CHAPTER 1

Overview

This document provides the steps required to install the Cisco IoT Field Network Director (Cisco IoT FND) Release 4.3.1 and Later application with Integrated Application Management (Fog Director) on an Open Virtual Appliance (OVA), VMware ESXi 5.5 or 6.0. You use the same instructions to install both VMware versions.

Note For information about installing Cisco IoT FND and Oracle on an OVA for Release 4.3 and Later, refer to the following guides:

- [Cisco IoT FND Deployment on an Open Virtual Appliance, VMware ESXi 5.5/6.0](#)
- [Cisco IoT Field Network Director Installation Guide-Oracle Deployment, Release 4.3.x and Later](#)

For an overview of the features and functionality of the IoT FND application and details on how to configure features and manage Cisco IoT FND after its installation, refer to the [Cisco IoT Field Network Director User Guide](#).

Note The documentation set for this product strives to use bias-free language. For purposes of this documentation set, bias-free is defined as language that does not imply discrimination based on age, disability, gender, racial identity, ethnic identity, sexual orientation, socioeconomic status, and intersectionality. Exceptions may be present in the documentation due to language that is hardcoded in the user interfaces of the product software, language used based on standards documentation, or language that is used by a referenced third-party product.

CHAPTER 2

OVA Images and Upgrade Scripts Verification

- [Introduction, on page 3](#)
- [Verifying the OVA Signature, on page 4](#)
- [Verifying the Upgrade RPM Signature, on page 4](#)

Introduction

Starting from Cisco IoT FND 4.9.0, you can verify the integrity of the OVA images and upgrade scripts before the installation or upgrade of IoT FND.

For more information, refer to:

- [Verifying the OVA Signature, on page 4](#)
- [Verifying the Upgrade RPM Signature, on page 4](#)

Table 1: OVA Images and Upgrade Scripts Zip File Contents

Zip File Contents	Description
CISCO-IOTFND-V-K9-<release>-<build number>.zip	Includes Oracle for Mesh management (CGR, IR5xx) use case.
<ol style="list-style-type: none"> 1. iot-fnd-oracle-<release>-<build number>_SHA1_signed.ova 2. iot-tps-<release>-<build number>_SHA1_signed.ova 	
CISCO-IOTFND-VPI-K9-<release>-<build number>.zip	Includes Postgres / Influx for gateway management (IR8xx, IR1101, IC3K) use case.
<ol style="list-style-type: none"> 1. iot-fnd-<release>-<build number>_SHA1_signed.ova 2. iot-tps-<release>-<build number>_SHA1_signed.ova 	
CISCO-IOTFND-VPI-K9-UPGRADE-SCRIPTS-<release>-<build number>.zip	Includes upgrade scripts for upgrading FND-Postgres / Influx OVA.

Zip File Contents	Description
1. upgrade-ova-<release>-<build number>.rpm	Signature embedded RPM image.
2. FND_RPM_SIGN-CCO_RELEASE.pem	Cisco signed x.509 end-entity certificate containing public key that is used to verify the signature. This certificate is chained to Cisco root CA and sub CA posted on https://www.cisco.com/security/pki/ .
3. cisco_openpgp_verify_release.py	Signature verification program for verifying the Open-pgp Complaint Public Key against x.509 end-entity certificate.
4. cisco_openpgp_verify_release.py.signature	Signature generated for the script cisco_openpgp_verify_release.py.
5. FND-rel-binary.gpg	Open-pgp public key is used for verification of signed RPM.
6. FND-rel-ascii.gpg	Open-pgp public key is used for verification of signed RPM.

Verifying the OVA Signature

To verify the OVA signature:

Step 1 Install the `ovftool`.

Step 2 Run the command to verify the signed ova file.

```
ovftool iot-fnd-<release>-<build number>_SHA1_signed.ova
```

Verifying the Upgrade RPM Signature

Prerequisites:

- Python 2.7.x
- OpenSSL
- Verification scripts running on customer-premises need internet connection to reach Cisco to download root and sub-CA certs

To verify the upgrade RPM signature:

Step 1 Unzip the file `CISCO-IOTFND-VPI-K9-UPGRADE-SCRIPTS-<release>-<build number>.zip`.

Step 2 Change directory (`cd`) to `CISCO-IOTFND-VPI-K9-UPGRADE-SCRIPTS-<release>-<build number>` folder.

Step 3 Extract the public key from the public cert:

```
openssl x509 -pubkey -noout -in FND_RPM_SIGN-CCO_RELEASE.pem > FND-EE-cert.pubkey
```

Expected Result:

FND-EE-cert.pubkey is created under the same folder

Step 4 Verify the verification script using the public key and the signature files.

```
openssl dgst -sha512 -verify FND-EE-cert.pubkey -signature
cisco_openpgp_verify_release.py.signature cisco_openpgp_verify_release.py
```

Expected Result:

Verified OK

Step 5 Verify if the delivered binary and ASCII keys have matching fingerprints.

a) `gpg FND-rel-binary.gpg`

Expected Result:

```
pub 2048R/F7D5ED29 2017-01-01 identity-name (FND.rel) identity-name@cisco.com
```

b) `gpg FND-rel-ascii.gpg`

Expected Result:

```
pub 2048R/F7D5ED29 2017-01-01 identity-name (FND.rel) identity-name@cisco.com
```

Step 6 Verify the binary GPG key against EE cert.

```
./cisco_openpgp_verify_release.py -e FND_RPM_SIGN-CCO_RELEASE.pem -G
FND-rel-binary.gpg
```

Expected Result:

```
Downloading CA certificate from http://www.cisco.com/security/pki/certs/crcam2.cer ...
Successfully downloaded crcam2.cer.

Downloading SubCA certificate from http://www.cisco.com/security/pki/certs/innerspace.cer ...
Successfully downloaded innerspace.cer.

Successfully verified Cisco root, subca and end-entity certificate chain.

Successfully fetched a public key from FND_RPM_SIGN-CCO_RELEASE.pem.

Successfully authenticated FND-rel-binary.gpg key using Cisco X.509 certificate trust chain.
```

Step 7 Verify the RPM Signature using the GPG ASCII key.

```
sudo rpm --import FND-rel-ascii.gpg
rpm -K upgrade-ova-<release>-<build number>.rpm
```

Expected Result:

```
upgrade-ova-<release>-<build number>.rpm: rsa sha1 (md5) pgp md5 OK
```

Step 8 Once the RPM is verified, you can upgrade OVA using the RPM.

CHAPTER 3

Installing the OVA

Prerequisites

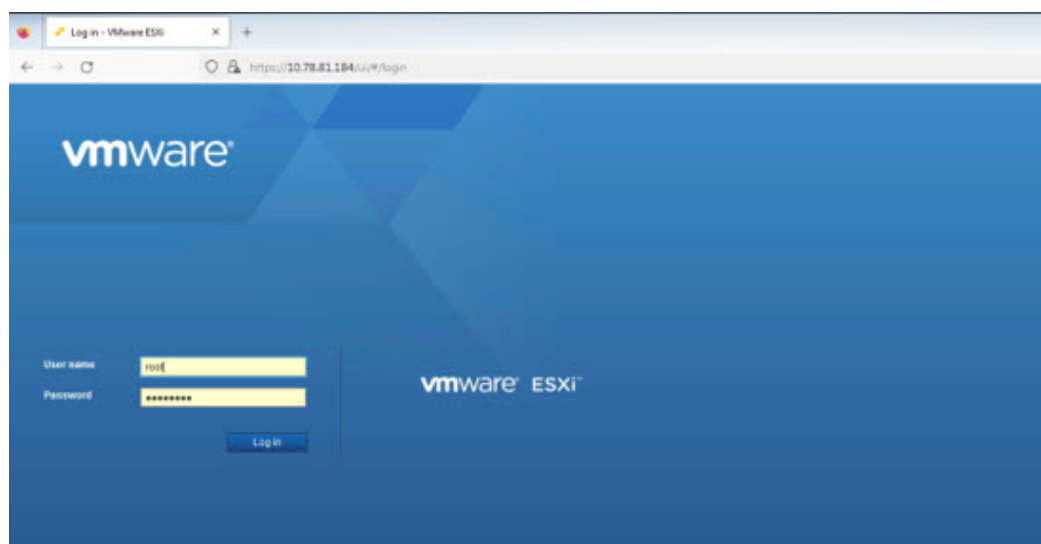

- Log in to the IP address of VMware ESXi server running 6.5 and above via a web browser with your user credentials (username and password).
- Ensure that you meet the VMware server machine (VM CPU and memory) requirements as listed below.
 - 24 GB memory
 - 4 vCPUs
 - Hard disk : 450 GB

To install the OVA:

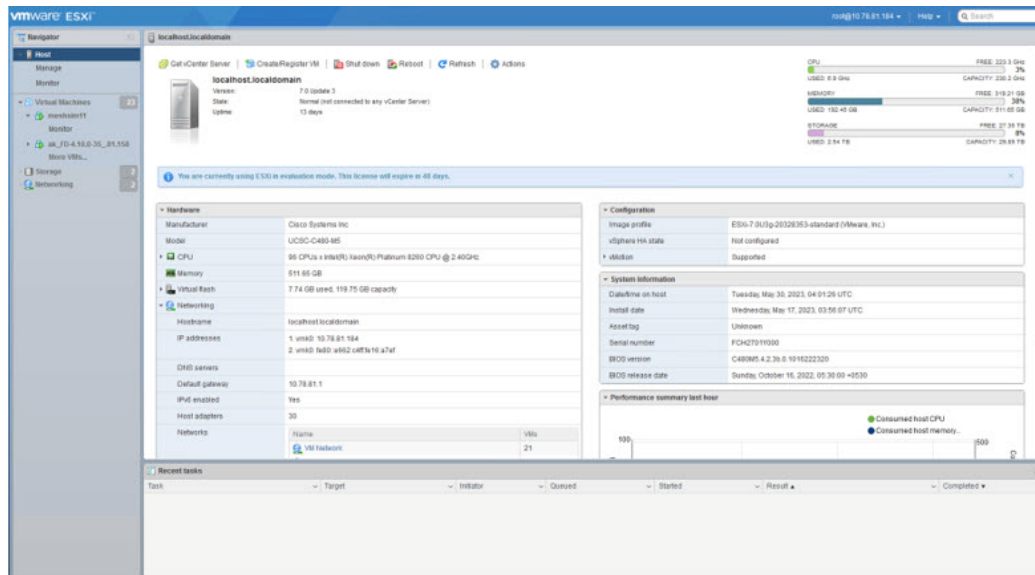

Step 1

Log in to the IP address of VMware ESXi server running 6.5 and above via a web browser with your user credentials (username and password).

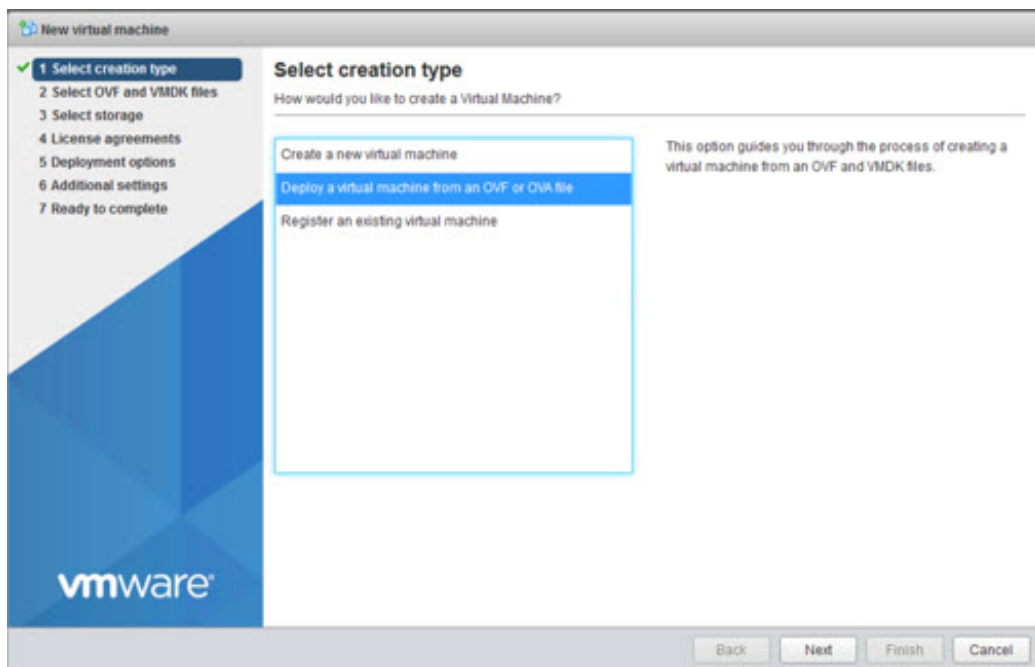

- a) Enter the ESXi IP address in the URL.
- b) Provide the ESXi root login credentials and click **Log In**.

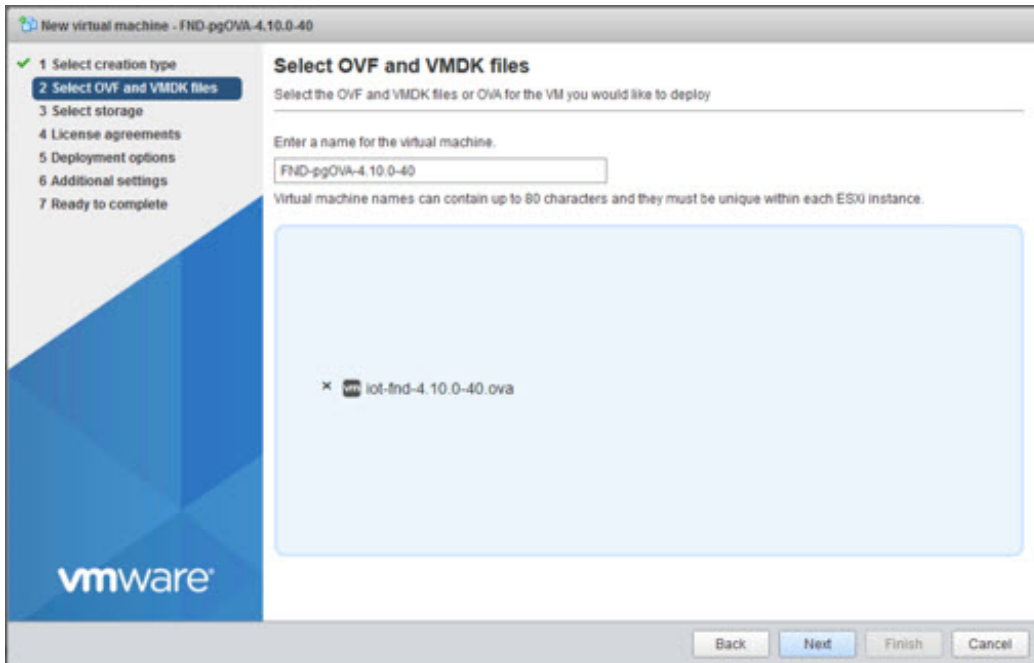

Step 2 In the Host page, select **Create/ Register VM**.

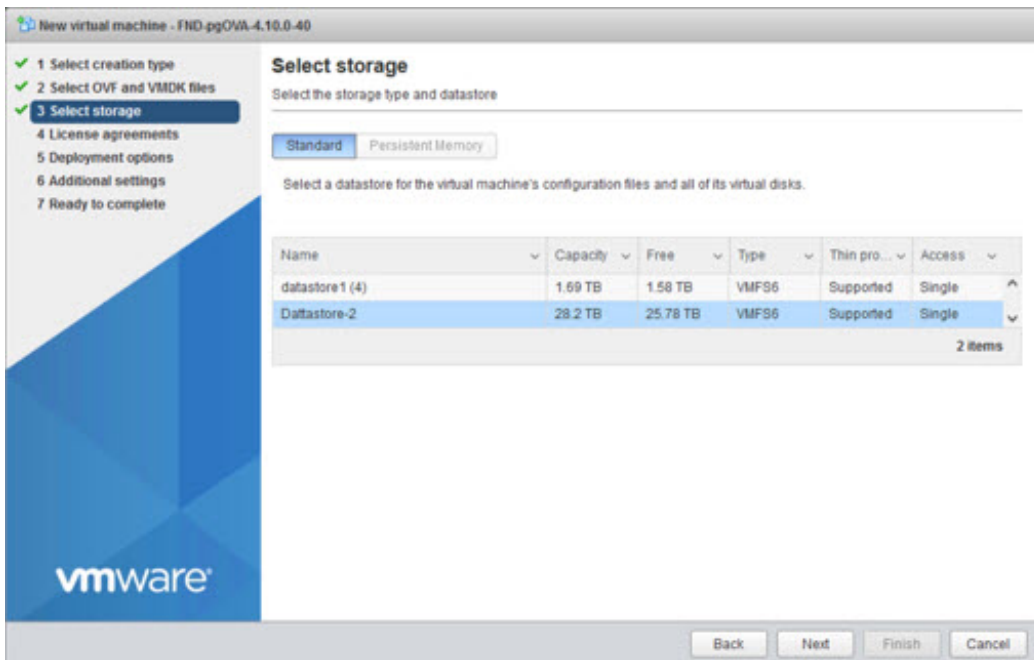

Step 3 In the New virtual machine window, select **Deploy a virtual machine from an OVF or OVA file** in Select creation type tab and click **Next**.

Step 4 In the Select OVF and VMDK files tab, provide a name for the virtual machine and browse to an OVF package from the internet or a file accessible from your computer (for example, iot-fnd-4.10.0-40.ovf). Click **Next**.

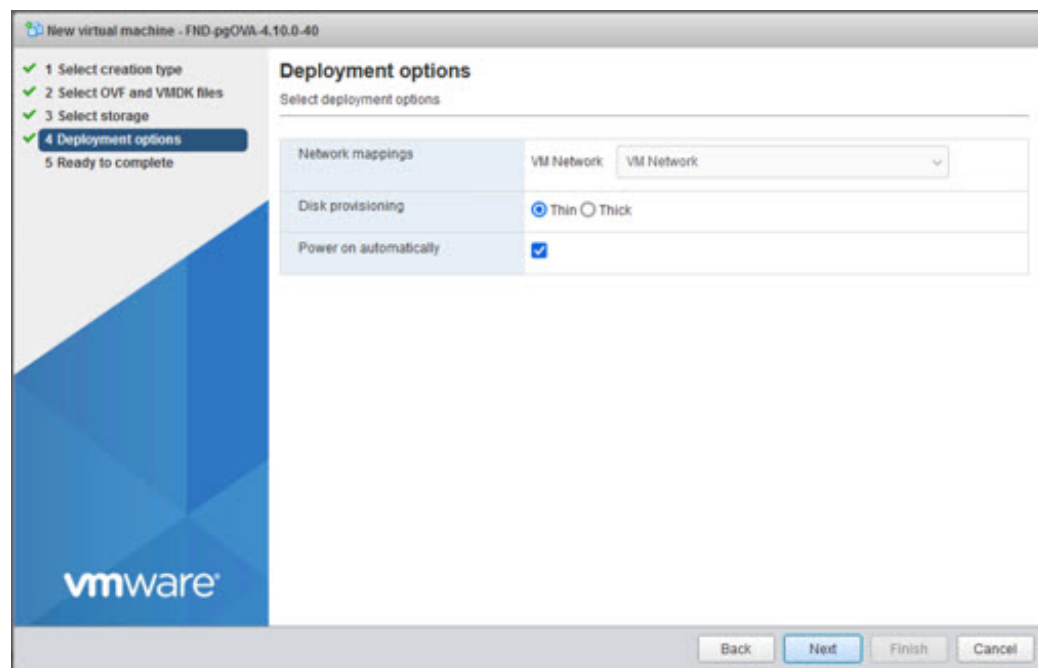

Step 5 Select a storage location for the virtual machines from the listed options (example - Datastore-2).

Step 6 After selecting the data store, select the provisioning type and enable the **Power on automatically** option. This ensures to power on the virtual machine once the deployment process is complete. Click **Next**.

- Note**
- **Thick Provisioning** — Absolute reservation on the disk space. For the IoT FND OVA deployment, the disk space required is 600 GB on the ESXi server.
 - **Thin Provisioning** — The disk space grows on demand. For the IoT FND OVA deployment, the disk space is approximately 50 GB initially and the disk space occupied by VM will grow as per the scale of deployment

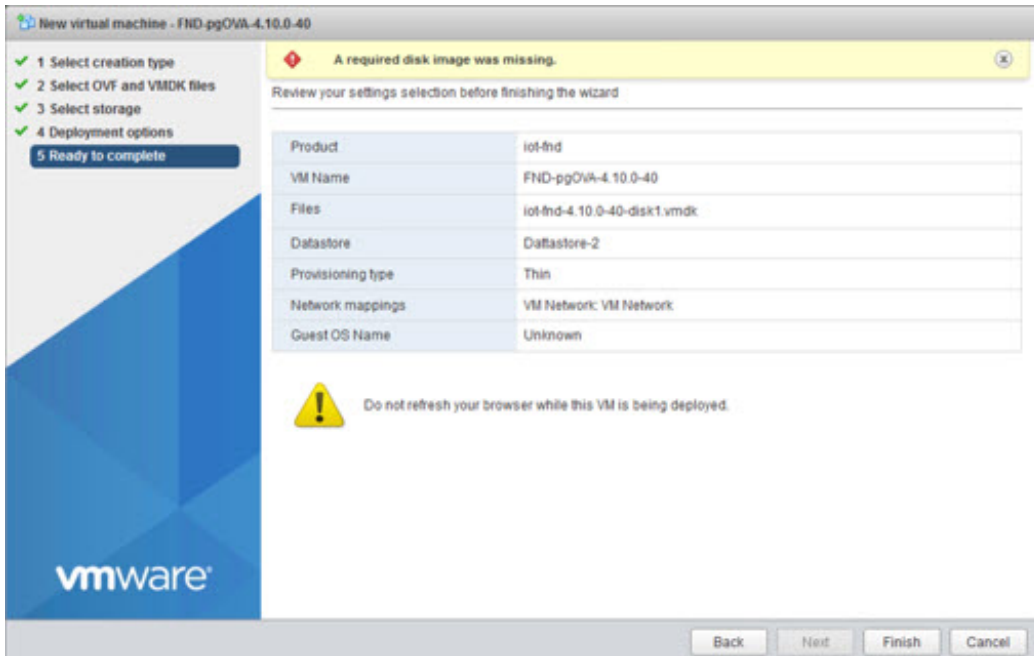

- Note** If the selected storage location does not have sufficient storage for the largest file installation option, a message displays noting insufficient storage. If the warning message appears, select another storage resource with greater capacity and click **Next**.

- Step 7** Do a final review of the **Ready to Complete** window. If you do not want to change any settings, click **Finish**.

- Note** If you see the following warning message while deployment, then cancel the upload, disconnect the Esxi from vCenter Server (**Actions > Disconnect from vCenter Server**) and then re-upload OVA. The upload will be successful.

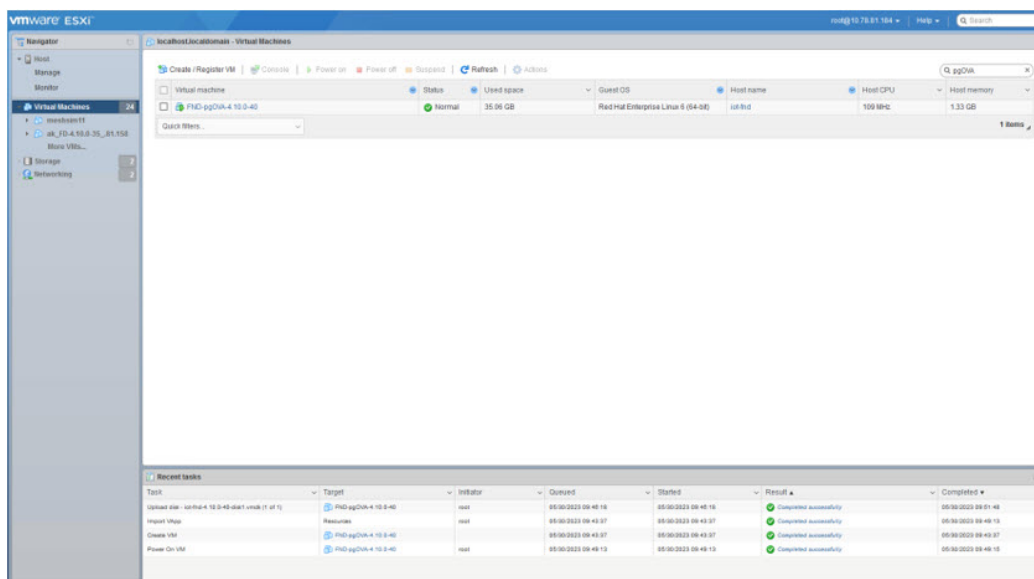

"Failed: Access to resource settings on the host is restricted to the server that is managing it 'vCenter Server IP'"

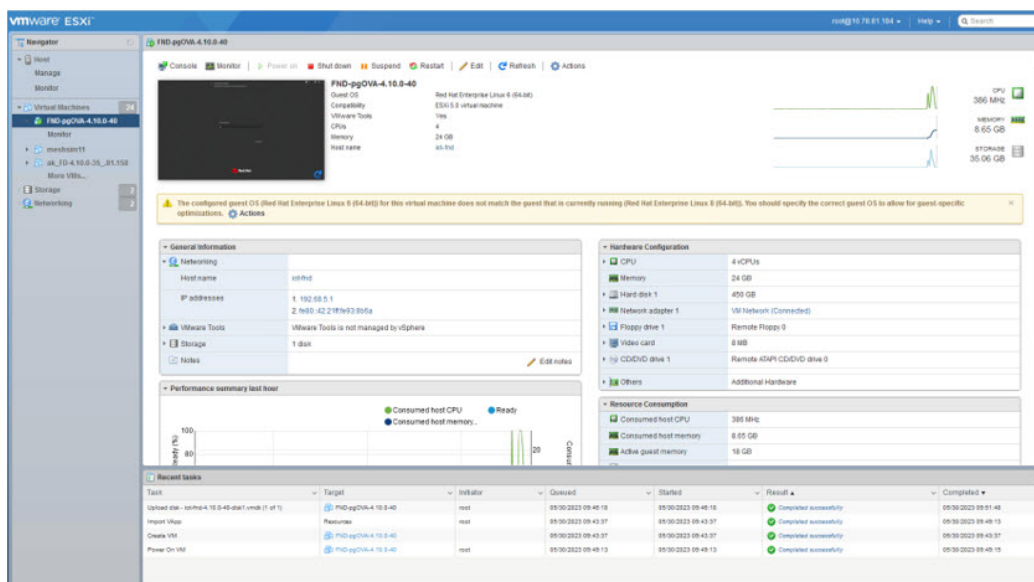

The virtual machine deployment is initiated. After completion of the install, the "Completed successfully" message appears in the Recent tasks pane at the bottom of the install window.

Step 8 Click Virtual Machines in the left pane and select the newly deployed VM.

Step 9 The deployed VM gets listed in the left pane. Select the IoT FND machine name.

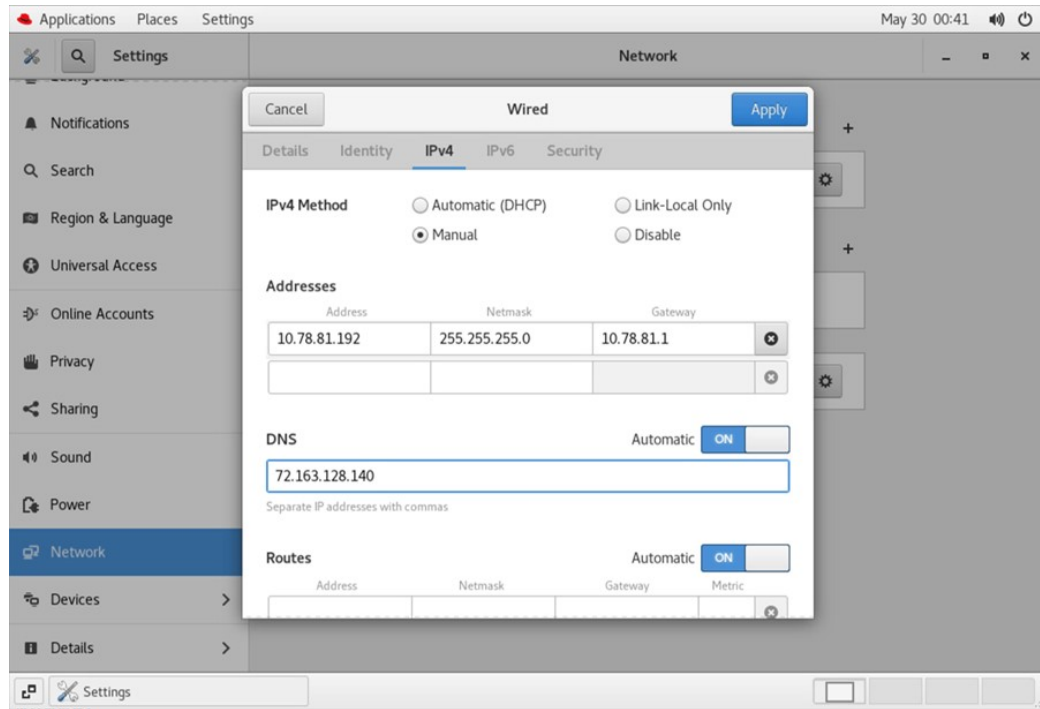

Step 10 Click **Console** and login with root/cisco123 once the OS is up. Once you enter the default password, you are prompted to reset your password.

Step 11 Reset the default root password. After you complete the password reset, IoT FND 4.10.0 is fully deployed.

Step 12 Once logged in, navigate to **Applications > System Tools > Settings > Network**.

Step 13 Click the cog icon under Wired, navigate to IPv4 tab to assign a static IP address or set up a DHCP server in the network.

- Under IPv4 tab, select the method as Manual and provide the IPv4 address as below and click **Apply**.
- Set up a valid, reachable working DNS server on the Host VM. (mandatory) Use this IP address to access the FND GUI.

Important Follow the same steps for TPS OVA installation as well. In order to upgrade the TPS OVA, delete the existing TPS and re-install the TPS OVA `iot-tps-version_number.ova` with the updated version number.

Step 14 Open a terminal window, and setup Health Monitoring for the Fog Director Container from FND.

```
[root@iot-fnd ~]# cd /opt/monitor/
```

```
[root@iot-fnd monitor]# ./setup.sh
Setup health metrics monitor for App Management Servers
Enter FND Username: root
Enter FND Password:
Successfully configured health metrics monitor for App Management Servers
```

After completing these steps, IoT FND starts monitoring the Fog Director container on the **ADMIN > SERVERS** page.

CHAPTER 4

Installing Custom CA Certificates and Importing SUDI Certificate

By default, the IoT FND OVA comes bundled with keys and certificates which is stored in a keystore. The default values are:

- On IoT FND OVA Linux Host:
Keystore Location: `/opt/fnd/data/`
Keystore Name: `cgms_keystore.selfsigned`
- On IoT FND container:
Keystore Location: `/opt/cgms/server/cgms/conf/`
Keystore Name: `cgms_keystore`
- **Default Password: Public123!**

Important

- This is the default password for both the files mentioned above.
 - Both these files have the same content.
 - When IoT FND container is restarted, the values of `/opt/cgms/server/cgms/conf/cgms_keystore` file in IoT FND container is overwritten by `/opt/fnd/data/cgms_keystore` file. If `/opt/fnd/data/cgms_keystore` file is not present in host, then `/opt/fnd/data/cgms_keystore.selfsigned` file is used.
-

When IoT FND OVA is a new installation, each certificate/key entry is referenced by an alias name in the keystore. The default alias are:

- `cisco_sudi` (cisco root CA certificate with 2029 expiry)
- `jmarconi` (cisco certificate)
- `cgms` (self signed certificate that is used by IoT FND when communicating with devices it has to manage)

Note This keystore is specific for certificates used for IoT FND communication with its managed devices. There is a different keystore for web certificate.

Custom cgms_keystore

The cgms certificate in `/opt/cgms/server/cgms/conf/cgms_keystore` file in IoT FND container and `/opt/fnd/data/cgms_keystore.selfsigned` file of the linux host has by default self signed certificate of IoT FND. There are two options to build a custom cgms_keystore in `/opt/fnd/data` location on linux host, where the IoT FND certificate of the customer organisation can be imported and stored.

We can either copy the existing `/opt/fnd/data/cgms_keystore.selfsigned` file on the Linux host or build it from scratch. After the cgms_keystore file is present on the linux host, if both `/opt/fnd/data/cgms_keystore.selfsigned` and `/opt/fnd/data/cgms_keystore` files are present, then `/opt/fnd/data/cgms_keystore` takes precedence.

Note NTP is a mandatory requirement for Public Key Infrastructure. Hence NTP should be in sync between the issuing Certificate Authority (CA) server, IoT FND, TPS, and FAR/HER. If hostname or IP address has to be changed for the IoT FND host, it has to be done before certificate for IoT FND is issued and hence it should be done before starting to build cgms_keystore.

The SAN field in IoT FND certificate is a mandatory requirement and contains the hostname of the IoT FND server. Any change in hostname or IP address is listed in SAN field (if IP address is also present in the SAN field), then the certificate should be reissued. Depending on the PnP type used, the SAN field contains the hostname of the IoT FND or the IP address or both.

The cgms_keystore should contain the below mandatory certificates/keys:

- Issuing CA certificate of the organisation – This is the certificate of the issuing CA server of the organisation. The issuing CA server can be a root CA server or intermediate CA server. If it is an intermediate CA, it is recommended to import root CA and also intermediate CA certificates into the keystore.
- IoT FND device certificate is issued for IoT FND by issuing CA server.
- Cisco SUDI with 2029 expiry date – This is the cisco manufacturer certificate for IoT FND issued by Cisco with expiry date 2029.
- Cisco SUDI with 2099 expiry date – This is the cisco manufacturer certificate for IoT FND issued by Cisco with expiry date 2099.

The below option shows how to build cgms_keystore file from scratch that contains the required certificates and keys.

Step 1 Change directory to `/opt/fnd/data` on linux host.

```
# cd /opt/fnd/data
```

Importing Root/Issuing CA Certificate

Step 2 Importing any certificate using keytool command creates the keystore file, if keystore file does not exist. Note that the name of the file has to be cgms_keystore as IoT FND refers the file with this name. Copy the issuing CA certificate of your organisation to any location (using scp or any other file transfer method). In this illustration, it is copied to

/root/rootca.pem. The certificate can be of the format .cer or .crt or .pem. In this illustration, the issuing CA is the root CA and hence the alias name root is used.

```
# keytool -import -trustcacerts -keystore /opt/fnd/data/cgms_keystore -alias
root -file /root/rootca.pem
```

Convert the keystore from jks to pkcs12.

```
# keytool -importkeystore -srckeystore /opt/fnd/data/cgms_keystore
-destkeystore /opt/fnd/data/cgms_keystore -deststoretype pkcs12
```

Verify that the file has been created by listing the contents of the keystore.

```
# keytool -list -keystore /opt/fnd/data/cgms_keystore
```

Importing IoT FND Certificate

Step 3

Import the IoT FND certificate.

Note IoT FND certificate has to be imported ONLY with alias name of cgms.

The below steps tells how to generate a key pair .csr file that can be presented to the issuing CA server for a certificate to be granted for IoT FND server. The .csr file is required by few issuing CA servers of few PKI vendors. If the .csr certificate is given to the issuing CA server, then a certificate is generated based on the contents of the .csr file. If a certificate of IoT FND has already been issued, use the following steps, if the IoT FND certificate issued has .pem or .cer or .crt extension. If the IoT FND certificate has .pfx extension, follow step 4.

a) Generate a key pair and .csr file .

```
# keytool -genkeypair -keyalg RSA -keysize 2048 -alias cgms
-ext "SAN=dns.labfnd.cisco.com, ip:1.0.0.1" -keystore /opt/fnd/data/cgms_keystore
-dname CN=labfnd, OU=iotescblr, O=cisco, L=Bengaluru, ST=Karnataka, C=IN"
```

Note The key size in this example is 2048, but 4096 can also be used.

```
# keytool -certreq -file labfnd.csr -keystore
/opt/fnd/data/cgms_keystore -alias cgms -ext "SAN=dns:labfnd.cisco.com,ip:1.0.0.1"
```

Note This .csr file is then presented to the issuing CA server and a certificate is obtained for IoT FND server.

b) Copy the issued certificate to FND server in any location. In this sample, it is copied to /opt/fnd/data as labfnd.pem file. Import the certificate using below command.

```
# keytool -import -trustcacerts -keystore /opt/fnd/data/cgms_keystore
-alias cgms -file /root/labfnd.pem
```

Step 4

If the FND issued certificate issued has .pfx format, then we will have a .pfx file instead of the .pem file. If it is a .pfx file, check the alias name of the .pfx file and then import it using the alias cgms in the cgms_keystore.

- Find the alias name of the pfx file. In this case, the nms.pfx is copied to the current location.

```
# keytool -list -v -keystore /opt/fnd/data/nms.pfx -srcstoretype
pkcs12 | grep Alias
```

- Import the pfx into the cgms_keystore with alias cgms. In this sample, "le-IoT FND-8f0908aa-dc8d-4101-a526-93b4eaad9481" is the alias present in the .pfx file.

```
# keytool -importkeystore -v -srckeystore /opt/fnd/data/nms.pfx
-destkeystore /opt/fnd/data/cgms_keystore -srcalias
le-IoT FND-8f0908aa-dc8d-4101-a526-93b4eaad9481 -destalias cgms
```

Importing SUDI with 2029 Expiry

Step 5 The SUDI certificate with 2029 expiry is present in /opt/fnd/data directory as cisco-sudi-ca.pem. Import this file to cgms_keystore.

```
# keytool -import -trustcacerts -alias cisco_sudi -file
/opt/fnd/data/cisco-sudi-ca.pem -keystore /opt/fnd/data/cgms_keystore
```

Importing SUDI with 2099 Expiry

Step 6 The updated SUDI certificate with 2099 expiry is present in IoT FND container as cisco-ca.pem file, copy this to /opt/fnd/data in linux host.

```
docker cp fnd-container:/opt/cgms/server/cgms/conf/ciscosudi/cisco-ca.pem
/opt/fnd/data/
```

Import the SUDI with 2099 expiry, that is, cisco-ca.pem to cgms_keystore.

```
# keytool -import -trustcacerts -keystore /opt/fnd/data/cgms_keystore
-alias sudil -file /opt/fnd/data/cisco-ca.pem
```

Step 7 Restart the container.

```
docker stop fnd-container
docker start fnd-container
```

Important It is not advised to use the restart command. It is best practice to stop the container and then start the container so the services can stop gracefully. Sometimes restart will not be graceful and can lead to operational issues.

Step 8 After restart, verify that the contents of the cgms_keystore in the IoT FND container has same contents as that of the cgms_keystore in /opt/fnd/data of linux host using the below command.

```
# keytool -list -v -keystore -/opt/fnd/data/cgms_keystore
```

```
# docker exec -it fnd-container keytool -list -v -keystore /opt/cgms/server/cgms/conf/cgms_keystore
```

Step 9 To configure or change the cgms_keystore password, see [Changing Password](#) for more information.

-
- [Changing Password, on page 18](#)

Changing Password

The cgms.properties file should contain the password for cgms_keystore, so that IoT FND application can access the cgms_keystore. Hence the first time cgms_keystore is created, encrypt the password of cgms_keystore and provide this encrypted password in cgms.properties file.

If at any time the password for cgms_keystore is changed, then the changed password has to be encrypted again and updated in the cgms.properties file.

Step 1 Run the following command to encrypt the password for the new **cgms_keystore**. The sample is provided below.

```
# docker exec -it fnd-container /opt/cgms/bin/encryption_util.sh
encrypt <keystore password>

# docker exec -it fnd-container /opt/cgms/bin/encryption_util.sh
encrypt cisco123
#2bVvZsq+vsq94YxuAKdaag--
```

Step 2 Modify the **cgms.properties** file in the `/opt/fnd/data` folder, and edit the following line to set the new encrypted **cgms_keystore** password:

```
cgms-keystore-password-hidden=<encrypted new cgms_keystore password>
```

Note: With OVA 4.3.x and above, you can leave the `cgms_keystore.selfsigned` default bundled keystore untouched.

If both the files (**cgms_keystore** and **cgms_keystore.selfsigned**) are present, the **cgms_keystore** will be used by the container.

CHAPTER 5

Configuring IoT FND for IPv6 Tunnel Provisioning and Registration

IoT FND OVA supports only IPv4 tunnels and Registration out of the box.

To setup an IPv6 network for tunnel provisioning and registration, follow these steps:

Step 1 Ensure you have one interface with a valid IPv6 network which has a IPv6 prefix length less than 125.

See the following example of the ens224 interface:

```
[root@iot-fnd ~]# ifconfig ens224
ens224: flags=4163[UP,BROADCAST,RUNNING,MULTICAST] mtu 1500
inet 2.2.56.117 netmask 255.255.0.0 broadcast 2.2.255.255
inet6 fe80::54f0:5d24:d320:8e38 prefixlen 64 scopeid 0x20[ink]
inet6 2001:420:7bf:5f::1522 prefixlen 64 scopeid 0x0[global]
ether 00:0c:29:18:1b:3a txqueuelen 1000 (Ethernet)
RX packets 97618 bytes 12391774 (11.8 MiB)
RX errors 1001 dropped 1011 overruns 0 frame 0
TX packets 3004 bytes 568097 (554.7 KiB)
TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0
[root@iot-fnd ~]#
```

Step 2 Run the `./setup-IPv6-network.sh` script in the `/opt/fnd/scripts` directory to obtain the FND IPv6 address on the router for tunnel provisioning and registration.

Note: While specifying the IPv6 address for the network-mgmt-bridge, provide an Interface Name and a valid IPv6 address (and IP address prefix length) that is in the subnet of the provided host interface. If IPv6 address is in a different subnet, the IPv6 tunnel provisioning and registration will not be successful.

```
[root@iot-fnd scripts]# ./setup-IPv6-network.sh

Setup IPv6 Network For Containers
IPv6 Network setup process will require an active interface with a Global IPv6 Address.
IPv6 prefix length must be less than 125.

Enter Interface Name: ens32
Enter IPv6 Address: 2001:1111:2222:0:20c:29ff:fe44:ea4d
Enter IPv6 Prefix Length: 64

One of the IPv6 networks in /125 subnet from 2001:1111:2222:0:20c:29ff:fe44:ea4d/64 will be required to setup container network.
Enter IPv6 Address for network-mgmt-bridge from /125 subnet: 2001:1111:2222:0:20c:29ff:fe44:1515

```

CHAPTER 6

Starting and Stopping FND

Use the `fnd-container.sh {start|stop|status|restart}` script in the following directory to start, stop, obtain status, and restart FND:

```
cd /opt/fnd/scripts/
```

```
[root@iot-fnd scripts]# ./fnd-container.sh status
fnd-container is running, pid=22745
CONTAINER ID      NAME          CPU %           MEM USAGE / LIMIT   MEM %           NET I/O         BLOCK I/O        PIDS

CHAPTER 8

Upgrading IoT FND OVA

Note Ensure to upgrade the DB and the docker server image first before upgrading the IoT FND and FD container images.

To upgrade the IoT FND OVA, follow the upgrade sequence given below:

1. Upgrade the DB and the docker server image using rpm scripts.
For more information, refer to [Upgrading the Database and Docker Server Image, on page 31](#).
2. Upgrade the IoT FND and FD container images.
For more information, refer to [Upgrading IoT FND and FD Container Images, on page 43](#).
3. Restart Postgres service if the current IoT FND release is prior to 4.9.1 and the target IoT FND release is 4.9.1 or above.

-
- Note**
- Postgres service restart is not required if the target IoT FND release is greater than 4.9.1. In this case, we assume that during the upgrade to IoT FND 4.9.1, the postgres service is already restarted.
 - Postgres service restart is a must if you are directly upgrading to 4.10 from a release prior to 4.9.1.
-

- [Pre-Upgrade Checklist, on page 27](#)
- [Upgrading the Database and Docker Server Image, on page 31](#)
- [Upgrading IoT FND and FD Container Images, on page 43](#)
- [Post-Upgrade Checklist, on page 45](#)
- [Upgrading IoT FND from 4.5.1 to later releases and Updating RHEL OS, on page 46](#)

Pre-Upgrade Checklist

The section identifies the tasks that you must perform before you begin the upgrade to ensure successful upgrade and limited downtime.

Step 1 Take a snapshot of the existing VM before you upgrade.

This helps in restoring if there is an upgrade failure.

Step 2 Take a backup of the PostgreSQL DB.

Note For any clarification on backup procedure, contact your DB administrator.

Step 3 Take a backup of **cgms.properties** file and **cgms_keystore** file in the location, `/opt/fnd/data/`.

You can either SCP these files to another server for backup or you can copy in the same or different folder.

```
root@iot-fnd:~[root@iot-fnd ~]#
root@iot-fnd:~[root@iot-fnd ~]# cd /opt/fnd/data
root@iot-fnd:/opt/fnd/data[root@iot-fnd data]#
root@iot-fnd:/opt/fnd/data[root@iot-fnd data]#ls
cgms_keystore cgms.properties cisco-sudi-ca.pem userPropertyTypes.xml
root@iot-fnd:/opt/fnd/data[root@iot-fnd data]#
root@iot-fnd:/opt/fnd/data[root@iot-fnd data]# cp cgms.properties cgms.properties_backup_09May2022
[root@iot-fnd data]# keytool -importkeystore -srckeystore cgms_keystore -destkeystore
cgms_keystore_backup_9May2022 -deststoretype PKCS12
Importing keystore cgms_keystore to cgms_keystore_backup_9May2022...
Enter destination keystore password:
Re-enter new password:
Enter source keystore password:
Entry for alias cgms successfully imported.
Entry for alias cisco_sudi successfully imported.
Entry for alias jmarconi successfully imported.
Import command completed: 3 entries successfully imported, 0 entries failed or cancelled
[root@iot-fnd data]#
[root@iot-fnd data]# ls
cgms_keystore cgms_keystore.selfsigned cgms.properties_backup_09May2022
fnd_psk.keystore
cgms_keystore_backup_9May2022 cgms.properties cisco-sudi-ca.pem
userPropertyTypes.xml
[root@iot-fnd data]#
```

a) During the IoT FND container upgrade, the following files get overwritten in the directories mentioned below:

- Directory — `/opt/cgms/server/cgms/conf/`:
 - `jbossas.keystore.password`
 - `jbossas.keystore`
 - `VAULT.dat`
 - `vault.keystore`
- Directory — `/opt/cgms/server/cgms/deploy/`:
 - `security-service.xml` file

Backup can be done in the same directory using different name or backup in a different directory or backup and store the files in the SCP server.

For example, taking backup in the same directory:

```
Login to the FND container
[root@iot-fnd ~]# docker exec -it fnd-container /bin/bash
[root@fnd-server ~]#
```

```
[root@fnd-server /]# cp /opt/cgms/server/cgms/conf/jbossas.keystore.password
/opt/cgms/server/cgms/conf/jbossas.keystore.password.bkp1
[root@fnd-server /]# cp /opt/cgms/server/cgms/conf/jbossas.keystore
/opt/cgms/server/cgms/conf/jbossas.keystore.bkp1
[root@fnd-server /]# cp /opt/cgms/server/cgms/conf/vault.keystore
/opt/cgms/server/cgms/conf/vault.keystore.bkp1
[root@fnd-server /]# cp /opt/cgms/server/cgms/conf/VAULT.dat
/opt/cgms/server/cgms/conf/VAULT.dat.bkp1
[root@fnd-server /]# cp /opt/cgms/server/cgms/deploy/security-service.xml
/opt/cgms/server/cgms/deploy/security-service.xml.bkp1
[root@fnd-server /]#
```

- b) If you are using *userpropertyTypes.xml* to define custom properties for backup, then follow the steps that are mentioned in the workaround of the bug ID: CSCwc12435. This will be fixed in IoT FND release 4.9 or later.

Step 4

Run the following commands and check the output before you start the upgrade process.

- /opt/scripts/status.sh

```
[root@iot-fnd ~]# /opt/scripts/status.sh
```

- postgresql-12.service - PostgreSQL 12 database server
Loaded: loaded (/usr/lib/systemd/system/postgresql-12.service; enabled; vendor preset: disabled)

```

Upgrading the Database and Docker Server Image

This section provides steps for upgrading the database and the docker server image by running the `rpm` upgrade scripts for releases 4.7.0 to later versions and 4.5.1 to later versions. By running the `rpm` scripts, you automatically integrate the DB with IoT FND scripts, upgrade the DB, and upgrade the docker server (Community Edition) image.

Note IoT FND version 4.5.1 provides the option to manually upgrade the DB and docker server image instead of running the Cisco `rpm` scripts. For more information, refer to [Manual Upgrade Option in FND 4.5.1](#).

Note IoT FND OVA upgrade will NOT upgrade the RHEL OS version. The RHEL version differs for different versions of IoT FND as in the table below. After upgrading the OVA, it is recommended to upgrade the OS sooner than later. Although IoT FND is a secure application, OS security and patches must be regularly updated with Cisco's guidance.

Table 2: List of IoT FND and the bundled Postgres, Docker, and RHEL OS versions:

IoT FND Version	Postgres Version	Docker Server Version	RHEL OS Version
4.11.0	12.12	19.03.15	8.8
4.10.0	12.12	19.03.15	8.7
4.9.1	12.12	19.03.15	8.6
4.9.0	12.9	19.03.15	8.6
4.8.1	12.9	19.03.15	8.5
4.8.0	12.5	19.03.15	7.7
4.7.2	12.5	19.03.15	7.7
4.7.1	12.5	19.03.15	7.7
4.7.0	12.4	18.09.6	7.7
4.5.1	9.6	18.09.6	7.5

Note Starting from FND 4.8.1 release, all python scripts are compatible only for Python 3 which comes as default python interpreter in RHEL 8.x. It is recommended to install Python 3.6 manually if IoT FND OVA is upgraded to 4.8.1 or higher without base OS upgrade.

Step 1 Obtain the IoT FND upgrade scripts from [Cisco](#).

Step 2 Check the RHEL OS version before upgrading IoT FND OVA to 4.7.1 or higher.

```
[root@fnd451testupgrade ~]# hostnamectl
  Static hostname: fnd451testupgrade
    Icon name: computer-vm
    Chassis: vm
  Machine ID: 58eb8d728d834d28ad426eca3c9b9c4e
    Boot ID: 40511dab9f4b4beaa8de82fb105423c9
  Virtualization: vmware
  Operating System: Red Hat Enterprise Linux
    CPE OS Name: cpe:/o:redhat:enterprise_linux:7.5:GA:server
    Kernel: Linux 3.10.0-862.el7.x86_64
  Architecture: x86-64
[root@fnd451testupgrade ~]#r
```

- If the RHEL version on the Linux server is lesser than 7.7, then use the following steps to upgrade. You can either do an [automatic](#) or [manual](#) upgrade.
- If the RHEL version on the Linux server is 7.7 or above, then you can skip the steps below.

a) **Method 1 — Automatic Upgrade:** For this method, you require subscription to RHEL subscription-manager and active internet connection.

Run the following command to upgrade the container-selinux package.

```
subscription-manager repos --enable=rhel-7-server-extras-rpms
yum update container-selinux
```

Example

```
[root@fnd451testupgrade ~]# subscription-manager repos --enable=rhel-7-server-extras-rpms
Repository 'rhel-7-server-extras-rpms' is enabled for this system.
[root@fnd451testupgrade ~]# yum update container-selinux
Loaded plugins: langpacks, product-id, search-disabled-repos, subscription-manager

  setools-libs.x86_64 0:3.3.8-4.el7

Complete!
[root@fnd451testupgrade ~]#

```

- b) **Method 2 — Manual Upgrade:** If the IoT FND server is offline, that has no internet connection because of security reasons, then you have to upgrade the container-selinux and the dependent packages manually by downloading them from the CentOS Mirror website. Download the 11 dependent packages and install them.

Run the following command to install the dependent packages in the same sequence listed in the [Table 3: The dependent packages below apply only for container-selinux-2.107-3.el7.noarch.rpm.](#)

```
rpm -Uvh package-name
```

Note Minimum required version of the container-selinux package is container-selinux-2.107-3.el7.noarch.rpm.

Note If the version of the container-selinux is higher, then the dependent rpm packages that are required is also higher. Refer to the CentOS Mirror website on the version requirements of the dependent packages.

Table 3: The dependent packages below apply only for container-selinux-2.107-3.el7.noarch.rpm.

Container-Selinux — Dependent Packages
libsepol-2.5-10.el7.x86_64.rpm
libselinux-2.5-15.el7.x86_64.rpm
libsemanage-2.5-14.el7.x86_64.rpm

Container-Selinux — Dependent Packages
libselinux-utils-2.5-15.el7.x86_64.rpm
policycoreutils-2.5-34.el7.x86_64.rpm
selinux-policy-3.13.1-268.el7_9.2.noarch.rpm
selinux-policy-targeted-3.13.1-268.el7_9.2.noarch.rpm
libsemanage-python-2.5-14.el7.x86_64.rpm
libselinux-python-2.5-15.el7.x86_64.rpm
setools-libs-3.3.8-4.el7.x86_64.rpm
policycoreutils-python-2.5-34.el7.x86_64.rpm

Step 3 Extract the `cgms rpms` files to the IoT FND server.

Based on the OS that you are using, you can extract the scripts (in ZIP format) as follows:

- For Windows—Extract the upgrade scripts on PC and then transfer to the IoT FND server.
- For extracting the upgrade scripts directly on IoT FND server or Linux—Run the following commands:
 - [root@iot-fnd opt]# `ls`
`cgms-influx cgms-postgres CISCO-IOTFND-VPI-K9-UPGRADE-SCRIPTS-4.7.0-101.zip containerd`
`fnd fogd monitor rh scripts`
 [root@iot-fnd opt]#
 [root@iot-fnd opt]# `rpm -qa | grep unzip`
`unzip-6.0-20.el7.x86_64`
 [root@iot-fnd opt]#
 - [root@iot-fnd opt]# `unzip CISCO-IOTFND-VPI-K9-UPGRADE-SCRIPTS-4.7.0-101.zip`
`Archive: CISCO-IOTFND-VPI-K9-UPGRADE-SCRIPTS-4.7.0-101.zip`
`inflating: upgrade-ova-4.7.0-101.rpm`
 [root@iot-fnd opt]#
 [root@iot-fnd opt]# `ls`
`cgms-influx cgms-postgres CISCO-IOTFND-VPI-K9-UPGRADE-SCRIPTS-4.7.0-101.zip containerd`
`fnd fogd monitor rh scripts upgrade-ova-4.7.0-101.rpm`
 [root@iot-fnd opt]#

For example, if you are upgrading the DB and the docker server image for IoT FND release 4.7.0.

a) Download the following upgrade script from Cisco.

CISCO-IOTFND-VPI-K9-UPGRADE-SCRIPTS-4.7.0-101.zip

b) Extract the file to get the rpm:

upgrade-ova-4.7.0-101.rpm

c) Transfer the extracted rpm file to the IoT FND server.

You can copy the rpm file to any directory. In this example, the file is copied to `/opt`.

Step 4 Go to the directory where you have copied the rpm file.

For example, `cd /opt` or any directory where the *upgrade-ova-4.7.0-101.rpm* file is copied.

Step 5 Run the the following upgrade script.

```
rpm -Uvh upgrade-ova-<release>-<build number>.rpm
```

For example, `rpm -Uvh upgrade-ova-4.7.2-8.rpm`.

The upgrade script automatically integrates the DB with IoT FND scripts (Postgres with Influx DB) and upgrades the docker server image.

Note You can find the install log information in `/root/rpm.log`.

Sample log information for the rpm upgrade script:

```
root@iot-fnd:/opt[root@iot-fnd opt]# rpm -Uvh upgrade-ova-4.7.2-8.rpm

Example

Manual Upgrade of IoT FND 4.5.1 to Later Versions—Use this upgrade procedure ONLY if you want to upgrade on your own without using Cisco rpm (*upgrade-ova-4.7.0-101.rpm*) that is provided to you:

1. Extract the rpm scripts by running the following command:

```
rpm2cpio upgrade-ova-4.7.0-101.rpm | cpio -idmv
```

```

[root@iot-fnd opt]# rpm2cpio upgrade-ova-4.7.0-101.rpm | cpio -idmv
./upgrade-ova-4.7.0-101
./upgrade-ova-4.7.0-101/Application-Watchdog

```

Note The options 3 and 4 present in the script, `./upgrade.sh`, ONLY install the database integration scripts and they do not upgrade the entire DB.

4. To upgrade the entire DB, contact your DB Administrator or visit <https://www.postgresql.org/docs/current/upgrading.html> to upgrade the Postgres.
5. Install the docker server image from <https://docs.docker.com/engine/install/rhel/>.

What to do next

[Upgrading IoT FND and FD Container Images, on page 43](#)

Upgrading IoT FND and FD Container Images

Before you begin

- [Pre-Upgrade Checklist, on page 27](#)
- [Upgrading the Database and Docker Server Image, on page 31](#)

Step 1

Run the following script:

```
/opt/fnd/scripts/upgrade.sh

[root@iot-fnd ~]# /opt/fnd/scripts/upgrade.sh

This script must be run with root privileges.
Usage: Load container images: No resource required
       For container reload: No resource required

1) Load container images
2) Container reload
3) Quit
Enter your choice: 1
Do you want to download docker image from registry (y/n)?y
Enter docker registry [devhub-docker.cisco.com]: dockerhub.cisco.com
Enter docker image tag: 4.7.2-8
Downloading FND docker image...

Enter your choice: 3
You have new mail in /var/spool/mail/root

```

Enter 3 to Quit the menu.

What to do next

[Post-Upgrade Checklist, on page 45](#)

Post-Upgrade Checklist

Step 1 Restart Postgres service if the current IoT FND release is prior to 4.9.1 and the target IoT FND release is 4.9.1 or above.

Step 2 Check the DB and IoT FND status by running the following commands:

- /opt/scripts/status.sh

- `docker version`
- `/opt/fnd/scripts/fnd-container.sh status`
- `docker exec -it fnd-container /etc/init.d/cgms status`

Note On completion of the upgrade process, restart the IoT FND container after replacing the files from backup to their original location.

```

Login to the FND container
[root@iot-fnd ~]# docker exec -it fnd-container /bin/bash
[root@fnd-server /]#
[root@fnd-server /]# cp /opt/cgms/server/cgms/conf/jbossas.keystore.password.bkpl
/opt/cgms/server/cgms/conf/jbossas.keystore.password
[root@fnd-server /]# cp /opt/cgms/server/cgms/conf/jbossas.keystore.bkpl
/opt/cgms/server/cgms/conf/jbossas.keystore
[root@fnd-server /]# cp /opt/cgms/server/cgms/conf/vault.keystore.bkpl
/opt/cgms/server/cgms/conf/vault.keystore
[root@fnd-server /]# cp /opt/cgms/server/cgms/conf/VAULT.dat.bkpl
/opt/cgms/server/cgms/conf/VAULT.dat
[root@fnd-server /]# cp /opt/cgms/server/cgms/deploy/security-service.xml.bkpl
/opt/cgms/server/cgms/deploy/security-service.xml
[root@fnd-server /]#exit
[root@fnd ~]# /opt/fnd/scripts/fnd-container.sh stop
[root@fnd ~]# /opt/fnd/scripts/fnd-container.sh start

```

Step 3 Log into IoT FND to check if the services are working fine.

For example, you can refresh the metrics for a couple of devices or add/delete devices using CSV.

Upgrading IoT FND from 4.5.1 to later releases and Updating RHEL OS

Note This procedure is applicable only when you want to upgrade IOT FND version from FND 4.5.1 to FND 4.9.x along with RHEL base OS upgrade.

Step 1 Download the latest 4.5.1-11 upgrade zip from [Cisco Download](#) page.

CISCO-IOTFND-VPI-K9-UPGRADE-SCRIPTS-4.5.1-11.zip

Step 2 Extract the file to get the rpm.

Step 3 Install the upgrade rpm using the following command.

```
rpm -ivh upgrade-ova-4.5.1-11.rpm
```

Step 4 Run the `./upgrade.sh` script in `/opt/fnd/scripts` directory.

Note You can skip the FND postgres rpm and FND influx upgrade rpm.

Step 5 To upgrade IoT FND from 4.5.1-11 to 4.7.2-8, download the latest 4.7.2-8 upgrade rpm from the Cisco Download page.

Step 6 Upgrade the upgrade-ova-4.7.2- 8.rpm using the following command.

```
rpm -Uvh upgrade-ova-4.7.2-8.rpm
```

Step 7 Run the `./upgrade.sh` script in `/opt/fnd/scripts` directory.

Note IoT FND OVA upgrade will NOT upgrade the RHEL OS version. After upgrading the OVA, it is recommended to upgrade the OS as well.

Step 8 Upgrade base OS from RHEL 7.5 to 7.9.

Step 9 To upgrade from IoT FND 4.7.2-8 to 4.9.x, download the latest 4.9.x upgrade rpm from [Cisco Download](#) page.

Step 10 Upgrade the upgrade-ova-4.9. x.rpm using the following command.

```
rpm -Uvh upgrade-ova-4.9.x.rpm
```

Step 11 Run the `./upgrade.sh` script in `/opt/fnd/scripts` directory.

Step 12 Upgrade base OS from RHEL 7.9 to 8.6.

Step 13 IoT FND 4.9.0 OVA is bundled with Postgres 12.9 rpms of rhel7. In order to upgrade Postgres 12.9 rpms of base OS rhel8 manually:

Note Starting from IoT FND 4.9.1 release, the postgres rpm upgrade is automated.

a) Run the following commands to uninstall the old Postgres (**rhel7**) rpms.

```
rpm -qa | grep postgres
rpm -e <postgresql12.9xxxx.rhel7.x86_64.rpm>
```

Note Keep the `cgms-postgres` rpm.

b) Download all the four Postgres dependent packages from the [YUM](#) link and place the packages in `/opt/` directory.

```
postgresql12-libs-12.9-1PGDG.rhel8.x86_64.rpm
postgresql12-12.9-1PGDG.rhel8.x86_64.rpm
postgresql12-server-12.9-1PGDG.rhel8.x86_64.rpm
postgresql12-contrib-12.9-1PGDG.rhel8.x86_64.rpm
```

c) Install all the above rpms in the same sequential order with the following command.

```
rpm -ivh <12.9.1PGDG.rhel8.rpm>
```

d) Make symlink with below command.

```
chkconfig postgresql-12 on
```

e) Start the postgres service:

```
service postgresql-12.service start
```

f) Check if the postgres status is Active (running):

```
service postgresql-12.service status
```

g) Reload all the required container with FND upgrade script by using 'Option 2) Container Reload'.

- Run the `./upgrade.sh` script in `/opt/fnd/scripts/` directory.

- Enter 2 to reload container.

```

[[root@bgl12-iot-fnd scripts]# cd /opt/fnd/scripts/
[[root@bgl12-iot-fnd scripts]# ./upgrade.sh

This script must be run with root privileges.
Usage: Load container images: No resource required
      For container reload: No resource required

1) Load container images
2) Container reload
3) Quit
Enter your choice: 2

```

- Enter 3 to quit menu.

- h) Run `./status.sh` script in `/opt/scripts/` directory to get the running status of all the required services.

```

[[root@bgl12-iot-fnd ~]# cd /opt/scripts/
[[root@bgl12-iot-fnd scripts]# ./status.sh

f6e0c5c313cb   fogd-container  1.64%    762.3MiB / 23.38GiB  3.18%    1.84MB / 3.45MB  106kB / 184kB  117
-----
[root@iot-fnd scripts]#
```

CHAPTER 10

Backup and Restore

You can export the entire OVA image file as backup, port it to different deployment or restore from an older image file.

- Step 1** Power down the OVA in vSphere Client.
 - Step 2** Select the **OVA**, and then select **File > Export > Export OVF Template**.
-

CHAPTER 11

Setting the Time and Timezone Using NTP Service

Use the **timedatectl** command on the Host VM to perform following operations to sync the time between the host and the docker:

- Displaying the Current Date and Time: **timedatectl**
- Changing the Current Time: **timedatectl set-time HH:MM:SS**
- Changing the Current Date: **timedatectl set-time YYYY-MM-DD**
- Listing the Time Zone: **timedatectl list - timezones**
- Changing the Time Zone: **timedatectl set-timezone time_zone**
- Enabling NTP Service: **timedatectl set-ntp yes**

```
[root@iot-fnd ~]# timedatectl
  Local time: Tue 2018-08-28 07:18:37 PDT
  Universal time: Tue 2018-08-28 14:18:37 UTC
     RTC time: Tue 2018-08-28 14:18:37
    Time zone: America/Los_Angeles (PDT, -0700)
  NTP enabled: yes
NTP synchronized: yes
  RTC in local TZ: no
     DST active: yes
Last DST change: DST began at
                  Sun 2018-03-11 01:59:59 PST
                  Sun 2018-03-11 03:00:00 PDT
Next DST change: DST ends (the clock jumps one hour backwards) at
                  Sun 2018-11-04 01:59:59 PDT
                  Sun 2018-11-04 01:00:00 PST
[root@iot-fnd ~]#
```
