Preface

Audience

This guide is for system administrators, network managers, and other users who want to manage standalone network devices and device groups through a GUI. It presents Cisco Network Assistant, known as Network Assistant, as a solution.

Purpose

The purpose of this guide is to give users information to start using Network Assistant. It consists of these chapters:

- Introduction—What Network Assistant is and what it does.
- Network Assistant Features—How Network Assistant makes it easy to manage devices and networks.
- Installing, Launching, and Connecting Network Assistant—How to install Network Assistant on your workstation, launch it, and connect it to a network device.
- Planning and Creating Communities—The concepts and procedures for planning and creating communities by using Network Assistant. The concept of clusters is supported for backward compatibility.

Obtaining Documentation

Cisco documentation and additional literature are available on Cisco.com. Cisco also provides several ways to obtain technical assistance and other technical resources. These sections explain how to obtain technical information from Cisco Systems.

Cisco.com

You can access the most current Cisco documentation at this URL:
http://www.cisco.com/univercd/home/home.htm
You can access the Cisco website at this URL:
http://www.cisco.com
You can access international Cisco websites at this URL:

Ordering Documentation

You can find instructions for ordering documentation at this URL:
You can order Cisco documentation in these ways:

- Registered Cisco.com users (Cisco direct customers) can order Cisco product documentation from the Ordering tool:
- Nonregistered Cisco.com users can order documentation through a local account representative by calling Cisco Systems Corporate Headquarters (California, USA) at 408 526-7208 or, elsewhere in North America, by calling 800 553-NETS (6387).

Documentation Feedback

You can send comments about technical documentation to bug-doc@cisco.com.
You can submit comments by using the response card (if present) behind the front cover of your document or by writing to the following address:
Cisco Systems
Attn: Customer Document Ordering
170 West Tasman Drive
San Jose, CA 95134-9883
We appreciate your comments.

Obtaining Technical Assistance

For all customers, partners, resellers, and distributors who hold valid Cisco service contracts, Cisco Technical Support provides 24-hour-a-day, award-winning technical assistance. The Cisco Technical Support Website on Cisco.com features extensive online support resources. In addition, Cisco Technical Assistance Center (TAC) engineers provide telephone support. If you do not hold a valid Cisco service contract, contact your reseller.
Cisco Technical Support Website

The Cisco Technical Support Website provides online documents and tools for troubleshooting and resolving technical issues with Cisco products and technologies. The website is available 24 hours a day, 365 days a year at this URL:

http://www.cisco.com/techsupport

Access to all tools on the Cisco Technical Support Website requires a Cisco.com user ID and password. If you have a valid service contract but do not have a user ID or password, you can register at this URL:

Submitting a Service Request

Using the online TAC Service Request Tool is the fastest way to open S3 and S4 service requests. (S3 and S4 service requests are those in which your network is minimally impaired or for which you require product information.) After you describe your situation, the TAC Service Request Tool automatically provides recommended solutions. If your issue is not resolved using the recommended resources, your service request will be assigned to a Cisco TAC engineer. The TAC Service Request Tool is located at this URL:

http://www.cisco.com/techsupport/servicerequest

For S1 or S2 service requests or if you do not have Internet access, contact the Cisco TAC by telephone. (S1 or S2 service requests are those in which your production network is down or severely degraded.) Cisco TAC engineers are assigned immediately to S1 and S2 service requests to help keep your business operations running smoothly.

To open a service request by telephone, use one of the following numbers:

Asia-Pacific: +61 2 8446 7411 (Australia: 1 800 805 227)
EMEA: +32 2 704 55 55
USA: 1 800 553 2447

For a complete list of Cisco TAC contacts, go to this URL:

http://www.cisco.com/techsupport/contacts

Definitions of Service Request Severity

To ensure that all service requests are reported in a standard format, Cisco has established severity definitions.

Severity 1 (S1)—Your network is “down,” or there is a critical impact to your business operations. You and Cisco will commit all necessary resources around the clock to resolve the situation.

Severity 2 (S2)—Operation of an existing network is severely degraded, or significant aspects of your business operation are negatively affected by inadequate performance of Cisco products. You and Cisco will commit full-time resources during normal business hours to resolve the situation.

Severity 3 (S3)—Operational performance of your network is impaired, but most business operations remain functional. You and Cisco will commit resources during normal business hours to restore service to satisfactory levels.

Severity 4 (S4)—You require information or assistance with Cisco product capabilities, installation, or configuration. There is little or no effect on your business operations.
Obtaining Additional Publications and Information

Information about Cisco products, technologies, and network solutions is available from various online and printed sources.

- Cisco Marketplace provides a variety of Cisco books, reference guides, and logo merchandise. Visit Cisco Marketplace, the company store, at this URL:
  http://www.cisco.com/go/marketplace/

- The Cisco Product Catalog describes the networking products offered by Cisco Systems, as well as ordering and customer support services. Access the Cisco Product Catalog at this URL:
  http://cisco.com/univercd/cc/td/doc/pcat/

- Cisco Press publishes a wide range of general networking, training and certification titles. Both new and experienced users will benefit from these publications. For current Cisco Press titles and other information, go to Cisco Press at this URL:
  http://www.ciscopress.com

- Packet magazine is the Cisco Systems technical user magazine for maximizing Internet and networking investments. Each quarter, Packet delivers coverage of the latest industry trends, technology breakthroughs, and Cisco products and solutions, as well as network deployment and troubleshooting tips, configuration examples, customer case studies, certification and training information, and links to scores of in-depth online resources. You can access Packet magazine at this URL:
  http://www.cisco.com/packet

- iQ Magazine is the quarterly publication from Cisco Systems designed to help growing companies learn how they can use technology to increase revenue, streamline their business, and expand services. The publication identifies the challenges facing these companies and the technologies to help solve them, using real-world case studies and business strategies to help readers make sound technology investment decisions. You can access iQ Magazine at this URL:
  http://www.cisco.com/go/iqmagazine

- Internet Protocol Journal is a quarterly journal published by Cisco Systems for engineering professionals involved in designing, developing, and operating public and private internets and intranets. You can access the Internet Protocol Journal at this URL:
  http://www.cisco.com/ipj

- World-class networking training is available from Cisco. You can view current offerings at this URL:
Getting Started with Cisco Network Assistant

CHAPTER 1

What Is Network Assistant?

Network Assistant is an application that manages standalone devices and device groups—communities and clusters—from anywhere in your intranet. Using its GUI, you can perform multiple configuration tasks without using command-line interface (CLI) commands. You can apply actions to multiple devices and ports at the same time for VLAN and quality of service (QoS) settings, inventory and statistics reports, link and device monitoring, software upgrades, and many other networking features.

Network Assistant gives you two graphical views of a device group:

- A topology view, which shows devices that are in a community, a cluster, or that are eligible to join the community or cluster, link information between devices, and other connected clusters.
- A front-panel view, from which you can monitor the real-time status of the devices and perform many configuration tasks. The devices and port LEDs in the view look like the physical devices and the port LEDs.

A community is a device group that can contain up to 20 connected network devices. Network Assistant uses the Cisco Discovery Protocol (CDP) automatic discovery capability to find eligible network devices and to add them to a community. When a network device is added to a community, it becomes a member device. Network Assistant manages, configures, and monitors each member on an individual basis; therefore, each member must have an IP address assigned to it.

Most Cisco network devices that have IP addresses, such as routers, switches, and access points, can belong to a community. For a specific list of network devices that can belong to a community, see the release notes. For information on community limitations, see the “Community Limits” section on page 4-2.

The main reason for creating a community is so that you can manage Cisco cluster-capable devices as well as noncluster-capable devices in the same logical group, regardless of their physical locations and the software installed on the devices. Network Assistant supports the creation, modification, deletion, and management of multiple communities.

A cluster is a device group that can contain up to 16 connected network devices, but they have to be cluster-capable Catalyst devices. The devices belong exclusively to one cluster; they do not participate in other clusters. You assign an IP address to a device that will become the command device. The IP address of the command device is the single point of access that Network Assistant uses to configure, manage, and monitor the command device and the member devices.

A community offers these benefits that a cluster does not:

- Communities can manage routers, access points, and switches. Clusters can only manage switches.
- The device limit for communities is 20, but the device limit for clusters is 16.
• Network Assistant can communicate securely with every member in a community. In a cluster, Network Assistant communicates with member devices through the command device, but the communication is secure only between Network Assistant and the command device. It is not secure from the command device to member devices.

• If a community member fails, Network Assistant can continue to manage the other members. If a cluster command device fails, Network Assistant cannot manage the other members of the cluster unless a cluster standby device has been configured.

• Communities have fewer restrictions than clusters about where members are located and how they are connected to each other. For more information on cluster member restrictions, see the online help.

• If candidate devices do not have CDP enabled, you can still create a community and manually add the devices. Clusters cannot be created unless CDP is enabled on all the candidate devices.

Network Assistant features include front panel and topology views of device groups. See Chapter 2, “Network Assistant Features,” for more information.

For information on setting up communities, see Chapter 4, “Planning and Creating Communities.”

For information on setting up device clusters, see Chapter 4, “Planning and Creating Clusters” of the Getting Started with Cisco Network Assistant document, version 1.0.
Network Assistant Features

Network Assistant simplifies device group management using communities or clusters by offering a GUI, alternative modes for configuring network devices, two levels of access, and comprehensive online help. Figure 2-1 shows the main features of the user interface.

Figure 2-1  Network Assistant GUI

The sections that follow describe the Network Assistant features.
Front Panel View

When Network Assistant connects to a community or a cluster, you can display the Front Panel view by clicking Front Panel on the toolbar or by choosing Monitor > View > Front Panel from the feature bar. You see the front-panel image of the device. If the device belongs to a community, you see all of the devices that were selected the last time that the front panel view appeared for that community. If the device commands a cluster, you see the cluster members that were selected the last time that the view was displayed.

By using the Front Panel view, you can
- Drag and re-arrange the devices that appear.
- Select and configure the devices.
- Right-click a port and configure it.
- Select multiple ports, on the same device or on different devices, and configure the ports at the same time.

Figure 2-2 shows a community with Catalyst 3560, 2955, 2924, and 3750 switches as member devices.

Figure 2-2  Front Panel View and Port Popup Window

Topology View

When Network Assistant connects to a community or a cluster, the Topology view appears by default. If you change this default, you can see the Topology view when Network Assistant connects to a device by clicking Topology view on the toolbar or by choosing Monitor > Views > Topology.
You can change the preferences in Network Assistant to also display the Front Panel view by default by choosing Application > Preferences > Show Front Panel View when connected to network. If you no longer want Network Assistant to show the Topology view by default, deselect Show Topology View when connected to a network.

The Topology view in Figure 2-3, shows the devices in a community and nonmember devices discovered by Network Assistant. When you right-click a device or a link icon, a popup window appears.

Figure 2-3   Topology View and Device Popup Windows

The Topology view shows how the devices within a community or a cluster are connected. The view also shows how a cluster is connected to other clusters and devices. You can add and remove device members from this community or cluster.

When you are managing a community, the Topology view displays all the devices in the community. To display a different community, you must connect to that community.

When you are managing a cluster, the Topology view displays only the cluster and network neighborhood of the specific command or member device that you access. To display a different cluster, you must access the command device or a member device of that cluster.
Menu Bar, Toolbar, and Feature Bar

Configuration and monitoring options are available from the menu bar, the toolbar, and the feature bar. The menu bar provides options for configuring communities and Network Assistant itself. The options on the feature bar are for configuring devices, ports and VLANs, for monitoring, and for getting reports.

Menu Bar

The menu bar provides these options for managing Network Assistant, navigating among windows, and accessing online help:

- Application—Choose printing options, select interaction modes, set user preferences, search for and install Network Assistant updates, show or hide the feature bar, create and modify communities, and request system message notifications.
- Window—Navigate to open Network Assistant windows.
- Help—Open the online help.

 Toolbar

The toolbar has icons for commonly used configuration options and for information windows like the legend and the online help. Table 2-1 lists the toolbar options from left to right on the toolbar.

<table>

1. Not available in read-only mode. For more information about the read-only and read-write access modes, see the “Privilege Levels” section on page 2-8.
2. Some options from this menu option are not available in read-only mode.

**Feature Bar**

The feature bar shows the networking features that are available for the devices in your community or cluster. By default, the feature bar is in standard mode. In this mode, it is always visible, and you can reduce or increase its width. In autohide mode, the feature bar appears only when you move the cursor to the left edge of the Network Assistant workspace.

- To see the feature bar in standard mode, click Application > Feature Bar, and select Standard Mode.
- To hide the feature bar, click Application > Feature Bar, and select Autohide Mode.
Figure 2-4 shows a feature bar.

**Figure 2-4   Feature Bar**

On the Features tab, the features are grouped under menus. When you click a menu item, the configuration window for the feature appears. On the Search tab, you can launch a configuration window by entering search text, clicking **Search**, and selecting from the search results.

Access modes affect the availability of features; some are not available in read-only mode. For more information about how access modes affect Network Assistant, see the “Privilege Levels” section on page 2-8.
Interaction Modes

There are two modes for interacting with the Network Assistant GUI, guide mode and expert mode. Guide mode presents feature options one step at a time, with accompanying help information. Expert mode presents all the options for configuring a feature in a single window; to get help, you click Help in the window.

Guide Mode

Network Assistant is in expert mode by default. When you choose a feature on the feature bar with a signpost icon (see Figure 2-5), you see a series of configuration steps—guide mode. If you choose a feature without this icon, you see a configuration window—expert mode.

Guide mode is not available if your switch access level is read-only. For more information about the read-only access mode, see the “Privilege Levels” section on page 2-8.
**Expert Mode**

If you prefer to see a configuration window for every feature, choose Expert in the Application menu, or click Expert on the toolbar. Even the features that appear with a signpost on the feature bar appear in expert mode. If you want to see guide mode again, choose Guide in the Application menu, or click Guide on the toolbar.

To launch a guide-mode feature in Expert mode, you must choose Expert before selecting the feature.

**Wizards**

Like guide mode, wizards provide a step-by-step approach for completing a specific configuration task. Unlike guide mode, a wizard does not prompt you to provide information for all of the feature options. Instead, it prompts you to provide minimal information and then uses the default settings of the remaining options to set default configurations.

When you select a feature that has Wizard in its name, as shown in Figure 2-5, the wizard starts.

Wizards are not available for read-only access levels. For more information about the read-only access mode, see the “Privilege Levels” section.

**Smartports Advisor**

When Network Assistant detects that you have not used Smartports to configure a device connection, it recommends that you do so in the Event Notification window. From this window, you can launch Smartports Advisor to configure the device connection. Smartports Advisor asks whether you want to use Smartports to apply Cisco-recommended configurations, or roles, to configure a port for optimal communication with the linked device.

Device connections are optimized wherever Smartports roles have been applied. Applying a role helps you configure the essential security, availability, quality of service (QoS), and manageability features on a device.

Smartports Advisor displays the front panels of devices to which you are connected. On the front panels, Smartports Advisor displays the ports to which Smartports roles have already been applied and the ports to which Smartports roles can be applied.

You apply roles to the port connections by accepting the role suggestion that Smartports Advisor makes, and then you enter the VLAN information. See the online help for more information on Smartport Advisor.

**Privilege Levels**

Network Assistant provides two types of access to configuration options: read-write and read-only. Your access type is determined by your privilege level, a number from 1 to 15. Privilege levels correspond to access types as follows:

- Level 15 provides read-write access.
• Levels 1 to 14 provide read-only access. Any options in the Network Assistant windows, feature bar, toolbar, and popup windows that change the device, community, or cluster configuration are enabled for read-only access. This means that users cannot modify the configuration shown in the windows launched by these items.

By default, Network Assistant tries to log you on with privilege level 15. However, this normally requires that you pass the authentication with a proper username and password. Lower levels do not generally impose this requirement.

**Note**

You must have privilege level 15 to access Network Assistant through a TACACS+ or a RADIUS server.

### Searching for a Network Assistant Update

Network Assistant can search Cisco.com to see whether new packages are available. Take either of these actions to request a search:

- Choose **Application > Preferences**, and use the Preferences window to request an automatic search every week or every month.
- Choose **Application > Application Updates** to request an immediate search for updates.

If an update is found, you can install it through Network Assistant.

### Online Help

Network Assistant provides comprehensive online help that explains configuration and monitoring tasks. Sometimes the information in a help topic differs for different devices. In these cases, the right pane of the Help window contains all the versions of the topic, each labeled with the hostnames of the devices it applies to.

Online help includes these features:

- Conceptual help that gives background information on networking features
- Window help that gives procedures for performing tasks
- An index of online help topics
- A glossary of terms used in the online help

You can send us feedback about the online help. Click **Feedback** on the Help window to display an online form. After completing the form, click **Submit** to send your comments to Cisco Systems Inc. We appreciate and value your comments.
Installing, Starting, and Connecting Network Assistant

This chapter describes installation requirements for Network Assistant, how to install it, how to start it, and how to connect it to a device or an existing community.

Installation Requirements

The PC on which you install Network Assistant must meet these minimum requirements:

- Processor speed: 1 GHz
- DRAM: 256 MB
- Hard-disk space: 200 MB recommended (the actual application requires around 70 MB)
- Number of colors: 65536
- Resolution: 1024 x 768
- Font size: Small

Network Assistant is supported on these operating systems:

- Windows XP, Service Pack 1 or later
- Windows 2000, Service Pack 3 or later

Installing Network Assistant

To install Network Assistant on your PC, follow these steps:

1. Go to this web address: [http://www.cisco.com/go/NetworkAssistant](http://www.cisco.com/go/NetworkAssistant).
   You must be a registered Cisco.com user, but you need no other access privileges.

2. Find the Network Assistant installer, cna-windows-k9-installer.3-0.exe.

3. Download the Network Assistant installer, and run it. (You can run it directly from the web if your browser offers this choice.)
   Network Assistant is free—there is no charge to download, install, or use it.
   When you run the installer, follow the displayed instructions. In the final panel, click Finish to complete the Network Assistant installation.
Starting Network Assistant

After Network Assistant is installed, you see its icon on your desktop, a Network Assistant shortcut under the Start menu, and a Network Assistant entry under Start > Programs. When you click any of these, you see a partial Network Assistant GUI and the Connect window.

In disconnect mode, Network Assistant is not connected to a device or a community; it cannot manage a standalone device, a community, or the command device of a cluster. Its menu bar and toolbar support only the tasks that customize Network Assistant itself. The feature bar, which usually lists device features, is empty.

Connecting Network Assistant to a Community or a Cluster

To connect Network Assistant to a device, use the Connect window shown in Figure 3-1. In it, enter the IP address of the device to which you want to connect. For an existing community, select its name from the pull-down menu. For an existing cluster, select the IP address. Click Options if you want to

- Communicate with the device by using HTTPS (secure HTTP) instead of HTTP (clusters only).

Note Because Catalyst 4500 series switches ship with HTTP and HTTPS turned off by default, you must enable them as needed. HTTPS v3.0 is supported in IOS 12.2(25)SG cryptographic versions and higher.

- Use an HTTP port other than 80 on the device (clusters only).
- Connect with read-only access.

For instructions on how to use the Connect to a new community option to create a community, see the “Creating a Community” section on page 4-4. When you click Connect, you are either connected to the community directly, or you are prompted for a username and password and then connected. When you connect to a cluster, Network Assistant asks if you want to convert the cluster to a community. For more information on converting a cluster to a community, see the “Converting a Cluster to a Community” section on page 4-5.

Figure 3-1 Connect Window

When the connection occurs, the Network Assistant window is in connect mode. The toolbar adds icons that represent device features. Similarly, the feature bar fills with menus that list the device features that Network Assistant manages.
Access Modes in Network Assistant

When you select a community to manage, you can set the access mode and access level. If you do not set the access mode before connecting to the community, Network Assistant applies the read-write default access mode to all the devices in the community.

Event Notification

Network Assistant informs you of events that it detects by putting a clickable event icon on the status bar and under devices in the Topology view. Clicking an event icon opens a window that describes the event and, whenever possible, connects you to windows where you can take needed actions.
Planning and Creating Communities

This chapter provides the concepts and procedures for planning and creating communities by using Network Assistant. For information on using Network Assistant to configure communities, refer to its online help.

Planning a Community

This section describes the guidelines, requirements, and caveats that you should understand before you create a community.

Candidate and Member Characteristics

Candidates are network devices that have IP addresses but have not been added to a community. Members are network devices that have actually been added to a community.

To join a community, a candidate must meet these requirements:

- It has an IP address.
- It has HTTP or HTTPS enabled on the default ports.

Note

You cannot add clusters to a community. You can add cluster members individually.

If you add a cluster command device to a community, the other members of the cluster are not added automatically. To manage the cluster members, you must add them individually to the community.

If you add a Catalyst 3750 switch stack master to a community, the individual stack members are added to the community automatically, even though the stack members do not appear in the Modify Community or Discover windows. However, when you connect to the community, the stack members do appear in the Front Panel and Topology views.
Community Limits

A community can consist of up to 20 devices of different types: Catalyst switches, Cisco access routers, Cisco Aironet Access Points, and PIX firewalls. A community cannot contain more than the listed number of these device types:

- 16 nonmodular Catalyst switches
- 4 modular Catalyst switches
- 2 Cisco access routers
- 2 PIX Firewalls
- 12 Cisco Aironet Access Points

Note: Even though the devices in a Catalyst 3750 switch stack function as a single switch, they count as individual switches within the device and switch maximums.

Users cannot exceed the defined community limits, but the warnings are in two stages.

When you create a community or add devices to a community, you are prevented from exceeding the overall limit of 20 devices. The individual device limits (like 12 access points) are not enforced at this point.

Individual device limits are enforced when you connect to the community, and then the window shown in Figure 4-1 appears. You cannot manage the community until you remove enough devices of that type that exceed the allowed maximum.

Figure 4-1   Community Limits Window
Automatic Discovery of Candidates and Members

Beginning with the IP address for a starting device and the port numbers for the HTTPS and HTTP protocols, Network Assistant uses CDP to compile a list of community candidates that are within four CDP hops of the starting device. Network Assistant can discover candidate and member devices across multiple networks and VLANs if they have valid IP addresses. See the “Candidate and Member Characteristics” section on page 4-1 for a list of requirements that network devices must meet in order to be discovered.

Note
Do not disable CDP on candidates, members, or any network devices that you might want Network Assistant to discover.

You can edit the list of discovered devices to fit your needs and to add them to the community. If Network Assistant does not discover a network device, you can manually add the device.

For instructions on adding discovered devices to a community or manually adding devices to a community, see the “Manually Adding Members” section on page 4-5.

Community Names

When you create a community, Network Assistant requires that you assign a name to it. The name can contain up to 64 alphanumeric characters and is not case sensitive.

Note
When you select a name in the Connect window and a cluster and a community share that name, Network Assistant connects to the community.

Hostnames

You do not need to assign a hostname to a community member, and Network Assistant does not assign one by default. If a member has a hostname, Network Assistant saves it to your PC as identifying information for that device.

Passwords

When connecting to a community, Network Assistant prompts you for each unique password that has already been assigned for members of the community. Network Assistant attempts to use these passwords to connect to other devices. You are prompted for a password only if the previously entered password does not work for a device.

For example, if a community has ten members, and five members share one password and the other five share a different password, Network Assistant prompts you twice, once for each password. Network Assistant does not save the passwords to your PC, so it prompts you for the passwords each time you attempt to connect to a community.
Communication Protocols

Network Assistant uses HTTPS and HTTP to communicate with network devices. It first attempts to use HTTPS both when using CDP to discover candidate devices and when devices are added manually. The HTTPS port is fixed at 443, and the HTTP port defaults to 80. You can change the HTTP port number before you add a device to a community. After you add a device to a community, you cannot change the HTTP port number. The port settings for both HTTPS and HTTP must be the same for all members of a community.

Community Information

Network Assistant saves all individual device information, such as the IP address, the hostname, and the communication protocol, to your local PC. When Network Assistant connects to a community, it uses the locally saved data to rediscover the member devices.

If you try to use a different PC to manage an existing community, none of the member device information is available. You need to create the community again and add the same member devices.

Creating a Community

There are three ways to create a community:

- By discovering candidates that you can add to the community
- By manually adding devices
- By using the Cluster Conversion Wizard to convert a cluster into a community

You should verify that the community contains the devices that you think it contains. This section tells you how to perform these tasks.

Discovering and Adding Devices

Follow these steps to compile a list of candidate devices and to add them to a community:

1. Start Network Assistant, and select Connect to a new community in the Connect window. Click Connect.
2. In the Create Community window, enter a name for the community.
3. Click the Advanced button if you want to set an HTTP port other than 80, the default port. Enter the HTTP port number that you want to use. Click OK.
4. Enter the IP address for the starting device, and click Discover Neighbors.
5. In the Devices Found list, select candidate devices that you want to remove.
   a. To remove more than one candidate, press Ctrl and make your choices, or press Shift and choose the first and last device in a range.
   b. Click Remove.
6. Click Add All To Community to add the remaining devices in the list to the community.
Manually Adding Members

Network Assistant provides two ways to manually add devices to a community.

1. In the Create Community window, enter the IP address for the device that you want to add.
2. Click Add to Community.

The second way to manually add a device uses the Topology view:
1. If the Topology view does not appear, choose View > Topology from the feature bar.
2. Right-click a candidate icon, and select Add to Community.
   Candidate device labels are cyan; member labels are green.

Converting a Cluster to a Community

The Cluster Conversion Wizard creates a community by using the information available for the cluster. The wizard prompts you to enter an IP address and from the pulldown lists to select an interface name and subnet mask for each device that does not have them. Network Assistant does not delete the cluster upon creating the community.

There are two ways to launch the Cluster Conversion Wizard. When you connect to a cluster command device, the wizard launches and asks if you want to convert the cluster into a community. You can also launch the wizard from the feature bar by choosing Configure > Cluster > Cluster Conversion Wizard.

Verifying a Community

Follow these steps to verify the community:

1. Choose Monitor > View > Topology to display the Topology view.
2. Choose Monitor > Reports > Inventory to display an inventory of the devices in the community.
   This summary includes device model numbers, serial numbers, software versions, IP information, and location.
3. Choose Monitor > View > Front Panel to display the Front Panel view.
