Packet Classification Using the Frame Relay DLCI Number

First Published: 12.2(13)T
Last Updated: February 28, 2006

The Packet Classification Using the Frame Relay DLCI Number feature allows customers to match and classify traffic based on the Frame Relay data-link connection identifier (DLCI) number associated with a packet. This new match criterion is in addition to the other match criteria, such as the IP precedence, differentiated service code point (DSCP) value, class of service (CoS), currently available.

Information About Packet Classification Using the Frame Relay DLCI Number

To configure Packet Classification Using the Frame Relay DLCI Number, you need to understand the following concepts:

- Modular Quality of Service Command-Line Interface, page 2
- DLCI Numbers and Network Addressing, page 2

Modular Quality of Service Command-Line Interface

The Packet Classification Using the Frame Relay DLCI Number feature extends the functionality of the Modular Quality of Service (QoS) Command-Line Interface (CLI) (MQC).

The MQC, a feature included in the Cisco IOS software, allows customers to match traffic on the basis of user-specified criteria (for example, access lists, or IP precedences). Traffic that matches that criteria can be organized into specific classes (class maps) that can, in turn, receive specific user-defined QoS treatment when that class is included in a policy map. The class map is placed in a policy map, and the policy map is then attached to an interface for use on the network.

The MQC is a CLI that allows you to create traffic policies and attach these policies to interfaces.

In the MQC, the class-map command is used to define a traffic class (which is then associated with a traffic policy). The purpose of a traffic class is to classify traffic.

The MQC consists of the following three processes:

- Defining a traffic class with the class-map command.
- Creating a traffic policy by associating the traffic class with one or more QoS features (using the policy-map command).
- Attaching the traffic policy to the interface with the service-policy command.

A traffic class contains three major elements: a name, a series of match commands, and, if more than one match command exists in the traffic class, an instruction on how to evaluate these match commands. The traffic class is named in the class-map command line; that is, if you enter the class-map cisco command while configuring the traffic class in the CLI, the traffic class would be named “cisco”.

The match commands are used to specify various criteria for classifying packets. Packets are checked to determine whether they match the criteria specified in the match commands. If a packet matches the specified criteria, that packet is considered a member of the class and is forwarded according to the quality of service (QoS) specifications set in the traffic policy. Packets that fail to meet any of the matching criteria are classified as members of the default traffic class.

DLCI Numbers and Network Addressing

A DLCI number is a data link connection identifier. Permanent virtual circuits (PVCs) and switched virtual circuits (SVCs) are identified by a DLCI number. The DLCI number defines a single virtual connection through the WAN and are the Frame Relay equivalent to a hardware address.
Periodically, through the exchange of signaling messages, a network may announce a new virtual circuit with its corresponding DLCI number. However, protocol addressing is not included in the announcement. The station receiving such an indication will learn of the new connection, but will not be able to address the other side. Without a new configuration or mechanism for discovering the protocol address of the other side, this new virtual circuit is unusable.

For this reason, Inverse Address Resolution Protocol (Inverse ARP) was developed. Inverse ARP allows a Frame Relay network to discover the protocol address associated with the virtual circuit, and ARP is more flexible than relying on static configuration.

How to Configure Packet Classification Using the Frame Relay DLCI Number

This section contains the following procedures:

- Configuring the Class Map to Match on the Frame Relay DLCI Number, page 3 (required)
- Creating a Policy Map, page 4 (required)
- Attaching the Policy Map to an Interface, page 4 (required)
- Verifying the Configuration, page 6 (optional)

Configuring the Class Map to Match on the Frame Relay DLCI Number

Class maps can be used to classify packets into groups based on a user-specified criterion. For example, class maps can be configured to match packets on the basis of the DSCP value or access list number. In this case, the class map is configured to match on the Frame Relay DLCI number associated with the packet. To configure the class map to match on the Frame Relay DLCI number, use the following commands.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `class-map class-map-name`
4. `match fr-dlci dlci-number`
5. `exit`
Packet Classification Using the Frame Relay DLCI Number

DETAILED STEPS

<td>• Enter name of class map.</td>
</tr>
<tr>
<td>Step 4 match fr-dlci dlci-number</td>
<td>Configures the class map created above to match traffic based on the Frame Relay DLCI number associated with the packet.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter the DLCI number.</td>
</tr>
<tr>
<td>Step 5 exit</td>
<td>(Optional) Exits class-map configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>

Creating a Policy Map

Traffic that matches a user-specified criterion can be organized into specific classes (class maps) that can, in turn, receive specific user-defined QoS treatment when that class is included in a policy map. A policy map (traffic policy) is created using the MQC.

To create a policy map using the MQC, refer to the instructions in the “Configuring the Modular Quality of Service Command-Line Interface” chapter of the Cisco IOS Quality of Service Solutions Configuration Guide, Release 12.2.

Attaching the Policy Map to an Interface

After a policy map is created, the next step is to attach the policy map to an interface. Policy maps can be attached to either the input or output direction of the interface.

Depending on the needs of your network, you may need to attach the policy map to a subinterface, an ATM PVC, a Frame Relay DLCI, or other type of interface.

To attach the policy map to an interface, use the following commands:
### SUMMARY STEPS

1. enable
2. configure terminal
3. interface type number
4. pvc [name] vpi/vci [ilmi | qsaal | smds]
5. service-policy {input | output} policy-map-name
6. exit

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>

Verifying the Configuration

This task allows you to verify that you created the configuration you intended and that the feature is functioning correctly. To verify the configuration, use the following commands.

SUMMARY STEPS

1. enable
2. show class-map [class-map-name]
   or
   show policy-map interface interface-name
3. exit
Packet Classification Using the Frame Relay DLCI Number

How to Configure Packet Classification Using the Frame Relay DLCI Number

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| Example: Router> enable |
| **Step 2** show class-map [class-map-name]  
and/or  
show policy-map interface interface-name | Displays all information about a class map, including the match criterion.  
or  
Displays the packet statistics of all classes that are configured for all service policies either on the specified interface or subinterface or on a specific PVC on the interface.  
- Enter the interface name. |
| Example:  
Router# show class-map class1  
and/or  
Router# show policy-map interface serial4/0 |
| **Step 3** exit | (Optional) Exits EXEC mode. |
| Example:  
Router# exit |

Troubleshooting Tips

The commands in the “Verifying the Configuration” section allow you to verify that you achieved the intended configuration and that the feature is functioning correctly. If, after using the `show` commands listed above, you find that the configuration is not correct or the feature is not functioning as expected, perform these operations:

If the configuration is not the one you intended, complete the following procedures:

- Use the `show running-config` command and analyze the output of the command.
- If the policy map does not appear in the output of the `show running-config` command, enable the `logging console` command.
- Attach the policy map to the interface again.
If the packets are not being matched correctly (for example, the packet counters are not incrementing correctly), complete the following procedures:

- Run the `show policy-map` command and analyze the output of the command.
- Run the `show running-config` command and analyze the output of the command.
- Use the `show policy-map interface` command and analyze the output of the command. Check the following findings:
  - If a policy map applies queueing, and the packets are matching the correct class, but you see unexpected results, compare the number of the packets in the queue with the number of the packets matched.
  - If the interface is congested, and only a small number of the packets are being matched, check the tuning of the tx ring, and evaluate whether the queueing is happening on the tx ring. To do this, use the `show controllers` command, and look at the value of the tx count in the output of the command.

### Configuration Examples for Packet Classification Using the Frame Relay DLCI Number

This section provides the following configuration example:

- Configuring the Frame Relay DLCI Number As a Match Criterion Example, page 8

#### Configuring the Frame Relay DLCI Number As a Match Criterion Example

In the following example, two PVCs are configured on one serial interface. QoS is provisioned so that one PVC receives 70 percent of the bandwidth and the other PVC receives 25 percent of the bandwidth. When configured as shown below, all traffic belonging to Frame Relay DLCI-102 will be guaranteed 70 percent of the bandwidth, while traffic belonging to Frame Relay DLCI-105 is guaranteed 25 percent of the bandwidth.

```plaintext
Router(config)# class-map match-all dlci-102
Router(config-cmap)# match fr-dlci 102

Router(config)# class-map match-all dlci-105
Router(config-cmap)# match fr-dlci 105

Router(config)# policy-map test-policy
Router(config-pmap)# class dlci-102
Router(config-pmap-c)# bandwidth percent 70
Router(config-pmap)# class dlci-105
Router(config-pmap-c)# bandwidth percent 25

Router(config)# interface Serial9/0/0:0
Router(config-if)# service-policy output test-policy
```

In the following example, QoS is further provisioned for traffic for a PVC (while also guaranteeing bandwidth to the PVC) by using a hierarchical policy. In this configuration example, traffic for PVC 102 (Frame Relay DLCI-102, shown above) is allocated 40 percent of the bandwidth.

```plaintext
Router(config)# class-map match-all precedence2
Router(config-cmap)# match ip precedence 2
```
Packet Classification Using the Frame Relay DLCI Number

Cisco IOS Release: Multiple releases (see the Feature History table)

Router(config)# policy-map child
Router(config-pmap)# class precedence2
Router(config-pmap-c)# bandwidth percent 40

Router(config)# policy-map test-policy
Router(config-pmap)# class dlci-102
Router(config-pmap-c)# bandwidth percent 70
Router(config-pmap-c)# service-policy child
Router(config-pmap-c)# class dlci-105
Router(config-pmap-c)# bandwidth percent 25

Router(config)# interface Serial9/0/0:
Router(config-if)# service-policy output test-policy

Command Reference

This section documents new and modified commands. All other commands used with this feature are documented in the Cisco IOS Release 12.3 command reference publications.

Modified Commands

- match fr-dlci
- show class-map
match fr-dlci

To specify the Frame Relay data-link connection identifier (DLCI) number as a match criterion in a class map, use the **match fr-dlci** command in class-map configuration mode. To remove a previously specified DLCI number as a match criterion, use the **no** form of this command.

```
match fr-dlci dlci-number

no match fr-dlci dlci-number
```

**Syntax Description**

| dlci-number | Number of the DLCI associated with the packet. |

**Defaults**

No DLCI number is specified.

**Command Modes**

Class-map configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(13)T</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(28)SB</td>
<td>This command was integrated into Cisco IOS Release 12.2(28)SB.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This match criterion can be used in main interfaces and point-to-multipoint subinterfaces in Frame Relay networks, and it can also be used in hierarchical policy maps.

**Examples**

In the following example a class map called “class1” has been created and the Frame Relay DLCI number of 500 has been specified as a match criterion. Packets matching this criterion are placed in class1.

```
Router(config)# class-map class1
Router(config-cmap)# match fr-dlci 500
Router(config-cmap)# end
```

**Related Commands**

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show class-map</td>
<td>Displays all class maps and their matching criteria.</td>
</tr>
<tr>
<td>show policy-map interface</td>
<td>Displays the packet statistics of all classes that are configured for all service policies either on the specified interface or subinterface or on a specific PVC on the interface.</td>
</tr>
</tbody>
</table>
**show class-map**

To display all class maps and their matching criteria, use the `show class-map` command in EXEC mode.

```
  show class-map [type {stack | access-control}] [class-map-name]
```

**Syntax Description**

- **type stack** (Optional) Displays class maps configured to determine the correct protocol stack in which to examine via flexible packet matching (FPM).
- **type access-control** (Optional) Displays class maps configured to determine the exact pattern to look for in the protocol stack of interest.
- **class-map-name** (Optional) Name of the class map. The class map name can be a maximum of 40 alphanumeric characters.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(5)T</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(13)T</td>
<td>This command was modified to display the Frame Relay data-link connection identified (DLCI) number as a criterion for matching traffic inside a class map. In addition, this command was modified to display Layer 3 packet length as a criterion for matching traffic inside a class map.</td>
</tr>
<tr>
<td>12.4(4)T</td>
<td>The <code>type</code>, <code>stack</code>, and <code>access-control</code> keywords were added to support flexible packet matching (FPM).</td>
</tr>
<tr>
<td>12.2(28)SB</td>
<td>This command was integrated into Cisco IOS Release 12.2(28)SB.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can use the `show class-map` command to display all class maps and their matching criteria. If you enter the optional `class-map-name` argument, the specified class map and its matching criteria will be displayed.

**Examples**

In the following example, three class maps are defined. Packets that match access list 103 belong to class c3, IP packets belong to class c2, and packets that come through input Ethernet interface 1/0 belong to class c1. The output from the `show class-map` command shows the three defined class maps.

```
Router# show class-map

  Class Map c3
    Match access-group 103

  Class Map c2
    Match protocol ip

  Class Map c1
    Match input-interface Ethernet1/0
```
In the following example, a class map called “c1” has been defined, and the Frame Relay DLCI number of 500 has been specified as a match criterion:

```
Router# show class-map

class map match-all c1
    match fr-dlci 500
```

Table 1 describes the significant fields shown in the display.

### Table 1  **show class-map Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class Map</td>
<td>Class of traffic being displayed. Output is displayed for each configured class map in the policy. The choice for implementing class matches (for example, match-all or match-any) can also appear next to the traffic class.</td>
</tr>
<tr>
<td>Match</td>
<td>Match criteria specified for the class map. Choices include criteria such as the Frame Relay DLCI number, Layer 3 packet length, IP precedence, IP differentiated services code point (DSCP) value, Multiprotocol Label Switching (MPLS) experimental value, access groups, and quality of service (QoS) groups.</td>
</tr>
</tbody>
</table>

1. A number in parentheses may appear next to the class-map name, and match criteria information. The number is for Cisco internal use only and can be disregarded.
