ATM CBR and VBR-rt Support

The ATM CBR and VBR-rt Support feature implements support for constant bit rate (CBR) and variable bit rate real-time (VBR-rt) service classes on ATM virtual circuits. This feature introduces CBR and VBR-rt support for ATM traffic management functions on enhanced ATM port adapters and the PA-A3-8T1/8E1 IMA port adapters.

Information About ATM CBR and VBR-rt Support

To learn an overview of this feature, the supported ATM port adapters, and available existing Cisco IOS documentation related to this feature, see the following sections:

- CBR and VBR-rt Support, page 2
- CBR and VBR-rt Documentation, page 3

CBR and VBR-rt Support

The Traffic Management Specification Version 4.0 standard defines five service classes that describe the user traffic transmitted on a network and the quality of service (QoS) that a network should provide for that traffic. Two of the service classes that are designed to support ATM real-time traffic management applications are constant bit rate (CBR) and variable bit rate real-time (VBR-rt).

The CBR and VBR-rt service classes are used to support ATM traffic management such as traffic shaping and traffic policing. For example, to perform ATM traffic shaping, the network operator uses the appropriate service class to configure the router to transmit ATM cells at a rate that conforms to the QoS that was purchased from an ATM Internet Service Provider (ISP). The service purchased is based on the type of service the user needs, such as voice, video, or data.

The CBR service class is designed for ATM virtual circuits (VCs) needing a static amount of bandwidth that is continuously available for the duration of the active connection. An ATM virtual circuit configured as CBR can send cells at peak cell rate (PCR) at any time and for any duration. It can also send cells at a rate less than the PCR or even emit no cells.

The VBR-rt service class is intended for real-time applications, such as compressed voice over IP (VoIP) and video conferencing. These applications require tightly constrained delays (cell transfer delay [CTD]) and delay variation (cell delay variation [CDV]). The source device transmits typically in bursts and at a rate that varies with time. VBR-rt is characterized by a peak cell rate (PCR), sustained cell rate (SCR), and maximum burst size (MBS).

This feature implements support for CBR and VBR-rt on the Cisco 7200 series and Cisco 7500 series routers in Cisco IOS Release 12.0(31)S and Cisco IOS Release 12.0(31)S4 on the following supported ATM port adapters:

- PA-A3-E3
- PA-A3-T3
- PA-A3-OC3
- PA-A3-8T1 IMA
- PA-A3-8E1 IMA

The PA-A3 port adapters provide advanced features for ATM traffic management. The PA-A3-OC3/T3/E3 ATM port adapters are single-port and single-wide port adapters for the Cisco 7200 series and Cisco 7500 series routers.

The eight-port PA-A3-8T1 and PA-A3-8E1 inverse multiplexing over ATM (IMA) port adapters support inverse multiplexing over ATM. Inverse multiplexing provides a means of access to ATM networks at rates between DS1/E1 and DS3/E3 levels by combining the bandwidth of multiple DS1/E1 links into groups that collectively provide higher intermediate rates. This is especially desirable in networks where DS3/E3 links are scarce.
CBR and VBR-rt Documentation

There is detailed, existing Cisco documentation on CBR, VBR-rt, the ATM PA-A3 port adapters, and the PA-A3-8T1/8E1 IMA port adapters.

How to Configure ATM CBR and VBR-rt Support

This section contains the following tasks:

- Configuring CBR
- Configuring VBR-rt
- Verifying CBR and VBR-rt Configurations on an ATM VC

Configuring CBR

This section contains the procedure to configure the constant bit rate (CBR) QoS class for an ATM permanent virtual circuit (PVC) and specifies the PVC bandwidth on a Cisco 7200 series or Cisco 7500 series router.
How to Configure ATM CBR and VBR-rt Support

SUMMARY STEPS

1. enable
2. configure terminal
3. interface type number
4. pvc [name] vpi | vci [l2transport]
5. cbr rate
6. end

DETAILED STEPS

<table>
<thead>
<tr>

How to Configure ATM CBR and VBR-rt Support

Cisco IOS Release: Multiple releases (see Feature History Table)

Configuring VBR-rt

This section contains the procedure to configure the real-time variable bit rate (VBR) for VoATM voice connections for an ATM PVC on a Cisco 7200 series or Cisco 7500 series router.

SUMMARY STEPS

1. enable
2. configure terminal
3. interface type number
4. pvc [name] vpi l vci [l2transport]
5. vbr-rt peak-rate average-rate burst
6. end

DETAILED STEPS

</table>
How to Configure ATM CBR and VBR-rt Support

Step 4

**Command or Action**
pvc [name] vpi|vci [l2transport]

**Example:**
Router(config-if)# pvc 0/100

Creates or assigns a name to an ATM permanent virtual circuit (PVC), specifies the encapsulation type on an ATM PVC, and enters virtual circuit configuration mode.

- name (optional) is the PVC name.
- vpi is the ATM network virtual path identifier (VPI) for this PVC.
- vci is the ATM network virtual channel identifier (VCI) for this PVC.
- l2transport (optional) is used to specify that the PVC is switched and not terminated.

The example creates a PVC with VPI 0 and VCI 100 in interface configuration mode.

For more information on the pvc command, see the Cisco IOS Wide-Area Networking Command Reference, Release 12.3.

Step 5

**Command or Action**
vbr-rt peak-rate average-rate burst

**Example:**
PA-A3-OC3 and PA-A3-E3 ATM PA configuration
Router(config-if-atm-vc)# vbr-rt 600 300 32

Example: PA-A3-T3 ATM PA configuration
Router(config-if-atm-vc)# vbr-rt 1000 1000 32

Configures the real-time variable bit rate (VBR) for VoATM voice connections for an ATM PVC in virtual circuit configuration mode.

- peak-rate is the peak cell rate (PCR) in Kbps.
- average-rate is the average cell rate in Kbps.
- burst is the burst cell size in number of cells.

The example creates a VBR-rt PVC with a PCR of 600 Kbps, an average cell rate of 300 Kbps, and a burst cell size of 32.

The PA-A3-T3 port adapter example creates a VBR-rt PVC with a PCR of 1000 Kbps, an average cell rate of 1000 Kbps, and a burst cell size of 32.

Step 6

**Command or Action**
end

**Example:**
Router(config-if-atm-vc)# end

Enter end four times or Ctrl-Z to exit the various configuration modes and return to privileged EXEC mode.

Verifying CBR and VBR-rt Configurations on an ATM VC

Perform this optional task to verify that CBR or VBR-rt are configured on an ATM VC.

**SUMMARY STEPS**

1. enable
2. show atm vc [vcd | interface interface-number]
DETAILED STEPS

Configuration Examples for ATM CBR and VBR-rt Support

This section contains the following examples:

- Configuring CBR: Example, page 7
- Configuring VBR-rt: Example, page 7
- Verifying CBR Output: Example, page 8

Configuring CBR: Example

To configure a CBR PVC, use the cbr command on an ATM VC, as shown in the following example:

```
Router(config)# interface atm 1/0
Router(config-if)# pvc 0/100
Router(config-if-atm-subif)# cbr 16000
```

Configuring VBR-rt: Example

The following example 1) configures a VBR-rt PVC with a peak cell rate of 10000 Kbps, an average cell rate of 5000 Kbps, and a burst cell size of 32 cells on a PVC; and 2) displays the configuration with a show run command. The highlighted arrow, for documentation purposes only, shows the configured VBR-rt:

```
Router(config-subif)# pvc 0/100
Router(config-if-atm-subif)# vbr-rt 10000 5000 32
Router(config-if-atm-subif)# end
```
The following is an example of a VBR-rt configuration on a PA-A3-OC3 ATM port adapter:

```
Router(config)# interface atm 1/0
Router(config-if)# pvc 0/100
Router(config-if-atm-vc)# vbr-rt ?
<64-155000> Peak Cell Rate (PCR) in Kbps
Router(config-if-atm-vc)# vbr-rt 600 ?
<64-600> Average Cell Rate in Kbps
Router(config-if-atm-vc)# vbr-rt 600 300 ?
<1-64000> Burst cell size in number of cells
Router(config-if-atm-vc)# vbr-rt 600 300 32
```

Verifying CBR Output: Example

The following example using the `show run interface` and `show atm vc` commands shows that CBR with a peak cell rate of 4000 Kbps is configured on ATM virtual circuit 2:

```
Router# show run interface atm 2/0.2
Building configuration...
Current configuration : 117 bytes
!
interface ATM2/0.2 point-to-point
ip address 10.0.0.2 10.255.255.255
no ip route-cache
pvc 10/40
cbr 4000
!
end
```

```
Router# show atm vc 2
01:13:52:%SYS-5-CONFIG_I:Configured from console by console
Description:N/A
ATM2/0.2:VCD:2, VPI:10, VCI:40
CBR, SusRate:4000 (9434 cps)
^^^^^^^^^^^^^^^^^^^^^^^^^^^^
AAL5-LLC/SNAP, etype:0x0, Flags:0x820, VCmode:0x0, Encapsize:12
OAM frequency:0 second(s)
VC TxRingLimit:157 particles
VC Rx Limit:47 particles
InARP frequency:15 minutes(s)
Transmit priority 1
```
