

## **Cisco IOS Software Modularity Commands**

## archive tar

To create a TAR file, to list the files in a TAR file, or to extract the files from a TAR file, use the **archive tar** command in privileged EXEC mode.

archive tar {/create destination-url flash:/file-url | /table source-url | /xtract source-url
flash:/file-url [dir/file...]}

Syntax Description	/create destination-url flash:/file-url	Creates a new TAR file on the local or network file system.
		For <i>destination-url</i> , specify the destination URL alias for the local or network file system and the name of the TAR file to create. The following options are supported:
		• flash:—Syntax for the local flash file system.
		• <b>ftp:</b> [[//username[:password]@location]/directory]/tar-filename.tar— Syntax for FTP.
		• <b>rcp:</b> [[//username@location]/directory]/tar-filename.tar—Syntax for Remote Copy Protocol (RCP).
		• tftp:[[//location]/directory]/tar-filename.tar — Syntax for TFTP.
		The tar-filename.tar is the name of the TAR file to be created.
		For <b>flash</b> :/ <i>file-url</i> , specify the location on the local flash file system from which the new TAR file is created.
		An optional list of files or directories within the source directory can be specified to write to the new TAR file. If none is specified, all files and directories at this level are written to the newly created TAR file.
	/table source-url	Displays the contents of an existing TAR file to the screen.
		For <i>source-url</i> , specify the source URL alias for the local or network file system. The following options are supported:
		• <b>flash:</b> —Syntax for the local flash file system.
		• <b>ftp:</b> [[//username[:password]@location]/directory]/tar-filename.tar— Syntax for FTP.
		<ul> <li>rcp:[[//username@location]/directory]/tar-filename.tar—Syntax for Remote Copy Protocol (RCP).</li> </ul>
		• tftp:[[//location]/directory]/tar-filename.tar —Syntax for TFTP.
		The <i>tar-filename.tar</i> is the name of the TAR file to be created.

	/ <b>xtract</b> source-url <b>flash:/</b> file-url [dir/file]	Extracts files from a TAR file to the local file system.	
		For <i>source-url</i> , specify the source URL alias for the local file system. The following options are supported:	
		• <b>flash:</b> —Syntax for the local flash file system.	
		• <b>ftp:</b> [[//username[:password]@location]/directory]/tar-filename.tar— Syntax for FTP.	
		• <b>rcp:</b> [[//username@location]/directory]/tar-filename.tar—Syntax for Remote Copy Protocol (RCP).	
		• <b>tftp:</b> [[//location]/directory]/tar-filename.tar — Syntax for TFTP.	
		The <i>tar-filename.tar</i> is the name of the TAR file to be created.	
Command Default	A TAR archive file is	not created.	
Command Modes	Privileged EXEC (#)		
Command History	Release	Modification	
•	12.1(13)AY	This command was introduced.	
	12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.	
	12.4(22)YB	This command was integrated into Cisco IOS Release 12.4(22)YB.	
	12.4(24)T	This command was integrated into Cisco IOS Release 12.4(24)T.	
Usage Guidelines	Filenames, directory n The TAR file is an arc	ames, and image names are also case sensitive. hive file from which you can extract files by using the <b>archive tar</b> command.	
Examples	The following example shows how to create a TAR file. The command writes the contents of the new-configs directory on the local flash device to a file named saved.tar on the TFTP server at 172.20.136.9.		
	Switch# archive tar /create tftp:172.20.136.9/saved.tar flash:/new-configs		
	Switch# archive tar	/create tftp:172.20.136.9/saved.tar flash:/new-configs	
	Switch# <b>archive tar</b> The following exampl memory. The contents	/create tftp:172.20.136.9/saved.tar flash:/new-configs e shows how to display the contents of the c2940-tv0-m.tar file that is in flash of the TAR file appear on the screen.	
	Switch# <b>archive tar</b> The following exampl memory. The contents Switch# <b>archive tar</b>	/create tftp:172.20.136.9/saved.tar flash:/new-configs e shows how to display the contents of the c2940-tv0-m.tar file that is in flash of the TAR file appear on the screen. /table flash:c2940-tv0-m.tar	

The following example shows how to extract the contents of a TAR file on the TFTP server at 172.20.10.30. This command extracts only the new-configs directory into the root directory on the local flash file system. The remaining files in the saved.tar file are ignored.

Switch# archive tar /xtract tftp:/172.20.10.30/saved.tar flash:/ new-configs

## clear raw statistics

To clear raw IP statistics when Cisco IOS Software Modularity software is running, use the **clear raw statistics** command in privileged EXEC mode.

clear raw statistics

Syntax Description	This command has no	arguments or keywords.
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	12.2(18)SXF4	This command was introduced to support Software Modularity images.
Usage Guidelines	There are three transport Control Protocol (TCP) generally counters, but the raw IP statistics, an the statistics are releva used in Software Modu	ort protocols used when Software Modularity software is running: Transmission ), User Datagram Protocol (UDP), and raw IP. The transport protocol statistics are some are averages or time stamps. Use the <b>clear raw statistics</b> command to reset ad use the <b>show raw statistics</b> command to display the raw IP statistics. Many of nt to all of the transport protocols. To clear the other transport protocol statistics alarity, use the <b>clear tcp statistics</b> and <b>clear udp statistics</b> commands.
Examples	The following example Router# clear raw st [confirm]	e shows how to clear the raw IP statistics using the <b>clear raw statistics</b> command:
Related Commands	Command	Description
	clear tcp statistics	Clears TCP statistics.
	clear udp statistics	Clears UDP statistics.
	show raw statistics	Displays raw IP statistics.

## clear udp statistics

To clear User Datagram Protocol (UDP) statistics when Cisco IOS Software Modularity software is running, use the **clear udp statistics** command in privileged EXEC mode.

clear udp statistics

Syntax Description	This command has no	arguments or keywords.
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	12.2(18)SXF4	This command was introduced to support Software Modularity images.
Usage Guidelines	There are three transport Control Protocol (TCP some are averages or the use the <b>show udp stati</b> to all of the transport p Modularity, use the <b>cle</b>	ort protocols used when Software Modularity software is running: Transmission ), UDP, and raw IP. The transport protocol statistics are generally counters, but me stamps. Use the <b>clear udp statistics</b> command to reset the UDP statistics, and <b>istics</b> command to display the UDP statistics. Many of the statistics are relevant protocols. To clear the other transport protocol statistics used in Software <b>ear raw statistics</b> and <b>clear tcp statistics</b> commands.
Examples	The following example Router# <b>clear udp st</b> [confirm]	e shows how to clear the UDP statistics using the <b>clear udp statistics</b> command:
Related Commands	<b>Command</b> clear raw statistics clear tcp statistics	Description         Clears raw IP statistics.         Clears TCP statistics.
	show udp statistics	Displays UDP statistics.

### debug registry

To turn on the debugging output for registry events or errors when Cisco IOS Software Modularity software is running, use the **debug registry** command in privileged EXEC mode. To turn off debugging output, use the **no** form of this command or the **undebug** command.

**debug registry** {**events** | **errors**} [*process-name* | *pid*]

**no debug registry** {**events** | **errors**} [*process-name* | *pid*]

Syntax Description	events	Displays debugging messages about registry event messages.	
	errors	Displays debugging messages about registry error messages.	
	process-name	(Optional) Process name.	
	pid	(Optional) Process ID. Number in the range from 1 to 4294967295.	
Command Modes	Privileged EXEC (#)		
Command History	Release	Modification	
	12.2(18)SXF4	This command was introduced to support Software Modularity images.	
<u> </u>	Use any debugging command with caution because the volume of generated output can slow or stop router operations. We recommend that this command be used only under the supervision of a Cisco engineer.		
Examples	The following examp TCP process: Router# <b>debug regis</b> Debug registry even The following examp Router# <b>debug regis</b>	The turns on debugging messages for Software Modularity registry events for the stry events tcp.proc Ints debugging is on the turns on debugging messages for Software Modularity registry errors: stry errors	
	Debug registry errors debugging is on		

### exception core

To set or change the core dump options for a Cisco IOS Software Modularity process, use the **exception core** command in global configuration mode. To reset the core dump options to their default settings, use the **no** form of this command.

exception core process-name {{off | mainmem | mainmem-sharedmem | mainmem-text | mainmem-text-sharedmem | sharedmem [maxcore value]}| maxcore value}

no exception core process-name

Syntax Description	process-name	Process name.
	off	When the process stops, no core dump is taken.
	mainmem	When the process stops, the main memory is dumped.
	mainmem-sharedm	When the process stops, the main memory and the shared memory segments are dumped.
	mainmem-text	When the process stops, the main memory text segment is dumped.
	mainmem-text-sha	<b>redmem</b> When the process stops, the main memory text and shared memory segments are dumped.
	sharedmem	When the process stops, the shared memory segments are dumped.
	maxcore	(Optional) Specifies a maximum number of dumps allowed for this process.
	value	(Optional) Integer from 0 to 4294967295. By default there is no limit.
Command Modes	Global configuration	(config)
Command History	Kelease	Modification
	12.2(18)SXF4	This command was introduced to support Software Modularity images.
Usage Guidelines	Core dumps are take component has an ass that process. Use the Use the <b>exception co</b> software component.	n when every process crashes. Each Cisco IOS Software Modularity software sociated .startup file that determines the core dump options (and other attributes) of <b>show processes detailed</b> command to display the core dump options for a process. <b>ore</b> command to override the default values set in the .startup file for the specific .
 Note	This command is of the field. Under norn that reason, this comm the direction of Cisco	use only to Cisco technical support representatives in analyzing system failures in nal circumstances, there should be no reason to change the core dump options. For mand should be used only by Cisco Certified Internetwork Experts (CCIEs) or under o Technical Assistance Center (TAC) personnel.

### Examples

In the following example, the maximum number of core dumps for all instances of the Cisco Discovery Protocol (CDP) process is set to 100. The command also limits the core dump output to the main memory text segments.

configure terminal exception core cdp2.proc mainmem-text maxcore 100

Related Commands	Command	Description
	exception flash	Configures the dump location for core files when a process reloads.
	show processes detailed	Displays detailed process information.

### exception core-file

To specify the name of the core dump file in Cisco IOS or Cisco IOS Software Modularity software, use the **exception core-file** command in global configuration mode. To return to the default core filename, use the **no** form of this command.

### **Cisco IOS Software**

**exception core-file** *filename* 

no exception core-file

### **Cisco IOS Software Modularity**

exception core-file [filename] [limit upper-limit] [compress] [timestamp]

no exception core-file

Syntax Description	filename	Name of the core dump file saved on the server.
		(Optional) In Software Modularity images, if this argument is not specified, the default core file is named using the name of the process that is being dumped. For example, if the raw_ip.proc is the process that is being dumped, then the default core file is named raw_ip.proc.
	limit	(Optional) For Cisco IOS Software Modularity images only. Specifies an upper limit of a range so that core dumps of more than one process can be created without overwriting the previous core dump.
	upper-limit	(Optional) For Cisco IOS Software Modularity images only. Number, in the range from 1 to 64, that represents the upper limit.
	compress	(Optional) For Cisco IOS Software Modularity images only. Turns on dump file compression. By default, compression is turned off.
	timestamp	(Optional) For Cisco IOS Software Modularity images only. Adds a time stamp to the core dump file.
Command Default	Cisco IOS Software Cisco IOS Software dumped.	: The core file is named <i>hostname</i> -core, where <i>hostname</i> is the name of the router. Modularity: The core file is named using the name of the process that is being
Command Modes	Global configuration	n (config)
Command History	Release	Modification
	10.2	This command was introduced.
	12.2(18)SXF4	The <b>limit</b> , <b>compress</b> , and <b>timestamp</b> keywords were added to support Software Modularity images.

### **Usage Guidelines**

If you use TFTP to dump the core file to a server, the router will only dump the first 16 MB of the core file. If the router's memory is larger than 16 MB, the whole core file will not be copied to the server. Therefore, use rcp or FTP to dump the core file. The network dump is not supported in Software Modularity images.

This command is of use only to Cisco technical support representatives in analyzing system failures in the field. Under normal circumstances, there should be no reason to change the default core filename. For that reason, this command should be used only by Cisco Certified Internetwork Experts (CCIEs) or under the direction of Cisco Technical Assistance Center (TAC) personnel.

### Examples

### **Cisco IOS Software**

In the following example, the router is configured to use FTP to dump a core file named dumpfile to the FTP server at 172.17.92.2 when the router crashes:

ip ftp username red ip ftp password blue exception protocol ftp exception dump 172.17.92.2 exception core-file dumpfile

### **Cisco IOS Software Modularity**

In the following example, the router is configured to dump the main memory used by the TCP process to a file named dump-tcp when the TCP process crashes. The dump file is configured with an upper limit of 20, to be compressed, and to have a time stamp applied.

exception core tcp.proc mainmem exception core-file dump-tcp limit 20 compress timestamp

# Note

The **exception protocol** and **exception dump** commands are not supported in Software Modularity images.

Related Commands	Command	Description
	exception core	Sets or changes the core dump options for a Cisco IOS Software Modularity process.
	exception dump	Causes the router to dump a core file to a particular server when the router crashes.
	exception memory	Causes the router to create a core dump and reboot when certain memory size parameters are violated.
	exception protocol	Configures the protocol used for core dumps.
	exception spurious-interrupt	Causes the router to create a core dump and reload after a specified number of spurious interrupts.
	ip ftp password	Specifies the password to be used for FTP connections.
	ip ftp username	Configures the username for FTP connections.

## exception crashinfo buffersize

To change the size of the buffer used for crashinfo files, use the **exception crashinfo buffersize** command in global configuration mode. To revert to the default buffer size, use the **no** form of this command.

exception crashinfo buffersize kilobytes

no exception crashinfo buffersize kilobytes

Syntax Description	kilobytes Buffe	er size, in kilobytes (KB). Range is 32 to 256. Default is 32.
Command Default	Crashinfo buffer is 32	KB.
Command Modes	Global configuration (	config)
Command History	Release	Modification
	12.2(4)T, 12.2(11)	This command was introduced for the Cisco 3600 series only (3620, 3640, and 3660 platforms).
	12.2(13)T	This command was implemented in Cisco 6400-NSP images.
	12.2(15)JA	This command was integrated into Cisco IOS Release 12.2(15)JA.
	12.2(18)SXF4	This command was integrated into Release 12.2(18)SXF4 to support Software Modularity images.
Usage Guidelines	The crashinto file save problems that caused th console at the time of th the failure (instead of y	s information that helps Cisco technical support representatives to debug ne Cisco IOS image to fail (crash). The device writes the crash information to the ne failure, and the file is created the next time you boot the Cisco IOS image after while the system is failing).
<u>Note</u>	If you are running a Software Modularity image, setting the crashinfo buffer size to the default of 32 KB does not limit the crashinfo buffer size. The crashinfo file size is limited to the value set if the value is set to anything other than the default 32 KB.	
Examples	In the following examp Router(config)# <b>exce</b>	ole, the crashinfo buffer is set to 100 KB:
Related Commands	Command	Description
	exception crashinfo f	ile Enables the creation of a diagnostic file at the time of unexpected system shutdowns.

## exception flash

To handle the device and erase permission for exceptions, and set the local dump location for core files when a process reloads, use the **exception flash** command in global configuration mode.

exception flash {all | iomem | procmem} device-name

no exception flash

Syntax Description	all	Dumps all the memory in the local dump location.
	device-name	Device name to be used as the local dump location.
	iomem	Dumps the input and output memory in the local dump location.
	procmem	Dumps the processor memory in the local dump location.
Command Default	No core dump locat	ion is set for a process.
Command Modes	Global configuration (config)	
Command History	Release	Modification
	12.2(18)SXF4	This command was introduced to support Software Modularity images.
	15.0(1)M	This command was modified in a release earlier than Cisco IOS Release 15.0(1)M. The <b>all</b> , <b>iomem</b> , and <b>procmem</b> keywords were added.
Usage Guidelines	Core dumps are taken when every process reloads. You can configure up to three destinations, and the order in which the dump locations are used follows the order in which the destinations are configured. Each Cisco IOS Software Modularity component has an associated .startup file that determines the core dump options (and other attributes) of that process. Use the <b>show processes detailed</b> command to display the core dump options for a process. Use the <b>exception core</b> command to override the default values set in the .startup file for the specific software component. This command is of use only to Cisco technical support representatives in analyzing system failures in the field. Under normal circumstances, there should be no reason to set a local core dump location for a process. For that reason, this command should be used only by Cisco Certified Internetwork	
Examples	In the following exa Router# configure Router(config)# ex Router(config)# ex	mple, three dump locations are configured to dump all the memory: terminal sception flash all disk1: sception flash all bootflash:

Related Commands	Command	Description
	exception core	Sets or changes the core dump options for a Cisco IOS Software Modularity process.
	show processes detailed	Displays detailed process information.
	write core	Generates a process core dump.

## exception kernel

To configure a networking device to dump the kernel memory, use the **exception kernel** command in global configuration mode. To turn off the kernel dump facility, use the **no** form of this command.

exception kernel [filename filename] filepath path [memory kernel]

no exception kernel

Syntax Description	filename	(Optional) Specifies the name of the kernel dump file.
	filename	(Optional) Name of the kernel dump file. Because this file is a compressed file, a .Z suffix is added to the name. By default, the filename is kernel_core.Z.
	filepath	Specifies the location to which the core dump file is written.
	path	Location to which the core dump file is written. The supported locations are <b>bootflash:</b> or <b>diskn:</b> . For <b>diskn:</b> or <b>bootflash:</b> , the <i>path</i> value is the absolute path to the file.
	memory	(Optional) Specifies the type of memory to be dumped.
	kernel	(Optional) Specifies that only kernel memory is to be dumped. If not specified, both user memory and kernel memory are dumped.
Command Default	No kernel memory is	s dumped.
Command Modes	Global configuration	(config)
Command History	Release	Modification
	12.2(18)SXF4	This command was introduced to support Software Modularity images.
Usage Guidelines	Use the <b>exception kernel</b> command to dump kernel memory when the kernel reloads. Please note that this is different from process dump, in which a process on the networking device reloads, but not the networking device itself. This command is used to configure where and what to dump. If the dump is to <b>bootflash:</b> , this command is all that is required.	
	For distributed netwo kernel core dump file kernel_core6.Z.	orking devices, the line card number is added to the default name assigned to the e. For example, the default kernel core dump file for the line card in slot 6 would be
Caution	This command is of the field. Under norr reason, this comman direction of Cisco Te	use only to Cisco technical support representatives in analyzing system failures in nal circumstances, there should be no reason to dump the kernel memory. For that d should be used only by Cisco Certified Internetwork Experts (CCIEs) or under the echnical Assistance Center (TAC) personnel.

### Examples

The following example writes kernel exceptions to the disk0:/core directory. Only kernel memory is dumped, and because no filename is specified, the kernel core dump file is given the default name kernel\_core.z.

configure terminal
 exception kernel filepath /disk0:/core memory kernel

## exception switch kernel

To configure a networking device to dump the kernel memory, use the **exception kernel** command in global configuration mode. To turn off the kernel dump facility, use the **no** form of this command.

exception switch kernel filesystem filename

no exception switch kernel filesystem filename

Syntax Description	filesystem	Specifies the file system for placing the kernel core file.	
	filename	(Optional) Name of the kernel core file. Because this file is a compressed file, a .Z suffix is added to the name. By default, the filename is kernel_core.Z.	
Command Default	No kernel memory i	is dumped.	
Command Modes	Global configuration	n (config)	
Command History	Release	Modification	
	12.2(33)SXI4	This command was introduced to support software modularity images.	
	12.2(33)SXI5	This command is not supported in Cisco IOS Release 12.2(33)SXI5 and later releases.	
Usage Guidelines  Caution	This command is use in the field. Under n reason, this comman the direction of Cisc	eful only to Cisco technical support representatives for analyzing system failures formal circumstances, you should not need to dump the kernel memory. For that ad should be used only by Cisco Certified Internetwork Experts (CCIEs), or under co Technical Assistance Center (TAC) personnel.	
	The <b>exception switch kernel</b> command is available in Cisco IOS Releases 12.2(33)SXI4 and 12.2(33)SXI4a		
	Use the <b>exception switch kernel</b> command to dump kernel memory when the kernel reloads on the SP. This operation is different from process dump in which a process on the networking device reloads, but not the networking device itself. This command is used to configure where and what to dump. If the dump is to <b>bootflash:</b> , the <b>exception switch kernel</b> command is all that is required.		
	The <b>filepath</b> keyword only accepts file systems available to the SP. Use this command for configuring modular Cisco IOS kernel core files on the SP.		
	For distributed networking devices, the line card number is added to the default name assigned to the kernel core dump file. For example, the default kernel core dump file for the line card in slot 6 would be kernel_core6.Z.		

# **Examples** The following example writes kernel exceptions to the disk0:/core directory. Only kernel memory is dumped, and because no filename is specified, the kernel core dump file is given the default name kernel\_core.z.

configure terminal
 exception switch kernel filesystem /disk0:/core memory kernel

Related Commands	Command	Description
	exception kernel	Configures module Cisco IOS kernel core files on the RP.

### install activate

1	Note

Effective with Cisco IOS Release 12.2(33)SXI3, the install activate command is not available in Cisco IOS software.

To activate the current pending change set, use the install activate command in privileged EXEC mode.

install activate search-root-directory [reload]

Syntax Description	search-root-directory	Local directory specified in the <i>destination-directory</i> argument of a previously executed <b>install file</b> command. Valid root directories are /sys, /oldsys, and /newsys.
	reload	(Optional) Treats the patch to be activated as a reload patch, thereby bypassing a time-consuming process restart.

### Command ModesPrivileged EXEC (#)

Command History	Release	Modification
	12.2(18)SXF4	This command was introduced to support Software Modularity images.
	12.2(33)SXI1	This command was modified. The <b>reload</b> keyword was added.
	12.2(33)SXI3	This command was removed.

### Usage Guidelines Use t

Use the **install activate** command after a patch file or maintenance pack (MP) has been installed. The state of files in the pending change set will change depending on whether a reload is required.

Cisco IOS Software Modularity introduces the concept of installed software that is different from just booting an image on the networking device. Cisco IOS Software Modularity images can be saved into the flash file system and booted like a Cisco IOS image, but this is referred to as uninstalled software. To gain the benefits of the Cisco IOS Software Modularity Installer and permit patch files to be installed, use the **install file** command to write the software to flash. Installation and activation are now separate processes. The **install bind** command is used to bind Cisco IOS Software Modularity base images system-wide; and the **install activate** command must be entered to activate a patch. Some patches will require a reload to be performed, and a message appears on the console after the **install activate** command has been entered to note the current state of the patch.

Table 5 shows whether the patch code is running in the various patch states. For more details about activating a patch, including a flowchart of the various patch states, see the "Cisco IOS Software Modularity Installation and Configuration" module.

State	State Description	Is Patch Code Running?
PendInst	Pending installation activation.	No processes are running the patch code.
InstPRel	Installation activation pending reload.	No processes are running the patch code until a card reload is performed.
IPRPndRo	Installation activation pending reload pending rollback.	No processes are running the patch code until a card reload is performed.
PendRoll	Pending rollback	Some processes are running the patch code.
RollPRel	Rollback pending reload.	Some processes are running the patch code.
RPRPndIn	Rollback pending reload pending installation activation.	Some processes are running the patch code.
Active	Patch is active.	Some processes are running the patch code.
Pruned	Patch is removed.	No processes are running the patch code.

Examples

The following example shows how to activate the current pending change set for the sys directory: Router# install activate disk0:/sys

Related Commands	Command	Description
	install bind	Binds Cisco IOS Software Modularity images.
	install file	Installs base system files and patches.

## install bind

Note	Effective with Cisco IOS Release 12.2(33)SXI3, the <b>install bind</b> command is not available in Cisco IOS software.		
	To bind a Cisco IOS So in global configuration this command.	ftware Modularity software image system-wide, use the <b>install bind</b> command mode. To remove the Software Modularity software binding, use the <b>no</b> form of	
	install bind search	<pre>-root-directory [prepend]</pre>	
	no install bind		
Syntax Description	search-root-directory	Directory to be bound as specified in the <i>destination-directory</i> argument of a previously executed <b>install file</b> command.	
	prepend	(Optional) Moves the latest boot system statement to the top of the boot variable, which makes that statement the primary image to boot.	
Command Default	The Cisco IOS Softward	e Modularity software image is not bound.	
Communa moues	Grobal configuration (c		
Command History	Release	Modification	
	12.2(18)SXF4	This command was introduced to support Software Modularity images.	
	12.2(33)SXI1	This command was modified. The <b>prepend</b> keyword was added.	
	12.2(33)SXI3	This command was removed.	
Usage Guidelines	The <b>install bind</b> communications inserted into the configuration of the search root directory. Cisco IOS Software Monutes the <b>boot system</b> contained of the search root system contained of the syst	and generates a <b>boot system</b> command, but the <b>install bind</b> command is not uration. The benefit in using the <b>install bind</b> command is that you just specify y, which is the destination directory used in the <b>install file</b> command, and the odularity software will determine the directory structure and image file. If you mmand, you must enter the complete directory path and image name.	
	Each instance of the <b>bo</b> configuration file in the commands. To configur- image to boot, you must in the order in which yo to a text file, insert the startup configuration.	ot system command generated by an <b>install bind</b> command is saved in the order in which it was configured, which is the normal behavior for <b>boot system</b> e a system to have the newly installed Software Modularity image as the primary remove all previous <b>boot system</b> commands in the configuration and enter them but want them to run. Alternatively, you can download the startup configuration new <b>install bind</b> or <b>boot system</b> command, and copy the changes back into the	

	To remove all <b>boot</b> command without a <b>boot system</b> comm	<b>system</b> commands from the configuration file, use the <b>no</b> form of the <b>boot system</b> any arguments. Using the <b>no</b> form of the <b>install bind</b> command will remove only the nands for installed software and leave other <b>boot system</b> commands intact.
Note	Use the <b>install bin</b> changes to the start before the installed	<b>d</b> command to bind one or more Software Modularity images, and then copy the up configuration file. Be aware that an image reload or switchover must be performed I and bound image is actually running on the device.
Examples	The following exar Software Modulari	nple shows how to remove all existing <b>boot system</b> commands and to bind the ty image in the directory named sys:
	Router# <b>configure</b> Router(config)# <b>r</b> Router(config)# <b>i</b> Router(config)# <b>e</b> Router# <b>copy run</b>	e terminal no boot system Install bind disk0:/sys exit ning-config startup-config
Related Commands	Command boot system	<b>Description</b> Specifies the system image that the router loads at startup.

Installs base system files and patches.

install file

## install clear

Note	Effective with Cisco IOS Release 12.2(33)SXI3, the <b>install clear</b> command is not available in Cisco IOS software.		
	To remove an entire inst	alled software system, use the <b>install clear</b> command in privileged EXEC mode.	
	install clear search	a-root-directory	
Syntax Description	search-root-directory	Local directory specified in the <i>destination-directory</i> argument of a previously executed <b>install file</b> command. Valid root directories are /sys, /oldsys, and /newsys.	
Command Modes	Privileged EXEC (#)		
Command History	Release	Modification	
	12.2(18)SXF4	This command was introduced to support Software Modularity images.	
	12.2(33)SXI3	This command was removed.	
Usage Guidelines	<b>delines</b> Use the <b>install clear</b> command with caution because the command cannot be reversed. After a installation is cleared, it cannot be undone. Software that is currently running or that has been run cannot be cleared. For bound software, you must remove the binding with the <b>no install h</b> command before using the <b>install clear</b> command.		
Examples	The following example shows how to clear the system installed in the local directory named sys: Router# install clear disk0:/sys		
Related Commands	Command	Description	
	install bind	Binds Cisco IOS Software Modularity images.	
	install file	Installs base system files and patches.	

## install commit

Note	Effective with Cisco IOS Release 12.2(33)SXI3, the <b>install commit</b> command is not available in Cisco IOS software. To define a tag name for a set of Cisco IOS Software Modularity software installed in the destination directory of a previously executed <b>install file</b> command, use the <b>install commit</b> command in privileged EXEC mode.		
	install commit sea	rch-root-directory tag-name	
Syntax Description	search-root-directory	Local directory specified in the <i>destination-directory</i> argument of a previously executed <b>install file</b> command.	
	tag-name	String of characters to identify a set of software installed in the <i>search-root-directory</i> value.	
Command Modes	Privileged EXEC (#)		
Command History	Release	Modification	
-	12.2(18)SXF4	This command was introduced to support Software Modularity images.	
	12.2(33)SXI3	This command was removed.	
Usage Guidelines	This command creates a considered unsatisfactor unique to the local file s	a point to which a user can roll back a system after a patch is installed that is ry. The <i>tag-name</i> argument provides a name for the point. A tag name must be system.	
	Use the <b>install prune</b> command to remove a previously defined tag from the installed software.		
Examples	The following example shows how to define a tag named tag1 to identify the software installed in the local directory named sys:		
	Router# <b>install commi</b>	t disk0:/sys tag1	
Related Commands	Command	Description	
	install file	Installs base system files and patches.	
	install prune	Removes a tag from the software installed in a directory specified in a previously executed <b>install file</b> command.	

## install copy

•	
N	lote

Effective with Cisco IOS Release 12.2(33)SXI3, the **install copy** command is not available in Cisco IOS software.

To make a copy of the Cisco IOS Software Modularity software, use the **install copy** command in privileged EXEC mode.

install copy source-root-directory destination-root-directory

Syntax Description	source-root-directory	Local directory specified in a previously executed <b>install file</b> command.
	destination-root-directory	Valid root directories are /sys, /oldsys, and /newsys.         V         Local root directory. Valid root directories are /sys, /oldsys, and /newsys.
		/newsys.
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	12.2(18)SXF4	This command was introduced to support Software Modularity images.
	12.2(33)SXI3	This command was removed.
Usage Guidelines	Use the <b>install copy</b> comr directory and place it at th local to the device.	nand to duplicate the Cisco IOS Software Modularity software at the source the destination directory. Both the source and destination directories must be
Examples	The following example shows how to copy the software in the directory named sys into a directory named oldsys:	
	Router# <b>install copy di</b>	sk0:/sys disk0:/oldsys
Related Commands	Command	Description
	install file	Installs base system files and patches.

## install file

Effective with Cisco IOS Release 12.2(33)SXI3, the **install file** command is not available in Cisco IOS software.

To install Cisco IOS Software Modularity base system files and patches, use the **install file** command in privileged EXEC mode.

install file source-file-url destination-directory [second-destination-directory] [interactive]

Syntax Description	source-file-url	Path of an installable file that contains the code to be installed. The installable file may be on a local file system or on a remote file system.
	destination-directory	Path of the destination directory in which the installable file is to be installed. The destination directory must be on a local file system and be in the following format: <i>file-system:</i> /{sys   newsys   oldsys}.
	second-destination-dire ctory	(Optional) Path of a secondary destination directory in which the installable file is to be installed. The secondary destination directory must be on a local file system and be in the following format: <i>file-system:</i> /{sys   newsys   oldsys}.
	interactive	(Optional) Enables prompting of the user before certain actions and activates more detailed output during the installation process.

### **Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(18)SXF4	This command was introduced to support Software Modularity images.
	12.2(33)SXI1	This command was modified. The optional <i>second-destination-directory</i> argument was added.
	12.2(33)SXI3	This command was removed.

**Usage Guidelines** 

Use the optional **interactive** keyword to display more detailed output during the installation. Messages indicating current tasks that are being performed during the installation may be displayed. The default output is a series of ! characters to indicate progress and a message at the end indicating success or failure.

Cisco IOS Software Modularity introduces the concept of installed software that is different from just booting an image on the networking device. Cisco IOS Software Modularity images can be saved into the flash file system and booted like a Cisco IOS image, but this is referred to as uninstalled software. To gain the benefits of the Cisco IOS Software Modularity Installer and permit patch files to be installed, use the **install file** command to write the software to local storage. Installation and activation are now separate processes; and the **install activate** command must be entered to activate patches. Some patches will require a reload to be performed, and a message appears on the console after the **install activate** command has been entered to note the current state of the patch.

Use the **show install** command to display information about the currently installed software. Use the **install clear** command to remove an entire installed software system, or use the **install rollback** command to remove specific patches installed on top of the software version.

**Examples** The following example shows how to install two different files from two different paths into the same local directory:

Router# install file tftp://username@hostname//directory/c6kpatch-vz disk0:/sys Router# install file rcp://s72033/base/s72033-adventerprisek9\_wan\_dbg-vz disk0:/sys

Related Commands	Command	Description
	install activate	Activates the current pending change set.
	install clear	Removes an entire installed software system.
	install rollback	Rolls back the installed Cisco IOS Software Modularity software to the point at which a tag was defined.
	show install	Displays information about the installed software.

## install move

	install file	Installs base system files and patches.
Related Commands	Command	Description
	Router# <b>install move di</b>	.sk0:/sys disk0:/oldsys
Examples	The following example shows how to move the software from the directory named /sys to the directory named /oldsys. The software will be removed from the /sys directory.	
Usage Guidelines	Use the <b>install move</b> com directory to a destination source and destination direct	mand to copy the Cisco IOS Software Modularity software from a source directory and then remove the software from the source directory. Both the ectories must be local.
	12.2(33)SXI3	This command was removed.
	12.2(18)SXF4	This command was introduced to support Software Modularity images.
Command History	Release	Modification
Command Modes	Privileged EXEC (#)	
	destination-root-directory	<ul> <li>Local root directory. Valid root directories are /sys, /oldsys, and /newsys.</li> </ul>
Syntax Description	source-root-directory	Local directory specified in a previously executed <b>install file</b> command. Valid root directories are /sys, /oldsys, and /newsys.
	install move command in install move source-r	privileged EXEC mode.
	To move the Cisco IOS So	ftware Modularity software from a source URL to a destination URL, use the
	software.	
Note	Effective with Cisco IOS R	Release 12.2(33)SXI3, the install move command is not available in Cisco IOS
×4		

### install prune

1	Note

Effective with Cisco IOS Release 12.2(33)SXI3, the **install prune** command is not available in Cisco IOS software.

To remove a tag or unused files from the software that is installed in the destination directory specified in a previously executed **install file** command, use the **install prune** command in privileged EXEC mode.

install prune search-root-directory tag-name [files]

Syntax Description	search-root-directory	Directory specified in the <i>destination-directory</i> argument of a previously executed <b>install file</b> command.
	tag-name	String of characters to identify a set of software as previously defined by the <b>install commit</b> command.
	files	(Optional) Cleans and removes all unused and nonactive files from the base image to the tag specified by the <i>tag-name</i> argument. The tag specified by the <i>tag-name</i> attribute is not removed.

### **Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(18)SXF4	This command was introduced to support Software Modularity images.
	12.2(18)SXF8	The <b>files</b> keyword was added.
	12.2(33)SXI3	This command was removed.

**Usage Guidelines** 

In addition to removing the tag from the installed software, the **install prune** command removes any files that are no longer required by the system as a result of the tag removal. After this command is executed, rollback can be performed to any previously installed tag.

When this command is executed using the optional **files** keyword, all of the tags from the base image to the tag specified are removed except for the specified tag. After this command is entered with the optional **files** keyword, rollback cannot be done to any tag beyond the specified tag; rollback can be performed to the base image only.

### Examples

The following example shows how to remove the tag named tag1 from the installed software.

Router# install prune disk0:/sys tag1

The following example shows how to remove all of the tags from the base image up to tag1. Tag1 is not removed.

Router# install prune disk0:/sys tag1 files

Related Commands	Command	Description
	install commit	Defines a tag for a set of software installed by the install file command.
	install file	Installs base system files and patches.

### install repackage

Note

Effective with Cisco IOS Release 12.2(33)SXI3, the **install repackage** command is not available in Cisco IOS software.

To create an installation or backup installable file from an installed system when a Cisco IOS Software Modularity image is running, use the **install repackage** command in privileged EXEC mode.

install repackage *source-root-directory destination-file-url* [compress]

Syntax Description         source-root-directory         Local directory specified in a previously executed install fle command.           destination-file-url         Local or remote URL that specifies the path and name of the destination file to which the installable file is written.           compress         (Optional) Indicates that the generated installable file is to be compressed.           Command Modes         Privileged EXEC (#)           Command History         Release         Modification           12.2(18)SXF4         This command was introduced to support Software Modularity images.           12.2(33)SXI3         This command was removed.           Usage Guidelines         To allow for easier deployment of a base image and several patches to multiple routers, an installable bundled image, referred to as a repackage, can be replicated. Use the install repackage command to generate a installable file from an installed system. The installable file can be used in an installation on another device or as a backup installation for the current device. While the image is being replicated, the Software Modularity Installer saves everything in the installed state including rollback tags. An initial boot must be performed on the device on which the replicated image is to be installed. The ability to create a repackage allows standard installations to be performed across the network and saves installation time.           Examples         The following example shows how to create an installation or backup file named s72033-finance-vm.repackage firsts1/sys disk0:/s72033-finance-vm.repackage           Related Commands         Comm			
destination-file-url       Local or remote URL that specifies the path and name of the destination file to which the installable file is written.         compress       (Optional) Indicates that the generated installable file is to be compressed.         Command Modes       Privileged EXEC (#)         Command History       Release       Modification         12.2(18)SXF4       This command was introduced to support Software Modularity images.         12.2(3)SX13       This command was removed.         Usage Guidelines       To allow for easier deployment of a base image and several patches to multiple routers, an installable bundled image, referred to as a repackage, can be replicated. Use the install repackage command to generate a installable file from an installed system. The installable file can be used in an installable for or as a backup installation for the current device. While the image is being replicated, the Software Modularity Installer saves everything in the installed state including rollback tags. An initial boot must be performed on the device on which the replicated image is to be installed. The ability to create a repackage allows standard installations to be performed across the network and saves installation time.         Examples       The following example shows how to create an installable system: Router# install repackage disk0:/srs disk0:/sr2033-finance-vm.repackage         Related Commands       Command       Description         Install file       Installs base system files and patches.	Syntax Description	source-root-directory	Local directory specified in a previously executed <b>install file</b> command.
compress         (Optional) Indicates that the generated installable file is to be compressed.           Command Modes         Privileged EXEC (#)           Command History         Release         Modification           12.2(18)SXF4         This command was introduced to support Software Modularity images.           12.2(33)SX13         This command was removed.           Usage Guidelines         To allow for easier deployment of a base image and several patches to multiple routers, an installable bundled image, referred to as a repackage, can be replicated. Use the install repackage command to generate a installable file from an installed system. The installable file can be used in an installation on another device or as a backup installation for the current device. While the image is being replicated, the Software Modularity Installer saves everything in the installed state including rollback tags. An initial boot must be performed on the device on which the replicated image is to be installed. The ability to create a repackage allows standard installations to be performed across the network and saves installation time.           Examples         The following example shows how to create an installation or backup file named s72033-finance-vm.repackage from an installed system: Router# install repackage disk0:/sys disk0:/s72033-finance-vm.repackage           Related Commands         Command         Description           Install file         Installs base system files and patches.		destination-file-url	Local or remote URL that specifies the path and name of the destination file to which the installable file is written.
Command Modes       Privileged EXEC (#)         Command History       Release       Modification         12.2(18)SXF4       This command was introduced to support Software Modularity images.         12.2(33)SXI3       This command was removed.         Usage Guidelines       To allow for easier deployment of a base image and several patches to multiple routers, an installable bundled image, referred to as a repackage, can be replicated. Use the install repackage command to generate a installable file from an installed system. The installable file can be used in an installation on another device or as a backup installation of the current installable site including rollback tags. An initial boot must be performed on the device on which the replicated image is to be installed. The ability to create a repackage allows standard installations to be performed across the network and saves installation time.         Examples       The following example shows how to create an installed system: Router# install repackage from an installed system: Router# install repackage first an installed system: Router# install repackage disk0:/sr2033-finance-vm.repackage         Related Commands       Command       Description         Install file       Installs base system files and patches.		compress	(Optional) Indicates that the generated installable file is to be compressed.
Release       Modification         12.2(18)SXF4       This command was introduced to support Software Modularity images.         12.2(33)SX13       This command was removed.         Usage Guidelines       To allow for easier deployment of a base image and several patches to multiple routers, an installable bundled image, referred to as a repackage, can be replicated. Use the install repackage command to generate a installable file from an installed system. 		install file	Installs base system files and patches.

## install rollback

 Note	Effective with Cisco IOS Release 12.2(33)SXI3, the <b>install rollback</b> command is not available in Cisco IOS software.				
	To roll back the installed Cisco IOS Software Modularity software to the point at which a tag was defined, use the <b>install rollback</b> command in privileged EXEC mode.				
	install rollback sea	arch-root-directory tag-name			
Syntax Description	search-root-directory	Directory specified in the <i>destination-directory</i> argument of a previously executed <b>install file</b> command. Valid root directories are /sys, /oldsys, and /newsys.			
	tag-name	String of characters to identify a set of software as previously defined by the <b>install commit</b> command.			
Command Modes	Privileged EXEC (#)				
Command History	Release	Modification			
	12.2(18)SXF4	This command was introduced to support Software Modularity images.			
	12.2(33)SXI3	This command was removed.			
Usage Guidelines	Similar to the idea of a database rollback, Cisco IOS Software Modularity images can roll back to a set of installed files defined by a tag. The installed system is captured at a point in time by defining a tag using the <b>install commit</b> command. If a subsequent installation of a patch file adversely affects the installed system, a rollback can be performed using the defined tag. The <b>install activate</b> command must be entered after the <b>install rollback</b> command to activate the rollback. All installation actions performed since the tag was defined are deleted, and the processes affected by the rollback of installed software are restarted after the rollback is activated. After the restart, these processes use the software that was present at the time the tag was created. Tags can be deleted, and the system will remove all installation files that will now never be used because the tag has been removed.				
Examples	The following example shows how to roll back the software to the time that tag1 was defined and then restart all the affected processes. The tag named tag1 is assumed to have been created using the install commit command in an earlier configuration.				
	Router# <b>install rollback disk0:/sys tag1</b> Router# <b>install activate disk0:/sys</b>				

Related Commands	Command	Description
	install activate	Activates the current pending change set for Cisco IOS Software Modularity images.
	install commit	Defines a tag for a set of software installed by the install file command.
	install file	Installs base system files and patches.

### process restart

To terminate and restart a process when a Cisco IOS Software Modularity image is running, use the **process restart** command in privileged EXEC mode.

process restart process-name [:instance-id] [cold]

Syntax Description	process-name	Process name.				
		Note	Only processes that are controlled by the System Manager can be restarted.			
	:instance-id	(Optional) Process number. The first process is numbered 1, and this is the default if no number is specified. The colon is required.				
	cold	(Optio	onal) Specifies a cold restart.			
Command Modes	Privileged EXEC (#)					
Command History	Release	Modif	ication			
	12.2(18)SXF4	This c	ommand was introduced to support Software Modularity images.			
	12.2(18)SXF5	This c possib	ommand was enhanced to display console and error messages about le configuration losses at restart.			
Usage Guidelines	The <b>process restart</b> command can be used to restart a newly installed version of an executable. Under special circumstances, it can also be used to restart a process that is operating in suboptimal mode. Only processes that are controlled by the System Manager can be restarted.					
	When restarting, a proce checkpoint. A cold resta saved configuration chec	ess will n art means ckpoint.	etrieve the previous state information from the saved configuration s that the process will delete the previous state information from the			
	If the <b>process restart</b> command is entered without first saving the active running configuration session and checkpointing the configuration changes, the changes could be lost. The following console warning about this possible configuration loss is displayed:					
	Some config has not yet been checkpointed and may be lost. It is recommended to do a `write checkpoint' to checkpoint the config and re-start the process. Do you want to continue ? [no]:					
	If you restart the process, a message similar to the following is displayed:					
	Restarting process iprouting.iosproc					
	02:51:21: %kern-6-SYSLOG_GEN: <30>:02:51:21:;1144354584.745: sysmgr.proc[72]: Some config for process iprouting.iosproc:1 has not yet been checkpointed and may be lost					
	To checkpoint the configuration, use the <b>write checkpoint</b> command. Some commands also checkpoint internally upon being entered, such as the <b>write memory</b> command, the <b>copy running-config startup-config</b> command and the <b>show running-config</b> command.					

	In Software Modula is disabled by defau command to restart messages:	rity, you cannot restart a process on the standby router. The standby router console lt. If you enable the standby router console, and then enter the <b>process restart</b> a process, the standby console will reload and display one of the following error	
	Standby process ex	kited, rebooting.	
	or		
	This process is not known to sysmgr.		
Examples	The following example restarts the Cisco Discovery Protocol (CDP) process:		
	Router# process restart cdp2.iosproc		
Related Commands	Command	Description	
interaction communus	process start	Initiates (spawns) a foreground or background POSIX process.	

### process start

To initiate (spawn) a foreground or background POSIX process when a Cisco IOS Software Modularity image is running, use the **process start** command in privileged EXEC mode.

process start path/process-name [argument-1...argument-n] [&]

Syntax Description	path	Path to the process.		
	Iprocess-name	Process name. The slash mark is required.		
	argument-1argument-n	(Optional) One or more command-line arguments that are passed to the		
		initiating process.		
	&	(Optional) Starts the process in the background.		
Command Modes	Privileged EXEC (#)			
Command History	Release	Modification		
	12.2(18)SXF4	This command was introduced to support Software Modularity images.		
Usage Guidennes	The <b>process start</b> command is used to control POSIX processes and processes that are registered with sysmgr by using .startup and .init files. To terminate a POSIX process that is running in the foreground, use the Ctrl-C (^C) keyboard sequence. Output for processes that are running in the foreground is directed to the tty (including Telnet) that initiates the command. Output for processes that are running in the background is directed only to the console.			
Examples	The following example initiates a POSIX process to run in the background:			
Related Commands	Command	Description		
	process stop	Terminates a process when running a Cisco IOS Software Modularity image without restarting the process.		
## process stop

To terminate a process without restarting the process when a Cisco IOS Software Modularity image is running, use the **process stop** command in privileged EXEC mode.

process stop process-name [:instance-id]

Syntax Description	process-name	Proce	ss name.
		Note	Only processes that are not controlled by the System Manager can be stopped.
	:instance-id	(Optio defaul	onal) Process number. The first process is numbered 1, and this is the t if no number is specified. The colon is required.
Command Default	After a process is ter	minated, th	e process is restarted.
Command Modes	Privileged EXEC (#)		
Command History	Release	Modif	ication
	12.2(18)SXF4	This c	ommand was introduced to support Software Modularity images.
Usage Guidelines	Use the <b>process stop</b> executing copies. Th	command e process is	to shut down (terminate) the specified process and any simultaneously not restarted, even if it had a respawn option specified.
Note	System-manager-con	trolled prod	cesses (for example, cdp2.iosproc) cannot be stopped.
Examples	The following examp Router# <b>process st</b>	ole shuts do op process	wn all instances of the POSIX process named process1: 1
Related Commands	Command	Descr	iption
	process start	Initiat	es (spawns) a foreground or background POSIX process.

## service checkpoint-config

To enable implicit configuration checkpointing when a Cisco IOS Software Modularity image is running, use the **service checkpoint-config** command in global configuration mode. To return to the default setting, use the **no** form of this command.

### service checkpoint-config

no service checkpoint-config

Syntax Description	This command has no arguments	or keywords.
--------------------	-------------------------------	--------------

**Command Default** Implicit configuration checkpointing is disabled.

**Command Modes** Global configuration (config)

Command History Release Modification		Modification
	12.2(18)SXF4	This command was introduced to support Software Modularity images.
	12.2(33)SXH	Automatic configuration checkpointing is disabled by default.

#### **Usage Guidelines**

Implicit configuration checkpointing means that configuration checkpointing occurs for all processes. A Software Modularity process can be restarted under an error condition or after upgrading. When the process is restarted and operational, the state of the process returns to the state the process was in prior to the restart. The software checkpoints the configuration information and when the process restarts, the configuration information is read from the checkpoint.

Configuration checkpoint information is implicitly generated as follows:

- Each time you exit from global configuration mode.
- Each time you enter the write memory, copy running-config, or show running-config command.
- When the action generated by the **write checkpoint** command has completed. The **write checkpoint** command is visible only after you enter the **no service checkpoint-config** command.

If you have a large configuration file, the default configuration checkpoint process may take some time to complete and prevent you from entering other CLI commands to save or display the configuration.

In Cisco IOS Release 12.2(18)SXF4, the checkpoint process is enabled by default. To disable the checkpoint process, enter the **no** form of the **service checkpoint-config** command. When you are ready to run the configuration checkpoint process, use the **write checkpoint** command to run the configuration checkpoint process.

In Cisco IOS Release 12.2(33)SXH, the default setting was changed to **no service checkpoint-config**, which means the checkpoint process is diabled by default. To enable the checkpoint process in this release, use the **service checkpoint-config** command.

### Examples

In the following example for Cisco IOS Release 12.2(18)SXF4, the **no** form of the **service checkpoint-config** command is entered to disable the configuration checkpoint process, configuration commands are entered, and after exiting from the configuration mode the **write checkpoint** command is entered to run the configuration checkpoint process.

write checkpoint

Related Commands	Command	Description
	write checkpoint	Runs the configuration checkpoint process when a Cisco IOS Software Modularity image is running.

## show buffers

To display statistics for the buffer pools on the network server when Cisco IOS or Cisco IOS Software Modularity images are running, use the **show buffers** command in user EXEC or privileged EXEC mode.

show buffers [{address hex-address | failures | pool pool-name | processes | {all | assigned
 [process-id] | free | old | input-interface interface-type interface-number} [pool pool-name]}
 [dump | header | packet]]

Syntax Description	address	(Optional) Displays buffers at a specified address.
.,	hex-address	(Optional) Address in hexadecimal notation.
	failures	(Optional) Displays huffer allocation foilures
	Tanures	(Optional) Displays bullet anocation failules.
	pool	(Optional) Displays buffers in a specified buffer pool.
	pool-name	(Optional) Name of buffer pool.
	processes	(Optional) For Cisco IOS Software Modularity images only. Displays buffers connected to Packet Manager.
	all	(Optional) Displays all buffers.
	assigned	(Optional) Displays the buffers in use.
	process-id	(Optional) For Cisco IOS Software Modularity images only. POSIX process identifier.
	free	(Optional) Displays the buffers available for use.
	old	(Optional) Displays buffers older than one minute.
	input-interface	(Optional) Displays interface pool information. If an interface type is specified and this interface has its own buffer pool, information for that pool is displayed.
	interface-type	(Optional) Interface type.
	interface-number	(Optional) Interface number.
	dump	(Optional) Displays the buffer header and all data.
	header	(Optional) Displays the buffer header only.
	packet	(Optional) Displays the buffer header and packet data.

## **Command Default** If no options are specified, all buffer pool information is displayed.

Command Modes User EXEC (>) Privileged EXEC (#)

Command History	Release	Modification
	10.0	This command was introduced.
	12.3	The option to filter display output based on specific buffer pools was expanded.
	12.2(18)SXF4	Two additional fields were added to the output to support Cisco IOS Software Modularity.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

#### Examples

Example output varies between Cisco IOS software images and Cisco IOS Software Modularity software images. To view the appropriate output, choose one of the following sections:

- Cisco IOS Software
- Cisco IOS Software Modularity

#### **Cisco IOS Software**

The following is sample output from the **show buffers** command with no arguments, showing all buffer pool information:

#### Router# show buffers

```
Buffer elements:
     398 in free list (500 max allowed)
     1266 hits, 0 misses, 0 created
Public buffer pools:
Small buffers, 104 bytes (total 50, permanent 50):
     50 in free list (20 min, 150 max allowed)
     551 hits, 0 misses, 0 trims, 0 created
Middle buffers, 600 bytes (total 25, permanent 25):
     25 in free list (10 min, 150 max allowed)
     39 hits, 0 misses, 0 trims, 0 created
Big buffers, 1524 bytes (total 50, permanent 50):
     49 in free list (5 min, 150 max allowed)
     27 hits, 0 misses, 0 trims, 0 created
VeryBig buffers, 4520 bytes (total 10, permanent 10):
     10 in free list (0 min, 100 max allowed)
     0 hits, 0 misses, 0 trims, 0 created
Large buffers, 5024 bytes (total 0, permanent 0):
     0 in free list (0 min, 10 max allowed)
     0 hits, 0 misses, 0 trims, 0 created
Huge buffers, 18024 bytes (total 0, permanent 0):
     0 in free list (0 min, 4 max allowed)
     0 hits, 0 misses, 0 trims, 0 created
Interface buffer pools:
Ethernet0 buffers, 1524 bytes (total 64, permanent 64):
     16 in free list (0 min, 64 max allowed)
     48 hits, 0 fallbacks
     16 max cache size, 16 in cache
Ethernet1 buffers, 1524 bytes (total 64, permanent 64):
     16 in free list (0 min, 64 max allowed)
     48 hits, 0 fallbacks
     16 max cache size, 16 in cache
SerialO buffers, 1524 bytes (total 64, permanent 64):
     16 in free list (0 min, 64 max allowed)
     48 hits, 0 fallbacks
     16 max cache size, 16 in cache
```

```
Serial1 buffers, 1524 bytes (total 64, permanent 64):
    16 in free list (0 min, 64 max allowed)
    48 hits, 0 fallbacks
    16 max cache size, 16 in cache
TokenRing0 buffers, 4516 bytes (total 48, permanent 48):
    0 in free list (0 min, 48 max allowed)
    48 hits, 0 fallbacks
    16 max cache size, 16 in cache
TokenRing1 buffers, 4516 bytes (total 32, permanent 32):
    32 in free list (0 min, 48 max allowed)
    16 hits, 0 fallbacks
    0 failures (0 no memory)
```

The following is sample output from the **show buffers** command with no arguments, showing onlybuffer pool information for Huge buffers. This output shows a highest total of five Huge buffers created five days and 18 hours before the command was issued.

```
Router# show buffers
```

```
Huge buffers, 18024 bytes (total 5, permanent 0, peak 5 @ 5d18h):
    4 in free list (3 min, 104 max allowed)
    0 hits, 1 misses, 101 trims, 106 created
    0 failures (0 no memory)
```

The following is sample output from the **show buffers** command with no arguments, showing only buffer pool information for Huge buffers. This output shows a highest total of 184 Huge buffers created one hour, one minute, and 15 seconds before the command was issued.

```
Router# show buffers
```

Router# show buffers Ethernet 0

```
Huge buffers, 65280 bytes (total 4, permanent 2, peak 184 @ 01:01:15):
    4 in free list (0 min, 4 max allowed)
    32521 hits, 143636 misses, 14668 trims, 14670 created
    143554 failures (0 no memory)
```

The following is sample output from the **show buffers** command with an interface type and interface number:

```
Ethernet0 buffers, 1524 bytes (total 64, permanent 64):
16 in free list (0 min, 64 max allowed)
48 hits, 0 fallbacks
16 max cache size, 16 in cache
```

Table 6 describes the significant fields shown in the display.

Table 6	show buffers	Cisco IOS	Software)	Field	Descriptions
---------	--------------	-----------	-----------	-------	--------------

Field	Description
Buffer elements	Small structures used as placeholders for buffers in internal operating system queues. Used when a buffer may need to be on more than one queue.
free list	Total number of the currently unallocated buffer elements.
max allowed	Maximum number of buffers that are available for allocation.
hits	Count of successful attempts to allocate a buffer when needed.
misses	Count of buffer allocation attempts that resulted in growing the buffer pool to allocate a buffer.

Field	Description	
created	Count of new buffers created to satisfy buffer allocation attempts when the available buffers in the pool have already been allocated.	
Public Buffer Pools		
Small buffers	Buffers that are 104 bytes long.	
Middle buffers	Buffers that are 600 bytes long.	
Big buffers	Buffers that are 1524 bytes long.	
VeryBig buffers	Buffers that are 4520 bytes long.	
Large buffers	Buffers that are 5024 bytes long.	
Huge buffers	Buffers that are 18,024 bytes long.	
total	Total number of this type of buffer.	
permanent	Number of these buffers that are permanent.	
peak	Maximum number of buffers created (highest total) and the time when that peak occurred. Formats include weeks, days, hours, minutes, and seconds. Not all systems report a peak value, which means this field may not display in output.	
free list	Number of available or unallocated buffers in that pool.	
min	Minimum number of free or unallocated buffers in the buffer pool.	
max allowed	Maximum number of free or unallocated buffers in the buffer pool.	
hits	Count of successful attempts to allocate a buffer when needed.	
misses	Count of buffer allocation attempts that resulted in growing the buffer pool in order to allocate a buffer.	
trims	Count of buffers released to the system because they were not being used. This field is displayed only for dynamic buffer pools, not interface buffer pools, which are static.	
created	Count of new buffers created in response to misses. This field is displayed only for dynamic buffer pools, not interface buffer pools, which are static.	
Interface Buffer Pools		
total	Total number of this type of buffer.	
permanent	Number of these buffers that are permanent.	
free list	Number of available or unallocated buffers in that pool.	
min	Minimum number of free or unallocated buffers in the buffer pool.	
max allowed	Maximum number of free or unallocated buffers in the buffer pool.	
hits	Count of successful attempts to allocate a buffer when needed.	
fallbacks	Count of buffer allocation attempts that resulted in falling back to the public buffer pool that is the smallest pool at least as big as the interface buffer pool.	

## Table 6 show buffers (Cisco IOS Software) Field Descriptions (continued)

Field	Description
max cache size	Maximum number of buffers from the pool of that interface that can be in the buffer pool cache of that interface. Each interface buffer pool has its own cache. These are not additional to the permanent buffers; they come from the buffer pools of the interface. Some interfaces place all of their buffers from the interface pool into the cache. In this case, it is normal for the <i>free list</i> to display 0.
failures	Total number of times a buffer creation failed. The failure may have occurred because of a number of different reasons, such as low processor memory, low IOMEM, or no buffers in the pool when called from interrupt context.
no memory	Number of times there has been low memory during buffer creation. Low or no memory during buffer creation may not necessarily mean that buffer creation failed; memory can be obtained from an alternate resource such as a fallback pool.

#### Table 6 show buffers (Cisco IOS Software) Field Descriptions (continued)

#### **Cisco IOS Software Modularity**

The following is sample output from the **show buffers** command using a Cisco IOS Modularity image from Cisco IOS Release 12.2(18)SXF4 and later releases. Two new output fields were introduced—Public buffer heads and Temporary buffer heads—and are shown within comments in the following sample output.

```
Router# show buffers
```

```
Buffer elements:
   500 in free list (500 max allowed)
   106586 hits, 0 misses, 0 created
Public buffer pools:
Small buffers, 104 bytes (total 50, permanent 50, peak 54 @ 1d13h):
    49 in free list (20 min, 150 max allowed)
    54486 hits, 0 misses, 4 trims, 4 created
    0 failures (0 no memory)
Middle buffers, 600 bytes (total 25, permanent 25, peak 27 @ 1d13h):
   25 in free list (10 min, 150 max allowed)
   20 hits, 0 misses, 2 trims, 2 created
    0 failures (0 no memory)
Big buffers, 1536 bytes (total 50, permanent 50):
    50 in free list (40 min, 150 max allowed)
    6 hits, 0 misses, 0 trims, 0 created
    0 failures (0 no memory)
VeryBig buffers, 4520 bytes (total 10, permanent 10):
   10 in free list (0 min, 100 max allowed)
    0 hits, 0 misses, 0 trims, 0 created
   0 failures (0 no memory)
Large buffers, 5024 bytes (total 0, permanent 0):
    0 in free list (0 min, 10 max allowed)
    0 hits, 0 misses, 0 trims, 0 created
   0 failures (0 no memory)
Huge buffers, 18024 bytes (total 1, permanent 0, peak 1 @ 1d13h):
    0 in free list (0 min, 4 max allowed)
    1 hits, 0 misses, 0 trims, 0 created
    0 failures (0 no memory)
! Start of Cisco IOS Software Modularity fields
Public buffer headers:
```

Header buffers, 880 bytes (total 1000, peak 142 @ 1d13h):

864 in permanent free list 142 hits, 0 misses
Temporary buffer headers:
Header buffers, 896 bytes (total 0):
0 in free list
0 hits, 0 misses, 0 trims, 0 created
0 failures
! End of Cisco IOS Software Modularity fields
Interface buffer pools:
Logger Pool buffers, 600 bytes (total 150, permanent 150):
22 hits, 0 misses

Table 7 describes the significant fields shown in the display that are different from the fields in Table 6.

Field	Description	
Public Buffer Headers		
Header buffers	Buffers that are 880 bytes long.	
total	Total number of this type of buffer.	
permanent free list	Number of available or unallocated permanent header buffers.	
hits	Count of successful attempts to allocate a header buffer when needed.	
misses	Count of buffer allocation attempts that resulted in growing the buffer pool in order to allocate a buffer.	
Temporary Buffer Heade	rs	
Header buffers	Buffers that are 896 bytes long.	
total	Total number of this type of buffer.	
free list	Number of available or unallocated header buffers in that pool.	
hits	Count of successful attempts to allocate a buffer when needed.	
misses	Count of buffer allocation attempts that resulted in growing the buffer pool in order to allocate a buffer.	
trims	Count of buffers released to the system because they were not being used. This field is displayed only for dynamic buffer pools, not interface buffer pools, which are static.	
created	Count of new buffers created in response to misses. This field is displayed only for dynamic buffer pools, not interface buffer pools, which are static.	
failures	Total number of allocation requests that have failed because no buffer was available for allocation; the datagram was lost. Such failures normally occur at interrupt level.	

 Table 7
 show buffers (Cisco IOS Software Modularity) Field Descriptions

## show exception

To display the current exception configuration when a Cisco IOS Software Modularity image is running, use the **show exception** command in user EXEC or privileged EXEC mode.

show exception

**Syntax Description** This command has no arguments or keywords.

Command Modes User EXEC (>) Privileged EXEC (#)

 Release
 Modification

 12.2(18)SXF4
 This command was introduced to support Software Modularity images.

**Usage Guidelines** Use the **show exception** command to display the current process and kernel dumper configuration as configured by the various **exception** commands used in Software Modularity images.

**Examples** 

The following is sample output from the **show exception** command:

Router# show exception

Core Dump Configurations:

Choice 1		
======		
Filepath	:	disk0:
Filename	:	test1
Lower Filename Suffix	:	0
Upper Filename Suffix	:	4
Current Filename Suffix	:	0
Compression	:	on
Choice 2		
======		
Filepath	:	disk1:
Filename	:	test1
Lower Filename Suffix	:	0
Upper Filename Suffix	:	4
Current Filename Suffix	:	0
Compression	:	on
Choice 3		
=======		
Filepath	:	slot0
Filename	:	test1
Lower Filename Suffix	:	0
Upper Filename Suffix	:	4
Current Filename Suffix	:	0
Compression	:	on
-		

Table 8 describes the significant fields shown in the display.

## Table 8show exception Field Descriptions

Field	Description
Choice	Indicates the order of local dump locations.
Filepath	Indicates the path of the core dump file.
Filename	Name of the core dump file.
Compression	Indicates whether the file is to be written as a compressed file.

Related Commands	Command	Description
	exception core	Sets or changes the core dump options for a Cisco IOS Software Modularity process.
	exception core-file	Specifies the name of the core dump file.
	exception flash	Configures the dump location for core files when a process reloads.
	exception kernel	Configures a networking device on which a Cisco IOS Software Modularity image is running, to dump the kernel memory.

# show install

To display information about the installed Cisco IOS Software Modularity software, including patch files, use the **show install** command in user EXEC or privileged EXEC mode.

show install [tags] {running | search-root-directory} [tagname tag-name] [detailed | pending]

Syntax Description	tags	(Optional) Displays the tag information that is defined for the installer software.
	running	Displays information about the software that is currently running on each location in the system.
	search-root-directory	A local directory specified as the destination directory in a previously executed <b>install file</b> command.
	tagname tag-name	(Optional) Displays the information for a particular tag. The <b>tagname</b> <i>tag-name</i> keyword/argument pair can be defined only if the optional <b>tags</b> keyword is used.
	detailed	(Optional) Displays more detailed information.
	pending	(Optional) Displays patch upgrade summary information.

## Command Modes User EXEC (>) Privileged EXEC (#)

Command History	Release	Modification
	12.2(18)SXF4	This command was introduced to support Software Modularity images.
	12.2(18)SXF5	The tagname tag-name keyword/argument pair was added.
	12.2(33)SXI1	The <b>pending</b> keyword was added.

### Examples

The following is sample output from the **show install running** command:

#### Router# show install running

Software running on card installed at location s72033 - Slot 5 :

```
B/P C State
            Filename
___ _ _____
     Active disk0:/sys/s72033/base/s72033-adventerprisek9_wan_dbg-vm(12.2(99)SX1010)
В
Software running on card installed at location s72033_rp - Slot 5 :
B/P C State
             Filename
____ _ ____
Р
     Active
            disk0:/sys/s72033_rp/patch/patch-AAA1258-patch-0-n.so
Software running on card installed at location s72033 - Slot 6 :
B/P C State Filename
____ _ _____
              _____
В
    Active
slavedisk0:/sys/s72033/base/s72033-adventerprisek9_wan_dbg-vm(12.2(99)SX1010)
```

LEGEND: \_\_\_\_, B/P/MP - (B)ase image, (P)atch, or (M)aintenance (P)ack 'C' - (C)ommitted Pruned - This file has been pruned from the system Active - This file is active in the system PendInst - This file is set to be made available to run on the system after next activation. PendRoll - This file is set to be rolled back after next activation. InstPRel - This file will run on the system after next reload RollPRel - This file will be removed from the system after next reload RPRPndIn - This file is both rolled back pending a reload, and pending installation. On reload, this file will not run and will move to PendInst state. If 'install activate' is done before reload, pending removal and install cancel each other and file simply remains active IPRPndRo - This file is both installed pending a reload, and pending rollback. If the card reloads, it will be active on the system pending a rollback If 'install activate' is done before a reload, the pending install and removal with cancel each other and the file will simply be removed Occluded - This file has been occluded from the system, a newer version of itself has superceded it. Ignored - This file is ignored, is not consumed by target.

Table 9 describes the significant fields shown in the display.

Field	Description
B/P/MP	Indicates whether the file is a base image file (B), a patch file (P), or a maintenance pack (MP) file.
С	An asterisk under this column indicates that this file has been committed under a user-defined tag.
State	Current state of the software file. For a list of states, see the description under the LEGEND section of the output.
Filename	Name and path of an installed file on the system. If the filename ends with some text in parenthesis, the text represents the Cisco IOS version number of the image file.

Table 9show install running Field Descriptions

The following is sample output from the **show install running** command with the **detailed** keyword: Router# **show install running detailed** 

Software running on card installed at location s72033 - Slot 5 :

Base image : disk0:/sys/s72033/base/s72033-adventerprisek9\_wan\_dbg-vm

Table 10 describes the significant fields shown in the display.

Table 10 show install running detailed Field Descriptions

Field	Description
Base image	Name of the base image for this node.
Version	Cisco IOS version number associated with this file.
File state	Current state of the file.
File Checksum	The Secure Hash Algorithm (SHA) checksum used to validate this file.
Date Installed	The date and time that this file was installed.
Commit Tags	Names of all the committed tags that include this file.

In the following example, the **show install** privileged EXEC command is used to display information about the tags that are defined for this system:

```
Router# show install tags running
```

Tags defined over software running on location s72033 - Slot 5 :

Tagname	# of Files	Date Committed
base MA0005	1 1	20:08:51 UTC Sep 9 2005 20:34:16 UTC Sep 9 2005
Tags defined over	software running	on location s72033_rp - Slot 5 :
Tagname	# of Files	Date Committed
base MA0005	1 1	20:08:51 UTC Sep 9 2005 20:34:16 UTC Sep 9 2005
Tags defined over	software running	on location s72033 - Slot 6 :
Tagname	# of Files	Date Committed
base	1	20:28:54 UTC Sep 9 2005

Table 11 describes the significant fields shown in the display.

Table 11show install tags running Field Descriptions

Field	Description
Tagname	Name of the tag being described.
# of Files	Number of installed files committed under this tag.
Date Committed	The date and time that this tag was created.

In the following example, the **show install** privileged EXEC command is used to display detailed information about the tags that are defined for this system:

```
Router# show install tags running detailed
```

Tags defined over software running on location s72033 : Tag Name :base Date Committed :Fri Sep 9 17:54:37 2005 Files under this tag: disk0:/sys/s72033/base/s72033-adventerprisek9\_wan\_dbg-vm

In the following example, the **show install** privileged EXEC command is used to display detailed information about the tag named tag1:

Router# show install tags running tagname tag1 detailed

Tags defined over software running on location c7200: Tag Name : tag1 Date Committed : 01:49:23 UTC Mar 8 2006 Files under this tag: disk0:/sys/c7200/base/c7200-p-vm

Table 12 describes the significant fields shown in the display.

#### Table 12 show install tags running detailed Field Descriptions

Field	Description
Tag Name	Name of the tag being described.
Date Committed	The date and time that this tag was created.
Files under this tag	List of all files committed under this tag.

Related Commands	Command	Description
	install bind	Binds Cisco IOS Software Modularity images.
	install commit	Defines a tag for a set of software installed by the <b>install file</b> command.
	install file	Installs base system files and patches.

## show memory

To display statistics about memory when Cisco IOS or Cisco IOS software Modularity images are running, use the show memory command in user EXEC or privileged EXEC mode.

#### **Cisco IOS Software**

show memory [memory-type] [free] [overflow] [summary]

#### **Cisco IOS Software Modularity**

show memory

Syntax Description	memory-type	(Optional) Memory type to display ( <b>processor</b> , <b>multibus</b> , <b>io</b> , or <b>sram</b> ). If <i>memory-type</i> is not specified, statistics for all memory types present are displayed.
	free	(Optional) Displays free memory statistics.
	overflow	(Optional) Displays details about memory block header corruption corrections when the <b>exception memory ignore overflow</b> global configuration command is configured.
	summary	(Optional) Displays a summary of memory usage including the size and number of blocks allocated for each address of the system call that allocated the block.

#### **Command Modes** User EXEC (>)

Privileged EXEC (#)

Release	Modification
10.0	This command was introduced.
12.3(7)T	This command was enhanced with the <b>overflow</b> keyword to display details about memory block header corruption corrections.
12.2(25)S	The command output was updated to display information about transient memory pools.
12.3(14)T	The command output was updated to display information about transient memory pools.
12.2(27)SBC	This command was integrated into Cisco IOS Release 12.2(27)SBC.
12.2(18)SXF4	This command was implemented in Cisco IOS Software Modularity images.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	Release           10.0           12.3(7)T           12.2(25)S           12.3(14)T           12.2(27)SBC           12.2(18)SXF4           12.2(33)SRA

### **Usage Guidelines**

**Cisco IOS Software** 

The show memory command displays information about memory available after the system image decompresses and loads.

#### **Cisco IOS Software Modularity**

No optional keywords or arguments are supported for the **show memory** command when a Software Modularity image is running. To display details about PSOIX and Cisco IOS style system memory information when Software Modularity images are running, use the **show memory detailed** command.

#### Examples

Example output varies between Cisco IOS software images and Cisco IOS Software Modularity software images. To view the appropriate output, choose one of the following sections:

- Cisco IOS Software
- Cisco IOS Software Modularity

#### **Cisco IOS Software**

The following is sample output from the **show memory** command:

Router# show memory

	Η	Head	Total(b)	Used	(b)	Free(b)	Lowest(b)	Largest(b)

	104	Free	list 8					
B59EF0	108	B59E8C	B59F84	0	0	0	2258DA	(fragment)

The output of the **show memory free** command contains the same types of information as the **show memory** output, except that only free memory is displayed, and the information is ordered by free list.

The first section of the display includes summary statistics about the activities of the system memory allocator. Table 13 describes the significant fields shown in the first section of the display.

Field	Description
Head	Hexadecimal address of the head of the memory allocation chain.
Total(b)	Sum of used bytes plus free bytes.
Used(b)	Amount of memory in use.
Free(b)	Amount of memory not in use.
Lowest(b)	Smallest amount of free memory since last boot.
Largest(b)	Size of largest available free block.

Table 13 show memory Field Descriptions—First Section

The second section of the display is a block-by-block listing of memory use. Table 14 describes the significant fields shown in the second section of the display.

Field	Description
Address	Hexadecimal address of block.
Bytes	Size of block (in bytes).
Prev.	Address of previous block (should match the address on previous line).
Next	Address of next block (should match the address on next line).
Ref	Reference count for that memory block, indicating how many different processes are using that block of memory.
PrevF	Address of previous free block (if free).
NextF	Address of next free block (if free).
Alloc PC	Address of the system call that allocated the block.
What	Name of process that owns the block, or "(fragment)" if the block is a fragment, or "(coalesced)" if the block was coalesced from adjacent free blocks.

 Table 14
 Characteristics of Each Block of Memory–Second Section

The **show memory io** command displays the free I/O memory blocks. On the Cisco 4000 router, this command quickly shows how much unused I/O memory is available.

The following is sample output from the show memory io command:

Router# show memory io

```
Address Bytes Prev.
                   Next Ref PrevF
                                       NextF Alloc PC What
6132DA0 59264 6132664 6141520 0 0
                                      600DDEC 3FCF0
                                                        *Packet Buffer*
600DDEC
         500 600DA4C 600DFE0 0
                                6132DA0 600FE68
                                               0
600FE68
          376 600FAC8 600FFE0 0
                                600DDEC 6011D54

                                               0
Total: 2723244
```

The following example displays details of a memory block overflow correction when the **exception memory ignore overflow** global configuration command is configured:

Router# show memory overflow

Count Buffer Count Last corrected Crashinfo files 1 1 00:11:17 slot0:crashinfo\_20030620-075755 Traceback 607D526C 608731A0 607172F8 607288E0 607A5688 607A566C

The report includes the amount of time since the last correction was made and the name of the file that logged the memory block overflow details.

The **show memory sram** command displays the free SRAM memory blocks. For the Cisco 4000 router, this command supports the high-speed static RAM memory pool to make it easier for you to debug or diagnose problems with allocation or freeing of such memory.

The following is sample output from the show memory sram command:

Router# show memory sram

AddressBytesPrev.NextRefPrevFNextFAlloc PCWhat7AE03817872F000000Total38178

The following example of the **show memory** command used on the Cisco 4000 router includes information about SRAM memory and I/O memory:

Router# show memory

	I	Head	Total(b)	Use	d(b)	Free(b)	Lowest(b)	Largest(b)
Processor	490	2724	28719324	151	0864	27208460	26511644	15513908

7AE0	38178	72F0	0	0	0	0	0	

The **show memory summary** command displays a summary of all memory pools and memory usage per Alloc PC (address of the system call that allocated the block).

The following is a partial sample output from the **show memory summary** command. This output shows the size, blocks, and bytes allocated. Bytes equal the size multiplied by the blocks. For a description of the other fields, see Table 13 and Table 14.

Router# show memory summary

## **Cisco IOS Software Modularity**

The following is sample output from the **show memory** command when a Cisco IOS Software Modularity image is running.

Router# show memory

System Memory: 262144K total, 116148K used, 145996K free 4000K kernel reserved

Table 15 describes the significant fields shown in the display.

### Table 15 show memory (Software Modularity Image) Field Descriptions

Description
Total amount of memory on the device, in kilobytes.
Amount of memory in use, in kilobytes.
Amount of memory not in use, in kilobytes.
Amount of memory reserved by the kernel, in kilobytes.

Related Commands	Command	Description
	exception memory ignore overflow	Configures the Cisco IOS software to correct corruptions in memory block headers and allow a router to continue its normal operation.
	show memory detailed	Displays POSIX and Cisco IOS style system memory information.
	show processes memory	Displays memory used per process.

# show memory detailed

To display detailed memory information about POSIX and Cisco IOS processes when Cisco IOS Software Modularity images are running, use the **show memory detailed** command in privileged EXEC mode.

show memory detailed [process-id | process-name] [start-address [end-address] | bigger | free |
physical | shared | statistics | summary]

Syntax Description	process-id	(Optional) POSIX process identifier.				
	process-name	(Optional) POSIX process name.				
	start-address	(Optional) Starting memory address.				
	end-address	(Optional) Ending memory address.				
	bigger	(Optional) Displays information about bigger free blocks in the process.				
	free	(Optional) Displays free memory information.				
	physical	(Optional) Displays physical memory information.				
	shared	(Optional) Displays shared memory information.				
	statistics	(Optional) Displays detailed memory usage by address of the system call that allocated the block.				
	<b>summary</b> (Optional) Displays summary information about memory usage per syste call that allocated the block.					
Command Modes	Privileged EXEC (#	)				
Command History	Release	Modification				
	12.2(18)SXF4	This command was introduced to support Software Modularity images.				
Usage Guidelines	Detailed output of th memory summary is POSIX memory info various segments suc memory information Cisco IOS memory of	he process memory on the device is displayed with this command. The process displayed first, followed by POSIX and Cisco IOS memory information. The prmation includes the address, the size in bytes, and the type of memory used by th as program text, data, stack, shared memory, device memory, and heap. Cisco IOS includes the native Cisco IOS display of memory blocks maintained by the management library.				

Examples	The following is partial sample output from the <b>show memory detailed</b> command for a Cisco IOS process:								
	Router# show memory detailed cdp2.iosproc								
	System Memory: 131072K total, 115836K used, 15236K free 4000K kernel reserved								
	Process sbin/cdp2.iosproc, type IOS, PID = 12329 636K total, 4K text, 4K data, 28K stack, 600K dynamic 16384 heapsize, 3972 allocated, 10848 free

The first section of the display shows system summary information. Table 16 describes the significant fields shown in the first section of the display.

Field	Description
total	Total amount of memory on the device, in kilobytes.
used	Amount of memory in use, in kilobytes.
free	Amount of memory not in use, in kilobytes.
kernel reserved	Amount of memory reserved by the kernel, in kilobytes.

Table 16 show memory detailed Field Descriptions – First Section

The second section of the display includes process summary statistics about the activities of the system memory allocator. Table 17 describes the significant fields shown in the second section of the display.

 Table 17
 show memory detailed Field Descriptions – Second Section

Description
Process name and path.
Type of process: POSIX or IOS.
Process ID.

Field	Description
total	Total amount of memory used by the specified process, in kilobytes.
text	Amount of memory, in kilobytes, used by the text segment of the specified process.
data	Amount of memory, in kilobytes, used by the data segment of the specified process.
stack	Amount of memory, in kilobytes, used by the stack segment of the specified process.
dynamic	Amount of memory, in kilobytes, used by the dynamic segment of the specified process.
heapsize	Size of the process heap. Note that the Cisco IOS memory management library allocates heap dynamically. This is shown in the Cisco IOS memory details that follow the POSIX memory display.
allocated	Amount of memory, in kilobytes, allocated from the heap.
free	Amount of free memory, in kilobytes, in the heap for the specified process.

Table 17 show memory detailed Field Descriptions—Second Section (continued)

The third section of the display shows POSIX process perspective memory information. Table 18 describes the significant fields shown in the third section of the display.

Field	Description
Address	Hexadecimal address of block.
Bytes	Size of block (in bytes).
What	Type of memory segment that owns the block, or "(fragment)" if the block is a fragment, or "(coalesced)" if the block was coalesced from adjacent free blocks.

 Table 18
 show memory detailed Field Descriptions – Third Section

The fourth section of the display shows Cisco IOS memory information as a block-by-block listing of memory use. Table 19 describes the significant fields shown in the fourth section of the display.

Table 19 show	<sup>,</sup> memory detailed	Field Descriptions –	-Fourth Section
---------------	------------------------------	----------------------	-----------------

Field	Description
Head	Hexadecimal address of the head of the memory allocation chain.
Total(b)	Sum of used bytes plus free bytes.
Used(b)	Amount of memory in use.
Free(b)	Amount of memory not in use.
Lowest(b)	Smallest amount of free memory since last boot.
Largest(b)	Size of largest available free block.

Field	Description
Address	Hexadecimal address of block.
Bytes	Size of block (in bytes).
Prev	Address of previous block (should match address on previous line).
Next	Address of next block (should match address on next line).
PrevF	Address of previous free block (if free).
NextF	Address of next free block (if free).
Alloc PC	Address of the system call that allocated the block.
what	Type of memory segment that owns the block, or "(fragment)" if the block is a fragment, or "(coalesced)" if the block was coalesced from adjacent free blocks.

Table 19 show memory detailed Field Descriptions—Fourth Section (continued)

The following is sample output from the **show memory detailed** command for a POSIX process:

#### Router# show memory detailed 12290

System Memory: 131072K total, 115876K used, 15196K free 4000K kernel reserved Process sbin/sysmgr.proc, type POSIX, PID = 12290 400K total, 100K text, 144K data, 12K stack, 144K dynamic 81920 heapsize, 68716 allocated, 8824 free Address Bytes What 0x7FDF000 126976 Program Stack (pages not allocated) 0x7FFE000 4096 Program Stack 122880 Program Stack (pages not allocated) 0x8000000 0x801E000 8192 Program Stack 0x8020000 102400 Program Text 0x8039000 147456 Program Data 0x805D000 8192 Heap Memory 0x8060000 16384 Heap Memory 0x8064000 16384 Heap Memory 0x8068000 8192 Heap Memory 0x806C000 16384 Heap Memory 0x8070000 16384 Heap Memory 16384 Heap Memory 0x8074000 16384 Heap Memory 0x8078000 16384 Heap Memory 0x807C000 0x8080000 16384 Heap Memory

The following partial sample output from the **show memory detailed** command with a process name and the **physical** keyword that displays the summary of physical memory used by the specified process along with the shared memory details:

Router# show memory detailed sysmgr.proc physical

Pid	Data	Stack	Dynamic	Text	Shared	Maps	Process

Table 20 describes the significant fields shown in the display.

## Table 20show memory detailed Field Descriptions

Field	Description
Shared	Amount of memory shared by the specified process, in kilobytes.
Maps	Number of memory maps for the specified process.
Process	Name of the process.
Private memory used	Total amount of private memory used by the process.
Shared memory mapped	Total amount of shared memory used by the process.
Number of memory maps	Total number of maps for the process.

Field	Description
Flags	Flags that specify information about handling of the mapped region. The available flags are as follows:
	• SHD:Shared—Specifies that memory is shared between different process.
	• PRV:Private—Specifies that memory is private to this process.
	• FXD:Fixed—Specifies that memory is mapped to a fixed virtual address in the process.
	• ANN:Anon—Specifies that physical memory was allocated by the kernel.
	• PHY:Phys—Specifies that the user specified the physical memory.
	• LZY:Lazy—Specifies that memory is lazy mapped; that is, physical memory is not allocated until the memory is either read or written to other memory.
	• ELF:Elf—Specifies that memory is an Executable and Linkable Format (ELF) object.
	• STK:Stack—Specifies that memory is used for stack.
	• NOC:Nocache—Specifies that memory is set up without any cache.
Phy Addr	Hexadecimal address of the physical memory block.
Size	Amount of physical memory mapped in the process of development.
Virt Addr	Virtual memory to which this memory is mapped.
Prot	Memory protection settings for the memory—read, write, and execute.
MapFlags	Represents special mapping properties used for the memory.

 show memory detailed Field Descriptions (continued)

## **Related Commands**

Command	Description
show memory	Displays system memory information.
show memory detailed all	Displays detailed memory information of all applicable processes.

# show memory detailed all

To display detailed memory information of all applicable processes when Cisco IOS Software Modularity images are running, use the **show memory detailed all** command in privileged EXEC mode.

show memory detailed all [[start-address [end-address] | failures alloc | shared | statistics
[history] | summary] | [fast | io | multibus [pci] | pci | processor] [allocating-process [totals]
| dead [totals] | free | physical]]

Syntax Description	start-address	(Optional) Starting memory address.
	end-address	(Optional) Ending memory address.
	failures	(Optional) Displays memory failure details.
	alloc	(Optional) Displays memory allocation failure.
	shared	(Optional) Displays shared memory information.
	statistics	(Optional) Displays detailed memory usage by address of the system call that allocated the block.
	history	(Optional) Displays the memory pool history.
	summary	(Optional) Displays summary information about memory usage per system call that allocated the block.
	fast	(Optional) Displays fast memory statistics.
	io	(Optional) Displays input output memory statistics.
	multibus	(Optional) Displays multibus memory statistics.
	pci	(Optional) Displays Payment Card Industry (PCI) memory statistics.
	processor	(Optional) Displays processor memory statistics.
	allocating-process	(Optional) Displays the allocating process name.
	totals	(Optional) Displays the total memory. This keyword is used with the <b>allocating-process</b> and <b>dead</b> keywords.
	dead	(Optional) Displays the dead memory information.
	free	(Optional) Displays free memory information.
	physical	(Optional) Displays physical memory information.
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	12.2SY	This command was introduced to support Software Modularity images.
Usage Guidelines	Detailed output of all a optional arguments and	pplicable processes on the device is displayed with this command. Use the keywords to display specific detailed information.

Examples	The following is partial sample output from the show memory detailed all command:
	Router# show memory detailed all
	System Memory: 2097152K total, 1303301K used, 793851K free, 0K kernel reserved Lowest(b) : 812904448

Table 21 show memory detailed all Field Descriptions—First Section

fields shown in the first section of the display.

Field	Description
total	Total amount of memory on the device, in kilobytes.
used	Amount of memory in use, in kilobytes.
free	Amount of memory not in use, in kilobytes.
kernel reserved	Amount of memory reserved by the kernel, in kilobytes.

The second section of the display includes process summary statistics about the activities of the system memory allocator. Table 22 describes the significant fields shown in the second section of the display.

Field	Description
Process	Process name and path.
type	Type of process: POSIX or Cisco IOS.
PID	Process ID.
total	Total amount of memory used by the specified process, in kilobytes.
text	Amount of memory, in kilobytes, used by the text segment of the specified process.
data	Amount of memory, in kilobytes, used by the data segment of the specified process.
stack	Amount of memory, in kilobytes, used by the stack segment of the specified process.
dynamic	Amount of memory, in kilobytes, used by the dynamic segment of the specified process.
heapsize	Size of the process heap. Note that the Cisco IOS memory management library allocates heap dynamically. This is shown in the Cisco IOS memory details that follow the POSIX memory display.
allocated	Amount of memory, in kilobytes, allocated from the heap.
free	Amount of free memory, in kilobytes, in the heap for the specified process.

Table 22 show memory detailed all Field Descriptions – Second Section

The third section of the display shows process perspective memory information. Table 23 describes the significant fields shown in the third section of the display.

Table 23 show memory detailed all Field Descriptions – Third Section

Field	Description
Address	Hexadecimal address of block.
Bytes	Size of block (in bytes).
What	Type of memory segment that owns the block, or "(fragment)" if the block is a fragment, or "(coalesced)" if the block was coalesced from adjacent free blocks.

The following is partial output from the show memory detailed all io command:

```
Router# show memory detailed all io

---	----------	--

The following sample output from the **show pakman statistics** command displays the different memory regions used by the Packet Manager for various uses. Some regions, such as the temporary packet and subblock region, can have multiple regions because regions can be added when the system requires more packet headers or subblocks. The region provided for data buffers is fixed and does not grow.

Table 26show pakman statistics Field Descriptions

Field	Description
Packet Manager Regions	Memory regions used by the Packet Manager.
Blocksize	Packet Manager allocates data in a number of fixed block sizes.
Allocs	The number of times the given block size has been allocated.
Frees	The number of times the given block size has been freed.
Inuse	The number of blocks of the given size that are currently in use.
Cached	The number of blocks of the given size that are currently being cached.

Related Commands Command		Description
	show buffers	Display statistics for the buffer pools on the network server when Cisco IOS
		or Cisco IOS Software Modularity images are running.

## show processes

To display information about the active Cisco IOS, Cisco IOS XE, or the Cisco IOS Software Modularity POSIX-style processes, use the **show processes** command in user EXEC or privileged EXEC mode.

show processes [history | process-id | timercheck]

Syntax Description	history	(Optional) For Cisco IOS processes only. Displays the process history in an ordered format.				
	<i>process-id</i> (Optional) For Cisco IOS processes only. An integer that specifies the process which memory and CPU utilization data will be returned.					
	timercheck (Optional) For Cisco IOS processes only. Displays the processes configured for a timer check.					
Command Modes	User EXEC (>) Privileged EXEC	C (#)				
Command History	Release	Modification				
	10.0	This command was introduced.				
	12.2(2)T	This command was modified. The <b>history</b> keyword was added.				
	12.3(2)T	This command was modified. The <i>process-id</i> argument was added.				
	12.2(18)SXF4	This command was modified. The syntax was modified to support Cisco IOS Software Modularity images.				
	12.3(14)T	This command was modified. The timercheck keyword was added.				
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.				
	Cisco IOS XE Release 2.1	This command was integrated into Cisco IOS XE Release 2.1.				
	Cisco IOS XE Release 3.1.0SC	This command was introduced on the Cisco Catalyst 4500e series switches.				
	15.1(2)8	This command was integrated into Cisco IOS Release 15.1(2)S.				
Ilsago Guidolinos	Ciego IOS Softwar	zo Modularity				
	Although no opti a Software Modu <b>processes cpu</b> , s commands.	ional keywords or arguments are supported for the base <b>show processes</b> command when alarity image is running, more details about processes are displayed using the <b>show</b> <b>show processes detailed</b> , <b>show processes kernel</b> , and <b>show processes memory</b>				
Examples	Example output vinages. The following the fo	varies between Cisco IOS software images and Cisco IOS Software Modularity software owing sections show output examples for each image:

Table 27 describes the significant fields shown in the display.

### Table 27 show processes Field Descriptions

Field	Description
CPU utilization for five seconds	CPU utilization for the last 5 seconds. The second number indicates the percentage of CPU time spent at the interrupt level.
one minute	CPU utilization for the last minute.
five minutes	CPU utilization for the last 5 minutes.
PID	Process ID.
Q	Process queue priority. Possible values: C (critical), H (high), M (medium), and L (low).

Field	Description				
Ту	Scheduler test. Possible values:				
	• * (currently running)				
	• E (waiting for an event)				
	• S (ready to run, voluntarily relinquished processor)				
	• rd (ready to run, wakeup conditions have occurred)				
	• we (waiting for an event)				
	• sa (sleeping until an absolute time)				
	• si (sleeping for a time interval)				
	• sp (sleeping for a time interval as an alternate call				
	• st (sleeping until a timer expires)				
	• hg (hung: the process will never execute again)				
	• xx (dead: the process has terminated, but has not yet been deleted)				
PC	Current program counter.				
Runtime (ms)	CPU time that the process has used (in milliseconds).				
Invoked	Number of times that the process has been invoked.				
uSecs	Microseconds of CPU time for each process invocation.				
Stacks	Low water mark/Total stack space available (in bytes).				
TTY	Terminal that controls the process.				
Process	Name of the process.				

 Table 27
 show processes Field Descriptions (continued)

Because platforms have a 4- to 8-millisecond clock resolution, run times are considered reliable only after a large number of invocations or a reasonable, measured run time.

```
For a list of process descriptions, see
```

Table 28 describes the significant fields shown in the display.

Table 28 show processes history Field Descriptions

Field	Description
PID	Process ID.
Exectime (ms)	Execution time (in milliseconds) of the most recent run or the total execution time of the most recent consecutive runs.
Caller PC	Current program counter of this process before it was suspended.
Process Name	Name of the process.

The following is sample output from the show processes process-id command:

```
Router# show processes 6
```

```
Process ID 6 [Pool Manager], TTY 0
Memory usage [in bytes]
Holding: 921148, Maximum: 940024, Allocated: 84431264, Freed: 99432136
Getbufs: 0, Retbufs: 0, Stack: 12345/67890
CPU usage
PC: 0x60887600, Invoked: 188, Giveups: 100, uSec: 24
5Sec: 3.03%, 1Min: 2.98%, 5Min: 1.55%, Average: 0.58%,
Age: 662314 msec, Runtime: 3841 msec
State: Running, Priority: Normal
```

Table 29 describes the significant fields shown in the display.

Field	Description
Process ID	Process ID number and process name.
TTY	Terminal that controls the process.
Memory usage [in bytes]	This section contains fields that show the memory used by the specified process.
Holding	Amount of memory currently allocated to the process.
Maximum	Maximum amount of memory allocated to the process since its invocation.
Allocated	Bytes of memory allocated by the process.
Freed	Bytes of memory freed by the process.
Getbufs	Number of times that the process has requested a packet buffer.

#### Table 29show processes process-id Field Descriptions

Field	Description		
Retbufs	Number of times that the process has relinquished a packet buffer.		
Stack	Low water mark/Total stack space available (in bytes).		
CPU usage	This section contains fields that show the CPU resources used by the specified process.		
PC	Current program counter of this process before it was suspended.		
Invoked	Number of times that the process executed since its invocation.		
Giveups	Number of times that the process voluntarily gave up the CPU.		
uSec	Microseconds of CPU time for each process invocation.		
5Sec	CPU utilization by process in the last five seconds.		
1Min	CPU utilization by process in the last minute.		
5Min	CPU utilization by process in the last five minutes.		
Average	The average amount of CPU utilization by the process since its invocation.		
Age	Milliseconds since the process was invoked.		
Runtime	CPU time that the process has used (in milliseconds).		
State	Current state of the process. Possible values: Running, Waiting for Event, Sleeping (Mgd Timer), Sleeping (Periodic), Ready, Idle, Dead.		
Priority	The priority of the process. Possible values: Low, Normal, High.		

 Table 29

Table 31 describes the significant fields shown in the display.

Table 31	show processes (Software Modularity) Field Descriptions
	show processes (bortware modulanty) ricia Descriptions

Description
CPU utilization for the last 5 seconds. The "3%" indicates the percentage of CPU time spent at the interrupt level.
CPU utilization for the last minute.
CPU utilization for the last 5 minutes.
Process ID.
Thread ID.
CPU time that the process has used (in milliseconds).
Number of times that the process has been invoked.
Microseconds of CPU time for each process invocation.
Size, in kilobytes, of the memory stack.
Process name.

# **Related Commands**

Command	Description
show processes cpu	Displays detailed CPU utilization statistics (CPU use per process) when a Software Modularity image is running.
show processes detailed	Displays detailed information about POSIX and Cisco IOS processes when a Software Modularity image is running.
show processes kernel	Displays information about System Manager kernel processes when a Software Modularity image is running.
show processes memory	Displays the amount of system memory used per system process.

# show processes cpu

To display detailed CPU utilization statistics (CPU use per process) when Cisco IOS or Cisco IOS Software Modularity images are running, use the show processes cpu command in user EXEC or privileged EXEC mode.

### **Cisco IOS Software**

show processes cpu [history [table] | sorted [1min | 5min | 5sec]]

### **Cisco IOS Software Modularity**

**show processes cpu** [detailed [process-id | process-name] | history]

Syntax Description	history	(Optional) Displays CPU history in a graph format.
	table	(Optional) Displays CPU history in a table format.
	sorted	(Optional) For Cisco IOS images only. Displays CPU utilization sorted by percentage.
	1min	(Optional) Sorts CPU utilization based on 1 minute utilization.
	5min	(Optional) Sorts CPU utilization based on 5 minutes utilization.
	5sec	(Optional) Sorts CPU utilization based on 5 seconds utilization.
	detailed	(Optional) For Cisco IOS Software Modularity images only. Displays more detailed information about Cisco IOS processes (not for POSIX processes).
	process-id	(Optional) For Cisco IOS Software Modularity images only. Process identifier.
	process-name	(Optional) For Cisco IOS Software Modularity images only. Process name.

Madification

#### **Command Modes** User EXEC (>)

Privileged EXEC (#)

## **Command History**

d History	Release	Modification
	12.0	This command was introduced.
	12.2(2)T	This command was modified. The history keyword was added.
	12.3(8)	This command was enhanced to display Address Resolution Protocol (ARP) output.
	12.3(14)T	This command was enhanced to display ARP output.
	12.2(18)SXF4	This command was enhanced to support Cisco IOS Software Modularity images.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.
	12.2(33)SCB3	This command was integrated into Cisco IOS Release 12.2(33)SCB3. Support was added for Cisco uBR10012 and uBR7200 routers.
	Cisco IOS XE Release 2.1	This command was integrated into Cisco IOS XE Release 2.1.

## Usage Guidelines Cisco IOS Software

If you use the optional **history** keyword, three graphs are displayed for Cisco IOS images:

- CPU utilization for the last 60 seconds
- CPU utilization for the last 60 minutes
- CPU utilization for the last 72 hours

Maximum usage is measured and recorded every second; average usage is calculated on periods of more than one second. Consistently high CPU utilization over an extended period indicates a problem. Use the **show processes cpu** command to troubleshoot. Also, you can use the output of this command in the Cisco Output Interpreter tool to display potential issues and fixes. Output Interpreter is available to registered users of Cisco.com who are logged in and have Java Script enabled.

For a list of system processes, go to http://www.cisco.com/en/US/products/sw/iosswrel/ps1828/products\_tech\_note09186a00800a65d0.sht ml.

### **Cisco IOS Software Modularity**

Cisco IOS Software Modularity images display only one graph that shows the CPU utilization for the last 60 minutes. The horizontal axis shows times (for example, 0, 5, 10, 15 minutes), and the vertical axis shows total percentage of CPU utilization (0 to 100 percent).

## Examples

Example output varies between Cisco IOS software images and Cisco IOS Software Modularity software images. The following sections show output examples for each image:

- Cisco IOS Software
- Cisco IOS Software Modularity

#### **Cisco IOS Software**

The following is sample output from the **show processes cpu** command without keywords:

Router# show processes cpu

CPU ut	cilization for	five second	s: 5%/2%;	one r	minute:	3%;	five n	ninutes: 2%

                    5
    CPU% per minute (last 60 minutes)
    * = maximum CPU% # = average CPU%
```

!--- 72-hour output omitted

The top two rows, read vertically, display the highest percentage of CPU utilization recorded during the time increment. In this example, the CPU utilization for the last minute recorded is 66 percent. The device may have reached 66 percent only once during that minute, or it may have reached 66 percent multiple times. The device records only the peak reached during the time increment and the average over the course of that increment.

The following is sample output from the **show processes cpu** command on a Cisco uBR10012 router:

#### Router# show processes cpu

The following is sample output from the **show processes cpu** command that shows an ARP probe process:

Router# show processes cpu | include ARP

17	38140	389690	97	0.00%	0.00%	0.00%	0 ARP Input
36	0	1	0	0.00%	0.00%	0.00%	0 IP ARP Probe
40	0	1	0	0.00%	0.00%	0.00%	0 ATM ARP INPUT
80	0	1	0	0.00%	0.00%	0.00%	0 RARP Input
114	0	1	0	0.00%	0.00%	0.00%	0 FR ARP

Table 32 describes the fields shown in the output.

Table 32show processes cpu Field Descriptions

Field	Description
CPU utilization	CPU utilization for the last 5 seconds. The second number indicates the percent of
for five seconds	CPU time spent at the interrupt level.
1 minute	CPU utilization for the last minute.
5 minutes	CPU utilization for the last 5 minutes.
PID	Process ID.
Runtime (ms)	CPU time that the process has used (in milliseconds).
Invoked	Number of times that the process has been invoked.
uSecs	Microseconds of CPU time for each process invocation.
5Sec	CPU utilization by task in the last 5 seconds.
1Min	CPU utilization by task in the last minute.
5Min	CPU utilization by task in the last 5 minutes.
TTY	Terminal that controls the process.
Process	Name of the process.

Note

Because platforms have a 4- to 8-millisecond clock resolution, run times are considered reliable only after several invocations or a reasonable, measured run time.

#### **Cisco IOS Software Modularity**

The following is sample output from the **show processes cpu** command when a Software Modularity image is running:

Router# show processes cpu

Total	CPU	utilizat	tion for	5 seco	onds:	99.6%;	1	minute:	98.5%;	5	minutes:	85.3%

Table 34 describes the significant fields shown in the display.

Table 34	show processes cpu detailed (Softwar	re Modularity) Field Descriptions
----------	--------------------------------------	-----------------------------------

Field	Description
Total CPU utilization for five seconds	Total CPU utilization for the last 5 seconds. The second number indicates the percent of CPU time spent at the interrupt level.
1 minute	CPU utilization for the last minute.
5 minutes	CPU utilization for the last 5 minutes.
PID/TID	Process ID or task ID.
5Sec	Percentage of CPU time spent at the interrupt level for this process during the last five seconds.
1Min	Percentage of CPU time spent at the interrupt level for this process during the last minute.
5Min	Percentage of CPU time spent at the interrupt level for this process during the last five minutes.
Process	Process name.
Prio	Priority level of the process.
STATE	Current state of the process.
CPU	CPU utilization of the process in minutes and seconds.
type	Type of process; can be either IOS or POSIX.
Task	Task sequence number.

Field	Description
Runtime(ms)	CPU time that the process has used (in milliseconds).
Invoked	Number of times that the process has been invoked.
uSecs	Microseconds of CPU time for each process invocation.
5Sec	CPU utilization by task in the last 5 seconds.
1Min	CPU utilization by task in the last minute.
5Min	CPU utilization by task in the last 5 minutes.
TTY	Terminal that controls the process.
Task Name	Task name.

# Table 34 show processes cpu detailed (Software Modularity) Field Descriptions (continued)

## **Related Commands**

Command	Description
show processes	Displays information about active processes.
show processes memory	Displays the amount of system memory used per system process.

# show processes detailed

To display detailed information about POSIX and Cisco IOS processes when Cisco IOS Software Modularity images are running, use the **show processes detailed** command in user EXEC or privileged EXEC mode.

show processes detailed [process-id | process-name]

Syntax Description	<b>x Description</b> process-id (Optional) Process identifier.							
	process-name	(Optional) Process name.						
Command Default	If no process ID or process name is specified, detailed information is displayed about all processes.							
Command Modes	User EXEC (>) Privileged EXEC (#	)						
Command History	Release	Modification						
	12.2(18)SXF4	This command was introduced to support Software Modularity images.						
Usage Guidelines Examples	Use the <b>show proce</b> running, the process <b>processes</b> command The following is sar sysmgr.proc:	<b>sses detailed</b> command to gather detailed information about the number of tasks state, and other information about a process that is not displayed by the <b>show</b>

Table 35 describes the significant fields shown in the display.

## Table 35show processes detailed Field Descriptions

Field	Description
Job Id	Job identifier.
PID	Process ID.
Executable name	Process name.
Executable path	Path and filename of the process.
Instance ID	Instance number.
Args	Arguments sent to the process at startup.
Respawn	Ability to respawn process: on or off.
Respawn count	Number of respawns of this process since boot where boot equals one.
Max. spawns per minute	Maximum number of respawns per minute for this process.
Last started	Date and time the process was last started.
Process state	Current state of process.
Core	Core dump options specified for the process.
Max. core	Maximum number of dumps allowed for this process.
Level	Internal number that determines the startup order for the process.
TID	Task ID.
Stack	Size, in kilobytes, of the memory stack.
pri	Process priority.
state	Current state of process.
Blked	Thread (with given process ID) that is currently blocked by the process.

Field	Description
HR:MM:SS:MSEC	Time (in hours, minutes, seconds, and milliseconds) used by the process.
FLAGS	Process flags (bitmask).
NAME	Process name.

Table 38 describes the significant fields shown in the display.

Field	Description
PID	Process ID.
Name	Process name.
Signals Pending	Signals in a pending state (waiting to be unblocked from a POSIX process or process thread) shown in hexadecimal format. A signal is an asynchronous notification of an event. Each POSIX process thread has a signal mask. Signals can be directed to a process or to a process thread.
Signals Ignored	Signals that are blocked from a POSIX process or process thread, shown in hexadecimal format.
Signals Queued	Signals waiting for the scheduler to run the signal handler, shown in hexadecimal format.

# Table 39 show processes kernel startup Field Descriptions

Field	Description
PID	Process ID.
Last Started	Date and time when process was last started.
State	Current state of process.
RCnt	Number of times this process has restarted.
Name:Instance_Id	Process name and instance ID.
Args	Arguments passed to this process when it was spawned.

# **Related Commands**

Command	Description
show processes	Displays information about active processes.

# show processes memory

To display the amount of memory used by each system process in Cisco IOS, Cisco IOS XE, or Cisco IOS Software Modularity images, use the **show processes memory** command in privileged EXEC mode.

### **Cisco IOS Software**

show processes memory [process-id | sorted [allocated | getbufs | holding]]

### **Cisco IOS Software Modularity**

show processes memory [detailed [process-name[:instance-id] | process-id [taskid task-id]]]
[alloc-summary | sorted {start | size | caller}]

Cisco Catalyst 4500e Series Switches Running Cisco IOS XE Software

show processes memory [detailed [process iosd | task task-id] | sorted [allocated | getbufs |
holding]]

Syntax Description	Cisco IOS Software Syntax					
	process-id	(Optional) Process ID (PID) of a specific process. When you specify a process ID, only details for the specified process will be shown.				
	sorted	(Optional) Displays memory data sorted by the Allocated,Getbufs,or Holding column. If the <b>sorted</b> keyword is used by itself, data is sorted by the Holding column by default.				
	allocated	(Optional) Displays memory data sorted by the Allocated column.				
	getbufs	(Optional) Displays memory data sorted by the Getbufs (Get Buffers) column.				
	holding	(Optional) Displays memory data sorted by the Holding column. This keyword is the default.				
	Cisco IOS Softwar	e Modularity Syntax				
	detailed	(Optional) Displays detailed information about iosproc processes.				
	process-name	(Optional) Process name.				
	:instance-id	(Optional) Instance name of either the Cisco IOS task or POSIX process. The colon is required.				
	process-id	(Optional) Process identifier.				
	taskid task-id	(Optional) Displays detailed memory usage of a specified Cisco IOS task within a process.				
	alloc-summary	(Optional) Displays summary POSIX process memory usage per allocator.				
	sorted	(Optional) Displays POSIX process memory usage sorted by start address, size, or the PC that called the process.				
	start	(Optional) Displays POSIX process memory usage sorted by the start address of the process.				
	size	(Optional) Displays POSIX process memory usage sorted by the size of the process.				
	caller	(Optional) Displays POSIX process memory usage sorted by the PC that called the process.				

# Command Default Cisco IOS Software

The memory used by all types of system processes is displayed.

Modification

### **Cisco IOS XE Software and Software Modularity**

The system memory followed by a one-line summary of memory information about each IOS XE or Software Modularity process is displayed.

# **Command Modes** Privileged EXEC (#)

Release

# **Command History**

10.0	This command was introduced.
12.0(23)S	The sorted, allocated, getbufs, and holding keywords were added.
12.2(13)	The sorted, allocated, getbufs, and holding keywords were added.
12.2(13)S	The sorted, allocated, getbufs, and holding keywords were added.
12.2(13)T	The sorted, allocated, getbufs, and holding keywords were added.
12.0(28)S	The output of the header line was updated to support the Memory Thresholding feature.
12.2(22)S	The output of the header line was updated to support the Memory Thresholding feature.
12.3(7)T	The output of the header line was updated to support the Memory Thresholding feature.
12.0(30)S	The summary information (first lines of output) for this command was separated from the rest of the output and labeled by memory pool type (Total Process Memory, Total I/O Memory, and so on).
	This enhancement also corrected a total process memory mismatch error (mismatch between the <b>show processes memory</b> command, the <b>show processes memory sorted</b> command, and the <b>show memory</b> command and its variants).
12.2(28)S	The summary information (first lines of output) for this command was separated from the rest of the output and labeled by memory pool type (Total Process Memory, Total I/O Memory, and so on).
	This enhancement also corrected a total process memory mismatch error (mismatch between the <b>show processes memory</b> command, the <b>show processes memory sorted</b> command, and the <b>show memory</b> command and its variants).
12.3(11)T	The summary information (first lines of output) for this command was separated from the rest of the output and labeled by memory pool type (Total Process Memory, Total I/O Memory, and so on).
	This enhancement also corrected a total process memory mismatch error (mismatch between the <b>show processes memory</b> command, the <b>show processes memory sorted</b> command, and the <b>show memory</b> command and its variants).
12.2(18)SXF4	The syntax was modified to support Cisco IOS Software Modularity images.

Release	Modification
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
Cisco IOS XE Release 3.1.0.SG	This command was introduced on the Cisco Catalyst 4500e series switches.
Cisco IOS XE Release 3.3S	This command was introduced on the Cisco ASR 1000 Series Aggregation Services Routers.

### Usage Guidelines

The **show processes memory** command and the **show processes memory sorted** command displays a summary of total, used, and free memory, followed by a list of processes and their memory impact.

If the standard **show processes memory** *process-id* command is used, processes are sorted by their PID. If the **show processes memory sorted** command is used, the default sorting is by the Holding value.

#### Output Prior to Releases 12.3(7)T, 12.2(22)S, and 12.0(28)S

The first line (header line) of the **show processes memory** [**sorted**] command listed Total memory, Used memory, and Free memory values.

#### Output in Releases 12.3(7)T, 12.3(8)T, and 12.2(22)S Through 12.2(27)S2, 12.0(28)S, and 12.0(29)S

In Releases 12.3(7)T, 12.2(22)S, and 12.0(28)S, the Memory Thresholding feature was introduced. This feature affected the header line and the Holding column of the **show processes memory** command as described in this section.

The value for Total in the **show processes memory** command and the values listed in the Holding column showed the total (cumulative) value for the processor memory pools and the alternate memory pool\* (typically, the I/O memory pool). However, the **show processes memory sorted** version of this command, and other commands, such as the **show memory summary** command, did not include the alternate memory pool in the totals; that is, these commands showed the total value for the Processor memory pool only. This caused an observed mismatch of memory totals between commands.

If you are using these releases, use the output of the **show memory summary** command to determine the individual amounts of Total and Free memory for the Processor memory pool and the I/O memory pool.

#### Output in Releases 12.3(11)T, 12.2(28)S, 12.0(30)S, and Later Releases

Beginning in Releases 12.3(11)T, 12.2(28)S, and 12.0(30)S, the summary information (first output lines) for the **show processes memory** command is separated by memory pool. For example, there are now individual lines for Total Process Memory, Total I/O Memory, and Total PCI Memory. In these releases or later releases, your Total Process Memory should match the total process memory shown for other commands, such as the **show memory summary** command.

#### **About Alternate Memory Pools**

An "alternate memory pool" is a memory pool that can be used as an alternative to allocate memory when the target (main) memory pool has been filled. For example, many platforms have a memory type called "Fast" that is limited to a small size (because the memory media used for Fast memory is expensive). You can prevent memory allocations from failing once the available Fast memory has been used up by configuring the normal Processor memory as an alternative memory pool for the Fast memory pool.

#### **Cisco IOS XE Software and Software Modularity**

Use the **show processes memory** command without any arguments and keywords to display the system memory followed by a one-line summary of memory information about each modular Cisco IOS process. Use the **detailed** keyword with this command to display detailed memory information about all processes. Other arguments and keywords are used to display Cisco IOS Software Modularity process memory information for a specified process name or process ID.

On Cisco IOS XE software images only, the **detailed** keyword will also show Cisco IOS task memory details.

Examples

Example output varies between Cisco IOS software releases. To see the appropriate output, choose one of the following sections:

- show processes memory Command for Cisco IOS Releases Prior to 12.3(7)T, 12.2(22)S, and 12.0(28)S
- show processes memory Command for Cisco IOS Releases Prior to 12.3(11)T, 12.2(28)S, and 12.0(30)S
- show processes memory Command for Cisco IOS Software Modularity
- Cisco Catalyst 4500e Series Switches Running Cisco IOS XE Software

## show processes memory Command for Cisco IOS Releases Prior to 12.3(7)T, 12.2(22)S, and 12.0(28)S

The following is sample output from the show processes memory command:

Router# show processes memory

Proce	essor	Pool Total:	25954228	Used:	8368640 Free:	175855	588

79	0	160	0	13088	0	0	DHCPD Database
				8329440	Total		

Table 40 describes the significant fields shown in the display.

Field	Description
Processor Pool Total	Total amount of memory, in kilobytes (KB), held for the Processor memory pool.
Used	Total amount of used memory, in KB, in the Processor memory pool.
Free	Total amount of free memory, in KB, in the Processor memory pool.
PID	Process ID.
TTY	Terminal that controls the process.
Allocated	Bytes of memory allocated by the process.
Freed	Bytes of memory freed by the process, regardless of who originally allocated it.
Holding	Amount of memory, in KB, currently allocated to the process.
Getbufs	Number of times the process has requested a packet buffer.
Retbufs	Number of times the process has relinquished a packet buffer.
Process	Process name.
*Init*	System initialization process.
*Sched*	The scheduler process.
*Dead*	Processes as a group that are now dead.
8329440 Total	Total amount of memory, in KB, held by all processes (sum of the "Holding" column).

Table 40	show processes memory	Field Descriptions

The following is sample output from the show processes memory command when the sorted keyword is used. In this case, the output is sorted by the Holding column, from largest to smallest.

Router# show processes memory sorted

Proce	essor	Pool Total:	25954228	Used:	8371280 Free:	175829	948

The following is sample output from the **show processes memory** command when a process ID (*process-id*) is specified:

Router# show processes memory 1 Process ID: 1 Process Name: Chunk Manager Total Memory Held: 8428 bytes Processor memory holding = 8428 bytes pc = 0x60790654, size = 6044, count = 1 pc = 0x607A5084, size = 1544, count = 1 pc = 0x6076DBC4, size = 652, count = 1 pc = 0x6076FF18, size = 188, count = 1 I/O memory holding = 0 bytes Router# show processes memory 2 Process ID: 2 Process Name: Load Meter Total Memory Held: 3884 bytes Processor memory holding = 3884 bytes pc = 0x60790654, size = 3044, count = 1 pc = 0x6076DBC4, size = 652, count = 1 pc = 0x6076FF18, size = 188, count = 1 I/O memory holding = 0 bytes

#### show processes memory Command for Cisco IOS Releases Prior to 12.3(11)T, 12.2(28)S, and 12.0(30)S

The following example shows the output of the **show processes memory** command before the changes to the summary information were made. Note that the Total in the **show processes summary** command output indicates total memory for all memory pools; in this example, the **show processes memory** total of 35423840 can be obtained by adding the Processor and I/O totals shown in the output of the **show memory summary** command. Note also that the **show processes memory sorted** command lists the Total Processor Memory (matches the **show memory summary** Processor Total), but the **show processes memory** command (without the **sorted** keyword) lists the total for all memory pools (Processor plus I/O memory).

## show processes memory Command for Cisco IOS Software Modularity

In a Cisco IOS Software Modularity image IOS, each process maintains its own heap memory, which is taken from the system memory in blocks. The process reuses this memory as required. If all the memory that was requested in a block is no longer in use, then the process can return the memory block to the system.

The following is sample output from the **show processes memory** command when a Cisco IOS Software Modularity image is running:

Router# show processes memory

System	Memory :	262144K	total,	113672K us	ed, 14847	/2K free
PID	Text	Data	Stack	Dynamic	Total	Process
1	0	0	12	0	12	kernel

12329	4	4	36	600	644	cdp2.iosproc

Table 41 describes the significant fields shown in the display.

Table 41	show processes memory (Software Modularity) Field Descriptions
----------	--

Field	Description
total	Total amount of memory, in KB, on the device.
used	Amount of memory, in KB, used in the system.
free	Amount of free memory, in KB, available in the system.
PID	Process ID.
Text	Amount of memory, in KB, used by the text segment of the specified process.
Data	Amount of memory, in KB, used by the data segment of the specified process.
Stack	Amount of memory, in KB, used by the stack segment of the specified process.
Dynamic	Amount of memory, in KB, used by the dynamic segment of the specified process.
Total	Total amount of memory, in KB, used by the specified process.
Process	Process name.

The following example shows the output of the **show processes memory detailed** command wherein the process (ios-base) holds sufficient memory to process a request of the Cisco IOS tasks without having to request more memory from the system. So although the amount of memory of the Cisco IOS tasks increased, the ios-base process does not consume more system memory.

Router# show processes memory detailed 16424 sorted holding

Table 43 describes the significant fields shown in the display.

Field	Description
heapsize	Size of the process heap, in KB.
allocated	Amount of memory, in KB, allocated from the heap.
free	Amount of free memory, in KB, in the heap for the specified process.
Address	Block address, in hexadecimal.
Usize	Block size, in hexadecimal, without the trailer header.
Size	Block size, in hexadecimal.
Caller	Caller PC of the allocator of this block.

Table 44 describes the significant fields shown in the display.

Table 44show processes memory Field Descriptions

Field	Description
Processor Pool Total	Total amount of memory, in KB, held for the Processor memory pool.
I/O Pool Total	Total amount of memory, in KB, held for the I/O memory pool.
Used	Total amount of used memory, in KB, in the Processor/I/O memory pool.
Free	Total amount of free memory, in KB, in the Processor/I/O memory pool.
PID	Process ID.
TTY	Terminal that controls the process.
Allocated	Bytes of memory allocated by the process.
Freed	Bytes of memory freed by the process, regardless of who originally allocated it.
Holding	Amount of memory, in KB, currently allocated to the process.
Getbufs	Number of times the process has requested a packet buffer.
Retbufs	Number of times the process has relinquished a packet buffer.
Process	Process name.
*Init*	System initialization process.
*Sched*	The scheduler process.
*Dead*	Processes as a group that are now dead.
8329440 Total	Total amount of memory, in KB, held by all processes (sum of the "Holding" column).

## **Related Commands**

Command	Description
show memory	Displays statistics about memory, including memory-free pool statistics.
show processes	Displays information about the active processes.

# show raw statistics

To display raw IP statistics when Cisco IOS Software Modularity software is running, use the **show raw statistics** command in user EXEC or privileged EXEC mode.

show raw statistics

Syntax Description This command has no arguments or keywords. **Command Modes** User EXEC (>) Privileged EXEC (#) **Command History** Release Modification 12.2(18)SXF4 This command was introduced to support Software Modularity images. **Usage Guidelines** There are three transport protocols used in Software Modularity: Transmission Control Protocol (TCP), User Datagram Protocol (UDP), and raw IP. The transport protocol statistics are generally counters, though some are averages and time stamps. Use the show raw statistics command to display the raw IP statistics, and use the clear raw statistics command to reset the raw IP statistics. Many of the statistics are relevant to all of the transport protocols. To view the other transport protocol statistics used in Software Modularity, see the show tcp statistics and show udp statistics commands. Examples The following is sample output from the show raw statistics command: Router# show raw statistics Current packet level is 0 (Clear) Rcvd: 0 packets, 0 bytes 0 packets dropped in total (0 %) 0 packets dropped due to invalid length 0 packets dropped due to no protocol listener 0 packets dropped due to receive packet limits 0 packets dropped due to receive byte limits 0 bytes dropped due to receive limits Sent: 11 packets, 0 bytes 26 Open sockets 0 Packets used by socket I/O 0 Packets recovered after starvation 0 Packet memory warnings 0 Packet memory alarms 0 Packet allocation errors 0 Transmission pulse errors 0 Packet punts from IP 9 Packet punts to IP 9 Packet punts from application 0 Packet punts to application 1 packets delivered to IP at a time 1 packets received from application at a time

3 read notification pulses 0 millisecond delay between notification and read

Table 45 describes the significant fields shown in the display.

Table 45show raw statistics Field Descriptions

Field	Description
Current packet level	A packet level of 0 (Clear) shows that less than 67 percent of the packet supply is in use. A packet level of 1 (Warn) shows that at least 67 percent of the packet supply is in use, and a packet level of 2 (Alarm) shows that at least 90 percent of the packet supply is in use.
Rcvd:	Statistics in this section refer to packets received by the router.
packets, bytes	Total number and size, in bytes, of raw IP packets received.
packets dropped in total	Total number of packets dropped, with percentage.
packets dropped due to invalid length	Number of packets dropped with an invalid length.
packets dropped due to no protocol listener	Number of packets dropped by raw IP because of no registered protocol. Each dropped packet generates an ICMP protocol unreachable message.
packets dropped due to no port	Number of packets dropped with no port.
packets dropped due to receive packet limits	Number of packets dropped after the receive packet limit is exceeded.
packets dropped due to receive byte limits	Number of packets dropped after the receive byte limit is exceeded.
bytes dropped due to receive limits	Number of bytes dropped after the receive byte limit is exceeded.
Sent:	Statistics in this section refer to packets sent by the router.
packets, bytes	Total number and size, in bytes, of raw IP packets sent.
Open sockets	Number of open sockets.
Packets used by socket I/O	Number of packets enqueued on socket send buffers, receive buffers, or reassembly queues. In summary, the number of packets currently being held by the transport protocol.
Packets recovered after starvation	Number of packets released by the transport protocol due to memory warnings or memory alarms.
Packet memory warnings	Number of packets with memory warnings.
Packet memory alarms	Number of packets with memory alarms.
Packet allocation errors	Number of packets with allocation errors.
Transmission pulse errors	Number of transmission signaling mechanism errors.
Packet punts from IP, Packet punts to IP	Number of batches of packets moved from and to the IP layer.
Packet punts from application, Packet punts to application	Number of batches of packets moved from and to the application layers.

Field	Description
packets delivered from IP at a time	Number of packets sent to the IP layer at one time.
packets received from application at a time	Number of packets received from the application layer at one time.
read notification pulses	Number of times that the transport protocol notified applications about input data.
millisecond delay between notification and read	Number of packets with a time delay of more than one millisecond between the time of notification and the time the packet was read.

## Table 45 show raw statistics Field Descriptions (continued)

# **Related Commands**

Command	Description
clear raw statistics	Clears raw IP statistics.
show tcp statistics	Displays TCP statistics.
show udp statistics	Displays UDP statistics.

# show registry

To display the function registry information when Cisco IOS or Cisco IOS Software Modularity images are running, use the **show registry** command in user EXEC or privileged EXEC mode.

## **Cisco IOS Software**

show registry [registry-name [registry-number]] [brief | statistics]

## **Cisco IOS Software Modularity**

show registry [name [registry-name [registry-number]]] [brief [name [registry-name
[registry-number]]] | preemptions | rpcp status | statistics [brief] [name [registry-name
[registry-number]]] [remote]] [process {process-name | process-id}]

Syntax Description	Cisco IOS Software Syntax				
	registry-name	(Optional) Name of the registry to display.			
	registry-number	(Optional) Number of the registry to display.			
	brief	(Optional) Displays limited functions and services information.			
	statistics	(Optional) Displays function registry statistics.			
	Cisco IOS Software Modularity Syntax				
	name	(Optional) Displays information about a specific registry.			
	registry-name	(Optional) Name of the registry to examine.			
	registry-number	(Optional) Number of the registry to examine.			
	brief	(Optional) Displays limited functions and services information.			
	preemptions	(Optional) Displays registry preemptions information.			
	rpcp status	(Optional) Displays status of remote procedure call (RPC) proxy.			
	statistics	(Optional) Displays function registry statistics.			
	remote	(Optional) Displays name server interactions and call statistics.			
	process	(Optional) Displays process-specific information.			
	process-name	(Optional) Process name.			
	process-id	(Optional) Process ID. Number in range from 1 to 4294967295.			

**Command Default** If no options are specified, registry information is displayed for all registries.

Command Modes User EXEC (>) Privileged EXEC (#)
Command History	Release	Modification
	11.1	This command was introduced.
	12.2(18)SXF4	Keywords and arguments were added to support Software Modularity images and this command was integrated into Cisco IOS Release 12.2(18)SXF4.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

#### Examples

Example output varies between Cisco IOS software images and Cisco IOS Software Modularity software images. To view the appropriate output, choose one of the following sections:

Field	Description
Registry information	Displays the registry information by process name.
services	Number of services displayed.
global bytes	Number of bytes for the service,
heap bytes	Size of the service heap, in bytes,

## show tcp

To display the status of Transmission Control Protocol (TCP) connections when Cisco IOS or Cisco IOS Software Modularity images re running, use the **show tcp** command in user EXEC or privileged EXEC mode.

show tcp [line-number] [tcb address]

Syntax Description	line-number	(Optional) Absolute line number of the line for which you want to display Telnet connection status.
	tcb	(Optional) Specifies the transmission control block (TCB) of the ECN-enabled connection that you want to display.
	address	(Optional) TCB hexadecimal address. The valid range is from 0x0 to 0xFFFFFFFF.

### Command Modes User EXEC (>)

Privileged EXEC (#)

Command History	Release	Modification
	10.0	This command was introduced.
	12.3(7)T	The <b>tcb</b> keyword and <i>address</i> argument were added.
	12.4(2)T	The output is enhanced to display status and option flags.
	12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB. The display output was modified to include the SSO capability flag and to indicate the reason that the SSO property failed on a TCP connection.
	12.2(18)SXF4	This command was integrated into Cisco IOS Release 12.2(18)SXF4 to support Software Modularity images.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2.
	12.2(1)1 12.4(2)T 12.2(28)SB 12.2(18)SXF4 12.2(33)SRA 12.2(31)SB2	<ul> <li>The teb hey nore and data test argument were dated.</li> <li>The output is enhanced to display status and option flags.</li> <li>This command was integrated into Cisco IOS Release 12.2(28)SB. The display output was modified to include the SSO capability flag and to indicate the reason that the SSO property failed on a TCP connection.</li> <li>This command was integrated into Cisco IOS Release 12.2(18)SXF4 to support Software Modularity images.</li> <li>This command was integrated into Cisco IOS Release 12.2(33)SRA.</li> <li>This command was integrated into Cisco IOS Release 12.2(31)SB2.</li> </ul>

#### Examples

Example output varies between Cisco IOS software images and Cisco IOS Software Modularity software images. To view the appropriate output, choose one of the following sections:

- Cisco IOS Software
- Cisco IOS Software Modularity

#### **Cisco IOS Software**

The following is sample output that displays the status and option flags:

```
Option Flags: vrf id set

IP Precedence value: 6

.

.

SRTT: 273 ms, RTTO: 490 ms, RTV: 217 ms, KRTT: 0 ms

minRTT: 0 ms, maxRTT: 300 ms, ACK hold: 200 ms

Status Flags: active open, retransmission timeout

Option Flags: vrf id set

IP Precedence value: 6
```

Table 48 contains the types of flags, all possible command output enhancements, and descriptions. SeeTable 49 through Table 53 for descriptions of the other fields in the sample output.

Type of Flag	Output Enhancement	Description
Status		
	Passive open	Set if passive open was done.
	Active open	Set if active open was done.
	Retransmission timeout	Set if retransmission timeout aborts.
	Net output pending	Output to network is pending.
	Wait for FIN	Wait for FIN to be acknowledged.
	App closed	Application has closed the TCB.
	Sync listen	Listen and establish a handshake.
	Gen tcbs	TCBs are generated as passive listener.
	Path mtu discovery	Path maximum transmission unit (MTU) discovery is enabled.
	Half closed	TCB is half closed.
	Timestamp echo present	Echo segment is present.
	Stopped reading	Read half is shut down.
Option		
	VRF id set	Set if connection has a VRF table identifier.
	Idle user	Set if the connection is idle.
	Sending urgent data	Set if urgent data is being sent.
	Keepalive running	Set if keepalive timer is running, or if an Explicit Congestion Notification (ECN)-enabled connection, or a TCB address bind is in effect.
	Nagle	Set if performing the Nagle algorithm.
	Always push	All packets and full-sized segments (internal use) are pushed.
	Path mtu capable	Path MTU discovery is configured.
	MD5	Message digest 5 (MD) messages are generated.
	Urgent data removed	Urgent data is removed.

 Table 48
 Type of Flags, All Possible Output Enhancements, and Descriptions

Type of Flag	Output Enhancement	Description
	SACK option permitted	Peer permits a selective acknowledgment (SACK) option.
	Timestamp option used	Time-stamp option is in use.
	Reuse local address	Local address can be reused.
	Non-blocking reads	Nonblocking TCP is read.
	Non-blocking writes	Nonblocking TCP is written.
	No delayed ACK	No TCP delayed acknowledgment is sent.
	Win-scale	Peer permits window scaling.
	Linger option set	The linger-on close option is set.

Table 48	Type of Flags, All Possible Outp	out Enhancements, and Descriptions (continued
----------	----------------------------------	---

The following is sample output from the **show tcp** command:

#### Router# show tcp

tty0, connection 1 to host cider Connection state is ESTAB, I/O status: 1, unread input bytes: 0 Local host: 172.31.232.17, Local port: 11184 Foreign host: 172.31.1.137, Foreign port: 23 Enqueued packets for retransmit: 0, input: 0, saved: 0 Event Timers (current time is 67341276): Retrans TimeWait AckHold SendWnd KeepAlive Timer: Starts: 30 0 32 0 0 0 1 14 0 0 Wakeups: 0 0 0 0 0 Next: iss: 67317172 snduna: 67317228 sndnxt: 67317228 sndwnd: 4096 irs: 1064896000 rcvnxt: 1064897597 rcvwnd: 2144 delrcvwnd: 0 SRTT: 317 ms, RTTO: 900 ms, RTV: 133 ms, KRTT: 0 ms minRTT: 4 ms, maxRTT: 300 ms, ACK hold: 300 ms Flags: higher precedence, idle user, retransmission timeout Datagrams (max data segment is 536 bytes): Rcvd: 41 (out of order: 0), with data: 34, total data bytes: 1596 Sent: 57 (retransmit: 1), with data: 35, total data bytes: 55

Table 49 describes the first five lines of output shown in the above display.

#### Table 49show tcp Field Descriptions—First Section of Output

Field	Description
tty	Identifying number of the line.
connection	Identifying number of the TCP connection.
to host	Name of the remote host to which the connection has been made.

Field	Description		
Connection state is	A connection progresses through a series of states during its lifetime. The states that follow are shown in the order in which a connection progresses through them.		
	• LISTEN—Waiting for a connection request from any remote TCP and port.		
	• SYNSENT—Waiting for a matching connection request after having sent a connection request.		
	• SYNRCVD—Waiting for a confirming connection request acknowledgment after having both received and sent a connection request.		
	• ESTAB—Indicates an open connection; data received can be delivered to the user. This is the normal state for the data transfer phase of the connection.		
	• FINWAIT1—Waiting for a connection termination request from the remote TCP or an acknowledgment of the connection termination request previously sent.		
	• FINWAIT2—Waiting for a connection termination request from the remote TCP host.		
	• CLOSEWAIT—Waiting for a connection termination request from the local user.		
	• CLOSING—Waiting for a connection termination request acknowledgment from the remote TCP host.		
	• LASTACK—Waiting for an acknowledgment of the connection termination request previously sent to the remote TCP host.		
	• TIMEWAIT—Waiting for enough time to pass to be sure that the remote TCP host has received the acknowledgment of its connection termination request.		
	• CLOSED—Indicates no connection state at all.		
	• For more information about TCBs, see RFC 793, <i>Transmission</i> Control Protocol Functional Specification.		
I/O status	Number that describes the current internal status of the connection.		
unread input bytes	Number of bytes that the lower-level TCP processes have read but that the higher-level TCP processes have not yet processed.		
Local host	IP address of the network server.		
Local port	Local port number, as derived from the following equation: <i>line-number</i> + (512 * <i>random-number</i> ). (The line number uses the lower nine bits; the other bits are random.)		
Foreign host	IP address of the remote host to which the TCP connection has been made.		
Foreign port	Destination port for the remote host.		

 Table 49
 show tcp Field Descriptions – First Section of Output (continued)

Field	Description
Enqueued packets for retransmit	Number of packets that are waiting on the retransmit queue. These are packets on this TCP connection that have been sent but that have not yet been acknowledged by the remote TCP host.
input	Number of packets that are waiting on the input queue to be read by the user.
saved	Number of received out-of-order packets that are waiting for all packets in the datagram to be received before they enter the input queue. For example, if packets 1, 2, 4, 5, and 6 have been received, packets 1 and 2 would enter the input queue, and packets 4, 5, and 6 would enter the saved queue.

#### Table 49 show tcp Field Descriptions—First Section of Output (continued)

<u>Note</u>

Use the **show tcp brief** command to display information about the ECN-enabled connections.

The following line of output shows the current elapsed time according to the system clock of the local host. The time shown is the number of milliseconds since the system started.

Event Timers (current time is 67341276):

The following lines of output display the number of times that various local TCP timeout values were reached during this connection. In this example, the local host re-sent data 30 times because it received no response from the remote host, and it sent an acknowledgment many more times because there was no data.

Timer:	Retrans	TimeWait	AckHold	SendWnd	Keepalive	GiveUp	PmtuAger
Starts:	30	0	32	0	0	0	0
Wakeups:	1	0	14	0	0	0	0
Next:	0	0	0	0	0	0	0

Table 50 describes the fields in the above lines of output.

#### Table 50 show tcp Field Descriptions—Second Section of Output

Field	Description
Timer	Names of the timer types in the output.
Starts	Number of times that the timer has been triggered during this connection.
Wakeups	Number of keepalives sent without receiving any response. (This field is reset to zero when a response is received.)
Next	System clock setting that triggers a timer for the next time an event (for example, TimeWait, AckHold, SendWnd, etc.) occurs.
Retrans	Retransmission timer is used to time TCP packets that have not been acknowledged and that are waiting for retransmission.
TimeWait	A time-wait timer ensures that the remote system receives a request to disconnect a session.
AckHold	An acknowledgment timer delays the sending of acknowledgments to the remote TCP in an attempt to reduce network use.

Field	Description
SendWnd	A send-window timer ensures that there is no closed window due to a lost TCP acknowledgment.
KeepAlive	A keepalive timer controls the transmission of test messages to the remote device to ensure that the link has not been broken without the knowledge of the local device.
GiveUp	A give-up timer determines the amount of time a local host will wait for an acknowledgment (or other appropriate reply) of a transmitted message after the the maximum number of retransmissions has been reached. If the timer expires, the local host gives up retransmission attempts and declares the connection dead.
PmtuAger	A path MTU (PMTU) age timer is an interval that displays how often TCP estimates the PMTU with a larger maximum segment size (MSS). When the age timer is used, TCP path MTU becomes a dynamic process. If the MSS is smaller than what the peer connection can manage, a larger MSS is tried every time the age timer expires. The discovery process stops when the send MSS is as large as the peer negotiated or the timer has been manually disabled by being set to infinite.

#### Table 50 show tcp Field Descriptions – Second Section of Output (continued)

The following lines of output display the sequence numbers that TCP uses to ensure sequenced, reliable transport of data. The local host and remote host each use these sequence numbers for flow control and to acknowledge receipt of datagrams.

iss: 67317172 snduna: 67317228 sndnxt: 67317228 sndwnd: 4096 irs: 1064896000 rcvnxt: 1064897597 rcvwnd: 2144 delrcvwnd: 0

Table 51 describes the fields shown in the display above.

#### Table 51 show tcp Field Descriptions – Sequence Numbers

Field	Description	
iss	Initial send sequence number.	
snduna	Last send sequence number that the local host sent but for which it has not received an acknowledgment.	
sndnxt	Sequence number that the local host will send next.	
sndwnd	TCP window size of the remote host.	
irs	Initial receive sequence number.	
rcvnxt	Last receive sequence number that the local host has acknowledged.	
rcvwnd	TCP window size of the local host.	
delrcvwnd	Delayed receive window—data that the local host has read from the connection but has not yet subtracted from the receive window that the host has advertised to the remote host. The value in this field gradually increases until it is larger than a full-sized packet, at which point it is applied to the rcvwnd field.	

The following lines of output display values that the local host uses to keep track of transmission times so that TCP can adjust to the network that it is using.

SRTT: 317 ms, RTTO: 900 ms, RTV: 133 ms, KRTT: 0 ms minRTT: 4 ms, maxRTT: 300 ms, ACK hold: 300 ms Flags: higher precedence, idle user, retransmission timeout

Table 52 describes the significant fields shown in the output above.

Table 52 show tcp Field Descriptions—Line Beginning with "SRTT"

Field	Description
SRTT	A calculated smoothed round-trip timeout.
RTTO	Round-trip timeout.
RTV	Variance of the round-trip time.
KRTT	New round-trip timeout (using the Karn algorithm). This field separately tracks the round-trip time of packets that have been re-sent.
minRTT	Smallest recorded round-trip timeout (hard-wire value used for calculation).
maxRTT	Largest recorded round-trip timeout.
ACK hold	Time for which the local host will delay an acknowledgment in order to add data to it.
Flags	Properties of the connection.

Note

For more information on the above fields, see *Round Trip Time Estimation*, P. Karn and C. Partridge, ACM SIGCOMM-87, August 1987.

The following lines of output display the number of datagrams that are transported with data.

Datagrams (max data segment is 536 bytes): Rcvd: 41 (out of order: 0), with data: 34, total data bytes: 1596 Sent: 57 (retransmit: 1), with data: 35, total data bytes: 55

Table 53 describes the significant fields shown in the last lines of the show tcp command output.

Field	Description
Rcvd	Number of datagrams that the local host has received during this connection (and the number of these datagrams that were out of order).
with data	Number of these datagrams that contained data.
total data bytes	Total number of bytes of data in these datagrams.
Sent	Number of datagrams that the local host sent during this connection (and the number of these datagrams that needed to be re-sent).
with data	Number of these datagrams that contained data.
total data bytes	Total number of bytes of data in these datagrams.

Table 53 show tcp Field Descriptions—Last Section of Output

The following is sample output from the **show tcp tcb** command that displays detailed information by hexadecimal address about an ECN-enabled connection:

Router# show tcp tcb 0x62CD2BB8

Connection state is LISTEN, I/O status: 1, unread input bytes: 0 Connection is ECN enabled Local host: 10.10.10.1, Local port: 179 Foreign host: 10.10.10.2, Foreign port: 12000

Enqueued packets for retransmit: 0, input: 0 mis-ordered: 0 (0 bytes)

Event Timers	(current	time is 0x41	F31940):			
Timer	Starts	Wakeups	Next			
Retrans	0	0	0x0			
TimeWait	0	0	0x0			
AckHold	0	0	0x0			
SendWnd	0	0	0x0

Related Commands	Command	Description
	show tcp brief	Displays a concise description of TCP connection endpoints.

## show tcp statistics

To display TCP statistics, use the **show tcp statistics** command in user EXEC or privileged EXEC mode.

show tcp statistics

**Syntax Description** This command has no arguments or keywords.

Command Modes User EXEC (>) Privileged EXEC (#)

Command History	Release	Modification
	11.3	This command was introduced.
	12.2(18)SXF4	This command was integrated into Cisco IOS Release 12.2(18)SXF4, and the output was modified to display Software Modularity information.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

#### Usage Guidelines Cisco IOS Software Modularity

There are three transport protocols used in Software Modularity: TCP, UDP, and raw IP. The transport protocol statistics are generally counters, though some are averages and time stamps. Use the **show tcp statistics** command to display the TCP statistics and use the **clear tcp statistics** command to reset the TCP statistics. Many of the statistics are relevant to all of the transport protocols. To view the other transport protocol statistics used in Software Modularity, see the **show raw statistics** and **show udp statistics** commands.

#### Examples

Example output varies between Cisco IOS software images and Cisco IOS Software Modularity software images. To view the appropriate output, choose one of the following sections:

- Cisco IOS Software
- Cisco IOS Software Modularity

#### **Cisco IOS Software**

The following is sample output from the show tcp statistics command:

```
Router# show tcp statistics
```

```
Rcvd: 210 Total, 0 no port
    0 checksum error, 0 bad offset, 0 too short
    132 packets (26640 bytes) in sequence
    5 dup packets (502 bytes)
    0 partially dup packets (0 bytes)
    0 out-of-order packets (0 bytes)
    0 packets (0 bytes) with data after window
    0 packets after close
    0 window probe packets, 0 window update packets
    0 dup ack packets, 0 ack packets with unsend data
```

69 ack packets (3044 bytes) Sent: 175 Total, 0 urgent packets 16 control packets (including 1 retransmitted) 69 data packets (3029 bytes) 0 data packets (0 bytes) retransmitted 73 ack only packets (49 delayed) 0 window probe packets, 17 window update packets 7 Connections initiated, 1 connections accepted, 8 connections established 8 Connections closed (including 0 dropped, 0 embryonic dropped) 1 Total rxmt timeout, 0 connections dropped in rxmt timeout 0 Kompalium to keepalium probe 0 Compations dropped in keepalium

 ${\tt 0}$  Keepalive timeout,  ${\tt 0}$  keepalive probe,  ${\tt 0}$  Connections dropped in keepalive

Table 54 describes the significant fields shown in the display.

#### Table 54show tcp statistics Field Descriptions

Field	Description
Rcvd:	Statistics in this section refer to packets received by the router.
Total	Total number of TCP packets received.
no port	Number of packets received with no port.
checksum error	Number of packets received with checksum error.
bad offset	Number of packets received with bad offset to data.
too short	Number of packets received that were too short.
packets in sequence	Number of data packets received in sequence.
dup packets	Number of duplicate packets received.
partially dup packets	Number of packets received with partially duplicated data.
out-of-order packets	Number of packets received out of order.
packets with data after window	Number of packets received with data that exceeded the window size of the receiver.
packets after close	Number of packets received after the connection was closed.
window probe packets	Number of window probe packets received.
window update packets	Number of window update packets received.
dup ack packets	Number of duplicate acknowledgment packets received.
ack packets with unsend data	Number of acknowledgment packets received with unsent data.
ack packets	Number of acknowledgment packets received.
Sent:	Statistics in this section refer to packets sent by the router.
Total	Total number of TCP packets sent.
urgent packets	Number of urgent packets sent.
control packets	Number of control packets (SYN, FIN, or RST) sent.
data packets	Number of data packets sent.
data packets retransmitted	Number of data packets re-sent.
ack only packets	Number of packets sent that are acknowledgments only.
window probe packets	Number of window probe packets sent.
window update packets	Number of window update packets sent.
Connections initiated	Number of connections initiated.

Field	Description
connections accepted	Number of connections accepted.
connections established	Number of connections established.
Connections closed	Number of connections closed.
Total rxmt timeout	Number of times that the router tried to resend, but timed out.
connections dropped in rxmit timeout	Number of connections dropped in the resend timeout.
Keepalive timeout	Number of keepalive packets in the timeout.
keepalive probe	Number of keepalive probes.
Connections dropped in keepalive	Number of connections dropped in the keepalive.

#### Table 54 show tcp statistics Field Descriptions (continued)

#### **Cisco IOS Software Modularity**

The following is sample output from the **show tcp statistics** command when a Software Modularity image is running under Cisco IOS Release 12.2(18)SXF4:

```
Router# show tcp statistics
Current packet level is 0 (Clear)
Rcvd: 0 Total, 0 no port
      0 checksum error, 0 bad offset, 0 too short
      0 packets (0 bytes) in sequence
      0 dup packets (0 bytes)
      0 partially dup packets (0 bytes)
      0 out-of-order packets (0 bytes)
      0 packets (0 bytes) with data after window
      0 packets after close
      0 window probe packets, 0 window update packets
      0 dup ack packets, 0 ack packets for unsent data
      0 ack packets (0 bytes)
      0 packets dropped due to PAWS
      0 packets dropped due to receive packet limits
      0 packets dropped due to receive byte limits
Sent: 0 Total, 0 urgent packets
      0 control packets (including 0 retransmitted)
      0 data packets (0 bytes)
      0 data packets (0 bytes) retransmitted
      0 data packets (0 bytes) fastretransmitted
      0 Sack retransmitted bytes, 0 Sack skipped bytes
      0 ack only packets (0 delayed)
      0 window probe packets, 0 window update packets
0 Connections initiated, 0 connections accepted, 0 connections established
0 Connections closed (including 0 dropped, 0 embryonic dropped)
0 Total rxmt timeout, 0 connections dropped in rxmt timeout
0 RTO, 0 KRTO (milliseconds)
0 VJ SRTT, 0 variance (milliseconds)
0 min RTT, 0 max RTT (milliseconds)
0 Keepalive timeout, 0 keepalive probe, 0 Connections dropped in keepalive
0 increase MSS, 0 decrease MSS
15 Open sockets
0 Timer interrupts
0 Packets used by socket I/O
0 Packets used by TCP reassembly
0 Packets recovered after starvation
```

0	Packet memory warnings
0	Packet memory alarms
0	Packet allocation errors
0	Packet to octet switches due to send flow control
0	Packet to octet switches due to partial ACKs
0	Packet to octet switches due to inadequate resources
0	Output function calls
0	Truncated write I/O vectors
0	Transmission pulse errors
0	Packet punts from IP 0 Packet punts to IP
0	Packet punts from application
0	Packet punts to application

Table 55 describes the significant fields shown in the display that are different from Table 45 on page 110.

Field	Description	
Current packet level	A packet level of 0 (Clear) shows that less than 67 percent of the packet supply is in use. A packet level of 1 (Warn) shows that at least 67 percent of the packet supply is in use, and a packet level of 2 (Alarm) shows that at least 90 percent of the packet supply is in use.	
packets dropped due to PAWS	Number of packets dropped because of sequence number wrap-around on high speed, low latency networks.	
packets dropped due to receive packet limits	Number of packets dropped after the receive packet limit is exceeded.	
packets dropped due to receive byte limits	Number of packets dropped after the receive byte limit is exceeded.	
data packets fastretransmitted	Number of packets retransmitted before timer expiry because of excessive duplicate ACKs.	
Sack retransmitted bytes, Sack skipped bytes	Number of retransmitted bytes due to selective acknowledgement.	
RTO, KRTO	RTO is the current retransmission timeout, as calculated by Van Jacobson's algorithm. KRTO is the exponentially backed off retransmission timeout.	
VJ SRTT, variance	Scaled mean and variance round trip times used by Van Jacobson's algorithm.	
min RTT, max RTT	Minimum and maximum round-trip time (RTT), in milliseconds.	
increase MSS, decrease MSS	Number of times that the maximum segment size (MSS) changed because of path MTU discovery.	
Open sockets	Number of open sockets.	
Timer interrupts	Number of packets received with timer interrupts.	
Packets used by socket I/O	Number of packets enqueued on socket send buffers, receive buffers, or reassembly queues. In summary, the number of packets currently being held by the transport protocol.	
Packets used by TCP reassembly	Number of out of order segments that cannot be passed to application because of missing holes in the data stream. These holes will be filled when the peer retransmits.	

 Table 55
 show tcp statistics (Software Modularity) Field Descriptions

Field	Description
Packets recovered after starvation	Number of packets released by the transport protocol due to memory warnings or memory alarms.
Packet memory warnings	Number of packets with memory warnings.
Packet memory alarms	Number of packets with memory alarms.
Packet allocation errors	Number of packets with allocation errors.
Packet to octet switches due to send flow control	Number of times that TCP switched from packet I/O to octet buffer I/O because of inadequate send window.
Packet to octet switches due to partial ACKs	Number of times that TCP switched from packet I/O to octet buffer I/O because of partially acknowledged data.
Packet to octet switches due to inadequate resources	Number of times that TCP switched from packet I/O to octet buffer I/O because of inadequate packet resources.
Output function calls	Number of times that the TCP output engine was invoked.
Truncated write I/O vectors	Number of truncated segments due to inadequate write buffers.
Transmission pulse errors	Number of transmission signaling mechanism errors.
Packet punts from IP, Packet punts to IP	Number of batches of packets moved from and to the IP layer.
Packet punts from application, Packet punts to application	Number of batches of packets moved from and to the application layers.

Table 55	show tcp statistics (Software Modularity) Field Descriptions (continued)
	show top statistics (continued modulanty) rich Descriptions (continued)

### Related Commands

Command	Description	
clear tcp statistics	Clears TCP statistics.	
show raw statistics	Displays raw IP transport protocol statistics.	
show udp statistics	Displays UDP transport protocol statistics.	

## show udp statistics

To display User Datagram Protocol (UDP) statistics when Cisco IOS Software Modularity software is running, use the **show udp statistics** command in user EXEC or privileged EXEC mode.

show udp statistics

Syntax Description	This command has no arguments or keywords.	
Command Modes	User EXEC (>) Privileged EXEC (#)	)
Command History	Release	Modification
	12.2(18)SXF4	This command was introduced to support Software Modularity images.
Usage Guidelines	There are three trans UDP, and raw IP. The time stamps. Use the <b>statistics</b> command protocols. To view th <b>statistics</b> and <b>show</b> the	port protocols used in Software Modularity: Transmission Control Protocol (TCP), e transport protocol statistics are generally counters, though some are averages and e <b>show udp statistics</b> command to display the UDP statistics, and use the <b>clear udp</b> to reset the UDP statistics. Many of the statistics are relevant to all of the transport he other transport protocol statistics used in Software Modularity, see the <b>show raw</b> <b>tcp statistics</b> commands
Examples	The following is san	nple output from the show udp statistics command:
	Router# show udp statistics	
	Current packet level is 0 (Clear) Rcvd: 3291 packets, 0 bytes 3291 packets dropped in total (100 %) 0 packets dropped due to invalid length 0 packets dropped due to invalid checksum 3291 packets dropped due to no port 0 packets dropped due to receive packet limits 0 packets dropped due to receive byte limits 0 bytes dropped due to receive byte limits Sent: 0 packets, 0 bytes 5 Open sockets 0 Packets used by socket I/O 0 Packets recovered after starvation 0 Packet memory warnings 0 Packet allocation errors 0 Transmission pulse errors 3291 Packet punts from IP 0 Packet punts to IP	
	0 Packet punts fro 0 Packet punts to 1 packets received	m application application & from IP at a time

Table 56 describes the significant fields shown in the display.

Table 56	show udp statistics	Field Descriptions
----------	---------------------	--------------------

Field	Description
Current packet level	A packet level of 0 (Clear) shows that less than 67 percent of the packet supply is in use. A packet level of 1 (Warn) shows that at least 67 percent of the packet supply is in use, and a packet level of 2 (Alarm) shows that at least 90 percent of the packet supply is in use.
Rcvd:	Statistics in this section refer to packets received by the router.
packets, bytes	Total number and size, in bytes, of UDP packets received.
packets dropped in total	Total number of packets dropped, with percentage.
packets dropped due to invalid length	Number of packets dropped with an invalid length.
packets dropped due to invalid checksum	Number of packets dropped with an invalid checksum.
packets dropped due to no port	Number of packets dropped with no port.
packets dropped due to receive packet limits	Number of packets dropped after the receive packet limit is exceeded.
packets dropped due to receive byte limits	Number of packets dropped after the receive byte limit is exceeded.
bytes dropped due to receive limits	Number of bytes dropped after the receive byte limit is exceeded.
Sent:	Statistics in this section refer to packets sent by the router.
packets, bytes	Total number and size, in bytes, of UDP packets sent.
Open sockets	Number of open sockets.
Packets used by socket I/O	Number of packets enqueued on socket send buffers, receive buffers, or reassembly queues. In summary, the number of packets currently being held by the transport protocol.
Packets recovered after starvation	Number of packets released by the transport protocol due to memory warnings or memory alarms.
Packet memory warnings	Number of packets with memory warnings.
Packet memory alarms	Number of packets with memory alarms.
Packet allocation errors	Number of packets with allocation errors.
Transmission pulse errors	Number of transmission signaling mechanism errors.
Packet punts from IP, Packet punts to IP	Number of batches of packets moved from and to the IP layer.
Packet punts from application Packet punts to application	Number of batches of packets moved from and to the application layers.
packets received from IP at a time	Number of packets received from the IP layer at one time.

Related Commands	Command	Description
	clear udp statistics	Clears UDP statistics.
	show raw statistics	Displays raw IP statistics.
	show tcp statistics	Displays TCP statistics.

# write checkpoint

To run the configuration checkpoint process when a Cisco IOS Software Modularity image is running, use the **write checkpoint** command in privileged EXEC mode.

write checkpoint

Syntax Description	This command has no arguments or keywords.		
Command Modes	Privileged EXEC (#)	)	
Command History	Release	Modification	
	12.2(18)SXF4	This command was introduced to support Software Modularity images.	
Usage Guidelines	If you have a large configuration file, the default implicit configuration checkpoint process may take some time to complete and prevent you from entering other command-line interface (CLI) commands to save or display the configuration. To disable the checkpoint process, enter the <b>no</b> form of the <b>service</b> <b>checkpoint-config</b> command. When you are ready to run the configuration checkpoint process, use the write checkpoint command to run the configuration checkpoint process.		
Implicit configuration checkpointing means that configuration checkpointing of Software Modularity process can be restarted under an error condition or after process is restarted and operational, the state of the process returns to the state to the restart. The software checkpoints the configuration information and when configuration information is read from the checkpoint.		on checkpointing means that configuration checkpointing occurs for all processes. A y process can be restarted under an error condition or after upgrading. When the and operational, the state of the process returns to the state the process was in prior ftware checkpoints the configuration information and when the process restarts, the nation is read from the checkpoint.	
	Configuration check	point information is implicitly generated as follows:	
	• Each time you exit from global configuration mode.		
	• Each time you e	nter the write memory, copy running-config, or show run command.	
	• When the action command is visit	generated by the <b>write checkpoint</b> command has completed. The <b>write checkpoint</b> ible only after you enter the <b>no service checkpoint-config</b> command.	
Examples	In the following example the configuration char configuration mode process.	mple, the <b>no</b> form of the <b>service checkpoint-config</b> command is entered to disable eckpoint process, configuration commands are entered, and after exiting from the the <b>write checkpoint</b> command is entered to run the configuration checkpoint	
	<pre>ind Service Checkp ! ! configuration cc end</pre>	mmands are entered here	

write checkpoint

Related Commands	Command	Description
	service checkpoint-config	Enables implicit configuration checkpointing when running a Cisco IOS Software Modularity image
		elseo 105 Software Modularity iniage.

# write core (Software Modularity)

To generate a core dump for a Cisco IOS Software Modularity process if the process crashes, use the **write core** command in privileged EXEC mode.

write core process-name [suspend]

Syntax Description	process-name	Process name.
	suspend	(Optional) Suspends the process while the core dump is performed.
Command Default	No core dumps are performed if a process crashes.	
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	12.2(18)SXF4	This command was introduced to support Software Modularity images.
Usage Guidelines	Use the <b>write core</b> (Software Modularity) command to dump the core of the process when the process crashes. The output generated in the dump can be used with the information generated by the <b>exception crashinfo file</b> command to verify the functionality of dumping the process core when the process crashes. Each Cisco IOS Software Modularity component has an associated .startup file that determines the core dump options (and other attributes) of that process. Use the <b>show processes detailed</b> command to display the core dump options for a process. Use the <b>exception core</b> command to override the default values set in the .startup file for the specific software component.	
Examples	In the following example, a core dump is generated for the Cisco Discovery Protocol (CDP) process. write core cdp.proc	
	In the following example, a core dump is generated for the CDP process and the CDP process is suspended while the core dump is performed.	
	write core cdp.proc suspend	
Related Commands	Command	Description
	exception core	Sets or changes the core dump options for a process.
	exception crashinfo fil	e Enables the creation of a diagnostic file at the time of unexpected system shutdowns.
	show processes detaile	Displays detailed process information.
