

# Implementing HSRP

The Hot Standby Router Protocol (HSRP) is an IP routing redundancy protocol designed to allow for transparent failover at the first-hop IP router. HSRP provides high network availability, because it routes IP traffic from hosts on networks without relying on the availability of any single router. HSRP is used in a group of routers for selecting an active router and a standby router. (An active router is the router of choice for routing packets; a standby router is a router that takes over the routing duties when an active router fails, or when preset conditions are met.)

#### **Feature History for Implementing HSRP**

Release	Modification
Release 5.0.0	This feature was introduced.

GLBP is not supported on ASR9k.

# **Prerequisites for Implementing HSRP**

You must be in a user group associated with a task group that includes the proper task IDs. The command
reference guides include the task IDs required for each command. If you suspect user group assignment
is preventing you from using a command, contact your AAA administrator for assistance.

# **Restrictions for Implementing HSRP**

HSRP is supported on Ethernet interfaces, Ethernet sub-interfaces and Ethernet link bundles.

# **Information About Implementing HSRP**

To implement HSRP on Cisco IOS XR software software, you need to understand the following concepts:

### **HSRP Overview**

HSRP is useful for hosts that do not support a router discovery protocol (such as Internet Control Message Protocol [ICMP] Router Discovery Protocol [IRDP]) and cannot switch to a new router when their selected router reloads or loses power. Because existing TCP sessions can survive the failover, this protocol also provides a more transparent recovery for hosts that dynamically choose a next hop for routing IP traffic.

When HSRP is configured on a network segment, it provides a virtual MAC address and an IP address that is shared among a group of routers running HSRP. The address of this HSRP group is referred to as the *virtual IP address*. One of these devices is selected by the protocol to be the *active router*. The active router receives and routes packets destined for the MAC address of the group. For n routers running HSRP, n + 1 IP and MAC addresses are assigned.

HSRP detects when the designated active router fails, at which point a selected standby router assumes control of the MAC and IP addresses of the HSRP group. A new *standby router* is also selected at that time.

Devices that are running HSRP send and receive multicast User Datagram Protocol (UDP) based hello packets to detect router failure and to designate active and standby routers.

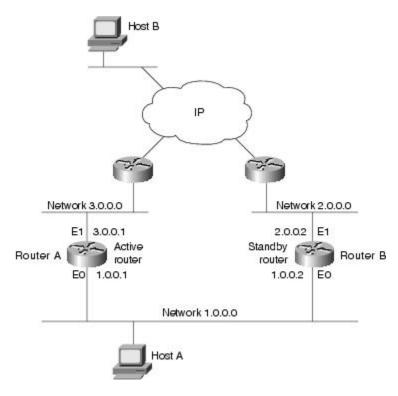

### **HSRP Groups**

An HSRP group consists of two or more routers running HSRP that are configured to provide hot standby services for one another. HSRP uses a priority scheme to determine which HSRP-configured router is to be the default active router. To configure a router as the active router, you assign it a priority that is higher than the priority of all the other HSRP-configured routers. The default priority is 100, so if you configure just one router to have a higher priority, that router will be the default active router.

HSRP works by the exchange of multicast messages that advertise priority among the HSRP group. When the active router fails to send a hello message within a configurable period of time, the standby router with the highest priority becomes the active router. The transition of packet-forwarding functions between routers is completely transparent to all hosts on the network.

Figure 1: Routers Configured as an HSRP Group, on page 3 shows routers configured as members of a single HSRP group.

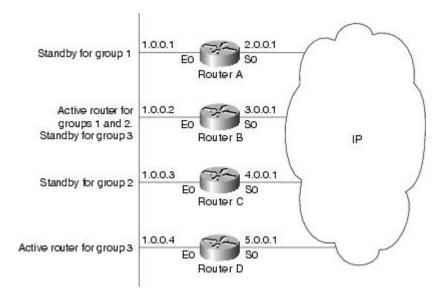

Figure 1: Routers Configured as an HSRP Group

All hosts on the network are configured to use the IP address of the virtual router (in this case, 1.0.0.3) as the default gateway.

A single router interface can also be configured to belong to more than one HSRP group. Figure 2: Routers Configured as Members of Multiple HSRP Groups, on page 4shows routers configured as members of multiple HSRP groups.

Figure 2: Routers Configured as Members of Multiple HSRP Groups

In Figure 2: Routers Configured as Members of Multiple HSRP Groups, on page 4, the Ethernet interface 0 of Router A belongs to group 1. Ethernet interface 0 of Router B belongs to groups 1, 2, and 3. The Ethernet interface 0 of Router C belongs to group 2, and the Ethernet interface 0 of Router D belongs to group 3. When you establish groups, you might want to align them along departmental organizations. In this case, group 1 might support the Engineering Department, group 2 might support the Manufacturing Department, and group 3 might support the Finance Department.

Router B is configured as the active router for groups 1 and 2 and as the standby router for group 3. Router D is configured as the active router for group 3. If Router D fails for any reason, Router B assumes the packet-transfer functions of Router D and maintains the ability of users in the Finance Department to access data on other subnets.

Note

A different virtual MAC address (VMAC) is required for each sub interface. VMAC is determined from the group ID. Therefore, a unique group ID is required for each sub interface configured, unless the VMAC is configured explicitly.

Note

We recommend that you disable Spanning Tree Protocol (STP) on switch ports to which the virtual routers are connected. Enable RSTP or rapid-PVST on the switch interfaces if the switch supports these protocols.

### **HSRP** and **ARP**

When a router in an HSRP group goes active, it sends a number of ARP responses containing its virtual IP address and the virtual MAC address. These ARP responses help switches and learning bridges update their port-to-MAC maps. These ARP responses also provide routers configured to use the burned-in address of the interface as its virtual MAC address (instead of the preassigned MAC address or the functional address) with a means to update the ARP entries for the virtual IP address. Unlike the gratuitous ARP responses sent to identify the interface IP address when an interface comes up, the HSRP router ARP response packet carries the virtual MAC address in the packet header. The ARP data fields for IP address and media address contain the virtual IP and virtual MAC addresses.

### **Preemption**

The HSRP preemption feature enables the router with highest priority to immediately become the active router. Priority is determined first by the priority value that you configure, and then by the IP address. In each case, a higher value is of greater priority.

When a higher-priority router preempts a lower-priority router, it sends a coup message. When a lower-priority active router receives a coup message or hello message from a higher-priority active router, it changes to the speak state and sends a resign message.

### **ICMP Redirect Messages**

Internet Control Message Protocol (ICMP) is a network layer Internet protocol that provides message packets to report errors and other information relevant to IP processing. ICMP provides many diagnostic functions and can send and redirect error packets to the host. When running HSRP, it is important to prevent hosts from discovering the interface (or real) MAC addresses of routers in the HSRP group. If a host is redirected by ICMP to the real MAC address of a router, and that router later fails, then packets from the host are lost.

ICMP redirect messages are automatically enabled on interfaces configured with HSRP. This functionality works by filtering outgoing ICMP redirect messages through HSRP, where the next-hop IP address may be changed to an HSRP virtual IP address.

To support ICMP redirects, redirect messages are filtered through HSRP, where the next-hop IP address is changed to an HSRP virtual address. When HSRP redirects are turned on, ICMP interfaces with HSRP do this filtering. HSRP keeps track of all HSRP routers by sending advertisements and maintaining a real IP address to virtual IP address mapping to perform the redirect filtering.

# **How to Implement HSRP**

This section contains instructions for the following tasks:

### **Enabling HSRP**

The hsrp ipv4 command activates HSRP on the configured interface. If an IP address is specified, that address is used as the designated address for the Hot Standby group. If no IP address is specified, the virtual address is learned from the active router. For HSRP to elect a designated router, at least one router in the Hot Standby

group must have been configured with, or learned, the designated address. Configuring the designated address on the active router always overrides a designated address that is currently in use.

### **SUMMARY STEPS**

- 1. configure
- 2. router hsrp
- **3. interface** type interface-path-id
- 4. address-family ipv4
- **5.** hsrp group-number version version-no
- **6.** address { learn | address [secondary] }
- 7. commit

	Command or Action	Purpose
Step 1	configure	
Step 2	router hsrp	Enables HSRP configuration mode.
	Example:	
	RP/0/RP0/CPU0:router(config)# router hsrp	
Step 3	interface type interface-path-id	Enables HSRP interface configuration mode on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp)# interface HundredGigE 0/2/0/1</pre>	
Step 4	address-family ipv4	Enables HSRP address-family configuration mode on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp-if)# address-family ipv4</pre>	
Step 5	hsrp group-number version version-no	Enables HSRP group submode.
	Example:	Note The version keyword is available only if IPv4 address-family is selected. By default, version is set to 2
<pre>RP/0/RP0/CPU0:router(config-hsrp-ipv4)# hsrp 1 version 1</pre>	for IPv6 address families.	
Step 6	address { learn   address [secondary] }	Activates HSRP on the configured interface.
	<pre>Example:  RP/0/RP0/CPU0:router(config-hsrp-gp)# address learn</pre>	<ul> <li>If an IP address is specified, that address is used as the designated address for the Hot Standby group. If no IP address is specified, the virtual address is learned from the active router.</li> </ul>

	Command or Action	Purpose
		Note If you configure HSRP for IPv6, you must configure a l local IPv6 address or enable it using the autoconfig keyword. If you do not configure a linklocal IPv6 address the router does not accept the configuration when you commit your changes using the commit keyword.
Step 7	commit	

## **Enabling HSRP for IPv6**

Use the following steps to enable HSRP for IPv6.

### **SUMMARY STEPS**

- 1. configure
- 2. router hsrp
- **3. interface** *type interface-path-id*
- 4. address-family ipv6
- **5. hsrp** *group-number*
- **6.** address linklocal {autoconfig | ipv6-address}
- 7. address global ipv6-address
- 8. commit

	Command or Action	Purpose
Step 1	configure	
Step 2	router hsrp	Enables HSRP configuration mode.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config)# router hsrp</pre>	
Step 3	interface type interface-path-id	Enables HSRP interface configuration mode on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp)# interface HundredGigE 0/2/0/1</pre>	

address-family ipv6	
address immy ip to	Enables HSRP address-family configuration mode on a specific interface.
Example:	
RP/0/RP0/CPU0:router(config-hsrp-if)# address-family ipv6	
hsrp group-number	Enables HSRP group submode.
Example:	<b>Note</b> The <b>version</b> keyword is available only if IPv4 address-family is selected. By default, version is set to 2 for IPv6 address
<pre>RP/0/RP0/CPU0:router(config-hsrp-ipv4)# hsrp 1</pre>	families.
	Activates HSRP on the configured interface and assigns a linklocal IPv6 address.
	• The virtual linklocal address must not match any other virtual
	linklocal address that is already configured for a different group.
	The virtual linklocal address must not match the interface linklocal IPv6 address.
	If you use the <b>autoconfig</b> keyword, the linklocal address is calculated using the EUI-64 format.
	Use the <b>legacy-compatible</b> keyword to be compatible with Cisco IOS and other legacy Cisco devices.
address global ipv6-address	Activates HSRP on the configured interface and assigns a global IPv6 address.
Example:	Note If you configure HSRP for IPv6, you must configure a link
RP/0/RP0/CPU0:router(config-hsrp-gp)# address global 2001:DB8:A:B::1	local IPv6 address or enable it using the <b>autoconfig</b> keyword. If you do not configure a linklocal IPv6 address, the router does not accept the configuration when you commit your changes using the <b>commit</b> keyword.
commit	
	RP/0/RP0/CPU0:router(config-hsrp-if) # address-family ipv6  hsrp group-number  Example:  RP/0/RP0/CPU0:router(config-hsrp-ipv4) # hsrp 1  address linklocal {autoconfig   ipv6-address}}  Example:  RP/0/RP0/CPU0:router(config-hsrp-gp) # address linklocal autoconfig  address global ipv6-address  Example:  RP/0/RP0/CPU0:router(config-hsrp-gp) # address global 2001:DB8:A:B::1

## **Configuring HSRP Group Attributes**

To configure other Hot Standby group attributes that affect how the local router participates in HSRP, use the following procedure in interface configuration mode as needed:

### **SUMMARY STEPS**

- 1. configure
- 2. router hsrp
- 3. interface type interface-path-id
- 4. hsrp use-bia
- 5. address-family ipv4
- **6.** hsrp group-number version version-no
- **7. priority** *priority*
- **8.** track type instance [priority-decrement]
- **9. preempt** [**delay** *seconds*]
- 10. authentication string
- 11. mac-address address
- 12. commit

	Command or Action	Purpose
Step 1	configure	
Step 2	router hsrp	Enables HSRP configuration mode.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config)# router hsrp</pre>	
Step 3	interface type interface-path-id	Enables HSRP interface configuration mode on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp)# interface HundredGigE 0/2/0/1</pre>	
Step 4	hsrp use-bia	(Optional) Configures the HSRP to use the burned-in address of the interface as its virtual MAC address, instead of the preassigned MAC address or the
	Example:	functional address.
	<pre>RP/0/RP0/CPU0:router(config-hsrp-if)# hsrp use-bia</pre>	<ul> <li>Enter the use-bia command on an interface when there are devices that reject Address Resolution Protocol (ARP) replies with source hardware addresses set to a functional address.</li> </ul>
		• To restore the default virtual MAC address, use the <b>no hsrp use-bia</b> command.

	Command or Action	Purpose
Step 5	address-family ipv4	Enables HSRP address-family configuration mode on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp-if)# address-family ipv4</pre>	
Step 6	hsrp group-number version version-no	Enables HSRP group submode.
	Example:	Note The version keyword is available only if IPv4 address-family is selected. By default, version is set to 2 for IPv6 address families.
	<pre>RP/0/RP0/CPU0:router(config-hsrp-ipv4)# hsrp 1 version 1</pre>	
Step 7	priority priority	(Optional) Configures HSRP priority.
	<pre>Example:     RP/0/RP0/CPU0:router(config-hsrp-gp)#     priority 100</pre>	<ul> <li>The assigned priority is used to help select the active and standby routers. Assuming that preemption is enabled, the router with the highest priority becomes the designated active router. In case of ties, the primary IP addresses are compared, and the higher IP address has priority.</li> </ul>
		• The priority of the device can change dynamically if an interface is configured with the <b>track</b> command and another interface on the device goes down.
		<ul> <li>If preemption is not enabled using the preempt command, the router may not become active even though it might have a higher priority than other HSRP routers.</li> </ul>
		To restore the default HSRP priority values, use the <b>no priority</b> command.
Step 8	track type instance [priority-decrement]	(Optional) Configures an interface so that the Hot Standby priority changes on the basis of the availability of other interfaces.
	Example:  RP/0/RP0/CPU0:router(config-hsrp-gp)# track HundredGigE 0/3/0/1	• When a tracked interface goes down, the Hot Standby priority decreases by 10. If an interface is not tracked, its state changes do not affect the Hot Standby priority. For each interface configured for Hot Standby, you can configure a separate list of interfaces to be tracked.
		• The optional <i>priority-decrement</i> argument specifies by how much to decrement the Hot Standby priority when a tracked interface goes down. When the tracked interface comes back up, the priority is incrementally increased by the same amount.
		• When multiple tracked interfaces are down and the <i>priority-decrement</i> argument has been configured, these configured priority decrements are cumulative. If tracked interfaces are down, but none of them were configured with priority decrements, the default decrement is 10 and it is cumulative.
		• The <b>preempt</b> command must be used in conjunction with this command on all routers in the group whenever the best available router

	Command or Action	Purpose
		should be used to forward packets. If the <b>preempt</b> command is not used, the active router stays active, regardless of the current priorities of the other HSRP routers.
		• To remove the tracking, use the <b>no preempt</b> command.
Step 9	preempt [delay seconds]	(Optional) Configures HSRP preemption and preemption delay.
	<pre>Example: RP/0/RP0/CPU0:router(config-hsrp-gp)# preempt</pre>	<ul> <li>When you configure preemption and preemption delay with the     preempt command, the local router attempts to assume control as the     active router when the local router has a Hot Standby priority higher     than the current active router. If the preempt command is not     configured, the local router assumes control as the active router only     if it receives information indicating that no router is currently in the     active state (acting as the designated router).</li> </ul>
		<ul> <li>When a router first comes up, it does not have a complete routing table.         If it is configured to preempt, it becomes the active router, yet it is unable to provide adequate routing services. This problem can be solved by configuring a delay before the preempting router actually preempts the currently active router.     </li> </ul>
		• The preempt <i>delay seconds</i> value does not apply if there is no router currently in the active state. In this case, the local router becomes active after the appropriate timeouts (see the <b>timers</b> command), regardless of the preempt delay seconds value.
		• To restore the default HSRP preemption and preemption delay values use the <b>no preempt</b> command.
Step 10	authentication string	(Optional) Configures an authentication string for the Hot Standby Router Protocol (HSRP).
	<pre>Example:     RP/0/RP0/CPU0:router(config-hsrp-gp)#     authentication company1</pre>	<ul> <li>The authentication string is sent unencrypted in all HSRP messages.</li> <li>The same authentication string must be configured on all routers and access servers on a LAN to ensure interoperation.</li> </ul>
		<ul> <li>Authentication mismatch prevents a device from learning the designated Hot Standby IP address and the Hot Standby timer values from other routers configured with HSRP.</li> </ul>
		<ul> <li>Authentication mismatch does not prevent protocol events such as one router taking over as the designated router.</li> </ul>
		<ul> <li>To delete an authentication string, use the no authentication command.</li> </ul>
Step 11	mac-address address	(Optional) Specifies a virtual MAC address for the HSRP.

	Command or Action	Purpose
	Example:  RP/0/RP0/CPU0:router(config-hsrp-if)# mac-address 4000.1000.1060	<ul> <li>• We do not recommend this command, except for IBM networking environments in which first-hop redundancy is based on being able to use a virtual MAC address, and in which you cannot change the first-hop addresses in the PCs that are connected to an Ethernet switch.</li> <li>• HSRP is used to help end stations locate the first-hop gateway for IP routing. The end stations are configured with a default gateway. However, HSRP can provide first-hop redundancy for other protocols. Some protocols, such as Advanced Peer-to-Peer Networking (APPN), use the MAC address to identify the first-hop for routing purposes. In this case, it is often necessary to specify the virtual MAC address; the virtual IP address is unimportant for these protocols. Use the mac-address command to specify the virtual MAC address.</li> </ul>
		The MAC address specified is used as the virtual MAC address when the router is active.
		The mac-address command is intended for certain APPN configurations.
		• In an APPN network, an end node is typically configured with the MAC address of the adjacent network node. Use the <b>mac-address</b> command in the routers to set the virtual MAC address to the value used in the end nodes.
		• Enter the <b>no mac-address</b> command to revert to the standard virtual MAC address (0000.0C07.ACn).
Step 12	commit	

### **Configuring the HSRP Activation Delay**

The activation delay for HSRP is designed to delay the startup of the state machine when an interface comes up. This give the network time to settle and avoids unnecessary state changes early after the link comes up.

### **SUMMARY STEPS**

- 1. configure
- 2. router hsrp
- 3. interface type interface-path-id
- 4. hsrp delay minimum seconds reload seconds
- 5. address-family ipv4
- 6. hsrp group-number version version-no
- 7. address { learn | address [secondary] }
- 8. commit

	Command or Action	Purpose
Step 1	configure	
Step 2	router hsrp	Enables HSRP configuration mode.
	Example:	
	RP/0/RP0/CPU0:router(config)# router hsrp	
Step 3	interface type interface-path-id	Enables HSRP interface configuration mode on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp)# interface HundredGigE 0/2/0/1</pre>	
Step 4	hsrp delay minimum seconds reload seconds	Delays the startup of the state machine when an interface comes up, so that the network has time to settle and there are no unnecessary
	Example:	state changes early after the link comes up. The reload delay is the
	RP/0/RP0/CPU0:router(config-hsrp-if)#hsrp delay minimum 2 reload 10	delay applied after the first interface up event. The minimum delay is the delay that is applied after any subsequent interface up event (if the interface flaps).
Step 5	address-family ipv4	Enables HSRP address-family configuration mode on a specific interface.
	Example:	interruce.
	RP/0/RP0/CPU0:router(config-hsrp-if)# address-family ipv4	
Step 6	hsrp group-number version version-no	Enables HSRP group submode.
	Example:	Note The version keyword is available only if IPv4 address-family is selected. By default, version is set to 2 for
	<pre>RP/0/RP0/CPU0:router(config-hsrp-ipv4)# hsrp 1 version 1</pre>	IPv6 address families.
Step 7	address { learn   address [secondary] }	Activates HSRP on the configured interface.
	Example:	<ul> <li>If an IP address is specified, that address is used as the designated address for the Hot Standby group. If no IP add</li> </ul>
	<pre>RP/0/RP0/CPU0:router(config-hsrp-gp)# address learn</pre>	is specified, the virtual address is learned from the active router.
		Note If you configure HSRP for IPv6, you must configure a link local IPv6 address or enable it using the autoconfig keyword. If you do not configure a linklocal IPv6 address, the router does not accept the configuration when you commit your changes using the commit keyword.
Step 8	commit	

### **Enabling HSRP Support for ICMP Redirect Messages**

By default, HSRP filtering of ICMP redirect messages is enabled on routers running HSRP.

To configure the reenabling of this feature on your router if it is disabled, use the **hsrp redirects** command in interface configuration mode.

#### **SUMMARY STEPS**

- 1. configure
- 2. router hsrp
- 3. interface type interface-path-id
- 4. hsrp redirects disable
- 5. address-family ipv4
- 6. hsrp group-number version version-no
- 7. address { learn | address [secondary] }
- 8. commit

	Command or Action	Purpose
Step 1	configure	
Step 2	router hsrp	Enables HSRP configuration mode.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config)# router hsrp</pre>	
Step 3	interface type interface-path-id	Enables HSRP interface configuration mode on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp)# interface HundredGigE 0/2/0/1</pre>	
Step 4	hsrp redirects disable	Configures Internet Control Message Protocol (ICMP) redirect messages to be sent when the Hot Standby Router Protocol (HSRP) is configured
	Example:	on an interface.
	<pre>RP/0/RP0/CPU0:router(config-hsrp-if)# hsrp redirects</pre>	<ul> <li>The hsrp redirects command can be configured on a per-interface basis. When HSRP is first configured on an interface, the setting for that interface inherits the global value. If ICMP redirects have been explicitly disabled on an interface, then the global command cannot reenable the functionality.</li> </ul>
		<ul> <li>With the hsrp redirects command enabled, ICMP redirect messages are filtered by replacing the real IP address in the next-hop address of the redirect packet with a virtual IP address, if it is known to HSRP.</li> </ul>

	Command or Action	Purpose
		To revert to the default, which is that ICMP messages are enabled, use the <b>no hsrp redirects</b> command.
Step 5	address-family ipv4	Enables HSRP address-family configuration mode on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp-if)# address-family ipv4</pre>	
Step 6	hsrp group-number version version-no	Enables HSRP group submode.
	Example:	Note The version keyword is available only if IPv4 address-family is selected. By default, version is set to 2 for IPv6 address
	<pre>RP/0/RP0/CPU0:router(config-hsrp-ipv4)# hsrp 1 version 1</pre>	families.
Step 7	address { learn   address [secondary] }	Activates HSRP on the configured interface.
	<pre>Example:     RP/0/RP0/CPU0:router(config-hsrp-qp)#</pre>	<ul> <li>If an IP address is specified, that address is used as the designated address for the Hot Standby group. If no IP address is specified, the virtual address is learned from the active router.</li> </ul>
	address learn	Note If you configure HSRP for IPv6, you must configure a link local IPv6 address or enable it using the <b>autoconfig</b> keyword. If you do not configure a linklocal IPv6 address, the router does not accept the configuration when you commit your changes using the <b>commit</b> keyword.
Step 8	commit	

### **Multiple Group Optimization (MGO) for HSRP**

**Multiple Group Optimization** provides a solution for reducing control traffic in a deployment consisting of many subinterfaces. By running the HSRP control traffic for just one of the sessions, the control traffic is reduced for the subinterfaces with identical redundancy requirements. All other sessions are slaves of this primary session, and inherit their states from it.

### **Customizing HSRP**

Customizing the behavior of HSRP is optional. Be aware that as soon as you enable a HSRP group, that group is in operation.

#### **SUMMARY STEPS**

- 1. configure
- 2. router hsrp
- 3. interface type interface-path-id
- 4. address-family ipv4
- 5. hsrp group-no version version-no
- 6. name name
- 7. address { learn | address}
- 8. address address secondary
- 9. authentication string
- 10. bfd fast-detect
- 11. mac-address address
- 12. hsrp group-no slave
- **13. follow** *mgo-session-name*
- 14. address ip-address
- 15. commit

	Command or Action	Purpose
Step 1	configure	
Step 2	router hsrp	Enables HSRP configuration mode.
	Example:	
	RP/0/RP0/CPU0:router(config)# router hsrp	
Step 3	interface type interface-path-id	Enables HSRP interface configuration mode on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp)# interface HundredGigE 0/2/0/1</pre>	
Step 4	address-family ipv4	Enables HSRP address-family configuration mode on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp-if)# address-family ipv4</pre>	
Step 5	hsrp group-no version version-no	Enables HSRP group configuration mode on a specific interface.
	Example:	<b>Note</b> The <b>version</b> keyword is available only if IPv4
	<pre>RP/0/RP0/CPU0:router(config-hsrp-ipv4)# hsrp 1 version 2</pre>	address family is selected By default version is

	Command or Action	Purpose
Step 6	name name	Configures an HSRP session name.
	Example:	
	RP/0/RP0/CPU0:router(config-hsrp-gp) # name s1	
Step 7	address { learn   address}	Enables hot standby protocol for IP.
	Example:	<ul> <li>If an IP address is specified, that address is used as the designated address for the Hot Standby group.</li> </ul>
	<pre>RP/0/RP0/CPU0:router(config-hsrp-gp) # address learn</pre>	If no IP address is specified, the virtual address is learned from the active router.
Step 8	address address secondary	Configures the secondary virtual IPv4 address for a router
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp-gp)# address 10.20.30.1 secondary</pre>	
Step 9	authentication string	Configures an authentication string for the Hot Standby Router Protocol (HSRP).
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp-gp)# authentication company1</pre>	
Step 10	bfd fast-detect	Enables bidirectional forwarding(BFD) fast-detection or a HSRP interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp-gp)# bfd fast-detect</pre>	
Step 11	mac-address address	Specifies a virtual MAC address for the Hot Standby Router Protocol (HSRP).
	Example:	router riototor (ribra ).
	RP/0/RP0/CPU0:router(config-hsrp-gp)# mac-address 4000.1000.1060	
Step 12	hsrp group-no slave	Enables HSRP slave configuration mode on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp-gp)# hsrp 2 slave</pre>	

	Command or Action	Purpose
Step 13	follow mgo-session-name	Instructs the slave group to inherit its state from a specified group.
	Example:	
	RP/0/RP0/CPU0:router(config-hsrp-slave)# follow s1	
Step 14	address ip-address	Configures the primary virtual IPv4 address for the slave group.
	Example:	
	RP/0/RP0/CPU0:router(config-hsrp-slave)# address 10.3.2.2	
Step 15	commit	

## **Configuring a Primary Virtual IPv4 Address**

To enable hot standby protocol for IP, use the address (hsrp) command in the HSRP group submode.

### **SUMMARY STEPS**

- 1. configure
- 2. router hsrp
- **3. interface** *type interface-path-id*
- 4. address-family ipv4
- 5. hsrp group-noversion version-no
- 6. address { learn | address}
- 7. commit

	Command or Action	Purpose
Step 1	configure	
Step 2	router hsrp	Enables HSRP configuration mode.
	Example:	
	RP/0/RP0/CPU0:router(config)# router hsrp	

	Command or Action	Purpose
Step 3	interface type interface-path-id	Enables HSRP interface configuration mode on a specific interface.
	Example:	
	RP/0/RP0/CPU0:router(config-hsrp)# interface HundredGigE 0/2/0/1	
Step 4	address-family ipv4	Enables HSRP address-family configuration mode on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp-if)# address-family ipv4</pre>	
Step 5	hsrp group-noversion version-no	Enables HSRP group configuration mode on a specific interface.
	Example:	Note • The version keyword is available only if
	<pre>RP/0/RP0/CPU0:router(config-hsrp-ipv4) # hsrp 1 version 2</pre>	IPv4 address-family is selected. By default, version is set to 2 for IPv6 address families.
		• HSRP version 2 provides an extended group range of 0-4095.
Step 6	address { learn   address}	Enables hot standby protocol for IP.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp-ipv4) # address learn</pre>	
Step 7	commit	

## **Configuring a Secondary Virtual IPv4 Address**

To configure the secondary virtual IPv4 address for a router, use the **address secondary** command in the Hot Standby Router Protocol (HSRP) virtual router submode.

### **SUMMARY STEPS**

- 1. configure
- 2. router hsrp
- **3. interface** *type interface-path-id*
- 4. address-family ipv4
- 5. hsrp group-noversion version-no
- 6. address address secondary
- 7. commit

### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	configure	
Step 2	router hsrp	Enables HSRP configuration mode.
	Example:	
	RP/0/RP0/CPU0:router(config)# router hsrp	
Step 3	interface type interface-path-id	Enables HSRP interface configuration mode on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp)# interface HundredGigE 0/2/0/1</pre>	
Step 4	address-family ipv4	Enables HSRP address-family configuration mode on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp-if)# address-family ipv4</pre>	
Step 5	hsrp group-noversion version-no	Enables HSRP group configuration mode on a specific interface.
	<pre>Example:  RP/0/RP0/CPU0:router(config-hsrp-ipv4) # hsrp 1   version 2</pre>	• The <b>version</b> keyword is available only if IPv4 address-family is selected. By default, version is set to 2 for IPv6 address families.
		• HSRP version 2 provides an extended group range of 0-4095.
Step 6	address address secondary	Configures the secondary virtual IPv4 address for a router.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp-ipv4)# address 10.20.30.1 secondary</pre>	
Step 7	commit	

# Configuring a slave follow

To instruct the slave group to inherit its state from a specified group, use the **slave follow** command in HSRP slave submode mode.

### **SUMMARY STEPS**

- 1. configure
- 2. router hsrp
- **3. interface** *type interface-path-id*
- 4. address-family ipv4
- 5. hsrp group-no slave
- **6. follow** *mgo-session-name*
- 7. commit

	Command or Action	Purpose
Step 1	configure	
Step 2	router hsrp	Enables HSRP configuration mode.
	Example:	
	RP/0/RP0/CPU0:router(config)# router hsrp	
Step 3	interface type interface-path-id	Enables HSRP interface configuration mode on a specific interface.
	Example:	
	RP/0/RP0/CPU0:router(config-hsrp)# interface HundredGigE 0/2/0/1	
Step 4	address-family ipv4	Enables HSRP address-family configuration mode on a specific interface.
	Example:	1
	<pre>RP/0/RP0/CPU0:router(config-hsrp-if) # address-family ipv4</pre>	
Step 5	hsrp group-no slave	Enables HSRP slave configuration mode on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp-ipv4) # hsrp 2 slave</pre>	
Step 6	follow mgo-session-name	Instructs the slave group to inherit its state from a specified group.
	Example:	
	RP/0/RP0/CPU0:router(config-hsrp-slave) # follow m1	
Step 7	commit	

OL-32717-01

### **Configuring a slave primary virtual IPv4 address**

To configure the primary virtual IPv4 address for the slave group, use the **slave primary virtual IPv4 address** command in the HSRP slave submode.

#### **SUMMARY STEPS**

- 1. configure
- 2. router hsrp
- 3. interface type interface-path-id
- 4. address-family ipv4
- 5. hsrp group-no slave
- 6. address ip-address
- 7. commit

	Command or Action	Purpose
Step 1	configure	
Step 2	router hsrp	Enables HSRP configuration mode.
	Example:	
	RP/0/RP0/CPU0:router(config)# router hsrp	
Step 3	interface type interface-path-id	Enables HSRP interface configuration mode on a specific interface.
	Example:	
	RP/0/RP0/CPU0:router(config-hsrp)# interface HundredGigE 0/2/0/1	
Step 4	address-family ipv4	Enables HSRP address-family configuration mode on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp-if)# address-family ipv4</pre>	
Step 5	hsrp group-no slave	Enables HSRP slave configuration mode on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp-ipv4)# hsrp 2 slave</pre>	

	Command or Action	Purpose
Step 6	address ip-address	Configures the primary virtual IPv4 address for the slave group.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp-slave)# address 10.2.3.2</pre>	
Step 7	commit	

### Configuring a Secondary Virtual IPv4 address for the Slave Group

Perform this task to configure the secondary virtual IPv4 address for the slave group.

### **SUMMARY STEPS**

- 1. configure
- 2. router hsrp
- 3. interface type interface-path-id
- 4. address-family ipv4
- 5. hsrp group-no slave
- 6. address address secondary
- 7. commit

	Command or Action	Purpose
Step 1	configure	
Step 2	router hsrp	Enables HSRP configuration mode.
	Example:	
	RP/0/RP0/CPU0:router(config)# router hsrp	
Step 3	interface type interface-path-id	Enables HSRP interface configuration mode on a specific interface.
	Example:	
	RP/0/RP0/CPU0:router(config-hsrp)# interface HundredGigE 0/2/0/1	

Command or Action	Purpose
address-family ipv4	Enables HSRP address-family configuration mode on a specific interface.
Example:	
<pre>RP/0/RP0/CPU0:router(config-hsrp-if)# address-family ipv4</pre>	
hsrp group-no slave	Enables HSRP slave configuration mode on a specific interface.
Example:	
<pre>RP/0/RP0/CPU0:router(config-hsrp-address-family)# hsrp 2 slave</pre>	
address address secondary	Configures the secondary virtual IPv4 address for a router.
Example:	
<pre>RP/0/RP0/CPU0:router(config-hsrp-slave)# address 10.20.30.1 secondary</pre>	
commit	
	address-family ipv4  Example:  RP/0/RP0/CPU0:router(config-hsrp-if)# address-family ipv4  hsrp group-no slave  Example:  RP/0/RP0/CPU0:router(config-hsrp-address-family)# hsrp 2 slave  address address secondary  Example:  RP/0/RP0/CPU0:router(config-hsrp-slave)# address 10.20.30.1 secondary

## **Configuring a slave virtual mac address**

To configure the virtual MAC address for the slave group, use the **slave virtual mac address** command in the HSRP slave submode.

### **SUMMARY STEPS**

- 1. configure
- 2. router hsrp
- 3. interface type interface-path-id
- 4. address-family ipv4
- 5. hsrp group-no slave
- 6. mac-address address
- 7. commit

	Command or Action	Purpose
Step 1	configure	

	Command or Action	Purpose
Step 2	router hsrp	Enables HSRP configuration mode.
	Example:	
	RP/0/RP0/CPU0:router(config)# router hsrp	
Step 3	interface type interface-path-id	Enables HSRP interface configuration mode on a specific interface.
	Example:	
	RP/0/RP0/CPU0:router(config-hsrp)# interface HundredGigE 0/2/0/1	
Step 4	address-family ipv4	Enables HSRP address-family configuration mode on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp-if)# address-family ipv4</pre>	
Step 5	hsrp group-no slave	Enables HSRP slave configuration mode on a specific interface.
	Example:	
	RP/0/RP0/CPU0:router(config-hsrp-ipv4)# hsrp 2 slave	
Step 6	mac-address address	Configures the virtual MAC address for the slave
	Example:	group.
	<pre>RP/0/RP0/CPU0:router(config-hsrp-slave)# mac-address 10.20.30</pre>	
Step 7	commit	

## **Configuring an HSRP Session Name**

To configure an HSRP session name, use the **session name** command in the HSRP group submode.

### **SUMMARY STEPS**

- 1. configure
- 2. router hsrp
- **3. interface** *type interface-path-id*
- 4. address-family ipv4
- 5. hsrp group-noversion version-no
- 6. name name
- 7. commit

#### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	configure	
Step 2	router hsrp	Enables HSRP configuration mode.
	Example:	
	RP/0/RP0/CPU0:router(config)# router hsrp	
Step 3	interface type interface-path-id	Enables HSRP interface configuration mode on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp)# interface HundredGigE 0/2/0/1</pre>	
Step 4	address-family ipv4	Enables HSRP address-family configuration mode on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp-if) # address-family ipv4</pre>	
Step 5	hsrp group-noversion version-no	Enables HSRP group configuration mode on a specific interface.
	Example:	Note • The version keyword is available only if
	<pre>RP/0/RP0/CPU0:router(config-hsrp-ipv4) # hsrp 1 version 2</pre>	IPv4 address-family is selected. By default, version is set to 2 for IPv6 address families.
		• HSRP version 2 provides an extended group range of 0-4095.
Step 6	name name	Configures an HSRP session name.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp-ipv4) # name s1</pre>	
Step 7	commit	

### **BFD for HSRP**

Bidirectional Forwarding Detection (BFD) is a network protocol used to detect faults between two forwarding engines. BFD sessions can operate in one of the two modes, namely, asynchronous mode or demand mode. In asynchronous mode, both endpoints periodically send hello packets to each other. If a number of those packets are not received, the session is considered down. In demand mode, it is not mandatory to exchange hello packets; either of the hosts can send hello messages, if needed. Cisco supports the BFD asynchronous mode.

### **Advantages of BFD**

- BFD provides failure detection in less than one second.
- BFD supports all types of encapsulation.
- BFD is not tied to any particular routing protocol, supports almost all routing protocols.

### **BFD Process**

HSRP uses BFD to detect link failure and facilitate fast failover times without excessive control packet overhead.

The HSRP process creates BFD sessions as required. When a BFD session goes down, each Standby group monitoring the session transitions to Active state.

HSRP does not participate in any state elections for 10 seconds after a transition to Active state triggered by a BFD session going down.

### **Configuring BFD**

For HSRP, configuration is applied under the existing HSRP-interface sub-mode, with BFD fast failure configurable per HSRP group and the timers (minimum-interface and multiplier) configurable per interface. BFD fast failure detection is disabled by default.

### **Enabling BFD**

#### **SUMMARY STEPS**

- 1. configure
- 2. router hsrp
- **3. interface** *type interface-path-id*
- 4. address-family ipv4
- **5. hsrp** [group number] **version** version-no **bfd fast-detect** [**peer ipv4** ipv4-address interface-type interface-path-id]
- 6. commit

	Command or Action	Purpose
Step 1	configure	

	Command or Action	Purpose
Step 2	router hsrp	Enables HSRP configuration mode.
	Example:	
	RP/0/RP0/CPU0:router(config)# router hsrp	
Step 3	interface type interface-path-id	Enables HSRP interface configuration mode on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp)# interface HundredGigE 0/2/0/1</pre>	
Step 4	address-family ipv4	Enables HSRP address-family configuration mode on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp-if)# address-family ipv4</pre>	
Step 5	hsrp [group number] version version-no bfd fast-detect	Enables fast detection on a specific interface.
	[peer ipv4 ipv4-address interface-type interface-path-id]	Note • The version keyword is available only if
	Example:	IPv4 address-family is selected. By default, version is set to 2 for IPv6
	RP/0/RP0/CPU0:router(config-hsrp-ipv4)# hsrp 1	address families.
	version 2 bfd fast-detect peer ipv4 10.3.5.2 HundredGigE 0/3/4/2	• HSRP version 2 provides an extended group range of 0-4095.
Step 6	commit	

### **Modifying BFD timers (minimum interval)**

Minimum interval determines the frequency of sending BFD packets to BFD peers (in milliseconds). The default minimum interval is 15ms.

### **SUMMARY STEPS**

- 1. configure
- 2. router hsrp
- 3. interface type interface-path-id
- 4. hsrp bfd minimum-interval interval
- 5. address-family ipv4
- 6. commit

#### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	configure	
Step 2	router hsrp	Enables HSRP configuration mode.
	Example:	
	RP/0/RP0/CPU0:router(config)# router hsrp	
Step 3	interface type interface-path-id	Enables HSRP interface configuration mode on a specific interface.
	Example:	
	RP/0/RP0/CPU0:router(config-hsrp)# interface HundredGigE 0/2/0/1	
Step 4	hsrp bfd minimum-interval interval	Sets the minimum interval to the specified period.
	Evample	The interval is in milliseconds; range is 15 to 30000 milliseconds.
	Example:	mmsconds.
	<pre>RP/0/RP0/CPU0:router(config-hsrp-if)# hsrp bfd minimum-interval 20</pre>	
Step 5	address-family ipv4	Enables HSRP address-family configuration mode
		on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp-if)# address-family ipv4</pre>	
Step 6	commit	

### **Modifying BFD timers (multiplier)**

Multiplier is the number of consecutive BFD packets which must be missed from a BFD peer before declaring that peer unavailable. The default multiplier is 3.

#### **SUMMARY STEPS**

- 1. configure
- 2. router hsrp
- 3. interface type interface-path-id
- 4. hsrp bfd multiplier multiplier
- 5. address-family ipv4
- 6. commit

#### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	configure	
Step 2	router hsrp	Enables HSRP configuration mode.
	Example:	
	RP/0/RP0/CPU0:router(config)# router hsrp	
Step 3	interface type interface-path-id	Enables HSRP interface configuration mode on a specific interface.
	Example:	
	RP/0/RP0/CPU0:router(config-hsrp)# interface HundredGigE 0/2/0/1	
Step 4	hsrp bfd multiplier multiplier	Sets the multiplier to the value. Range is 2 to 50.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp-if)# hsrp bfd multiplier 30</pre>	
Step 5	address-family ipv4	Enables HSRP address-family configuration mode on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp-if)# address-family ipv4</pre>	
Step 6	commit	

# **Enhanced Object Tracking for HSRP and IP Static**

A failure between the active router and the core network cannot be detected using standard HSRP failure detection mechanisms. Object tracking is used to detect such failures. When such a failure occurs, the active router applies a priority decrement to its HSRP session. If this causes its priority to fall below that of the standby router, it will detect this from the HSRP control traffic, and then use this as a trigger to preempt and take over the active role.

The enhanced object tracking for HSRP and IP Static feature provides first-hop redundancy as well as default gateway selection based on IP Service Level Agreement (IPSLA).

See the *Routing Configuration Guide for Cisco NCS 6000 Series Routers*, for more information about enhanced object tracking for static routes.

OL-32717-01

## **Configuring object tracking for HSRP**

To enable tracking of the named object with the specified decrement, use the following configuration in the HSRP group sub mode.

### **SUMMARY STEPS**

- 1. configure
- 2. router hsrp
- **3. interface** type interface-path-id
- 4. address-family ipv4
- **5.** hsrp group-number version version-no
- **6.** track object name [priority-decrement]
- 7. commit

	Command or Action	Purpose
Step 1	configure	
Step 2	router hsrp	Enables HSRP configuration mode.
	Example:	
	RP/0/RP0/CPU0:router(config)# router hsrp	
Step 3	interface type interface-path-id	Enables HSRP interface configuration mode on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp)# interface HundredGigE 0/2/0/1</pre>	
Step 4	address-family ipv4	Enables HSRP address-family configuration mode on a specific interface.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp-if)# address-family ipv4</pre>	
Step 5	hsrp group-number version version-no	Enables HSRP group submode.
	Example:	Note The version keyword is available only if IPv4 address-family is selected. By default, version
	<pre>RP/0/RP0/CPU0:router(config-hsrp-ipv4)# hsrp 1 version 1</pre>	is set to 2 for IPv6 address families.

	Command or Action	Purpose
Step 6	track object name [priority-decrement]	Enable tracking of the named object with the specified decrement.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-hsrp-gp)# track object t1 2</pre>	
Step 7	commit	

# **Hot Restartability for HSRP**

In the event of failure of a HSRP process in one active group, forced failovers in peer HSRP active router groups should be prevented. Hot restartability supports warm RP failover without incurring forced failovers to peer HSRP routers for active groups.

# Configuration Examples for HSRP Implementation on Software

This section provides the following HSRP configuration examples:

### **Configuring an HSRP Group: Example**

The following is an example of enabling HSRP on an interface and configuring HSRP group attributes:

```
configure
router hsrp
interface HundredGigE 0/2/0/1
address-family ipv4
hsrp 1
name s1
address 10.0.0.5
timers 100 200
preempt delay 500
priority 20
track HundredGigE 0/2/0/2
authentication company0
use-bia
commit
hsrp 2 slave
follow s1
address 10.3.2.2
commit.
```

### Configuring a Router for Multiple HSRP Groups: Example

The following is an example of configuring a router for multiple HSRP groups:

```
configure router hsrp
```

interface HundredGigE 0/2/0/3 address family ipv4 hsrp 1 address 1.0.0.5 priority 20 preempt authentication sclara hsrp 2 address 1.0.0.6 priority 110 preempt authentication mtview hsrp 3 address 1.0.0.7 preempt authentication svale commit
