VXLAN Interfaces

This chapter tells how to configure Virtual eXtensible LAN (VXLAN) interfaces. VXLANs act as Layer 2 virtual networks over Layer 3 physical networks to stretch Layer 2 networks.

About VXLAN Interfaces, page 12-1
Guidelines for VXLAN Interfaces, page 12-6
Default Settings for VXLAN Interfaces, page 12-6
Configure VXLAN Interfaces, page 12-6
Monitoring VXLAN Interfaces, page 12-10
Examples for VXLAN Interfaces, page 12-12
History for VXLAN Interfaces, page 12-16

About VXLAN Interfaces

VXLAN provides the same Ethernet Layer 2 network services as VLAN does, but with greater extensibility and flexibility. Compared to VLAN, VXLAN offers the following benefits:

- Flexible placement of multitenant segments throughout the data center.
- Higher scalability to address more Layer 2 segments: up to 16 million VXLAN segments.

This section describes how VXLAN works. For detailed information, see RFC 7348.

VXLAN Encapsulation, page 12-1
VXLAN Tunnel Endpoint, page 12-2
VTEP Source Interface, page 12-2
VNI Interfaces, page 12-2
Peer VTEPs, page 12-3
VXLAN Use Cases, page 12-3

VXLAN Encapsulation

VXLAN is a Layer 2 overlay scheme on a Layer 3 network. It uses MAC Address-in-User Datagram Protocol (MAC-in-UDP) encapsulation. The original Layer 2 frame has a VXLAN header added and is then placed in a UDP-IP packet.
VXLAN Tunnel Endpoint

VXLAN tunnel endpoint (VTEP) devices perform VXLAN encapsulation and decapsulation. Each VTEP has two interface types: one or more virtual interfaces called VXLAN Network Identifier (VNI) interfaces to which you apply your security policy, and a regular interface called the VTEP source interface that tunnels the VNI interfaces between VTEPs. The VTEP source interface is attached to the transport IP network for VTEP-to-VTEP communication.

The following figure shows two ASAs and Virtual Server 2 acting as VTEPs across a Layer 3 network, extending the VNI 1, 2, and 3 networks between sites. The ASAs act as bridges or gateways between VXLAN and non-VXLAN networks.

The underlying IP network between VTEPs is independent of the VXLAN overlay. Encapsulated packets are routed based on the outer IP address header, which has the initiating VTEP as the source IP address and the terminating VTEP as the destination IP address. The destination IP address can be a multicast group when the remote VTEP is not known. The destination port is UDP port 4789 by default (user configurable).

VTEP Source Interface

The VTEP source interface is a regular ASA interface (physical, redundant, EtherChannel, or even VLAN) with which you plan to associate all VNI interfaces. You can configure one VTEP source interface per ASA/security context.

The VTEP source interface can be devoted wholly to VXLAN traffic, although it is not restricted to that use. If desired, you can use the interface for regular traffic and apply a security policy to the interface for that traffic. For VXLAN traffic, however, all security policy must be applied to the VNI interfaces. The VTEP interface serves as a physical port only.

In transparent firewall mode, the VTEP source interface is not part of a BVI, and you do configure an IP address for it, similar to the way the management interface is treated.

VNI Interfaces

VNI interfaces are similar to VLAN interfaces: they are virtual interfaces that keep network traffic separated on a given physical interface by using tagging. You apply your security policy directly to each VNI interface.

All VNI interfaces are associated with the same VTEP interface.
VXLAN Packet Processing

Traffic entering and exiting the VTEP source interface is subject to VXLAN processing, specifically encapsulation or decapsulation.

Encapsulation processing includes the following tasks:

- The VTEP source interface encapsulates the inner MAC frame with the VXLAN header.
- The UDP checksum field is set to zero.
- The Outer frame source IP is set to the VTEP interface IP.
- The Outer frame destination IP is decided by a remote VTEP IP lookup.

Decapsulation; the ASA only decapsulates a VXLAN packet if:

- It is a UDP packet with the destination port set to 4789 (this value is user configurable).
- The ingress interface is the VTEP source interface.
- The ingress interface IP address is the same as the destination IP address.
- The VXLAN packet format is compliant with the standard.

Peer VTEPs

When the ASA sends a packet to a device behind a peer VTEP, the ASA needs two important pieces of information:

- The destination MAC address of the remote device
- The destination IP address of the peer VTEP

There are two ways in which the ASA can find this information:

- A single peer VTEP IP address can be statically configured on the ASA.
  You cannot manually define multiple peers.
  The ASA then sends a VXLAN-encapsulated ARP broadcast to the VTEP to learn the end node MAC address.
- A multicast group can be configured on each VNI interface (or on the VTEP as a whole).
  The ASA sends a VXLAN-encapsulated ARP broadcast packet within an IP multicast packet through the VTEP source interface. The response to this ARP request enables the ASA to learn both the remote VTEP IP address along with the destination MAC address of the remote end node.

The ASA maintains a mapping of destination MAC addresses to remote VTEP IP addresses for the VNI interfaces.

VXLAN Use Cases

This section describes the use cases for implementing VXLAN on the ASA.

- VXLAN Bridge or Gateway Overview, page 12-4
- VXLAN Bridge (Transparent Mode), page 12-4
- VXLAN Gateway (Routed Mode), page 12-4
- Router Between VXLAN Domains, page 12-5
**VXLAN Bridge or Gateway Overview**

Each ASA VTEP acts as a bridge or gateway between end nodes such as VMs, servers, and PCs and the VXLAN overlay network. For incoming frames received with VXLAN encapsulation over the VTEP source interface, the ASA strips out the VXLAN header and forwards it to a physical interface connected to a non-VXLAN network based on the destination MAC address of the inner Ethernet frame.

The ASA always processes VXLAN packets; it does not just forward VXLAN packets untouched between two other VTEPs.

**VXLAN Bridge (Transparent Mode)**

In transparent firewall mode, the ASA can serve as a VXLAN bridge between a (remote) VXLAN segment and a local segment where both are in the same network. In this case, one member of the bridge virtual interface (BVI) is a regular interface while the other member is a VNI interface.

**VXLAN Gateway (Routed Mode)**

The ASA can serve as a router between VXLAN and non-VXLAN domains, connecting devices on different networks.
Router Between VXLAN Domains

With a VXLAN-stretched Layer 2 domain, a VM can point to an ASA as its gateway while the ASA is not on the same rack, or even when the ASA is far away over the Layer 3 network.
See the following notes about this scenario:

1. For packets from VM3 to VM1, the destination MAC address is the ASA MAC address, because the ASA is the default gateway.
2. The VTEP source interface on Virtual Server 2 receives packets from VM3, then encapsulates the packets with VNI 3’s VXLAN tag and sends them to the ASA.
3. When the ASA receives the packets, it decapsulates the packets to get the inner frames.
4. The ASA uses the inner frames for route lookup, then finds that the destination is on VNI 2. If it does not already have a mapping for VM1, the ASA sends an encapsulated ARP broadcast on the multicast group IP on VNI 2.

Note: The ASA must use dynamic VTEP peer discovery because it has multiple VTEP peers in this scenario.

5. The ASA encapsulates the packets again with the VXLAN tag for VNI 2 and sends the packets to Virtual Server 1. Before encapsulation, the ASA changes the inner frame destination MAC address to be the MAC of VM1 (multicast-encapsulated ARP might be needed for the ASA to learn the VM1 MAC address).
6. When Virtual Server 1 receives the VXLAN packets, it decapsulates the packets and delivers the inner frames to VM1.

Guidelines for VXLAN Interfaces

IPv6
- The VNI interface supports IPv6 traffic, but the VTEP source interface IP address only supports IPv4.
- IPv6 OSPF interface settings are not supported.

Clustering
ASA clustering does not support VXLAN in Individual Interface mode. Only Spanned EtherChannel mode supports VXLAN.

Routing
- Only static routing is supported on the VNI interface; dynamic routing protocols are not supported.
- Policy Based Routing is not supported.

Default Settings for VXLAN Interfaces

VNI interfaces are enabled by default.

Configure VXLAN Interfaces

To configure VXLAN, perform the following steps.
Configure VXLAN Interfaces

Configure the VTEP Source Interface

You can configure one VTEP source interface per ASA or per security context. The VTEP is defined as a Network Virtualization Endpoint (NVE); VXLAN VTEP is the only supported NVE at this time.

**Before You Begin**

For multiple context mode, complete the tasks in this section in the context execution space. Enter the `changeto context name` command to change to the context you want to configure.

**Procedure**

**Step 1** (Transparent mode) Specify that the source interface is NVE-only:

```
interface id
nve-only
```

Example:

```
ciscoasa(config)# interface gigabitethernet 1/1
ciscoasa(config-if)# nve-only
```

This setting lets you configure an IP address for the interface. This command is optional for routed mode where this setting restricts traffic to VXLAN and common management traffic only on this interface.

**Step 2** Configure the source interface name and IPv4 address.

Example (Routed Mode):

```
ciscoasa(config)# interface gigabitethernet 1/1
ciscoasa(config-if)# nameif outside
ciscoasa(config-if)# ip address 10.1.1.1 255.255.255.0
```

Example (Transparent Mode):

```
ciscoasa(config)# interface gigabitethernet 1/1
ciscoasa(config-if)# nve-only
ciscoasa(config-if)# nameif outside
ciscoasa(config-if)# ip address 10.1.1.1 255.255.255.0
```

**Step 3** Specify the NVE instance:

```
nve 1
```

You can only specify one NVE instance, with the ID 1.

**Note** The `encapsulation vxlan` command is added by default for the NVE instance; you do not need to explicitly add it.

**Step 4** Specify the source interface name that you configured in **Step 2**: 
source-interface interface_name

Example:
ciscoasa(cfg-nve)# source-interface outside

Step 5 (Multiple context mode; Optional for single mode) Manually specify the peer VTEP IP address:
peer ip ip_address

Example:
ciscoasa(cfg-nve)# peer ip 10.1.1.2

If you specify the peer IP address, you cannot use multicast group discovery. Multicast is not supported in multiple context mode, so manual configuration is the only option. You can only specify one peer for the VTEP.

Step 6 (Optional; single mode only) Specify a default multicast group for all associated VNI interfaces:
default-mcast-group mcast_ip

Example:
ciscoasa(cfg-nve)# default-mcast-group 236.0.0.100

If you do not configure the multicast group per VNI interface, then this group is used. If you configure a group at the VNI interface level, then that group overrides this setting.

---

Configure the VNI Interface

Add a VNI interface, associate it with the VTEP source interface, and configure basic interface parameters.

Procedure

Step 1 Create the VNI interface:
interface vni vni_num

Example:
ciscoasa(config)# interface vni 1

Set the ID between 1 and 10000. This ID is only an internal interface identifier.

Step 2 Specify the VXLAN segment ID:
segment-id id

Example:
ciscoasa(config-if)# segment-id 1000

Set the ID between 1 and 16777215. The segment ID is used for VXLAN tagging.

Step 3 (Transparent mode) Specify the bridge group to which you want to associate this interface:
bridge-group number

Example:
ciscoasa(config-if)# bridge-group 1

See Configure Transparent Mode Interfaces, page 13-9 to configure the BVI interface and associate regular interfaces to this bridge group.

Step 4  
Associate this interface with the VTEP source interface:

vtep-nve 1

Step 5  
Name the interface:

nameif vni_interface_name

Example:

ciscoasa(config-if)# nameif vxlan1000

The name is a text string up to 48 characters, and is not case-sensitive. You can change the name by reentering this command with a new value. Do not enter the no form, because that command causes all commands that refer to that name to be deleted.

Step 6  
(Routed mode) Assign an IPv4 and/or IPv6 address:

ip address {ip_address [mask] [standby ip_address] | dhcp [setroute] | pppoe [setroute]}

ipv6 address {autoconfig | ipv6-address/prefix-length [standby ipv6-address]}

Example:

ciscoasa(config-if)# ip address 10.1.1.1 255.255.255.0 standby 10.1.1.2

ciscoasa(config-if)# ipv6 address 2001:0DB8::BA98:0:3210/48

Step 7  
Set the security level:

security-level level

Example:

ciscoasa(config-if)# security-level 50

Where number is an integer between 0 (lowest) and 100 (highest).

Step 8  
(Single mode) Set the multicast group address:

mcast-group multicast_ip

Example:

ciscoasa(config-if)# mcast-group 236.0.0.100

If you do not set the multicast group for the VNI interface, the default group from the VTEP source interface configuration is used, if available. If you manually set a VTEP peer IP for the VTEP source interface, you cannot specify a multicast group for the VNI interface. Multicast is not supported in multiple context mode.

(Optional) Change the VXLAN UDP Port

By default, the VTEP source interface accepts VXLAN traffic to UDP port 4789. If your network uses a non-standard port, you can change it.
Before You Begin

For multiple context mode, complete this task in the system execution space. To change from the context to the system execution space, enter the `changeto system` command.

Procedure

**Step 1** Set the VXLAN UDP port:
```
 vxlan port number
```
Example:
```
ciscoasa(config)# vxlan port 5678
```

Monitoring VXLAN Interfaces

See the following commands to monitor VTEP and VNI interfaces.

- `show nve [id] [summary]`
  
  This command shows the parameters, status and statistics of a NVE interface, status of its carrier interface (source-interface), IP address of the carrier interface, VNIs that use this NVE as the VXLAN VTEP, and peer VTEP IP addresses associated with this NVE interface. With the `summary` option, this command only shows the status of the NVE interface, number of VNIs behind the NVE interface, and number of VTEPs discovered.

  See the following output for the `show nve 1` command:
  
  ```
ciscoasa# show nve 1
ciscoasa(config-if)# show nve
  nve 1, source-interface "inside" is up
  IP address 15.1.2.1, subnet mask 255.255.255.0
  Encapsulation: vxlan
  Encapsulated traffic statistics:
  6701004 packets input, 3196266002 bytes
  6700897 packets output, 3437418084 bytes
  1 packets dropped
  Number of configured static peer VTEPs: 0
  Number of discovered peer VTEPs: 1
  Discovered peer VTEPs:
  IP address 15.1.2.3
  Number of VNIs attached to nve 1: 2
  VNIs attached:
  vni 2: segment-id 5002, mcast-group 239.1.2.3
  vni 1: segment-id 5001, mcast-group 239.1.2.3
  ```

  See the following output for the `show nve 1 summary` command:
  
  ```
ciscoasa# show nve 1 summary
  nve 1, source-interface "inside" is up
  Encapsulation: vxlan
  Number of configured static peer VTEPs: 0
  Number of discovered peer VTEPs: 1
  Default multicast group: 239.1.2.3
  Number of VNIs attached to nve 1: 2
  ```

- `show interface vni id [summary]`
This command shows the parameters, status and statistics of a VNI interface, status of its bridged interface (if configured), and NVE interface it is associated with. The summary option shows only the VNI interface parameters.

See the following output for the show interface vni 1 command:

ciscoasa# show interface vni 1
Interface vni1 "vni-inside", is up, line protocol is up
VTEP-NVE 1
Segment-id 5001
Tag-switching: disabled
MTU: 1500
MAC: aaaa.bbbb.1234
IP address 192.168.0.1, subnet mask 255.255.255.0
Multicast group 239.1.3.3
Traffic Statistics for "vni-inside":
235 packets input, 23606 bytes
524 packets output, 32364 bytes
14 packets dropped
1 minute input rate 0 pkts/sec, 0 bytes/sec
1 minute output rate 0 pkts/sec, 2 bytes/sec
1 minute drop rate, 0 pkts/sec
5 minute input rate 0 pkts/sec, 0 bytes/sec
5 minute output rate 0 pkts/sec, 0 bytes/sec
5 minute drop rate, 0 pkts/sec

See the following output for the show interface vni 1 summary command:

ciscoasa# show interface vni 1 summary
Interface vni1 "vni-inside", is up, line protocol is up
VTEP-NVE 1
Segment-id 5001
Tag-switching: disabled
MTU: 1500
MAC: aaaa.bbbb.1234
IP address 192.168.0.1, subnet mask 255.255.255.0
Multicast group not configured

• show vni vlan-mapping

This command shows the mapping between VNI segment IDs and VLAN interfaces or physical interfaces. This command is only valid in transparent firewall mode because in routed mode, the mapping between VXLANs and VLANs can include too many values to show.

See the following output for the show vni vlan-mapping command:

ciscoasa# show vni vlan-mapping
vni1: segment-id: 6000, interface: 'g0110', vlan 10, interface: 'g0111', vlan 11
vni2: segment_id: 5000, interface: 'g01100', vlan 1, interface: 'g111', vlan 3,
interface: 'g112', vlan 4

• show arp vtep-mapping

This command displays MAC addresses cached on the VNI interface for IP addresses located in the remote segment domain and the remote VTEP IP addresses.

See the following output for the show arp vtep-mapping command:

ciscoasa# show arp vtep-mapping
vni-outside 192.168.1.4 0012.0100.0003 577 15.1.2.3
vni-inside 192.168.0.4 0014.0100.0003 577 15.1.2.3

• show mac-address-table vtep-mapping
In transparent mode, this command displays the Layer 2 forwarding table (MAC address table) on the VNI interface with the remote VTEP IP addresses.

See the following output for the `show mac-address-table vtep-mapping` command:

```
ciscoasa# show mac-address-table vtep-mapping
interface             mac address  type     Age(min)  bridge-group  VTEP
--------------------------------------------------------------------------------------
vni-outside           00ff.9200.0000  dynamic    5         1      10.9.1.3
vni-inside            0041.9f00.0000  dynamic    5         1      10.9.1.3
```

### Examples for VXLAN Interfaces

See the following configuration examples for VXLAN.

- Transparent VXLAN Gateway Example, page 12-12
- VXLAN Routing Example, page 12-14

### Transparent VXLAN Gateway Example

See the following description of this example:

- The outside interface on GigabitEthernet 0/0 is used as the VTEP source interface, and it is connected to the Layer 3 network.
- The insidevm100 VLAN subinterface on GigabitEthernet 0/1.100 is connected to the 10.10.10.0/24 network, on which VM3 resides. When VM3 communicates with VM1 (not shown; both have 10.10.10.0/24 IP addresses), the ASA uses VXLAN tag 6000.
- The insidevm200 VLAN subinterface on GigabitEthernet 0/1.200 is connected to the 10.20.20.0/24 network, on which VM2 resides. When VM2 communicates with VM4 (not shown; both have 10.20.20.0/24 IP addresses), the ASA uses VXLAN tag 8000.
The insidepc interface on GigabitEthernet 0/2 is connected to the 10.30.30.0/24 network on which a few PCs reside. When those PCs communicate with VMs/PCs (not shown) behind a remote VTEP that belongs to same network (all have 10.30.30.0/24 IP addresses), the ASA uses VXLAN tag 10000.

**ASA Configuration**

```plaintext
firewall transparent
vxlan port 8427
!
interface gigabitethernet0/0
  nve-only
  nameif outside
  ip address 192.168.1.30 255.255.255.0
  no shutdown
!
  nve 1
    encapsulation vxlan
    source-interface outside

!
interface bvi 2
```
ip address 10.20.20.1 255.255.255.0

interface bvi 3
ip address 10.30.30.1 255.255.255.0

Notes

- For VNI interfaces vni1 and vni2, the inner VLAN tag is removed during encapsulation.
- VNI interfaces vni2 and vni3 share the same multicast IP address for encapsulated ARP over multicast. This sharing is allowed.
- The ASA bridges the VXLAN traffic to non-VXLAN-supported interfaces based on the above BVIs and bridge group configurations. For each of the stretched Layer 2 network segments (10.10.10.0/24, 10.20.20.0/24 and 10.30.30.0/24), the ASA serves as a bridge.
- It is allowed to have more than one VNI or more than one regular interface (VLAN or just physical interface) in a bridge group. The forwarding or association between VXLAN segment ID to the VLAN ID (or a physical interface) is decided by the destination MAC address and which interface connects to the destination.
- The VTEP source-interface is a Layer 3 interface in transparent firewall mode indicated by `nve-only` in the interface configuration. The VTEP source interface is not a BVI interface or a management interface, but it has an IP address and uses the routing table.

**VXLAN Routing Example**

See the following description of this example:

- VM1 (10.10.10.10) is hosted on Virtual Server 1, and VM2 (10.20.20.20) is hosted on Virtual Server 2.
- The default gateway for VM1 is the ASA, which is not in the same pod as Virtual Server 1, but VM1 is not aware of it. VM1 only knows that its default gateway IP address is 10.10.10.1. Similarly, VM2 only knows that its default gateway IP address is 10.20.20.1.
- The VTEP-supported hypervisors on Virtual Server 1 and 2 are able to communicate with the ASA over the same subnet or through a Layer 3 network (not shown; in which case, the ASA and uplinks of virtual servers have different network addresses).
• VM1’s packet will be encapsulated by its hypervisor’s VTEP and sent to its default gateway over VXLAN tunneling.

• When VM1 sends a packet to VM2, the packet will be sent through default gateway 10.10.10.1 from its perspective. Virtual Server1 knows 10.10.10.1 is not local, so the VTEP encapsulates the packet over VXLAN and sends it to ASA’s VTEP.

• On the ASA, the packet is decapsulated. The VXLAN segment ID is learned during decapsulation. The ASA then re-injects the inner frame to the corresponding VNI interface (vni1) based on the VXLAN segment ID. The ASA then conducts a route lookup and sends the inner packet through another VNI interface, vni2. All egressing packets through vni2 are encapsulated with VXLAN segment 8000 and sent through the VTEP to outside.

• Eventually the encapsulated packet is received by the VTEP of Virtual Server 2, which decapsulates it and forwards it to VM2.

ASA Configuration

```plaintext
interface gigabitethernet0/0
  nameif outside
  ip address 192.168.1.30 255.255.255.0
  no shutdown
!
 nve 1
  encapsulation vxlan
  source-interface outside
  default-mcast-group 235.0.0.100
!
 interface vni1
  segment-id 6000
  nameif vxlan6000
  security-level 0
  vtep-nve 1
  ip address 10.20.20.1 255.255.255.0
!
 interface vni2
  segment-id 8000
  nameif vxlan8000
  security-level 0
  vtep-nve 1
  ip address 10.10.10.1 255.255.255.0
!
```
## History for VXLAN Interfaces

Table 12-1  History for VXLAN Interfaces

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>VXLAN support</td>
<td>9.4(1)</td>
<td>VXLAN support was added, including VXLAN tunnel endpoint (VTEP) support. You can define one VTEP source interface per ASA or security context. We introduced the following commands: <code>debug vxlan</code>, <code>default-mcast-group</code>, <code>encapsulation vxlan</code>, <code>inspect vxlan</code>, <code>interface vni</code>, <code>mcast-group</code>, <code>nve</code>, <code>nve-only</code>, <code>peer ip</code>, <code>segment-id</code>, <code>show arp vtep-mapping</code>, <code>show interface vni</code>, <code>show mac-address-table vtep-mapping</code>, <code>show nve</code>, <code>show vni vlan-mapping</code>, <code>source-interface</code>, <code>vtep-nve</code>, <code>vxlan port</code></td>
</tr>
