

Manually Quarantine an IP Address

In the event your quarantine fails, you can manually quarantine one or more IP addresses as discussed in the followint topics.

- Overview of Manually Quarantining an IP Address, on page 1
- Find an IP Address to Quarantine, on page 1
- Create a uSeg EPG Attribute, on page 2
- Verify the Manual IP Address Quarantine, on page 3

Overview of Manually Quarantining an IP Address

If a quarantine fails as discussed in earlier sections in this guide, you can manually quarantine that IP address. You must find the IP address and MAC address to quarantine. The IP address is shown in the Secure Firewall Management Center and the MAC address is shown in APIC.

Find an IP Address to Quarantine

This topic discusses how to look at correlation logs in the management center to find an IP address to quarantine.

Step 1	If you haven't done so already, log in to the management center.
Step 2	Click Analysis > Correlation > Status.
Step 3	Find the timestamp of entry for the unsuccessful quarantine and make note of the source IP address.
Step 4	Log in to APIC if you haven't already done so.
Step 5	On the Operations tab page, click EP Tracker, enter the IP address, and press Enter.
Step 6	If no information is displayed, the endpoint cannot be quarantined. If more than one IP address is displayed, look for the one in the offending tenant.

What to do next

Create a uSeg EPG Attribute, on page 2

Create a uSeg EPG Attribute

If you can identify the EPG of the endpoint that you want to quarantine, create a uSeg EPG attribute corresponding to this endpoint.

Step 1

To find the MAC address of the IP address to quarantine, go to the APIC Object Store Browser at https://apic_IP_address/visore.html. Use the IP address of the endpoint to run a query and display the MAC address. The following figure shows an example.

cisco Object S	tore				0
Class or DN or URL fvCEp		Property	Operation ==	Value	Run Query
77 objects found Show U	RL and response of last query	0			Empty Properties
dn	 uni/tn-TenantED/ap-; 	app-repro/epg-EPG2/cep-00:50	:56:8E:E2:0F > 🗇 🔺		
annotation					
baseEpgDn					
bdDn	vni/tn-TenantED/BD-	BD2 > 🗇			
childAction					
contName	FTD_WEB				
encap	vlan-931				
esgUsegDn					
extMngdBy					
fabricPathDn					
hostingServer	1.11.11.11.11.1				
id	0				
idepdn					
IcC	vmm				
lcOwn	local				
mac	00:50:56:8E:E2:0F				

- **Step 2** Log in to APIC if you haven't already done so.
- Step 3 Click Tenants > ALL TENANTS.
- **Step 4** Double-click the tenant that contains the endpoint to be quarantined.
- **Step 5** Expand **Networking** > **Bridge Domains**.
- **Step 6** Make note of the EPG bridge domain.
- **Step 7** Expand **Application Profile** *> profile-name* > **Application EPGs** > *epg-name* and make note of the domain profile name.
- **Step 8** Expand **Application Profiles** and right-click **uSeg EPG**.
- Step 9 Click Create uSeg EPG.
- **Step 10** Enter a name for the uSeg EPG, in the format **uSegEPG***endpoint-name*. (For example, **uSegEPG-EPG1**.)
- **Step 11** From the **Bridge Domain** list, click the EPG's bridge domain.
- Step 12 Click Next.

Step 13	On the Domains page, click Add (+).				
Step 14	From the Domain Profiles list, click the domain profile.				
Step 15	Set Deployment Immediacy to Immediate.				
Step 16	Set Resolution Immediacy to Immediate.				
Step 17	Add an IP filter attribute by clicking Add (+) on the lower right and entering the IP address for the name and filter.				
Step 18	Click Update and then click Finish.				
	If the uSeg EPG is not displayed, refresh your browser page.				
Step 19	Click uSeg Attributes.				
Step 20	Click Add (+)				
Step 21	Add attributes for the quarantined host's IP address and MAC address with an operator of Match Any.				
	For the IP filter, use the IP address as the name. For MAC filter, use the IP address plus an underscore and the last three octets of the MAC address as a name.				
Step 22	Right-click Domains (VMs and Bare Metals) under the newly created uSeg EPG, and add a domain association with the same name and domain type as the original EPG.				
Step 23	For Bare Metal, right-click Static Leafs, and click Statically Link With Node.				
Step 24	Click Submit.				

What to do next

Verify the Manual IP Address Quarantine, on page 3

Verify the Manual IP Address Quarantine

Verify that no traffic can go into or out from the quarantined endpoint.

Before you begin

- Step 1Perform some task such as pinging a quarantined IP address.The operation should fail.
- **Step 2** If the ping succeeds, verify the IP and MAC addresses of the endpoint to quarantine and try again.

I
