Configuring IPv6

This chapter describes how to enable and configure IPv6 on the security appliance. IPv6 is available in Routed firewall mode only.

This chapter includes the following sections:
- IPv6-enabled Commands, page 9-1
- Configuring IPv6 on an Interface, page 9-2
- Configuring IPv6 Default and Static Routes, page 9-3
- Configuring IPv6 Access Lists, page 9-4
- Verifying the IPv6 Configuration, page 9-5
- Configuring a Dual IP Stack on an Interface, page 9-6
- IPv6 Configuration Example, page 9-7

IPv6-enabled Commands

The following security appliance commands can accept and display IPv6 addresses:
- capture
- configure
- copy
- http
- name
- object-group
- ping
- show conn
- show local-host
- show tcpstat
- ssh
When entering IPv6 addresses in commands that support them, simply enter the IPv6 address using standard IPv6 notation, for example ping fe80::2e0:b6ff:fe01:3b7a. The security appliance correctly recognizes and processes the IPv6 address. However, you must enclose the IPv6 address in square brackets ([ ]) in the following situations:

- You need to specify a port number with the address, for example [fe80::2e0:b6ff:fe01:3b7a]:8080.
- The command uses a colon as a separator, such as the write net and config net commands. For example, configure net [fe80::2e0:b6ff:fe01:3b7a]:/tftp/config/pixconfig.

The following commands were modified to work for IPv6:

- debug
- fragment
- ip verify
- mtu
- icmp (entered as ipv6 icmp)

The following inspection engines support IPv6:

- FTP
- HTTP
- ICMP
- SMTP
- TCP
- UDP

### Configuring IPv6 on an Interface

At a minimum, each interface needs to be configured with an IPv6 link-local address. Additionally, you can add a site-local and global address to the interface.

**Note**

The security appliance does not support IPv6 anycast addresses.

You can configure both IPv6 and IPv4 addresses on an interface.

To configure IPv6 on an interface, perform the following steps:

**Step 1**

Enter interface configuration mode for the interface for which you are configuring the IPv6 addresses:

```
hostname(config)# interface if
```

**Step 2**

Configure an IPv6 address for the interface. You can assign several IPv6 addresses to an interface, such as an IPv6 link-local, site-local, and global address. However, at a minimum, you must configure a link-local address.
There are several methods for configuring IPv6 addresses for an interface. Pick the method that suits your needs from the following:

- The simplest method is to enable stateless autoconfiguration on the interface. Enabling stateless autoconfiguration on the interface configures IPv6 addresses based on prefixes received in Router Advertisement messages. A link-local address, based on the Modified EUI-64 interface ID, is automatically generated for the interface when stateless autoconfiguration is enabled. To enable stateless autoconfiguration, enter the following command:

  hostname(config-if)# ipv6 address autoconfig

- If you only need to configure a link-local address on the interface and are not going to assign any other IPv6 addresses to the interface, you have the option of manually defining the link-local address or generating one based on the interface MAC address (Modified EUI-64 format).

Enter the following command to manually specify the link-local address:

  hostname(config-if)# ipv6 address ipv6-address link-local

Enter the following command to enable IPv6 on the interface and automatically generate the link-local address using the Modified EUI-64 interface ID based on the interface MAC address:

  hostname(config-if)# ipv6 enable

**Note** You do not need to use the `ipv6 enable` command if you enter any other `ipv6 address` commands on an interface; IPv6 support is automatically enabled as soon as you assign an IPv6 address to the interface.

- Assign a site-local or global address to the interface. When you assign a site-local or global address, a link-local address is automatically created. Enter the following command to add a global or site-local address to the interface. Use the optional `eui-64` keyword to use the Modified EUI-64 interface ID in the low order 64 bits of the address.

  hostname(config-if)# ipv6 address ipv6-address [eui-64]

**Step 3** (Optional) Suppress Router Advertisement messages on an interface. By default, Router Advertisement messages are automatically sent in response to router solicitation messages. You may want to disable these messages on any interface for which you do not want the security appliance to supply the IPv6 prefix (for example, the outside interface).

Enter the following command to suppress Router Advertisement messages on an interface:

  hostname(config-if)# ipv6 nd suppress-ra

See the “IPv6 Configuration Example” section on page 9-7 for an example IPv6 addresses applied to an interface.

**Configuring IPv6 Default and Static Routes**

IPv6 unicast routing is always enabled. The security appliance routes IPv6 traffic between interfaces as long as the interfaces are enabled for IPv6 and the IPv6 ACLs allow the traffic. You can add a default route and static routes using the `ipv6 route` command.

To configure an IPv6 default route and static routes, perform the following steps:
Chapter 9  Configuring IPv6

Configuring IPv6 Access Lists

Configuring an IPv6 access list is similar configuring an IPv4 access, but with IPv6 addresses.

To configure an IPv6 access list, perform the following steps:

Step 1  Create an access entry. To create an access list, use the `ipv6 access-list` command to create entries for the access list. There are two main forms of this command to choose from, one for creating access list entries specifically for ICMP traffic, and one to create access list entries for all other types of IP traffic.

- To create an IPv6 access list entry specifically for ICMP traffic, enter the following command:

  ```
  hostname(config)# ipv6 access-list id [line num] (permit | deny) icmp source destination [icmp_type]
  ```

- To create an IPv6 access list entry, enter the following command:

  ```
  hostname(config)# ipv6 access-list id [line num] (permit | deny) protocol source [src_port] destination [dst_port]
  ```

The following describes the arguments for the `ipv6 access-list` command:

- *id*—The name of the access list. Use the same *id* in each command when you are entering multiple entries for an access list.
- *line num*—When adding an entry to an access list, you can specify the line number in the list where the entry should appear.
- *permit* | *deny*—Determines whether the specified traffic is blocked or allowed to pass.
- *icmp*—Indicates that the access list entry applies to ICMP traffic.
- *protocol*—Specifies the traffic being controlled by the access list entry. This can be the name (ip, tcp, or udp) or number (1-254) of an IP protocol. Alternatively, you can specify a protocol object group using `object-group grp_id`.
- *source* and *destination*—Specifies the source or destination of the traffic. The source or destination can be an IPv6 prefix, in the format *prefix/length*, to indicate a range of addresses, the keyword *any*, to specify any address, or a specific host designated by `host host_ipv6_addr`.

See the “IPv6 Configuration Example” section on page 9-7 for an example of the `ipv6 route` command used to configure the default route.
Verifying the IPv6 Configuration

This section describes how to verify your IPv6 configuration. You can use various show commands to verify your IPv6 settings.

This section includes the following topics:

- The show ipv6 interface Command, page 9-5
- The show ipv6 route Command, page 9-6

The show ipv6 interface Command

To display the IPv6 interface settings, enter the following command:

```
hostname# show ipv6 interface [if_name]
```

Including the interface name, such as “outside”, displays the settings for the specified interface. Excluding the name from the command displays the setting for all interfaces that have IPv6 enabled on them. The output for the command shows the following:

- The name and status of the interface.
- The link-local and global unicast addresses.
- The multicast groups the interface belongs to.
- ICMP redirect and error message settings.
- Neighbor discovery settings.

The following is sample output from the `show ipv6 interface` command:

```
hostname# show ipv6 interface

ipv6 interface is down, line protocol is down
IPV6 is enabled, link-local address is fe80::20d:88ff:fee:6a82 [TENTATIVE]
No global unicast address is configured
Joined group address(es):
  ff02::1
  ff02::1:ff:fe:6a82
ICMP error messages limited to one every 100 milliseconds
```
ICMP redirects are enabled
ND DAD is enabled, number of DAD attempts: 1
ND reachable time is 30000 milliseconds

Note

The show interface command only displays the IPv4 settings for an interface. To see the IPv6 configuration on an interface, you need to use the show ipv6 interface command. The show ipv6 interface command does not display any IPv4 settings for the interface (if both are configured on the interface).

The show ipv6 route Command

To display the routes in the IPv6 routing table, enter the following command:

```
hostname# show ipv6 route
```

The output from the show ipv6 route command is similar to the IPv4 show route command. It displays the following information:

- The protocol that derived the route.
- The IPv6 prefix of the remote network.
- The administrative distance and metric for the route.
- The address of the next-hop router.
- The interface through which the next hop router to the specified network is reached.

The following is sample output from the show ipv6 route command:

```
hostname# show ipv6 route
IPv6 Routing Table - 7 entries
Codes: C - Connected, L - Local, S - Static, R - RIP, B - BGP
        U - Per-user Static route
        I1 - ISIS L1, I2 - ISIS L2, IA - ISIS interarea
        O - OSPF intra, OI - OSPF inter, OE1 - OSPF ext 1, OE2 - OSPF ext 2
L   fe80::/10 [0/0]
    via ::, inside
L   fec0::a:0:0:a0a:a70/128 [0/0]
    via ::, inside
C   fec0:0:0:a::/64 [0/0]
    via ::, inside
L   ff00::/8 [0/0]
    via ::, inside
```

Configuring a Dual IP Stack on an Interface

The security appliance supports the configuration of both IPv6 and IPv4 on an interface. You do not need to enter any special commands to do so; simply enter the IPv4 configuration commands and IPv6 configuration commands as you normally would. Make sure you configure the default route for both IPv4 and IPv6.
IPv6 Configuration Example

Example 9-1 shows several features of IPv6 configuration:

- Each interface is configured with both IPv6 and IPv4 addresses.
- The IPv6 default route is set with the ipv6 route command.
- An IPv6 access list is applied to the outside interface.

Example 9-1  IPv6 Configuration Example

```plaintext
interface Ethernet0
  speed auto
