

Users

Managed devices include a default **admin** account for CLI access. This chapter discusses how to create custom user accounts.

- About Users, on page 1
- Requirements and Prerequisites for User Accounts for Devices, on page 2
- Guidelines and Limitations for User Accounts for Devices, on page 3
- Add an Internal User at the CLI, on page 3
- Configure External Authentication for the Threat Defense, on page 5
- Troubleshooting LDAP Authentication Connections, on page 17
- History for Users, on page 19

About Users

You can add custom user accounts on managed devices, either as internal users or as external users on a LDAP or RADIUS server. Each managed device maintains separate user accounts. For example, when you add a user to the management center, that user only has access to the management center; you cannot then use that username to log directly into a managed device. You must separately add a user on the managed device.

Internal and External Users

Managed devices support two types of users:

- Internal user—The device checks a local database for user authentication.
- External user—If the user is not present in the local database, the system queries an external LDAP or RADIUS authentication server.

CLI Access

Firepower devices include a Firepower CLI that runs on top of Linux. You can create internal users on devices using the CLI. You can establish external users on threat defense devices using the management center.

On managed devices, user access to commands in the CLI depends on the role you assign.

None

The user cannot log into the device on the command line.

Config

The user can access all commands, including configuration commands. Exercise caution in assigning this level of access to users.

Basic

The user can access non-configuration commands only. Only internal users and threat defense external RADIUS users support the Basic role.

Requirements and Prerequisites for User Accounts for Devices

Model Support

· Threat Defense-Internal and external users

Supported Domains

Any

User Roles

Configure external users-Admin FMC user

Configure internal users-Config CLI user

Guidelines and Limitations for User Accounts for Devices

Usernames

- You cannot add the same username for both internal and external users. If the external server uses a duplicate username, the deployment to the device fails.
- The username must be Linux-valid:
 - Maximum 32 alphanumeric characters, plus hyphen (-) and underscore (_)
 - All lowercase
 - Cannot start with hyphen (-); cannot be all numbers; cannot include a period (.), at sign (@), or slash (/)

Defaults

All devices include an **admin** user as a local user account; you cannot delete the **admin** user. The default initial password is **Admin123**; the system forces you to change this during the initialization process. See the getting started guide for your model for more information about system initialization.

Number of User Accounts

You can create a maximum of 43 user accounts for the Firepower 1000 and 2100.

Add an Internal User at the CLI

Use the CLI to create internal users on the threat defense.

Procedure

Step 1 Log into the device CLI using an account with Config privileges.

The **admin** user account has the required privileges, but any account with Config privileges will work. You can use an SSH session or the Console port.

For certain threat defense models, the Console port puts you into the FXOS CLI. Use the **connect ftd** command to get to the threat defense CLI.

Step 2 Create the user account.

configure user add username {basic | config}

• username-Sets the username. The username must be Linux-valid:

- Maximum 32 alphanumeric characters, plus hyphen (-) and underscore (_)
- · All lowercase

- **basic**—Gives the user basic access. This role does not allow the user to enter configuration commands.
- **config**—Gives the user configuration access. This role gives the user full administrator rights to all commands.

Example:

The following example adds a user account named johncrichton with Config access rights. The password is not shown as you type it.

```
> configure user add johncrichton config
Enter new password for user johncrichton: newpassword
Confirm new password for user johncrichton: newpassword
> show user
Login UID Auth Access Enabled Reset Exp Warn Str Lock Max
admin 1000 Local Config Enabled No Never N/A Dis No N/A
johncrichton 1001 Local Config Enabled No Never N/A Dis No 5
```

Note

Tell users they can change their own passwords using the **configure password** command.

Step 3 (Optional) Adjust the characteristics of the account to meet your security requirements.

You can use the following commands to change the default account behavior.

• configure user aging username max_days warn_days

Sets an expiration date for the user's password. Specify the maximum number of days for the password to be valid followed by the number of days before expiration the user will be warned about the upcoming expiration. Both values are 1 to 9999, but the warning days must be less than the maximum days. When you create the account, there is no expiration date for the password.

• configure user forcereset username

Forces the user to change the password on the next login.

• configure user maxfailedlogins username number

Sets the maximum number of consecutive failed logins you will allow before locking the account, from 1 to 9999. Use the **configure user unlock** command to unlock accounts. The default for new accounts is 5 consecutive failed logins.

• configure user minpasswdlen username number

Sets a minimum password length, which can be from 1 to 127.

• configure user strengthcheck username {enable | disable}

Enables or disables password strength checking, which requires a user to meet specific password criteria when changing their password. When a user's password expires or if the **configure user forcereset** command is used, this requirement is automatically enabled the next time the user logs in.

Step 4 Manage user accounts as necessary.

Users can get locked out of their accounts, or you might need to remove accounts or fix other issues. Use the following commands to manage the user accounts on the system.

4

• configure user access username { basic | config }

Changes the privileges for a user account.

• configure user delete username

Deletes the specified account.

• configure user disable username

Disables the specified account without deleting it. The user cannot log in until you enable the account.

• configure user enable username

Enables the specified account.

configure user password username

Changes the password for the specified user. Users should normally change their own password using the **configure password** command.

• configure user unlock username

Unlocks a user account that was locked due to exceeding the maximum number of consecutive failed login attempts.

Configure External Authentication for the Threat Defense

To enable external authentication for threat defense devices, you need to add one or more external authentication objects.

About External Authentication for the Threat Defense

When you enable external authentication for threat defense users, the threat defense verifies the user credentials with an LDAP or RADIUS server as specified in an *external authentication object*.

External authentication objects can be used by the management center and threat defense devices. You can share the same object between the different appliance/device types or create separate objects. For the threat defense, you can only activate one external authentication object in the platform settings that you deploy to the devices.

Note The timeout range is different for the threat defense and the management center, so if you share an object, be sure not to exceed the threat defense's smaller timeout range (1-30 seconds for LDAP, and 1-300 seconds for RADIUS). If you set the timeout to a higher value, the threat defense external authentication configuration will not work.

Only a subset of fields in the external authentication object are used for threat defense SSH access. If you fill in additional fields, they are ignored. If you also use this object for other device types, those fields will be used.

LDAP users always have Config privileges. RADIUS users can be defined as either Config or Basic users.

You can either define users on the RADIUS server (with the Service-Type attribute), or you can pre-define the user list in the external authentication object. For LDAP, you can specify a filter to match CLI users on the LDAP server.

Note Users with CLI access can gain Linux shell access with the **expert** command. Linux shell users can obtain root privileges, which can present a security risk. Make sure that you:

- · Restrict the list of users with Linux shell access.
- Do not create Linux shell users.

About LDAP

The Lightweight Directory Access Protocol (LDAP) allows you to set up a directory on your network that organizes objects, such as user credentials, in a centralized location. Multiple applications can then access those credentials and the information used to describe them. If you ever need to change a user's credentials, you can change them in one place.

Microsoft has announced that Active Directory servers will start enforcing LDAP binding and LDAP signing in 2020. Microsoft is making these a requirement because when using default settings, an elevation of privilege vulnerability exists in Microsoft Windows that could allow a man-in-the-middle attacker to successfully forward an authentication request to a Windows LDAP server. For more information, see 2020 LDAP channel binding and LDAP signing requirement for Windows on the Microsoft support site.

If you have not done so already, we recommend you start using TLS/SSL encryption to authenticate with an Active Directory server.

About RADIUS

Remote Authentication Dial In User Service (RADIUS) is an authentication protocol used to authenticate, authorize, and account for user access to network resources. You can create an authentication object for any RADIUS server that conforms to RFC 2865.

Firepower devices support the use of SecurID tokens. When you configure authentication by a server using SecurID, users authenticated against that server append the SecurID token to the end of their SecurID PIN and use that as their password when they log in. You do not need to configure anything extra on the Firepower device to support SecurID.

Add an LDAP External Authentication Object for Threat Defense

Add an LDAP server to support external users for threat defense management.

In a multidomain deployment, external authentication objects are only available in the domain in which they are created.

Sharing External Authentication Objects

External LDAP objects can be used by the management center and threat defense devices. You can share the same object between the management center and devices or create separate objects.

Note For LDAP, the timeout range is different for the threat defense and the management center, so if you share an object, be sure not to exceed the threat defense's smaller timeout range (1-30 seconds). If you set the timeout to a higher value, the deployment to the threat defense will fail.

Threat Defense Supported Fields

Only a subset of fields in the LDAP object are used for threat defense SSH access. If you fill in additional fields, they are ignored. If you also use this object for the management center, those fields will be used. This procedure only covers the supported fields for the threat defense. For other fields, see Add an LDAP External Authentication Object for the Management Center.

Usernames

Usernames must be Linux-valid usernames and be lower-case only, using alphanumeric characters plus period (.) or hyphen (-). Other special characters such as at sign (@) and slash (/) are not supported. You cannot add the **admin** user for external authentication. You can only add external users (as part of the External Authentication object) in the management center; you cannot add them at the CLI. Note that internal users can only be added at the CLI, not in the management center.

If you previously configured the same username for an internal user using the **configure user add** command, the threat defense first checks the password against the internal user, and if that fails, it checks the LDAP server. Note that you cannot later add an internal user with the same name as an external user; only pre-existing internal users are supported.

Privilege Level

LDAP users always have Config privileges.

Before you begin

You must specify DNS server(s) for domain name lookup on your device. Even if you specify an IP address and not a hostname for the LDAP server on this procedure, the LDAP server may return a URI for authentication that can include a hostname. A DNS lookup is required to resolve the hostname. See Modify Threat Defense Management Interfaces at the CLI to add DNS servers.

Procedure

Step 1	Choose System $(\Box) > $ Users .			
Step 2	Click the External Authentication tab.			
Step 3	Click (+)Add External Authentication Object.			
Step 4	Set the Authentication Method to LDAP.			
Step 5	Enter a Name and optional Description.			
Step 6	Choose a Server Type from the drop-down list.			
Step 7	For the Primary Server, enter a Host Name/IP Address.			
	If you are using a certificate to connect via TLS or SSL, the host name in the certificate must match the host name used in this field. In addition, IPv6 addresses are not supported for encrypted connections.			
Step 8	(Optional) Change the Port from the default.			

Step 9 (Optional) Enter the **Backup Server** parameters.

Step 10 Enter LDAP-Specific Parameters.

- a) Enter the **Base DN** for the LDAP directory you want to access. For example, to authenticate names in the Security organization at the Example company, enter ou=security, dc=example, dc=com. Alternatively click **Fetch DNs**, and choose the appropriate base distinguished name from the drop-down list.
- b) (Optional) Enter the Base Filter. For example, if the user objects in a directory tree have a physicalDeliveryOfficeName attribute and users in the New York office have an attribute value of NewYork for that attribute, to retrieve only users in the New York office, enter (physicalDeliveryOfficeName=NewYork).
- c) Enter a User Name for a user who has sufficient credentials to browse the LDAP server. For example, if you are connecting to an OpenLDAP server where user objects have a uid attribute, and the object for the administrator in the Security division at your example company has a uid value of NetworkAdmin, you might enter uid=NetworkAdmin, ou=security, dc=example, dc=com.
- d) Enter the user password in the **Password** and the **Confirm Password** fields.
- e) (Optional) Click Show Advanced Options to configure the following advanced options.
 - Encryption—Click None, TLS, or SSL.

If you change the encryption method after specifying a port, you reset the port to the default value for that method. For **None** or **TLS**, the port resets to the default value of 389. If you choose SSL encryption, the port resets to 636.

 SSL Certificate Upload Path—For SSL or TLS encryption, you must choose a certificate by clicking Choose File.

If you previously uploaded a certificate and want to replace it, upload the new certificate and redeploy the configuration to your devices to copy over the new certificate.

- **Note** TLS encryption requires a certificate on all platforms. For SSL, the threat defense also requires a certificate. For other platforms, SSL does not require a certificate. However, we recommend that you *always* upload a certificate for SSL to prevent man-in-the-middle attacks.
- (Not Used) User Name Template—Not used by the threat defense.
- **Timeout (Seconds)**—Enter the number of seconds before rolling over to the backup connection, between 1 and 30. The default is 30.
 - **Note** The timeout range is different for the threat defense and the management center, so if you share an object, be sure not to exceed the threat defense's smaller timeout range (1-30 seconds). If you set the timeout to a higher value, the threat defense LDAP configuration will not work.
- **Step 11** Configure Attribute Mapping to retrieve users based on an attribute.
 - Enter a **UI Access Attribute**. **Note**: This field is not used for device CLI access; however, it is a required field, so you need to enter a value. You can just enter the same value that you enter for the **CLI Access Attribute**.
 - Set the **CLI Access Attribute** if you want to use a CLI access attribute other than the user distinguished type. For example, on a Microsoft Active Directory Server, use the sAMAccountName CLI access attribute to retrieve CLI access users by typing sAMAccountName.

- **Note** Users with CLI access can gain Linux shell access with the **expert** command. Linux shell users can obtain root privileges, which can present a security risk. Make sure that you restrict the list of users with CLI or Linux shell access.
- **Note** Deploying an external authentication object that allows a large number of users with CLI access may cause deployments to time out and fail while waiting for the users to be created.

Step 12 Set the CLI Access Filter.

Choose one of the following methods:

- To use the same filter you specified when configuring authentication settings, check the check box of **Same as Base Filter**.
- To retrieve administrative user entries based on attribute value, enter the attribute name, a comparison operator, and the attribute value you want to use as a filter, enclosed in parentheses. For example, if all network administrators have a manager attribute which has an attribute value of shell, you can set a base filter of (manager=shell).

The usernames must be Linux-valid:

- Maximum 32 alphanumeric characters, plus hyphen (-) and underscore (_)
- All lowercase
- Cannot start with hyphen (-); cannot be all numbers; cannot include a period (.), at sign (@), or slash (/)
- **Note** If you previously configured the same username for an internal user, the threat defense first checks the password against the internal user, and if that fails, it checks the LDAP server. Note that you cannot later add an internal user with the same name as an external user; only pre-existing internal users are supported.

Step 13 Click Save.

Step 14 Enable use of this server. See External Authentication.

- **Step 15** If you later add or delete users on the LDAP server, you must refresh the user list and redeploy the Platform Settings on managed devices.
 - a) Click **Refresh** ($^{\mathbb{C}}$) next to each LDAP server.

If the user list changed, you will see a message advising you to deploy configuration changes for your device.

b) Deploy configuration changes; see Deploy Configuration Changes.

Examples

Basic Example

The following figures illustrate a basic configuration of an LDAP login authentication object for a Microsoft Active Directory Server. The LDAP server in this example has an IP address of 10.11.3.4. The connection uses port 389 for access.

Use for CAC authentication and authorizat lasic Configuration Example IS Active Directory • Set Defaults 89	ion • ex. IP or hostname
Use for CAC authentication and authorizat asic Configuration Example IS Active Directory • Set Defaults 89	ex. IP or hostname
Asic Configuration Example IS Active Directory Set Defaults 89	• ex. IP or hostname
IS Active Directory Set Defaults 89	• ex. IP or hostname
1S Active Directory Set Defaults 89	ex. IP or hostname
89	ex. IP or hostname
89	ex. IP or hostname
89	
nal)	
	ex. IP or hostname
89	
eters	
ou=security, DC=it, DE=example, E	
Fetch DNs	ex. ac=sourcettre,ac=com
	ex. (cn=jsmith), (!cn=jsmith), (&(cn=jsmith)(] (cn=tsmith)(cn=csmith*)))
CN=admin, DC=example, DC=com	ex. cn=jsmith,dc=sourcefire,dc=com
]
	eters ou=security, DC=it, DE=example, E Fetch DNs CN=admin, DC=example, DC=com

This example shows a connection using a base distinguished name of

OU=security, DC=it, DC=example, DC=com for the security organization in the information technology domain of the Example company.

Attribute Mapping					
UI Access Attribute *	sAMAccountName	Fetch Attrs			
CLI Access Attribute *	sAMAccountName				
Group Controlled Acc	ess Roles (Optional)				
CLI Access Filter					
CLI Access Filter 👩	Same as Base Filter		and the former have a second first		
(Mandatory for FTD devices)			ex. (co-print), (co-print)), (c),	n-Istantolii (co-d	sanitri(en+csmitr/II)
Additional Test Paramet	ters				
User Name					
Password					
*Required Field					
				Cancel	Test Save

A CLI Access Attribute of SAMAccountName causes each SAMAccountName attribute to be checked for all objects in the directory for matches when a user logs into the threat defense.

Note that because no base filter is applied to this server, the threat defense checks attributes for all objects in the directory indicated by the base distinguished name. Connections to the server time out after the default time period (or the timeout period set on the LDAP server).

Advanced Example

This example illustrates an advanced configuration of an LDAP login authentication object for a Microsoft Active Directory Server. The LDAP server in this example has an IP address of 10.11.3.4. The connection uses port 636 for access.

Authentication Method	LDAP	*	
CAC	Use for CAC authentication	n and authorization	
Name *	Advanced Configuration Ex	cample	
Description	(
Server Type	MS Active Directory	▼ Set Defaults	
Primary Server			
Host Name/IP Address *	10.11.3.4		ex. IP or hostname
Port *	636		

This example shows a connection using a base distinguished name of

OU=security, DC=it, DC=example, DC=com for the security organization in the information technology domain of the Example company. However, note that this server has a base filter of (cn=*smith). The filter restricts the users retrieved from the server to those with a common name ending in smith.

LDAP-Specific Paramet	ters		
Base DN *	OU=security,DC-it,DC=example, D	Fetch DNs	ex. do-sourcefire,do-com
Base Filter	(CN=*smith)		$ax. \ (cn+jamith), \ (xn-jamith), \ (\&(cn-jamith))[(cn+bsmith)(cn+camith^*)])$
User Name *	CN=admin,DC=example,DC=com		ex. cn=jsmith,dc=sourcefire,dc=com
Password *			
Confirm Password *			
 Show Advanced Options Encryption 	● SSL ○ TLS ○ None		
SSL Certificate Upload Path	Choose File certificate pers		ex. PEM Format (base64 encoded version of DER)
User Name Template	%s		ex. cn=%s,dc=sourcelire,dc=com
Timeout (Seconds)	60		
Attribute Mapping			
UI Access Attribute *	sAMAccountName	Fetch Attrs	
CLI Access Attribute *	sAMAccountName		

The connection to the server is encrypted using SSL and a certificate named certificate.pem is used for the connection. In addition, connections to the server time out after 60 seconds because of the **Timeout** (Seconds) setting.

Because this server is a Microsoft Active Directory server, it uses the sAMAccountName attribute to store user names rather than the uid attribute.

The CLI Access Attribute of SAMAccountName causes each SAMAccountName attribute to be checked for all objects in the directory for matches when a user logs into the threat defense.

In the following example, the CLI access filter is set to be the same as the base filter.

CLI Access Filter		
CLI Access Filter 🕦	Same as Base Filter	
(Mandatory for Firewall Threat Defense devices)		ex. (cn=jsmith), (!cn=jsmith), (&(cn=jsmith)((lcn=bsmith)(cn=csmith*)))
Additional Test Parame	eters	
User Name		
Password		
*Required Field		Cancel Test Save

Add a RADIUS External Authentication Object for Threat Defense

Add a RADIUS server to support external users for the threat defense.

Sharing External Authentication Objects

You can share the same object between the management center and devices or create separate objects. Note that the threat defense supports defining users on the RADIUS server, while the management center requires you to predefine the user list in the external authentication object. You can choose to use the predefined list method for the threat defense, but if you want to define users on the RADIUS server, you must create separate objects for the threat defense and the management center.

Note

The timeout range is different for the threat defense and the management center, so if you share an object, be sure not to exceed the threat defense's smaller timeout range (1-300 seconds). If you set the timeout to a higher value, the threat defense RADIUS configuration will not work.

threat defense Supported Fields

Users

Only a subset of fields in the RADIUS object are used for threat defense SSH access. If you fill in additional fields, they are ignored. If you also use this object for the management center, those fields will be used. This procedure only covers the supported fields for the threat defense. For other fields, see Add a RADIUS External Authentication Object for Management Center in the Cisco Secure Firewall Management Center Administration Guide.

Usernames

You cannot add the **admin** user for external authentication. You can only add external users (as part of the External Authentication object) in the management center; you cannot add them at the CLI. Note that internal users can only be added at the CLI, not in the management center.

If you previously configured the same username for an internal user using the **configure user add** command, the threat defense first checks the password against the internal user, and if that fails, it checks the RADIUS server. Note that you cannot later add an internal user with the same name as an external user; only pre-existing internal users are supported. For users defined on the RADIUS server, be sure to set the privilege level to be the same as any internal users; otherwise you cannot log in using the external user password.

Procedure

Step 1 Define users on the RADIUS server using the Service-Type attribute.

The following are supported values for the Service-Type attribute:

- Administrator (6)—Provides Config access authorization to the CLI. These users can use all commands in the CLI.
- NAS Prompt (7) or any level other than 6—Provides Basic access authorization to the CLI. These users can use read-only commands, such as **show** commands, for monitoring and troubleshooting purposes.

The names must be Linux-valid usernames:

- Maximum 32 alphanumeric characters, plus hyphen (-) and underscore (_)
- All lowercase
- Cannot start with hyphen (-); cannot be all numbers; cannot include a sign (@) or slash (/)

Alternatively, you can predefine users in the external authentication object (see, Step 12, on page 14). To use the same RADIUS server for the threat defense and management center while using the Service-Type attribute method for the threat defense, create two external authentication objects that identify the same RADIUS server: one object includes the predefined **CLI Access Filter** users (for use with the management center), and the other object leaves the **CLI Access Filter** empty (for use with threat defenses).

- **Step 2** In the management center, choose **System** (\clubsuit) > **Users**.
- Step 3 Click External Authentication.
- Step 4 Click (+)Add External Authentication Object.
- **Step 5** Set the **Authentication Method** to **RADIUS**.
- **Step 6** Enter a **Name** and optional **Description**.
- Step 7For the Primary Server, enter a Host Name/IP Address.Only IPv4 is supported.

- **Note** If you are using a certificate to connect via TLS or SSL, the host name in the certificate must match the host name used in this field.
- **Step 8** (Optional) Change the **Port** from the default.
- Step 9 Enter the **RADIUS Secret Key**.
- **Step 10** (Optional) Enter the **Backup Server** parameters.
- Step 11 (Optional) Enter RADIUS-Specific Parameters.
 - a) Enter the **Timeout (Seconds**) in seconds before retrying the primary server, between 1 and 300. The default is 30.
 - **Note** The timeout range is different for the threat defense and the management center, so if you share an object, be sure not to exceed the threat defense's smaller timeout range (1-300 seconds). If you set the timeout to a higher value, the threat defense RADIUS configuration will not work.
 - b) Enter the **Retries** before rolling over to the backup server. The default is 3.
- Step 12(Optional) Instead of using RADIUS-defined users (see, Step 1, on page 13), in the CLI Access Filter areaAdministrator CLI Access User List field, enter the user names that should have CLI access, separated by
commas. For example, enter jchrichton, aerynsun, rygel.

You may want to use the **CLI Access Filter** method for threat defense so you can use the same external authentication object with threat defense and other platform types.

Note If you want to use RADIUS-defined users, you must leave the CLI Access Filter empty.

Make sure that these usernames match usernames on the RADIUS server. The names must be Linux-valid usernames:

- Maximum 32 alphanumeric characters, plus hyphen (-) and underscore (_)
- All lowercase
- Cannot start with hyphen (-); cannot be all numbers; cannot include a period (.), at sign (@), or slash (/)
- **Note** Users with CLI access can gain Linux shell access with the **expert** command. Linux shell users can obtain root privileges, which can present a security risk. Make sure that you restrict the list of users with CLI or Linux shell access.
- **Note** Deploying an external authentication object that allows a large number of users with CLI access may cause deployments to time out and fail while waiting for the users to be created.
- **Step 13** (Optional) Click **Test** to test management center connectivity to the RADIUS server.

This function can only test management center connectivity to the RADIUS server; there is no test function for managed device connectivity to the RADIUS server.

- **Step 14** (Optional) You can also enter **Additional Test Parameters** to test user credentials for a user who should be able to authenticate: enter a **User Name** and **Password**, and then click **Test**.
 - TipIf you mistype the name or password of the test user, the test fails even if the server configuration
is correct. To verify that the server configuration is correct, click **Test** without entering user
information in the **Additional Test Parameters** field first. If that succeeds, supply a user name
and password to test with the specific user.

L

Example:

To test if you can retrieve the JSmith user credentials at the Example company, enter JSmith and the correct password.

Step 15 Click Save.

Step 16 Enable use of this server. See External Authentication

Examples

Simple User Role Assignments

The following figure illustrates a sample RADIUS login authentication object for a server running Cisco Identity Services Engine (ISE) with an IP address of 10.10.10.98 on port 1812. No backup server is defined.

External Authentication	n Object		
Authentication Method	RADIUS	•	
Name *	ISE_RADIUS		
Description			
Primary Server			
Host Name/IP Address *	10.10.10.98		ex. IP or hostname
Port *	1812		
RADIUS Secret Key *			

The following example shows RADIUS-specific parameters, including the timeout (30 seconds) and number of failed retries before the system attempts to contact the backup server, if any.

This example illustrates important aspects of RADIUS user role configuration:

Users ewharton and gsand are granted web interface Administrative access.

The user cbronte is granted web interface Maintenance User access.

The user jausten is granted web interface Security Analyst access.

The user ewharton can log into the device using a CLI account.

RADIUS-Specific Param	neters	
Timeout (Seconds)	30	
Retries	3	1
Access Admin		
Administrator	swbarion, gsand	
Discovery Admin		
External Database User		
Intrusion Admin		
Maintenance User	shonts

Security Approver		
Threat Intelligence Director (TID) User		
	Discovery Admin	
	External Database User	
Default User Role	Intrusion Admin	To specify the default user role if user is not found in any group
	Maintenance User	
CLI Access Filter	and 6.2), define users for CLI access. For FTD	6.4 and later, we recommend defining users on the RADIUS server. Click bere for more information
Administrator CU Access User List	swharton	ex. user1, user2, user2 (lowercase letters only).

The following graphic depicts the role configuration for the example:

Roles for Users Matching an Attribute-Value Pair

You can use an attribute-value pair to identify users who should receive a particular user role. If the attribute you use is a custom attribute, you must define the custom attribute.

The following figure illustrates the role configuration and custom attribute definition in a sample RADIUS login authentication object for the same ISE server as in the previous example.

In this example, however, the MS-RAS-Version custom attribute is returned for one or more of the users because a Microsoft remote access server is in use. Note the MS-RAS-Version custom attribute is a string. In this example, all users logging in to RADIUS through a Microsoft v. 5.00 remote access server should receive the Security Analyst (Read Only) role, so you enter the attribute-value pair of MS-RAS-Version=MSRASV5.00 in the Security Analyst (Read Only) field.

Security Analyst (Read Only)	MS-RAS-Version=MSRASV5.00		
Security Approver			
Threat Intelligence Director (TID) User			
	External Database User		
Default User Role	Intrusion Admin	To spec	ify the default user role if user is not found in any group
	Maintenance User		
CLL Access Filter	Cherwork Abrin		
(For FMG (all versions) and FTD (6.2.3 and	d 6.3), define users for GLI access. For FTD 6.4	and later, we recommend defining u	sers on the RADIUS server. Click here for more information

Enable External Authentication for Users on Threat Defense Devices

Enable External Authentication in the Threat Defense Platform Settings, and then deploy the settings to the managed devices. See External Authentication for more information.

Troubleshooting LDAP Authentication Connections

If you create an LDAP authentication object and it either does not succeed in connecting to the server you select or does not retrieve the list of users you want, you can tune the settings in the object.

If the connection fails when you test it, try the following suggestions to troubleshoot your configuration:

- Use the messages displayed at the top of the web interface screen and in the test output to determine which areas of the object are causing the issue.
- Check that the user name and password you used for the object are valid:
 - Check that you have the rights to browse to the directory indicated in your base-distinguished name by connecting to the LDAP server using a third-party LDAP browser.
 - Check that the user name is unique to the directory information tree for the LDAP server.
 - If you see an LDAP bind error 49 in the test output, the user binding for the user failed. Try authenticating to the server through a third-party application to see if the binding fails through that connection as well.
- Check that you have correctly identified the server:
 - · Check that the server IP address or host name is correct.
 - Check that you have TCP/IP access from your local appliance to the authentication server where you want to connect.

Users

- Check that access to the server is not blocked by a firewall and that the port you have configured in the object is open.
- If you are using a certificate to connect via TLS or SSL, the host name in the certificate must match the host name used for the server.
- Check that you have not used an IPv6 address for the server connection if you are authenticating CLI access.
- If you used server type defaults, check that you have the correct server type and click **Set Defaults** again to reset the default values.
- If you typed in your base-distinguished name, click **Fetch DNs** to retrieve all the available base distinguished names on the server, and select the name from the list.
- If you are using any filters, access attributes, or advanced settings, check that each is valid and typed correctly.
- If you are using any filters, access attributes, or advanced settings, try removing each setting and testing the object without it.
- If you are using a base filter or a CLI access filter, make sure that the filter is enclosed in parentheses and that you are using a valid comparison operator (maximum 450 characters, including the enclosing parentheses).
- To test a more restricted base filter, try setting it to the base distinguished name for the user to retrieve just that user.
- If you are using an encrypted connection:
 - Check that the name of the LDAP server in the certificate matches the host name that you use to connect.
 - Check that you have not used an IPv6 address with an encrypted server connection.
- If you are using a test user, make sure that the user name and password are typed correctly.
- If you are using a test user, remove the user credentials and test the object.
- Test the query that you are using by connecting to the LDAP server and using this syntax:

```
ldapsearch -x -b 'base_distinguished_name'
-h LDAPserver_ip_address -p port -v -D
'user_distinguished_name' -W 'base_filter'
```

For example, if you are trying to connect to the security domain on myrtle.example.com using the domainadmin@myrtle.example.com user and a base filter of (cn=*), you could test the connection using this statement:

```
ldapsearch -x -b 'CN=security,DC=myrtle,DC=example,DC=com'
-h myrtle.example.com -p 389 -v -D
'domainadmin@myrtle.example.com' -W '(cn=*)'
```

If you can test your connection successfully but authentication does not work after you deploy a platform settings policy, check that authentication and the object you want to use are both enabled in the platform settings policy that is applied to the device.

If you connect successfully but want to adjust the list of users retrieved by your connection, you can add or change a base filter or CLI access filter or use a more restrictive or less restrictive base DN.

While authenticating a connection to Active Directory (AD) server, rarely the connection event log indicates blocked LDAP traffic although the connection to AD server is successful. This incorrect connection log occurs when the AD server sends a duplicate reset packet. The threat defense device identifies the second reset packet as part of a new connection request and logs the connection with Block action.

History for Users

Feature	Minimum Management Center	Minimum Threat Defense	Details
Support for the Service-Type attribute for threat defense users defined on the RADIUS server	6.4	Any	For RADIUS authentication of threat defense CLI users, you used to have to pre-define the usernames in the RADIUS external authentication object and manually make sure that the list matched usernames defined on the RADIUS server. You can now define CLI users on the RADIUS server using the Service-Type attribute and also define both Basic and Config user roles. To use this method, be sure to leave the shell access filter blank in the external authentication object. New/Modified screens: System > Users > External Authentication (+)Add External Authentication Object > Shell Access Filter Supported platforms: threat defense
External Authentication for threat defense SSH Access	6.2.3	Any	You can now configure external authentication for SSH access to the threat defense using LDAP or RADIUS. New/Modified screens: Devices > Platform Settings > External Authentication Supported platforms: threat defense
