

# MPLS LSP Ping/Traceroute for LDP/TE, and LSP Ping for VCCV

---

**First Published: January 26, 2004**

**Last Updated: May 4, 2009**

The MPLS LSP Ping/Traceroute for LDP/TE, and LSP Ping for VCCV feature helps service providers monitor label switched paths (LSPs) and quickly isolate Multiprotocol Label Switching (MPLS) forwarding problems.

The feature provides the following capabilities:

- MPLS LSP ping to test LSP connectivity for IPv4 Label Distribution Protocol (LDP) prefixes, Resource Reservation Protocol (RSVP) traffic engineering (TE), and Any Transport over MPLS (AToM) forwarding equivalence classes (FECs).
- MPLS LSP traceroute to trace the LSPs for IPv4 LDP prefixes and RSVP TE prefixes.

## Finding Feature Information

For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for MPLS LSP Ping/Traceroute for LDP/TE, and LSP Ping for VCCV”](#) section on page 60.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS XE software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Glossary, page 61](#)

## Prerequisites for MPLS LSP Ping/Traceroute for LDP/TE, and LSP Ping for VCCV

Before you use the MPLS LSP Ping/Traceroute for LDP/TE, and LSP Ping for VCCV feature, you should:

- Determine the baseline behavior of your MPLS network. For example:
  - Expected MPLS experimental (EXP) treatment.
  - Expected maximum size packet or maximum transmission unit (MTU) of the LSP.
  - The topology, expected label switched path, and number of links in the LSP. Trace the paths of the label switched packets including the paths for load balancing.
- Understand how to use MPLS and MPLS applications. You need to:
  - Know how LDP is configured.
  - Understand AToM concepts.
- Understand label switching, forwarding, and load balancing.

Before using the **ping mpls** or **trace mpls** command, you must ensure that the router is configured to encode and decode MPLS echo packets in a format that all receiving routers in the network can understand.

## Restrictions for MPLS LSP Ping/Traceroute for LDP/TE, and LSP Ping for VCCV

- You cannot use MPLS LSP traceroute to trace the path taken by AToM packets. MPLS LSP traceroute is not supported for AToM. (MPLS LSP ping is supported for AToM.) However, you can use MPLS LSP traceroute to troubleshoot the Interior Gateway Protocol (IGP) LSP that is used by AToM.
- You cannot use MPLS LSP ping to validate or trace MPLS Virtual Private Networks (VPNs).
- You cannot use MPLS LSP traceroute to troubleshoot LSPs that employ time-to-live (TTL) hiding.
- MPLS supports per-destination and per-packet (round robin) load balancing. If per-packet load balancing is in effect, you should not use MPLS LSP traceroute because LSP traceroute at a transit router consistency checks the information supplied in the previous echo response from the directly connected upstream router. When round robin is employed, the path that an echo request packet takes cannot be controlled in a way that allows a packet to be directed to TTL expire at a given router. Without that ability, the consistency checking may fail during an LSP traceroute. A consistency check failure return code may be returned.

- A platform must support LSP ping and traceroute in order to respond to an MPLS echo request packet.
- Unless the MPLS LSP Ping/Traceroute for LDP/TE, and LSP Ping for VCCV feature is enabled along the entire path, you cannot get a reply if the request fails along the path at any node.
- There are certain limitations when a mixture of draft versions are implemented within a network. The version of the draft must be compatible with Cisco's implementation. Due to the way the LSP Ping draft was written, earlier versions may not be compatible with later versions because of changes to type, length, values (TLVs) formats without sufficient versioning information. Cisco attempts to compensate for this in its implementations by allowing the sending and responding routers to be configured to encode and decode echo packets assuming a certain version.
- If you want to use MPLS LSP traceroute, the network should not use TTL hiding.

## Information About MPLS LSP Ping/Traceroute for LDP/TE, and LSP Ping for VCCV

Before using the MPLS LSP Ping/Traceroute for LDP/TE, and LSP Ping for VCCV feature, you should understand the following concepts:

- [MPLS LSP Ping/Traceroute for LDP/TE, and LSP Ping for VCCV Functionality, page 3](#)
- [MPLS LSP Ping Operation, page 4](#)
- [MPLS LSP Traceroute Operation, page 5](#)
- [MPLS Network Management with MPLS LSP Ping and MPLS LSP Traceroute, page 7](#)
- [Any Transport over MPLS Virtual Circuit Connection, page 7](#)
- [IP Does Not Forward MPLS Echo Request Packets, page 9](#)

## MPLS LSP Ping/Traceroute for LDP/TE, and LSP Ping for VCCV Functionality

Internet Control Message Protocol (ICMP) ping and traceroute are often used to help diagnose the root cause when a forwarding failure occurs. However, they are not well suited for identifying LSP failures because an ICMP packet can be forwarded via IP to the destination when an LSP breakage occurs.

The MPLS LSP Ping/Traceroute for LDP/TE, and LSP Ping for VCCV feature is well suited for identifying LSP breakages for the following reasons:

- An MPLS echo request packet cannot be forwarded via IP because IP TTL is set to 1 and the IP destination address field is set to a 127/8 address.
- The FEC being checked is not stored in the IP destination address field (as is the case of ICMP).

MPLS echo request and reply packets test LSPs. There are two methods by which a downstream router can receive packets:

- The Cisco implementation of MPLS echo request and echo reply that was previously based on the Internet Engineering Task Force (IETF) Internet Draft *Detecting MPLS Data Plane Failures* (draft-ietf-mpls-lsp-ping-03.txt).

- Features described in this document that are based on the IETF RFC 4379 [Detecting Multi-Protocol Label Switched \(MPLS\) Data Plane Failures](#):
  - Echo request output interface control
  - Echo request traffic pacing
  - Echo request end-of-stack explicit-null label shimming
  - Echo request request-dsmap capability
  - Request-fec checking
  - Depth limit reporting

## MPLS LSP Ping Operation

MPLS LSP ping uses MPLS echo request and reply packets to validate an LSP. You can use MPLS LSP ping to validate IPv4 LDP, AToM, and IPv4 RSVP FECs by using appropriate keywords and arguments with the **ping mpls** command.

The MPLS echo request packet is sent to a target router through the use of the appropriate label stack associated with the LSP to be validated. Use of the label stack causes the packet to be forwarded over the LSP itself.

The destination IP address of the MPLS echo request packet is different from the address used to select the label stack. The destination IP address is defined as a 127.x.y.z/8 address. The 127.x.y.z/8 address prevents the IP packet from being IP switched to its destination if the LSP is broken.

An MPLS echo reply is sent in response to an MPLS echo request. The reply is sent as an IP packet and it is forwarded using IP, MPLS, or a combination of both types of switching. The source address of the MPLS echo reply packet is an address obtained from the router generating the echo reply. The destination address is the source address of the router that originated the MPLS echo request packet.

The MPLS echo reply destination port is set to the echo request source port.

[Figure 1](#) shows MPLS LSP ping echo request and echo reply paths.

**Figure 1** *MPLS LSP Ping Echo Request and Echo Reply Paths*

If you initiate an MPLS LSP ping request at LSR1 to a FEC at LSR6, you get the results shown in [Table 1](#).

**Table 1**      **MPLS LSP Ping Example from Figure 1**

Step	Router	Action
1.	LSR1	Initiates an MPLS LSP ping request for an FEC at the target router LSR6 and sends an MPLS echo request to LSR2.
2.	LSR2	Receives the MPLS echo request packet and forwards it through transit routers LSR3 and LSR4 to the penultimate router LSR5.
3.	LSR5	Receives the MPLS echo request, pops the MPLS label, and forwards the packet to LSR6 as an IP packet.
4.	LSR6	Receives the IP packet, processes the MPLS echo request, and sends an MPLS echo reply to LSR1 through an alternate route.
5.	LSR7 to LSR10	Receives the MPLS echo reply and forwards it back toward LSR1, the originating router.
6.	LSR1	Receives the MPLS echo reply in response to its MPLS echo request.

## MPLS LSP Traceroute Operation

MPLS LSP traceroute uses MPLS echo request and reply packets to validate an LSP. You can use MPLS LSP traceroute to validate IPv4 LDP and IPv4 RSVP FECs by using appropriate keywords and arguments with the **trace mpls** command.

The MPLS LSP Traceroute feature uses TTL settings to force expiration of the TTL along an LSP. MPLS LSP Traceroute incrementally increases the TTL value in its MPLS echo requests (TTL = 1, 2, 3, 4) to discover the downstream mapping of each successive hop. The success of the LSP traceroute depends on the transit router processing the MPLS echo request when it receives a labeled packet with a TTL = 1. On Cisco routers, when the TTL expires, the packet is sent to the Route Processor (RP) for processing. The transit router returns an MPLS echo reply containing information about the transit hop in response to the TTL-expired MPLS packet.

The MPLS echo reply destination port is set to the echo request source port.

### Note

When a router traces an IPV4 FEC that goes over a traffic engineering tunnel, intermediate routers may return U (unreachable) if LDP is not running in those intermediate routers.

Figure 2 shows an MPLS LSP traceroute example with an LSP from LSR1 to LSR4.

**Figure 2**      **MPLS LSP Traceroute Example**

If you enter an LSP traceroute to an FEC at LSR4 from LSR1, you get the results shown in [Table 2](#).

**Table 2**      **MPLS LSP Traceroute Example Based on [Figure 2](#)**

Step	Router	MPLS Packet Type and Description	Router Action (Receive or Send)
1.	LSR1	MPLS echo request—With a target FEC pointing to LSR4 and to a downstream mapping	<ul style="list-style-type: none"> <li>Sets the TTL of the label stack to 1</li> <li>Sends the request to LSR2</li> </ul>
2.	LSR2	MPLS echo reply	<ul style="list-style-type: none"> <li>Receives the packet with a TTL = 1</li> <li>Processes the User Datagram Protocol (UDP) packet as an MPLS echo request</li> <li>Finds a downstream mapping and replies to LSR1 with its own downstream mapping, based on the incoming label</li> </ul>
3.	LSR1	MPLS echo request—With the same target FEC and the downstream mapping received in the echo reply from LSR2	<ul style="list-style-type: none"> <li>Sets the TTL of the label stack to 2</li> <li>Sends the request to LSR2</li> </ul>
4.	LSR2	MPLS echo request	<ul style="list-style-type: none"> <li>Receives the packet with a TTL = 2</li> <li>Decrements the TTL</li> <li>Forwards the echo request to LSR3</li> </ul>
5.	LSR3	MPLS reply packet	<ul style="list-style-type: none"> <li>Receives the packet with a TTL = 1</li> <li>Processes the UDP packet as an MPLS echo request</li> <li>Finds a downstream mapping and replies to LSR1 with its own downstream mapping based on the incoming label</li> </ul>
6.	LSR1	MPLS echo request—With the same target FEC and the downstream mapping received in the echo reply from LSR3	<ul style="list-style-type: none"> <li>Sets the TTL of the packet to 3</li> <li>Sends the request to LSR2</li> </ul>

**Table 2** *MPLS LSP Traceroute Example Based on Figure 2 (continued)*

Step	Router	MPLS Packet Type and Description	Router Action (Receive or Send)
7.	LSR2	MPLS echo request	<ul style="list-style-type: none"> <li>Receives the packet with a TTL = 3</li> <li>Decrements the TTL</li> <li>Forwards the echo request to LSR3</li> </ul>
8.	LSR3	MPLS echo request	<ul style="list-style-type: none"> <li>Receives the packet with a TTL = 2</li> <li>Decrements the TTL</li> <li>Forwards the echo request to LSR4</li> </ul>
9.	LSR4	MPLS echo reply	<ul style="list-style-type: none"> <li>Receives the packet with a TTL = 1</li> <li>Processes the UDP packet as an MPLS echo request</li> <li>Finds a downstream mapping and also finds that the router is the egress router for the target FEC</li> <li>Replies to LSR1</li> </ul>

## MPLS Network Management with MPLS LSP Ping and MPLS LSP Traceroute

To manage an MPLS network, you must have the ability to monitor LSPs and quickly isolate MPLS forwarding problems. You need ways to characterize the liveliness of an LSP and reliably detect when an LSP fails to deliver user traffic.

You can use MPLS LSP ping to verify the LSP that is used to transport packets destined for IPv4 LDP prefixes, and AToM PW FECs. You can use MPLS LSP traceroute to trace LSPs that are used to carry packets destined for IPv4 LDP prefixes.

An MPLS echo request is sent through an LSP to validate it. A TTL expiration or LSP breakage causes the transit router to process the echo request before it gets to the intended destination. The router returns an MPLS echo reply that contains an explanatory reply code to the originator of the echo request.

The successful echo request is processed at the egress of the LSP. The echo reply is sent via an IP path, an MPLS path, or a combination of both back to the originator of the echo request.

## Any Transport over MPLS Virtual Circuit Connection

AToM Virtual Circuit Connection Verification (VCCV) allows you to send control packets inband of an AToM PW from the originating provider edge (PE) router. The transmission is intercepted at the destination PE router, instead of being forwarded to the customer edge (CE) router. This capability allows you to use MPLS LSP ping to test the PW section of AToM virtual circuits (VCs).

LSP ping allows verification of AToM VC setup by FEC 128 or FEC 129. FEC 128-based AToM VCs can be set up by using LDP for signaling or by using a static pseudowire configuration without using any signaling component on the two endpoints. Cisco IOS XE software does not distinguish between FEC 128 and FEC 129 static pseudowires while issuing MPLS ping; the same commands are used.

AToM VCCV consists of the following:

- A signaled component in which the AToM VCCV capabilities are advertised during VC label signaling
- A switching component that causes the AToM VC payload to be treated as a control packet

## AToM VCCV Signaling

One of the steps involved in AToM VC setup is the signaling or communication of VC labels and AToM VCCV capabilities between AToM VC endpoints. To communicate the AToM VCCV disposition capabilities of each endpoint, the router uses an optional parameter, defined in the IETF Internet Draft *Pseudo Wire (PW) Virtual Circuit Connection Verification (VCCV)* (draft-ietf-pwe3-vccv-01).

The AToM VCCV disposition capabilities are categorized as follows:

- Applications—MPLS LSP ping and ICMP ping are applications that AToM VCCV supports to send packets inband of an AToM PW for control purposes.
- Switching modes—Type 1 and Type 2 are switching modes that AToM VCCV uses for differentiating between control and data traffic.

Table 3 describes AToM VCCV Type 1 and Type 2 switching modes.

**Table 3**      **Type 1 and Type 2 AToM VCCV Switching Modes**

Switching Mode	Description
Type 1	Uses a Protocol ID (PID) field in the AToM control word to identify an AToM VCCV packet
Type 2	Uses an MPLS Router Alert Label above the VC label to identify an AToM VCCV packet

## Selection of AToM VCCV Switching Types

Cisco routers always use Type 1 switching, if available, when they send MPLS LSP ping packets over an AToM VC control channel. Type 2 switching accommodates those VC types and implementations that do not support or interpret the AToM control word.

Table 4 shows the AToM VCCV switching mode advertised and the switching mode selected by the AToM VC.

**Table 4**      **AToM VCCV Switching Mode Advertised and Selected by AToM VC**

Type Advertised	Type Selected
AToM VCCV not supported	—
Type 1 AToM VCCV switching	Type 1 AToM VCCV switching
Type 2 AToM VCCV switching	Type 2 AToM VCCV switching
Type 1 and Type 2 AToM VCCV switching	Type 1 AToM VCCV switching

An AToM VC advertises its AToM VCCV disposition capabilities in both directions: that is, from the originating router (PE1) to the destination router (PE2), and from PE2 to PE1.

In some instances, AToM VCs might use different switching types if the two endpoints have different AToM VCCV capabilities. If PE1 supports Type 1 and Type 2 AToM VCCV switching and PE2 supports only Type 2 AToM VCCV switching, there are two consequences:

- LSP ping packets sent from PE1 to PE2 are encapsulated with Type 2 switching.
- LSP ping packets sent from PE2 to PE1 use Type 1 switching.

You can determine the AToM VCCV capabilities advertised to and received from the peer by entering the **show mpls l2transport binding** command at the PE router.

## Information Provided by the Router Processing LSP Ping or LSP Traceroute

Table 5 describes the characters that the router processing an LSP ping or LSP traceroute packet returns to the sender about the failure or success of the request.

You can also display the return code for an MPLS LSP Ping operation if you enter the **verbose** keyword in the **ping mpls** command.

**Table 5** *Echo Reply Return Codes*

Output Code	Echo Return Code	Meaning
x	0	No return code.
M	1	Malformed echo request.
m	2	Unsupported TLVs.
!	3	Success.
F	4	No FEC mapping.
D	5	DS Map mismatch.
I	6	Unknown Upstream Interface index.
U	7	Reserved.
L	8	Labeled output interface.
B	9	Unlabeled output interface.
f	10	FEC mismatch.
N	11	No label entry.
P	12	No receive interface label protocol.
p	13	Premature termination of the LSP.
X	unknown	Undefined return code.

**Note**

Echo return codes 6 and 7 are accepted only for Version 3 (draft-ietf-mpls-ping-03).

## IP Does Not Forward MPLS Echo Request Packets

MPLS echo request packets sent during an LSP ping are never forwarded by IP. The IP header destination address field in an MPLS echo request packet is a 127.x.y.z/8 address. Routers should not forward packets using a 127.x.y.z/8 address. The 127.x.y.z/8 address corresponds to an address for the local host.

Use of a 127.x.y.z address as the destination address of the UDP packet is significant because the MPLS echo request packet fails to make it to the target router if a transit router does not label switch the LSP. The use of the 127.x.y.z address allows for the detection of LSP breakages. The following occurs at the transit router:

- If an LSP breakage occurs at a transit router, the MPLS echo packet is not forwarded; it is consumed by the router.
- If the LSP is intact, the MPLS echo packet reaches the target router and is processed by the terminal point of the LSP.

Figure 3 shows the path of the MPLS echo request and reply when a transit router fails to label switch a packet in an LSP.

**Figure 3** Path when Transit Router Fails to Label Switch a Packet

**Note**

An AToM payload does not contain usable forwarding information at a transit router because the payload may not be an IP packet. An MPLS VPN packet, although an IP packet, does not contain usable forwarding information at a transit router because the destination IP address is significant only to the virtual routing and forwarding (VRF) instances at the endpoints of the MPLS network.

## How to Configure MPLS LSP Ping/Traceroute for LDP/TE, and LSP Ping for VCCV

This section contains the following tasks:

- [Enabling Compatibility Between the MPLS LSP and Ping or Traceroute Implementation, page 11](#) (required)
- [Validating an FEC by Using MPLS LSP Ping and MPLS LSP Traceroute, page 12](#) (required)
- [Using DSCP to Request a Specific Class of Service in an Echo Reply, page 15](#) (optional)
- [Controlling How a Responding Router Replies to an MPLS Echo Request, page 16](#) (optional)
- [Preventing Loops when Using MPLS LSP Ping and LSP Traceroute Command Options, page 18](#) (optional)
- [Detecting LSP Breaks, page 20](#) (optional)

## Enabling Compatibility Between the MPLS LSP and Ping or Traceroute Implementation

LSP ping drafts after Version 3 (draft-ietf-mpls-ping-03) have undergone numerous TLV format changes, but the versions of the draft do not always interoperate.

To allow later Cisco implementations to interoperate with draft Version 3 Cisco and non-Cisco implementations, use a global configuration mode to decode echo packets in formats understood by draft Version 3 implementations.

Unless configured otherwise, a Cisco implementation encodes and decodes echo requests assuming the version on which the IETF implementations is based.

To prevent failures reported by the replying router due to TLV version issues, you should configure all routers in the core. Encode and decode MPLS echo packets in the same draft version. For example, if the network is running RFC 4379 (Cisco Version 4) implementations but one router is capable of only Version 3 (Cisco Revision 3), configure all routers in the network to operate in Revision 3 mode.

The Cisco implementation of MPLS echo request and echo reply is based on the IETF RFC 4379. IETF drafts subsequent to this RFC (drafts 3, 4, 5, 6, and 7) introduced TLV format differences. These differences could not be identified because the echo packet had no way to differentiate between one TLV format and another TLV format. To allow interoperability, a **revision** keyword was added for the **ping mpls** and **trace mpls** commands. The **revision** keyword enables Cisco IOS XE releases to support the existing draft changes and any changes from future versions of the IETF LSP Ping draft.

**Note**

We recommend that you use the **mpls oam** global configuration command instead of the revision option.

**Note**

No images are available on cisco.com to support Revision 2. It is recommended that you use only images supporting Version 3 and later when configuring TLV encode and decode modes. MPLS Multipath LSP traceroute requires Cisco Revision 4 or later.

**Cisco Vendor Extensions:** In Cisco's Version 3 (draft-ietf-mpls-ping-03.txt) implementations, Cisco defined a vendor extension TLV in the ignore-if-not-understood TLV space. It is used for the following purposes:

- Provide an ability to track TLV versions.
- Provide an experimental Reply TOS capability.

The first capability was defined before the existence of the global configuration command for setting the echo packet encode and decode behavior. TLV version information in an echo packet overrides the configured decoding behavior. Using this TLV for TLV versions is no longer required since the introduction of the global configuration capability.

The second capability controls the reply DSCP. Draft Version 8 defines a Reply TOS TLV, so the use of the reply DSCP is no longer required.

To enable compatibility between the MPLS LSP and ping or traceroute implementation by customizing the default behavior of echo packets, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. **mpls oam**
4. **echo revision {3 | 4}**
5. **echo vendor-extension**
6. **exit**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>mpls oam</b>  <b>Example:</b> Router(config)# mpls oam	Enters MPLS OAM configuration mode for customizing the default behavior of echo packets.
Step 4	<b>echo revision {3   4}</b>  <b>Example:</b> Router(config-mpls)# echo revision 4	Specifies the revision number of the echo packet's default values. <ul style="list-style-type: none"> <li>3—draft-ietf-mpls-ping-03 (Revision 2).</li> <li>4—RFC 4379 compliant (default).</li> </ul>
Step 5	<b>echo vendor-extension</b>  <b>Example:</b> Router(config-mpls)# echo vendor-extension	Sends the Cisco-specific extension of TLVs with echo packets.
Step 6	<b>exit</b>  <b>Example:</b> Router(config-mpls)# exit	Returns to global configuration mode.

## Validating an FEC by Using MPLS LSP Ping and MPLS LSP Traceroute

An LSP is formed by labels. Routers learn labels through LDP, AToM, or some other MPLS applications. You can use MPLS LSP ping or traceroute to validate an LSP used for forwarding traffic for a given FEC.

This section describes the following tasks:

- Validating an LDP IPv4 FEC by Using MPLS LSP Ping and MPLS LSP Traceroute, page 13
- Validating a Layer 2 FEC by Using MPLS LSP Ping and MPLS LSP Traceroute, page 13

## Validating an LDP IPv4 FEC by Using MPLS LSP Ping and MPLS LSP Traceroute

To ensure that the router will be able to forward MPLS packets for IPv4 FEC prefixes advertised by LDP, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **ping mpls ipv4** *destination-address/destination-mask-length* [**repeat count**] [**exp exp-bits**] [**verbose**]  
or  
**trace mpls ipv4** *destination-address/destination-mask-length*
3. **exit**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>ping mpls ipv4</b> <i>destination-address /destination-mask-length</i> [ <b>repeat count</b> ] [ <b>exp exp-bits</b> ] [ <b>verbose</b> ]  or <b>trace mpls ipv4</b> <i>destination-address /destination-mask-length</i>  <b>Example:</b> Router# ping mpls ipv4 10.131.191.252/32 exp 5 repeat 5 verbose  or  <b>Example:</b> Router# trace mpls ipv4 10.131.191.252/32	Selects an LDP IPv4 prefix FEC for validation.
Step 3	<b>exit</b>  <b>Example:</b> Router# exit	Returns to user EXEC mode.

## Validating a Layer 2 FEC by Using MPLS LSP Ping and MPLS LSP Traceroute

To ensure that the router will be able to forward MPLS packets for Layer 2 FEC prefixes advertised by LDP, perform the following steps.

SUMMARY STEPS

- 1. enable
- 2. ping mpls pseudowire ipv4-address vc-id vc-id
- 3. exit

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>enable</p> <p><b>Example:</b> Router&gt; enable</p>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>

	Command or Action	Purpose
Step 2	<p><b>ping mpls pseudowire</b> <i>ipv4-address vc-id vc-id</i></p> <p><b>Example:</b> Router# ping mpls pseudowire 10.131.191.252 vc-id 333</p>	Selects a Layer 2 FEC for validation.
Step 3	<p><b>exit</b></p> <p><b>Example:</b> Router# exit</p>	Returns to user EXEC mode.

## Using DSCP to Request a Specific Class of Service in an Echo Reply

Cisco IOS XE software includes a reply differentiated services code point (DSCP) option that lets you request a specific class of service (CoS) in an echo reply.

The reply DSCP option is supported in the experimental mode for IETF draft-ietf-mpls-lsp-ping-03.txt. Cisco implemented a vendor-specific extension for the reply DSCP option rather than using a Reply TOS TLV. A Reply TOS TLV serves the same purpose as the **reply dscp** command in RFC 4379. This draft provides a standardized method of controlling the reply DSCP.

### Note

Before draft Version 8, Cisco implemented the Reply DSCP option as an experimental capability using a Cisco vendor extension TLV. If a router is configured to encode MPLS echo packets for draft Version 3 implementations, a Cisco vendor extension TLV is used instead of the Reply TOS TLV that was defined in draft Version 8.

To use DSCP to request a specific CoS in an echo reply, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **ping mpls** {**ipv4** *destination-address/destination-mask-length* | **pseudowire** *ipv4-address vc-id vc-id* } [**reply dscp** *dscp-value*]  
or  
**trace mpls ipv4** *destination-address/destination-mask-length* [**reply dscp** *dscp-value*]
3. **exit**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>ping mpls</b> { <b>ipv4</b> <i>destination-address</i> / <i>destination-mask-length</i>   <b>pseudowire</b> <i>ipv4-address</i> <b>vc-id</b> <i>vc-id</i> } [ <b>reply dscp</b> <i>dscp-value</i> ]  or  <b>trace mpls ipv4</b> <i>destination-address</i> / <i>destination-mask-length</i> [ <b>reply dscp</b> <i>dscp-value</i> ]  <b>Example:</b> Router# ping mpls ipv4 10.131.191.252/32 reply dscp 50  or  <b>Example:</b> Router# trace mpls ipv4 10.131.191.252/32 reply dscp 50	Controls the DSCP value of an echo reply.
Step 3	<b>exit</b>  <b>Example:</b> Router# exit	Returns to user EXEC mode.

## Controlling How a Responding Router Replies to an MPLS Echo Request

To control how a responding router replies to an MPLS echo request, see the [“Reply Modes for an MPLS LSP Ping and LSP Traceroute Echo Request Response”](#) section.

## Reply Modes for an MPLS LSP Ping and LSP Traceroute Echo Request Response

The reply mode controls how a responding router replies to an MPLS echo request sent by a **ping mpls** or **trace mpls** command. There are two reply modes for an echo request packet:

- ipv4—Reply with an IPv4 UDP packet (default)
- router-alert—Reply with an IPv4 UDP packet with router alert

**Note**

It is useful to use ipv4 and router-alert reply modes in conjunction with each other to prevent false negatives. If you do not receive a reply via the ipv4 mode, it is useful to send a test with the router-alert reply mode. If both fail, something is wrong in the return path. The problem may be only that the Reply TOS is not set correctly.

**ipv4 Reply Mode:** IPv4 packet is the most common reply mode used with a **ping mpls** or **trace mpls** command when you want to periodically poll the integrity of an LSP. With this option, you do not have explicit control over whether the packet traverses IP or MPLS hops to reach the originator of the MPLS echo request. If the originating (headend) router fails to receive a reply to an MPLS echo request when you use the **reply mode ipv4** keywords, use the **reply mode router-alert** keywords.

**Router-alert Reply Mode:** The router-alert reply mode adds the router alert option to the IP header. When an IP packet that contains an IP router alert option in its IP header or an MPLS packet with a router alert label as its outermost label arrives at a router, the router punts (redirects) the packet to the Route Processor (RP) level for handling. This forces the Cisco router to handle the packet at each intermediate hop as it moves back to the destination. Hardware and line-card forwarding inconsistencies are bypassed. Router-alert reply mode is more expensive than IPv4 mode because the reply goes hop-by-hop. It also is slower, so the sender receives a reply in a relatively longer period of time.

Table 6 describes how IP and MPLS packets with an IP router alert option are handled by the router switching path processes.

**Table 6** Path Process Handling of IP and MPLS Router Alert Packets

Incoming Packet	Normal Switching Action	Process Switching Action	Outgoing Packet
IP packet—Router alert option in IP header	Router alert option in IP header causes the packet to be punted to the process switching path.	Forwards the packet as is	IP packet—Router alert option in IP header
		Forwards the packet as is	MPLS packet
MPLS packet—Outermost label contains a router alert	If the router alert label is the outermost label, it causes the packet to be punted to the process switching path.	Removes the outermost router alert label and forwards the packet as an IP packet	IP packet—Router alert option in IP header
		Preserves the outermost router alert label and forwards the MPLS packet	MPLS packet—Outermost label contains a router alert.

## SUMMARY STEPS

1. **enable**
2. **ping mpls** {**ipv4** *destination-address/destination-mask-length* | **pseudowire** *ipv4-address vc-id*} **reply mode** {**ipv4** | **router-alert**}  
or  
**trace mpls** **ipv4** *destination-address/destination-mask* **reply mode** {**ipv4** | **router-alert**}
3. **exit**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>ping mpls</b> { <b>ipv4</b> <i>destination-address</i> / <i>destination-mask-length</i>   <b>pseudowire</b> <i>ipv4-address</i> <b>vc-id</b> <i>vc-id</i> } <b>reply mode</b> { <b>ipv4</b>   <b>router-alert</b> }  or  <b>trace mpls ipv4</b> <i>destination-address</i> / <i>destination-mask</i> <b>reply mode</b> { <b>ipv4</b>   <b>router-alert</b> }  <b>Example:</b> Router# ping mpls ipv4 10.131.191.252/32 reply mode ipv4  or Router# trace mpls ipv4 10.131.191.252/32 reply mode router-alert	Checks MPLS LSP connectivity.  or Discovers MPLS LSP routes that packets actually take when traveling to their destinations.  <b>Note</b> To specify the reply mode, you must enter the <b>reply mode</b> keyword with the <b>ipv4</b> or <b>router-alert</b> keyword.
Step 3	<b>exit</b>  <b>Example:</b> Router# exit	Returns to user EXEC mode.

## Preventing Loops when Using MPLS LSP Ping and LSP Traceroute Command Options

The interaction of the MPLS Embedded Management—LSP Ping for LDP feature options can cause loops. See the following sections for a description of the loops you may encounter with the **ping mpls** and **trace mpls** commands:

- [Using MPLS LSP Ping to Discover Possible Loops, page 18](#)
- [Using MPLS LSP Traceroute to Discover Possible Loops, page 19](#)

### Using MPLS LSP Ping to Discover Possible Loops

With the MPLS LSP Ping feature, loops can occur if you use the UDP destination address range, repeat option, or sweep option.

To use MPLS LSP ping to discover possible loops, perform the following steps.

## SUMMARY STEPS

1. **enable**
2. **ping mpls** {**ipv4** *destination-address/destination-mask* [**destination** *address-start address-end increment*] | [**pseudowire** *ipv4-address vc-id vc-id address-end increment*] } [**repeat** *count*] [**sweep** *minimum maximum size-increment*]
3. **exit**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>ping mpls</b> { <b>ipv4</b> <i>destination-address /destination-mask</i> [ <b>destination</b> <i>address-start address-end increment</i> ]   [ <b>pseudowire</b> <i>ipv4-address vc-id vc-id address-end increment</i> ]} [ <b>repeat</b> <i>count</i> ] [ <b>sweep</b> <i>minimum maximum size-increment</i> ]  <b>Example:</b> Router# ping mpls ipv4 10.131.159.251/32 destination 127.0.0.1 127.0.0.2 1 repeat 2 sweep 1450 1475 25	Checks MPLS LSP connectivity.
Step 3	<b>exit</b>  <b>Example:</b> Router# exit	Returns to user EXEC mode.

## Using MPLS LSP Traceroute to Discover Possible Loops

With the MPLS LSP Traceroute feature, loops can occur if you use the UDP destination address range option and the time-to-live option.

By default, the maximum TTL is set to 30. Therefore, the traceroute output may contain 30 lines if the target of the traceroute is not reached, which can happen when an LSP problem exists. If an LSP problem occurs, there may be duplicate entries. The router address of the last point that the trace reaches is repeated until the output is 30 lines. You can ignore the duplicate entries.

## SUMMARY STEPS

1. **enable**
2. **trace mpls ipv4** *destination-address/destination-mask* [**destination** *address-start address-end address-increment*] [**tll** *maximum-time-to-live*]
3. **exit**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>trace mpls ipv4 destination-address /destination-mask [destination address-start address-end address increment] [ttl maximum-time-to-live]</b>  <b>Example:</b> Router# trace mpls ipv4 10.131.159.251/32 destination 127.0.0.1 127.0.0.3 1 ttl 5	Discovers MPLS LSP routes that packets take when traveling to their destinations. The example shows how a loop can occur.
Step 3	<b>exit</b>  <b>Example:</b> Router# exit	Returns to user EXEC mode.

## Detecting LSP Breaks

If there is a problem forwarding MPLS packets in your network, you can determine where there are LSP breaks. This section describes MTU discovery in an LSP.

Untagged output interfaces at a penultimate hop do not impact the forwarding of IP packets through an LSP because the forwarding decision is made at the penultimate hop through use of the incoming label. However, untagged output interfaces cause AToM and MPLS VPN traffic to be dropped at the penultimate hop.

During an MPLS LSP ping, MPLS echo request packets are sent with the IP packet attribute set to “do not fragment.” That is, the Don’t Fragment (DF) bit is set in the IP header of the packet. This allows you to use the MPLS echo request to test for the MTU that can be supported for the packet through the LSP without fragmentation.

Figure 4 shows a sample network with a single LSP from PE1 to PE2 formed with labels advertised by the LDP.

**Figure 4**      **Sample Network with LSP—Labels Advertised by LDP**

You can determine the maximum receive unit (MRU) at each hop by using the MPLS Traceroute feature to trace the LSP. The MRU is the maximum size of a labeled packet that can be forwarded through an LSP.

This section contains the following tasks:

- [Tracking Packets Tagged as Implicit Null, page 21](#)
- [Tracking Untagged Packets, page 22](#)
- [Determining Why a Packet Could Not Be Sent, page 22](#)
- [Detecting LSP Breaks when Load Balancing Is Enabled for IPv4 LDP LSPs, page 23](#)
- [Specifying the Interface Through Which Echo Packets Leave a Router, page 24](#)
- [Pacing the Transmission of Packets, page 25](#)
- [Interrogating the Transit Router for Its Downstream Information by Using Echo Request request-dsmap, page 26](#)
- [Interrogating a Router for Its DSMAP, page 27](#)
- [Requesting that a Transit Router Validate the Target FEC Stack, page 28](#)
- [Enabling LSP Ping to Detect LSP Breakages Caused by Untagged Interfaces, page 29](#)
- [Viewing the AToM VCCV Capabilities Advertised to and Received from the Peer, page 30](#)

## Tracking Packets Tagged as Implicit Null

To track packets tagged as implicit null, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **trace mpls ipv4** *destination-address* /*destination-mask*
3. **exit**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<b>trace mpls ipv4</b> <i>destination-address</i> / <i>destination-mask</i>  <b>Example:</b> Router# trace mpls ipv4 10.131.159.252/32	Discovers MPLS LSP routes that packets actually take when traveling to their destinations.
Step 3	<b>exit</b>  <b>Example:</b> Router# exit	Returns to user EXEC mode.

## Tracking Untagged Packets

To track untagged packets, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **show mpls forwarding-table** *destination-address/destination-mask*
3. **show mpls ldp discovery**
4. **exit**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>show mpls forwarding-table</b> <i>destination-address/destination-mask</i>  <b>Example:</b> Router# show mpls forwarding-table 10.131.159.252/32	Displays the content of the MPLS Label Forwarding Information Base (LFIB) and displays whether the LDP is properly configured.
Step 3	<b>show mpls ldp discovery</b>  <b>Example:</b> Router# show mpls ldp discovery	Displays the status of the LDP discovery process and displays whether the LDP is properly configured.
Step 4	<b>exit</b>  <b>Example:</b> Router# exit	Returns to user EXEC mode.

## Determining Why a Packet Could Not Be Sent

The Q return code means that the packet could not be sent. The problem can be caused by insufficient processing memory, but it probably results because an LSP could not be found that matches the FEC information that was entered on the command line.

You need to determine the reason why the packet was not forwarded so that you can fix the problem in the path of the LSP. To do so, look at the Routing Information Base (RIB), the Forwarding Information Base (FIB), the Label Information Base (LIB), and the MPLS LFIB. If there is no entry for the FEC in any of these routing or forwarding bases, there is a Q return code.

To determine why a packet could not be transmitted, perform the following steps.

## SUMMARY STEPS

1. **enable**
2. **show ip route** [*ip-address* [*mask*]]
3. **show mpls forwarding-table** [*network* {*mask* | *length*} | **labels** *label* [- *label*] | **interface** *interface* | **next-hop** *address* | **lsp-tunnel** [*tunnel-id*]]
4. **exit**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>show ip route</b> [ <i>ip-address</i> [ <i>mask</i> ]]  <b>Example:</b> Router# show ip route 10.0.0.1	Displays the current state of the routing table.  When the MPLS echo reply returns a Q, troubleshooting occurs on the routing information database.
Step 3	<b>show mpls forwarding-table</b> [ <i>network</i> { <i>mask</i>   <i>length</i> }   <b>labels</b> <i>label</i> [- <i>label</i> ]   <b>interface</b> <i>interface</i>   <b>next-hop</b> <i>address</i>   <b>lsp-tunnel</b> [ <i>tunnel-id</i> ]]  <b>Example:</b> Router# show mpls forwarding-table 10.0.0.1/32	Displays the content of the MPLS LFIB. When the MPLS echo reply returns a Q, troubleshooting occurs on a label information database and an MPLS forwarding information database.
Step 4	<b>exit</b>  <b>Example:</b> Router# exit	Returns to user EXEC mode.

## Detecting LSP Breaks when Load Balancing Is Enabled for IPv4 LDP LSPs

An ICMP ping or trace follows one path from the originating router to the target router. Round robin load balancing of IP packets from a source router discovers the various output paths to the target IP address.

For MPLS ping and traceroute, Cisco routers use the source and destination addresses in the IP header for load balancing when multiple paths exist through the network to a target router. The Cisco implementation of MPLS may check the destination address of an IP payload to accomplish load balancing (the type of checking depends on the platform).

To detect LSP breaks when load balancing is enabled for IPv4 LDP LSPs, perform the following steps.

## SUMMARY STEPS

1. **enable**
2. **ping mpls ipv4** *destination-address/destination-mask-length* [**destination** *address-start address-end* *increment*]
3. **exit**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> <b>enable</b>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>ping mpls ipv4</b> <i>destination-address</i> / <i>destination-mask-length</i> [ <b>destination</b> <i>address-start</i> <i>address-end</i> <i>increment</i> ]  <b>Example:</b> Router# <b>ping mpls ipv4</b> 10.131.159.251/32 <b>destination</b> 127.0.0.1/8	Checks for load balancing paths.  Enter the 127.z.y.x/8 destination address.
Step 3	<b>exit</b>  <b>Example:</b> Router# <b>exit</b>	Returns to user EXEC mode.

## Specifying the Interface Through Which Echo Packets Leave a Router

To specify the interface through which echo packets leave a router, perform the following steps.

## Echo Request Output Interface Control

You can control the interface through which packets leave a router. Path output information is used as input to LSP ping and traceroute.

The echo request output interface control feature allows you to force echo packets through the paths that perform detailed debugging or characterizing of the LSP. This feature is useful if a PE router connects to an MPLS cloud and there are broken links. You can direct traffic through a certain link. The feature also is helpful for troubleshooting network problems.

To specify the output interface for echo requests, perform the following steps.

## SUMMARY STEPS

- enable**
- ping mpls** { **ipv4** *destination-address/destination-mask* | **pseudowire** *ipv4-address* **vc-id** *vc-id* } [**output interface** *tx-interface*]  
or  
**trace mpls ipv4** *destination-address/destination-mask* [**output interface** *tx-interface*]
- exit**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>ping mpls</b> { <b>ipv4</b> <i>destination-address</i> / <i>destination-mask</i>   <b>pseudowire</b> <i>ipv4-address</i> <b>vc-id</b> <i>vc-id</i> } [ <b>output interface</b> <i>tx-interface</i> ]  or  <b>trace mpls ipv4</b> <i>destination-address/destination-mask</i> [ <b>output interface</b> <i>tx-interface</i> ]  <b>Example:</b> Router# ping mpls ipv4 10.131.159.251/32 output interface fastethernet0/0/0  or  Router# trace mpls ipv4 10.131.159.251/32 output interface fastethernet0/0/0	Checks MPLS LSP connectivity.  or  Discovers MPLS LSP routes that packets actually take when traveling to their destinations.  <b>Note</b> For this task, you must specify the <b>output interface</b> keyword.
Step 3	<b>exit</b>  <b>Example:</b> Router# exit	Returns to user EXEC mode.

## Pacing the Transmission of Packets

Echo request traffic pacing allows you to pace the transmission of packets so that the receiving router does not drop packets. To perform echo request traffic pacing, perform the following steps.

## SUMMARY STEPS

- enable**
- ping mpls** {**ipv4** *destination-address/destination-mask* | **pseudowire** *ipv4-address* **vc-id** *vc-id*} [**interval** *ms*]  
or  
**trace mpls ipv4** *destination-address/destination-mask*
- exit**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>ping mpls</b> { <b>ipv4</b> <i>destination-address</i> / <i>destination-mask</i>   <b>pseudowire</b> <i>ipv4-address</i> <b>vc-id</b> <i>vc-id</i> } [ <b>interval</b> <i>ms</i> ]  or  <b>trace mpls ipv4</b> <i>destination-address</i> / <i>destination-mask</i>  <b>Example:</b> Router# ping mpls ipv4 10.131.159.251/32 interval 2  or  <b>Example:</b> Router# trace mpls ipv4 10.131.159.251/32	Checks MPLS LSP connectivity.  or  Discovers MPLS LSP routes that packets take when traveling to their destinations.  <b>Note</b> In this task, if you use the <b>ping mpls</b> command you must specify the <b>interval</b> keyword.
Step 3	<b>exit</b>  <b>Example:</b> Router# exit	Returns to user EXEC mode.

## Interrogating the Transit Router for Its Downstream Information by Using Echo Request request-dsmap

The echo request request-dsmap capability troubleshooting feature, used in conjunction with the TTL flag, allows you to selectively interrogate a transit router. If there is a failure, you do not have to enter an **lsp traceroute** command for each previous failure; you can focus just on the failed hop.

A request-dsmap flag in the downstream mapping flags field, and procedures that specify how to trace noncompliant routers allow you to arbitrarily time-to-live (TTL) expire MPLS echo request packets with a wildcard downstream map (DSMAP).

Echo request DSMAPs received without labels indicate that the sender did not have any DSMAPs to validate. If the downstream router ID field of the DSMAP TLV in an echo request is set to the ALLROUTERS address (224.0.0.2) and there are no labels, the source router can arbitrarily query a transit router for its DSMAP information.

The **ping mpls** command allows an MPLS echo request to be TTL-expired at a transit router with a wildcard DSMAP for the explicit purpose of troubleshooting and querying the downstream router for its DSMAPs. The default is that the DSMAP has an IPv4 bitmap hashkey. You also can select hashkey 0 (none). The purpose of the **ping mpls** command is to allow the source router to selectively TTL expire an echo request at a transit router to interrogate the transit router for its downstream information. The ability to also select a multipath (hashkey) type allows the transmitting router to interrogate a transit router for load-balancing information as is done with multipath LSP traceroute, but without having to

interrogate all subsequent nodes traversed between the source router and the router on which each echo request TTL expires. Use an echo request in conjunction with the TTL setting because if an echo request arrives at the egress of the LSP with an echo request, the responding routers never return DSMAPs.

To interrogate the transit router for its downstream information so that you can focus just on the failed hop if there is a failure, perform the following steps.

## SUMMARY STEPS

1. **enable**
2. **ping mpls {ipv4 destination-address/destination-mask | pseudowire ipv4-address vc-id vc-id} [dmap [hashkey {none | ipv4 bitmap bitmap-size}] ]**
3. **exit**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<b>ping mpls {ipv4 destination-address /destination-mask   pseudowire ipv4-address vc-id vc-id} [dmap [hashkey {none   ipv4 bitmap bitmap-size}] ]</b>  <b>Example:</b> Router# ping mpls ipv4 10.161.251/32 dmap hashkey ipv4 bitmap 16	Checks MPLS LSP connectivity.  <b>Note</b> In this task, you must specify the <b>dmap</b> and <b>hashkey</b> keywords.
Step 3	<b>exit</b>  <b>Example:</b> Router# exit	Returns to user EXEC mode.

## Interrogating a Router for Its DSMAP

The router can interrogate the software or hardware forwarding layer for the depth limit that needs to be returned in the DSMAP TLV. If forwarding does not provide a value, the default is 255.

To determine the depth limit, specify the **dmap** and **tll** keywords in the **ping mpls** command. The transit router will be interrogated for its DSMAP. The depth limit is returned with the echo reply DSMAP. A value of 0 means that the IP header is used for load balancing. Another value indicates that the IP header load balances up to the specified number of labels.

To interrogate a router for its DSMAP, perform the following steps.

## SUMMARY STEPS

1. **enable**
2. **ping mpls {ipv4 destination-address/destination-mask | pseudowire ipv4-address vc-id vc-id} tll time-to-live dmap**

3. **exit**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<b>ping mpls</b> { <b>ipv4</b> <i>destination-address</i> / <i>destination-mask</i>   <b>pseudowire</b> <i>ipv4-address</i> <b>vc-id</b> <i>vc-id</i> } <b>ttl</b> <i>time-to-live</i> <b>dsmap</b>  <b>Example:</b> Router# ping mpls ipv4 10.131.159.252/32 ttl 1 dsmap	Checks MPLS LSP connectivity. <b>Note</b> You must specify the <b>ttl</b> and <b>dsmap</b> keywords.
Step 3	<b>exit</b>  <b>Example:</b> Router# exit	Returns to user EXEC mode.

## Requesting that a Transit Router Validate the Target FEC Stack

An MPLS echo request tests a particular LSP. The LSP to be tested is identified by the FEC stack.

To request that a transit router validate the target FEC stack, set the V flag from the source router by entering the **flags fec** keyword in the **ping mpls** and **trace mpls** commands. The default is that echo request packets are sent with the V flag set to 0.

To request that a transit router validate the target FEC stack, perform the following steps.

## SUMMARY STEPS

1. **enable**
2. **ping mpls** {**ipv4** *destination-address*/*destination-mask* | **pseudowire** *ipv4-address* **vc-id** *vc-id*} **flags fec**  
  
or  
**trace mpls ipv4** *destination-address*/*destination-mask* **flags fec**
3. **exit**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>ping mpls</b> { <b>ipv4 destination-address</b> / <b>destination-mask</b>   <b>pseudowire ipv4-address vc-id vc-id</b> } <b>flags fec</b>  or  <b>trace mpls ipv4 destination-address</b> / <b>destination-mask flags fec</b>  <b>Example:</b> Router# ping mpls ipv4 10.131.159.252/32 flags fec  or  <b>Example:</b> Router# trace mpls ipv4 10.131.159.252/32 flags fec	Checks MPLS LSP connectivity.  or  Discovers MPLS LSP routes that packets actually take when traveling to their destinations.  <b>Note</b> You must enter the <b>flags fec</b> keyword.
Step 3	<b>exit</b>  <b>Example:</b> Router# exit	Returns to user EXEC mode.

## Enabling LSP Ping to Detect LSP Breakages Caused by Untagged Interfaces

For MPLS LSP ping and traceroute of LSPs carrying IPv4 FECs, you can force an explicit null label to be added to the MPLS label stack even though the label was unsolicited. This allows LSP ping to detect LSP breakages caused by untagged interfaces. LSP ping does not report that an LSP is operational when it is unable to send MPLS traffic.

An explicit null label is added to an MPLS label stack if MPLS echo request packets are forwarded from untagged interfaces that are directly connected to the destination of the LSP ping or if the IP TTL value for the MPLS echo request packets is set to 1.

When you enter an **lsp ping** command, you are testing the LSP's ability to carry IP traffic. Failure at untagged output interfaces at the penultimate hop are not detected. Explicit-null shimming allows you to test an LSP's ability to carry MPLS traffic.

To enable LSP ping to detect LSP breakages caused by untagged interfaces, specify the **force-explicit-null** keyword in the **ping mpls** or **trace mpls** commands as shown in the following steps.

## SUMMARY STEPS

1. **enable**
2. **ping mpls** {**ipv4** *destination-address/destination-mask* | **pseudowire** *ipv4-address vc-id vc-id*}  
**force-explicit-null**  
or  
**trace mpls ipv4** *destination-address/destination-mask* **force-explicit-null**
3. **exit**

## DETAILED STEP

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>ping mpls</b> { <b>ipv4</b> <i>destination-address /destination-mask</i>   <b>pseudowire</b> <i>ipv4-address vc-id vc-id</i> } <b>force-explicit-null</b>  or <b>trace mpls ipv4</b> <i>destination-address /destination-mask</i> <b>force-explicit-null</b>  <b>Example:</b> Router# ping mpls ipv4 10.131.191.252/32 force-explicit null  or  <b>Example:</b> Router# trace mpls ipv4 10.131.191.252/32 force-explicit-null	Checks MPLS LSP connectivity. or Discovers MPLS LSP routes that packets actually take when traveling to their destinations. <b>Note</b> You must enter the <b>force-explicit-null</b> keyword.
Step 3	<b>exit</b>  <b>Example:</b> Router# exit	Returns to user EXEC mode.

## Viewing the AToM VCCV Capabilities Advertised to and Received from the Peer

To view the AToM VCCV capabilities advertised to and received from the peer, perform the following steps.

## SUMMARY STEPS

1. **enable**
2. **show mpls l2transport binding**
3. **exit**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>show mpls l2transport binding</b>  <b>Example:</b> Router# show mpls l2transport binding	Displays VC label binding information.
Step 3	<b>exit</b>  <b>Example:</b> Router# exit	Returns to user EXEC mode.

## Configuration Examples for MPLS LSP Ping/Traceroute for LDP/TE, and LSP Ping for VCCV

Examples for the MPLS LSP Ping/Traceroute for LDP/TE, and LSP Ping for VCCV feature are based on the sample topology shown in [Figure 5](#).

**Figure 5**      **Sample Topology for Configuration Examples**

This section contains the following configuration examples:

- [Enabling Compatibility Between the MPLS LSP and Ping or Traceroute Implementation: Example, page 32](#)
- [Validating an FEC by Using MPLS LSP Ping and LSP Traceroute: Example, page 32](#)
- [Using DSCP to Request a Specific Class of Service in an Echo Reply: Example, page 33](#)
- [Controlling How a Responding Router Replies to an MPLS Echo Request: Example, page 33](#)
- [Preventing Loops when Using MPLS LSP Ping and LSP Traceroute Command Options: Example, page 33](#)
- [Detecting LSP Breaks: Example, page 37](#)
- [Viewing the ATOM VCCV Capabilities Advertised to and Received from the Peer: Example, page 58](#)

## Enabling Compatibility Between the MPLS LSP and Ping or Traceroute Implementation: Example

The following example shows how to configure MPLS multipath LSP traceroute to interoperate with a vendor implementation that does not interpret RFC 4379 as Cisco does:

```
configure terminal
!
mpls oam
  echo revision 4
  no echo vendor-extension
exit
```

The default echo revision number is 4, which corresponds to the IEFT draft 11.

## Validating an FEC by Using MPLS LSP Ping and LSP Traceroute: Example

This section describes the following procedures:

- [Validating an LDP IPv4 FEC by Using MPLS LSP Ping and MPLS LSP Traceroute: Example, page 32](#)
- [Validating a Layer 2 FEC by Using MPLS LSP Ping: Example, page 32](#)

### Validating an LDP IPv4 FEC by Using MPLS LSP Ping and MPLS LSP Traceroute: Example

The following example shows how to use the **ping mpls** command to test connectivity of an IPv4 LDP LSP:

```
Router# ping mpls ipv4 10.131.191.252/32 repeat 5 exp 5 verbose
```

Sending 5, 100-byte MPLS Echos to 10.131.191.252, timeout is 2 seconds:

Codes:

```
'!' - success, 'Q' - request not sent, '.' - timeout,
'L' - labeled output interface, 'B' - unlabeled output interface,
'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
'M' - malformed request, 'm' - unsupported tlvs, 'N' - no rx label,
'P' - no rx intf label prot, 'p' - premature termination of LSP,
'R' - transit router, 'X' - unknown return code, 'x' - return code 0
```

Type escape sequence to abort.

```
! 10.131.191.230, return code 3
! 10.131.191.230, return code 3
! 10.131.191.230, return code 3
! 10.131.191.230, return code 3
! 10.131.191.230, return code 3
```

Success rate is 100 percent (5/5), round-trip min/avg/max = 100/10

### Validating a Layer 2 FEC by Using MPLS LSP Ping: Example

The following example validates a Layer 2 FEC:

```
Router# ping mpls pseudowire 10.10.10.15 108 vc-id 333
```

Sending 5, 100-byte MPLS Echos to 10.10.10.15,  
timeout is 2 seconds, send interval is 0 msec:

```

Codes: '!' - success, 'Q' - request not sent, '.' - timeout,
'L' - labeled output interface, 'B' - unlabeled output interface,
'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
'M' - malformed request, 'm' - unsupported tlvs, 'N' - no label entry,
'P' - no rx intf label prot, 'p' - premature termination of LSP,
'R' - transit router, 'I' - unknown upstream index,
'X' - unknown return code, 'x' - return code 0

Type escape sequence to abort.
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 28/32/40 ms PE-802#

```

## Using DSCP to Request a Specific Class of Service in an Echo Reply: Example

The following example shows how to use DSCP to request a specific CoS in an echo reply:

```
Router# ping mpls ipv4 10.131.159.252/32 reply dscp 50
```

```

<0-63> Differentiated services codepoint value
af11 Match packets with AF11 dscp (001010)
af12 Match packets with AF12 dscp (001100)
af13 Match packets with AF13 dscp (001110)
af21 Match packets with AF21 dscp (010010)
af22 Match packets with AF22 dscp (010100)
af23 Match packets with AF23 dscp (010110)
af31 Match packets with AF31 dscp (011010)
af32 Match packets with AF32 dscp (011100)
af33 Match packets with AF33 dscp (011110)
af41 Match packets with AF41 dscp (100010)
af42 Match packets with AF42 dscp (100100)
af43 Match packets with AF43 dscp (100110)

```

## Controlling How a Responding Router Replies to an MPLS Echo Request: Example

The following example checks MPLS LSP connectivity by using ipv4 reply mode:

```
Router# ping mpls ipv4 10.131.191.252/32 reply mode ipv4
```

## Preventing Loops when Using MPLS LSP Ping and LSP Traceroute Command Options: Example

This section contains the following examples:

- [Possible Loops with MPLS LSP Ping: Example, page 34](#)
- [Possible Loop with MPLS LSP Traceroute: Example, page 35](#)

## Possible Loops with MPLS LSP Ping: Example

The following example shows how a loop operates if you use the following **ping mpls** command:

```
Router# ping mpls ipv4 10.131.159.251/32 destination 127.0.0.1 127.0.0.2 1 repeat 2
sweep 1450 1475 25
```

```
Sending 2, [1450..1500]-byte MPLS Echos to 10.131.159.251/32,
    timeout is 2 seconds, send interval is 0 msec:
```

Codes:

```
'!' - success, 'Q' - request not sent, '.' - timeout,
'L' - labeled output interface, 'B' - unlabeled output interface,
'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
'M' - malformed request, 'm' - unsupported tlvs, 'N' - no rx label,
'P' - no rx intf label prot, 'p' - premature termination of LSP,
'R' - transit router, 'X' - unknown return code, 'x' - return code 0
```

Type escape sequence to abort.

```
Destination address 127.0.0.1
```

```
!
```

```
!
```

```
Destination address 127.0.0.2
```

```
!
```

```
!
```

```
Destination address 127.0.0.1
```

```
!
```

```
!
```

```
Destination address 127.0.0.2
```

```
!
```

```
!
```

A **ping mpls** command is sent for each packet size range for each destination address until the end address is reached. For this example, the loop continues in the same manner until the destination address, 127.0.0.5, is reached. The sequence continues until the number is reached that you specified with the **repeat count** keyword and argument. For this example, the repeat count is 2. The MPLS LSP ping loop sequence is as follows:

```
repeat = 1
  destination address 1 (address-start)
    for (size from sweep minimum to maximum, counting by size-increment)
      send an lsp ping

  destination address 2 (address-start + address-increment)
    for (size from sweep minimum to maximum, counting by size-increment)
      send an lsp ping

  destination address 3 (address-start + address-increment + address-increment)
    for (size from sweep minimum to maximum, counting by size-increment)
      send an lsp ping
  .
  .
  .
until destination address = address-end

.
.
.
until repeat = count 2
```

## Possible Loop with MPLS LSP Traceroute: Example

The following example shows how a loop occurs if you use the following **trace mpls** command:

```
Router# trace mpls ipv4 10.131.159.251/32 destination 127.0.0.1 127.0.0.3 1 ttl 5
```

Tracing MPLS Label Switched Path to 10.131.159.251/32, timeout is 2 seconds

Codes:

```
'!' - success, 'Q' - request not sent, '.' - timeout,
'L' - labeled output interface, 'B' - unlabeled output interface,
'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
'M' - malformed request, 'm' - unsupported tlvs, 'N' - no rx label,
'P' - no rx intf label prot, 'p' - premature termination of LSP,
'R' - transit router, 'X' - unknown return code, 'x' - return code 0
```

Type escape sequence to abort.

Destination address 127.0.0.1

```
0 10.131.191.230 MRU 1500 [Labels: 19 Exp: 0]
```

```
R 1 10.131.159.226 MRU 1504 [implicit-null] 40 ms
```

```
! 2 10.131.159.225 40 ms
```

Destination address 127.0.0.2

```
0 10.131.191.230 MRU 1500 [Labels: 19 Exp: 0]
```

```
R 1 10.131.159.226 MRU 1504 [implicit-null] 40 ms
```

```
! 2 10.131.159.225 40 ms
```

Destination address 127.0.0.3

```
0 10.131.191.230 MRU 1500 [Labels: 19 Exp: 0]
```

```
R 1 10.131.159.226 MRU 1504 [implicit-null] 40 ms
```

```
! 2 10.131.159.225 48 ms
```

An **mpls trace** command is sent for each TTL from 1 to the maximum TTL (**ttl maximum-time-to-live** keyword and argument) for each destination address until the address specified with the destination **end-address** argument is reached. In this example, the maximum TTL is 5 and the end destination address is 127.0.0.3. The MPLS LSP traceroute loop sequence is as follows:

```
destination address 1 (address-start)
```

```
for (ttl from 1 to maximum-time-to-live)
```

```
send an lsp trace
```

```
destination address 2 (address-start + address-increment)
```

```
for (ttl from 1 to 5)
```

```
send an lsp trace
```

```
destination address 3 (address-start + address-increment + address-increment)
```

```
for (ttl from 1 to maximum-time-to-live)
```

```
send an lsp trace
```

```
.
.
.
```

```
until destination address = 4
```

The following example shows that the trace encountered an LSP problem at the router that has an IP address of 10.6.1.6:

```
Router# traceroute mpls ipv4 10.6.7.4/32
```

Tracing MPLS Label Switched Path to 10.6.7.4/32, timeout is 2 seconds

Codes:

```
'!' - success, 'Q' - request not sent, '.' - timeout,
'L' - labeled output interface, 'B' - unlabeled output interface,
'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
'M' - malformed request, 'm' - unsupported tlvs, 'N' - no rx label,
```

'P' - no rx intf label prot, 'p' - premature termination of LSP,  
 'R' - transit router, 'X' - unknown return code, 'x' - return code 0

Type escape sequence to abort.

```

0 10.6.1.14 MRU 4470 [Labels: 22 Exp: 0]
R 1 10.6.1.5 MRU 4470 [Labels: 21 Exp: 0] 2 ms
R 2 10.6.1.6 4 ms                <----- Router address repeated for 2nd to 30th TTL.
R 3 10.6.1.6 1 ms
R 4 10.6.1.6 1 ms
R 5 10.6.1.6 3 ms
R 6 10.6.1.6 4 ms
R 7 10.6.1.6 1 ms
R 8 10.6.1.6 2 ms
R 9 10.6.1.6 3 ms
R 10 10.6.1.6 4 ms
R 11 10.6.1.6 1 ms
R 12 10.6.1.6 2 ms
R 13 10.6.1.6 4 ms
R 14 10.6.1.6 5 ms
R 15 10.6.1.6 2 ms
R 16 10.6.1.6 3 ms
R 17 10.6.1.6 4 ms
R 18 10.6.1.6 2 ms
R 19 10.6.1.6 3 ms
R 20 10.6.1.6 4 ms
R 21 10.6.1.6 1 ms
R 22 10.6.1.6 2 ms
R 23 10.6.1.6 3 ms
R 24 10.6.1.6 4 ms
R 25 10.6.1.6 1 ms
R 26 10.6.1.6 3 ms
R 27 10.6.1.6 4 ms
R 28 10.6.1.6 1 ms
R 29 10.6.1.6 2 ms
R 30 10.6.1.6 3 ms                <----- TTL 30.

```

If you know the maximum number of hops in your network, you can set the TTL to a lower value with the **trace mpls ttl maximum-time-to-live** command. The following example shows the same **traceroute** command as the previous example, except that this time the TTL is set to 5:

```
Router# traceroute mpls ipv4 10.6.7.4/32 ttl 5
```

Tracing MPLS Label Switched Path to 10.6.7.4/32, timeout is 2 seconds

Codes:

'!' - success, 'Q' - request not sent, '.' - timeout,  
 'L' - labeled output interface, 'B' - unlabeled output interface,  
 'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,  
 'M' - malformed request, 'm' - unsupported tlvs, 'N' - no rx label,  
 'P' - no rx intf label prot, 'p' - premature termination of LSP,  
 'R' - transit router, 'X' - unknown return code, 'x' - return code 0

Type escape sequence to abort.

```

0 10.6.1.14 MRU 4470 [Labels: 22 Exp: 0]
R 1 10.6.1.5 MRU 4474 [No Label] 3 ms
R 2 10.6.1.6 4 ms                <----- Router address repeated for 2nd to 5th TTL.
R 3 10.6.1.6 1 ms
R 4 10.6.1.6 3 ms
R 5 10.6.1.6 4 ms

```

## Detecting LSP Breaks: Example

This section contains the following examples:

- [Troubleshooting with LSP Ping or Traceroute: Example, page 37](#)
- [MTU Discovery in an LSP: Example, page 47](#)
- [Tracking Packets Tagged as Implicit Null: Example, page 48](#)
- [Tracking Untagged Packets: Example, page 49](#)
- [Determining Why a Packet Could Not Be Sent: Example, page 50](#)
- [Detecting LSP Breaks when Load Balancing Is Enabled for IPv4 LSPs: Example, page 51](#)
- [Specifying the Interface Through Which Echo Packets Leave a Router: Example, page 52](#)
- [Pacing the Transmission of Packets: Example, page 54](#)
- [Interrogating the Transit Router for Its Downstream Information: Example, page 54](#)
- [Interrogating a Router for Its DSMAP: Example, page 56](#)
- [Requesting that a Transit Router Validate the Target FEC Stack: Example, page 56](#)
- [Enabling LSP Ping to Detect LSP Breakages Caused by Untagged Interfaces: Example, page 57](#)

## Troubleshooting with LSP Ping or Traceroute: Example

ICMP **ping** and **trace** commands are often used to help diagnose the root cause of a failure. When an LSP is broken, the packet may reach the target router by IP forwarding, thus making the ICMP ping and traceroute features unreliable for detecting MPLS forwarding problems. The MPLS LSP ping or traceroute and AToM VCCV features extend this diagnostic and troubleshooting ability to the MPLS network and handle inconsistencies (if any) between the IP and MPLS forwarding tables, inconsistencies in the MPLS control and data plane, and problems with the reply path.

[Figure 6](#) shows a sample topology with an LDP LSP.

**Figure 6**      *Sample Topology with LDP LSP*

This section contains the following subsections:

- [Configuration for Sample Topology, page 37](#)
- [Verification That the LSP Is Configured Correctly, page 44](#)
- [Discovery of LSP Breaks, page 45](#)

### Configuration for Sample Topology

These are sample topology configurations for the troubleshooting examples in the following sections (see [Figure 6](#)). There are the six sample router configurations.

**Router CE1 Configuration**

Following is the configuration for the CE1 router:

```

!
version 2.3
service timestamps debug datetime msec
service timestamps log datetime msec
no service password-encryption
!
hostname CE1
!
boot-start-marker
boot-end-marker
!
enable password lab

## Verification That the LSP Is Configured Correctly

Use the output from the **show** commands in this section to verify that the LSP is configured correctly.

A **show mpls forwarding-table** command shows that tunnel 1 is in the MPLS forwarding table.

```
PE1# show mpls forwarding-table 10.131.159.252
```

Local tag	Outgoing tag or VC	Prefix or Tunnel Id	Bytes tag switched	Outgoing interface	Next Hop
22	18 [T]	10.131.159.252/32 0	Tu1	point2point	

```

[T] Forwarding through a TSP tunnel.
View additional tagging info with the 'detail' option

```

A **trace mpls** command issued at PE1 verifies that packets with 16 as the outermost label and 18 as the end-of-stack label are forwarded from PE1 to PE2.

```
PE1# trace mpls ipv4 10.131.159.252/32
```

Tracing MPLS Label Switched Path to 10.131.159.252/32, timeout is 2 seconds

Codes:

```

'!' - success, 'Q' - request not sent, '.' - timeout,
'L' - labeled output interface, 'B' - unlabeled output interface,
'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
'M' - malformed request, 'm' - unsupported tlvs, 'N' - no rx label,
'P' - no rx intf label prot, 'p' - premature termination of LSP,
'R' - transit router, 'X' - unknown return code, 'x' - return code 0

```

Type escape sequence to abort.

```
0 10.131.191.252 MRU 1496 [Labels: 16/18 Exp: 0/0] L 1 10.131.191.229
MRU 1508 [Labels: 18 Exp: 0] 0 ms L 2 10.131.159.225
MRU 1504 [Labels: implicit-null Exp: 0] 0 ms ! 3 10.131.159.234 20 ms
PE1#
```

The MPLS LSP Traceroute to PE2 is successful, as indicated by the exclamation point (!).

## Discovery of LSP Breaks

Use the output of the commands in this section to discover LSP breaks.

An LDP target session is established between routers PE1 and P2, as shown in the output of the following **show mpls ldp discovery** command:

```
PE1# show mpls ldp discovery
```

```
Local LDP Identifier:
 10.131.191.252:0
Discovery Sources:
Interfaces:
  FastEthernet0/0/0 (ldp): xmit/recv
    LDP Id: 10.131.191.251:0
  Tunnel1 (ldp): Targeted -> 10.131.159.251
Targeted Hellos:
 10.131.191.252 -> 10.131.159.252 (ldp): active/passive, xmit/recv
    LDP Id: 10.131.159.252:0
 10.131.191.252 -> 10.131.159.251 (ldp): active, xmit/recv
    LDP Id: 10.131.159.251:0
```

Enter the following command on the P2 router in global configuration mode:

```
P2(config)# no mpls ldp discovery targeted-hello accept
```

The LDP configuration change causes the targeted LDP session between the headend and tailend of the TE tunnel to go down. Labels for IPv4 prefixes learned by P2 are not advertised to PE1. Thus, all IP prefixes reachable by P2 are reachable by PE1 only through IP (not MPLS). In other words, packets destined for those prefixes through Tunnel 1 at PE1 will be IP switched at P2 (which is undesirable).

The following **show mpls ldp discovery** command shows that the LDP targeted session is down:

```
PE1# show mpls ldp discovery
```

```
Local LDP Identifier:
 10.131.191.252:0
Discovery Sources:
Interfaces:
  FastEthernet0/0/0 (ldp): xmit/recv
    LDP Id: 10.131.191.251:0
  Tunnel1 (ldp): Targeted -> 10.131.159.251
Targeted Hellos:
 10.131.191.252 -> 10.131.159.252 (ldp): active/passive, xmit/recv
    LDP Id: 10.131.159.252:0
 10.131.191.252 -> 10.131.159.251 (ldp): active, xmit
```

Enter the **show mpls forwarding-table** command at the PE1 router. The display shows that the outgoing packets are untagged as a result of the LDP configuration changes.

```
PE1# show mpls forwarding-table 10.131.159.252
```

Local tag	Outgoing tag or VC	Prefix or Tunnel Id	Bytes tag switched	Outgoing interface	Next Hop
22	Untagged[T]	10.131.159.252/32	0	Tu1	point2point

```
[T]      Forwarding through a TSP tunnel.
        View additional tagging info with the 'detail' option
```

A **ping mpls** command entered at the PE1 router displays the following:

```
PE1# ping mpls ipv4 10.131.159.252/32 repeat 1
```

```
Sending 1, 100-byte MPLS Echos to 10.131.159.252/32,
        timeout is 2 seconds, send interval is 0 msec:
```

Codes:

```
'!' - success, 'Q' - request not sent, '.' - timeout,
'L' - labeled output interface, 'B' - unlabeled output interface,
'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
'M' - malformed request, 'm' - unsupported tlvs, 'N' - no rx label,
'P' - no rx intf label prot, 'p' - premature termination of LSP,
'R' - transit router, 'X' - unknown return code, 'x' - return code 0
```

Type escape sequence to abort.

R

Success rate is 0 percent (0/1)

The **ping mpls** command fails. The R indicates that the sender of the MPLS echo reply had a routing entry but no MPLS FEC. Entering the **verbose** keyword with the **ping mpls** command displays the MPLS LSP echo reply sender address and the return code. You should be able to determine where the breakage occurred by telnetting to the replying router and inspecting its forwarding and label tables. You might need to look at the neighboring upstream router as well, because the breakage might be on the upstream router.

```
PE1# ping mpls ipv4 10.131.159.252/32 repeat 1 verbose
```

```
Sending 1, 100-byte MPLS Echos to 10.131.159.252/32,
        timeout is 2 seconds, send interval is 0 msec:
```

Codes:

```
'!' - success, 'Q' - request not sent, '.' - timeout,
'L' - labeled output interface, 'B' - unlabeled output interface,
'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
'M' - malformed request, 'm' - unsupported tlvs, 'N' - no rx label,
'P' - no rx intf label prot, 'p' - premature termination of LSP,
'R' - transit router, 'X' - unknown return code, 'x' - return code 0
```

Type escape sequence to abort.

R 10.131.159.225, return code 6

Success rate is 0 percent (0/1)

Alternatively, use the LSP **traceroute** command to figure out which router caused the breakage. In the following example, for subsequent values of TTL greater than 2, the same router keeps responding (10.131.159.225). This suggests that the MPLS echo request keeps getting processed by the router regardless of the TTL. Inspection of the label stack shows that P1 pops the last label and forwards the packet to P2 as an IP packet. This explains why the packet keeps getting processed by P2. MPLS echo request packets cannot be forwarded by use of the destination address in the IP header because the address is set to a 127/8 address.

```
PE1# trace mpls ipv4 10.131.159.252/32 ttl 5
```

```
Tracing MPLS Label Switched Path to 10.131.159.252/32, timeout is 2 seconds
```

Codes:

```
'!' - success, 'Q' - request not sent, '.' - timeout,
'L' - labeled output interface, 'B' - unlabeled output interface,
'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
'M' - malformed request, 'm' - unsupported tlvs, 'N' - no rx label,
'P' - no rx intf label prot, 'p' - premature termination of LSP,
'R' - transit router, 'X' - unknown return code, 'x' - return code 0
```

Type escape sequence to abort.

```
0 10.131.191.230 MRU 1496 [Labels: 22/19 Exp: 0/0]
R 1 10.131.159.226 MRU 1500 [Labels: 19 Exp: 0] 40 ms
R 2 10.131.159.229 MRU 1504 [implicit-null] 28 ms
! 3 10.131.159.230 40 ms
pe1#
```

## MTU Discovery in an LSP: Example

The following example shows the results of a **trace mpls** command when the LSP is formed with labels created by LDP:

```
PE1# trace mpls ipv4 10.131.159.252/32
```

Tracing MPLS Label Switched Path to 10.131.159.252/32, timeout is 2 seconds

Codes:

```
'!' - success, 'Q' - request not sent, '.' - timeout,
'L' - labeled output interface, 'B' - unlabeled output interface,
'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
'M' - malformed request, 'm' - unsupported tlvs, 'N' - no rx label,
'P' - no rx intf label prot, 'p' - premature termination of LSP,
'R' - transit router, 'X' - unknown return code, 'x' - return code 0
```

Type escape sequence to abort.

```
0 10.131.191.230 MRU 1496 [Labels: 22/19 Exp: 0/0]
R 1 10.131.159.226 MRU 1500 [Labels: 19 Exp: 0] 40 ms
R 2 10.131.159.229 MRU 1504 [implicit-null] 28 ms
! 3 10.131.159.230 40 ms
pe1#
```

You can determine the MRU for the LSP at each hop through the use of the **show mpls forwarding detail** command:

```
PE1# show mpls forwarding 10.131.159.252 detail
```

Local tag	Outgoing tag or VC	Prefix or Tunnel Id	Bytes tag switched	Outgoing interface	Next Hop
22	19	10.131.159.252/32	0	Tu1	point2point
MAC/Encaps=14/22, MRU=1496, Tag Stack{22 19}, via Et0/0					
AABBCC009700AABBCC0098008847 0001600000013000					
No output feature configured					

To determine how large an echo request will fit on the LSP, first calculate the size of the IP MTU by using the **show interface interface-name** command:

```
PE1# show interface e0/0
```

```
FastEthernet0/0/0 is up, line protocol is up
Hardware is Lance, address is aabb.cc00.9800 (bia aabb.cc00.9800)
Internet address is 10.131.191.230/30
MTU 1500 bytes, BW 10000 Kbit, DLY 1000 usec, rely 255/255, load 1/255
Encapsulation ARPA, loopback not set
Keepalive set (10 sec)
ARP type: ARPA, ARP Timeout 04:00:00
```

```

Last input 00:00:01, output 00:00:01, output hang never
Last clearing of "show interface" counters never
Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 0
Queueing strategy: fifo
Output queue: 0/40 (size/max)
5 minute input rate 0 bits/sec, 0 packets/sec
5 minute output rate 0 bits/sec, 0 packets/sec
 377795 packets input, 33969220 bytes, 0 no buffer
  Received 231137 broadcasts, 0 runts, 0 giants, 0 throttles
  0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
  0 input packets with dribble condition detected
441772 packets output, 40401350 bytes, 0 underruns
  0 output errors, 0 collisions, 10 interface resets
  0 babbles, 0 late collision, 0 deferred
  0 lost carrier, 0 no carrier
  0 output buffer failures, 0 output buffers swapped out

```

The IP MTU in the **show interface interface-name** example is 1500 bytes. Subtract the number of bytes corresponding to the label stack from the MTU number. The output of the **show mpls forwarding** command indicates that the Tag stack consists of one label (21). Therefore, the largest MPLS echo request packet that can be sent in the LSP is  $1500 - (2 \times 4) = 1492$ .

You can validate this by using the following **mpls ping** command:

```
PE1# ping mpls ipv4 10.131.159.252/32 sweep 1492 1500 1 repeat 1
```

```

Sending 1, [1492..1500]-byte MPLS Echos to 10.131.159.252/32,
  timeout is 2 seconds, send interval is 0 msec:

```

Codes:

```

'!' - success, 'Q' - request not sent, '.' - timeout,
'L' - labeled output interface, 'B' - unlabeled output interface,
'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
'M' - malformed request, 'm' - unsupported tlvs, 'N' - no rx label,
'P' - no rx intf label prot, 'p' - premature termination of LSP,
'R' - transit router, 'X' - unknown return code, 'x' - return code 0

```

Type escape sequence to abort.

```
!QQQQQQQQ
```

```
Success rate is 11 percent (1/9), round-trip min/avg/max = 40/40/40 ms
```

In this command, echo packets that have a range in size from 1492 to 1500 bytes are sent to the destination address. Only packets of 1492 bytes are sent successfully, as indicated by the exclamation point (!). Packets of byte sizes 1493 to 1500 are source-quenched, as indicated by the Qs.

You can pad an MPLS echo request so that a payload of a given size can be tested. The pad TLV is useful when you use the MPLS echo request to discover the MTU that is supportable by an LSP. MTU discovery is extremely important for applications like AToM that contain non-IP payloads that cannot be fragmented.

## Tracking Packets Tagged as Implicit Null: Example

In the following example, Tunnel 1 is shut down, and only an LSP formed with LDP labels is established. An implicit null is advertised between the P2 and PE2 routers. Entering an MPLS LSP traceroute command at the PE1 router results in the following output that shows that packets are forwarded from P2 to PE2 with an implicit-null label. Address 10.131.159.229 is configured for the P2 Fast Ethernet 0/0/0 out interface for the PE2 router.

```
PE1# trace mpls ipv4 10.131.159.252/32
```

```
Tracing MPLS Label Switched Path to 10.131.159.252/32, timeout is 2 seconds
```

```

Codes:
'!' - success, 'Q' - request not sent, '.' - timeout,
'L' - labeled output interface, 'B' - unlabeled output interface,
'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
'M' - malformed request, 'm' - unsupported tlvs, 'N' - no rx label,
'P' - no rx intf label prot, 'p' - premature termination of LSP,
'R' - transit router, 'X' - unknown return code, 'x' - return code 0

Type escape sequence to abort.
 0 10.131.191.230 MRU 1496 [Labels: 22/19 Exp: 0/0]
R 1 10.131.159.226 MRU 1500 [Labels: 19 Exp: 0] 40 ms
R 2 10.131.159.229 MRU 1504 [implicit-null] 28 ms
! 3 10.131.159.230 40 ms
pe1#

```

## Tracking Untagged Packets: Example

Untagged cases are valid configurations for IGP LSPs that could cause problems for MPLS VPNs.

A **show mpls forwarding-table** command and a **show mpls ldp discovery** command issued at the P2 router show that LDP is properly configured:

```
P2# show mpls forwarding-table 10.131.159.252
```

Local tag	Outgoing tag or VC	Prefix or Tunnel Id	Bytes tag switched	Outgoing interface	Next Hop
19	Pop tag	10.131.159.252/32	0	fe0/0/0	10.131.159.230

```
P2# show mpls ldp discovery
```

```

Local LDP Identifier:
 10.131.159.251:0
Discovery Sources:
Interfaces:
  FastEthernet0/0/0 (ldp): xmit/recv
    LDP Id: 10.131.159.252:0
  FastEthernet1/0/0 (ldp): xmit/recv
    LDP Id: 10.131.191.251:0

```

The **show mpls ldp discovery** command output shows that Fast Ethernet interface 0/0/0, which connects PE2 to P2, is sending and receiving packets.

If a **no mpls ip** command is entered on Fast Ethernet interface 0/0/0, this could prevent an LDP session between the P2 and PE2 routers from being established. A **show mpls ldp discovery** command entered on the PE router shows that the MPLS LDP session with the PE2 router is down.

```
P2# show mpls ldp discovery
```

```

Local LDP Identifier:
 10.131.159.251:0
Discovery Sources:
Interfaces:
  FastEthernet0/0/0 (ldp): xmit
  FastEthernet1/0/0 (ldp): xmit/recv
    LDP Id: 10.131.191.251:0

```

If the MPLS LDP session to PE2 goes down, the LSP to 10.131.159.252 becomes untagged, as shown by the **show mpls forwarding-table** command:

```
P2# show mpls forwarding-table 10.131.159.252/32
```

Local tag	Outgoing tag or VC	Prefix or Tunnel Id	Bytes tag switched	Outgoing interface	Next Hop
19	Untagged	10.131.159.252/32	864	fe0/0/0	10.131.159.230

Untagged cases would provide an MPLS LSP traceroute reply with packets tagged with No Label, as shown in the following display. You may need to reestablish an MPLS LSP session from interface P2 to PE2 by entering an **mpls ip** command on the output interface from P2 to PE2, which is Fast Ethernet 0/0/0 in this example:

```
PE1# trace mpls ipv4 10.131.159.252/32
```

Tracing MPLS Label Switched Path to 10.131.159.252/32, timeout is 2 seconds

Codes:

```
'!' - success, 'Q' - request not sent, '.' - timeout,
'L' - labeled output interface, 'B' - unlabeled output interface,
'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
'M' - malformed request, 'm' - unsupported tlvs, 'N' - no rx label,
'P' - no rx intf label prot, 'p' - premature termination of LSP,
'R' - transit router, 'X' - unknown return code, 'x' - return code 0
```

Type escape sequence to abort.

```
0 10.131.191.230 MRU 1500 [Labels: 20 Exp: 0]
R 1 10.131.159.226 MRU 1500 [Labels: 19 Exp: 0] 80 ms
R 2 10.131.159.229 MRU 1504 [No Label] 28 ms      <----No MPLS session from P2 to PE2.
! 3 10.131.159.230 40 ms
```

## Determining Why a Packet Could Not Be Sent: Example

The following example shows a **ping mpls** command when an MPLS echo request is not sent. The transmission failure is shown by the returned Qs.

```
PE1# ping mpls ipv4 10.0.0.1/32
```

Sending 5, 100-byte MPLS Echos to 10.0.0.1/32,  
timeout is 2 seconds, send interval is 0 msec:

Codes:

```
'!' - success, 'Q' - request not sent, '.' - timeout,
'L' - labeled output interface, 'B' - unlabeled output interface,
'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
'M' - malformed request, 'm' - unsupported tlvs, 'N' - no rx label,
'P' - no rx intf label prot, 'p' - premature termination of LSP,
'R' - transit router, 'X' - unknown return code, 'x' - return code 0
```

Type escape sequence to abort.

QQQQQ

Success rate is 0 percent (0/5)

The following **show mpls forwarding-table** command and **show ip route** command demonstrate that the IPv4 address (10.0.0.1) address is not in the LFIB or RIB routing table. Therefore, the MPLS echo request is not sent.

```
PE1# show mpls forwarding-table 10.0.0.1
```

Local tag	Outgoing tag or VC	Prefix or Tunnel Id	Bytes tag switched	Outgoing interface	Next Hop
-----------	--------------------	---------------------	--------------------	--------------------	----------

```
PE1# show ip route 10.0.0.1
```

```
% Subnet not in table
```

## Detecting LSP Breaks when Load Balancing Is Enabled for IPv4 LSPs: Example

In the following examples, different paths are followed to the same destination. The output from these examples demonstrates that load balancing occurs between the originating router and the target router.

To ensure that Fast Ethernet interface 1/0/0 on the PE1 router is operational, enter the following commands on the PE1 router:

```
PE1# configure terminal
```

To see the actual path chosen, enter the **debug mpls lspv** command with the **packet** and **data** keywords.

#### Note

The load balancing algorithm attempts to uniformly distribute packets across the available output paths by hashing based on the IP header source and destination addresses. The selection of the *address-start*, *address-end*, and *address-increment* arguments for the **destination** keyword may not provide the expected results.

## Specifying the Interface Through Which Echo Packets Leave a Router: Example

The following example tests load balancing from the upstream router:

```
Router# ping mpls ipv4 10.131.161.251/32 ttl 1 repeat 1 dsmap hashkey ipv4 bitmap 8
```

```
Sending 1, 100-byte MPLS Echos to 10.131.161.251/32,
    timeout is 2 seconds, send interval is 0 msec:
```

```
Codes: '.' - success, 'Q' - request not sent, '.' - timeout,
'L' - labeled output interface, 'B' - unlabeled output interface,
'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
'M' - malformed request, 'm' - unsupported tlvs, 'N' - no rx label,
'P' - no rx intf label prot, 'p' - premature termination of LSP,
'R' - transit router, 'X' - unknown return code, 'x' - return code 0
```

```
Type escape sequence to abort.
```

```
L
```

```
Echo Reply received from 10.131.131.2
```

```

  127.0.0.12     127.0.0.13     127.0.0.14     127.0.0.15
  127.0.0.16
```

```

DSMAP 1, DS Router Addr 10.131.141.2, DS Intf Addr 10.131.141.2
Depth Limit 0, MRU 1500 [Labels: 40 Exp: 0]
Multipath Addresses:
  127.0.0.1      127.0.0.2      127.0.0.4      127.0.0.5
  127.0.0.7      127.0.0.8      127.0.0.11

```

Success rate is 0 percent (0/1)

The multipath addresses cause a packet to transit to the router with the output label stack. The **ping mpls** command is useful for determining the number of output paths, but when the router is more than one hop away a router cannot always use those addresses to get the packet to transit through the router being interrogated. This situation exists because the change in the IP header destination address may cause the packet to be load-balanced differently by routers between the source router and the responding router. Load balancing is affected by the source address in the IP header. The following example tests load-balancing reporting from the upstream router:

```
Router# ping mpls ipv4 10.131.161.251/32 ttl 1 repeat 1 dsmap hashkey ipv4 bitmap 8
```

```

Sending 1, 100-byte MPLS Echos to 10.131.161.251/32,
timeout is 2 seconds, send interval is 0 msec:

```

```

Codes: '!' - success, 'Q' - request not sent, '.' - timeout,
'L' - labeled output interface, 'B' - unlabeled output interface,
'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
'M' - malformed request, 'm' - unsupported tlvs, 'N' - no rx label,
'P' - no rx intf label prot, 'p' - premature termination of LSP,
'R' - transit router, 'X' - unknown return code, 'x' - return code 0

```

Type escape sequence to abort.

L

Echo Reply received from 10.131.131.2

```

DSMAP 0, DS Router Addr 10.131.141.130, DS Intf Addr 10.131.141.130

```

## Requesting that a Transit Router Validate the Target FEC Stack: Example

The following example causes a transit router to validate the target FEC stack by which an LSP to be tested is identified:

```

Router# trace mpls ipv4 10.5.5.5/32 flags fec

Tracing MPLS Label Switched Path to 10.5.5.5/32, timeout is 2 seconds

```

```

Codes: '!' - success, 'Q' - request not sent, '.' - timeout,
'L' - labeled output interface, 'B' - unlabeled output interface,
'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
'M' - malformed request, 'm' - unsupported tlvs, 'N' - no label entry,
'P' - no rx intf label prot, 'p' - premature termination of LSP,
'R' - transit router, 'I' - unknown upstream index,
'X' - unknown return code, 'x' - return code 0

Type escape sequence to abort.
 0 10.2.3.2 10.2.3.3 MRU 1500 [Labels: 19 Exp: 0] L 1 10.2.3.3 10.3.4.4 MRU 1500 [Labels:
19 Exp: 0] 40 ms, ret code 8 L 2 10.3.4.4 10.4.5.5 MRU 1504 [Labels: implicit-null Exp: 0]
32 ms, ret code 8 ! 3 10.4.5.5 40 ms, ret code 3
Router# ping mpls ipv4 10.5.5.5/32
Sending 5, 100-byte MPLS Echos to 10.5.5.5/32
      timeout is 2 seconds, send interval is 0 msec:

Codes: '!' - success, 'Q' - request not sent, '.' - timeout,
'L' - labeled output interface, 'B' - unlabeled output interface,
'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
'M' - malformed request, 'm' - unsupported tlvs, 'N' - no label entry,
'P' - no rx intf label prot, 'p' - premature termination of LSP,
'R' - transit router, 'I' - unknown upstream index,
'X' - unknown return code, 'x' - return code 0

Type escape sequence to abort.
!    size 100, reply addr 10.4.5.5, return code 3
!    size 100, reply addr 10.4.5.5, return code 3
!    size 100, reply addr 10.4.5.5, return code 3
!    size 100, reply addr 10.4.5.5, return code 3
!    size 100, reply addr 10.4.5.5, return code 3

Success rate is 100 percent (5/5), round-trip min/avg/max = 28/31/32 ms

```

## Enabling LSP Ping to Detect LSP Breakages Caused by Untagged Interfaces: Example

The following example shows the extra label that is added to the end of the label stack when there is explicit-null label shimming:

```

Router# trace mpls ipv4 10.131.159.252/32 force-explicit-null

Tracing MPLS Label Switched Path to 10.131.159.252/32, timeout is 2 seconds

Codes:
'!' - success, 'Q' - request not sent, '.' - timeout,
'L' - labeled output interface, 'B' - unlabeled output interface,
'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
'M' - malformed request, 'm' - unsupported tlvs, 'N' - no rx label,
'P' - no rx intf label prot, 'p' - premature termination of LSP,
'R' - transit router, 'X' - unknown return code, 'x' - return code 0

Type escape sequence to abort.
 0 10.131.191.252 MRU 1492 [Labels: 16/18/explicit-null Exp: 0/0/0]
L 1 10.131.191.229 MRU 1508 [Labels: 18/explicit-null Exp: 0/0] 0 ms
L 2 10.131.159.225 MRU 1508 [Labels: explicit-null Exp: 0] 0 ms
! 3 10.131.159.234 4 ms

```

The following example shows the command output when there is not explicit-null label shimming:

```

Router# trace mpls ipv4 10.131.159.252/32

Tracing MPLS Label Switched Path to 10.131.159.252/32, timeout is 2 seconds

```

```

Codes: '!' - success, 'Q' - request not sent, '.' - timeout,
'L' - labeled output interface, 'B' - unlabeled output interface,
'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
'M' - malformed request, 'm' - unsupported tlvs, 'N' - no rx label,
'P' - no rx intf label prot, 'p' - premature termination of LSP,
'R' - transit router, 'X' - unknown return code, 'x' - return code 0

```

Type escape sequence to abort.

```

0 10.131.191.252 MRU 1496 [Labels: 16/18 Exp: 0/0]
L 1 10.131.191.229 MRU 1508 [Labels: 18 Exp: 0] 4 ms
L 2 10.131.159.225 MRU 1504 [Labels: implicit-null Exp: 0] 4 ms
! 3 10.131.159.234 4 ms

```

## Viewing the AToM VCCV Capabilities Advertised to and Received from the Peer: Example

The following example shows that router PE1 advertises both AToM VCCV Type 1 and Type 2 switching capabilities and that the remote router PE2 advertises only a Type 2 switching capability.

Router# **show mpls l2transport binding**

```

Destination Address: 10.131.191.252, VC ID: 333
Local Label: 16
  Cbit: 1, VC Type: FastEthernet, GroupID: 0
  MTU: 1500, Interface Desc: n/a
  VCCV Capabilities: Type 1, Type 2 <----- Locally advertised VCCV capabilities
Remote Label: 19
  Cbit: 1, VC Type: FastEthernet, GroupID: 0
  MTU: 1500, Interface Desc: n/a
  VCCV Capabilities: Type 2 <-----Remotely advertised VCCV capabilities

```

# Feature Information for MPLS LSP Ping/Traceroute for LDP/TE, and LSP Ping for VCCV

Table 7 lists the release history for this feature and provides links to specific configuration information.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS XE software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 7 lists only the Cisco IOS XE software release that introduced support for a given feature in a given Cisco IOS XE software release train. Unless noted otherwise, subsequent releases of that Cisco IOS XE software release train also support that feature.

**Table 7** Feature Information for MPLS LSP Ping/Traceroute for LDP/TE, and LSP Ping for VCCV

Feature Name	Releases	Feature Information
MPLS Embedded Management —LSP Ping/Traceroute for LDP	Cisco IOS XE Release 2.1	This feature was introduced on Cisco ASR 1000 Series Aggregation Services Routers.
MPLS Embedded Management—LSP Ping/Trace for LDP and Resource Reservation Protocol (RSVP) IPv4 Forwarding Equivalence Classes (FECs)	Cisco IOS XE Release 2.3	The MPLS Embedded Management—LSP Ping/Trace for LDP feature was modified to include support for RSVP IPv4 FECs.
MPLS LSP Ping/Traceroute for LDP/TE, and LSP Ping for VCCV	Cisco IOS XE Release 2.3	<p>The MPLS LSP Ping/Traceroute for LDP/TE, and LSP Ping for VCCV feature helps service providers monitor label switched paths and quickly isolate MPLS forwarding problems.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Information About MPLS LSP Ping/Traceroute for LDP/TE, and LSP Ping for VCCV, page 3</a></li> <li>• <a href="#">How to Configure MPLS LSP Ping/Traceroute for LDP/TE, and LSP Ping for VCCV, page 10</a></li> </ul> <p>The following commands were introduced or modified: <b>debug mpls lspv</b>, <b>echo</b>, <b>mpls oam</b>, <b>ping mpls</b>, <b>show mpls oam</b>, <b>echo statistics</b>, <b>trace mpls</b>.</p>

# Glossary

**FEC**—forwarding equivalence class. A set of packets that can be handled equivalently for forwarding purposes and are thus suitable for binding to a single label. Examples include the set of packets destined for one address prefix and the packets in any flow.

**flow**—A set of packets traveling between a pair of hosts, or between a pair of transport protocol ports on a pair of hosts. For example, packets with the same source address, source port, destination address, and destination port might be considered a flow.

A flow is also a stream of data traveling between two endpoints across a network (for example, from one LAN station to another). Multiple flows can be transmitted on a single circuit.

**fragmentation**—The process of breaking a packet into smaller units when they are to be transmitted over a network medium that cannot support the original size of the packet.

**ICMP**—Internet Control Message Protocol. A network layer Internet protocol that reports errors and provides other information relevant to IP packet processing. It is documented in RFC 792.

**LFIB**—Label Forwarding Information Base. A data structure and way of managing forwarding in which destinations and incoming labels are associated with outgoing interfaces and labels.

**localhost**—A name that represents the host router (device). The localhost uses the reserved loopback IP address 127.0.0.1.

**LSP**—label switched path. A connection between two routers in which MPLS forwards the packets.

**LSPV**—Label Switched Path Verification. An LSP Ping subprocess. It encodes and decodes MPLS echo requests and replies, and it interfaces with IP, MPLS, and AToM switching for sending and receiving MPLS echo requests and replies. At the MPLS echo request originator router, LSPV maintains a database of outstanding echo requests for which echo responses have not been received.

**MPLS router alert label**—An MPLS label of 1. An MPLS packet with a router alert label is redirected by the router to the Route Processor (RP) processing level for handling. This allows these packets to bypass any forwarding failures in hardware routing tables.

**MRU**—maximum receive unit. Maximum size, in bytes, of a labeled packet that can be forwarded through an LSP.

**MTU**—maximum transmission unit. Maximum packet size, in bytes, that a particular interface can send or receive.

**punt**—Redirect packets with a router alert from the line card or interface to Route Processor (RP) level processing for handling.

**PW**—pseudowire. A form of tunnel that carries the essential elements of an emulated circuit from one provider edge (PE) router to another PE router over a packet-switched network.

**RP**—Route Processor. The processor module in a Cisco 7000 series router that contains the CPU, system software, and most of the memory components that are used in the router. It is sometimes called a supervisory processor.

**RSVP**—Resource Reservation Protocol. A protocol that supports the reservation of resources across an IP network. Applications running on IP end systems can use RSVP to indicate to other nodes the nature (bandwidth, jitter, maximum burst, and so on) of the packet streams they want to receive. RSVP depends on IPv6. It is also known as Resource Reservation Setup Protocol.

**TLV**—type, length, values. A block of information included in a Cisco Discovery Protocol address.

**TTL hiding**—Time-to-live is a parameter you can set that indicates the maximum number of hops a packet should take to reach its destination.

**UDP**—User Datagram Protocol. Connectionless transport layer protocol in the TCP/IP protocol stack. UDP is a simple protocol that exchanges datagrams without acknowledgments or guaranteed delivery, so error processing and retransmission must be handled by other protocols. UDP is defined in RFC 768.
