About FXOS Security Modules/Security Engine

You can use the FXOS CLI to perform the following functions on a security module/engine:

- Decommission (security modules only)—Decommissioning a security module places the security module into maintenance mode. You can also decommission and then acknowledge a security module in order to correct certain fault states. See Decommissioning a Security Module, on page 2.
- Acknowledge—Brings newly installed security modules online. See Acknowledge a Security Module/Engine, on page 2.
- Power Cycle—Restarts the security module/engine. See Power-Cycling a Security Module/Engine, on page 3.
- Reinitialize—Reformats the security module/engine hard disk, removing all deployed applications and configurations from the security module/engine, and then restarts the system. After reinitialization is complete, if a logical device is configured for the security module/engine, the Firepower eXtensible Operating System will reinstall the application software, redeploy the logical device, and auto start the application. See Reinitializing a Security Module/Engine, on page 4.

Warning

All application data on the security module/engine is deleted during reinitialization. Please back up all application data before reinitializing a security module/engine.

• Power off/on—Toggles the power state for the security module/engine. See Power-Cycling a Security Module/Engine, on page 3.

Decommissioning a Security Module

When you decommission a security module, the security module object is deleted from the configuration and the security module becomes unmanaged. Any logical devices or software running on the security module will become inactive.

You can decommission a security module if you want to temporarily discontinue use of the security module.

Note

A module must be decommissioned before it can be deleted using the delete decommissioned command.

Procedure

Step 1 To decommission a module, enter the decommission server command:

```
decommission server { ID | chassis-id/blade-id}
```

Depending on the type of device hosting the module to be decommissioned, identify it using its module ID (4100 series), or the chassis number and the module number (9300 devices).

Example:

FP9300-A# **decommission server 1/2** FP9300-A* #

Step 2 Enter the commit-buffer command to commit the change.

You can use the show server decommissioned command to view a list of decommissioned modules.

Acknowledge a Security Module/Engine

When a new security module is installed into the chassis, or when an existing module is replaced with one with a different product ID (PID), you must acknowledge the security module before you can begin using it.

If the security module is showing a status of "mismatch" or "token mismatch," this is an indication that the security module installed in the slot has data on it that does not match what was previously installed in the slot. If the security module has existing data on it and you are sure you want to use it in the new slot (in other words, the security module wasn't inadvertently installed into the wrong slot), you must reinitialize the security module before you can deploy a logical device to it.

Procedure

Step 1 Enter chassis mode:

scope chassis

L

Step 2 Enter the acknowledge slot command after decommissioning and physically removing a module that will not be replaced, or after replacing a module with another that is not the same type (that is, with a different PID):

acknowledge slot

Example:

```
FP9300-A# scope chassis
FP9300-A /chassis # acknowledge slot 2
FP9300-A /chassis* #
```

```
Step 3 Commit the configuration:
```

commit-buffer

Power-Cycling a Security Module/Engine

Follow these steps to power-cycle a security module/engine.

Procedure

Step 1 Enter / service-profile mode:

scope service-profile server {chassis_id>/blade_id}

Example:

```
FP9300-A # scope service-profile server 1/1
FP9300-A /org/service-profile #
```

- **Step 2** Enter one of the cycle commands:
 - cycle cycle-immediate—power-cycles the module immediately.
 - cycle cycle-wait—the system waits for up to five minutes for the application running on the module to shut down before power-cycling the module.

Example:

```
FP9300-A /org/service-profile # cycle cycle-wait
FP9300-A /org/service-profile* #
```

Step 3 Commit the buffer to power-cycle the module:

commit-buffer

Reinitializing a Security Module/Engine

When a security module/engine is reinitialized, the security module/engine hard disk is formatted and all installed application instances, configurations, and data are removed. After reinitialization has completed, if a logical device is configured for the security module/engine, FXOS will reinstall the application software, redeploy the logical device, and auto start the application.

Â	
n	All application data on the security module/engine is deleted during reinitialization. Back up all application data before reinitializing a security module/engine.
	Procedure
	Enter security services mode:
	scope ssa
	Enter slot mode for the desired module:
	<pre>scope slot {slot_id}</pre>
	Example:
	FP9300-A # scope ssa FP9300-A /ssa # scope slot 2 FP9300-A /ssa/slot #
	Enter the reinitialize command:
	Example:
	FP9300-A # scope ssa FP9300-A /ssa # scope slot 2 FP9300-A /ssa/slot # reinitialize Warning: Reinitializing blade takes a few minutes. All the application data on blade will get lost. Please backup application running config files before commit-buffer. FP9300-A /ssa/slot* #
	Back up application configuration files as necessary.
	Commit the buffer to reinitialize the module:
	commit-buffer
	The module is restarted and all data on the module is deleted. This process can take several minutes.
	You can use the show detail command to check the progress of the reformatting operation, the result of the reformatting (success or failure), and an error code if the operation fails.

Taking a Network Module Offline or Online

Follow these steps to use CLI commands to take a network module offline, or to bring it back online; used for example, when performing module online insertion and removal (OIR).

- Note
- If removing and replacing a network module, follow the instructions in the "Maintenance and Upgrades" chapter of the appropriate Install Guide for your device. See https://www.cisco.com/c/en/us/support/ security/firepower-ngfw/products-installation-guides-list.html.

Procedure

Step 1 Use the following commands to enter /fabric-interconnect mode and then enter /card mode for the module to be taken offline:

scope fabric-interconnect a
scope card ID

- **Step 2** You can use the **show** detail command to view information about this card, including its current status.
- **Step 3** To take the module offline, enter:

set adminstate offline

Step 4 Enter the commit-buffer command to save the configuration change.

You can use the show detail command again to confirm that the module is offline.

Step 5 To bring the network module back online, enter:

set adminstate online commit-buffer

Example

```
FP9300-A# scope fabric-interconnect a
FP9300-A /fabric-interconnect # scope card 2
FP9300-A /fabric-interconnect/card # show detail
Fabric Card:
    Id: 2
   Description: Firepower 4x40G QSFP NM
   Number of Ports: 16
    State: Online
   Vendor: Cisco Systems, Inc.
   Model: FPR-NM-4X40G
   HW Revision: 0
   Serial (SN): JAD191601DE
    Perf: N/A
   Admin State: Online
    Power State: Online
    Presence: Equipped
```

```
Thermal Status: N/A
    Voltage Status: N/A
FP9300-A /fabric-interconnect/card # set adminstate offline
FP9300-A /fabric-interconnect/card* # commit-buffer
FP9300-A /fabric-interconnect/card # show detail
Fabric Card:
    Id: 2
    Description: Firepower 4x40G QSFP \ensuremath{\mathsf{NM}}
   Number of Ports: 16
   State: Offline
    Vendor: Cisco Systems, Inc.
    Model: FPR-NM-4X40G
    HW Revision: 0
    Serial (SN): JAD191601DE
    Perf: N/A
   Admin State: Offline
    Power State: Off
    Presence: Equipped
   Thermal Status: N/A
    Voltage Status: N/A
FP9300-A /fabric-interconnect/card #
```
