Auto Scale Solution for the ASA Virtual on Azure

Overview

The auto scale solution enables allocation of resources to match performance requirements and reduce costs. If the demand for resources increases, the system ensures that resources are allocated as required. If the demand for resources decreases, resources are deallocated to reduce costs.

The ASA virtual auto scale for Azure is a complete serverless implementation which makes use of serverless infrastructure provided by Azure (Logic App, Azure Functions, Load Balancers, Security Groups, Virtual Machine Scale Set, etc.).

Some of the key features of the ASA virtual auto scale for Azure implementation include:

- Azure Resource Manager (ARM) template-based deployment.
- Support for scaling metrics based on CPU.

Note

See Auto Scale Logic, on page 30 for more information.

• Support for ASA virtual deployment and multi-availability zones.

- · Completely automated configuration automatically applied to scaled-out ASA virtual instances.
- Support for Load Balancers and multi-availability zones.
- Support for enabling and disabling the auto scale feature.
- · Cisco provides an auto scale for Azure deployment package to facilitate the deployment.

The ASA virtual auto scale solution on Azure supports two types of use cases configured using different topologies:

- Auto scale using Sandwich Topology The ASA virtual scale set is sandwiched between an Azure Internal load balancer (ILB) and an Azure External load balancer (ELB).
- Auto scale with Azure Gateway load balancer (GWLB) The Azure GWLB is integrated with Secure Firewall, public load balancer, and internal servers to simplify deployment, management, and scaling of firewalls.

Auto Scale using Sandwich Topology Use Case

The ASA virtual auto scale for Azure is an automated horizontal scaling solution that positions an ASA virtual scale set sandwiched between an Azure Internal load balancer (ILB) and an Azure External load balancer (ELB).

- The ELB distributes traffic from the Internet to ASA virtual instances in the scale set; the firewall then forwards traffic to application.
- The ILB distributes outbound Internet traffic from an application to ASA virtual instances in the scale set; the firewall then forwards traffic to Internet.
- A network packet will never pass through both (internal & external) load balancers in a single connection.
- The number of ASA virtual instances in the scale set will be scaled and configured automatically based on load conditions.

L

Figure 1: ASA Virtual Auto Scale using Sandwich Topology Use Case

Auto Scale with Azure Gateway Load Balancer Use Case

The Azure Gateway Load Balancer (GWLB) ensures that internet traffic to and from an Azure VM, such as an application server, is inspected by Secure Firewall without requiring any routing changes. This integration of the Azure GWLB with Secure Firewall simplifies deployment, management, and scaling of firewalls. This integration also reduces operational complexity and provides a single entry and exit point for traffic at the firewall. The applications and infrastructure can maintain visibility of source IP address, which is critical in some environments.

In the Azure GWLB Auto Scale use case, the ASA virtual uses only two interfaces: Management and one data interface.

Note

• Network Address Translation (NAT) is not required if you are deploying the Azure GWLB.

• Only IPv4 is supported.

Licensing

Both PAYG and BYOL are supported.

BYOL is supported.

Inbound Traffic Use Case and Topology

The following diagram displays the traffic flow for inbound traffic.

Outbound Traffic Use Case and Topology

The following diagram displays the traffic flow for outbound traffic.

Traffic Flow between the Application VPC and Security VPC

In the diagram shown below, traffic is redirected from the existing topology to the firewalls for inspection by the external load balancer. The traffic is then routed to the newly created GWLB. Any traffic that is routed to the ELB is forwarded to the GWLB.

The GWLB then forwards the VXLAN-encapsulated traffic to a ASA virtual instance. You have to create two ASA virtual associations as the GWLB uses two separate VXLAN tunnels for ingress and egress traffic. The ASA virtual decapsulates the VXLAN-encapsulated traffic, inspects it, and routes the traffic to the GWLB. The GWLB then forwards the traffic to the ELB.

Scope

This document covers the detailed procedures to deploy the serverless components for the ASA virtual auto scale for Azure solution.

Important

C.

- Read the entire document before you begin your deployment.
- Make sure the prerequisites are met before you start deployment.
- · Make sure you follow the steps and order of execution as described herein.

Download the Deployment Package

The ASA virtual auto scale for Azure solution is an Azure Resource Manager (ARM) template-based deployment which makes use of the serverless infrastructure provided by Azure (Logic App, Azure Functions, Load Balancers, Virtual Machine Scale Set, and so on).

Download the files required to launch the ASA virtual auto scale for Azure solution. Deployment scripts and templates for your version are available in the GitHub repository.

Attention Note that Cisco-provided deployment scripts and templates for auto scale are provided as open source examples, and are not covered within the regular Cisco TAC support scope. Check GitHub regularly for updates and ReadMe instructions.

See Build Azure Functions from Source Code, on page 32 for instructions on how to build the *ASM_Function.zip* package.

Auto Scale Solution Components

The following components make up the ASA virtual auto scale for Azure solution.

Azure Functions (Function App)

The Function App is a set of Azure functions. The basic functionality includes:

- · Communicate/Probe Azure metrics periodically.
- Monitor the ASA virtual load and trigger Scale In/Scale Out operations.

These functions are delivered in the form of compressed Zip package (see Build the Azure Function App Package, on page 10). The functions are as discrete as possible to carry out specific tasks, and can be upgraded as needed for enhancements and new release support.

Orchestrator (Logic App)

The Auto Scale Logic App is a workflow, i.e. a collection of steps in a sequence. Azure functions are independent entities and cannot communicate with each other. This orchestrator sequences the execution of these functions and exchanges information between them.

- The Logic App is used to orchestrate and pass information between the auto scale Azure functions.
- Each step represents an auto scale Azure function or built-in standard logic.
- The Logic App is delivered as a JSON file.
- The Logic App can be customized via the GUI or JSON file.

Virtual Machine Scale Set (VMSS)

The VMSS is a collection of homogeneous virtual machines, such as ASA virtual devices.

- The VMSS is capable of adding new identical VMs to the set.
- New VMs added to the VMSS are automatically attached with Load Balancers, Security Groups, and network interfaces.
- The VMSS has a built-in auto scale feature which is disabled for ASA virtual for Azure.
- You should not add or delete ASA virtual instances in the VMSS manually.

Azure Resource Manager (ARM) Template

ARM templates are used to deploy the resources required by the ASA virtual auto scale for Azure solution.

ASA virtual auto scale for Azure - The ARM template **azure_asav_autoscale.json** provides input for the Auto Scale Manager components including:

- Azure Function App
- Azure Logic App
- The Virtual Machine Scale Set (VMSS)
- Internal/External load balancers.
- Security Groups and other miscellaneous components needed for deployment.

ASA virtual auto scale with Azure GWLB - The ARM template **azure_asav_autoscale_with_GWLB.json** provides input for the Auto Scale Manager components including:

- Azure Function App
- Azure Logic App
- Virtual Machine (VM) or Virtual Machine Scale Set (VMSS)
- Networking Infrastructure
- Gateway load balancer
- · Security Groups and other miscellaneous components needed for deployment

C C

Important

The ARM template has limitations with respect to validating user input, hence it is your responsibility to validate input during deployment.

Prerequisites

Azure Resources

Resource Group

An existing or newly created Resource Group is required to deploy all the components of this solution.

Note

Record the Resource Group name, the Region in which it is created, and the Azure Subscription ID for later use.

Networking

Make sure a virtual network is available or created. An auto scale deployment with sandwich topology does not create, alter, or manage any networking resources. However, note that auto scale deployment with the Azure GWLB creates networking infrastructure.

The ASA virtual requires three network interfaces, thus your virtual network requires three subnets for:

- **1.** Management traffic
- 2. Inside traffic
- 3. Outside traffic

The following ports should be open in the Network Security Group to which the subnets are connected:

• SSH(TCP/22)

Required for the Health probe between the Load Balancer and ASA virtual.

Required for communication between the Serverless functions and ASA virtual.

Application-specific protocol/ports

Required for any user applications (for example, TCP/80, etc.).

Note

Record the virtual network name, the virtual network CIDR, the names of the 3 subnets, and the Gateway IP addresses of the outside and inside subnets.

Prepare the ASA Configuration File

Prepare an ASA virtual configuration file and store in a http/https server accessible by the ASA virtual instance. This is a standard ASA configuration file format. A scaled-out ASA virtual will download this file and update its configuration.

The ASA configuration file should have the following (at a minimum):

- Set DHCP IP assignment to all the interfaces.
- GigabitEthernet0/1 should be the 'inside' interface.
- GigabitEthernet0/0 should be the 'outside' interface.

Note Auto scale deployment using sandwich topology requires two data interfaces. However, auto scale deployment with Azure GWLB requires only one data interface.

- Set the gateway to the inside and outside interface.
- Enable SSH on the inside and outside interface from Azure utility IP (for health probe).
- Create a NAT configuration to forward traffic from the outside to the inside interface.

- Create an access policy to allow desired traffic.
- License the configuration. PAYG billing is not supported.

Note There is no need to specifically configure the Management interface.

The following is a sample ASA configuration file for the ASA virtual auto scale for Azure solution.

```
ASA Version 9.13(1)
1
interface GigabitEthernet0/1
nameif inside
security-level 100
ip address dhcp setroute

Build the Azure Function App Package

The ASA virtual auto scale solution requires that you build an archive file: *ASM_Function.zip*. which delivers a set of discrete Azure functions in the form of a compressed ZIP package.

See Build Azure Functions from Source Code, on page 32 for instructions on how to build the *ASM_Function.zip* package.

These functions are as discrete as possible to carry out specific tasks, and can be upgraded as needed for enhancements and new release support.

Input Parameters

The following table defines the template parameters and provides an example. Once you decide on these values, you can use these parameters to create the ASA virtual device when you deploy the ARM template into your Azure subscription. See Deploy the Auto Scale ARM Template, on page 15. In the Auto scale with Azure GWLB solution, networking infrastructure is also created due to which additional input parameters have to be configured in the template. The parameter descriptions are self-explanatory.

Table 1: Template Paramete	rs
----------------------------	----

Parameter Name	Allowed Values/Type	Description	Resource Creation Type
resourceNamePrefix	String* (3-10 characters)	All the resources are created with name containing this prefix. Note: Use only lowercase letters. Example: asav	New

Parameter Name	Allowed Values/Type	Description	Resource Creation Type
virtualNetworkRg	String	The virtual network resource group Existing name.	
		Example: cisco-virtualnet-rg	
virtualNetworkName	String	The virtual network name (already Existing created).	
		Example: cisco-virtualnet	
mgmtSubnet	String	The management subnet name (already created).	Existing
		Example: cisco-mgmt-subnet	
insideSubnet	String	The inside Subnet name (already created).	Existing
		Example: cisco-inside-subnet	
internalLbIp	String	The internal load balancer IP address for the inside subnet (already created). Existing	
		Example: 1.2.3.4	
outsideSubnet	String	The outside subnet name (already created).	Existing
		Example: cisco-outside-subnet	
softwareVersion	String	The ASA virtual Version (selected from drop-down during deployment).	Existing
		Default: 914.1.0Allowed: 914.1.0, 913.1.0	
vmSize	String	Size of ASA virtual instance (selected from drop-down during deployment).	N/A

Parameter Name	Allowed Values/Type	Description	Resource Creation Type
asaAdminUserName	String*	User name for the ASA virtual 'admin' user.	New
		Passwords must be 12 to 72 characters long, and must have: lowercase, uppercase, numbers, and special characters; and must have no more than 2 repeating characters.	
		This cannot be 'admin'. See Azure for VM administrator user name guidelines.	
		Note There is no compliance check for this in the template.	
asaAdminUserPassword	String*	Password for the ASA virtual administrator user.	New
		Passwords must be 12 to 72 characters long, and must have: lowercase, uppercase, numbers, and special characters; and must have no more than 2 repeating characters.	
		Note There is no compliance check for this in the template.	
scalingPolicy	POLICY-1 / POLICY-2	POLICY-1 : Scale-Out will be triggered when the average load of any ASA virtual goes beyond the Scale Out threshold for the configured duration.	N/A
		POLICY-2 : Scale-Out will be triggered when average load of all the ASA virtual devices in the auto scale group goes beyond the Scale Out threshold for the configured duration.	
		In both cases Scale-In logic remains the same: Scale-In will be triggered when average load of all the ASA virtual devices comes below the Scale In threshold for the configured duration.	

Parameter Name	Allowed Values/Type	Description	Resource Creation Type
scalingMetricsList	String	Metrics used in making the scaling decision.	N/A
		Allowed: CPU	
		Default: CPU	
scaleInThreshold	String	The Scale-In threshold in percent.	N/A
		Default: 10	
		When the ASA virtual metric goes below this value the Scale-In will be triggered.	
		See Auto Scale Logic, on page 30.	
scaleOutThreshold	String	The Scale-Out threshold in percent.	N/A
		Default: 80	
		When the ASA virtual metric goes above this value, the Scale-Out will be triggered.	
		The 'scaleOutThreshold' should always be greater than the 'scaleInThreshold'.	
		See Auto Scale Logic, on page 30.	
minAsaCount	Integer	The minimum ASA virtual instances available in the scale set at any given time.	N/A
		Example: 2	
maxAsaCount	Integer	The maximum ASA virtual instances allowed in the Scale set.	N/A
		Example: 10	
		Note The Auto Scale logic will not check the range of this variable, hence fill this carefully.	

Parameter Name	Allowed Values/Type	Description	Resource Creation Type
metricsAverageDuration	Integer	Select from the drop-down.	N/A
		This number represents the time (in minutes) over which the metrics are averaged out.	
		If the value of this variable is 5 (i.e. 5min), when the Auto Scale Manager is scheduled it will check the past 5 minutes average of metrics and based on this it will make a scaling decision.	
		Note Only numbers 1, 5, 15, and 30 are valid due to Azure limitations.	
initDeploymentMode	BULK / STEP	Primarily applicable for the first deployment, or when the Scale Set does not contain any ASA virtual instances.	
		BULK: The Auto Scale Manager will try to deploy 'minAsaCount' number of ASA virtual instances in parallel at one time.	
		STEP: The Auto Scale Manager will deploy the 'minAsaCount' number of ASA virtual devices one by one at each scheduled interval.	
configurationFile	String	The file path to the ASA virtual configuration file.	N/A
		Example: https://myserver/asavconfig/asaconfig .txt	
*Azure has restrictions on the name all lowercase. Do not use spaces o	ing convention for r any other speci	new resources. Review the limitational characters.	ons or simply use

Deploy the Auto Scale Solution

Deploy the Auto Scale ARM Template

ASA virtual auto scale for Azure using Sandwich Topology - Use the ARM template

azure_asav_autoscale.json to deploy the resources required by the ASA virtual auto scale for Azure. Within a given resource group, the ARM template deployment creates the following:

- Virtual Machine Scale Set (VMSS)
- External Load Balancer
- · Internal Load Balancer
- Azure Function App
- Logic App
- Security groups (For Data and Management interfaces)

ASA virtual auto scale with Azure GWLB - Use the ARM template

azure_asav_autoscale_with_GWLB.json to deploy the resources required by the ASA virtual auto scale with Azure GWLB solution. Within a given resource group, the ARM template deployment creates the following:

- Virtual Machine (VM) or Virtual Machine Scale Set (VMSS)
- Gateway Load Balancer
- Azure Function App
- Logic App
- Networking Infrastructure
- · Security Groups and other miscellaneous components needed for deployment

Before you begin

 Download the ARM templates from the GitHub repository (https://github.com/CiscoDevNet/cisco-asav/ tree/master/autoscale/azure).

Step 1 If you need to deploy the ASA virtual instances in multiple Azure zones, edit the ARM template based on the zones available in the Deployment region.

Example:

```
"zones": [
"1",
"2",
"3"
],
```

This example shows the "Central US" region which has 3 zones.

Step 2 Edit the traffic rules required in External Load Balancer. You can add any number of rules by extending this 'json' array.

Example:

```
"type": "Microsoft.Network/loadBalancers",
        "name": "[variables('elbName')]",
        "location": "[resourceGroup().location]",
        "apiVersion": "2018-06-01",
        "sku": {
          "name": "Standard"
        },
        "dependsOn": [
          "[concat('Microsoft.Network/publicIPAddresses/', variables('elbPublicIpName'))]"
        ],
        "properties": {
          "frontendIPConfigurations": [
            {
              "name": "LoadBalancerFrontEnd",
                "properties": {
                  "publicIPAddress": {
                    "id": "[resourceId('Microsoft.Network/publicIPAddresses/',
variables('elbPublicIpName'))]"
                  }
                3
            }
          ],
          "backendAddressPools": [
            {
              "name": "backendPool"
            }
          ],
          "loadBalancingRules": [
            {
              "properties": {
                "frontendIPConfiguration": {
               "Id": "[concat(resourceId('Microsoft.Network/loadBalancers', variables('elbName')),
 '/frontendIpConfigurations/LoadBalancerFrontend')]"
                },
                "backendAddressPool": {
               "Id": "[concat(resourceId('Microsoft.Network/loadBalancers', variables('elbName')),
 '/backendAddressPools/BackendPool')]"
                },
                "probe": {
               "Id": "[concat(resourceId('Microsoft.Network/loadBalancers', variables('elbName')),
 '/probes/lbprobe')]"
                },
                "protocol": "TCP",
                "frontendPort": "80",
                "backendPort": "80",
                "idleTimeoutInMinutes": "[variables('idleTimeoutInMinutes')]"
              },
              "Name": "lbrule"
            }
          ],
```

You can also edit this from the Azure portal post-deployment if you prefer not to edit this file.

- **Step 3** Log in to the Microsoft Azure portal using your Microsoft account username and password.
- **Step 4** Click **Resource groups** from the menu of services to access the Resource Groups blade. You will see all the resource groups in your subscription listed in the blade.

Create a new resource group or select an existing, empty resource group; for example, ASA virtual_AutoScale.

Deploy the Azure Function App

When you deploy the ARM template, Azure creates a skeleton Function App, which you then need to update and configure manually with the functions required for the Auto Scale Manager logic.

Before you begin

• Build the ASM_Function.zip package. See Build Azure Functions from Source Code, on page 32.

Step 1 Go to the Function App you created when you deployed the ARM template, and verify that no functions are present. In a browser go to this URL:

https://<Function App Name>.scm.azurewebsites.net/DebugConsole

For the example in Deploy the Auto Scale ARM Template, on page 15:

https://asav-function-app.scm.azurewebsites.net/DebugConsole

- **Step 2** In the file explorer navigate to **site/wwwroot**.
- Step 3 Drag-and-drop the ASM_Function.zip to the right side corner of the file explorer.

Figure 8: Upload the ASA Virtual Auto Scale Functions

Step 5 Download the PuTTY SSH client.

Azure functions need to access the ASA virtual via an SSH connection. However, the opensource libraries used in the serverless code do not support the SSH key exchange algorithms used by the ASA virtual. Hence you need to download a pre-built SSH client.

Download the PuTTY command-line interface to the PuTTY back end (plink.exe) from www.putty.org.

Figure 10: Download PuTTY

Alternativ	e binary files		
The installer	packages above will provide version	ons of all of these (except Pul	TYtel), but you can down
(Not sure wh	ether you want the 32-bit or the 64	-bit version? Read the FAQ e	ntry.)
putty, exe (th	e SSH and Telnet client itself)		
32-bit:	putty.exe	(or by FTP)	(signature)
64-bit:	putty.exe	(or by FTP)	(signature)
pscp.exe (an	SCP client, i.e. command-line se	cure file copy)	
32-bit:	pscp.exe	(or by FTP)	(signature)
64-bit:	pscp.exe	(or by FTP)	(signature)
psftp.exe (an	n SFTP client, i.e. general file tra	insfer sessions much like FT	P)
32-bit:	psftp.exe	(or by FTP)	(signature)
64-bit:	psftp.exe	(or by FTP)	(signature)
puttytel.exe	(a Telnet-only client)		
32-bit:	puttytel.exe	(or by FTP)	(signature)
64-bit:	puttytel.exe	(or by FTP)	(signature)
plink.exe (a	command-line interface to the P	uTTY back ends)	
32-bit:	plink.exe	(or by FTP)	(signature)
61 hit	plink.exe	(or by FTP)	(signature)

- **Step 6** Rename the SSH client executable file **plink.exe** to **asassh.exe**.
- **Step 7** Drag-and-drop the **asassh.exe** to the right side corner of the file explorer, to the location where **ASM_Function.zip** was uploaded in the previous step.
- **Step 8** Verify the SSH client is present with the function application. Refresh the page if necessary.

Fine Tune the Configuration

There are a few configurations available to fine tune the Auto Scale Manager or to use in debugging. These options are not exposed in the ARM template, but you can edit them under the Function App.

Before you begin

Ŵ,

Note This can be edited at any time. Follow this sequence to edit the configurations.

- Disable the Function App.
- Wait for existing scheduled task to finish.
- Edit and save the configuration.
- Enable the Function App.

Step 1 In the Azure portal, search for and select the ASA virtual function application.

Figure 11: ASA Virtual Function Application

Step 2 Configurations passed via the ARM template can also be edited here. Variable names may appear different from the ARM template, but you can easily identify the purpose of these variables from their name.

Most of the options are self-explanatory from the name. For example:

• Configuration Name: "DELETE_FAULTY_ASA" (Default value : YES)

During Scale-Out, a new ASA virtual instance is launched and configured via the configuration file. In case the configuration fails, based on this option, Auto Scale Manager will decide to keep that ASA virtual instance or delete it. (YES : Delete faulty ASA virtual / NO : Keep the ASA virtual instance even if the configuration fails).

• In the Function App settings, all the variables (including variables containing a secure string like 'password') can be seen in clear text format by users that have access to the Azure subscription.

If users have any security concerns with this (for example, if an Azure subscription is shared among users with lower privilages within the organization), a user can make use of Azure's *Key Vault* service to protect passwords. Once this is configured, instead of providing a clear text 'password' in function settings, a user has to provide a secure identifier generated by the key vault where the password is stored.

Note Search the Azure documentation to find the best practices to secure your application data.

Configure the IAM Role in the Virtual Machine Scale Set

Azure Identity and Access Management (IAM) is used as a part of Azure Security and Access Control to manage and control a user's identity. Managed identities for Azure resources provides Azure services with an automatically managed identity in Azure Active Directory.

This allows the Function App to control the Virtual Machine Scale Sets (VMSS) without explicit authentication credentials.

Step 1 In the Azure portal, go to the VMSS.

- Step 2 Click Access control (IAM).
- **Step 3** Click **Add** to add a role assignment
- **Step 4** From the **Add role assignment** drop-down, choose **Contributor**.
- Step 5 From the Assign access to drop-down, choose Function App.
- **Step 6** Select the ASA virtual function application.

Figure 12: AIM Role Assignment

s identity				
Monitoring P insights				Save Discard

Step 7 Click Save.

Note You should also verify that there are no ASA virtual instances launched yet.

Update Security Groups

The ARM template creates two security groups, one for the Management interface, and one for data interfaces. The Management security group will allow only traffic required for ASA virtual management activities. However, the data interface security group will allow all traffic.

Fine tune the security group rules based on the topology and application needs of your deployments.

Note The data interface security group should allow, at a minimum, SSH traffic from the load balancers.

Update the Azure Logic App

The Logic App acts as the orchestrator for the Autoscale functionality. The ARM template creates a skeleton Logic App, which you then need to update manually to provide the information necessary to function as the auto scale orchestrator.

}

Step 1 From the repository, retrieve the file *LogicApp.txt* to the local system and edit as shown below.

Important Read and understand all of these steps before proceeding.

These manual steps are not automated in the ARM template so that only the Logic App can be upgraded independently later in time.

- a) Required: Find and replace all the occurrences of "SUBSCRIPTION ID" with your subscription ID information.
- b) Required: Find and replace all the occurrences of "RG NAME" with your resource group name.
- c) Required: Find and replace all of the occurrences of "FUNCTIONAPPNAME" to your function app name.

The following example shows a few of these lines in the LogicApp.txt file:

}

```
"AutoScaleManager": {
    "inputs": {
        "function": {
            "id":
            //c.boxidemode //c.box//considemod/immediates//cites//INTERCENTION/Constinue//immediates//cites//INTERCENTION/Constinue//immediates//cites//INTERCENTION/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Constinue/Con
```

"/subscriptions/SUBSCRIPTION_ID/resourceGroups/RG_NAME/providers/Microsoft.Web/sites/FUNCTIONAPPNAME/functions/AutoScaleManager"

```
},
"Deploy_Changes_to_ASA": {
    "inputs": {
        "body": "@body('AutoScaleManager')",
        "function": {
            "id":
```

"/subscriptions/SUBSCRIPTION ID/resourceGroups/RG NAME/providers/Microsoft.Web/sites/FUNCTIONAPPNAME/functions/DeployConfiguration"

"/subscriptions/SUBSCRIPTION ID/resourceGroups/RG NAME/providers/Microsoft.Web/sites/FUNCTIONAPPNAME/functions/DeviceDeRegister"

```
}
},
"runAfter": {
"Delay_For_connection_Draining": [
```

d) (Optional) Edit the trigger interval, or leave the default value (5). This is the time interval at which the Autoscale functionality is periodically triggered. The following example shows these lines in the *LogicApp.txt* file:

```
"triggers": {
    "Recurrence": {
        "conditions": [],
        "inputs": {},
        "recurrence": {
            "frequency": "Minute",
            "interval": 5
        },
```

e) (Optional) Edit the time to drain, or leave the default value (5). This is the time interval to drain existing connections from the ASA virtual before deleting the device during the Scale-In operation. The following example shows these lines in the *LogicApp.txt* file:

 f) (Optional) Edit the cool down time, or leave the default value (10). This is the time to perform NO ACTION after the Scale-Out is complete. The following example shows these lines in the *LogicApp.txt* file:

Note These steps can also be done from the Azure portal. Consult the Azure documentation for more information.

Step 2 Go to the **Logic App code view**, delete the default contents and paste the contents from the edited *LogicApp.txt* file, and click **Save**.

In this example, three ASA virtual instances are launched because 'minAsaCount' was set to '3' and 'initDeploymentMode' was set to 'BULK' in the ARM template deployment.

Upgrade the ASA virtual

The ASA virtual upgrade is supported only in the form of an image upgrade of virtual machine scale set (VMSS). Hence, you upgrade the ASA virtual through the Azure REST API interface.

Note You can use any REST client to upgrade the ASA virtual.

Before you begin

- Obtain the new ASA virtual image version available in market place (example: 914.001).
- Obtain the SKU used to deploy original scale set (example: asav-azure-byol).
- Obtain the Resource Group and the virtual machine scale set name.

Step 1 In a browser go to the following URL:

https://docs.microsoft.com/en-us/rest/api/compute/virtualmachinescalesets/update#code-try-0

Step 2 Enter the details in the Parameters section.

Figure 17: Upgrade the ASA virtual

Step 3 Enter the JSON input containing the new ASA virtual image version, SKU, and trigger RUN in the **Body** section.

Step 4 A successful response from Azure means that the VMSS has accepted the change.

The new image will be used in the new ASA virtual instances which will get launched as part of Scale-Out operation.

- Existing ASA virtual instances will continue to use the old software image while they exist in a scale set.
- You can override the above behavior and upgrade the existing ASA virtual instances manually. To do this, click the **Upgrade** button in the VMSS. It will reboot and upgrade the selected ASA virtual instances. You must reregister and reconfigure these upgraded ASA virtual instances manually. **Note that this method is NOT recommended.**

Auto Scale Logic

Scale-Out Logic

- **POLICY-1**: Scale-Out will be triggered when the average load of **any** ASA virtual goes beyond the Scale-Out threshold for the configured duration.
- **POLICY-2**: Scale-Out will be triggered when average load of **all** of the ASA virtual devices go beyond Scale-Out threshold for the configured duration.

Scale-In Logic

• If the CPU utilization of **all** of the ASA virtual devices goes below the configured Scale-In threshold for the configured duration.

Notes

- Scale-In/Scale-Out occurs in steps of 1 (i.e. only 1 ASA virtual will be scaled in/out at a time).
- The above logic is based on the assumption that the load balancer will try to equally distribute connections across all ASA virtual devices, and on an average all ASA virtual devices should be loaded equally.

Auto Scale Logging and Debugging

Each component of the serverless code has its own logging mechanism. In addition, logs are published to application insight.

· Logs of individual Azure functions can be viewed.

- If needed, any running task in the Logic App can be stopped/terminated at any time. However, currently running ASA virtual devices getting launched/terminated will be in an inconsistent state.
- The time taken for each run/individual task can be seen in the Logic App.
- The Function App can be upgraded at any time by uploading a new zip. Stop the Logic App and wait for all tasks to complete before upgrading the Function App.

Auto Scale Guidelines and Limitations

Be aware of the following guidelines and limitations when deploying the ASA virtual auto scale for Azure:

- · Scaling decisions are based on CPU utilization.
- The ASA virtual Management interface is configured to have public IP address.
- Only IPv4 is supported.
- The ARM template has limited input validation capabilities, hence it is your responsibility to provide the correct input validation.
- The Azure administrator can see sensitive data (such as admin login credentials and passwords) in plain text format inside Function App environment. You can use the *Azure Key Vault* service to secure sensitive data.
- Any changes in configuration won't be automatically reflected on already running instances. Changes will be reflected on upcoming devices only. Any such changes should be manually pushed to already existing devices.
- If you are facing issues while manually updating the configuration on existing instances, we recommend removing these instances from the Scaling Group and replacing them with new instances.

Troubleshooting

The following are common error scenarios and debugging tips for the ASA virtual auto scale for Azure:

- Unable to SSH into the ASA virtual: Check if a complex password is passed to the ASA virtual via the template; check if Security Groups allow SSH connections.
- Load Balancer Health check failure: Check if the ASA virtual responds to SSH on data interfaces; check Security Group settings.
- Traffic issues: Check Load Balancer rules, NAT rules / Static routes configured in ASA virtual; check Azure virtual network / subnets / gateway details provided in the template and Security Group rules.
- Logic App failed to access VMSS: Check if the IAM role configuration in VMSS is correct.
- Logic App runs for very long time: Check SSH access on scaled-out ASA virtual devices; check the state
 of the ASA virtual devices in Azure VMSS.
- Azure Function throwing error related to subscription ID : Verify that you have a default subscription selected in your account.
- Failure of Scale-In operation: Sometimes, Azure takes a considerably long time to delete an instance in such situations, Scale-in operation may time out and report an error; but eventually the instance, will get deleted.
- Before doing any configuration change, make sure to disable the logic application and wait for all the running tasks to complete.

The following are troubleshooting tips if you encounter any issues during ASA virtual auto scale with Azure GWLB deployment:

- Check the ELB-GWLB association.
- Check the health probe status in the GWLB.
- Check VXLAN configuration by verifying the traffic flow at the physical and logical interfaces of the ASA virtual.
- Check security group rules.

Build Azure Functions from Source Code

System Requirements

- Microsoft Windows desktop/laptop.
- Visual Studio (tested with Visual studio 2019 version 16.1.3)

Note Azure functions are written using C#.

• The "Azure Development" workload needs to be installed in Visual Studio.

Build with Visual Studio

- 1. Download the 'code' folder to the local machine.
- 2. Navigate to the folder 'ASAAutoScaling'.
- 3. Open the project file 'ASAAutoScaling.csproj' in Visual Studio.
- 4. Use Visual Studio standard procedure to Clean and Build.

- 5. Once the build is compiled successfully, navigate to the \bin\Release\netcoreapp2.1 folder.
- 6. Select all the contents, click Send to > Compressed (zipped) folder, and save the ZIP file as *ASM_Function.zip*.
