PBR Recursive Next Hop

The PBR Recursive Next Hop feature enhances route maps to enable configuration of a recursive next-hop IP address that is used by policy-based routing (PBR). The recursive next-hop IP address is installed in the routing table and can be a subnet that is not directly connected. If the recursive next-hop IP address is not available, packets are routed using a default route.

Because Cisco Express Forwarding (CEF) or process switching provides the infrastructure, the benefit of this feature is the CEF load sharing.

How to Configure PBR Recursive Next Hop

This section contains the following procedures:

- Setting the Recursive Next-Hop IP Address, page 2 (required)
- Verifying the Recursive Next-Hop Configuration, page 4 (optional)

Setting the Recursive Next-Hop IP Address

The infrastructure provided by CEF or process switching performs the recursion to the next-hop IP address. The configuration sequence, which affects routing, is as follows:

1. Next-hop
2. Next-hop recursive
3. Interface
4. Default next-hop
5. Default interface

If both a next-hop and a recursive next-hop IP address are present in the same route-map entry, the next-hop is used. If the next-hop is not available, the recursive next-hop is used. If the recursive next-hop is not available and no other IP address is present, the packet is routed using the default routing table; it is not dropped. If the packet is supposed to be dropped, use the `set next-hop recursive` command followed by a `set interface null0` configuration.

Perform this task to set the IP address for the recursive next-hop router.

Prerequisites

If load sharing is required, CEF load sharing should be configured for per-packet or per-destination load sharing. Load balancing should be done over all equal-cost routes to the subnet that have been configured by the `set next-hop recursive` command.

This functionality should be available in centralized and distributed systems.

Restrictions

Only one recursive next-hop IP address is supported per route-map entry.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `access-list permit source`
4. `route-map map-tag`
5. `set ip next-hop ip-address`
6. `set ip next-hop recursive ip-address`
7. `match ip address access-list-number`
8. `exit`
# PBR Recursive Next Hop

## How to Configure PBR Recursive Next Hop

### Cisco IOS Release: Multiple releases (see the Feature History Table)

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | enable            | Enables privileged EXEC mode.  

**Example:**

```
Router> enable
```

- Enter your password if prompted.

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**

```
Router# configure terminal
```

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 3    | access-list permit source | Configures an access list. The example configuration permits any source IP address that falls within the 10.60.0.0 0.0.255.255 subnet.  

**Example:**

```
Router(config)# access-list permit 10.60.0.0 0.0.255.255
```

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>route-map map-tag</td>
<td>Enables policy routing and enters route-map configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**

```
Router(config)# route-map abccomp
```

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 5    | set ip next-hop ip-address | Sets a next-hop router IP address.  

**Note**  
Set this IP address separately from the next-hop recursive router configuration.

**Example:**

```
Router(config-route-map)# set ip next-hop 10.10.1.1
```

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 6    | set ip next-hop recursive ip-address | Sets a recursive next-hop IP address.  

**Note**  
This configuration does not ensure that packets get routed using the recursive IP address if an intermediate IP address is a shorter route to the destination.

**Example:**

```
Router(config-route-map)# set ip next-hop recursive 10.20.3.3
```

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 7    | match ip address access-list-number | Sets an access list to be matched.  

**Example:**

```
Router(config-route-map)# match ip address 101
```

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 8    | exit              | Exits global configuration mode.  

**Example:**

```
Router(config-route-map)# exit
```
Verifying the Recursive Next-Hop Configuration

To verify the recursive next-hop configuration, perform the following steps.

SUMMARY STEPS

1. show running-config | beg abccomp
2. show route-map abccomp

DETAILED STEPS

Step 1  show running-config | beg abccomp
Use this command to verify the IP addresses for a next-hop and recursive next-hop IP address, for example:

```
Router# show running-config | beg abccomp
route-map abccomp permit 10
match ip address 101 ! Defines the match criteria for an access list.
set ip next-hop recursive 10.3.3.3 ! If the match criteria is met, the recursive IP address is set.
set ip next-hop 10.1.1.1 10.2.2.2 10.4.4.4
```

Step 2  show route-map abccomp
Use this command to display the route-maps, for example:

```
Router# show route-map abccomp
route-map abccomp, permit, sequence 10
Match clauses:
   ip address (access-lists): 101
Set clauses:
   ip next-hop recursive 10.3.3.3
   ip next-hop 10.1.1.1 10.2.2.2 10.4.4.4
Policy routing matches: 0 packets, 0 bytes
```

Configuration Examples for PBR Recursive Next Hop

This section provides the following configuration example:

- Recursive Next-Hop IP Address: Example, page 4

Recursive Next-Hop IP Address: Example

The following example shows the configuration of IP address 10.3.3.3 as the recursive next-hop router:

```
route-map abccomp
set ip next-hop 10.1.1.1
set ip next-hop 10.2.2.2
set ip next-hop recursive 10.3.3.3
set ip next-hop 10.4.4.4
```

Command Reference

This section documents modified commands only.

- set ip next-hop
- show route-map
set ip next-hop

To indicate where to output packets that pass a match clause of a route map for policy routing, use the set ip next-hop command in route-map configuration mode. To delete an entry, use the no form of this command.

```
set ip next-hop {ip-address [...ip-address] | recursive ip-address}
no set ip next-hop ip-address [...ip-address]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip-address</td>
<td>IP address of the next hop to which packets are output. It must be the address of an adjacent router.</td>
</tr>
<tr>
<td>recursive</td>
<td>IP address of the recursive next-hop router.</td>
</tr>
<tr>
<td>ip-address</td>
<td>Note: The next-hop IP address must be assigned separately from the recursive next-hop IP address.</td>
</tr>
</tbody>
</table>

### Defaults

This command is disabled by default.

### Command Modes

Route-map configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.0</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.0(28)S</td>
<td>The recursive keyword was added.</td>
</tr>
<tr>
<td>12.3(14)T</td>
<td>This command was integrated into Cisco IOS Release 12.3(14)T.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

An ellipsis (...) in the command syntax indicates that your command input can include multiple values for the ip-address argument.

Use the ip policy route-map interface configuration command, the route-map global configuration command, and the match and set route-map configuration commands to define the conditions for policy routing packets. The ip policy route-map command identifies a route map by name. Each route-map command has a list of match and set commands associated with it. The match commands specify the match criteria—the conditions under which policy routing occurs. The set commands specify the set actions—the particular routing actions to perform if the criteria enforced by the match commands are met.

If the interface associated with the first next hop specified with the set ip next-hop command is down, the optionally specified IP addresses are tried in turn.
The set clauses can be used in conjunction with one another. They are evaluated in the following order:

1. set ip next-hop
2. set interface
3. set ip default next-hop
4. set default interface

**Note**

The `set ip next-hop` and `set ip default next-hop` are similar commands but have a different order of operations. Configuring the `set ip next-hop` command causes the system to use policy routing first and then use the routing table. Configuring the `set ip default next-hop` command causes the system to use the routing table first and then policy route the specified next hop.

**Examples**

In the following example, packets with a Level 3 length of 3 to 50 bytes are output to the router at IP address 10.14.2.2:

```plaintext
interface serial 0
 ip policy route-map thataway

route-map thataway
 match length 3 50
 set ip next-hop 10.14.2.2
```

In the following example, the IP address of 10.3.3.3 is set as the recursive next-hop address:

```plaintext
route-map map_recurse
 set ip next-hop recursive 10.3.3.3
```

show route-map

To display static and dynamic route maps, use the `show route-map` command in privileged EXEC mode.

```
show route-map [map-name | dynamic [dynamic-map-name | application [application-name]] | all]
```

**Syntax Description**

- **map-name** (Optional) Name of a specific route map.
- **dynamic** (Optional) Displays dynamic route map information.
- **dynamic-map-name** (Optional) Name of a specific dynamic route map.
- **application** (Optional) Displays dynamic route maps based on applications.
- **application-name** (Optional) Name of a specific application.
- **all** (Optional) Displays all static and dynamic route maps.

**Command Modes**

Privileged EXEC

**Command History**

**Examples**

**show route-map Command with No Keywords Specified Example**

The following is sample output from the `show route-map` command:

```
Router# show route-map

route-map sid, permit, sequence 10
Match clauses:
  tag 1 2
Set clauses:
  metric 5
route-map sid, permit, sequence 20
Match clauses:
  tag 3 4
Set clauses:
  metric 6
Policy routing matches: 0 packets; 0 bytes
```

The following example shows MPLS-related route map information:

```
Router# show route-map
```

Cisco IOS Release: Multiple releases (see the Feature History Table)
show route-map

route-map OUT, permit, sequence 10
Match clauses:
ip address (access-lists): 1
Set clauses:
  mpls label
Policy routing matches: 0 packets, 0 bytes

route-map IN, permit, sequence 10
Match clauses:
ip address (access-lists): 2
mpls label
Set clauses:
Policy routing matches: 0 packets, 0 bytes

Table 1 describes the significant fields shown in the display.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-map</td>
<td>Name of the route map.</td>
</tr>
<tr>
<td>permit</td>
<td>Indicates that the route is redistributed as controlled by the set actions.</td>
</tr>
<tr>

<td>Tag Match criteria—conditions under which redistribution is allowed for the current route map.</td>
</tr>
<tr>
<td>Set clauses</td>
<td>Metric Set actions—the particular redistribution actions to perform if the criteria enforced by the match commands are met.</td>
</tr>
<tr>
<td>Policy routing matches</td>
<td>Number of packets and bytes that have been filtered by policy routing.</td>
</tr>
</tbody>
</table>

show route-map Command with Dynamic Route Map Specified Example

The following is sample output from the show route-map command when entered with the dynamic keyword:

Router# show route-map dynamic

route-map AAA-02/06/04-14:01:26.619-1-AppSpec, permit, sequence 0, identifier 1137954548
Match clauses:
ip address (access-lists): PBR#1 PBR#2
Set clauses:
  Policy routing matches: 0 packets, 0 bytes
route-map AAA-02/06/04-14:01:26.619-1-AppSpec, permit, sequence 1, identifier 1137956424
Match clauses:
ip address (access-lists): PBR#3 PBR#4
Set clauses:
  Policy routing matches: 0 packets, 0 bytes
route-map AAA-02/06/04-14:01:26.619-1-AppSpec, permit, sequence 2, identifier 1124436704
Match clauses:
ip address (access-lists): PBR#5 PBR#6
  length 10 100
Set clauses:
ip next-hop 7.1.1.1
ip gateway 7.1.1.1
  Policy routing matches: 0 packets, 0 bytes
Current active dynamic routemaps = 1
The following is sample output from the `show route-map` command when entered with the `dynamic` and `application` keywords:

Router# show route-map dynamic application

Application - AAA
Number of active routemaps = 1

When you specify an application name, only dynamic routes for that application are shown. The following is sample output from the `show route-map` command when entered with the `dynamic` and `application` keywords and the AAA application name:

Router# show route-map dynamic application AAA

AAA
Number of active rmaps = 2
AAA-02/06/04-14:01:26.619-1-AppSpec
AAA-02/06/04-14:34:09.735-2-AppSpec

Router# show route-map dynamic AAA-02/06/04-14:34:09.735-2-AppSpec

route-map AAA-02/06/04-14:34:09.735-2-AppSpec, permit, sequence 0, identifier 1128046100
Match clauses:
  ip address (access-lists): PBR#7 PBR#8
Set clauses:
Policy routing matches: 0 packets, 0 bytes

route-map AAA-02/06/04-14:34:09.735-2-AppSpec, permit, sequence 1, identifier 1141277624
Match clauses:
  ip address (access-lists): PBR#9 PBR#10
Set clauses:
Policy routing matches: 0 packets, 0 bytes

route-map AAA-02/06/04-14:34:09.735-2-AppSpec, permit, sequence 2, identifier 1141279420
Match clauses:
  ip address (access-lists): PBR#11 PBR#12
  length 10 100
Set clauses:
  ip next-hop 7.1.1.1
  ip gateway 7.1.1.1
Policy routing matches: 0 packets, 0 bytes

Current active dynamic routemaps = 2

In the following example, a recursive route-map has been configured for the route-map named `abccomp`:

Router# show route-map abccomp

route-map abccomp, permit, sequence 10
Match clauses:
  ip address (access-lists): 101
Set clauses:
  ip next-hop recursive 10.3.3.3
  ip next-hop 10.1.1.1 10.2.2.2 10.4.4.4
Policy routing matches: 0 packets, 0 bytes

---
