified by this feature.</p>

Feature Name	Releases	Feature Information
LNS Address Checking	12.2(34)SB 12.2(33)XNE	<p>This feature allows an LAC, which is receiving data from a LNS, to check the IP address of the LNS prior to establishing an L2TP tunnel.</p> <p>The following command was introduced by this feature: <b>l2tp security ip address-check</b>.</p>
Modified LNS Dead-Cache Handling	12.2(34)SB	<p>This feature displays and clears (restarts) any LNS entry in a dead-cache (DOWN) state.</p> <p>The following commands were introduced by this feature: <b>clear vpdn dead-cache, show vpdn dead-cache</b>.</p> <p>The following commands were modified by this feature: <b>snmp-server enable traps, vpdn logging</b>.</p>
RADIUS Attribute 82: Tunnel Assignment ID	12.2(4)T	<p>This feature allows the L2TP NAS to group users from different per-user or domain RADIUS profiles into the same active tunnel if the tunnel endpoints, tunnel type, and Tunnel-Assignment-ID are identical.</p> <p>No commands were introduced or modified by this feature.</p>
RADIUS Tunnel Attribute Extensions	12.2(13)T	<p>This feature introduces RADIUS attribute 90 and RADIUS attribute 91. Both attributes help support the provision of compulsory tunneling in VPDNs by allowing the user to specify authentication names for the NAS and the RADIUS server.</p> <p>No commands were introduced or modified by this feature.</p>

Feature Name	Releases	Feature Information
RADIUS Tunnel Preference for Load Balancing and Fail-Over	12.2(4)T 12.2(11)T	This feature provides industry-standard load balancing and failover functionality for multi-vendor networks. Support for Cisco access server platforms was introduced in Cisco IOS Release 12.2(11)T.
RFC-2867 RADIUS Tunnel Accounting	12.3(4)T	<p>This feature introduces six new RADIUS accounting types that are used with the RADIUS accounting attribute Acct-Status-Type (attribute 40), which indicates whether an accounting request marks the beginning of user service (start) or the end (stop).</p> <p>The following commands were introduced or modified by this feature: <b>aaa accounting</b>, <b>vpdn session accounting network</b>, <b>vpdn tunnel accounting network</b>.</p>
Shell-Based Authentication of VPDN Users	12.2(2)T	<p>This feature provides terminal services for VPDN users to support rollout of wholesale dial networks.</p> <p>The following command was modified by this feature: <b>aaa dnis map authentication group</b>.</p>
Tunnel Authentication via RADIUS on Tunnel Terminator	12.3(4)T	<p>This feature allows the L2TP tunnel server to perform remote authentication and authorization with RADIUS on incoming L2TP NAS dial-in connection requests. This feature also allows the L2TP NAS to perform remote authentication and authorization with RADIUS on incoming L2TP tunnel server dial-out connection requests.</p> <p>The following commands were introduced by this feature: <b>vpdn tunnel authorization network</b>, <b>vpdn tunnel authorization password</b>, <b>vpdn tunnel authorization virtual-template</b>.</p>
