

Configure Multipoint Layer 2 Services

This module provides the conceptual and configuration information for Multipoint Layer 2 Bridging Services, also called Virtual Private LAN Services (VPLS).

Note

VPLS supports Layer 2 VPN technology and provides transparent multipoint Layer 2 connectivity for customers. This approach enables service providers to host a multitude of new services such as broadcast TV and Layer 2 VPNs.

- Prerequisites for Implementing Multipoint Layer 2 Services, on page 1
- Information About Implementing Multipoint Layer 2 Services, on page 1
- How to Implement Services, on page 7
- Configuration Examples for Multipoint Layer 2 Services, on page 26

Prerequisites for Implementing Multipoint Layer 2 Services

Before configuring Multipoint Layer 2 Services, ensure that these tasks and conditions are met:

- You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command.
- If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.
- Configure IP routing in the core so that the provider edge (PE) routers can reach each other through IP.
- Configure a loopback interface to originate and terminate Layer 2 traffic. Make sure that the PE routers can access the other router's loopback interface.

Information About Implementing Multipoint Layer 2 Services

To implement Multipoint Layer 2 Services, you must understand these concepts:

Multipoint Layer 2 Services Overview

Multipoint Layer 2 Services enable geographically separated local-area network (LAN) segments to be interconnected as a single bridged domain over an MPLS network. The full functions of the traditional LAN such as MAC address learning, aging, and switching are emulated across all the remotely connected LAN segments that are part of a single bridged domain. A service provider can offer VPLS service to multiple customers over the MPLS network by defining different bridged domains for different customers. Packets from one bridged domain are never carried over or delivered to another bridged domain, thus ensuring the privacy of the LAN service.

Some of the components present in a Multipoint Layer 2 Services network are described in these sections.

Note

Multipoint Layer 2 services are also called as Virtual Private LAN Services.

Bridge Domain

The native bridge domain refers to a Layer 2 broadcast domain consisting of a set of physical or virtual ports (including VFI). Data frames are switched within a bridge domain based on the destination MAC address. Multicast, broadcast, and unknown destination unicast frames are flooded within the bridge domain. In addition, the source MAC address learning is performed on all incoming frames on a bridge domain. A learned address is aged out. Incoming frames are mapped to a bridge domain, based on either the ingress port or a combination of both an ingress port and a MAC header field.

When the number of bridge domains exceeds 200, to enable clean up and reprogramming, it takes about 120 seconds for unconfiguring L2VPN and rollback.

The following table details the minimum interval required between unconfiguring L2VPN and rollback:

Number of BDs	Minimum interval in seconds
250	180
500	300
750 or greater	600

Pseudowires

A pseudowire is a point-to-point connection between pairs of PE routers. Its primary function is to emulate services like Ethernet over an underlying core MPLS network through encapsulation into a common MPLS format. By encapsulating services into a common MPLS format, a pseudowire allows carriers to converge their services to an MPLS network.

Access Pseudowire is not supported over VPLS Bridge Domain

Access PW is not supported over VPLS bridge domain. Only core PW which is configured under VFI is supported.

Configuration Example

12vpn bridge group bg1

```
bridge-domain 12vpn
  interface TenGigEO/0/0/13.100
!
vfi 1
  neighbor 192.0.2.1 pw-id 12345
   pw-class mpls_csr
!
!
```

Virtual Forwarding Instance

VPLS is based on the characteristic of virtual forwarding instance (VFI). A VFI is a virtual bridge port that is capable of performing native bridging functions, such as forwarding, based on the destination MAC address, source MAC address learning and aging, and so forth.

A VFI is created on the PE router for each VPLS instance. The PE routers make packet-forwarding decisions by looking up the VFI of a particular VPLS instance. The VFI acts like a virtual bridge for a given VPLS instance. More than one attachment circuit belonging to a given VPLS are connected to the VFI. The PE router establishes emulated VCs to all the other PE routers in that VPLS instance and attaches these emulated VCs to the VFI. Packet forwarding decisions are based on the data structures maintained in the VFI.

VPLS for an MPLS-based Provider Core

VPLS is a multipoint Layer 2 VPN technology that connects two or more customer devices using bridging techniques. A bridge domain, which is the building block for multipoint bridging, is present on each of the PE routers. The access connections to the bridge domain on a PE router are called attachment circuits. The attachment circuits can be a set of physical ports, virtual ports, or both that are connected to the bridge at each PE device in the network.

After provisioning attachment circuits, neighbor relationships across the MPLS network for this specific instance are established through a set of manual commands identifying the end PEs. When the neighbor association is complete, a full mesh of pseudowires is established among the network-facing provider edge devices, which is a gateway between the MPLS core and the customer domain.

The MPLS/IP provider core simulates a virtual bridge that connects the multiple attachment circuits on each of the PE devices together to form a single broadcast domain. This also requires all of the PE routers that are participating in a VPLS instance to form emulated virtual circuits (VCs) among them.

Now, the service provider network starts switching the packets within the bridged domain specific to the customer by looking at destination MAC addresses. All traffic with unknown, broadcast, and multicast destination MAC addresses is flooded to all the connected customer edge devices, which connect to the service provider network. The network-facing provider edge devices learn the source MAC addresses as the packets are flooded. The traffic is unicasted to the customer edge device for all the learned MAC addresses.

VPLS for Layer 2 Switching

VPLS technology includes the capability of configuring the router to perform Layer 2 bridging. In this mode, the router can be configured to operate like other Cisco switches.

Note

- The storm control configuration is supported only on one sub-interface under a main interface, though the system allows you to configure storm control on more than one sub-interface. However, only the first storm control configuration under a main interface takes effect, though the running configuration shows all the storm control configurations that are committed. After reload, any of the storm control configurations may take effect irrespective of the order of configuration.
- The storm control configuration under a bridge domain is not supported.
- Storm control counters are not supported.

The storm control that is applied to multiple subinterfaces of the same physical port pertains to that physical port only. All subinterfaces with storm control configured are policed as aggregate under a single policer rate shared by all EFPs. None of the subinterfaces are configured with a dedicated policer rate. When a storm occurs on several subinterfaces simultaneously, and because subinterfaces share the policer, you can slightly increase the policer rate to accommodate additional policing.

These features are supported:

- Bridging IOS XR Trunk Interfaces
- Bridging on EFPs

Interoperability Between Cisco IOS XR and Cisco IOS on VPLS LDP Signaling

The Cisco IOS Software encodes the NLRI length in the fist byte in bits format in the BGP Update message. However, the Cisco IOS XR Software interprets the NLRI length in 2 bytes. Therefore, when the BGP neighbor with VPLS-VPWS address family is configured between the IOS and the IOS XR, NLRI mismatch can happen, leading to flapping between neighbors. To avoid this conflict, IOS supports **prefix-length-size 2** command that needs to be enabled for IOS to work with IOS XR. When the **prefix-length-size 2** command is configured in IOS, the NLRI length is encoded in bytes. This configuration is mandatory for IOS to work with IOS XR.

This is a sample IOS configuration with the **prefix-length-size 2** command:

```
router bgp 1
address-family 12vpn vpls
neighbor 5.5.5.2 activate
neighbor 5.5.5.2 prefix-length-size 2 -----> NLRI length = 2 bytes
exit-address-family
```

MAC Address-related Parameters

The MAC address table contains a list of the known MAC addresses and their forwarding information. In the current VPLS design, the MAC address table and its management are maintained on the route processor (RP) card.

These topics provide information about the MAC address-related parameters:

MAC Address Flooding

Ethernet services require that frames that are sent to broadcast addresses and to unknown destination addresses be flooded to all ports. To obtain flooding within VPLS broadcast models, all unknown unicast, broadcast,

and multicast frames are flooded over the corresponding pseudowires and to all attachment circuits. Therefore, a PE must replicate packets across both attachment circuits and pseudowires.

MAC Address-based Forwarding

To forward a frame, a PE must associate a destination MAC address with a pseudowire or attachment circuit. This type of association is provided through a static configuration on each PE or through dynamic learning, which is flooded to all bridge ports.

MAC Address Source-based Learning

When a frame arrives on a bridge port (for example, pseudowire or attachment circuit) and the source MAC address is unknown to the receiving PE router, the source MAC address is associated with the pseudowire or attachment circuit. Outbound frames to the MAC address are forwarded to the appropriate pseudowire or attachment circuit.

MAC address source-based learning uses the MAC address information that is learned in the hardware forwarding path. The updated MAC tables are propagated and programs the hardware for the router.

Note

Static MAC move is not supported from one port, interface, or AC to another port, interface, or AC. For example, if a static MAC is configured on AC1 (port 1) and then, if you send a packet with the same MAC as source MAC on AC2 (port 2), then you can't attach this MAC to AC2 as a dynamic MAC. Therefore, do not send any packet with a MAC as any of the static MAC addresses configured.

The number of learned MAC addresses is limited through configurable per-port and per-bridge domain MAC address limits.

MAC Address Aging

A MAC address in the MAC table is considered valid only for the duration of the MAC address aging time. When the time expires, the relevant MAC entries are repopulated. When the MAC aging time is configured only under a bridge domain, all the pseudowires and attachment circuits in the bridge domain use that configured MAC aging time.

A bridge forwards, floods, or drops packets based on the bridge table. The bridge table maintains both static entries and dynamic entries. Static entries are entered by the network manager or by the bridge itself. Dynamic entries are entered by the bridge learning process. A dynamic entry is automatically removed after a specified length of time, known as *aging time*, from the time the entry was created or last updated.

If hosts on a bridged network are likely to move, decrease the aging-time to enable the bridge to adapt to the change quickly. If hosts do not transmit continuously, increase the aging time to record the dynamic entries for a longer time, thus reducing the possibility of flooding when the hosts transmit again.

MAC Address Limit

The MAC address limit is used to limit the number of learned MAC addresses.

When a limit is exceeded, the system is configured to perform these notifications:

- Syslog (default)
- Simple Network Management Protocol (SNMP) trap

- · Syslog and SNMP trap
- None (no notification)

To generate syslogs messages and SNMP trap notifications, use the **mac limit notification both** command in the L2VPN bridge-domain configuration mode.

MAC address limit action applies only when the number of local MAC addresses exceeds the configured limit. The software unlearns the MAC addresses until it reaches the configured MAC limit threshold value. Later, the router restarts learning new MAC addresses. In the event when the MAC limit threshold is not configured, the default threshold is 75% of the configured MAC address limit.

Restrictions

- You can configure up to a maximum of six different mac-limit values under a bridge domain for the following routers and line cards:
 - NCS-55A1-24H
 - NCS-55A1-48Q6H
 - NCS-55A1-36H
 - NCS-55A1-36H-SE
 - NCS-55A2-MOD-HD-S
 - NCS-55A2-MOD-S
 - NCS-5502
 - NCS-5502-SE
 - NCS55-36x100G-S
 - NC55-24H12F-SE
 - NCS55-36x100G-A-SS
- You can configure up to a maximum of 30 different mac-limit values under a bridge domain on routers that have the Cisco NC57 line cards installed.
- For NCS55xx routers and NCS57 line cards, the mac-limit value programmed in the hardware depends on the:
 - Static MAC address configured under the AC for a bridge domain.
 - · BVI configured under a bridge domain.

Depending on the BVI or static MAC address configured, new mac-limit profiles are required. The following example shows the different bridge domains with default mac-limit with static MAC address and BVI.

Example 1

In this example, the bridge domain requires a default mac-limit profile. For instance, default mac-limit = X.

```
bridge-domain 1
  interface HundredGigE 0/0/0/10
```

In this example, the bridge domain requires a new mac-limit profile with mac-limit = X+1 to accommodate the static BVI MAC address.

```
bridge-domain 2
  interface HundredGigE 0/0/0/11
  routed interface bvi
```

Example 3

In this example, the bridge domain requires a new mac-limit profile with mac-limit = X+2 to accommodate two static MAC addresses configured under the AC.

```
bridge-domain 3
interface HundredGigE 0/0/0/12
static-mac-address 0000.1111.2222
static-mac-address 0000.2222.1111
```

MAC Address Withdrawal

For faster VPLS convergence, you can remove or unlearn the MAC addresses that are learned dynamically. The Label Distribution Protocol (LDP) Address Withdrawal message is sent with the list of MAC addresses, which need to be withdrawn to all other PEs that are participating in the corresponding VPLS service.

For the Cisco IOS XR VPLS implementation, a portion of the dynamically learned MAC addresses are cleared by using the MAC addresses aging mechanism by default. The MAC address withdrawal feature is added through the LDP Address Withdrawal message. To enable the MAC address withdrawal feature, use the **withdrawal** command in l2vpn bridge group bridge domain MAC configuration mode. To verify that the MAC address withdrawal is enabled, use the **show l2vpn bridge-domain** command with the **detail** keyword.

Note

By default, the LDP MAC Withdrawal feature is enabled on Cisco IOS XR.

The LDP MAC Withdrawal feature is generated due to these events:

- Attachment circuit goes down. You can remove or add the attachment circuit through the CLI.
- MAC withdrawal messages are received over a VFI pseudowire. RFC 4762 specifies that both wildcards (by means of an empty Type, Length and Value [TLV]) and a specific MAC address withdrawal. Cisco IOS XR software supports only a wildcard MAC address withdrawal.

How to Implement Services

This section describes the tasks that are required to implement Multipoint Layer 2 Services:

Configuring a Bridge Domain

These topics describe how to configure a bridge domain:

Creating a Bridge Domain

Perform this task to create a bridge domain.

Procedure

Step 1 configure

Example:

RP/0/RP0/CPU0:router# configure

Enters the XR Config mode.

Step 2 12vpn

Example:

```
RP/0/RP0/CPU0:router(config) # 12vpn
RP/0/RP0/CPU0:router(config-12vpn) #
```

Enters L2VPN configuration mode.

Step 3 bridge group *bridge-group-name*

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn)# bridge group csco
RP/0/RP0/CPU0:router(config-l2vpn-bg)#
```

Creates a bridge group that can contain bridge domains, and then assigns network interfaces to the bridge domain.

Step 4 bridge-domain *bridge-domain-name*

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn-bg) # bridge-domain abc
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd) #
```

Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.

Step 5 Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:

- Yes Saves configuration changes and exits the configuration session.
- No Exits the configuration session without committing the configuration changes.
- Cancel Remains in the configuration mode, without committing the configuration changes.

Associating Members with a Bridge Domain

After a bridge domain is created, perform this task to assign interfaces to the bridge domain. These types of bridge ports are associated with a bridge domain:

• Ethernet and VLAN

• VFI

Procedure

Step 1 configure

Example:

RP/0/RP0/CPU0:router# configure

Enters the XR Config mode.

Step 2 12vpn

Example:

RP/0/RP0/CPU0:router(config) # 12vpn

Enters L2VPN configuration mode.

Step 3 bridge group bridge group name

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn)# bridge group csco
RP/0/RP0/CPU0:router(config-l2vpn-bg)#
```

Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

Step 4 bridge-domain bridge-domain name

Example:

```
RP/0/RP0/CPU0:router(config-12vpn-bg)# bridge-domain abc
RP/0/RP0/CPU0:router(config-12vpn-bg-bd)#
```

Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.

Step 5 interface type interface-path-id

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd)# interface GigabitEthernet 0/4/0/0
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd-ac)#
```

Enters interface configuration mode and adds an interface to a bridge domain that allows packets to be forwarded and received from other interfaces that are part of the same bridge domain.

Step 6 (Optional) static-mac-address { MAC-address }

```
RP/0/RP0/CPU0:router(config-12vpn-bg-bd-ac)# static-mac-address 1.1.1
RP/0/RP0/CPU0:router(config-12vpn-bg-bd-ac)# exit
```

```
RP/0/RP0/CPU0:router(config-12vpn-bg-bd)#
```

Configures the static MAC address to associate a remote MAC address with a pseudowire or any other bridge interface.

Step 7 Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:

- Yes Saves configuration changes and exits the configuration session.
- No Exits the configuration session without committing the configuration changes.
- Cancel Remains in the configuration mode, without committing the configuration changes.

Configuring Bridge Domain Parameters

To configure bridge domain parameters, associate these parameters with a bridge domain:

- Maximum transmission unit (MTU)—Specifies that all members of a bridge domain have the same MTU. The bridge domain member with a different MTU size is not used by the bridge domain even though it is still associated with a bridge domain.
- Flooding—Flooding is enabled always.

Procedure

Step 1 configure

Example:

RP/0/RP0/CPU0:router# configure

Enters the XR Config mode.

Step 2 12vpn

Example:

```
RP/0/RP0/CPU0:router(config) # 12vpn
RP/0/RP0/CPU0:router(config-12vpn) #
```

Enters the 12vpn configuration mode.

Step 3 bridge group *bridge-group-name*

```
RP/0/RP0/CPU0:router(config-l2vpn)# bridge group csco
RP/0/RP0/CPU0:router(config-l2vpn-bg)#
```

Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

Step 4 bridge-domain *bridge-domain-name*

Example:

```
RP/0/RP0/CPU0:router(config-12vpn-bg)# bridge-domain abc
RP/0/RP0/CPU0:router(config-12vpn-bg-bd)#
```

Establishes a bridge domain and enters 12vpn bridge group bridge domain configuration mode.

Step 5 flooding disable

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd) # flooding disable
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd) #
```

Disables flooding.

Step 6 mtu bytes

Example:

```
RP/0/RP0/CPU0:router(config-12vpn-bg-bd) # mtu 1000
```

Adjusts the maximum packet size or maximum transmission unit (MTU) size for the bridge domain.

• Use the bytes argument to specify the MTU size, in bytes. The range is from 64 to 65535.

Step 7 Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:

- Yes Saves configuration changes and exits the configuration session.
- No Exits the configuration session without committing the configuration changes.
- Cancel Remains in the configuration mode, without committing the configuration changes.

Disabling a Bridge Domain

Perform this task to disable a bridge domain. When a bridge domain is disabled, all VFIs that are associated with the bridge domain are disabled. You are still able to attach or detach members to the bridge domain and the VFIs that are associated with the bridge domain.

Procedure

Step 1 configure

Example:

RP/0/RP0/CPU0:router# configure

Enters the XR Config mode.

Step 2 12vpn

Example:

```
RP/0/RP0/CPU0:router(config) # 12vpn
RP/0/RP0/CPU0:router(config-12vpn) #
```

Enters L2VPN configuration mode.

Step 3 bridge group *bridge group name*

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn)# bridge group csco
RP/0/RP0/CPU0:router(config-l2vpn-bg)#
```

Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

Step 4 bridge-domain bridge-domain name

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn-bg) # bridge-domain abc
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd) #
```

Establishes a bridge domain and enters 12vpn bridge group bridge domain configuration mode.

Step 5 shutdown

Example:

```
RP/0/RP0/CPU0:router(config-12vpn-bg-bd) # shutdown
```

Shuts down a bridge domain to bring the bridge and all attachment circuits and pseudowires under it to admin down state.

Step 6 Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:

- Yes Saves configuration changes and exits the configuration session.
- No Exits the configuration session without committing the configuration changes.
- Cancel Remains in the configuration mode, without committing the configuration changes.

Configuring a Layer 2 Virtual Forwarding Instance

These topics describe how to configure a Layer 2 virtual forwarding instance (VFI):

Creating the Virtual Forwarding Instance

Perform this task to create a Layer 2 Virtual Forwarding Instance (VFI) on all provider edge devices under the bridge domain.

Procedure

Step 1 configure

Example:

RP/0/RP0/CPU0:router# configure

Enters the XR Config mode.

Step 2 12vpn

Example:

```
RP/0/RP0/CPU0:router(config) # 12vpn
RP/0/RP0/CPU0:router(config-12vpn)#
```

Enters L2VPN configuration mode.

Step 3 bridge group *bridge group name*

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn)# bridge group csco
RP/0/RP0/CPU0:router(config-l2vpn-bg)#
```

Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

Step 4 bridge-domain bridge-domain name

Example:

```
\label{eq:rp0/RP0/CPU0:router(config-12vpn-bg) \# bridge-domain abc RP/0/RP0/CPU0:router(config-12vpn-bg-bd) \# \\
```

Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.

Step 5 vfi {vfi-name}

Example:

```
RP/0/RP0/CPU0:router(config-12vpn-bg-bd)# vfi v1
RP/0/RP0/CPU0:router(config-12vpn-bg-bd-vfi)#
```

Configures virtual forwarding interface (VFI) parameters and enters L2VPN bridge group bridge domain VFI configuration mode.

Step 6 Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:

- Yes Saves configuration changes and exits the configuration session.
- No Exits the configuration session without committing the configuration changes.
- Cancel Remains in the configuration mode, without committing the configuration changes.

Associating Pseudowires with the Virtual Forwarding Instance

After a VFI is created, perform this task to associate one or more pseudowires with the VFI.

Procedure

Step 1 configure

Example:

RP/0/RP0/CPU0:router# configure

Enters the XR Config mode.

Step 2 12vpn

Example:

```
RP/0/RP0/CPU0:router(config) # 12vpn
RP/0/RP0/CPU0:router(config-12vpn) #
```

Enters L2VPN configuration mode.

Step 3 bridge group *bridge-group-name*

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn)# bridge group csco
RP/0/RP0/CPU0:router(config-l2vpn-bg)#
```

Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

Step 4 bridge-domain bridge-domain-name

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn-bg) # bridge-domain abc
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd) #
```

Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.

Step 5 vfi { *vfi name* }

```
RP/0/RP0/CPU0:router(config-12vpn-bg-bd)# vfi v1
RP/0/RP0/CPU0:router(config-12vpn-bg-bd-vfi)#
```

Configures virtual forwarding interface (VFI) parameters and enters L2VPN bridge group bridge domain VFI configuration mode.

Step 6 neighbor $\{A.B.C.D\}$ $\{$ pw-id value $\}$

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd-vfi) # neighbor 10.1.1.2 pw-id 1000 RP/0/RP0/CPU0:router(config-l2vpn-bg-bd-vfi-pw) #
```

Adds a pseudowire port to a bridge domain or a pseudowire to a bridge virtual forwarding interface (VFI).

- Use the A.B.C.D argument to specify the IP address of the cross-connect peer.
- Use the **pw-id** keyword to configure the pseudowire ID and ID value. The range is 1 to 4294967295.

Step 7 Use the **commit** or **end** command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:

- Yes Saves configuration changes and exits the configuration session.
- No Exits the configuration session without committing the configuration changes.
- Cancel Remains in the configuration mode, without committing the configuration changes.

Associating a Virtual Forwarding Instance to a Bridge Domain

Perform this task to associate a VFI to be a member of a bridge domain.

Procedure

Step 1 configure

Example:

RP/0/RP0/CPU0:router# configure

Enters the XR Config mode.

Step 2 12vpn

Example:

```
RP/0/RP0/CPU0:router(config) # 12vpn
RP/0/RP0/CPU0:router(config-12vpn) #
```

Enters the L2VPN configuration mode.

Step 3 bridge group *bridge group name*

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn)# bridge group csco
RP/0/RP0/CPU0:router(config-l2vpn-bg)#
```

Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

Step 4 bridge-domain bridge-domain name

Example:

```
RP/0/RP0/CPU0:router(config-12vpn-bg)# bridge-domain abc
RP/0/RP0/CPU0:router(config-12vpn-bg-bd)#
```

Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.

Step 5 vfi { vfi name }

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd)# vfi v1
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd-vfi)#
```

Configures virtual forwarding interface (VFI) parameters and enters L2VPN bridge group bridge domain VFI configuration mode.

Step 6 neighbor $\{A.B.C.D\}$ $\{$ pw-id value $\}$

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd-vfi)# neighbor 10.1.1.2 pw-id 1000
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd-vfi-pw)#
```

Adds a pseudowire port to a bridge domain or a pseudowire to a bridge virtual forwarding interface (VFI).

- Use the A.B.C.D argument to specify the IP address of the cross-connect peer.
- Use the **pw-id** keyword to configure the pseudowire ID and ID value. The range is 1 to 4294967295.

Step 7 static-mac-address { *MAC-address* }

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd-vfi-pw)# static-mac-address 1.1.1
```

Configures the static MAC address to associate a remote MAC address with a pseudowire or any other bridge interface.

Step 8 Use the **commit** or **end** command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:

- Yes Saves configuration changes and exits the configuration session.
- No Exits the configuration session without committing the configuration changes.
- Cancel Remains in the configuration mode, without committing the configuration changes.

Attaching Pseudowire Classes to Pseudowires

Perform this task to attach a pseudowire class to a pseudowire.

Procedure

Step 1 configure

Example:

RP/0/RP0/CPU0:router# configure

Enters the XR Config mode.

Step 2 12vpn

Example:

```
RP/0/RP0/CPU0:router(config) # 12vpn
RP/0/RP0/CPU0:router(config-12vpn)#
```

Enters the L2VPN configuration mode.

Step 3 bridge group *bridge group name*

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn)# bridge group csco
RP/0/RP0/CPU0:router(config-l2vpn-bg)#
```

Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

Step 4 bridge-domain bridge-domain name

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn-bg)# bridge-domain abc
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd)#
```

Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.

Step 5 vfi { vfi-name }

Example:

RP/0/RP0/CPU0:router(config-12vpn-bg-bd) # vfi v1

```
RP/0/RP0/CPU0:router(config-12vpn-bg-bd-vfi)#
```

Configures virtual forwarding interface (VFI) parameters and enters L2VPN bridge group bridge domain VFI configuration mode.

Step 6 neighbor $\{A.B.C.D\}$ $\{$ pw-id value $\}$

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd-vfi) # neighbor 10.1.1.2 pw-id 1000
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd-vfi-pw) #
```

Adds a pseudowire port to a bridge domain or a pseudowire to a bridge virtual forwarding interface (VFI).

- Use the A.B.C.D argument to specify the IP address of the cross-connect peer.
- Use the **pw-id** keyword to configure the pseudowire ID and ID value. The range is 1 to 4294967295.

Step 7 pw-class { class-name }

Example:

```
RP/0/RP0/CPU0:router(config-12vpn-bg-bd-vfi-pw) # pw-class canada
```

Configures the pseudowire class template name to use for the pseudowire.

Step 8 Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:

- Yes Saves configuration changes and exits the configuration session.
- No Exits the configuration session without committing the configuration changes.
- Cancel Remains in the configuration mode, without committing the configuration changes.

Configuring Pseudowires Using Static Labels

Perform this task to configure the Any Transport over Multiprotocol (AToM) pseudowires by using the static labels. A pseudowire becomes a static AToM pseudowire by setting the MPLS static labels to local and remote.

Procedure

Step 1 configure

Example:

RP/0/RP0/CPU0:router# configure

Enters the XR Config mode.

Step 2 12vpn

```
RP/0/RP0/CPU0:router(config) # 12vpn
RP/0/RP0/CPU0:router(config-12vpn) #
```

Enters the L2VPN configuration mode.

Step 3 bridge group *bridge-group-name*

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn)# bridge group csco
RP/0/RP0/CPU0:router(config-l2vpn-bg)#
```

Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

Step 4 bridge-domain bridge-domain-name

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn-bg)# bridge-domain abc
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd)#
```

Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.

Step 5 vfi { vfi-name }

Example:

```
RP/0/RP0/CPU0:router(config-12vpn-bg-bd)# vfi v1
RP/0/RP0/CPU0:router(config-12vpn-bg-bd-vfi)#
```

Configures virtual forwarding interface (VFI) parameters and enters L2VPN bridge group bridge domain VFI configuration mode.

Step 6 neighbor { A.B.C.D } { pw-id value }

Example:

```
RP/0/RP0/CPU0:router(config-12vpn-bg-bd-vfi) # neighbor 10.1.1.2 pw-id 1000 RP/0/RP0/CPU0:router(config-12vpn-bg-bd-vfi-pw) #
```

Adds a pseudowire port to a bridge domain or a pseudowire to a bridge virtual forwarding interface (VFI).

- Use the A.B.C.D argument to specify the IP address of the cross-connect peer.
- Use the **pw-id** keyword to configure the pseudowire ID and ID value. The range is 1 to 4294967295.

Step 7 mpls static label { local value } { remote value }

Example:

```
RP/0/RP0/CPU0:router(config-12vpn-bg-bd-vfi-pw) # mpls static label local 800 remote 500
```

Configures the MPLS static labels and the static labels for the pseudowire configuration. You can set the local and remote pseudowire labels.

Step 8 Use the **commit** or **end** command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:

- Yes Saves configuration changes and exits the configuration session.
- No Exits the configuration session without committing the configuration changes.
- Cancel Remains in the configuration mode, without committing the configuration changes.

Disabling a Virtual Forwarding Instance

Perform this task to disable a VFI. When a VFI is disabled, all the previously established pseudowires that are associated with the VFI are disconnected. LDP advertisements are sent to withdraw the MAC addresses that are associated with the VFI. However, you can still attach or detach attachment circuits with a VFI after a shutdown.

Procedure

Step 1 configure

Example:

RP/0/RP0/CPU0:router# configure

Enters the XR Config mode.

Step 2 12vpn

Example:

```
RP/0/RP0/CPU0:router(config) # 12vpn
RP/0/RP0/CPU0:router(config-12vpn) #
```

Enters the L2VPN configuration mode.

Step 3 bridge group *bridge group name*

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn)# bridge group csco
RP/0/RP0/CPU0:router(config-l2vpn-bg)#
```

Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

Step 4 bridge-domain bridge-domain name

```
RP/0/RP0/CPU0:router(config-l2vpn-bg)# bridge-domain abc
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd)#
```

Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.

Step 5 vfi { vfi-name }

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd)# vfi v1
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd-vfi)#
```

Configures virtual forwarding interface (VFI) parameters and enters L2VPN bridge group bridge domain VFI configuration mode.

Step 6 shutdown

Example:

```
RP/0/RP0/CPU0:router(config-12vpn-bg-bd-vfi) # shutdown
```

Disables the virtual forwarding interface (VFI).

Step 7 Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:

- Yes Saves configuration changes and exits the configuration session.
- No Exits the configuration session without committing the configuration changes.
- Cancel Remains in the configuration mode, without committing the configuration changes.

Step 8 show l2vpn bridge-domain [detail]

Example:

```
RP/0/RP0/CPU0:router# show 12vpn bridge-domain detail
```

Displays the state of the VFI. For example, if you shut down the VFI, the VFI is shown as shut down under the bridge domain.

Configuring the MAC Address-related Parameters

These topics describe how to configure the MAC address-related parameters:

The MAC table attributes are set for the bridge domains.

Note

The show l2vpn forwarding bridge-domain BRIDGE_GROUP:BRIDGE_DOMAIN mac-address location R/S/I command does not automatically dump MAC address hardware information. The show output information might not be current. Perform any of the following actions before executing the show l2vpn forwarding bridge-domain BRIDGE_GROUP:BRIDGE_DOMAIN mac-address location R/S/I command:

- Resynchronize the MAC address entries by executing l2vpn resynchronize forwarding mac-address location R/S/I command.
- Dump the MAC address table by running show l2vpn forwarding bridge-domain mac-address location R/S/I command.

Configuring the MAC Address Source-based Learning

Perform this task to configure the MAC address source-based learning.

Procedure

Step 1 configure

Example:

RP/0/RP0/CPU0:router# configure

Enters the XR Config mode.

Step 2 12vpn

Example:

RP/0/RP0/CPU0:router(config) # 12vpn
RP/0/RP0/CPU0:router(config-12vpn) #

Enters the L2VPN configuration mode.

Step 3 bridge group bridge group name

Example:

RP/0/RP0/CPU0:router(config-l2vpn)# bridge group csco
RP/0/RP0/CPU0:router(config-l2vpn-bg)#

Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

Step 4 bridge-domain bridge-domainname

Example:

RP/0/RP0/CPU0:router(config-l2vpn-bg) # bridge-domain abc
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd) #

Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.

Step 5 mac

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd)# mac
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd-mac)#
```

Enters L2VPN bridge group bridge domain MAC configuration mode.

Step 6 learning disable

Example:

RP/0/RP0/CPU0:router(config-12vpn-bg-bd-mac) # learning disable

Step 7 Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:

- Yes Saves configuration changes and exits the configuration session.
- No Exits the configuration session without committing the configuration changes.
- Cancel Remains in the configuration mode, without committing the configuration changes.

Step 8 show 12vpn bridge-domain [detail]

Example:

```
RP/0/RP0/CPU0:router# show l2vpn bridge-domain detail
```

Displays the details that the MAC address source-based learning is disabled on the bridge.

Configuring the MAC Address Aging

Perform this task to configure the parameters for MAC address aging.

Procedure

Step 1 configure

Example:

RP/0/RP0/CPU0:router# configure

Enters the XR Config mode.

Step 2 12vpn

```
RP/0/RP0/CPU0:router(config) # 12vpn
RP/0/RP0/CPU0:router(config-12vpn) #
```

Enters the L2VPN configuration mode.

Step 3 bridge group *bridge-group-name*

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn)# bridge group csco
RP/0/RP0/CPU0:router(config-l2vpn-bg)#
```

Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

Step 4 bridge-domain bridge-domain-name

Example:

```
RP/0/RP0/CPU0:router(config-12vpn-bg)# bridge-domain abc
RP/0/RP0/CPU0:router(config-12vpn-bg-bd)#
```

Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.

Step 5 mac

Example:

```
RP/0/RP0/CPU0:router(config-12vpn-bg-bd)# mac
RP/0/RP0/CPU0:router(config-12vpn-bg-bd-mac)#
```

Enters L2VPN bridge group bridge domain MAC configuration mode.

Step 6 aging

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd-mac)# aging
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd-mac-aging)#
```

Enters the MAC aging configuration submode to set the aging parameters such as time and type.

Step 7 time { seconds }

Example:

```
RP/0/RP0/CPU0:router(config-12vpn-bg-bd-mac-aging) # time 300
```

Configures the maximum aging time.

• Use the *seconds* argument to specify the maximum age of the MAC address table entry. Aging time is counted from the last time that the switch saw the MAC address. The default value is 300 seconds.

Step 8 Use the **commit** or **end** command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:

- Yes Saves configuration changes and exits the configuration session.
- No Exits the configuration session without committing the configuration changes.
- Cancel Remains in the configuration mode, without committing the configuration changes.

Step 9 show l2vpn bridge-domain [detail]

Example:

```
RP/0/RP0/CPU0:router# show 12vpn bridge-domain detail
```

Displays the details about the aging fields.

Disabling MAC Flush at the Bridge Port Level

Perform this task to disable the MAC flush at the bridge domain level.

You can disable the MAC flush at the bridge domain or bridge port level. By default, the MACs learned on a specific port are immediately flushed, when that port becomes nonfunctional.

Procedure

Step 1 configure

Example:

RP/0/RP0/CPU0:router# configure

Enters the XR Config mode.

Step 2 12vpn

Example:

```
RP/0/RP0/CPU0:router(config) # 12vpn
RP/0/RP0/CPU0:router(config-12vpn) #
```

Enters L2VPN configuration mode.

Step 3 bridge group *bridge-group-name*

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn)# bridge group csco
RP/0/RP0/CPU0:router(config-l2vpn-bg)#
```

Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

Step 4 bridge-domain bridge-domain-name

```
RP/0/RP0/CPU0:router(config-12vpn-bg) # bridge-domain abc
RP/0/RP0/CPU0:router(config-12vpn-bg-bd) #
```

Establishes a bridge domain and enters 12vpn bridge group bridge domain configuration mode.

Step 5 mac

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd)# mac
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd-mac)#
```

Enters 12vpn bridge group bridge domain MAC configuration mode.

Step 6 port-down flush disable

Example:

```
RP/0/RP0/CPU0:router(config-l2vpn-bg-bd-mac)#
port-down flush disable
```

Disables MAC flush when the bridge port becomes nonfunctional.

Step 7 Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:

- Yes Saves configuration changes and exits the configuration session.
- No Exits the configuration session without committing the configuration changes.
- Cancel Remains in the configuration mode, without committing the configuration changes.

Configuration Examples for Multipoint Layer 2 Services

This section includes these configuration examples:

Multipoint Layer 2 Services Configuration for Provider Edge-to-Provider Edge: Example

These configuration examples show how to create a Layer 2 VFI with a full-mesh of participating Multipoint Layer 2 Services provider edge (PE) nodes.

This configuration example shows how to configure PE 1:

```
configure
  12vpn
  bridge group 1
  bridge-domain PE1-VPLS-A
   interface TenGigE0/0/0/0
  vfi 1
   neighbor 172.16.0.1 pw-id 1
   neighbor 192.168.0.1 pw-id 1
```

```
!
interface loopback 0
ipv4 address 10.0.0.1 255.0.0.0
```

This configuration example shows how to configure PE 2:

```
configure
  12vpn
  bridge group 1
  bridge-domain PE2-VPLS-A
   interface TenGigE0/0/0/1

  vfi 1
   neighbor 10.0.0.1 pw-id 1
   neighbor 192.168.0.1 pw-id 1
  !
  !
  interface loopback 0
  ipv4 address 172.16.0.1 255.240.0.0
```

This configuration example shows how to configure PE 3:

```
configure
12vpn
bridge group 1
bridge-domain PE3-VPLS-A
interface TenGigE0/0/0/2
vfi 1
neighbor 10.0.0.1 pw-id 1
neighbor 172.16.0.1 pw-id 1
!
!
interface loopback 0
ipv4 address 192.168.0.1 255.255.0.0
```

Multipoint Layer 2 Services Configuration for Provider Edge-to-Customer Edge: Example

This configuration shows how to configure Multipoint Layer 2 Services for a PE-to-CE nodes:

```
configure
interface TenGigE0/0/0/0
   12transport---AC interface
   no ipv4 address
   no ipv4 directed-broadcast
   negotiation auto
```

Displaying MAC Address Withdrawal Fields: Example

This sample output shows the MAC address withdrawal fields:

```
RP/0/RSP0/CPU0:router# show 12vpn bridge-domain detail
Legend: pp = Partially Programmed.
Bridge group: 222, bridge-domain: 222, id: 0, state: up, ShgId: 0, MSTi: 0

Bridging on IOS XR Trunk Interfaces: Example

This example shows how to configure a as a simple L2 switch.

Important notes:

Create a bridge domain that has four attachment circuits (AC). Each AC is an IOS XR trunk interface (i.e. not a subinterface/EFP).

- This example assumes that the running config is empty, and that all the components are created.
- This example provides all the necessary steps to configure the to perform switching between the interfaces.
 However, the commands to prepare the interfaces such as no shut, negotiation auto, etc., have been excluded.
- The bridge domain is in a no shut state, immediately after being created.

- Only trunk (i.e. main) interfaces are used in this example.
- The trunk interfaces are capable of handling tagged (i.e. IEEE 802.1Q) or untagged (i.e. no VLAN header) frames.
- The bridge domain learns, floods, and forwards based on MAC address. This functionality works for frames regardless of tag configuration.
- The bridge domain entity spans the entire system. It is not necessary to place all the bridge domain ACs on a single LC. This applies to any bridge domain configuration.
- The show bundle and the show l2vpn bridge-domain commands are used to verify that the router was configured as expected, and that the commands show the status of the new configurations.
- The ACs in this example use interfaces that are in the admin down state.

Configuration Example

```
RP/0/RSP0/CPU0:router#config
RP/0/RSP0/CPU0:router(config) #interface Bundle-ether10
RP/0/RSP0/CPU0:router(config-if)#12transport
RP/0/RSP0/CPU0:router(config-if-l2)#interface GigabitEthernet0/2/0/5
RP/0/RSP0/CPU0:router(config-if) #bundle id 10 mode active
RP/0/RSP0/CPU0:router(config-if)#interface GigabitEthernet0/2/0/6
RP/0/RSP0/CPU0:router(config-if) #bundle id 10 mode active
RP/0/RSP0/CPU0:router(config-if)#interface GigabitEthernet0/2/0/0
RP/0/RSP0/CPU0:router(config-if)#12transport
\label{eq:rp-order} \mbox{RP/0/RSP0/CPU0:} router (\mbox{config-if-l2}) \mbox{\#interface GigabitEthernet0/2/0/1} \\ \mbox{RP/0/RSP0/CPU0:} router (\mbox{RP/0/RSP0/CPU0:} router (\mbox{RP/0/RSP0/CPU0
RP/0/RSP0/CPU0:router(config-if)#12transport
RP/0/RSP0/CPU0:router(config-if-12)#interface TenGigE0/1/0/2
RP/0/RSP0/CPU0:router(config-if)#12transport
RP/0/RSP0/CPU0:router(config-if-12) #12vpn
RP/0/RSP0/CPU0:router(config-12vpn) #bridge group examples
RP/0/RSP0/CPU0:router(config-12vpn-bg) #bridge-domain test-switch

This table lists the configuration steps (actions) and the corresponding purpose for this example:

Procedure

Step 1 configure

Enters global configuration mode.

Step 2 interface Bundle-ether 10

Creates a new bundle trunk interface.

Step 3 12transport

Changes Bundle-ether10 from an L3 interface to an L2 interface.

Step 4 interface GigabitEthernet0/2/0/5

Enters interface configuration mode. Changes configuration mode to act on GigabitEthernet0/2/0/5.

Step 5 bundle id 10 mode active

Establishes GigabitEthernet0/2/0/5 as a member of Bundle-ether10. The **mode active** keywords specify LACP protocol.

Step 6 interface GigabitEthernet0/2/0/6

Enters interface configuration mode. Changes configuration mode to act on GigabitEthernet0/2/0/6.

Step 7 bundle id 10 mode active

Establishes GigabitEthernet0/2/0/6 as a member of Bundle-ether10. The **mode active** keywords specify LACP protocol.

Step 8 interface GigabitEthernet0/2/0/0

Enters interface configuration mode. Changes configuration mode to act on GigabitEthernet0/2/0/0.

Step 9 12transport

Change GigabitEthernet0/2/0/0 from an L3 interface to an L2 interface.

Step 10 interface GigabitEthernet0/2/0/1

Enters interface configuration mode. Changes configuration mode to act on GigabitEthernet0/2/0/1.

Step 11 12transport

Change GigabitEthernet0/2/0/1 from an L3 interface to an L2 interface.

Step 12 interface TenGigE0/1/0/2

Enters interface configuration mode. Changes configuration mode to act on TenGigE0/1/0/2.

Step 13 l2transport

Changes TenGigE0/1/0/2 from an L3 interface to an L2 interface.

Step 14 12vpn

Enters L2VPN configuration mode.

Step 15 bridge group examples

Creates the bridge group examples.

Step 16 bridge-domain test-switch

Creates the bridge domain **test-switch**, that is a member of bridge group **examples**.

Step 17 interface Bundle-ether 10

Establishes Bundle-ether10 as an AC of bridge domain test-switch.

Step 18 exit

Exits bridge domain AC configuration submode, allowing next AC to be configured.

Step 19 interface GigabitEthernet0/2/0/0

Establishes GigabitEthernet0/2/0/0 as an AC of bridge domain **test-switch**.

Step 20 exit

Exits bridge domain AC configuration submode, allowing next AC to be configured.

Step 21 interface GigabitEthernet0/2/0/1

Establishes GigabitEthernet0/2/0/1 as an AC of bridge domain **test-switch**.

Step 22 exit

Exits bridge domain AC configuration submode, allowing next AC to be configured.

Step 23 interface TenGigE0/1/0/2

Establishes interface TenGigE0/1/0/2 as an AC of bridge domain **test-switch**.

Step 24 Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:

- Yes Saves configuration changes and exits the configuration session.
- No Exits the configuration session without committing the configuration changes.
- Cancel Remains in the configuration mode, without committing the configuration changes.

Bridging on Ethernet Flow Points: Example

This example shows how to configure a to perform Layer 2 switching on traffic that passes through Ethernet Flow Points (EFPs). EFP traffic typically has one or more VLAN headers. Although both IOS XR trunks and IOS XR EFPs can be combined as attachment circuits in bridge domains, this example uses EFPs exclusively.

Important notes:

- An EFP is a Layer 2 subinterface. It is always created under a trunk interface. The trunk interface must exist before the EFP is created.
- In an empty configuration, the bundle interface trunk does not exist, but the physical trunk interfaces are automatically configured. Therefore, only the bundle trunk is created.
- In this example the subinterface number and the VLAN IDs are identical, but this is out of convenience, and is not a necessity. They do not need to be the same values.
- The bridge domain test-efp has three attachment circuits (ACs). All the ACs are EFPs.
- Only frames with a VLAN ID of 999 enter the EFPs. This ensures that all the traffic in this bridge domain has the same VLAN encapsulation.
- The ACs in this example use interfaces that are in the admin down state (unresolved state). Bridge
 domains that use nonexistent interfaces as ACs are legal, and the commit for such configurations does
 not fail. In this case, the status of the bridge domain shows unresolved until you configure the missing
 interface.

Configuration Example

```
RP/0/RSP1/CPU0:router#configure

This table lists the configuration steps (actions) and the corresponding purpose for this example:

Procedure

Step 1 configure

Enters global configuration mode.

Step 2 interface Bundle-ether10

Creates a new bundle trunk interface.

Step 3 interface Bundle-ether 10.999 l2 transport

Creates an EFP under the new bundle trunk.

Step 4 encapsulation dot1q 999

Assigns VLAN ID of 999 to this EFP.

Step 5 interface GigabitEthernet0/6/0/5

Enters interface configuration mode. Changes configuration mode to act on GigabitEthernet0/6/0/5.

Step 6 bundle id 10 mode active

Establishes GigabitEthernet0/6/0/5 as a member of Bundle-ether10. The **mode active** keywords specify LACP protocol.

Step 7 interface GigabitEthernet0/6/0/6

Enters interface configuration mode. Changes configuration mode to act on GigabitEthernet0/6/0/6.

Step 8 bundle id 10 mode active

Establishes GigabitEthernet0/6/0/6 as a member of Bundle-ether10. The **mode active** keywords specify LACP protocol.

Step 9 interface GigabitEthernet0/6/0/7.999 12transport

Creates an EFP under GigabitEthernet0/6/0/7.

Step 10 encapsulation dot1q 999

Assigns VLAN ID of 999 to this EFP.

Step 11 interface TenGigE0/1/0/2.999 l2transport

Creates an EFP under TenGigE0/1/0/2.

Step 12 encapsulation dot1q 999

Assigns VLAN ID of 999 to this EFP.

Step 13 l2vpn

Enters L2VPN configuration mode.

Step 14 bridge group examples

Creates the bridge group named examples.

Step 15 bridge-domain test-efp

Creates the bridge domain named **test-efp**, that is a member of bridge group **examples**.

Step 16 interface Bundle-ether 10.999

Establishes Bundle-ether10.999 as an AC of the bridge domain named **test-efp**.

Step 17 exit

Exits bridge domain AC configuration submode, allowing next AC to be configured.

Step 18 interface GigabitEthernet0/6/0/7.999

Establishes GigabitEthernet0/6/0/7.999 as an AC of the bridge domain named **test-efp**.

Step 19 exit

Exits bridge domain AC configuration submode, allowing next AC to be configured.

Step 20 interface TenGigE0/1/0/2.999

Establishes interface TenGigE0/1/0/2.999 as an AC of bridge domain named **test-efp**.

Step 21 Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:

- Yes Saves configuration changes and exits the configuration session.
- No Exits the configuration session without committing the configuration changes.
- Cancel Remains in the configuration mode, without committing the configuration changes.
