

# Configuring Objects

This chapter describes how to configure reusable named objects and groups for use in your configuration, and it includes the following sections:

- [Information About Objects, page 20-1](#)
- [Licensing Requirements for Objects, page 20-1](#)
- [Configuring Objects, page 20-2](#)
- [Monitoring Objects, page 20-16](#)
- [Feature History for Objects, page 20-17](#)

## Information About Objects

Objects are reusable components for use in your configuration. They can be defined and used in ASA configurations in the place of inline IP addresses, services, names, and so on. Objects make it easy to maintain your configurations because you can modify an object in one place and have it be reflected in all other places that are referencing it. Without objects you would have to modify the parameters for every feature when required, instead of just once. For example, if a network object defines an IP address and subnet mask, and you want to change the address, you only need to change it in the object definition, not in every feature that refers to that IP address.

## Licensing Requirements for Objects

Model	License Requirement
All models	Base License.

## Guidelines and Limitations

### Context Mode Guidelines

Supported in single and multiple context mode.

**Firewall Mode Guidelines**

Supported in routed and transparent firewall mode.

**IPv6 Guidelines**

- Supports IPv6.
- The ASA does not support IPv6 nested network object groups, so you cannot group an object with IPv6 entries under another IPv6 object group.
- You can mix IPv4 and IPv6 entries in a network object group; you cannot use a mixed object group for NAT.

**Additional Guidelines and Limitations**

- Object must have unique names. While you might want to create a network object group named “Engineering” and a service object group named “Engineering,” you need to add an identifier (or “tag”) to the end of at least one object group name to make it unique. For example, you can use the names “Engineering\_admins” and “Engineering\_hosts” to make the object group names unique and to aid in identification.
- Objects and object groups share the same name space.
- You cannot remove an object or make an object empty if it is used in a command.

## Configuring Objects

- [Configuring Network Objects and Groups, page 20-2](#)
- [Configuring Service Objects and Service Groups, page 20-4](#)
- [Configuring Local User Groups, page 20-7](#)
- [Configuring Security Group Object Groups, page 20-8](#)
- [Configuring Regular Expressions, page 20-10](#)
- [Configuring Time Ranges, page 20-15](#)

**Note**

---

For other objects not included in this chapter, see the following chapters:

- Local Users—See [Chapter 33, “Configuring the Local Database for AAA.”](#)
  - Class Maps—See Chapter 9, “Getting Started with Application Layer Protocol Inspection,” in the firewall configuration guide.
  - Inspect Maps—See Chapter 9, “Getting Started with Application Layer Protocol Inspection,” in the firewall configuration guide.
  - TCP Maps—See the [Configuring Connection Settings](#) section in the firewall configuration guide.
- 

## Configuring Network Objects and Groups

This section describes how to configure network objects and groups, and it includes the following topics:

- [Configuring a Network Object, page 20-3](#)
- [Configuring a Network Object Group, page 20-3](#)

## Configuring a Network Object

A network object can contain a host, a network IP address, or a range of IP addresses, a fully qualified domain name (FQDN). You can also enable NAT rules on the object (excepting FQDN objects). (See Chapter 4, “Configuring Network Object NAT,” in the firewall configuration guide for more information.)

### Detailed Steps

---

**Step 1** Choose **Configuration > Firewall > Objects > Network Objects/Group**.

**Step 2** Click **Add**, and choose **Network Object** to add a new object, or choose an existing object to edit, and click **Edit**.

You can also add or edit network objects from the Addresses side pane in a rules window or when you are adding a rule.

To find an object in the list, enter a name or IP address in the Filter field, and click **Filter**. The wildcard characters asterisk (\*) and question mark (?) are allowed.

The Add/Edit Network Object dialog box appears.

**Step 3** Fill in the following values:

- **Name**—The object name. Use characters a to z, A to Z, 0 to 9, a period, a dash, a comma, or an underscore. The name must contain 64 characters or fewer.
- **Type**—Either Network, Host, Range, or FQDN.
- **IP Address**—An IPv4 or an IPv6 address, either a host or network address. When you enter a colon (:) in this field for an IPv6 address, the Netmask field changes to Prefix Length. If you select Range as the object type, the IP Address field changes to allow you to enter a Start Address and an End address.
- **Netmask or Prefix Length**—If the IP address is an IPv4 address, enter the subnet mask. If the IP address is an IPv6 address, enter the prefix. (This field is not available if you enter the object type as Host.)
- **Description**—(Optional) The description of the network object (up to 200 characters in length).

---

**Note** To add NAT rules to the network object, see Chapter 4, “Configuring Network Object NAT,” in the firewall configuration guide for more information.

---

**Step 4** Click **OK**.

**Step 5** Click **Apply** to save the configuration.

You can now use this network object when you create a rule. If you edit an object, the change is inherited automatically by any rules using the object.

---

## Configuring a Network Object Group

Network object groups can contain multiple network objects as well as inline networks. Network object groups can support a mix of both IPv4 and IPv6 addresses.

## Restrictions

You cannot use a mixed IPv4 and IPv6 object group for NAT, or object groups that include FQDN objects.

## Detailed Steps

- 
- Step 1** Choose **Configuration > Firewall > Objects > Network Objects/Groups**.
- Step 2** Click **Add > Network Object Group** to add either a new object or a new object group.
- You can also add or edit network object groups from the Addresses side pane in a rules window, or when you add a rule.
- To find an object in the list, enter a name or IP address in the Filter field, and click Filter. The wildcard characters asterisk (\*) and question mark (?) are allowed.
- The Add Network Object Group dialog box appears.
- Step 3** In the Group Name field, enter a group name.
- Use characters a to z, A to Z, 0 to 9, a period, a comma, a dash, or an underscore. The name must contain 64 characters or fewer.
- Step 4** (Optional) In the Description field, enter a description, up to 200 characters in length.
- Step 5** You can add existing objects or groups to the new group (nested groups are allowed), or you can create a new address to add to the group:
- To add an existing network object or group to the new group, double-click the object in the Existing Network Objects/Groups pane.  
You can also select the object, and then click **Add**. The object or group is added to the right-hand Members in Group pane.
  - To add a new address, fill in the values under the Create New Network Object Member area, and click **Add**.  
The object or group is added to the right-hand Members in Group pane. This address is also added to the network object list.
- To remove an object, double-click the object in the Members in Group pane, or select the object and click **Remove**.
- Step 6** After you add all the member objects, click **OK**.
- You can now use this network object group when you create a rule. For an edited object group, the change is inherited automatically by any rules using the group.
- 

## Configuring Service Objects and Service Groups

Service objects and groups identify protocols and ports. This section describes how to configure service objects, service groups, TCP and UDP port service groups, protocol groups, and ICMP groups, and it includes the following topics:

- [Configuring a Service Object, page 20-5](#)
- [Configuring a Service Group, page 20-5](#)
- [Configuring a TCP or UDP Port Service Group, page 20-6](#)

- [Configuring an ICMP Group, page 20-6](#)
- [Configuring an ICMP Group, page 20-6](#)

## Configuring a Service Object

The service object can contain a protocol, ICMP, ICMPv6, TCP or UDP port or port ranges.

### Detailed Steps

- 
- Step 1** Choose **Configuration > Firewall > Objects > Service Object/Group**.
- Step 2** Choose **Add > Service Object** from the drop-down list.
- Step 3** In the name field, enter a name for the service object. Use characters a to z, A to Z, 0 to 9, a period, a dash, a comma, or an underscore. The name must be 64 characters or fewer.
- Step 4** From the Service Type field, choose the desired type: tcp, udp, icmp, or icmp6 protocol.
- Step 5** (Optional) If you chose tcp or udp as the Service Type, enter the following:
- Destination Port/Range
  - Source Port/Range—Lists the protocol source ports/ranges.
  - Description—Lists the service group description.
- Step 6** (Optional) If you chose icmp or icmp6 as the Service Type, enter the following:
- ICMP Type—Lists the service group ICMP type.
  - ICMP Code—(Optional) Valid values range from 1 to 255.
  - Description—(Optional) Lists the service group description.
- Step 7** If you chose protocol as the Service Type, enter the following:
- Protocol—Lists the service group protocol.
  - Description—(Optional) Lists the service group description.
- Step 8** Click **OK**, and then **Apply**.
- 

## Configuring a Service Group

A service object group includes a mix of protocols, if desired, including optional source and destination ports for TCP or UDP.

### Detailed Steps

- 
- Step 1** Choose **Configuration > Firewall > Objects > Service Object/Group**.
- Step 2** Choose **Add > Service Group** from the drop-down list.
- The Add Service Group dialog box appears.
- Step 3** In the Name field, enter a name for the new service group. The name can be up to 64 characters in length and must be unique for all object groups. A service group name cannot share a name with other objects and groups.

- Step 4** In the Description field, enter a description for this service group (up to 200 characters in length).
- Step 5** To add an existing service object or group, or predefined protocol or port, click the **Existing Service/Service Group** radio button, select the entry from the Name field, and click **Add**.
- Step 6** To create a new service, click the **Create new member** radio button and then choose the Service Type from the drop-down list:
- If you choose tcp, udp, or tcp/udp, enter a name, the destination port/range, the source port/range, and an optional description.
  - If you choose icmp or icmp6, enter a name, the ICMP Type (from the Existing Service/Service Group list), an ICMP Code (a value from 0-255), and an optional description.
  - If you choose protocol, enter a name, the protocol, and an optional description.
- Click **Add** to add the new service.
- Step 7** Click **OK**, and then **Apply**.
- 

## Configuring a TCP or UDP Port Service Group

A TCP or UDP service group includes a group of ports for a specific protocol (TCP, UDP, or TCP-UDP).

---

- Step 1** Choose **Configuration > Firewall > Objects > Service Object/Group**.
- Step 2** Choose **Add > TCP Service Group, UDP Service Group, or TCP-UDP Service Group** from the drop-down list.
- The Add Service Group dialog box appears.
- Step 3** In the Name field, enter a name for the new service group. The name can be up to 64 characters in length and must be unique for all object groups. A service group name cannot share a name with other objects and groups.
- Step 4** In the Description field, enter a description for this service group (up to 200 characters in length).
- Step 5** To add an existing service group, or predefined port, click the **Existing Service/Service Group** radio button, select the entry from the Name field, and click **Add**.
- Step 6** To create a new port, click the **Create new member** radio button, enter the port name, number, or range and then click **Add** to add the new port.
- Step 7** Click **OK**, and then **Apply**.
- 

## Configuring an ICMP Group

An ICMP group includes multiple ICMP types.

### Detailed Steps

---

- Step 1** Choose **Configuration > Firewall > Objects > Service Object/Group**.
- Step 2** Choose **Add > ICMP Group** from the drop-down list.
- The Add ICMP Group dialog box appears.

- Step 3** In the Name field, enter a name for the new ICMP group. The name can be up to 64 characters in length and must be unique for all object groups. An ICMP group name cannot share a name with other objects and groups..
  - Step 4** In the Description field, enter a description for this ICMP group (up to 200 characters in length).
  - Step 5** To add an existing ICMP group, or predefined type, click the **Existing Service/Service Group** radio button, select the entry from the Name field, and click **Add**.
  - Step 6** To create a new type, click the **Create new member** radio button, enter the type name or number, and then click **Add** to add the new type.
  - Step 7** Click **OK**, and then **Apply**.
- 

## Configuring a Protocol Group

A protocol group contains IP protocol types.

### Detailed Steps

- 
- Step 1** Choose **Configuration > Firewall > Objects > Service Object/Group**.
  - Step 2** Choose **Add > Protocol Group** from the drop-down list.  
The Add Protocol Group dialog box appears.
  - Step 3** In the Name field, enter a name for the new group. The name can be up to 64 characters in length and must be unique for all object groups. A group name cannot share a name with other objects and groups.
  - Step 4** In the Description field, enter a description for this group (up to 200 characters in length).
  - Step 5** To add an existing protocol group, or predefined protocol, click the **Existing Service/Service Group** radio button, select the entry from the Name field, and click **Add**.
  - Step 6** To create a new protocol, click the **Create new member** radio button, enter the protocol name or number, and then click **Add** to add the new protocol.
  - Step 7** Click **OK**, and then **Apply**.
- 

## Configuring Local User Groups

You can create local user groups for use in features that support the identity firewall (IDFW) by including the group in an extended ACL, which in turn can be used in an access rule, for example.

The ASA sends an LDAP query to the Active Directory server for user groups globally defined in the Active Directory domain controller. The ASA imports these groups for identity-based rules. However, the ASA might have localized network resources that are not defined globally that require local user groups with localized security policies. Local user groups can contain nested groups and user groups that are imported from Active Directory. The ASA consolidates local and Active Directory groups.

A user can belong to local user groups and user groups imported from Active Directory.

### Prerequisites

See [Chapter 38, “Configuring the Identity Firewall,”](#) to enable IDFW.

## Detailed Steps

- 
- Step 1** Open the **Configuration > Firewall > Objects > Local User Groups** pane.  
A table of user groups and their members appears.
- Step 2** To add a group, click **Add**. The Add User Object Group dialog appears.
- Step 3** Enter a name and description for the group.  
The group name can contain any character including [a-z], [A-Z], [0-9], [!@#\$\$%^&()-\_{}].]. If the group name contains a space, you must enclose the name in quotation marks.
- Step 4** From the Domain list, select the default domain for users in this group or click **Manage** to add a new domain or edit an existing domain.
- Step 5** To add existing groups to this group, enter a search string in the text box and click **Find**.
- Step 6** To add users to the group, enter a search string in the text box and click **Find**.
- Step 7** Select groups and click the **Add** button to add them to the group.
- Step 8** Select users and click the **Add** button to add them to the group.
- Step 9** Click **OK** to save your changes.
- 

## Configuring Security Group Object Groups

You can create security group object groups for use in features that support Cisco TrustSec by including the group in an extended ACL, which in turn can be used in an access rule, for example.

When integrated with Cisco TrustSec, the ASA downloads security group information from the ISE. The ISE acts as an identity repository, by providing Cisco TrustSec tag to user identity mapping and Cisco TrustSec tag to server resource mapping. You provision and manage security group ACLs centrally on the ISE.

However, the ASA might have localized network resources that are not defined globally that require local security groups with localized security policies. Local security groups can contain nested security groups that are downloaded from the ISE. The ASA consolidates local and central security groups.

To create local security groups on the ASA, you create a local security object group. A local security object group can contain one or more nested security object groups or Security IDs or security group names. User can also create a new Security ID or security group name that does not exist on the ASA.

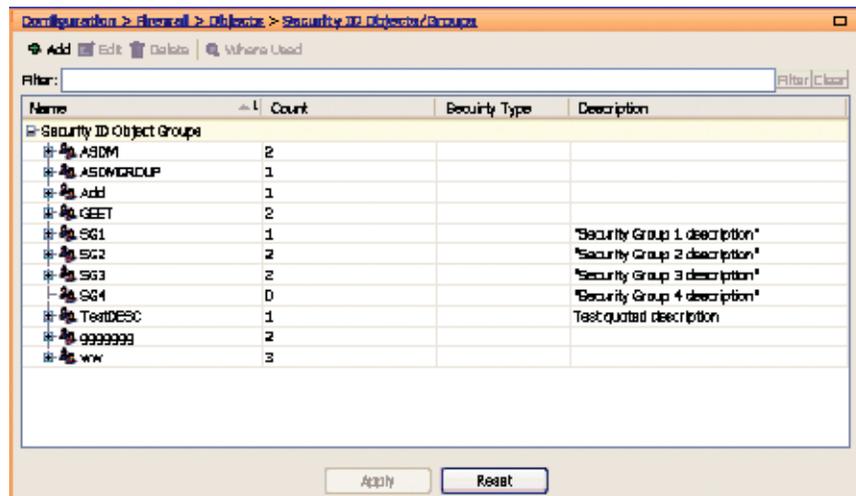

You can use the security object groups you create on the ASA to control access to network resources. You can use the security object group as part of an access group or service policy.

## Prerequisites

See [Chapter 39, “Configuring the ASA to Integrate with Cisco TrustSec,”](#) to enable TrustSec.

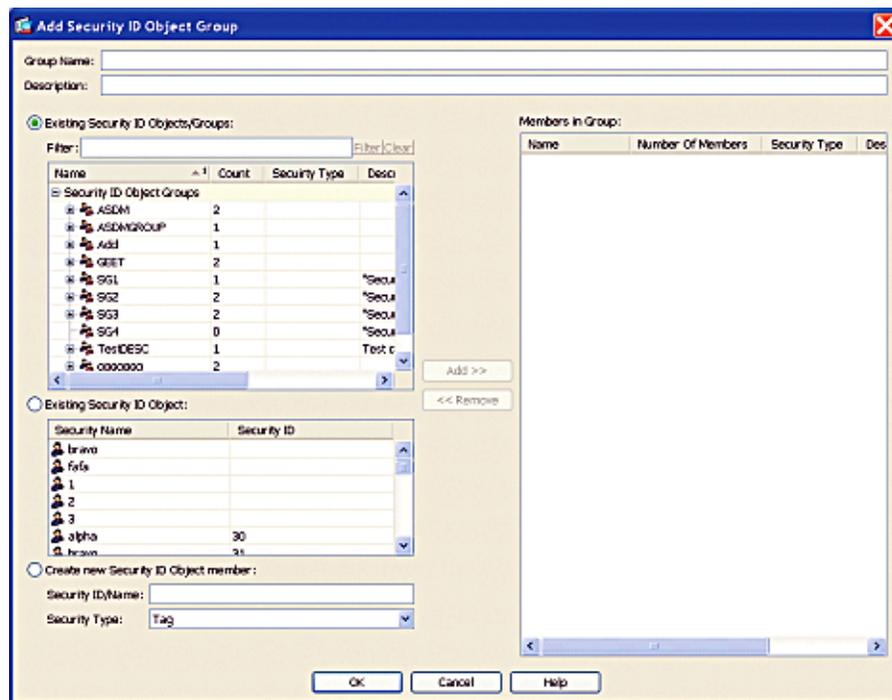

## Detailed Steps

- 
- Step 1** In the main ASDM application window, choose **Configuration > Firewall > Objects > Security Group Object Groups**. The Security Group Object Groups pane appears:

The Security Group Object Groups pane lists the members of the security object group and shows the number of members in the Count column. Click **Where Used** to display where the selected security group object is used in an ACL or nested in another security group object.

**Step 2** Click **Add**. The Add Security ID Object Group dialog box appears.

**Step 3** In the Group Name field, enter the name for the group as a 32-byte case sensitive string. The group name can contain any character including [a-z], [A-Z], [0-9], [!@#%\$^&()-\_{} .].

**Step 4** In the Description field, enter a description for the group.

**Step 5** Add members to the security group object by performing the following task:

- a. Select one of the following options:

- Existing Security ID Objects/Groups radio button
- Existing Security ID Object radio button

In the Filter field, enter the security object ID number or the name of the security group and click **Filter**. Use wildcards to broaden the search for security groups.

- Click **Add** to select it as Members in Group.

A security object group must contain at least one member.

- Continue selecting members and clicking Add. You can create nested security object groups by selecting existing security ID object/groups and existing security ID objects.

**Step 6** Create a locally defined object by performing the following tasks:

- Click the **Create new Security ID Object member** radio button.
- From the Security Type drop-down field, select Tag or Name.

An SGT is assigned to a device through IEEE 802.1X authentication, web authentication, or MAC authentication bypass (MAB) by the ISE. Security group names are created on the ISE and provide user-friendly names for security groups. The security group table maps SGTs to security group names.

- In the Security ID/Name field, enter a number from 1 to 65533 for A Tag security type or a 32-byte case-sensitive string for a Name security type.

A security group has a single name assigned to it. The same name can only be associated with a single SGT.

**Step 7** Click OK. The Security ID Objects/Groups pane reappears.

**Step 8** Click **Apply** to save the changes to the running configuration.

---

## Configuring Regular Expressions

- [Creating a Regular Expression, page 20-10](#)
- [Creating a Regular Expression Class Map, page 20-14](#)

### Creating a Regular Expression

A regular expression matches text strings either literally as an exact string, or by using *metacharacters* so that you can match multiple variants of a text string. You can use a regular expression to match the content of certain application traffic; for example, you can match a URL string inside an HTTP packet.

#### Guidelines

#### Note

As an optimization, the ASA searches on the deobfuscated URL. Deobfuscation compresses multiple forward slashes (/) into a single slash. For strings that commonly use double slashes, like “http://”, be sure to search for “http:” instead.

---

Table 20-1 lists the metacharacters that have special meanings.

**Table 20-1** *regex Metacharacters*

Character	Description	Notes
.	Dot	Matches any single character. For example, <b>d.g</b> matches dog, dag, dtg, and any word that contains those characters, such as doggonnit.
( <i>exp</i> )	Subexpression	A subexpression segregates characters from surrounding characters, so that you can use other metacharacters on the subexpression. For example, <b>d(ola)g</b> matches dog and dag, but <b>dolag</b> matches do and ag. A subexpression can also be used with repeat quantifiers to differentiate the characters meant for repetition. For example, <b>ab(xy){3}z</b> matches abxyxyz.
	Alternation	Matches either expression it separates. For example, <b>dog cat</b> matches dog or cat.
?	Question mark	A quantifier that indicates that there are 0 or 1 of the previous expression. For example, <b>lo?se</b> matches lse or lose.  <b>Note</b> You must enter <b>Ctrl+V</b> and then the question mark or else the help function is invoked.
*	Asterisk	A quantifier that indicates that there are 0, 1 or any number of the previous expression. For example, <b>lo*se</b> matches lse, lose, loose, and so on.
+	Plus	A quantifier that indicates that there is at least 1 of the previous expression. For example, <b>lo+se</b> matches lose and loose, but not lse.
{ <i>x</i> } or { <i>x</i> ,}	Minimum repeat quantifier	Repeat at least <i>x</i> times. For example, <b>ab(xy){2,}z</b> matches abxyxyz, abxyxyz, and so on.
[ <i>abc</i> ]	Character class	Matches any character in the brackets. For example, <b>[abc]</b> matches a, b, or c.
[^ <i>abc</i> ]	Negated character class	Matches a single character that is not contained within the brackets. For example, <b>[^abc]</b> matches any character other than a, b, or c. <b>[^A-Z]</b> matches any single character that is not an uppercase letter.
[ <i>a-c</i> ]	Character range class	Matches any character in the range. <b>[a-z]</b> matches any lowercase letter. You can mix characters and ranges: <b>[abcq-z]</b> matches a, b, c, q, r, s, t, u, v, w, x, y, z, and so does <b>[a-cq-z]</b> .  The dash (-) character is literal only if it is the last or the first character within the brackets: <b>[abc-]</b> or <b>[-abc]</b> .
“”	Quotation marks	Preserves trailing or leading spaces in the string. For example, “ test” preserves the leading space when it looks for a match.
^	Caret	Specifies the beginning of a line.

*	Asterisk	A quantifier that indicates that there are 0, 1 or any number of the previous expression. For example, <b>lo*se</b> matches lse, lose, loose, and so on.
+	Plus	A quantifier that indicates that there is at least 1 of the previous expression. For example, <b>lo+se</b> matches lose and loose, but not lse.
{x} or {x,}	Minimum repeat quantifier	Repeat at least x times. For example, <b>ab(xy){2,}z</b> matches abxyxyz, abxyxyxyz, and so on.
[abc]	Character class	Matches any character in the brackets. For example, <b>[abc]</b> matches a, b, or c.
[^abc]	Negated character class	Matches a single character that is not contained within the brackets. For example, <b>[^abc]</b> matches any character other than a, b, or c. <b>[^A-Z]</b> matches any single character that is not an uppercase letter.
[a-c]	Character range class	Matches any character in the range. <b>[a-z]</b> matches any lowercase letter. You can mix characters and ranges: <b>[abcq-z]</b> matches a, b, c, q, r, s, t, u, v, w, x, y, z, and so does <b>[a-cq-z]</b> .  The dash (-) character is literal only if it is the last or the first character within the brackets: <b>[abc-]</b> or <b>[-abc]</b> .
“”	Quotation marks	Preserves trailing or leading spaces in the string. For example, “ <b>test</b> ” preserves the leading space when it looks for a match.
^	Caret	Specifies the beginning of a line.

## Detailed Steps

**Step 1** Choose **Configuration > Global Objects > Regular Expressions**.

- Step 2** In the Regular Expressions area, click **Add**.  
The Add Regular Expression dialog box appears.
- Step 3** In the Name field, name the expression, up to 40 characters in length.
- Step 4** (Optional) Click **Build** to use the [Creating a Regular Expression Class Map](#) dialog box. See [Table 20-1 on page 20-11](#) for more information about metacharacters.
- **Build Snippet**—This area lets you build text snippets of regular text or lets you insert a metacharacter into the Regular Expression field.
  - **Starts at the beginning of the line (^)**—Indicates that the snippet should start at the beginning of a line, using the caret (^) metacharacter. Be sure to insert any snippet with this option at the beginning of the regular expression.
  - **Specify Character String**—Enter a text string manually.
    - **Character String**—Enter a text string.
    - **Escape Special Characters**—If you entered any metacharacters in your text string that you want to be used literally, check this box to add the backslash (\) escape character before them. For example, if you enter “example.com,” this option converts it to “example\com”.
    - **Ignore Case**—If you want to match upper and lower case characters, this check box automatically adds text to match both upper and lower case. For example, entering “cats” is converted to “[cC][aA][tT][sS]”.
  - **Specify Character**—Lets you specify a metacharacter to insert in the regular expression.
    - **Negate the character**—Specifies not to match the character you identify.
    - **Any character (.)**—Inserts the period (.) metacharacter to match any character. For example, **d.g** matches dog, dag, dtg, and any word that contains those characters, such as doggonnit.
    - **Character set**—Inserts a character set. Text can match any character in the set. Sets include:
      - [0-9A-Za-z]
      - [0-9]
      - [A-Z]
      - [a-z]
      - [aeiou]
      - [\n\r\t] (which matches a new line, form feed, carriage return, or a tab)
 For example, if you specify [0-9A-Za-z], then this snippet will match any character from A to Z (upper or lower case) or any digit 0 through 9.
    - **Special character**—Inserts a character that requires an escape, including \, ?, \*, +, |, ., [, (, or ^. The escape character is the backslash (\), which is automatically entered when you choose this option.
    - **Whitespace character**—Whitespace characters include \n (new line), \f (form feed), \r (carriage return), or \t (tab).
    - **Three digit octal number**—Matches an ASCII character as octal (up to three digits). For example, the character \040 represents a space. The backslash (\) is entered automatically.
    - **Two digit hexadecimal number**—Matches an ASCII character using hexadecimal (exactly two digits). The backslash (\) is entered automatically.
    - **Specified character**—Enter any single character.
  - **Snippet Preview**—*Display only*. Shows the snippet as it will be entered in the regular expression.

- Append Snippet—Adds the snippet to the end of the regular expression.
- Append Snippet as Alternate—Adds the snippet to the end of the regular expression separated by a pipe (|), which matches either expression it separates. For example, **dog|cat** matches dog or cat.
- Insert Snippet at Cursor—Inserts the snippet at the cursor.

Regular Expression—This area includes regular expression text that you can enter manually and build with snippets. You can then select text in the Regular Expression field and apply a quantifier to the selection.

- Selection Occurrences—Select text in the Regular Expression field, click one of the following options, and then click **Apply to Selection**. For example, if the regular expression is “test me,” and you select “me” and apply **One or more times**, then the regular expression changes to “test (me)+”.
  - Zero or one times (?)—A quantifier that indicates that there are 0 or 1 of the previous expression. For example, **lo?se** matches lse or lose.
  - One or more times (+)—A quantifier that indicates that there is at least 1 of the previous expression. For example, **lo+se** matches lose and loose, but not lse.
  - Any number of times (\*)—A quantifier that indicates that there are 0, 1 or any number of the previous expression. For example, **lo\*se** matches lse, lose, loose, etc.
  - At least—Repeat at least *x* times. For example, **ab(xy){2,}z** matches abxyxyz, abxyxyxyz, etc.
  - Exactly—Repeat exactly *x* times. For example, **ab(xy){3}z** matches abxyxyxyz.
  - Apply to Selection—Applies the quantifier to the selection.
- Test—Tests a regular expression against some sample text.

**Step 5** If you do not use the Build tool, enter the regular expression manually in the Value field, up to 100 characters in length. Refer to the metacharacters in [Table 20-1](#).

**Step 6** To test the regular expression before adding it, click **Test**.

The Test Regular Expression dialog box appears.

- Regular Expression—Enter the regular expression you want to test. By default, the regular expression you entered in the Add/Edit Regular Expression or Build Regular Expression dialog box is input into this field. If you change the regular expression during your testing, and click **OK**, the changes are inherited by the Add/Edit Regular Expression or Build Regular Expression dialog boxes. Click **Cancel** to dismiss your changes.
- Test String—Enter a text string that you expect to match the regular expression.
- Test—Tests the Text String against the Regular Expression,
- Test Result—*Display only*. Shows if the test succeeded or failed.

## Creating a Regular Expression Class Map

A regular expression class map identifies one or more regular expressions. You can use a regular expression class map to match the content of certain traffic; for example, you can match URL strings inside HTTP packets.

### Prerequisites

Create one or more regular expressions according to the “[Creating a Regular Expression](#)” section on [page 20-10](#).

## Detailed Steps

- 
- Step 1** Choose **Configuration > Global Objects > Regular Expressions**.
- Step 2** In the Regular Expression Classes area, click **Add**.
- **Name**—Enter a name for the class map, up to 40 characters in length. The name “class-default” is reserved. All types of class maps use the same name space, so you cannot reuse a name already used by another type of class map.
  - **Description**—Enter a description, up to 200 characters in length.
  - **Available Regular Expressions**—Lists the regular expressions that are not yet assigned to the class map.
    - **Edit**—Edits the selected regular expression.
    - **New**—Creates a new regular expression.
  - **Add**—Adds the selected regular expression to the class map.
  - **Remove**—Removes the selected regular expression from the class map.
  - **Configured Match Conditions**—Shows the regular expressions in this class map, along with the match type.
    - **Match Type**—Shows the match type, which for regular expressions is always a positive match type (shown by the icon with the equal sign (=)) the criteria. (Inspection class maps allow you to create negative matches as well (shown by the icon with the red circle)). If more than one regular expression is in the class map, then each match type icon appears with “OR” next it, to indicate that this class map is a “match any” class map; traffic matches the class map if only one regular expression is matched.
    - **Regular Expression**—Lists the regular expression names in this class map.

## Configuring Time Ranges

Create a reusable component that defines starting and ending times that can be applied to various security features. Once you have defined a time range, you can select the time range and apply it to different options that require scheduling.

The time range feature lets you define a time range that you can attach to traffic rules, or an action. For example, you can attach an ACL to a time range to restrict access to the ASA.

A time range consists of a start time, an end time, and optional recurring entries.

### Guidelines

- Multiple periodic entries are allowed per time range. If a time range has both absolute and periodic values specified, then the periodic values are evaluated only after the absolute start time is reached, and they are not further evaluated after the absolute end time is reached.
- Creating a time range does not restrict access to the device. This procedure defines the time range only.

## Detailed Steps

- 
- Step 1** Choose **Configuration > Global Objects > Time Ranges**.
- Step 2** Click **Add**.  
The Add Time Range window appears.
- Step 3** In the Time Range Name field, enter a time range name, with no spaces.
- Step 4** Choose the Start Time and the End Time by doing one of the following:
- Allow the default settings, in which the Start Now and the Never End radio buttons are checked.
  - Apply a specific time range by clicking the **Start at** and **End at** radio buttons and selecting the specified start and stop times from the lists.  
The time range is inclusive of the times that you enter.
- Step 5** (Optional) To specify additional time constraints for the time range, such as specifying the days of the week or the recurring weekly interval in which the time range will be active, in the Recurring Time Ranges area, click **Add**.  
The Add Recurring Time Range dialog box appears.
- Step 6** Do one of the following:
- Click **Specify days of the week and times on which this recurring range will be active**, and choose the days and times from the lists, and click **OK**.
  - Click **Specify a weekly interval when this recurring range will be active**, and choose the days and times from the lists, and click **OK**.
- Step 7** Click **OK**, and then click **Apply**.
- 

## Monitoring Objects

To view which rules use a network object or group, in the Configuration > Firewall > Objects > Network Objects/Group pane, click the magnifying glass Find icon.

The Usages dialog box appears, listing all the rules currently using the network object or group. This dialog box also lists any network object groups that contain the object.

# Feature History for Objects

Table 20-2 lists each feature change and the platform release in which it was implemented. ASDM is backwards-compatible with multiple platform releases, so the specific ASDM release in which support was added is not listed.

**Table 20-2** Feature History for Object Groups

Feature Name	Platform Releases	Feature Information
Object groups	7.0(1)	Object groups simplify ACL creation and maintenance.
Regular expressions and policy maps	7.2(1)	Regular expressions and policy maps were introduced to be used under inspection policy maps. The following commands were introduced: <b>class-map type regex</b> , <b>regex</b> , <b>match regex</b> .
Objects	8.3(1)	Object support was introduced.
User Object Groups for Identity Firewall	8.4(2)	User object groups for identity firewall were introduced.
Mixed IPv4 and IPv6 network object groups	9.0(1)	Previously, network object groups could only contain all IPv4 addresses or all IPv6 addresses. Now network object groups can support a mix of both IPv4 and IPv6 addresses. <b>Note</b> You cannot use a mixed object group for NAT.
Security Group Object Groups for Cisco TrustSec	8.4(2)	Security group object groups for TrustSec were introduced.
Extended ACL and object enhancement to filter ICMP traffic by ICMP code	9.0(1)	ICMP traffic can now be permitted/denied based on ICMP code. We introduced or modified the following screens: Configuration > Firewall > Objects > Service Objects/Groups Configuration > Firewall > Access Rule
