| User                    | <p>(ASA 8.4(2+) only.) The Active Directory (AD) usernames, user groups, or identity user group objects for the rule, if any. You can enter more than one value by separating the items with commas.</p> <p><b>Note</b> If you leave a field blank, the query matches only those rules that have nothing in the User field.</p> <p>You can enter any combination of the following values.</p> <ul style="list-style-type: none"> <li>• Individual user names: NetBIOS_DOMAIN\username</li> <li>• User groups (note the double \): NetBIOS_DOMAIN\user_group</li> <li>• Identity user group object names.</li> </ul> <p>Click <b>Select</b> to select objects, users, or user groups from a list or to create new objects.</p> <p>For more information, see:</p> <ul style="list-style-type: none"> <li>• <a href="#">Selecting Identity Users in Policies</a> , on page 656</li> <li>• <a href="#">Configuring Identity-Based Firewall Rules</a> , on page 657</li> <li>• <a href="#">Creating Identity User Group Objects</a> , on page 654</li> </ul>                                                                                                                                                                                                                                 |

| Element                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Services                                            | <p>The services that define the type of traffic that is acted on. You can enter more than one value by separating the items with commas.</p> <p><b>Note</b> If you leave the field blank, the query matches any service.</p> <p>You can enter any combination of service objects and service types (which are typically a protocol and port combination). If you type in a service, you are prompted as you type with valid values. You can select a value from the list and press Enter or Tab.</p> <p>For complete information on how to specify services, see <a href="#">Understanding and Specifying Services and Service and Port List Objects</a> , on page 329</p> <p><b>Tip</b> You can create an object with a list of the services to facilitate future policy query requests.</p> |
| Interfaces                                          | <p>The interfaces for which the rule is defined. You can enter any combination of interface or interface role names, separated by commas. Enter the name or click <b>Select</b> to select the interface or interface role.</p> <p><b>Note</b> If you leave the field blank, the query matches any interface or interface role.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Query for Global Rules                              | Whether the query should also consider global rules when querying access rules or inspection rules.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| From Zone<br>To Zone                                | For zone based firewall rules, the zones defined for the rule. Enter the zone names (which are interface roles), or click <b>Select</b> to select them from a list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Actions                                             | For zone based firewall rules, the actions defined for the rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Check if Matching Rules Are Shadowed by Rules Above | Whether to have the policy query results include rule conflict detection information. Selecting this option might have an impact on performance and cost results.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Interpreting Policy Query Results

Use the Policy Query Results dialog box to view the results of a policy query that you defined on the Query Device or Policy dialog box. The results report opens after you define your query parameters on the [Querying Device or Policy Dialog Box](#) , on page 626 and click **OK**. For the procedure, see [Generating Policy Query Reports](#) , on page 625. To see an example report, see [Example Policy Query Result](#) , on page 631.

**Tip** In the query results table, you can double-click a row, or right-click and select **Go to Rule**, to select the rule in the rules policy page, where you can edit the rule. If the appropriate rules policy is not already selected in the policy selector, you might have to do this twice to actually select the rule.

To read the report, consider the following report sections:

- **Query Parameters**—The top portion of the report specifies the parameters you entered for the query. If you want to change them, click **Edit Query** to open the [Querying Device or Policy Dialog Box](#) , on page 626, where you can make your changes and regenerate the report.

- **Results Table**—This table lists all rules that match your query. If you queried more than one type of rule, select the rule type you want to examine in the **Display** field. The columns in the table are the same as those for that type of rule, except for the following:
  - **Match Status**—Indicates how the rule matches your query:

**Complete Match**—The rule matches all query parameters.

**Partial Match**—All of the search criteria overlap or are a superset of the matched rule. For example, if you have a rule defined with a source address of 10.100.20.0/24, a destination address of 10.200.100.0/24 and a service of IP, and your query is to search for a source of 10.100.20.0/24, the match status is shown as a partial match because the query results represent only a portion of the rule's definition.

**No Effect**—Rules are blocked by other matching rules, or a conflict exists that has no effect. For example, you might have two matching rules, A and B. If rule A's source address, destination address, and services are equivalent to, or contain, those of rule B, rule B is blocked by rule A. Thus, rule B will have no effect on traffic.

In another example, you might have a global mandatory rule that permits a service, but a rule at the device (local) level denies the service. Because rules are recognized on a first-match basis, after discovering a match at the mandatory global scope, no other rules are checked. The local rule has no effect; the service is permitted, not denied. You should edit your policies to ensure you get the desired results.

- **Scope**—Identifies whether a rule is shared or local, mandatory or default.
- **Details Table**—The details table shows the detailed query match information for the rule selected in the results table. The folders on the left represent the attributes for which you can see detailed information. Select a folder to view the details.

The details show the query value, which is the parameter you defined, and the item in the rule that matches the parameter. The matching relationship is one of the following:

- **Identical**—The parameter is identical to the value in the rule.
- **Contains**—The parameter is a superset that contains the value in the rule. For example, the query parameter might have been a network/host object, and the rule used an IP address that was part of the object definition.
- **Is contained by**—The parameter is a subset nested within the value of the rule.
- **Overlaps**—The query parameter shows results that overlap between more than one policy object used in the rule. For example, the service query parameter was tcp/70-90 and the results show a service defined as tcp/80-100.

## Example Policy Query Result

The below figure shows an example of a policy query report on access rules. The criteria does not limit source, destination, service, and interface parameters, but limits the query to enabled rules. Both shared and local rules are included.

The Query Parameters section shows the query criteria for the report. In this example, the first row in the results table is selected, and the detailed information for that rule is shown in the details table in the bottom half of the window. In this example, the source folder is selected in the details table, and the result shows that the rule value, **any**, is an identical match to the query parameter **\***, which is equivalent to any source address.

For detailed information on reading the report, see [Interpreting Policy Query Results](#), on page 629.

**Figure 20: Policy Query Results**

The screenshot displays the 'Policy Query Results' window, divided into three main sections: Query Parameters, Results Table, and Details Table.

**Query Parameters:** Shows the search criteria used for the query. The 'Query Scope' is set to 'Device: odin', 'Rule Types' to 'Access Rules', and 'Enabled or Disabled' to 'Enabled Rules'. The 'Display' dropdown is set to 'Access Rule Results'.

**Results Table:** A table listing the results of the query. The first row is selected (highlighted in yellow).

| Match Status              | Scope              | Rule | Permit | Source     | Destination | Service | Interface               | Dir. |
|---------------------------|--------------------|------|--------|------------|-------------|---------|-------------------------|------|
| Partial Match             | Shared - Mandatory | 1    | ⊘      | any        | any         | IP      | All-Interfaces          | in   |
| Partial Match (No Effect) | Local - Default    | 1    | ✓      | 5.5.5.0/24 | 3.3.3.0/24  | ICM...  | intf5<br>intf6<br>intf7 | in   |
| Partial Match (No Effect) | Local - Default    | 2    | ✓      | 10.10.1... | 6.6.6.0     | ICM...  | intf5<br>intf6<br>intf7 | in   |
| Partial Match (No Effect) | Local - Default    | 3    | ⊘      | 4.5.4.0/24 | nestedAny   | ICM...  | intf5                   | in   |

**Details Table:** Provides a detailed view of the selected rule's parameters.

| Folder  | Query Value    | Relationship | Rule Value |
|---------|----------------|--------------|------------|
| Sources | * (Any Source) | identical    | any        |

The 'Sources' folder is expanded in the left sidebar of the Details Table, and an arrow points to the 'any' value in the 'Rule Value' column.

## Optimizing Network Object Groups When Deploying Firewall Rules

When you deploy firewall rules policies to an ASA, PIX, FWSM, or IOS 12.4(20)T+ device, you can configure Security Manager to evaluate and optimize the network/host policy objects that you use in the rules when it creates the associated network object groups on the device. Optimization merges adjacent networks and removes redundant network entries. This reduces the runtime access list data structures and the size of the configuration, which can be beneficial to some FWSM and PIX devices that are memory-constrained.

For example, consider a network/host object named **test** that contains the following entries and that is used in an access rule:

```
192.168.1.0/24
192.168.1.23
10.1.1.0
10.1.1.1
10.1.1.2/31
```

If you enable optimization, when you deploy the policy, the resulting object group configuration is generated. Note that the description indicates the group was optimized:

```
object-group network test
description (Optimized by CS-Manager)
network-object 10.1.1.0 255.255.255.252
network-object 192.168.1.0 255.255.255.0
```

If you do not enable optimization, the group configuration would be as follows:

```
object-group network test
network-object 192.168.1.0 255.255.255.0
network-object 192.168.1.23 255.255.255.255
network-object 10.1.1.0 255.255.255.255
network-object 10.1.1.1 255.255.255.255
network-object 10.1.1.2 255.255.255.254
```

This optimization does not change the definition of the network/host object, nor does it create a new network/host policy object. If you rediscover policies on the device, the existing unchanged policy object is used.

---

**Note** If a network/host object contains another network/host object, the objects are not combined. Instead, each network/host object is optimized separately. Also, Security Manager cannot optimize network/host objects that use discontinuous subnet masks.

---

To configure optimization, select the **Optimize Network Object-Groups During Deployment** option on the [Deployment Page](#), on page 522 (select **Tools > Security Manager Administration** and select **Deployment** from the table of contents). The default is to not optimize network object groups during deployment.

**Note**

if you have upgraded to CSM 4.19 without configuring CSM 4.17 SP1 and CSM 4.18, the deployment of a firewall that has an object-group service fails for the following objects:

- service-object gre
- service-object 41
- service-object ah

You must execute the following SQL queries on the DB side of the CSM server to avoid the deployment failure.

```

$SIG{INT} = 'IGNORE';

C:\PROGRA~2\CSCOpX\bin\resolveDBEntriesCSCvj54910.pl#!/usr/bin/perl

```

## Expanding Object Groups During Discovery

When you discover policies from a device that uses object groups, you can elect to have those object groups expanded into the items they contain rather than create policy objects from the group.

For example, if an object group named CSM\_INLINE\_55 contains the hosts 10.100.10.15, 10.100.10.18, and 10.100.10.25, importing an access control list by expanding the objects will create a rule that includes all three addresses in the source (or destination, as appropriate) cell rather than a network/host policy object named CSM\_INLINE\_55.

To configure expansion, you must have a naming scheme for your object groups that allows you to identify the prefix of groups that you want to expand. The default is to expand any object group that starts with the prefix CSM\_INLINE. Configure these prefixes in the **Auto-Expand Object Groups with These Prefixes** field on the [Discovery Page](#), on page 534 by selecting **Tools > Security Manager Administration** and selecting **Discovery** from the table of contents.

## CHAPTER 13

# Managing Identity-Aware Firewall Policies

Identity-aware firewall policies allow you to control traffic based on user identity or a host's fully-qualified domain name. For example, you can selectively allow a specific type of traffic for one user group while disallowing it for another user group, instead of allowing or disallowing all of that traffic. With fully-qualified domain names, you could disallow HTTP access to a specific server while allowing HTTP traffic to all other servers.

Identity awareness is integrated into several existing firewall rules; there is no unique identity-aware firewall policy. This chapter explains identity-aware firewall policies and how to implement them in the various policies that support identity awareness.

This chapter contains the following topics:

- [Overview of Identity-Aware Firewall Policies](#) , on page 637
- [Configuring Identity-Aware Firewall Policies](#) , on page 642
- [Monitoring Identity Firewall Policies](#) , on page 662

## Overview of Identity-Aware Firewall Policies

In traditional firewall policies, decisions are made based on source and destination IP addresses, ports, and services. The Identity Firewall in the ASA provides more granular control based on either or both of the following:

- **User identity**—You can configure access rules and security policies based on user names and user group names rather than through source IP addresses alone. The ASA applies the security policies based on an association of IP addresses to Windows Active Directory login information and reports events based on the mapped user names instead of network IP addresses.

The Identity Firewall integrates with Microsoft Active Directory in conjunction with an external Active Directory (AD) agent that provides the actual identity mapping. The ASA uses Windows Active Directory as the source to retrieve the current user identity information for specific IP addresses and allows transparent authentication for Active Directory users. For information on setting up and configuring the AD agent, see *Installation and Setup Guide for the Active Directory Agent* on Cisco.com at [http://www.cisco.com/en/US/products/ps6120/prod\\_installation\\_guides\\_list.html](http://www.cisco.com/en/US/products/ps6120/prod_installation_guides_list.html).

- **FQDN network objects**—You can use a host's fully-qualified domain name (FQDN) in a rule instead of its IP address. Thus, if the host's address changes (for example, because it acquires the address through DHCP), the rule will still apply.

Identity-based firewall services enhance the existing access control and security policy mechanisms by allowing users or groups to be specified as sources, and FQDNs in place of source or destination IP addresses. Identity-based security policies can be interleaved without restriction between traditional IP address based rules.

The key benefits of the Identity Firewall include:

- Decoupling network topology from security policies. The rules will apply to a user regardless of where the user connects in the network.
- Simplifying the creation of security policies.
- Providing the ability to easily identify user activities on network resources.
- Simplify user activity monitoring.

This section contains the following topics:

- [User Identity Acquisition](#) , on page 638
- [Requirements for Identity-Aware Firewall Policies](#) , on page 639
- [Configuring the Firewall to Provide Identity-Aware Services](#) , on page 641

## User Identity Acquisition

When you specify Active Directory user names or user group names in a firewall policy, the ASA eventually needs to map the name to an IP address to process packets. The ASA uses two primary sources for this information:

- User group membership—If you specify a user group in a rule, the ASA contacts the configured Active Directory (AD) server to obtain group membership.
- User-to-IP address mappings—For users who log into the network domain on your standard (non-VPN) network, the AD agent, in communication with the AD server, obtains the login information and creates a user-to-IP address mapping table. This information is supplied to the ASA.

You must install and configure the required AD servers and agents before you can configure user-based identity firewall policies. For an explanation of the various deployment scenarios, see the ASA configuration guide for ASDM or CLI at [http://www.cisco.com/en/US/products/ps6120/products\\_installation\\_and\\_configuration\\_guides\\_list.html](http://www.cisco.com/en/US/products/ps6120/products_installation_and_configuration_guides_list.html) .

User names are acquired for the following types of traffic, and include the AD domain unless noted otherwise:

- Standard traffic.
- Remote access VPN, including IPsec IKEv1 and IKEv2, Secure Client, and L2TP VPN. If you use LDAP authentication for the VPN, and use the same server group for a domain for the VPN and identity firewall, the users are associated with the domain used for authentication. For all other authorization mechanisms, users acquired through VPN are considered to be in the LOCAL domain. The ASA reports these users to the AD agent, which distributes them to other ASAs or clients registered with the AD agent.

---

**Note** User names are not acquired for clientless SSL VPN.

---

- IPv4 cut-through proxy. User names are not acquired for IPv6 cut-through proxy. If the user includes the domain name during authentication, the user is associated with the domain name. Otherwise, the domain is the default domain as configured in the Identity Options policy. See [Configuring Cut-Through Proxy](#), on page 659.

## Requirements for Identity-Aware Firewall Policies

Identity-aware firewall policies are not supported by all types of device and operating systems. The following table explains the requirements and some limits for implementing these types of policies in your network.

**Table 169: Requirements for Identity-Aware Firewall Policies**

| Requirement           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Firewall device       | <p>ASA running ASA Software version 8.4(2) or later, but not including the ASA-SM running 8.5(1). Single or multiple context configurations.</p> <p><b>Tip</b> The ASA must have on-board encryption acceleration. To determine if the device has the required ability, log into the device console and use the <b>show version</b> command. The output should include “Encryption hardware device.”</p> <p>You can register up to 100 ASAs with a single Active Directory agent.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Active Directory (AD) | <p>You must use Active Directory to define users and user groups. The ASA obtains user group information directly from the AD server, which runs the LDAP protocol. You cannot use other types of LDAP servers.</p> <p>For detailed information on the types of AD servers supported, and their configuration requirements, see <i>Installation and Setup Guide for the Active Directory Agent</i> on Cisco.com at <a href="https://www.cisco.com/c/en/us/support/security/asa-5500-series-next-generation-firewalls/products-installation-guides-list.html">https://www.cisco.com/c/en/us/support/security/asa-5500-series-next-generation-firewalls/products-installation-guides-list.html</a>.</p> <p><b>Tip</b> You can have multiple AD servers, but they must have unique IP addresses among all domains. No other type of LDAP server is supported.</p>                                                                                                |
| AD agent              | <p>You must configure off-box AD agents to act as an intermediary between the ASA and the AD servers. The AD agent maintains an active mapping of users to IP address.</p> <p>By default, except for the 5505, the ASA obtains this list when it boots or reloads, and the AD agent sends new mappings as they are collected. The 5505 queries the AD agent on an as-needed basis in response to traffic matching rules that include identity criteria. We recommend that you use this default behavior, although you can change it using the Identity Options policy.</p> <p>The AD agent uses the RADIUS protocol.</p> <p>For information on setting up and configuring the AD agent, see <i>Installation and Setup Guide for the Active Directory Agent</i> on Cisco.com at <a href="http://www.cisco.com/en/US/products/ps6120/prod_installation_guides_list.html">http://www.cisco.com/en/US/products/ps6120/prod_installation_guides_list.html</a>.</p> |

| Requirement                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Client systems                     | <p>Users who pass traffic through the device must use one of the following client platforms:</p> <ul style="list-style-type: none"> <li>• Windows XP SP3.</li> <li>• Windows Vista.</li> <li>• Windows 7.</li> <li>• Other systems that use Active Directory in a manner consistent with the explicitly supported platforms.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| IPv6                               | <p>IPv6 is supported with the following exceptions:</p> <ul style="list-style-type: none"> <li>• NetBIOS over IPv6 is not supported.</li> <li>• Multiple IPv6 addresses on user workstations is not supported. Windows 64-bit systems can use temporary IPv6 addresses when initiating some communications. If a user registers with the AD agent using one IPv6 address, then initiates communication with another address, an identity-aware firewall rule for the user would not be applied and instead a rule that matches the second IPv6 address would be applied</li> </ul> <p>There are two options for disabling the use of these temporary addresses:</p> <ul style="list-style-type: none"> <li>• Disable IPv6 routing advertisements on all interfaces on all networking devices in the network.</li> <li>• On each Windows machine, open a command window, enter the following commands, and reboot the workstation:</li> </ul> <p><b>netsh interface ipv6 set privacy state=disable</b></p> <p><b>netsh interface ipv6 set global randomizeidentifiers=disabled</b></p>                                                                                                                                                                                   |
| NetBIOS logout probing (Optional.) | <p>If you enable NetBIOS logout probing, the ASA can use NetBIOS to determine if an inactive user is logged off so the user can be removed from the database. The probe uses UDP-encapsulated NetBIOS traffic. Thus, you must ensure that access rules allow the following traffic on the networks between the ASA, AD agent, and user workstations:</p> <ul style="list-style-type: none"> <li>• Query packets: any UDP source port to UDP port 137 (UDP/137).</li> <li>• Query responses: UDP/137 source to any UDP port.</li> </ul> <p>In addition, you must configure workstations to provide user name information in NetBIOS reply packets. For Windows workstations, you need to enable the messenger service and configure WINS. If the messenger service is not turned on, the response from the workstation is the same whether the user is logged on or off.</p> <p><b>Tips</b></p> <ul style="list-style-type: none"> <li>• The NetBIOS logout probe is never used with VPN or cut-through proxy users.</li> <li>• The ASA has an inactive user timeout that is also used to remove users from the database. The timer applies to all user types. Thus, implementing NetBIOS probing is not required to remove inactive users from the database.</li> </ul> |

| Requirement                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DNS configuration<br><br>(Required for fully-qualified domain name usage.) | <p>If you use fully-qualified domain name (FQDN) network/host objects in firewall rules, you must configure the domain name system (DNS) settings as described in <a href="#">DNS Page , on page 2020</a>. These settings identify the DNS servers used for looking up the names to determine the associated IP address. All processing is ultimately based on the IP address.</p> <p>When configuring DNS for FQDN usage, consider the following points:</p> <ul style="list-style-type: none"> <li>• DNS replies can be spoofed, which can open a security hole in your network. Specify only trusted DNS servers, ideally only those inside your network.</li> <li>• Some hosts can have constantly changing multiple IP addresses, so the ASA might not always have all valid IP addresses at any one time.</li> <li>• Host names with short time to live values will require frequent DNS lookups; this can impact the performance of the ASA.</li> <li>• Multiple host names can resolve to the same IP address. Ultimately, the firewall rules are applied based on IP address. Thus, if two names map to the same address, and your rules specify different services for those names, the service that is actually provided will be those specified on the first matched rule.</li> </ul> <p>Looked at another way, this means that you do not need to specify every version of an FQDN host name in your rules. When you know that several names always point to the same host, you can configure rules for the most commonly-used name and they will apply to all synonyms of that name.</p> |
| Maximum limits                                                             | <p>There are limits to the number of users, user groups, and IP addresses per user. If these limits are exceeded, identity-aware processing will not occur for the additional traffic:</p> <ul style="list-style-type: none"> <li>• IP address limits—A user can be associated with at most 8 IP addresses across all domains.</li> <li>• User group limits—Policies can be applied to up to 256 user groups. Users can be in multiple user groups.</li> <li>• User limits—Policies can be applied to up to the following number of users. This number is the total aggregate across all contexts defined on the device.               <ul style="list-style-type: none"> <li>• ASA 5505—1024 users.</li> <li>• Other ASA 5500 series—64,000 users.</li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Configuring the Firewall to Provide Identity-Aware Services

To provide identity-aware firewall services to your network, you need to configure several policies to enable the firewall to process user-based or fully-qualified domain name (FQDN)-based rules. The ASA depends on other servers in your network to provide the user, user group, and FQDN name resolution services required to implement your identity-aware policies.

The required configuration depends on which aspects of identity awareness that you will use:

- User, user group resolution—To use identity user group objects in your firewall rules, you must configure several objects and policies to identify the Active Directory servers that will supply user and user group information.
- FQDN resolution—To use FQDN network/host objects in your firewall rules, you must configure DNS servers to resolve FQDNs to IP addresses.

This procedure explains the overall process for implementing identity-aware policies.

### Before You Begin

Your network must meet the requirements explained in [Requirements for Identity-Aware Firewall Policies](#), on page 639. The following procedure assumes that you are already using Active Directory (AD), that you have installed and configured the AD agents, and that these services are working correctly.

- 
- Step 1** Enable AD user and user group resolution.
- a) Create the policy objects needed to identify the AD servers and agents and configure the NetBIOS domain for the server groups. For detailed information, see [Identifying Active Directory Servers and Agents](#), on page 643.
  - b) If you want non-default settings, change the identity options. Use these options to enable the NetBIOS logout probe and to configure various timers and error handling. For detailed information, see [Configuring Identity Options](#), on page 651.
  - c) If you want to create user groups defined on the ASA (in addition to AD-defined user groups), create the required identity user group policy objects. See [Creating Identity User Group Objects](#), on page 654.
- Step 2** Enable FQDN network/host object resolution.
- a) Configure DNS servers in the DefaultDNS group. DNS is required to resolve FQDNs to IP addresses. For information on configuring DNS, see [DNS Page](#), on page 2020.
  - b) Create FQDN network/host objects as described in [Creating Networks/Hosts Objects](#), on page 311.
- Step 3** Configure firewall rules to use FQDN objects, usernames, user group names, or identity user group objects. See [Configuring Identity-Based Firewall Rules](#), on page 657.
- Step 4** Monitor the identity firewall system. See [Monitoring Identity Firewall Policies](#), on page 662.
- 

## Configuring Identity-Aware Firewall Policies

Identity awareness is integrated into several existing firewall rules; there is no unique identity-aware firewall policy. The topics in this section explain the various procedures for integrating identity awareness into firewall policies.

This section contains the following topics:

- [Enabling Identity-Aware Firewall Services](#), on page 643
- [Creating Identity User Group Objects](#), on page 654
- [Selecting Identity Users in Policies](#), on page 656
- [Configuring Identity-Based Firewall Rules](#), on page 657
- [Configuring Cut-Through Proxy](#), on page 659
- [Collecting User Statistics](#), on page 661

- [Filtering VPN Traffic with Identity-Based Rules](#) , on page 662

## Enabling Identity-Aware Firewall Services

Use the Identity Options policy to enable identity-aware firewall services. To configure the policy, do one of the following:

- (Device view) Select an ASA device, then select **Identity Options** from the Policy selector.
- (Policy view) Select **Identity Options (ASA)** from the Policy selector. Select an existing policy or create a new one.

The policy includes the following tabs:

- **AD Setup**—Configure the Active Directory servers that define the users and user groups for the network, and the AD agent used to collect the information and provide it to the ASA. See [Identifying Active Directory Servers and Agents](#) , on page 643.
- **Advanced**—Enable or disable user identity services and configure options for error handling, the NetBIOS logout probe, idle timeout, and AD agent communication settings. See [Configuring Identity Options](#) , on page 651.

## Identifying Active Directory Servers and Agents

Use the AD Setup tab of the Identity Options policy to identify the Active Directory servers and agents to use for user identity information. You must configure at least one AD server and one AD agent to enable identity-aware firewall policies that include user specifications (such as identity user group objects).

---

**Note** ASA Software 8.4(2+) is required for identity-aware firewall.

---

### Before You Begin

The configuration uses AAA server group policy objects, and the server group objects incorporate AAA server objects. You can create these objects through the Policy Object Manager (by selecting Manage > Policy Objects), or you can create them while completing this procedure (by using the configuration wizard or by clicking the Add Object + button in the object selector dialog box).

The objects need to meet these requirements:

- AD servers—Must use the LDAP protocol. If you select Microsoft as the LDAP server type, you can also specify the LDAP Group Base DN to identify the base directory for user group searches, to reduce search time. If you select Auto Detect, you cannot configure the group base DN, even though Microsoft AD servers are the only type of LDAP server that you can use in the identity firewall configuration. You must also abide by the following limitations for communications between Security Manager and Active Directory:
  - Do not select the Enable LDAP over SSL option.
  - Do not select the SASL Kerberos Authentication option. Only simple and SASL MD5 authentication mechanisms are supported. The simple mechanism, in which usernames and passwords are transmitted in clear text, is used if you do not select one of the SASL options.

- AD agents—Must use the RADIUS protocol. In the AAA server group object, select the **AD Agent Mode** option.

You should install the AD agents and configure them prior to configuring this policy. You can configure at most two AD agents in the server group: the second agent is used only if the first agent ceases to respond to queries. Any agents defined after the first two are ignored.

Obtain the AD agent software from <http://www.cisco.com/go/asa>. For information on setting up and configuring the AD agent, see *Installation and Setup Guide for the Active Directory Agent* on Cisco.com.

#### Related Topics

- [Requirements for Identity-Aware Firewall Policies](#), on page 639
- [Understanding AAA Server and Server Group Objects](#), on page 254
- [Creating AAA Server Objects](#), on page 260
- [AAA Server Dialog Box—LDAP Settings](#), on page 268
- [Creating AAA Server Group Objects](#), on page 276
- [Configuring Identity Options](#), on page 651

- 
- Step 1** Do one of the following:
- (Device view) Select an ASA device, then select **Identity Options** from the Policy selector. Select the **AD Setup** tab.
  - (Policy view) Select **Identity Options (ASA)** from the Policy selector. Select an existing policy or create a new one. Select the **AD Setup** tab.
- Step 2** If you want to be guided through the AD setup, click the **Configure Identity** button to start the Identity configuration wizard. The wizard walks you through the process of configuring the AD servers for a domain, and the AD agents, and can create the required AAA server and AAA server group objects for you.
- The wizard goes through the following steps:
- AD Server Settings—To configure the AD servers for a domain. See [Identity Configuration Wizard Active Directory Settings](#), on page 646.
  - AD Agent Settings—To configure the AD agents for the ASA. See [Identity Configuration Wizard Active Directory Agent](#), on page 648.
  - Preview—To show you which objects will be created. See [Identity Configuration Wizard Preview](#), on page 650.
- Tip** You can use the wizard multiple times to configure different NetBIOS domains. However, the wizard always prompts for AD agent information. Because you can configure a single group for AD agents, not a separate group per domain, the selection overwrites any AD agent configuration that you have already made. So be sure to select the same AAA server group for the AD agents each time you run the wizard.
- Step 3** If not using the wizard, configure the AD servers. The AD servers are used for obtaining user membership information for any AD user groups that you use in identity-aware firewall policies.

The table lists the AD servers for the network. You need to add an entry for each NetBIOS domain name. Each row defines the AAA server group used to identify the AD LDAP servers for the domain, and whether identity-aware firewall rules for the domain are active or inactive if the AD server group is unavailable.

You can do the following:

- To add an entry, click the **Add Row (+)** button and fill in the Add AD Domain Server dialog box. See [Domain AD Server Dialog Box](#) , on page 645.
- To edit an entry, select it and click the **Edit Row (pencil)** button.
- To delete an entry, select it and click the **Delete Row (trash can)** button.

**Step 4** If not using the wizard, configure the AD agents. The AD agents obtain user login/logoff and IP address mappings from the AD servers. The ASA then obtains the information from the AD agent.

In **Active Directory Agent Group**, enter the name of the AAA server group object that defines the list of AD agents, or click **Select** to select it from a list or to create a new group object.

**Step 5** In **Default Domain**, select the domain to configure as the default domain on the device. You must add the domain to the AD server table before you can select it as the default domain.

The default is LOCAL, which applies to user groups defined on the device or to VPN users who authenticate using a method other than an AD server configured for identity services. This setting is also used if you configure cut-through proxy (see [Configuring Cut-Through Proxy](#) , on page 659).

**Step 6** Click **Save** to save your changes.

You are asked if the identity settings page in the administrative settings should be updated with the domain-to-AD server mappings. The identity settings determine which servers are used when you use the Find feature when specifying users or user groups in a firewall policy or an identity user group object. The identity administrative settings do not affect the configuration of the ASA.

---

## Domain AD Server Dialog Box

Use the Add or Edit Domain AD Server dialog box to define the Active Directory server group for a NetBIOS domain. If you configure firewall rules for a user group in the NetBIOS domain, the user membership is determined by querying the AD servers defined for the domain.

### Navigation Path

Do one of the following:

- From the AD Setup tab of the Identity Options page, click the Add or Edit buttons for the domain table. See [Identifying Active Directory Servers and Agents](#) , on page 643.
- From the Identity Settings Security Manager Administration page, click the Add or Edit buttons for the settings table. These settings determine which servers are used when using Find to locate a user or user group name when configuring firewall rules or identity user group objects. See [Identity Settings Page](#) , on page 548.

|----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Domain                                                               | The NetBIOS domain for this AD server group. The domain name can be up to 32 characters, typically in all uppercase. For example, if the user specification is DOMAIN\user1, DOMAIN is the NetBIOS domain name.                                                                                                                                                                 |
| AD Server Group                                                      | The name of the AAA server group policy object that identifies the AD servers for this domain. The object must use the LDAP protocol.<br><br>Click <b>Select</b> to select the object or to create a new one.                                                                                                                                                                   |
| Disable Rules When Server Is Down<br>(Identity Options policy only.) | Whether to disable all identity-aware firewall rules for this domain if the domain controller is down. If you select this option, all users for a domain are marked as disabled until the server becomes available.                                                                                                                                                             |
| Update Administrative Settings<br>(Identity Options policy only.)    | Whether to add the domain and server mapping to the Security Manager Administration Identity Settings page. This administrative page determines which AD servers are queried when you try to find users or user groups when adding them to firewall policies or to identity user group objects. For more information, see <a href="#">Identity Settings Page</a> , on page 548. |

## Identity Configuration Wizard Active Directory Settings

Use the Active Directory Settings page of the Identity Configuration wizard to identify the Active Directory (AD) servers for a NetBIOS domain. These settings are required to enable user-identity-aware firewall policies for users in the domain.

### Navigation Path

Do one of the following:

- From the AD Setup tab of the Identity Options page, click the **Configure Identity** button. See [Identifying Active Directory Servers and Agents](#) , on page 643.
- If the Identity Options policy is not already configured, you can start the wizard from the AAA Rules, Access Rules, or Inspection Rules policies by clicking the Select button for the User field and then clicking Yes when asked if you want to configure identity.

## Field Reference

**Table 171: Identity Configuration Wizard Active Directory Settings**

| Element        | Description                                                                                                                                                                                                     |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NetBIOS Domain | The NetBIOS domain for this AD server group. The domain name can be up to 32 characters, typically in all uppercase. For example, if the user specification is DOMAIN\user1, DOMAIN is the NetBIOS domain name. |

| Element                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Select Existing AD Server Group                        | Select this option if the AAA server group policy object that identifies the required AD servers already exists. The object must use the LDAP protocol.<br><br>Click <b>Select</b> next to the Group Name field to select the object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Create New AD Server Group                             | Select this option if the AAA server group policy object does not already exist, or you want the wizard to create a new object.<br><br>Configure the remaining options to identify the group and the servers that it contains.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Create AD Server Group Properties                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Group Name<br>(When creating the group in the wizard.) | The name of the AAA server group object that you want to create. The name can be up to 16 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| AD Server Name/IP                                      | One of the following: <ul style="list-style-type: none"> <li>The name of an existing AAA server object that defines the AD server. Click <b>Select</b> to select the object from a list.</li> </ul> If you select an object, you cannot configure the remaining properties. <ul style="list-style-type: none"> <li>The IP address of the AD server.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                         |
| Username                                               | The name of the user or the directory object in the LDAP hierarchy used for authenticated binding (maximum of 128 characters). Authenticated binding is required by some LDAP servers (including the Microsoft Active Directory server) before other LDAP operations can be performed. This field describes the authentication characteristics of the device. These characteristics should correspond to those of a user with administrator privileges.<br><br>This string is case-sensitive. Spaces are not permitted in the string, but other special characters are allowed.<br><br>Typically, this is a username such as DOMAIN\Administrator. However, you can use the more traditional format too, for example, cn=Administrator,OU=Employees,DN=example,DN=com. |
| Password Confirm                                       | The case-sensitive, alphanumeric password for accessing the LDAP server (maximum of 64 characters). Spaces are not allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface             | <p>The interface whose IP address should be used for all outgoing packets (known as the source interface). Enter the name of an interface or interface role, or click <b>Select</b> to select it from a list or to create a new interface role.</p> <p><b>Tips</b></p> <ul style="list-style-type: none"> <li>• If you enter the name of an interface, make sure the policy that uses this AAA object is assigned to a device containing an interface with this name.</li> <li>• If you enter the name of an interface role, make sure the role represents a single interface, not multiple interfaces.</li> <li>• Only one source interface can be defined for the AAA servers in a AAA server group, so if you specify more than one server, ensure that they all use the same interface.</li> </ul> |
| Add Another AD Server | <p>Click this button only if you want to create an additional server.</p> <p>When you click the button, the information in the server fields is saved and the fields are cleared so that you can add information about the next server. You can add up to 16 servers in single-context mode and 4 servers in multiple-context mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### Identity Configuration Wizard Active Directory Agent

Use the Active Directory Agent Settings page of the Identity Configuration wizard to identify the Active Directory (AD) agents for a NetBIOS domain. These settings are required to enable user-identity-aware firewall policies for users in the domain.

---

**Tip** You can configure a single AD agent group for an ASA; you do not configure a different group for each NetBIOS domain. Thus, if you already configured the correct AD agent group in the Identity Options policy, select the same group on this wizard page. Your selection here will replace the group defined in the policy.

---

### Navigation Path

Do one of the following:

- From the AD Setup tab of the Identity Options page, click the **Configure Identity** button and proceed to this page. See [Identity Settings Page](#), on page 548.
- If the Identity Options policy is not already configured, you can start the wizard from the AAA Rules, Access Rules, or Inspection Rules policies by clicking the Select button for the User field and then clicking Yes when asked if you want to configure identity.

## Field Reference

**Table 172: Identity Configuration Wizard Active Directory Agent Settings**

| Element                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Select Existing AD Agent Group                         | Select this option if the AAA server group policy object that identifies the required AD agents already exists. The object must use the RADIUS protocol, and should have the option <b>AD Agent Mode</b> selected.<br><br>Click <b>Select</b> next to the Group Name field to select the object.                                                                                                                                                         |
| Create New AD Agent Group                              | Select this option if the AAA server group policy object does not already exist, or you want the wizard to create a new object.<br><br>Configure the remaining options to identify the group and the servers that it contains.                                                                                                                                                                                                                           |
| Create AD Agent Group Properties                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Group Name<br>(When creating the group in the wizard.) | The name of the AAA server group object that you want to create. The name can be up to 16 characters.                                                                                                                                                                                                                                                                                                                                                    |
| AD Agent Name/IP                                       | One of the following: <ul style="list-style-type: none"> <li>The name of an existing AAA server object that defines the AD agent. Click <b>Select</b> to select the object from a list.</li> </ul> If you select an object, you cannot configure the remaining properties. <ul style="list-style-type: none"> <li>The IP address of the AD agent.</li> </ul>                                                                                             |
| Secret Key<br>Confirm                                  | The shared secret that is used to encrypt data between the network device (client) and AAA server. The key is a case-sensitive, alphanumeric string of up to 127 characters. Special characters are permitted.<br><br>The key you define in this field must match the key on the RADIUS server. Enter the key again in the Confirm field.<br><br>If you do not define a key, all traffic between the AAA server and its AAA clients is sent unencrypted. |

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface              | <p>The interface whose IP address should be used for all outgoing packets (known as the source interface). Enter the name of an interface or interface role, or click <b>Select</b> to select it from a list or to create a new interface role.</p> <p><b>Tips</b></p> <ul style="list-style-type: none"> <li>• If you enter the name of an interface, make sure the policy that uses this AAA object is assigned to a device containing an interface with this name.</li> <li>• If you enter the name of an interface role, make sure the role represents a single interface, not multiple interfaces.</li> <li>• Only one source interface can be defined for the AAA servers in a AAA server group, so if you specify more than one server, ensure that they all use the same interface.</li> </ul> |
| Add Secondary AD Agent | <p>Click this button only if you want to create an additional agent. The agent is used in case the first agent becomes unavailable.</p> <p>When you click the button, the information in the agent fields is saved and added to the preview pane, and the fields are cleared so that you can add information about the secondary agent.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Identity Configuration Wizard Preview

Use the Preview page of the Identity Configuration wizard to verify the information you entered into the wizard.

The preview summarizes the objects that will be created or used for the Active Directory configuration for the NetBIOS domain.

- AD server group shows the name of the AAA server group object for the AD servers used in the domain. The table shows the AAA server objects that define each of the AD servers.
- AD Agent shows the name of the AAA server group object for the AD agents. The primary and secondary agent shows the AAA server object that defines the agents.

For objects that the wizard will create, names are automatically generated for the AAA server objects, either adding **ldap\_** or **radius\_** as a prefix to the server IP address.

To make changes, click **Back**. Otherwise, click **Finish** to save the settings.

**Tip** After you complete the wizard, you can edit the properties of the newly-created objects to configure settings that the wizard left as default settings.

## Navigation Path

Do one of the following:

- From the AD Setup tab of the Identity Options page, click the **Configure Identity** button and proceed to this page. See [Identifying Active Directory Servers and Agents](#), on page 643.

- If the Identity Options policy is not already configured, you can start the wizard from the AAA Rules, Access Rules, or Inspection Rules policies by clicking the Select button for the User field and then clicking Yes when asked if you want to configure identity.

## Configuring Identity Options

Use the Advanced tab of the Identity Options policy to enable or disable user identity services and configure options for error handling, the NetBIOS logout probe, idle timeout, and AD agent communication settings. The options on this tab have default values, so you need to change them only if you want to fine-tune the settings for your network.

### Navigation Path

- (Device view) Select an ASA device, then select **Identity Options** from the Policy selector. Select the **Advanced** tab.
- (Policy view) Select **Identity Options (ASA)** from the Policy selector. Select an existing policy or create a new one. Select the **Advanced** tab.

| Element                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable User Identity                              | <p>Whether to enable the device to obtain user identity information from the AD agent and AD servers, if they are configured on the <b>AD Setup</b> tab. The default is enabled.</p> <p>If you change this option and deploy, the change has the following effect based on the new setting:</p> <ul style="list-style-type: none"> <li>• Disabled—The entire IP address to user mapping database is flushed and all users without activated user-specific rules are released. The AD agent and servers are no longer queried for updates, and all activated user-identity-based rules will have no effect on traffic.</li> <li>• Enabled—Activated users are recreated gradually through communications with the AD agent. VPN users might need to reauthenticate. Queries to the AD agent and AD server recommence.</li> </ul> |
| Error Conditions                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Disable Rules When Active Directory Agent Is Down | <p>Whether to disable all rules that include user identity if the connection to the AD agent is unavailable. If you select this option, all user-to-IP address mappings are marked disabled and all rules that include user specifications are not applied to traffic. By default the option is disabled.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Element                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remove User IP When NetBIOS Probe Fails                | Whether to remove the User's IP address mapping from the database if the NetBIOS probe for the user fails for any reason, whether the probe is somehow blocked in the network or the probe fails because the user is not in operation. The user must log into the workstation again. This option has effect only if you enable the NetBIOS logout probe on this page. By default the option is disabled.                                                                                                                                                                                                                                                                                                                                                                                                             |
| Remove User IP When User's MAC Address is Inconsistent | Whether to check the Media Access Control (MAC) address in each request from a user-mapped IP address to the MAC address in the previous packet.<br><br>If you select this option, and the MAC address changes between packets, the user-to-IP address mapping is removed from the database, subsequent packets are dropped, and the user must reauthenticate to Active Directory. The AD agent is notified if the user-to-IP mapping is removed due to MAC mismatch. By default this option is enabled.<br><br>MAC checking occurs only on packets from IP addresses on networks that are directly attached to the ASA. VPN users are not checked.                                                                                                                                                                  |
| Track User Not Found                                   | Whether to enable user-not-found tracking. By default, the option is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| NetBIOS Logout Probe                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Enable (NetBIOS Logout Probe)                          | Whether to enable the NetBIOS logout probe.<br><br>You can use the probe to proactively determine if a user has logged out of the network, allowing the device to remove the user-to-IP address mapping more quickly than if idle timeout is the only mechanism used for this purpose. By default the probe is disabled, and users are removed only if they are idle for longer than the Idle Timeout value.<br><br>Users are probed only if they are in the active state and they are used in at least one activated rule. VPN and cut-through proxy users are not probed. The AD agent is notified if the user-to-IP mapping is removed by the NetBIOS logout probe.<br><br>In addition to configuring the following options, see <a href="#">Requirements for Identity-Aware Firewall Policies</a> , on page 639. |
| Probe Timer                                            | The frequency of sending NetBIOS probes to activated users, regardless of whether the user is idle. The default is 15 minutes, the range is 1 to 65535 minutes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Retry Interval                                         | The frequency of retrying the probe if a response is not received from an IP address, and the number of times the probe should be retried. The default is 3 seconds and 3 retries. The range is 1 to 65535 seconds, for retry count, 1 to 256.<br><br>If there is no response from the final retry, the user-to-IP address mapping is removed if you selected the <b>Remove User IP When NetBIOS Probe Fails</b> option; otherwise, the address is probed during the next interval.                                                                                                                                                                                                                                                                                                                                  |

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User Name              | <p>When a NetBIOS response is received, how to handle the response based on the usernames returned:</p> <ul style="list-style-type: none"> <li>• <b>Match Any</b> (the default)—Any username in the response can match the username in the database for the IP address. If there are multiple names in the response (that is, more than one user is logged into the workstation), if any user in the response matches a user in the database, the probe is considered successful and the mapping is retained.</li> <li>• <b>User Not Needed</b>—The usernames in the NetBIOS response are ignored; the query response is sufficient to maintain the user-to-IP address mapping. This option is useful if the messenger service is not turned on in the workstation, in which case the NetBIOS response will not contain usernames. The option is also useful when multiple users log into a workstation.</li> <li>• <b>Exact Match</b>—There must be one username in the NetBIOS response, and it must exactly match the username in the user-to-IP address mapping database. If there is more than one user, or if the username does not match, the mapping is removed from the database and the IP address is marked as inactive.</li> </ul> |
| Users                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Idle Timeout           | <p>The amount of time, in minutes, to allow the user to be idle before removing the user-to-IP address mapping in the database. Once removed, the user must log in again to update the mapping (for example, by using Ctrl+Alt+Delete to lock the workstation, then log in again). The default is 60 minutes, the range is 1 to 65535 minutes.</p> <p>You can deselect the option to disable idle timeout checking, in which case user-to-IP mappings are not removed due to idleness.</p> <p>VPN and cut-through proxy users are not subject to this timer. The AD agent is not notified if the user-to-IP address mapping is removed due to idle timeout.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Active Directory Agent |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Hello Timer            | <p>The frequency of sending Hello packets to the AD agent. The ASA uses Hello packets to obtain ASA replication status and domain status. If the ASA does not receive a response after the final retry, the AD agent is considered down, and the ASA switches to the backup AD agent, if you configure one.</p> <p>By default, Hello packets are sent every 30 seconds, and up to 5 retries are attempted if no response is received. The range is 10 to 65535 seconds and 1 to 65535 retries.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Poll Groups Timer         | <p>How often the Active Directory server should be queried to obtain user membership lists for user groups that you have specified in firewall rules. The ASA queries the server for membership in a group only if you have used the group; it does not query every group defined in the AD server. The default is 8 hours, the range is 1 to 65535 hours.</p> <p><b>Tip</b> If group membership changes, the changes are not reflected in rule processing until this timer expires and the ASA polls the AD server for updated information. Thus, you should configure the timer based on the frequency of changes to group membership in your network, balancing the need to update group membership in the ASA with the desire to reduce the amount of polling.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Retrieve User Information | <p>How the ASA should retrieve user-to-IP address mappings from the AD agent.</p> <ul style="list-style-type: none"> <li>• <b>Full Download</b> (default for ASA non-5505 devices)—On boot, the ASA obtains the full user-to-IP address mapping database from the AD agent, and then gets incremental updates as users log into and out of the network.</li> </ul> <p>Use this option on the 5505 only if there are fewer than 1024 users in the network, because the 5505 is limited to 1024 user-to-IP mappings. For the 5505, the default On Demand setting is appropriate if only a few users will pass traffic through the device.</p> <ul style="list-style-type: none"> <li>• <b>On Demand</b> (default for ASA 5505 devices)—The ASA queries the AD agent for user-to-IP mappings only when a new packet requires a connection and no mapping exists. This option uses less memory, but there can be a delay in getting the mapping, and the packets are initially evaluated based on traditional source and destination IP address and service information, which might result in the wrong action. The potential delay can be increased if a large number of users log in at the same time, either due to corporate culture or to a malicious attack.</li> </ul> |

## Creating Identity User Group Objects

You can create identity user group objects to identify individual users, user groups, or a combination of users and groups. These users and groups must be defined in Active Directory (AD), you cannot define other types of users.

**Tip** Identity user groups are defined on the ASA. You do not need to create these groups to duplicate groups that are already defined in AD. You can directly specify AD groups in firewall rules. Identity user group objects are needed only to define collections of users and user groups that do not otherwise exist in AD.

There are two pre-defined identity user groups. These groups are used when configuring cut-through proxy, as described in [Configuring Cut-Through Proxy](#), on page 659.

- all-auth-users—To match any IP address that has been associated with an authenticated user.
- all-unauth-users—To match only IP addresses that have **not** been associated with authenticated users.

### Tips

- Use of these objects is supported on ASA 8.4(2+) only.
- You must configure the Identity Options policy on the ASA to enable the use of these objects.
- You can create identity user group objects when defining policies or objects that use this object type. For more information, see [Selecting Identity Users in Policies](#) , on page 656.

### Related Topics

- [Configuring Identity-Based Firewall Rules](#) , on page 657
- [Requirements for Identity-Aware Firewall Policies](#) , on page 639
- [Identity Settings Page](#) , on page 548
- [Creating Policy Objects](#) , on page 235

- 
- Step 1** Select **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager](#) , on page 230).
- Step 2** Select **Identity User Group** from the Object Type selector.
- Step 3** Right-click in the work area, then select **New Object** to open the Identity User Group dialog box.
- Step 4** Enter a name for the object and optionally a description of the object.
- Step 5** Add and remove items in the **Members in Group** list to identify the users and user groups defined in the object.

To populate the list, do any combination of the following:

- In **Available Identity User Group**, select an existing object and click the **Add >>** button between the lists.
- In **Search User/User Group**, select a user or user group from the Active Directory server configured for the domain in the Identity Settings administration options. You must configure the settings before you can select users or user groups, so that Security Manager knows which AD server to use.

To find a user or user group, select the NetBIOS domain, indicate whether you are searching for a user or user group, and enter a search string. Then, click **Search** to find matches. A name is considered a match if the string appears anywhere within the name (first, middle initial, last), user ID, CN, or for groups, user group name.

To add the user or group, select it in the list and click the **Add >>** button between the lists.

- In **Type in comma separated identity user or user group**, type in a valid name, then click the **Add >>** button between the lists. Separate multiple names with commas; they are added as separate lines in the members list.

You can enter names in the following formats:

- Individual users: NETBIOS\_DOMAIN\user
- User groups (note the double \): NETBIOS\_DOMAIN\\user\_group

If you do not include the domain name, one is added for you based on the options selected in the Security Manager Administration Identity Settings page. If you precede the name with \ or \\, the default domain defined on the Identity Settings page is automatically added.

- To remove an item from the object, select it in the Members list and click the << **Remove** button between the lists.

- Step 6** (Optional) Under Category, select a category to help you identify this object in the Objects table. See [Using Category Objects](#) , on page 239.

- Step 7** (Optional) Select **Allow Value Override per Device** to allow the properties of this object to be redefined on individual devices. See [Allowing a Policy Object to Be Overridden](#) , on page 245.
- Step 8** Click **OK** to save the object.

## Selecting Identity Users in Policies

In any policy or policy object that allows the specification of identity users, whether directly or through the selection of an identity user group object, you can click the Select button next to the User field to help you enter the information.

In the Identity User Group Selector dialog box, you can define the content of the User field by populating the **Members in Group** list. To populate the list, do any combination of the following:

- In **Available Identity User Group**, select an existing object and click the **Add >>** button between the lists. If the desired object does not exist, you can click the **Add (+)** button below the list to create a new object. You can also select an object and click the **Edit (pencil)** button to modify it or to examine its contents.

There are two pre-defined identity user groups. These groups are used when configuring cut-through proxy, as described in [Configuring Cut-Through Proxy](#) , on page 659.

- **all-auth-users**—To match any IP address that has been associated with an authenticated user.
- **all-unauth-users**—To match only IP addresses that have **not** been associated with authenticated users.
- In **Search User/User Group**, select a user or user group from the Active Directory server configured for the domain in the Identity Settings administrative options. You must configure the settings before you can select users or user groups, so that Security Manager knows which AD server to use.

To find a user or user group, select the NetBIOS domain, indicate whether you are searching for a user or user group, and enter a search string. Then, click **Search** to find matches. A name is considered a match if the string appears anywhere within the name (first, middle initial, last), user ID, CN, or for groups, user group name.

To add the user or group, select it in the list and click the **Add >>** button between the lists.

- In **Type in comma separated identity user or user group**, type in a valid name, then click the **Add >>** button between the lists. Separate multiple names with commas; they are added as separate lines in the members list.

You can enter names in the following formats:

- Individual users: NETBIOS\_DOMAIN\user
- User groups (note the double \): NETBIOS\_DOMAIN\user\_group

If you do not include the domain name, one is added for you based on the options selected in the Security Manager Administration Identity Settings page as explained in [Identity Settings Page](#) , on page 548. If you precede the name with \ or \\, the default domain defined on the Identity Settings page is automatically added.

- To remove an item from the object, select it in the Members list and click the << **Remove** button between the lists.

## Configuring Identity-Based Firewall Rules

Identity awareness is integrated into the access control entries, or rules, in the ACLs used to provide firewall services. Because the feature is integrated into the ACL, the techniques for adding identity-based rules to a firewall policy are the same for all types of firewall policy. This topic provides general guidance on how to incorporate identity-based rules into your existing policies, and directs you to more specific information on configuring each type of policy that allows identity-based rules.

### Guidelines For Adding Identity-Based Rules

Following are some general guidelines and recommendations for adding identity-based rules:

- FQDN (fully-qualified domain name) network/host objects are allowed in both Source and Destination fields. For information on configuring these objects, see [Creating Networks/Hosts Objects](#), on page 311.
- User, user group, and identity user group objects, which specify Active Directory (AD) user or user group names, are defined in a separate field: User. If you configure a rule with one or more user names, user group names, or identity user group objects, the specifications modify the Source address configuration only. They never apply to the addresses specified in the Destination field. For information on configuring these identity user group objects, see [Creating Identity User Group Objects](#), on page 654.

You must always configure a source address in a rule, even if you want the rule to primarily operate based on the specified users or user groups. The source and user specifications conjoin to control the scope of the rule. Based on the value of the Source field, the rules operate as follows:

- **Source = any**—Use “any” as the source if you want the rule to apply based solely on the user specifications. These rules will match the user specification regardless of the workstation IP address from which the user sends traffic.
- **Source = anything else**—If you specify anything other than “any” as the source address, the rule applies only if the user sends traffic from an IP address that matches the source address specification. Use this technique if you want to provide variable services based on the source network.

For example, you might have an internal trusted network from which you would allow access to a sensitive destination for users in a particular user group, although you would deny access even to those users if they were outside of the trusted network. In this case, you would create a permit rule that specified the trusted network as the source, the trusted user group as the user, and the sensitive server as the destination. You could also create a specific deny rule with just the source and destination specified, or allow the default deny any rule to capture the non-matching traffic.

- Evaluate whether there are classes of traffic that will never be sensitive to user identity. For example, you might allow DNS traffic for all users. Place these types of rules above identity-based rules so that matching traffic can be quickly allowed before the device needs to evaluate identity-based rules.
- When troubleshooting rules, keep in mind that ultimately rules are applied based on IP address. FQDN rule matching is based on DNS lookups, and the IP address of a host can change between a successful lookup and the next time the lookup is refreshed. For users, IP address mappings are obtained from the AD agent configured in the network or by authentications conducted by the ASA itself.
- FQDN and user specifications are completely independent. You can use one without the other.

### Firewall Policies That Allow Identity-Based Rules

Identity-based rules are allowed on ASA 8.4.2+ only. The following policies allow you to configure identity-based rules:

- AAA Rules—Select **Firewall > AAA Rules** and see [Configuring AAA Rules for ASA, PIX, and FWSM Devices](#) , on page 686.

**Tip** You can use AAA rules to configure cut-through proxy, which allows users whose IP address mappings have become invalid, resulting in denied network access, to authenticate directly to the ASA to resolve the mapping problem. See [Configuring Cut-Through Proxy](#) , on page 659.

- Access Rules—Select **Firewall > Access Rules** and see [Configuring Access Rules](#) , on page 721.
- Inspection Rules—Select **Firewall > Inspection Rules** and see [Configuring Inspection Rules](#) , on page 769.
- Policies that use extended ACL policy objects—Several firewall policies use extended ACL policy objects to define traffic matching criteria instead of incorporating a rule table directly in the policy. You can configure extended ACL policy objects to include FQDN objects or user specifications (see [Creating Extended Access Control List Objects](#) , on page 282). You can then use these identity-based extended ACL objects in the following policies:
  - Botnet Traffic Filter Rules—Select **Firewall > Botnet Traffic Filter Rules** and see [Enabling Traffic Classification and Actions for the Botnet Traffic Filter](#) , on page 911. You can use identity-based ACLs as traffic classification for Enable and Drop rules.
  - IPS, QoS, and Connection Rules (service policy rules)—Select **Platform > Service Policy Rules > IPS, QoS, and Connection Rules** and see [Service Policy Rules Page](#) , on page 2283.

Traffic match criteria in this policy is based on extended ACL policy objects that are incorporated into traffic flow policy objects. You must select one of the options for specifying an ACL in the traffic flow object to incorporate identity-based traffic classification. You can use identity-based ACLs for all service types. For more information, see [Configuring Traffic Flow Objects](#) , on page 2297.

One of the services available in this policy, User Statistics, is specifically designed to collect accounting information for identity-based firewall users. See [Collecting User Statistics](#) , on page 661.

- VPN filter in remote access group policies—The VPN filter ACL is applied to VPN traffic. You can configure a VPN filter on the Connection Settings page in an ASA Group Policy object, which you use in a remote access connection policy. See [ASA Group Policies Connection Settings](#) , on page 1522 and [Filtering VPN Traffic with Identity-Based Rules](#) , on page 662.

### Policies That Do Not Allow Identity-Based Rules or Objects

There are several types of policy where you can specify network/host objects or extended ACL objects, but where the policy does not allow FQDN network/host objects or ACLs that use those objects or identity user group objects. Following are some examples where you cannot use these types of objects:

- Routing policies, including route maps.
- Network address translation (NAT).

- WCCP (web cache control protocol).
- Crypto maps in VPN configurations.
- Dynamic access policies in remote access VPN configurations.

## Configuring Cut-Through Proxy

When you use identity-aware firewall policies, user-to-IP address mappings are obtained from various facilities, primarily from the AD agent in the network. Although mappings are updated regularly, there can occur instances where a firewall rule blocks a legitimate user because the user-to-IP address mapping is not synchronized.

You can configure cut-through proxy to account for this possibility. With cut-through proxy, if a user is blocked, the user can sign on directly to the ASA, and the ASA will update the user-to-IP mapping to correctly reflect the current IP address for the user. The new mapping is forwarded to all contexts that contain the interface where the HTTP/HTTPS packets are received and authenticated.

You use AAA rules to configure cut-through proxy. You have two configuration choices, based on whether there is one or more NetBIOS domains in the network:

- Single domain—Configure a regular AAA rule for authentication and specify the LDAP server group that identifies the Active Directory servers for the domain. Use “any” for the source, and the IP address of the ASA for the destination. For service, you can include HTTP and HTTPS. Then, when the user needs to authenticate to the server, the user enters one of the standard authentication URLs, where *interface\_ip* is the IP address of the interface and *port* is optionally the port number, if you specify a non-default port for the protocol in the interactive authentication table: **http://interface\_ip [:port ]/netaccess/connstatus.html** or **https://interface\_ip [:port ]/netaccess/connstatus.html**.

---

**Tip** The user-to-IP mapping is put under the same domain as configured for the selected AD server group. If you use another means for authentication, the mapping is placed under the LOCAL domain.

---

- Multiple domains—Configure two authentication rules that use the User-Identity option instead of a specific AAA server group. The following procedure explains this setup. Note that this setup also works for single domain networks. Users authenticate to the ASA using the same URLs mentioned above.

When you use the User-Identity option, authentication is handled as follows:

- If the user includes the domain in the login credentials, in the format DOMAIN\username, the ASA uses the domain to determine which AD server to use for authentication based on the domain mappings in the Identity Options policy. If no AAA server is mapped to the domain, the authentication attempt is rejected.
- If the login credentials do not include an identifiable domain name (typically, if the \ character is not included in the username string), the ASA uses the AD server assigned to the default domain selected in the Identity Options policy. If no AAA server is mapped to the default domain, the authentication attempt will be rejected.

---

**Tip** Cut-through proxy works for IPv4 addresses only; IPv6 is not supported.

---

### Related Topics

- [Requirements for Identity-Aware Firewall Policies](#) , on page 639
- [Configuring the Firewall to Provide Identity-Aware Services](#) , on page 641
- [Configuring AAA Rules for ASA, PIX, and FWSM Devices](#) , on page 686
- [Understanding How Users Authenticate](#) , on page 684

- 
- Step 1** Configure the Identity Options policy to specify all of the NetBIOS domains and their AD server groups, and the AD agent group, for the network, as described in [Identifying Active Directory Servers and Agents](#) , on page 643.
- Step 2** Do one of the following to open the [AAA Rules Page](#) , on page 691:
- (Device view) Select **Firewall > AAA Rules** from the Policy selector.
  - (Policy view) Select **Firewall > AAA Rules** from the Policy Type selector. Select an existing policy or create a new one.
- Step 3** Create the following rules using the **Add Row** button. For detailed information about the fields in the Add AAA Rules dialog box, see [Add and Edit AAA Rule Dialog Boxes](#) , on page 695.

**Tip** You can use more specific source, destination, or service specifications than the ones shown here.

#### **Rule 1: Do not force users who have already authenticated to authenticate again.**

- Select the **Authentication Action** and **User-Identity** options.
- Action = Deny. For AAA authentication rules, “deny” means the user is not prompted for authentication, it does not mean the user’s traffic is dropped.
- Sources = any.
- Users = all-auth-users.

For users, **all-auth-users** means any user who has already authenticated to Active Directory, for which there is an IP mapping.

- Destination = any.
- Services = IP.
- AAA Server Group = (no selection).
- Interface = (your choice, typically inside interfaces).

#### **Rule 2: Authenticate users who have not been authenticated yet.**

- Select the **Authentication Action** and **User-Identity** options.
- Action = Permit. This action requires matching users to authenticate.
- User = all-unauth-users.

In this case, **all-unauth-users** means any user who has not already authenticated to Active Directory.

- All other options are identical to the first rule.
- 

## Collecting User Statistics

You can collect user statistics accounting information for identity-based firewall policies. These statistics are kept for users to which a firewall policy is applied based on username or user group membership.

  - [Configuring the Firewall to Provide Identity-Aware Services](#) , on page 641
  - [Service Policy Rules Page](#) , on page 2283
  - [Configuring Traffic Flow Objects](#) , on page 2297
- 

- Step 1** Do one of the following:
- (Device view) Select an ASA device, then select **Platform > Service Policy Rules > IPS, QoS, and Connection Rules** from the Policy selector.
  - (Policy view) Select **PIX/ASA/FWSM Platform > Service Policy Rules > IPS, QoS, and Connection Rules** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** Select the row after which you want to add the rule, then click the **Add Row (+)** button below the table to start the Insert Service Policy Rule wizard.
- Step 3** In step 1 of the wizard, select whether the rule will be Global or it will apply to specific interfaces or interface roles. Select Global if you want to collect statistics for users regardless of which interface their traffic passes through. Click **Next**.
- Step 4** In step 2, select the traffic class that defines the traffic for which you are collecting statistics. Select Use class-default if you want to collect statistics on all traffic. Otherwise, select Traffic Class and select the traffic flow object that defines the traffic matching attributes. Click **Next**.
- Step 5** In step 3, select the **User Statistics** tab.
- Select **Enable user statistics accounting**.
  - Select the type of information you want to collect:
    - **Account for sent drop count**
    - **Account for sent packet, sent drop and received packet count**
- Step 6** Click **Finish** to save your rule.
-

## Filtering VPN Traffic with Identity-Based Rules

When you support remote access VPNs on an ASA, you configure user-sensitive access. You can also use identity-based rules to filter the traffic after validating the remote user access.

Before creating identity-based rules for VPN, understand the rules for VPN user names, to ensure that the rules use the correct domain name:

- If you use an Active Directory LDAP server group for authorization, and you configured that domain/server group in the Identity Options policy, the username is associated with the NetBIOS domain.
- For all other authorization mechanisms, the domain name for VPN users is LOCAL.

With this in mind, there are two methods you can use to filter the traffic on the VPN with identity-based ACL rules:

- Apply a VPN filter in the ASA Group Policy object. The filter applies to all users in the group. You can configure a VPN filter on the Connection Settings page in an ASA Group Policy object, which you use in a remote access connection policy. See [ASA Group Policies Connection Settings](#), on page 1522.
- By default, VPN traffic bypasses interface access rules. You can change this behavior so that all VPN traffic must also pass through the interface access rules. If you take this approach, you must ensure that the interface rules are sensitive to your VPN traffic. To force VPN traffic to go through interface access rules, deselect the **Enable IPsec over Sysopt** option on the ISAKMP/IPsec tab of the RA VPN Global Settings policy. See [Configuring VPN Global ISAKMP/IPsec Settings](#), on page 1182.

## Monitoring Identity Firewall Policies

You can use Event Viewer to monitor identity-aware firewall policies the same way you would monitor other types of policies and events. The following are some tips to help you effectively monitor identity policies. For general information on using Event Viewer, see [Viewing Events](#), on page 2703.

- There is a group of syslog messages that relate specifically to identity firewall: 746001-746019. You can find descriptions of these messages in the Syslog Message document for your ASA software version at [http://www.cisco.com/en/US/products/ps6120/products\\_system\\_message\\_guides\\_list.html](http://www.cisco.com/en/US/products/ps6120/products_system_message_guides_list.html).

The following messages are of particular concern:

- **746004 and 746011**—These syslogs indicate that you have exceeded the supported number of references to user groups or users. You should consider changing your policies. For more information on these restrictions, see [Requirements for Identity-Aware Firewall Policies](#), on page 639.
- **746003**—There was a failure in downloading user group or user mappings to IP address. The message explains the reason for the failure.
- **746005**—The AD agent could not be reached. Ensure that the agent is functioning correctly and that there is a network path between the ASA and the agent.
- **746010**—An update to the imported user or user group failed for the stated reason.
- **746016**—DNS lookup for the fully-qualified domain name (FQDN) failed for the stated reason.

- Several existing syslog messages now include username or FQDN information. Event Viewer has two columns to display the information: Destination User Identity / FQDN and Source User Identity. Updated messages include:
  - 302005, 302006, 302013, 302014, 302016-302018, 302020, 302021.
  - 305005, 305006, 305009-305013.
  - 304001-304002 include identity information, but they are not parsed.
- You can filter on all identity-related syslog messages by creating a filter on Event Type and selecting the Identity Firewall Events folder.
- When you use the Go to Policy command on an event, as described in [Looking Up a Security Manager Policy from Event Viewer](#), on page 2757, identity information is included in the lookup criteria. Note that identity information is not included in 106100, so policy lookup on that message cannot be sensitive to user identity.

## CHAPTER 14

# Managing Trustsec Firewall Policies

Cisco TrustSec provides an access-control solution that builds upon an existing identity-aware infrastructure to ensure data confidentiality between network devices and integrate security access services on one platform. In the Cisco TrustSec solution, enforcement devices utilize a combination of user attributes and end-point attributes to make role-based and identity-based access control decisions.

Cisco ASA devices integrate with Cisco TrustSec to provide security group based policy enforcement. Access policies within the Cisco TrustSec domain are topology-independent, based on the roles of source and destination devices rather than on network IP addresses.

---

**Note** From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software.

---

Security group awareness is integrated into several existing firewall rules; there is no unique TrustSec firewall policy. This chapter explains TrustSec firewall policies and how to implement them in the various policies that support security group awareness.

This chapter contains the following topics:

- [Overview of TrustSec Firewall Policies](#) , on page 665
- [Configuring TrustSec Firewall Policies](#) , on page 672
- [Monitoring TrustSec Firewall Policies](#) , on page 682

## Overview of TrustSec Firewall Policies

Traditionally, security features such as firewalls performed access control based on predefined IP addresses, subnets and protocols. However, with enterprises transitioning to borderless networks, both the technology used to connect people and organizations and the security requirements for protecting data and networks have evolved significantly. End points are becoming increasingly nomadic and users often utilize a variety of end points (for example, laptop versus desktop, smart phone, or tablet), which means that a combination of user attributes plus end-point attributes provide the key characteristics, in addition to existing 6-tuple based rules, that enforcement devices, such as switches and routers with firewall features or dedicated firewalls, can reliably use for making access control decisions.

As a result, the availability and propagation of end point attributes or client identity attributes have become increasingly important requirements to enable security solutions across the customers' networks, at the access, distribution, and core layers of the network and in the data center to name but a few examples.

Cisco TrustSec provides an access-control solution that builds upon an existing identity-aware infrastructure to ensure data confidentiality between network devices and integrate security access services on one platform. In the Cisco TrustSec solution, enforcement devices utilize a combination of user attributes and end-point attributes to make role-based and identity-based access control decisions.

Implementing Cisco TrustSec into your environment has the following advantages:

- Provides a growing mobile and complex workforce with appropriate and more secure access from any device
- Lowers security risks by providing comprehensive visibility of who and what is connecting to the wired or wireless network
- Offers exceptional control over activity of network users accessing physical or cloud-based IT resources
- Reduces total cost of ownership through centralized, highly secure access policy management and scalable enforcement mechanisms

For information about Cisco TrustSec, see <http://www.cisco.com/go/trustsec>

This section contains the following topics:

- [Understanding SGT and SXP Support in Cisco TrustSec, on page 666](#)
- [Roles in the Cisco TrustSec Solution, on page 667](#)
- [Security Group Policy Enforcement, on page 667](#)
- [About Speaker and Listener Roles, on page 670](#)
- [Prerequisites for Integrating an ASA with Cisco TrustSec, on page 670](#)

## Understanding SGT and SXP Support in Cisco TrustSec

In the Cisco TrustSec solution, security group access transforms a topology-aware network into a role-based network, thus enabling end-to-end policies enforced on the basis of role-based access-control (RBAC). Device and user credentials acquired during authentication are used to classify packets by security groups. Every packet entering the Cisco TrustSec cloud is tagged with a security group tag (SGT). The tagging helps trusted intermediaries identify the source identity of the packet and enforce security policies along the data path.

An SGT can indicate a privilege level across the domain when the SGT is used to define a security group ACL. An SGT is assigned to a device through IEEE 802.1X authentication, web authentication, or MAC authentication bypass (MAB), which occurs with a RADIUS vendor-specific attribute. An SGT can be assigned statically to a particular IP address or to a switch interface. An SGT is passed along dynamically to a switch or access point after successful authentication.

The Security-group eXchange Protocol (SXP) is a protocol developed for Cisco TrustSec to propagate the IP-to-SGT mapping database across network devices that do not have SGT-capable hardware support to hardware that supports SGTs and security group ACLs. SXP, a control plane protocol, passes IP-SGT mappings from authentication points (such as legacy access layer switches) to upstream devices in the network.

The SXP connections are point-to-point and use TCP as the underlying transport protocol. SXP uses the well known TCP port number 64999 to initiate a connection. Additionally, an SXP connection is uniquely identified by the source and destination IP addresses.

## Roles in the Cisco TrustSec Solution

To provide identity and policy-based access enforcement, the Cisco TrustSec solution includes the functionality:

- **Access Requestor (AR):** Access requestors are end-point devices that request access to protected resources in the network. They are primary subjects of the architecture and their access privilege depends on their Identity credentials.

Access requestors include end-point devices such as PCs, laptops, mobile phones, printers, cameras, and MACsec-capable IP phones.

- **Policy Decision Point (PDP):** A policy decision point is responsible for making access control decisions. The PDP provides features such as 802.1x, MAB, and Web authentication. The PDP supports authorization and enforcement through VLAN, DACL, and security group access (SGACL/SXP/SGT).

In the Cisco TrustSec solution, the Cisco Identity Services Engine (ISE) acts as the PDP. The Cisco ISE provides identity and access control policy functionality.

- **Policy Information Point (PIP):** A policy information point is a source that provides external information (for example, reputation, location, and LDAP attributes) to policy decision points.

Policy information points include devices such as Session Directory, Sensors IPS, and Communication Manager.

- **Policy Administration Point (PAP):** A policy administration point defines and inserts policies into authorization system. The PAP acts as an identity repository, by providing Cisco TrustSec tag to user identity mapping and Cisco TrustSec tag to server resource mapping.

In the Cisco TrustSec solution, the Cisco Secure Access Control System (a policy server with integrated 802.1x and SGT support) acts as the PAP.

- **Policy Enforcement Point (PEP):** A policy enforcement point is the entity that carries out the decisions (policy rules and actions) made by the PDP for each AR. PEP devices learn identity information through the primary communication path that exists across networks. PEP devices learn the identity attributes of each AR from many sources, such as end-point agents, authorization servers, peer-enforcement devices, and network flows. In turn, PEP devices use SXP to propagate IP-SGT mappings to mutually-trusted peer devices across the network.

Policy enforcement points include network devices such as Catalyst switches, routers, firewalls (specifically the ASA), servers, VPN devices, and SAN devices.

## Security Group Policy Enforcement

Security policy enforcement is based on security group name. Compared to traditional IP-based policies configured on firewalls, identity-based policies are configured based on user and device identities. For example, mktg-contractor is allowed to access mktg-servers; mktg-corp-users are allowed to access mktg-server and corp-servers.

The benefits of this type of deployment include:

- User group and Resource is defined and enforced using a single object (SGT) - simplified policy management.
- User identity and resource identity are retained throughout the Cisco Trustsec capable switch infrastructure.

**Figure 21: Security Group Name Based Policy Enforcement Deployment**

Implementing Cisco TrustSec allows you to configure security policies that support server segmentation and includes the following features:

- A pool of servers can be assigned an SGT for simplified policy management.
- The SGT information is retained within the infrastructure of Cisco Trustsec capable switches.
- The ASA can leverage the IP-SGT mapping for policy enforcement across the Cisco TrustSec domain.
- Deployment simplification is possible because 802.1x authorization for servers is mandatory.

### How the ASA Enforces Security Group Based Policies

**Note** User-based security policies and security-group based policies can coexist on the ASA. Any combination of network, user-based, and security-group based attributes can be configured in a security policy.

To configure the ASA to function with Cisco TrustSec, you must import a Protected Access Credential (PAC) file from the ISE.

Importing the PAC file to the ASA establishes a secure communication channel with the ISE. After the channel is established, the ASA initiates a PAC secure RADIUS transaction with the ISE and downloads Cisco TrustSec environment data (that is, the security group table). The security group table maps SGTs to security group names. Security group names are created on the ISE and provide user-friendly names for security groups.

**Note** From version 4.23 onwards, Cisco Security Manager supports the retrieval of more than 20 Security Group Tags (SGTs) from ISE server in ACL and AAA policies. You can also use underscores in the search text box in SGT and User fields, to reduce the effort of searching usernames with underscores.

**Note** For more information about the Cisco Identity Services Engine, see <http://www.cisco.com/en/US/products/ps11640/index.html>

The first time that the ASA downloads the security group table, it walks through all entries in the table and resolves all the security group names included in security policies that have been configured on it; then the ASA activates those security policies locally. If the ASA cannot resolve a security group name, it generates a syslog message for the unknown security group name.

The following figure shows how a security policy is enforced in Cisco TrustSec.

**Figure 22: Security Policy Enforcement**

1. An end-point device connects to an access layer device directly or via remote access and authenticates with Cisco TrustSec.
2. The access layer device authenticates the end-point device with the ISE by using authentication methods such as 802.1X or web authentication. The end-point device passes role and group membership to classify the device into the appropriate security group.
3. The access layer device uses SXP to propagate the IP-SGT mapping to the upstream devices.
4. The ASA receives the packet and looks up the SGTs for the source and destination IP addresses using the IP-SGT mapping passed by SXP.

If the mapping is new, the ASA records it in its local IP-SGT Manager database. The IP-SGT Manager database, which runs in the control plan, tracks IP-SGT mappings for each IPv4 or IPv6 address. The database records the source from which the mapping was learned. The peer IP address of the SXP connection is used as the source of the mapping. Multiple sources can exist for each IP-SGT mapping.

If the ASA is configured as a Speaker, the ASA transmits all IP-SGT mappings to its SXP peers. See [About Speaker and Listener Roles, on page 670](#).

- If a security policy is configured on the ASA with that SGT or security group name, the ASA enforces the policy. (You can create security policies on the ASA that include SGTs or security group names. To enforce policies based on security group names, the ASA needs the security group table to map security group names to SGTs.)

If the ASA cannot find a security group name in the security group table and it is included in a security policy, the ASA considers the security group name unknown and generates a syslog message. After the ASA refreshes the security group table from the ISE and learns the security group name, the ASA generates a syslog message indicating that the security group name is known.

## About Speaker and Listener Roles

The Security-group eXchange Protocol (SXP) is used to send and receive IP-SGT mappings to and from other network devices. Employing SXP allows security devices and firewalls to learn identity information from access switches without the need for hardware upgrades or changes. SXP can also be used to pass IP-SGT mappings from upstream devices (such as datacenter devices) back to the downstream devices.

When configuring an SXP connection to an SXP peer, you must designate the device as a Speaker or a Listener for that connection so that it can exchange identity information:

- Speaker mode—configures the device so that it can forward all active IP-SGT mappings to upstream devices for policy enforcement.
- Listener mode—configures the device so that it can receive IP-SGT mappings from downstream devices (SGT-capable switches) and use that information in creating policy definitions.

If one end of an SXP connection is configured as Speaker, then the other end must be configured as a Listener, and vice versa. If both devices on each end of an SXP connection are configured with the same role (either both as Speakers or both as Listeners), the SXP connection will fail and the device will generate a system log message.

Configuring the device to be both a Speaker and a Listener for an SXP connection can cause SXP looping, meaning that SXP data can be received by an SXP peer that originally transmitted it.

As part of configuring SXP, you configure an SXP reconcile timer. After an SXP peer terminates its SXP connection, the device starts a hold down timer. Only SXP peers designated as Listener devices can terminate a connection. If an SXP peer connects while the hold down timer is running, the device starts the reconcile timer; then, the device updates the IP-SGT mapping database to learn the latest mappings.

## Prerequisites for Integrating an ASA with Cisco TrustSec

Before configuring the ASA to integrate with Cisco TrustSec, you must perform the following prerequisites:

- Register the ASA with the ISE.
- Create a security group for the ASA on the ISE.
- Generate the PAC file on the ISE to import into the ASA.

### Registering the ASA with the ISE

The ASA must be configured as a recognized Cisco TrustSec network device in the ISE before the ASA can successfully import a PAC file.

1. Log into the ISE.
2. Choose **Administration > Network Devices > Network Devices**.
3. Click **Add**.
4. Enter the IP address of the ASA.
5. When the ISE is being used for user authentication in the Cisco TrustSec solution, enter a shared secret in the Authentication Settings area. When you configure the AAA sever on the ASA, provide the shared secret you create here on the ISE. The AAA server on the ASA uses this shared secret to communicate with the ISE.
6. Specify a device name, device ID, password, and a download interval for the ASA. See the ISE documentation for the details to perform these tasks.

### Creating a Security Group on the ISE

When configuring the ASA to communicate with the ISE, you specify a AAA server. When configuring the AAA server on the ASA, you must specify a server group.

The security group must be configured to use the RADIUS protocol.

1. Log into the ISE.
2. Choose **Policy > Policy Elements > Results > Security Group Access > Security Group**.
3. Add a security group for the ASA. (Security groups are global and not ASA specific.)  
The ISE creates an entry under Security Groups with a tag.
4. Under the Security Group Access section, configure a device ID credentials and password for the ASA.

### Generating the PAC

Before generating the PAC file, you must have registered the ASA with the ISE.

1. Log into the ISE.
2. Choose **Administration > Network Resources > Network Devices**.
3. From the list of devices, select the ASA device.
4. Under the Security Group Access (SGA), click **Generate PAC**.
5. To encrypt the PAC file, enter a password.

The password (or encryption key) you enter to encrypt the PAC file is independent of the password that was configured on the ISE as part of the device credentials.

The ISE generates the PAC file. The ASA can import the PAC from flash or from a remote server via TFTP, FTP, HTTP, HTTPS, or SMB. (The PAC does not have to reside on the ASA flash before you can import it.)

# Configuring TrustSec Firewall Policies

Security group awareness is integrated into several existing firewall rules; there is no unique TrustSec firewall policy. Additionally, supporting tools have been updated to work on TrustSec firewall policies. For example, you can search for rules that include a specific Security Group using the Find and Replace tool.

The topics in this section explain the various procedures for integrating security group awareness into firewall policies.

This section contains the following topics:

- [Configuring Cisco TrustSec Services](#) , on page 672
- [Creating Security Group Objects](#) , on page 679
- [Selecting Security Groups in Policies](#) , on page 681
- [Configuring TrustSec-Based Firewall Rules](#) , on page 681

## Configuring Cisco TrustSec Services

This procedure explains how to enable and configure Cisco TrustSec in Cisco Security Manager and on the required security devices.

### Before You Begin

Before configuring an ASA to integrate with Cisco TrustSec, you must meet the prerequisites explained in [Prerequisites for Integrating an ASA with Cisco TrustSec](#), on page 670.

To configure Cisco TrustSec, perform the following tasks:

- 
- Step 1** Configure communication between Cisco Security Manager and the Cisco Identity Services Engine (ISE). See [ISE Settings Page](#) , on page 567.
- Note** Security Manager supports communications with only one ISE appliance/server for fetching and resolving security group names and tags.
- Step 2** Enable and set the default values for the Security Exchange Protocol (SXP). See [Understanding SGT and SXP Support in Cisco TrustSec](#), on page 666.
- Step 3** Add SXP connection peers for the Cisco TrustSec architecture. See [Defining SXP Connection Peers](#) , on page 677.
- Step 4** (ASA 9.3.1+ devices only) Configure Security Group Tagging options. See [Add/Edit Interface Dialog Box: Advanced Tab \(ASA/PIX 7.0+\)](#) , on page 1853.
- Step 5** (ASA 9.3.1+ devices only) Configure Security Group Tagging for VPN sessions. See [ASA Group Policies SSL VPN Full Client Settings](#) , on page 1506.
- Step 6** Configure the Security Policy. See [Configuring TrustSec-Based Firewall Rules](#) , on page 681
- Step 7** Monitor the TrustSec firewall system. See [Monitoring TrustSec Firewall Policies](#) , on page 682.
-

## Configuring Security Exchange Protocol (SXP) Settings

Use the SXP Settings page to enable the Security Exchange Protocol (SXP) on your security device and to configure SXP settings for the device.

**Note** All settings are available on the SXP Settings page whether you access that page from Policy view or from Device view for a specific device type. If you configure a setting that is not supported on a particular device, you will receive a validation warning and the unsupported CLI will not be generated for the device.

### Navigation Path

- (Device view) Select the security device, then select **TrustSec > SXP Settings** from the Policy selector.
- (Policy view) Select **TrustSec > SXP Settings** from the Policy selector. Select an existing policy or create a new one.

### Related Topics

- [Prerequisites for Integrating an ASA with Cisco TrustSec, on page 670](#)
- [Defining SXP Connection Peers , on page 677](#)

### Field Reference

*Table 174: SXP Settings Page*

| Element                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable SGT Exchange Protocol (SXP) | Whether to enable the Security Exchange Protocol on the device. The default is disabled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Retry Timer                        | <p>The default time interval between attempts to set up new SXP connections between SXP peers. Enter the retry timer value as a number of seconds in the range of 0 to 64000 seconds. If you specify 0 seconds, the timer never expires and the device will not attempt to connect to SXP peers. By default, the timer value is 120 seconds.</p> <p>The device will continue to attempt to connect to new SXP peers until a successful connection is made. The retry timer is triggered as long as there is one SXP connection on the device that is not up.</p> <p>When the retry timer expires, the device goes through the connection database and if the database contains any connections that are off or in a "pending on" state, the device restarts the retry timer.</p> |

| Element                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reconcile Timer                                  | <p>The reconcile timer value as a number of seconds in the range of 0 to 64000 seconds. By default, the timer value is 120 seconds.</p> <p>After an SXP peer terminates its SXP connection, the security device starts a hold down timer. If an SXP peer reconnects while the hold down timer is running, the device starts the reconcile timer; then, the device updates the SXP mapping database to learn the latest mappings.</p> <p>When the reconcile timer expires, the device scans the SXP mapping database to identify stale mapping entries (entries that were learned in a previous connection session). The device marks these connections as obsolete. When the reconcile timer expires, the device removes the obsolete entries from the SXP mapping database.</p> <p><b>Note</b> Setting the reconciliation period to 0 seconds disables the timer and causes all entries from the previous connection to be removed.</p> |
| Network Map                                      | <p>The Network Map argument specifies the maximum number of subnet IP hosts from 0 to 65,535 that can be bound to SGTs and exported to the SXP listener. The default is 0 (no expansions performed).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Server Group Name<br>(not applicable for IOS-XE) | <p>Enter or select the name of the security group created on the ISE for the device.</p> <p><b>Note</b> If you choose to select a server group, you are also give the option to add a AAA Server group.</p> <p>The server group name you specify here must match the name of the security group created on the ISE for the device. If these two group names do not match, the device will not be able to communicate with the ISE. Contact your ISE administrator if you do not have this information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                               |
| CTS Server Settings (IOS/IOS-XE Only)            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Log Binding Changes                              | <p>Whether to enable logging for IP-to-SGT binding changes causing SXP syslog (sev 5 syslog) to be generated whenever a change to IP-to-SGT binding occurs (add, delete, change). These changes are learned and propagated on the SXP connection. This logging function is disabled by default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Element                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| CTS SGT Number                                                  | Enter a number from 1-65533 to manually assign a Security Group Tag (SGT) number for this device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Server Dead Time<br>(not applicable for IOS-XE)                 | Specifies how long a server in the group should not be selected for service once it has been marked as dead. The default is 20 seconds; the range is 1 to 864000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Load Balance<br>(not applicable for IOS-XE)                     | Whether to configure RADIUS server group load balancing. When Load Balance is enabled, the following options can be specified:<br><br>Batch size—The number of transactions to be assigned per batch. The default transactions is 25.<br><br><b>Note</b> Changes in batch size may impact CPU load and network throughput. As batch size increases, CPU load decreases and network throughput increases. However, if a large batch size is used, all available server resources may not be fully utilized. As batch size decreases, CPU load increases, and network throughput decreases. It is recommended that the default batch size, 25, be used because it is optimal for high throughput, without adversely impacting CPU load.<br><br>Ignore Preferred-Server—Instructs the device not to try to use the same server throughout a session. |

| Element                                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| SGT Rolebased Map table<br><br>(ASA 9.3(1)+, IOS15.2(2)T+, and IOS-XE3.5.x(15.2(1)S)+ only) | Use the SGT Rolebased Map table to manually map Security Group Tag (SGT) numbers to individual IP addresses or host objects.<br><br>You can do the following: <ul style="list-style-type: none"> <li>• To add an entry, click the <b>Add Row (+)</b> button and fill in the Add Connection Peer dialog box. See <a href="#">Add/Edit SGT Role Dialog Box</a>, on page 676.</li> <li>• To edit an entry, select it and click the <b>Edit Row (pencil)</b> button.</li> <li>• To delete an entry, select it and click the <b>Delete Row (trash can)</b> button.</li> </ul> |

### Add/Edit SGT Role Dialog Box

Use the Add/Edit SGT Role dialog box to manually map Security Group Tag (SGT) numbers to individual IP addresses or host objects.

#### Navigation Path

- (Device view) Select an ASA device, then select **TrustSec > SXP Settings** from the Policy selector.
  - To add an entry, click the **Add Row (+)** button beneath the SGT Rolebased Map table.
  - To edit an entry, select it and click the **Edit Row (pencil)** button beneath the SGT Rolebased Map table.
- (Policy view) Select **TrustSec > SXP Settings** from the Policy selector. Select an existing policy or create a new one.
  - To add an entry, click the **Add Row (+)** button beneath the SGT Rolebased Map table.
  - To edit an entry, select it and click the **Edit Row (pencil)** button beneath the SGT Rolebased Map table.

|----------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| CTS SGT Number | The Security Group Tag (SGT) number to assign to the specified host/IP address. Valid security tag numbers are 2-65519 for ASA 9.3(1)+. |

## Defining SXP Connection Peers

The Security-group eXchange Protocol (SXP) is a protocol developed for Cisco TrustSec to propagate the IP-to-SGT mapping database across network devices that do not have SGT-capable hardware support to hardware that supports SGTs and security group ACLs. SXP, a control plane protocol, passes IP-SGT mappings from authentication points (such as legacy access layer switches) to upstream devices in the network. SXP connections between peers are point-to-point and use TCP as the underlying transport protocol.

### Related Topics

- [Prerequisites for Integrating an ASA with Cisco TrustSec, on page 670](#)
- [About Speaker and Listener Roles, on page 670](#)
- [Configuring Security Exchange Protocol \(SXP\) Settings , on page 673](#)

- 
- Step 1** Do one of the following:
- (Device view) Select an ASA device, then select **TrustSec > SXP Connection Peers** from the Policy selector.
  - (Policy view) Select **TrustSec > SXP Connection Peers** from the Policy selector. Select an existing policy or create a new one.
- Step 2** In **Default Source**, enter the default local IP address for SXP connections. You can enter an IP address or the name of a network/host object, or click Select to select the object from a list or to create a new one. The IP address can be an IPv4 or IPv6 address.
- Note** The device determines the local IP address for an SXP connection as the outgoing interface IP address that is reachable by the peer IP address. If the configured local address is different from the outgoing interface IP address, the device cannot connect to the SXP peer and generates a system log message.
- Step 3** In **Default Password** and **Confirm**, enter the default password for TCP MD5 authentication with SXP peers. By default, SXP connections do not have a password set.
- You can specify the password as an encrypted string up to 162 characters or an ASCII key string up to 80 characters.
- Step 4** Configure the SXP Peers:
- You can do the following:
- To add an entry, click the **Add Row (+)** button and fill in the Add Connection Peer dialog box. See [Add/Edit Connection Peer Dialog Box , on page 678](#).
  - To edit an entry, select it and click the **Edit Row (pencil)** button.
  - To delete an entry, select it and click the **Delete Row (trash can)** button.
- Step 5** Click **Save** to save your changes.
-

## Add/Edit Connection Peer Dialog Box

Use the Add/Edit Connection Peer dialog box to define the settings for an SXP Connection.

**Note** All settings are available on the Add/Edit Connection Peer dialog box whether you access that dialog box from Policy view or from Device view for a specific device type. If you configure a setting that is not supported on a particular device, you will receive a validation warning and the unsupported CLI will not be generated for the device.

### Navigation Path

- (Device view) Select an ASA device, then select **TrustSec > SXP Connection Peers** from the Policy selector.
  - To add an entry, click the **Add Row (+)** button.
  - To edit an entry, select it and click the **Edit Row (pencil)** button.
- (Policy view) Select **TrustSec > SXP Connection Peers** from the Policy selector. Select an existing policy or create a new one.
  - To add an entry, click the **Add Row (+)** button.
  - To edit an entry, select it and click the **Edit Row (pencil)** button.

|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Password                                           | Whether to use the authentication key for the SXP connection. Select from the following values: <ul style="list-style-type: none"> <li>• default—Use the default password configured for SXP connections. See <a href="#">Defining SXP Connection Peers</a>, on page 677.</li> <li>• none—Do not use a password for the SXP connection.</li> </ul>            |
| Mode                                               | The mode of the SXP connection. Select from the following values: <ul style="list-style-type: none"> <li>• local—Use the local SXP device.</li> <li>• peer—Use the peer SXP device.</li> </ul>                                                                                                                                                                |
| Role                                               | Whether the device functions as a Speaker or Listener for the SXP connection: <ul style="list-style-type: none"> <li>• listener—The device can receive IP-SGT mappings from downstream devices.</li> <li>• speaker—The device can forward IP-SGT mappings to upstream devices.</li> </ul> See <a href="#">About Speaker and Listener Roles</a> , on page 670. |
| Hold Time Min<br>Only applicable on IOS and IOS-XE | The minimum length of the hold-time period in seconds for the speaker or listener device.                                                                                                                                                                                                                                                                     |
| Hold Time Max<br>Only applicable on IOS and IOS-XE | The maximum length of the hold-time period in seconds for the speaker or listener device. A hold-time maximum-period value is required only when you use the following option combinations: peer speaker and local listener. In other instances, only a hold-time minimum-period value is required.                                                           |

## Creating Security Group Objects

You can create security group object groups for use in features that support Cisco TrustSec by including the group in an extended ACL, which in turn can be used in an access rule, for example.

When integrated with Cisco TrustSec, the security device downloads security group information from the Cisco Identity Services Engine (ISE). The ISE acts as an identity repository, by providing Cisco TrustSec tag to user identity mapping and Cisco TrustSec tag to server resource mapping. You provision and manage security group access lists centrally on the ISE.

However, the device might have localized network resources that are not defined globally that require local security groups with localized security policies. Local security groups can contain nested security groups that are downloaded from the ISE. The security device consolidates local and central security groups.

To create local security groups on the device, you create a local security object group. A local security object group can contain one or more nested security object groups or Security IDs or security group names. Users can also create a new Security ID or security group name that does not exist on the device.

You can use the security object groups you create to control access to network resources. You can use the security object group as part of an access group or service policy.

### Tips

- Use of these objects is supported on ASA 9.0(1)+ only.
- You must configure the TrustSec policy on the device to enable the use of these objects.
- You can create security group objects when defining policies or objects that use this object type. For more information, see [Selecting Security Groups in Policies , on page 681](#).

### Related Topics

- [Selecting Security Groups in Policies , on page 681](#)
- [Creating Policy Objects , on page 235](#)

---

**Step 1** Select **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager , on page 230](#)).

**Step 2** Select **Security Group** from the Object Type selector.

**Step 3** Right-click in the work area, then select **New Object** to open the Add Security Group dialog box.

**Step 4** Enter a name for the object and optionally a description of the object.

**Step 5** Add and remove items in the **Members in Group** list to identify the users and user groups defined in the object.

To populate the list, do any combination of the following:

- In **Available Security Group**, select an existing object and click the **Add >>** button between the lists.
- In **Search name/tag**, select a security group from the ISE server configured in the ISE Settings administrative options. You must configure the settings before you can select a name or tag (see [ISE Settings Page , on page 567](#)).

To find a security group, enter a search string. Then, click **Search** to find matches. A name is considered a match if the string appears anywhere within the security group name.

To add the security group, select it in the list and click the **Add >>** button between the lists.

- In **Type in comma separated (Name or Tag)**, first select the type of entry you are making, Name or Tag. Type in a valid security group name or tag number, then click the **Add >>** button between the lists. Separate multiple names or tags with commas; they are added as separate lines in the members list. When adding multiple names or tags, avoid adding spaces before or after the comma.

Valid security tag numbers are 0-65533 for ASA 9.3+ and 1-65533 for ASA versions less than 9.3.

- To remove an item from the object, select it in the Members list and click the **<< Remove** button between the lists.

**Note** From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software.

**Step 6** (Optional) Under Category, select a category to help you identify this object in the Objects table. See [Using Category Objects , on page 239](#).

**Step 7** (Optional) Select **Allow Value Override per Device** to allow the properties of this object to be redefined on individual devices. See [Allowing a Policy Object to Be Overridden , on page 245](#).

**Step 8** Click **OK** to save the object.

---

## Selecting Security Groups in Policies

In any policy or policy object that allows the specification of security groups, whether directly or through the selection of a TrustSec security group object, you can click the **Select** button next to the Security Groups field to help you enter the information.

In the Security Group Selector dialog box, you can define the content of the Security Groups field by populating the **Members in Group** list. To populate the list, do any combination of the following:

- In **Available Security Group**, select an existing object and click the **Add >>** button between the lists. If the desired object does not exist, you can click the **Add (+)** button below the list to create a new object. You can also select an object and click the **Edit (pencil)** button to modify it or to examine its contents.
- In **Search name/tag**, select a security group from the ISE server configured in the ISE Settings administrative options. You must configure the settings before you can select a name or tag (see [ISE Settings Page](#) , on page 567).

To find a security group, enter a search string. Then, click **Search** to find matches. A name is considered a match if the string appears anywhere within the security group name.

To add the security group, select it in the list and click the **Add >>** button between the lists.

- In **Type in comma separated (Name or Tag)**, first select the type of entry you are making, Name or Tag. Type in a valid security group name or tag number, then click the **Add >>** button between the lists. Separate multiple names or tags with commas; they are added as separate lines in the members list. When adding multiple names or tags, avoid adding spaces before or after the comma.

Valid security tag numbers are 0-65533 for ASA 9.3+ and 1-65533 for ASA versions less than 9.3.

- To remove an item from the object, select it in the Members list and click the << **Remove** button between the lists.

## Configuring TrustSec-Based Firewall Rules

Security group awareness is integrated into the access control entries, or rules, in the ACLs used to provide firewall services. Because the feature is integrated into the ACL, the techniques for adding security group awareness to a firewall policy are the same for all types of firewall policy. This topic provides general guidance on how to incorporate security group awareness into your existing policies, and directs you to more specific information on configuring each type of policy that supports security groups.

### Firewall Policies That Support Security Groups

For ASA 9.0.1+ only, you can configure security groups for the following policy types:

- AAA Rules—Select **Firewall > AAA Rules** and see [Configuring AAA Rules for ASA, PIX, and FWSM Devices](#) , on page 686.
- Access Rules—Select **Firewall > Access Rules** and see [Configuring Access Rules](#) , on page 721.
- Inspection Rules—Select **Firewall > Inspection Rules** and see [Configuring Inspection Rules](#) , on page 769.
- Policies that use extended ACL policy objects—Several firewall policies use extended ACL policy objects to define traffic matching criteria instead of incorporating a rule table directly in the policy. You can configure extended ACL policy objects to include security group specifications (see [Creating](#)

[Extended Access Control List Objects](#) , on page 282). You can then use these extended ACL objects in the following policies:

- Botnet Traffic Filter Rules—Select **Firewall > Botnet Traffic Filter Rules** and see [Enabling Traffic Classification and Actions for the Botnet Traffic Filter](#) , on page 911. You can use security groups as part of the traffic classification for Enable and Drop rules.
- IPS, QoS, and Connection Rules (service policy rules)—Select **Platform > Service Policy Rules > IPS, QoS, and Connection Rules** and see [Service Policy Rules Page](#) , on page 2283.

Traffic match criteria in this policy is based on extended ACL policy objects that are incorporated into traffic flow policy objects. You must select one of the options for specifying an ACL in the traffic flow object to incorporate security group traffic classification. For more information, see [Configuring Traffic Flow Objects](#) , on page 2297.

For devices running IOS 15.2(2)T+ and IOS-XE 3.5.x(15.2(1)S)+, you can configure security groups for Zone-based Firewall Rules (**Firewall > Zone Based Firewall Rules**). For more information, see [Adding Zone-Based Firewall Rules](#) , on page 940.

## Monitoring TrustSec Firewall Policies

You can use Event Viewer to monitor TrustSec firewall policies the same way you would monitor other types of policies and events. The following are some tips to help you effectively monitor identity policies. For general information on using Event Viewer, see [Viewing Events](#), on page 2703.

- There are groups of syslog messages that relate specifically to Cisco TrustSec: 766001-766020, 766201-766205, 766251-766254, and 766301-766313. You can find descriptions of these messages in the Syslog Message document for your ASA software version at [http://www.cisco.com/en/US/products/ps6120/products\\_system\\_message\\_guides\\_list.html](http://www.cisco.com/en/US/products/ps6120/products_system_message_guides_list.html) .
- Event Viewer has the following columns to display TrustSec information: TrustSec Security Group Name, TrustSec Security Group Tag, SXP Connection Source IP, SXP Connection Failure Reason, SXP Peer IP, SXP Peer Connection Failure Reason.
- You can filter on all identity-related syslog messages by creating a filter on Event Type and selecting the All Firewall Events > Trustsec Events folder.

## CHAPTER 15

# Managing Firewall AAA Rules

You can use Authentication, Authorization, and Accounting (AAA) rules to control access to network resources based on user privileges rather than by IP addresses. If you configure authentication rules, users must enter a username and password whenever they attempt to access a network behind the protected device. Once authenticated, you can further require that the user account be checked to ensure the user is authorized for network access. Finally, you can use accounting rules to track access for billing, security, or resource allocation purposes.

AAA rule configuration is complex and requires that you configure more than just the AAA rules policy. The following topics explain AAA rules in greater detail and include procedures that explain not only the AAA rules policy configuration but also what you must configure in related policies:

- [Understanding AAA Rules](#) , on page 683
- [Understanding How Users Authenticate](#) , on page 684
- [Configuring AAA Rules for ASA, PIX, and FWSM Devices](#) , on page 686
- [Configuring AAA Rules for IOS Devices](#) , on page 689
- [AAA Rules Page](#) , on page 691
- [AAA Firewall Settings Policies](#) , on page 702

## Understanding AAA Rules

You can use Authentication, Authorization, and Accounting (AAA) rules to control access to network resources based on user privileges rather than by IP addresses. AAA rules provide a different type of control compared to traditional access rules; where access rules allow you to control which IP addresses and services are allowed, AAA rules allow you to configure ACLs for each user to define the authorization available on a user basis, regardless of the IP address from which the user connects. (These per-user ACLs are configured in the AAA server, not in the AAA rule defined on the device.)

AAA rules policies differ from other device platform AAA policies in that AAA rules apply to traffic that is passing through the device, not to traffic directed specifically at the device. By using AAA rules, you can control entry into, or out of, a network. This might be useful if you have a network segment that is high security, where you want to carefully control access. AAA rules are also useful for circumstances where you need to maintain per-user accounting records for billing, security, or resource allocation purposes.

The AAA rules policy actually configures three separate types of rule, and the configuration of these rules differs significantly between IOS devices on the one hand and ASA, PIX, and FWSM devices on the other hand. For IOS devices, these policies define what is called authentication proxy admission control. When creating shared AAA rules, create separate rules for these types of devices. Following are the types of rules you can configure with AAA rules:

- Authentication rules—Authentication rules control basic user access. If you configure an authentication rule, users must log in if their connection request goes through the device on which the rule is defined. You can force users to log in for HTTP, HTTPS, FTP, or Telnet connections. For ASA, PIX, and FWSM devices, you can control other types of services, but users must first authenticate using one of the supported protocols before other types of traffic are allowed.

The device recognizes these traffic types only on the default ports: FTP (21), Telnet (23), HTTP (80), HTTPS (443). If you map these types of traffic to other ports, the user will not be prompted, and access will fail.

- Authorization rules—You can define an additional level of control over and above authentication. Authentication simply requires that users identify themselves. After authentication is successful, an authorization rule can query the AAA server to determine if the user has sufficient privileges to complete the attempted connection. If authorization fails, the connection is dropped.
  - For ASA, PIX, and FWSM devices, you define authorization rules directly in the AAA rules policy; if you require authorization for traffic that does not also require authentication, the unauthenticated traffic is always dropped. If you use RADIUS servers for authentication, authorization is automatically performed and authorization rules are not necessary. If you configure authorization rules, you must use a TACACS+ server.
  - For IOS devices, to configure authorization, you must configure an authorization server group in the **Firewall > Settings > AAA** policy; authorization is done for any traffic that is subject to authentication. You can use TACACS+ or RADIUS servers.
- Accounting—You can define accounting rules even if you do not configure authentication or authorization. If you do configure authentication, accounting records are created for each user, so that you can identify the specific user who made the connection. Without user authentication, accounting records are based on IP address. You can use TACACS+ or RADIUS servers for accounting.
  - For ASA, PIX, and FWSM devices, you define accounting rules directly in the AAA rules policy. You can perform accounting for any TCP or UDP protocol.
  - For IOS devices, to configure accounting, you must configure an accounting server group in the **Firewall > Settings > AAA** policy; accounting is done for any traffic that is subject to authentication.

## Understanding How Users Authenticate

When you create AAA rules to require that users authenticate when trying to make connections through a device, users will be prompted to supply credentials: a username and password. These credentials must be defined in a AAA server or in the local database configured on the device.

Users are prompted only for HTTP, HTTPS, FTP, and Telnet connections (if you configure those protocols to require authentication). For ASA, PIX, and FWSM devices, you can also require authentication for other protocols; however, users are not prompted for them, and so they must first attempt one of the four supported protocols and successfully authenticate before completing connections of any other protocol that requires authentication.

---

**Tip** For ASA, PIX, and FWSM devices, if you do not want to allow HTTP, HTTPS, Telnet, or FTP through the security appliance but want to authenticate other types of traffic, you can require that the user authenticate with the security appliance directly using HTTP or HTTPS by configuring the interface to use interactive authentication (using the **Firewall > Settings > AAA Firewall** policy). The user would then authenticate with the appliance before trying other connections, using one of the following URLs, where *interface\_ip* is the IP address of the interface and *port* is optionally the port number, if you specify a non-default port for the protocol in the interactive authentication table: **http://interface\_ip [:port ]/netaccess/connstatus.html** or **https://interface\_ip [:port ]/netaccess/connstatus.html**.

---

When attempting a connection through the device, the user is prompted based on the protocol:

- HTTP—The device prompts the user with a web page to provide username and password. The user is prompted repeatedly until successfully authorized. After the user authenticates correctly, the device redirects the user to the original destination. If the destination server also has its own authentication, the user enters another username and password.

For ASA, PIX, and FWSM devices, the security appliance uses basic HTTP authentication by default, and provides an authentication prompt. You can improve the user experience by configuring the interface for interactive authentication and specifying redirect for HTTP traffic. This redirects the user to a web page hosted on the appliance for authentication. To configure an interface to use interactive authentication, add the interface to the Interactive Authentication table on the **Firewall > Settings > AAA Firewall** policy (see [AAA Firewall Settings Page, Advanced Setting Tab](#), on page 702). Ensure that you select the HTTP and Redirect options when adding the interface.

You might want to continue to use basic HTTP authentication if: you do not want the security appliance to open listening ports; if you use NAT on a router and you do not want to create a translation rule for the web page served by the security appliance; basic HTTP authentication might work better with your network. For example non-browser applications, like when a URL is embedded in email, might be more compatible with basic authentication.

However, when using basic HTTP authentication, if the user is going to an HTTP server that requires authentication, the same username and password used to authenticate with the appliance is sent to the HTTP server. Thus, login to the HTTP server fails unless the same username and password are used by the ASA and HTTP server. To avoid this problem, you must configure a virtual HTTP server on the ASA. You can configure a virtual HTTP server using the **Firewall > Settings > AAA Firewall** policy (see [AAA Firewall Settings Page, Advanced Setting Tab](#), on page 702).

---

**Tip** In HTTP authentication, the username and password are transmitted in clear text. You can prevent this by selecting the **Use Secure HTTP Authentication** option on the **Firewall > Settings > AAA Firewall** policy. This option ensures that credentials are encrypted.

---

- HTTPS—The user experience for HTTPS is the same as for HTTP; the user is prompted until successfully authorized, and then redirected to the original destination.

For ASA, PIX, and FWSM devices, the security appliance uses a custom login screen. Like with HTTP, you can configure the interface to use interactive authentication, in which case HTTPS connections use the same authentication page as HTTP connections. You must configure the interface separately for HTTPS redirection; use the **Firewall > Settings > AAA Firewall** policy.

For IOS devices, HTTPS connections are authenticated only if you enable SSL on the device and your AAA rules require HTTP authentication proxy. This configuration is explained in [Configuring AAA Rules for IOS Devices](#) , on page 689.

- FTP—The device prompts once for authentication. If authentication fails, the user must retry the connection.

When prompted, the user can enter the username required for device authentication followed by an at sign (@) and then the FTP username (name1@name2). For the password, the user would then enter the device authentication password followed by an at sign (@) and then the FTP password (password1@password2). For example, enter the following text.

```
name> asa1@partreqpassword> letmein@he110
```

For IOS devices, this method of entering both the device and FTP credentials is required. For ASA, PIX, and FWSM devices, this feature is useful when you have cascaded firewalls that require multiple logins. You can separate several names and passwords by multiple at signs (@).

- Telnet—The device prompts several times for authentication. After a number of failed attempts, the user must retry the connection. After authentication, the Telnet server prompts for its username/password. You can configure a virtual Telnet server using the **Firewall > Settings > AAA Firewall** policy (see [AAA Firewall Settings Page, Advanced Setting Tab](#) , on page 702).

## Configuring AAA Rules for ASA, PIX, and FWSM Devices

---

**Note** From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functionality, it does not support any enhancements.

---

When you configure AAA rules for an ASA, PIX, or FWSM device, you are configuring policies that define who is allowed to make HTTP, HTTPS, FTP, and Telnet connections through (not to) the device. To fully configure network access authentication, you need to configure several policies, not just the AAA rules policy.

The following procedure covers all policies you would need to configure to supply full authentication, authorization, and accounting support for network access authentication. You do not need to configure options for features you do not need.

### Related Topics

- [Understanding AAA Rules](#) , on page 683
- [Understanding How Users Authenticate](#) , on page 684
- [Creating a New Shared Policy](#) , on page 219
- [Modifying Policy Assignments in Policy View](#) , on page 219

- [Understanding Interface Role Objects](#) , on page 301
- [Understanding and Specifying Services and Service and Port List Objects](#) , on page 329

- [Understanding AAA Server and Server Group Objects](#) , on page 254

- 
- Step 1** Do one of the following to open the [AAA Rules Page](#) , on page 691:
- (Device view) Select **Firewall > AAA Rules** from the Policy selector.
  - (Policy view) Select **Firewall > AAA Rules** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** Select the row after which you want to create the rule and click the **Add Row** button or right-click and select **Add Row**. This opens the [Add and Edit AAA Rule Dialog Boxes](#) , on page 695.
- Tip** If you do not select a row, the new rule is added at the end of the local scope. You can also select an existing row and edit either the entire row or specific cells. For more information, see [Editing Rules](#) , on page 605.
- Step 3** Configure the rule. Following are the highlights of what you typically need to decide. For specific information on configuring the fields, see [Add and Edit AAA Rule Dialog Boxes](#) , on page 695.
- Authentication (with or without User-Identity), Authorization, or Accounting Action—Select the options applicable for this rule. Authentication prompts the user for a username and password when attempting HTTP, HTTPS, FTP, or Telnet access. Authorization is an additional level, where after the user authenticates, the AAA server is checked to ensure that the user is authorized for that type of access. Accounting generates usage records in the AAA server and can be used for billing, security, or resource allocation purposes. You can generate accounting information for any TCP or UDP traffic.

When you select Authentication, you can also select User-Identity (ASA 8.4(2+) only). This option indicates that the ASA should use the Active Directory servers configured in the identity-firewall domain mappings to authenticate users (see [Identifying Active Directory Servers and Agents](#) , on page 643). If the user enters a domain name, the AD server associated with the domain is queried. Otherwise, the AD server associated with the default domain is queried. When you select User-Identity, and you do not select Authorization or Accounting, do not specify a AAA server group.

- Permit or Deny—Whether you are subjecting the identified traffic to AAA control (permit) or you are exempting it from AAA control (deny). Any denied traffic is not prompted for authentication and is allowed to pass unauthenticated, although your access rules might drop the traffic.
- Source and Destination addresses—If the rule should apply no matter which addresses generated the traffic or their destinations, use “All-Addresses” as the source or destination. If the rule is specific to a host or network, enter the addresses or network/host objects. For information on the accepted address formats, see [Specifying IP Addresses During Policy Definition](#) , on page 316.
- Source and Destination Security Groups (ASA 9.0+ only)—You can specify TrustSec security groups used to filter traffic in addition to the source and destination addresses. See [Selecting Security Groups in Policies](#) , on page 681, [Configuring TrustSec-Based Firewall Rules](#) , on page 681 and [Creating Security Group Objects](#) , on page 679 for more information about security groups.
- Source Users (ASA 8.4.2+ only)—You can further define the traffic source by specifying Active Directory (AD) user names (in the format NetBIOS\_DOMAIN\username), user groups (NetBIOS\_DOMAIN\user\_group), or identity user group objects that define the names and groups. The user specification is conjoined to the source address to limit the match to user addresses within the source address range. For more information, see [Configuring Identity-Based Firewall Rules](#) , on page 657 and [Creating Identity User Group Objects](#) , on page 654.
- Services—You can specify any type of service for authentication and authorization rules; however, the user is prompted to authenticate only for HTTP, HTTPS, FTP, and Telnet connections. Thus, if you specify something other than these services, the user must first attempt one of these connections and successfully authenticate (and be

authorized, if you include that action) before any other types of connections are allowed. For accounting rules, you can specify any TCP or UDP service (or simply TCP and UDP themselves), if you want to account for all types of traffic.

- **AAA Server Group**—The AAA server group policy object to be used for authentication, authorization, or accounting. If the rule applies more than one of these actions, the server group must support all selected actions. For example, only TACACS+ servers can provide services for authorization rules (although using RADIUS for authentication rules automatically includes RADIUS authorization), and only TACACS+ and RADIUS servers can provide accounting services. If you want to use different server groups for particular actions, define separate rules for each type of action that requires different groups.
- **Interfaces**—The interface or interface role for which you are configuring the rule.

Click **OK** when you are finished defining your rule.

**Step 4** If you did not select the right row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. For more information, see [Moving Rules and the Importance of Rule Order](#), on page 615.

**Step 5** Select **Firewall > Settings > AAA Firewall** (in Device or Policy view) to open the [AAA Firewall Settings Page, Advanced Setting Tab](#), on page 702. Configure the AAA firewall settings:

- If you configured rules for HTTP authentication, you should select **Use Secure HTTP Authentication**. This ensures that the username and password entered for HTTP authentication are encrypted. If you do not select this option, the credentials are sent in clear text, which is insecure.

**Tip** If you select this option, ensure that you do not configure 0 for the user authentication timeout (**timeout uauth 0**, configured in the **Platform > Security > Timeouts** policy), or users might be repeatedly prompted for authentication, making the feature disruptive to your network.

- If you configured authentication for HTTP or HTTPS traffic on an interface, you should consider adding the interface to the Interactive Authentication table. When you enable an interface for interactive authentication, users get an improved authorization web page, one that is the same for both HTTP and HTTPS.

Click **Add Row** to add the interface to the table. Select whether the interface should listen for HTTP or HTTPS traffic (add the interface twice to listen for both protocols), and the port to listen on if not the default port for the protocol (80 and 443, respectively). Select **Redirect network users for authentication request** so that network access traffic gets the improved authentication prompt; if you do not select the option, only users trying to log into the device get the prompt.

**Note** You might want to continue to use basic HTTP authentication if: you do not want the security appliance to open listening ports; if you use NAT on a router and you do not want to create a translation rule for the web page served by the security appliance; basic HTTP authentication might work better with your network. For example non-browser applications, like when a URL is embedded in email, might be more compatible with basic authentication.

- For FWSM devices, you can also disable the authentication challenge for protocols you have otherwise configured to require authentication. You can also add interfaces to the Clear Connections table to ensure that active connections for users whose authentication has timed out are cleared and do not hang.
- If you want to exempt some devices from your AAA rules based on their media access control (MAC) address, click the **MAC Exempt List** tab to open the [AAA Firewall Page, MAC-Exempt List Tab](#), on page 708. Enter a name for the exemption list, and then click the **Add Row** button and fill in the [Firewall AAA MAC Exempt Setting Dialog Box](#), on page 709 to add the MAC address to the table with a permit rule. You might want to do this for secure, trusted devices.

The order of entries matters, so ensure that any specific entries that are covered by broader entries come before the broad entries in the table. The device processes the list in order and the first match is applied to the host. For more detailed information about how the entries on the MAC exempt list are processed, see [AAA Firewall Page, MAC-Exempt List Tab](#) , on page 708.

**Step 6**

If you are configuring authentication rules using a RADIUS server, and you include per-user ACL configurations in the user profiles, enable per-user downloadable ACLs on the interface. (RADIUS authentication automatically includes authorization checking.) For information on configuring per-user ACLs, see the information on configuring RADIUS authorization in the *Cisco ASA 5500 Series Configuration Guide Using the CLI* at [http://www.cisco.com/en/US/docs/security/asa/asa82/configuration/guide/access\\_fwaaa.html](http://www.cisco.com/en/US/docs/security/asa/asa82/configuration/guide/access_fwaaa.html).

- a) Select **Firewall > Settings > Access Control** (in Device or Policy view) to open the [Access Control Settings Page](#) , on page 738.
- b) Click the Add Row button beneath the interface table and fill in the [Firewall ACL Setting Dialog Box](#) , on page 740 with at least these options:
  - Enter the interface or interface role on which you are performing authorization.
  - Select **Per User Downloadable ACLs**.
- c) Click **OK** to save your changes.

---

## Configuring AAA Rules for IOS Devices

When you configure AAA rules for an IOS device, you are configuring authentication proxy (AuthProxy) admission control policies. These policies define who is allowed to make HTTP, HTTPS, FTP, and Telnet connections through (not to) the device. To fully configure authentication proxy, you must configure several policies, not just the AAA rules policy.

The following procedure covers all policies you would need to configure to supply full authentication, authorization, and accounting support for authorization proxy. You do not need to configure options for features you do not need.

### Related Topics

- [Understanding AAA Rules](#) , on page 683
- [Understanding How Users Authenticate](#) , on page 684
- [Creating a New Shared Policy](#) , on page 219
- [Modifying Policy Assignments in Policy View](#) , on page 219
- [Understanding Networks/Hosts Objects](#) , on page 308
- [Understanding Interface Role Objects](#) , on page 301
- [Understanding and Specifying Services and Service and Port List Objects](#) , on page 329
- [Understanding AAA Server and Server Group Objects](#) , on page 254

**Step 1**

Do one of the following to open the [AAA Rules Page](#) , on page 691:

- (Device view) Select **Firewall > AAA Rules** from the Policy selector.

- (Policy view) Select **Firewall > AAA Rules** from the Policy Type selector. Select an existing policy or create a new one.

**Step 2** Select the row after which you want to create the rule and click the **Add Row** button or right-click and select **Add Row**. This opens the [Add and Edit AAA Rule Dialog Boxes](#) , on page 695.

**Tip** If you do not select a row, the new rule is added at the end of the local scope. You can also select an existing row and edit either the entire row or specific cells. For more information, see [Editing Rules](#) , on page 605.

**Step 3** Configure the rule. Following are the highlights of what you typically need to decide. For specific information on configuring the fields, see [Add and Edit AAA Rule Dialog Boxes](#) , on page 695.

- **Authentication Action**—Select this option. Authentication rules are the only type of rule you can configure in the AAA rules policy for IOS devices.
- **Permit or Deny**—Whether you are subjecting the identified traffic to AAA control (permit) or you are exempting it from AAA control (deny). Any denied traffic is not prompted for authentication and is allowed to pass unauthenticated, although your access rules might drop the traffic.
- **Source and Destination addresses**—If the rule should apply no matter which addresses generated the traffic or their destinations, use “All-Addresses” as the source or destination. If the rule is specific to a host or network, enter the addresses or network/host objects. For information on the accepted address formats, see [Specifying IP Addresses During Policy Definition](#) , on page 316.
- **Source and Destination Security Groups (ASA 9.0+ only)**—You can specify TrustSec security groups used to filter traffic in addition to the source and destination addresses. See [Selecting Security Groups in Policies](#) , on page 681, [Configuring TrustSec-Based Firewall Rules](#) , on page 681, and [Creating Security Group Objects](#) , on page 679 for more information about security groups.
- **Source Users (ASA 8.4.2+ only)**—You can further define the traffic source by specifying Active Directory (AD) user names (in the format NetBIOS\_DOMAIN\username), user groups (NetBIOS\_DOMAIN\user\_group), or identity user group objects that define the names and groups. The user specification is conjoined to the source address to limit the match to user addresses within the source address range. For more information, see [Configuring Identity-Based Firewall Rules](#) , on page 657 and [Creating Identity User Group Objects](#) , on page 654.
- **Services**—You can specify any type of service for authentication and authorization rules; however, the user is prompted to authenticate only for HTTP, HTTPS, FTP, and Telnet connections. Thus, if you specify something other than these services, the user must first attempt one of these connections and successfully authenticate (and be authorized, if you include that action) before any other types of connections are allowed. For accounting rules, you can specify any TCP or UDP service (or simply TCP and UDP themselves), if you want to account for all types of traffic.
- **Interfaces**—The interface or interface role for which you are configuring the rule.
- **Service triggering the authentication proxy**—Select the checkboxes for the type of traffic you want to trigger user authentication: HTTP, FTP, or Telnet. You can select any combination. If you want to trigger the proxy for HTTPS support, select HTTP and perform the HTTPS configuration that is explained in a subsequent step in this procedure.

Click **OK** when you are finished defining your rule.

**Step 4** If you did not select the right row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. For more information, see [Moving Rules and the Importance of Rule Order](#) , on page 615.

**Step 5** Select **Firewall > Settings > AuthProxy** (in Device or Policy view) to open the [AAA Page](#) , on page 710. Configure the authentication proxy settings:

- **Authorization server groups**—If you want all of your authentication rules to also perform user authorization, specify the list of AAA server group policy objects that identify the TACACS+ or RADIUS servers that control authorization. You can also specify LOCAL to use the user database defined on the device. If you do not specify a server group, authorization is not performed.

**Tip** You must configure per-user ACLs in your AAA server to define the privileges you want to apply to each user. When configuring authorization, specify **auth-proxy** as the service (e.g. service = auth-proxy), with a privilege level of 15. For more information on configuring the AAA server, including information on configuring authentication proxy in general, see the “Configuring the Authentication Proxy” section in the *Cisco IOS Security Configuration Guide: Securing User Services, Release 12.4T* at [http://www.cisco.com/en/US/docs/ios/sec\\_user\\_services/configuration/guide/sec\\_cfg\\_authen\\_prxy\\_ps6441\\_TSD\\_Products\\_Configuration\\_Guide\\_Chapter.html](http://www.cisco.com/en/US/docs/ios/sec_user_services/configuration/guide/sec_cfg_authen_prxy_ps6441_TSD_Products_Configuration_Guide_Chapter.html).

- **Accounting server groups**—If you want to perform accounting for all of your authentication rules, specify the list of AAA server group policy objects that identify the TACACS+ or RADIUS servers that perform accounting. If you do not specify a server group, no accounting is performed. When performing accounting, also configure the following options as appropriate:
  - If you specify more than one server group, consider selecting **Use Broadcast for Accounting**. This option sends accounting records to the primary server in each server group.
  - The **Accounting Notice** option defines when the server is notified. The default is to notify the server at the start and stop of a connection, but you can select to only send stop notices (or none at all).
- You can also customize authentication banners for each service, and on the Timeout tab, you can change the default idle and absolute session timeouts globally or for each interface.

**Step 6** Select **Platform > Device Admin > AAA** (in policy view, this is in the Router Platform folder) to open the [AAA Policy Page](#), on page 2414. Configure these options on the Authentication tab:

- Select **Enable Device Login Authentication**.
- Enter the list of server groups that will control authentication in priority order. Typically, you will use at least some of the same LDAP, RADIUS, or TACACS+ server groups used in the AuthProxy policy. However, this policy also defines device login control, so you might want to include some other server groups. For more information, see [AAA Page—Authentication Tab](#), on page 2415.

**Step 7** If you are using the authentication proxy with HTTP connections, and you also want to use the proxy with HTTPS connections, select **Platform > Device Admin > Device Access > HTTP** (in policy view, this is in the Router Platform folder) to open the [HTTP Policy Page](#), on page 2440. Configure these options:

- Select **Enable HTTP** and **Enable SSL** if they are not already selected.
- On the AAA tab, ensure that the configuration for login access to the device is appropriate. If you are using AAA to control access through the device, you might want to use it for access to the device.

---

## AAA Rules Page

Use the AAA Rules page to configure AAA rules for device interfaces. AAA rules configure network access control (called authentication proxy on IOS devices), which forces the user to authenticate when attempting network connections that traverse the device. Authenticated traffic can also be required to undergo authorization

(where after the user enters a valid user name and password, the AAA server is checked to verify that the user is authorized for network access). You can also configure accounting rules, even for unauthenticated traffic, to provide information you can use for billing, security, and resource allocation purposes.

**Note** With the release of Security Manager 4.4 and versions 9.0 and later of the ASA, the separate policies and objects for configuring IPv4 and IPv6 AAA rules were “unified,” meaning one set of AAA rules in which you can use either IPv4 or IPv6 addresses, or a mixture of both. (See [Policy Object Changes in Security Manager 4.4](#), on page 11 for additional information.) In Policy view, IPv4 and unified versions of the AAA policy type are provided. In addition, a utility that you can use to convert existing IPv4 policies is provided (see [Converting IPv4 Rules to Unified Rules](#), on page 624). The following descriptions apply to all versions of the AAA rule table, except where noted. If you assign an IPv4 AAA-rule shared policy to a 9.0+ device, you will no longer be able to assign unified versions of those policies to that device. Likewise, if you assign a unified AAA-rule shared policy to a 9.0+ device, you will no longer be able to assign IPv4 versions of those shared policies to that device--the device will not be included in the list of available devices on the Assignments tab for the shared policy.

AAA rule configuration is complex and differs significantly based on the operating system. Carefully read the following topics before configuring AAA rules:

- [Understanding AAA Rules](#), on page 683
- [Understanding How Users Authenticate](#), on page 684
- [Configuring AAA Rules for ASA, PIX, and FWSM Devices](#), on page 686
- [Configuring AAA Rules for IOS Devices](#), on page 689

**Tip** Disabled rules are shown with hash marks covering the table row. When you deploy the configuration, disabled rules are removed from the device. For more information, see [Enabling and Disabling Rules](#), on page 616.

### Navigation Path

To access the AAA Rules page, do one of the following:

- (Device view) Select a device, then select **Firewall > AAA Rules** from the Policy selector.
- (Policy view) Select **Firewall > AAA Rules** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Policies > AAA Rules**.

| Conflict Indicator icons          | Identifies conflicts and provides a quick visual representation of the type of conflict. For more details, including types of conflicts and the actions you can take from this column, see <a href="#">Understanding Automatic Conflict Detection</a> , on page 742.                                                                          |
| No.                               | The ordered rule number.                                                                                                                                                                                                                                                                                                                      |
| Permit                            | Whether the defined traffic will be subject to the rule (Permit) or exempted from the rule (Deny): <ul style="list-style-type: none"> <li>• Permit—Shown as a green check mark.</li> <li>• Deny—Shown as a red circle with slash.</li> </ul>                                                                                                  |
| Sources                           | The sources of traffic for this rule; can be networks, security groups (ASA 9.0+ only), and users. Multiple entries are displayed on separate lines within the table cell.                                                                                                                                                                    |
| Destinations                      | The destinations for this rule; can be networks and security groups (ASA 9.0+ only). Multiple entries are displayed on separate lines within the table cell.                                                                                                                                                                                  |
| Service                           | The services or service objects that specify the protocol and port of the traffic to which the rule applies. Multiple entries are displayed on separate lines within the table cell. See <a href="#">Understanding and Specifying Services and Service and Port List Objects</a> , on page 329.                                               |
| Interface                         | The interfaces or interface roles to which the rule is assigned. Interface role objects are replaced with the actual interface names when the configuration is generated for each device. Multiple entries are displayed as separate subfields within the table cell. See <a href="#">Understanding Interface Role Objects</a> , on page 301. |

| Element                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action                                                   | <p>The type of AAA control defined by this rule:</p> <ul style="list-style-type: none"> <li>• <b>Authenticate</b>—Users making connections through the device must authenticate with their username and password. Protocols requiring authentication are defined by the Service field (for ASA/PIX/FWSM devices) or the AuthProxy methods (for IOS devices).</li> <li>• <b>Authorize</b>—Authenticated users are also checked with the AAA server to ensure that they are authorized to make the connection (ASA/PIX/FWSM only).</li> <li>• <b>Account</b>—Accounting records for the identified traffic are sent to the AAA server (ASA/PIX/FWSM only).</li> </ul> <p>You can right-click the Action cell in an existing AAA rule and choose <b>Edit Action</b> to change your selections. See <a href="#">Edit AAA Option Dialog Box</a>, on page 701 for more information.</p> |
| AAA Method (IOS)<br>(not presented for ASA 9.0+ devices) | The authentication method for this rule: Web Authorization Proxy (Auth-Proxy), HTTP Basic, or Windows NT LAN Manager (NTLM)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| AuthProxy                                                | <p>The protocols that require authentication using the authentication proxy method. This applies only to IOS devices.</p> <p>You can right-click the AuthProxy cell in an existing AAA rule and choose <b>Edit AuthProxy</b> to change your selections. See <a href="#">AuthProxy Dialog Box</a>, on page 701 for more information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Server Group                                             | <p>The AAA server group that provides the authentication, authorization, or accounting support defined in the rule. This group is used for ASA/PIX/FWSM devices only. For information on configuring AAA servers for IOS devices for use with these rules, see <a href="#">Configuring AAA Rules for IOS Devices</a>, on page 689.</p> <p>You can right-click the Server Group cell in an existing AAA rule and choose <b>Edit Server Group</b> to change your selections. See <a href="#">Edit Server Group Dialog Box</a>, on page 701 for more information.</p>                                                                                                                                                                                                                                                                                                                |
| Category                                                 | The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Description                                              | The description of the rule, if any.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Last Ticket(s)                                           | Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see <a href="#">Ticket Management Page</a> , on page 584).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Page elements below the rules table                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Query                                                    | Click this button to run a policy query, which can help you evaluate your rules and identify ineffective rules. See <a href="#">Generating Policy Query Reports</a> , on page 625                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Element                                   | Description                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Find and Replace button (binoculars icon) | Click this button to search for various types of items within the table and to optionally replace them. See <a href="#">Finding and Replacing Items in Rules Tables</a> , on page 612.                                                                                                                                             |
| Up Row and Down Row buttons (arrow icons) | Click these buttons to move the selected rules up or down within a scope or section. For more information, see <a href="#">Moving Rules and the Importance of Rule Order</a> , on page 615.                                                                                                                                        |
| Add Row button                            | Click this button to add a rule to the table after the selected row using the <a href="#">Add and Edit AAA Rule Dialog Boxes</a> , on page 695. If you do not select a row, the rule is added at the end of the local scope. For more information about adding rules, see <a href="#">Adding and Removing Rules</a> , on page 604. |
| Edit Row button                           | Click this button to edit the selected rule. You can also edit individual cells. For more information, see <a href="#">Editing Rules</a> , on page 605.                                                                                                                                                                            |
| Delete Row button                         | Click this button to delete the selected rule.                                                                                                                                                                                                                                                                                     |

### Right-click Menu

A right-click menu is also available. This menu provides access to many of the functions listed above; the options presented depend on the location right-clicked:

- If you right-click a rule in the table, the options may include editing functions relative to the specific table cell right-clicked. For example, the command “Edit Server Group” is included when you right-click a Server Group cell. See [Editing Rules](#) , on page 605 for more information.
- The Combine Rules option is also included in the right-click menu. See [Combining Rules](#) , on page 618 for more information.

## Add and Edit AAA Rule Dialog Boxes

Use the Add and Edit AAA Rules dialog boxes to add and edit AAA rules. AAA rule configuration is more complex than just filling in this dialog box, and differs significantly based on the operating system. Carefully read the following topics before configuring AAA rules:

- [Understanding AAA Rules](#) , on page 683
- [Understanding How Users Authenticate](#) , on page 684
- [Configuring AAA Rules for ASA, PIX, and FWSM Devices](#) , on page 686
- [Configuring AAA Rules for IOS Devices](#) , on page 689

### Navigation Path

From the [AAA Rules Page](#) , on page 691, click the **Add Row** button or select a row and click the **Edit Row** button.

### Related Topics

- [Editing Rules](#) , on page 605

### Field Reference

*Table 178: Add and Edit AAA Rules Dialog Boxes*

| Element              | Description                                                                                                                                                                                                                                                                                                                                  |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Rule          | Whether to enable the rule, which means the rule becomes active when you deploy the configuration to the device. Disabled rules are shown overlain with hash marks in the rule table. For more information, see <a href="#">Enabling and Disabling Rules</a> , on page 616.                                                                  |
| Action (Permit/Deny) | Whether the defined traffic will be subject to the rule (Permit) or exempted from the rule (Deny).<br><br>For example, if you create an authentication deny rule for the 10.100.10.0/24 network to any destination using the HTTP service, users on this network are not prompted to authenticate with the device when making HTTP requests. |

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sources      | <p>Provide traffic sources for this rule; can be networks, security groups, and users. You can enter values or object names, or Select objects, for one or more of the following types of sources:</p> <ul style="list-style-type: none"> <li>• Network – You can specify a various network, host and interface definitions, either individually or as objects. If you Select an interface object as a source, the dialog box displays tabs to differentiate between hosts/networks and interfaces.</li> </ul> <p>The “All-Address” objects do not restrict the rule to specific hosts, networks, or interfaces. These addresses are IPv4 or IPv6 addresses for hosts or networks, network/host objects, interfaces, or interface roles.</p> <p><b>Note</b> You can only specify a fully qualified domain name (FQDN) by providing an FQDN network/host object, or a group object that includes an FQDN object. You cannot directly type in an FQDN.</p> <p>See <a href="#">Understanding Networks/Hosts Objects</a> , on page 308, <a href="#">Specifying IP Addresses During Policy Definition</a> , on page 316 and <a href="#">Understanding Interface Role Objects</a> , on page 301 for additional information about these definitions.</p> <ul style="list-style-type: none"> <li>• Security Groups (ASA 9.0+) – Enter or Select the name or tag number for one or more source security groups for the rule, if any. See <a href="#">Selecting Security Groups in Policies</a> , on page 681, <a href="#">Configuring TrustSec-Based Firewall Rules</a> , on page 681 and <a href="#">Creating Security Group Objects</a> , on page 679 for more information about security groups.</li> <li>• Users – Enter or Select the Active Directory (AD) user names, user groups, or identity user group objects for the rule, if any. You can enter any combination of the following: <ul style="list-style-type: none"> <li>• Individual user names: NetBIOS_DOMAIN\username</li> <li>• User groups (note the double \): NetBIOS_DOMAIN\\user_group</li> <li>• Identity user group object names.</li> </ul> </li> </ul> <p>For more information, see:</p> <ul style="list-style-type: none"> <li>• <a href="#">Selecting Identity Users in Policies</a> , on page 656</li> <li>• <a href="#">Configuring Identity-Based Firewall Rules</a> , on page 657</li> <li>• <a href="#">Creating Identity User Group Objects</a> , on page 654</li> </ul> <p><b>Note</b> Enter more than one value in any of these fields by separating the items with commas.</p> <p>Each specification is combined with any others to limit traffic matches to only those flows that include all definitions. For example, specified user traffic originating from within a specified source address range.</p> |
| Destinations | <p>Provide traffic destinations for this rule; can be networks or security groups. As with Sources, you can enter values or object names, or Select objects, for one or more destinations of Network and Security Group (ASA 9.0+) type.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Services                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>The services that define the type of traffic upon which to act. You can enter or Select any combination of service objects and service types (which are typically a protocol and port combination).</p> <p>Enter more than one value by separating the items with commas.</p> <p>It is important that you select the service type carefully based on the device type:</p> <ul style="list-style-type: none"> <li>• For IOS devices, only the protocols you select with the authorization proxy check boxes at the bottom of the dialog box are used for AAA control, so you can use IP as the protocol.</li> <li>• For ASA, PIX, and FWSM devices, although you can force authentication for any type of traffic, the security appliance prompts only for HTTP/HTTPS, FTP, and Telnet traffic. If you specify a service other than one of these, users are prevented from making any connection through the appliance until they try one of these services and successfully authenticate.</li> </ul> <p>If the rule is only for accounting, you can specify any TCP or UDP protocols for which you want to create records.</p> <p>For complete information on how to specify services, see <a href="#">Understanding and Specifying Services and Service and Port List Objects</a> , on page 329.</p> <p><b>Note</b> Due to an issue in PIX 6.3 and FWSM devices, if you specify a service with a source port, no traffic is authenticated. Therefore, source ports are ignored when the CLI is generated from your rule for these device types.</p> |
| Interface                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>The interface or interface role object that identifies the interface from which to authenticate, authorize, or account users. Enter the name of the interface or interface role, or click <b>Select</b> to select it from a list or to create a new interface role object.</p> <p>For authentication rules on ASA and PIX devices, you can modify how this interface authenticates HTTP/HTTPS traffic by using the <b>Firewall &gt; Settings &gt; AAA Firewall</b> policy. Configuring the interface as an HTTP/HTTPS listening port can improve the authentication experience for users. For more information, see <a href="#">Understanding How Users Authenticate</a> , on page 684 and <a href="#">AAA Firewall Settings Page, Advanced Setting Tab</a> , on page 702.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | An optional description of the rule (up to 1024 characters).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <p>The Authentication Action, Authorization Action, and Accounting Action check boxes define the types of rules that will be generated on the device. Each type generates a separate set of commands, but if you select more than one option, your other selections in this dialog box are limited to those supported by all selected actions.</p> <p>You can right-click the Action cell in an existing AAA rule and choose Edit Action to change your selections. See <a href="#">Edit AAA Option Dialog Box</a> , on page 701 for more information.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authentication Action<br>User-Identity | <ul style="list-style-type: none"> <li>• <b>Authentication</b>—Users must supply a user name and password to make a connection through the device. For ASA, PIX, and FWSM devices, what you enter in the Services field determines which protocols require authentication, although the device will prompt only for HTTP, HTTPS, FTP, and Telnet connections. For IOS devices, the protocols that require authentication are based on the authorization proxy check boxes you select at the bottom of the dialog box.</li> <li>• <b>User-Identity (ASA 8.4(2+) only.)</b>—For ASA devices, when you select Authentication Action, you also have the option to select User-Identity. This option indicates that the device should use the identity-firewall domain mappings defined in the Identity Options policy to authenticate users instead of the AAA Server Group setting in the AAA rule. If the user enters a domain name, the AD server associated with the domain is queried. Otherwise, the AD server associated with the default domain is queried. See <a href="#">Identifying Active Directory Servers and Agents</a> , on page 643.</li> </ul> |
| Authorization Action<br>(PIX/ASA/FWSM) | <p>Authorization—After successful authentication, the AAA server is also checked to determine if the user is authorized to make the requested connection. If you specify a RADIUS server for authentication rules, authorization happens without you having to configure authorization rules. If you are using a TACACS+ server, you must create separate authorization rules.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Accounting Action<br>(PIX/ASA/FWSM)    | <p>Accounting—Accounting records will be sent to the TACACS+ or RADIUS server for the TCP and UDP protocols specified in the Services field. If you also configure authentication, these records are per-user; otherwise, they are based on IP address. For IOS devices, accounting is configured in the <b>Firewall &gt; Settings &gt; ScanSafe Web Security</b> policy, not in AAA rules, and applies only to the protocols you select for authentication proxy.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Element                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| AAA Server Group (PIX, ASA, FWSM)                    | <p>The AAA server group policy object that defines the AAA server that should provide authentication, authorization, or accounting for the traffic defined in the rule. Enter the name of the policy object or click <b>Select</b> to select it from a list or to create a new object.</p> <p>You must select a type of server that can perform all actions defined in the rule. For example, the local database (defined on the device) cannot provide authorization services. If you use a RADIUS server for authentication, it automatically provides authorization services, but you cannot define an authorization rule that uses a RADIUS server.</p> <p>You can use a mix of server groups for different actions for the same source/destination pair by creating separate rules for the desired combination of authentication, authorization, and accounting actions. For more information on AAA server group objects, see <a href="#">Understanding AAA Server and Server Group Objects</a> , on page 254.</p> <p><b>Tips</b></p> <ul style="list-style-type: none"> <li>• If you select Authenticate Action and User-Identity, but not the Authorization or Accounting actions, any server you specify here is ignored. Do not select a server to avoid validation warnings.</li> <li>• AAA server groups for IOS devices are defined in other policies. For a complete explanation of the configuration, see <a href="#">Configuring AAA Rules for IOS Devices</a> , on page 689.</li> <li>• You can right-click the Server Group cell in an existing AAA rule and choose Edit Server Group to change your selections. See <a href="#">Edit Server Group Dialog Box</a> , on page 701 for more information.</li> </ul> |
| Category                                             | <p>The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Method (IOS)<br>(not presented for ASA 9.0+ devices) | <p>Choose Auth-Proxy, HTTP-basic, or NTLM.</p> <p>If you choose Auth-Proxy, the following options are available:</p> <ul style="list-style-type: none"> <li>• HTTP</li> <li>• FTP</li> <li>• Telnet</li> </ul> <p>Specify the protocols for which you want to enforce authentication using the authentication proxy. If you select HTTP, you can also configure HTTPS authentication proxy by enabling SSL on the device. See <a href="#">Configuring AAA Rules for IOS Devices</a> , on page 689 for more information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Edit AAA Option Dialog Box

Use the Edit AAA Option dialog box to select whether the rule performs authentication (with or without user identity), authorization, or accounting. Authorization and accounting rules work only on ASA, PIX, and FWSM devices. For a complete explanation of these options, see the related explanations in the following topics:

- [Add and Edit AAA Rule Dialog Boxes](#) , on page 695
- [Understanding AAA Rules](#) , on page 683

### Navigation Path

Right-click the Action cell in a AAA rule (on the [AAA Rules Page](#) , on page 691) and select **Edit AAA**.

## AuthProxy Dialog Box

Use the AuthProxy dialog box to edit the authorization proxy settings in a AAA rule. For IOS devices, select the protocols (HTTP, FTP, or Telnet) for which you want to enforce authentication using the authentication proxy. If you select HTTP, you can also configure HTTPS authentication proxy by enabling SSL on the device. For specific information, see [Configuring AAA Rules for IOS Devices](#) , on page 689.

### Navigation Path

Right-click the AuthProxy cell in a AAA rule (on the [AAA Rules Page](#) , on page 691) and select **Edit AuthProxy**.

## Edit Server Group Dialog Box

Use the Edit Server Group dialog box to edit the AAA server group used in a AAA rule, which defines the AAA server that should provide authentication, authorization, or accounting for the traffic defined in the rule. Enter the name of the policy object or click **Select** to select it from a list or to create a new object. For more information on AAA server group objects, see [Understanding AAA Server and Server Group Objects](#) , on page 254.

You must select a type of server that can perform all actions defined in the rule. For example, the local database (defined on the device) cannot provide authorization services. If you use a RADIUS server for authentication, it automatically provides authorization services, but you cannot define an authorization rule that uses a RADIUS server. Unlike the [Add and Edit AAA Rule Dialog Boxes](#) , on page 695, this dialog box does not validate your selection.

---

**Note** This setting applies only to ASA, PIX, and FWSM devices. AAA server groups for IOS devices are defined in other policies. For a complete explanation of the configuration, see [Configuring AAA Rules for IOS Devices](#) , on page 689.

---

### Navigation Path

Right-click the Server Group cell in a AAA rule (on the [AAA Rules Page](#) , on page 691) and select **Edit Server Group**.

# AAA Firewall Settings Policies

The AAA firewall settings policy configurations influence the behavior of your AAA rules.

This section contains the following topics:

- [AAA Firewall Settings Page, Advanced Setting Tab](#) , on page 702
- [AAA Firewall Page, MAC-Exempt List Tab](#) , on page 708
- [AAA Page](#) , on page 710

## AAA Firewall Settings Page, Advanced Setting Tab

Use the AAA Firewall settings policy to configure optional settings to refine how your AAA rules policy behaves. This topic describes the settings available on the Advanced Setting tab; for information on the MAC Exempt List tab, see [AAA Firewall Settings Page, Advanced Setting Tab](#) , on page 702.

### Navigation Path

To access the AAA Firewall settings page, do one of the following:

- (Device view) Select an ASA, PIX, or FWSM device, select **Firewall > Settings > AAA Firewall**; select the **Advanced Setting** tab if necessary.
- (Policy view) Select **Firewall > Settings > AAA Firewall** from the Policy Type selector. Create a new policy or select an existing one, then select the **Advanced Setting** tab if necessary.
- (Map view) Right-click an ASA, PIX, or FWSM device and select **Edit Firewall Settings > AAA Firewall**, then select the **Advanced Setting** tab if necessary.

| Use Secure HTTP Authentication                                      | <p>Whether to require users making HTTP requests that traverse the security appliance to first authenticate with the security appliance using SSL (HTTPS). The user is prompted for username and password.</p> <p>Secure HTTP authentication offers a secure method for user authentication to the security appliance prior to allowing HTTP-based web requests to traverse the security appliance. This is also called HTTP cut-through proxy authentication.</p> <p>If you select this option, ensure that your access rules do not block HTTPS traffic (port 443), and that any PAT configuration also includes port 443. Also, be aware that a maximum of 16 concurrent authentications are allowed, and that if you configure 0 for the user authentication timeout (<b>timeout uauth 0</b>, configured in the <b>Platform &gt; Security &gt; Timeouts</b> policy) users might be repeatedly prompted for authentication, making the feature disruptive to your network.</p> <p><b>Tip</b> If you do not select this option, HTTP authentication sends the username and password in clear text.</p> |
| Enable Proxy Limit<br>Maximum<br>Concurrent Proxy<br>Limit per User | <p>Whether to allow proxy connections. If you enable proxies, you must set a limit on the number of proxy connections allowed for each user, from 1 to 128. The device default is 16, but you must specify a number.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Enable Virtual HTTP | <p>Whether to configure a virtual HTTP server. This feature redirects all HTTP connections that require AAA authentication to the virtual HTTP server on the ASA. The ASA prompts for the AAA server username and password. After the AAA server authenticates the user, the ASA redirects the HTTP connection back to the original server, but it does not include the AAA server username and password. Because the username and password are not included in the HTTP packet, the HTTP server prompts the user separately for the HTTP server username and password. For more information, see <a href="#">Understanding How Users Authenticate</a>, on page 684.</p> <p>For inbound users (from lower security to higher security), you must also include the virtual HTTP address as a destination interface in the access rule applied to the source interface. Moreover, you must add a static NAT rule for the virtual HTTP IP address, even if NAT is not required. An identity NAT rule is typically used (where you translate the address to itself).</p> <p>For outbound users, there is an explicit permit for traffic, but if you apply an access rule to an inside interface, be sure to allow access to the virtual HTTP address. A static NAT rule is not required.</p> <p>To configure a virtual HTTP server:</p> <ol style="list-style-type: none"> <li>1. Select the Enable Virtual HTTP check box.</li> <li>2. Enter the IP address or select a Networks/Hosts object representing the virtual HTTP server. Make sure this address is an unused address that is routed to the ASA. For example, if you perform NAT for inside addresses accessing an outside server, and you want to provide outside access to the virtual HTTP server, you can use one of the global NAT addresses for the virtual HTTP server address.</li> <li>3. (Optional) If you are using text-based browsers, where redirection does not happen automatically, select the Warning check box. This enables an alert to notify users when the HTTP connection is being redirected.</li> </ol> |

| Disable FTP Authentication Challenge<br>Disable HTTP Authentication Challenge<br>Disable HTTPS Authentication Challenge<br>Disable Telnet Authentication Challenge<br>(All options FWSM 3.x+ only.) | <p>Whether to disable authentication challenges for the indicated protocols. By default, the FWSM prompts the user for a username and password when a AAA rule enforces authentication for traffic in a new session and the protocol of the traffic is FTP, Telnet, HTTP, or HTTPS.</p> <p>In some cases, you might want to disable the authentication challenge for one or more of these protocols. If you disable challenge authentication for a particular protocol, traffic using that protocol is allowed only if the traffic belongs to a session previously authenticated. This authentication can be accomplished by traffic using a protocol whose authentication challenge remains enabled. For example, if you disable challenge authentication for FTP, the FWSM denies a new session using FTP if the traffic is included in an authentication AAA rule. If the user establishes the session with a protocol whose authentication challenge is enabled (such as HTTP), FTP traffic is allowed.</p> |
| Clear Connections When Uauth Timer Expires table<br>(FWSM 3.2+ only.)                                                                                                                               | <p>Use this table to identify the interfaces and source addresses where you want to force any active connections to close immediately after the user authentication times out or when you clear the authentication session with the <b>clear uauth</b> command. (User authentication timeouts are defined in the <b>Platform &gt; Security &gt; Timeouts</b> policy.) For any interface/source address pairs not listed in this table, active connections are not terminated even though the user authentication session expired.</p> <ul style="list-style-type: none"> <li>• To add any interface and source address pair, click the <b>Add Row</b> button and fill in the <a href="#">Clear Connection Configuration Dialog Box</a> , on page 707.</li> <li>• To edit a setting, select it and click the <b>Edit Row</b> button.</li> <li>• To delete a setting, select it and click the <b>Delete Row</b> button.</li> </ul>                                                                                |

## Interactive Authentication Configuration Dialog Box

Use the Interactive Authentication Configuration dialog box to configure an interface to listen for HTTP or HTTPS traffic to authenticate network users. The authentication web page used by a listening port provides an improved user experience compared to the default authentication pages used for these protocols. The authentication pages are used for connections directly to the device and if you select the redirection option, also for through traffic if your AAA rules policy requires HTTP/HTTPS network access authentication. For more information, see [Understanding How Users Authenticate](#) , on page 684.

### Navigation Path

Go to the [AAA Firewall Settings Page, Advanced Setting Tab](#) , on page 702 and click the **Add Row** button beneath the Interactive Authentication table, or select an item in the table and click the **Edit Row** button.

## Field Reference

**Table 180: Interactive Authentication Configuration Dialog Box**

| Element                                           | Description                                                                                                                                                                                                                                                           |
|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol                                          | The protocol that you want to listen for, either HTTP or HTTPS. If you want to listen for both protocols on an interface, add the interface to the table twice.                                                                                                       |
| Interface                                         | The interface or interface role on which to enable listeners. Enter the name of the interface or interface role, or click <b>Select</b> to select it from a list or to create a new interface role.                                                                   |
| Port                                              | The port number that the security appliance listens on for this protocol if other than the default, which is 80 (HTTP) and 443 (HTTPS).                                                                                                                               |
| Redirect network users for authentication request | Whether to redirect users who are making requests through the device to the authentication web page served by the security appliance. If you do not select this option, only traffic directed to the interface is prompted with the improved authentication web page. |

## Clear Connection Configuration Dialog Box

Use the Clear Connection Configuration dialog box to identify the source addresses whose active connections to close immediately after the user authentication times out or when you clear the authentication session with the **clear uauth** command. You must specify the interfaces on which those sessions should be cleared. These settings are used only for FWSM 3.2+ devices.

User authentication timeouts are defined in the **Platform > Security > Timeouts** policy.

### Navigation Path

Go to the [AAA Firewall Settings Page, Advanced Setting Tab](#), on page 702 and click the **Add Row** button beneath the Clear Connections When Uauth Timer Expires table, or select an item in the table and click the **Edit Row** button.

|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                 | The interfaces or interface roles for which you are configuring settings. Enter the name or click <b>Select</b> to select the interface or interface role or to create a new role. Separate multiple entries with commas.                                                                                                                                                                                 |
| Source IP Address/Netmask | The host or network addresses for which you want to clear connections immediately when the user authentication timer expires. The list can include host IP addresses, network addresses, address ranges, or network/host objects Separate multiple addresses with commas. For more information on entering addresses, see <a href="#">Specifying IP Addresses During Policy Definition</a> , on page 316. |

## AAA Firewall Page, MAC-Exempt List Tab

Use the MAC Exempt List tab of the AAA Firewall settings policy to identify hosts that should be exempt from authentication and authorization for ASA, PIX, and FWSM 3.x+ devices. For example, if the security appliance authenticates TCP traffic originating on a particular network but you want to allow unauthenticated TCP connections from a specific server, create a rule permitting traffic from the MAC address of the server.

You can use masks to create rules for groups of MAC addresses. For example, if you want to exempt all Cisco IP phones whose MAC addresses start with 0003.e3, create a permit rule for 0003.e300.0000 with the mask ffff.ff00.0000. (An f in a mask exactly matches the corresponding number in the address, whereas a 0 matches anything.)

Deny rules are necessary only if you are permitting a group of MAC addresses but there are some addresses within the permitted group that you want to require to use authentication and authorization. Deny rules do not prohibit traffic; they simply require the host to go through normal authentication and authorization. For example, if you want to allow all hosts with MAC addresses that start with 00a0.c95d, but you want to force 00a0.c95d.0282 to use authentication and authorization, enter these rules in order:

1. Deny 00a0.c95d.0282 ffff.ffff.ffff
2. Permit 00a0.c95d.0000 ffff.ffff.0000

When you deploy the policy to the device, these entries are configured using the **mac-list** and **aaa mac-exempt** commands.

**Tip** The MAC exempt list is processed on a first match basis. Thus, the order of entries matters. If you want to permit a group of MAC addresses, but deny a subset of them, the deny rule must come before the permit rule. However, Security Manager does not allow you to order MAC exempt rules: they are implemented in the order shown. If you sort the table, your policy changes. If your entries do not depend on each other, this does not matter. Otherwise, ensure that you enter rows in the proper order.

### Navigation Path

To access the MAC Exempt List tab, do one of the following:

- (Device view) Select an ASA, PIX, or FWSM device, then select **Firewall > Settings > AAA Firewall**. Select the **MAC-Exempt List** tab.
- (Policy view) Select **Firewall > Settings > AAA Firewall** from the Policy Type selector. Create a new policy or select an existing one, then select the **MAC-Exempt List** tab.
- (Map view) Right-click an ASA, PIX, or FWSM device and select **Edit Firewall Settings > AAA Firewall**, then select the **MAC-Exempt List** tab.

| Action      | <p>The action you want to take for the hosts that use the specified MAC addresses:</p> <ul style="list-style-type: none"> <li>• Permit—Exempts the host from authentication and authorization.</li> <li>• Deny—Forces the host to go through authentication and authorization.</li> </ul> |
| MAC Address | <p>The MAC address of the hosts in standard 12-digit hexadecimal format, such as 00a0.cp5d.0282. You can enter complete MAC addresses or partial addresses.</p> <p>For partial addresses, you can enter 0 for digits you are not matching.</p>                                            |

| Element  | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAC Mask | <p>The mask to apply to the MAC address. Use f to match a digit exactly, 0 to match any digit at that place:</p> <ul style="list-style-type: none"> <li>• To specify an exact match of the address, enter ffff.ffff.ffff.</li> <li>• To match an address pattern, enter 0 for any digit for which you want to match any character. For example, ffff.fff.0000 matches all addresses that have the same first 8 digits.</li> </ul> |

## AAA Page

Use the AAA firewall settings policy to identify the servers and banners to use for the authentication proxy and to configure non-default timeout values. The authentication proxy for IOS devices is a service that forces users to log in and authenticate when trying to make HTTP, Telnet, or FTP connections through an IOS device. The settings you configure here work in conjunction with your AAA rules; only if a AAA rule requires user authentication for one of these services does your AuthProxy settings come into play.

Ensure that your configuration of this policy is consistent with your **Firewall > AAA Rules** policy. Additionally, you must use the **Platform > Device Admin > AAA** policy to define the AAA server groups to use for authenticating user access; this policy defines only the authorization and accounting server groups. If you also want to use authorization proxy for HTTPS access, you must enable SSL and configure AAA in the **Platform > Device Admin > Device Access > HTTP** policy in addition to enabling HTTP authorization proxy in your AAA rules policy.

**Tip** You must configure per-user ACLs in your AAA server to define the privileges you want to apply to each user. When configuring authorization, specify **AAA** as the service (e.g. service = AAA), with a privilege level of 15. For more information on configuring the AAA server, including information on configuring authentication proxy in general, see the “Configuring the Authentication Proxy” section in the *Cisco IOS Security Configuration Guide: Securing User Services, Release 12.4T* at [http://www.cisco.com/en/US/docs/sec\\_user\\_services/configuration/guide/sec\\_cfg\\_authn\\_proxy\\_ps6441\\_TSD\\_Product\\_Configuration\\_Guide\\_Chapter.html](http://www.cisco.com/en/US/docs/sec_user_services/configuration/guide/sec_cfg_authn_proxy_ps6441_TSD_Product_Configuration_Guide_Chapter.html).

### Navigation Path

To access the AAA page, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > AAA** from the Policy selector.
- (Policy view) Select **Firewall > Settings > AAA** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Settings > AAA**.

|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Virtual IP Address                                       | You use the Virtual IP Address only in communications between the IOS HTTP authentication and clients. For the system to operate correctly, the virtual IP address must be set (it cannot be 0.0.0.0), and no other device on the network can have the same address. Configure with an unassigned and unused gateway IP address, such as 1.1.1.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| General Tab                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Authorization Server Groups                              | <p>The AAA server group policy objects that identify the LDAP, TACACS+, or RADIUS servers that will provide per-user authorization control. You can also use the LOCAL user database defined on the device.</p> <p>Enter the names of the server group objects, or click <b>Select</b> to select them from a list or to create new objects. Ensure that you put the groups in priority order; authorization is attempted with the first group and if that group is not available, with subsequent groups.</p>                                                                                                                                                                                                                                                                                                                     |
| Accounting Server Groups<br>Use Broadcast for Accounting | <p>The AAA server group policy objects that identify the LDAP, TACACS+, or RADIUS servers that will provide accounting services. Accounting collects per-user usage information for billing, security, or resource allocation purposes. Enter the names of the server group objects, or click <b>Select</b> to select them from a list or to create new objects.</p> <p>Ensure that you put the groups in priority order; if you do not select the broadcast option, accounting is attempted with the first group and if that group is not available, with subsequent groups.</p> <p>If you select <b>Use Broadcast for Accounting</b>, accounting records are sent simultaneously to the first server in each group. If the first server is unavailable, failover occurs using the backup servers defined within that group.</p> |
| Accounting Notice                                        | <p>The types of accounting notices to be sent to the accounting server groups:</p> <ul style="list-style-type: none"> <li>• <b>Start-stop</b>—Sends a start accounting notice at the beginning of a user process and a stop accounting notice at the end of the process. The start accounting record is sent in the background. The requested user process begins regardless of whether the start accounting notice was received by the accounting server.</li> <li>• <b>Stop-only</b>—Sends a stop accounting notice at the end of the requested user process.</li> <li>• <b>None</b>—No accounting records are sent.</li> </ul>                                                                                                                                                                                                 |

| Element                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Advanced Tab                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Global Inactivity Time                     | <p>The length of time, in minutes, that the authentication proxy for a user is maintained when there is no user activity in the session. If this timer expires, the user session is cleared along with its dynamic user access control list (ACL), and the user must re-authenticate. The range is 1 to 2,147,483,647. The default is 60 minutes.</p> <p>Ensure that this timeout value is greater than or equal to the idle timeout values configured in the <b>Firewall &gt; Settings &gt; Inspection</b> policy; otherwise, timed-out user sessions might continue to be monitored and eventually hang.</p>                                  |
| Global Absolute Time                       | <p>The length of time, in minutes, that an authentication proxy user session can remain active. After this timer expires, the user session must go through the entire process of establishing its connection as if it were a new request. The range is 0 to 35,791. The default is 0, which means that there is no global absolute timeout; user sessions are maintained as long as they are active.</p>                                                                                                                                                                                                                                        |
| Interface Timeout Table                    | <p>This table contains the interfaces for which you want to configure timeout values that differ from the global timeout values. If you want to use the global values for all interfaces, you do not need to configure anything in this table.</p> <ul style="list-style-type: none"> <li>• To add an interface with customized timeout values, click the <b>Add Row</b> button and fill in the <a href="#">Firewall AAA IOS Timeout Value Setting</a>, on page 712.</li> <li>• To edit a setting, select it and click the <b>Edit Row</b> button.</li> <li>• To delete a setting, select it and click the <b>Delete Row</b> button.</li> </ul> |

## Firewall AAA IOS Timeout Value Setting

**Note** From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Use the Firewall AAA IOS Timeout Value Setting dialog box to configure idle and absolute timeout values for specific interfaces. These values override the global timeout values configured on the **Firewall > Settings > ScanSafe Web Security** policy Server Timeout tab.

### Navigation Path

From the Advanced tab of the [AAA Page](#), on page 710, click the **Add Row** button beneath the table of interfaces, or select a row and click the **Edit Row** button.

### Field Reference

*Table 185: Firewall AAA IOS Timeout Value Setting Dialog Box*

| Element                           | Description                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interfaces                        | The interfaces or interface roles for which you are configuring timeout values. Enter the names of the interfaces or roles, or click <b>Select</b> to select them from a list or to create new interface roles. Separate multiple entries with commas.                                                                                                                                                                 |
| Auth Proxy Tab                    |                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Inactivity/Cache Time             | The length of time, in minutes, that the authentication proxy for a user is maintained when there is no user activity in the session on the interface. If this timer expires, the user session is cleared along with its dynamic user access control list (ACL), and the user must re-authenticate. The range is 1 to 2,147,483,647. The default is the global inactivity timeout value (whose default is 60 minutes). |
| Absolute Time                     | The length of time, in minutes, that an authentication proxy user session can remain active on the interface. After this timer expires, the user session must go through the entire process of establishing its connection as if it were a new request. The range is 1 to 35,791. The default is 0, which means that there is no absolute timeout; user sessions are maintained as long as they are active.            |
| Authentication Proxy Method (IOS) | The protocols to which these timeout values should apply. You can select any combination of HTTP, FTP, or Telnet.                                                                                                                                                                                                                                                                                                      |
| HTTP/NTLM Tab                     | The HTTP and the NTLM areas contain the same following fields and selections:<br>Set the <b>Inactivity/Cache Time</b> and the <b>Absolute Time</b> for HTTP/NTLM and then, if desired, select Enable Passive Authentication. Finally, select the <b>Identity Policy</b> that you want to apply.                                                                                                                        |
| Method Order Tab                  | Select the checkbox of each method you want to employ and then use the up and down arrows to arrange the methods in the order you desire.                                                                                                                                                                                                                                                                              |
| AAA Settings Tab                  | Select the <b>AAA Settings</b> tab to specify the Authentication, Authorization, and Account settings as detailed below.                                                                                                                                                                                                                                                                                               |

| Element                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authenticate Using             | <p>In the Authenticate Using section you can select the server group(s) to use for authentication. Choices are:</p> <ul style="list-style-type: none"> <li>• <b>None</b>—No authentication</li> <li>• <b>Default</b>—Use the default authentication server group(s).</li> <li>• <b>Custom</b>—Enable the selection of user specified authentication server group(s). Then click <b>Select</b> to specify or add a server group.</li> </ul>                                |
| Authorize Exec Operation Using | <p>In the Authorize Exec Operation Using section you can select the server group(s) to use for authorization of executive operations. Choices are:</p> <ul style="list-style-type: none"> <li>• <b>None</b>—No authorization</li> <li>• <b>Default</b>—Use the default authorization server group(s)</li> <li>• <b>Custom</b>—Enable the selection of user specified authorization server group(s). Then click <b>Select</b> to specify or add a server group.</li> </ul> |
| Perform Exec Operation Using   | <p>In the Authorize Exec Operation Using section you can select the server group(s) to use for performing executive operations. Choices are:</p> <ul style="list-style-type: none"> <li>• <b>None</b>—No authorization</li> <li>• <b>Default</b>—Use the default server group(s)</li> <li>• <b>Custom</b>—Enable the selection of user specified server group(s). Then click <b>Select</b> to specify or add a server group.</li> </ul>                                   |

| Accounting Server Groups       | <p>Specify what accounting server groups to use. Either enter or select the Accounting Server group.</p> <p><b>Note</b> If you choose to select an accounting server group, you are also give the option to add an Accounting Server group.</p>                                                                                                                                                                                                                           |
| Use Broadcast for Accounting   | <p>Select this checkbox to broadcast accounting notices.</p>                                                                                                                                                                                                                                                                                                                                                                                                              |

## CHAPTER 16

# Managing Firewall Access Rules

---

Access rules define the rules that traffic must meet to pass through an interface. When you define rules for incoming traffic, they are applied to the traffic before any other policies are applied (with the exception of less common AAA rules). In that sense, they are your first line of defense.

For some types of devices, you can configure IPv6 access rules in addition to IPv4 access rules. For information on supported device types, see <IPv6 Support in Security Manager, page 1-8>.

The following topics help you understand and work with access rules:

- [Understanding Access Rules](#) , on page 715
- [Configuring Access Rules](#) , on page 721
- [Configuring Expiration Dates for Access Rules](#) , on page 736
- [Configuring Settings for Access Control](#) , on page 737

- [Viewing Hit Count Details](#) , on page 751
- [Importing Rules](#) , on page 755
- [Optimizing Access Rules Automatically During Deployment](#) , on page 761
- [Customizing defaults in the Add Access Rule dialog](#) , on page 763

## Understanding Access Rules

Access rules policies define the rules that allow or deny traffic to transit an interface. Typically, you create access rules for traffic entering an interface, because if you are going to deny specific types of packets, it is better to do it before the device spends a lot of time processing them.

When you deploy access rules to devices, they become one or more entries (ACEs) to access control lists (ACLs) that are attached to interfaces. Typically, these rules are the first security policy applied to packets; they are your first line of defense. You use access rules to filter out undesired traffic based on service (protocol and port numbers) and source and destination addresses, either permitting the traffic or denying (dropping) it. Each packet that arrives at an interface is examined to determine whether to forward or drop the packet based on criteria you specify. If you define access rules in the out direction, packets are also analyzed before they are allowed to leave an interface.

---

**Tip** For ASA 8.3+ devices, you can augment interface-specific access rules with global access rules. For more information, see [Understanding Global Access Rules](#) , on page 717.

---

When you permit traffic in an access rule, subsequent policies might end up dropping it. For example, inspection rules, web filter rules, and zone-based firewall rules are applied after a packet makes it through the interface's access rules. These subsequent rules might then drop the traffic based on a deeper analysis of the traffic; for example, the packet header might not meet your inspection requirements, or the URL for a web request might be for an undesired web site.

Thus, you should carefully consider the other types of firewall rules you intend to create when you define access rules. Do not create a blanket denial in an access rule for traffic that you really want to inspect. On the other hand, if you know that you will never allow a service from or to a specific host or network, use an access rule to deny the traffic.

Keep in mind that access rules are ordered. That is, when the device compares a packet against the rules, it searches from top to bottom and applies the policy for the first rule that matches it, and ignores all subsequent rules (even if a later rule is a better match). Thus, you should place specific rules above more general rules to ensure those rules are not ignored. To help you identify cases where IPv4 rules will never be matched, and to identify redundant rules, you can use the automatic conflict detection and policy query tools. For more information, see [Using Automatic Conflict Detection](#), on page 742 and [Generating Policy Query Reports](#), on page 625.

The following are additional ways in which you can evaluate your access rules:

- Combine rules—You can use a tool to evaluate your IPv4 rules and combine them into a smaller number of rules that perform the same functions. This can leave you with a smaller, easier to manage list of rules. For more information, see [Combining Rules](#), on page 618.
- Generate hit counts—You can use a tool to view the hit count statistics maintained by the device for IPv4 and IPv6 ACLs. This can tell you how often a rule has permitted or denied traffic. For more information, see [Viewing Hit Count Details](#), on page 751.
- View events collected by CS-MARS—You can analyze real time or historical events related to an IPv4 rule using the Cisco Security Monitoring, Analysis and Response System application if you configured it to monitor the device and you configure the rule to generate syslog messages. For more information, see [Viewing CS-MARS Events for an IPS Signature](#), on page 2908.

## Understanding Global Access Rules

Traditionally, access rules (ACLs), which control which traffic can flow through a device, are applied to device interfaces. However, with ASA devices running software release 8.3+, you have the option to create global access rules for IPv4 and IPv6.

Global access rules are defined as a special ACL that is processed for every interface on the device for traffic entering the interface. Thus, although the ACL is configured once on the device, it acts like a secondary interface-specific ACL defined for the In direction. (Global rules are always for the In direction, never the Out direction.)

When traffic enters an interface on an ASA 8.3+ device, when applying ACLs, the device first applies any interface-specific access rules to the traffic. It then applies global rules. (Overall processing is explained in [Understanding the Processing Order of Firewall Rules](#) , on page 596.

Global rules are best used for rules that you want to apply to all traffic that enters a device regardless of which interface it enters. For example, there might be a specific host or subnet that you always want to deny or permit. You can create these as global rules, so they are configured once on the device instead of configured again for each interface (although functionally the same as an interface-specific rule configured for the All-Interfaces role, All-Interfaces rules are repeated for each interface rather than being configured once on the device).

---

**Tip** If you want to configure the same set of global rules for more than one device, create a shared policy and inherit it in the IPv4 or IPv6 access rules policy for each device. Ensure that all global rules are in the Default section of the shared policy. If you put any global rules in the Mandatory section, you will not be able to inherit it on devices that have local interface-specific access rules defined. For more information on shared and inherited policies, see [Local Policies vs. Shared Policies](#) , on page 167 and [Understanding Rule Inheritance](#) , on page 168.

---

When you configure access rules for an ASA 8.3+ device in Security Manager, interface-specific and global rules are configured in the same policy. However, because the device always processes interface-specific rules first, Security Manager prevents you from intermixing these different types of rules. Therefore, if you configure both interface-specific and global rules on a device, keep the following in mind:

- Global rules always come last in the access rules policy. All interface-specific rules come before global rules.
- You cannot move rules in a way that violates the required order. For example, you cannot move an interface-specific rule below a global rule, or a global rule above an interface-specific rule.
- You cannot create rules in a location that violates the required order. For example, if you select an interface-specific rule, and another interface-specific rule follows it in the table, you cannot create a global rule. If you try to create the wrong kind of rule, when you save the rule, Security Manager will ask you if the rule can be created at the nearest valid location. You must accept the suggestion or the rule will not be added to the table. You can always move the rule after creating it if the suggested location is not ideal (but without violating the rules on order).

- You cannot inherit a policy if the rules in the inherited policy will violate the required order. For example, if you create global rules in the device policy, and try to inherit a shared policy that contains interface-specific rules in the Default section, Security Manager will prevent you from inheriting the policy.
- After assigning or inheriting a shared policy, you cannot edit the policy in a way that will violate rule order on any device that uses the policy.
- If you assign or inherit a policy that contains global rules on a device that does not support them, all global rules are ignored and not configured on the device. For example, if you permit all traffic from host 10.100.10.10 in a global rule in a shared policy, and assign that policy to an IOS device, the rule permitting 10.100.10.10 access is not configured on the IOS device, and traffic from that host is handled either by another interface-specific policy, or the default deny all policy. As a good practice, you should not assign shared policies that contain global rules to devices that do not support them, to ensure that you do not mistakenly believe the policy defined in a global rule is being configured on the unsupported device.

There are also some changes in how certain tools work with global rules:

- Find/Replace—You can search for global rules by using the Global interface name. However, there is no way to convert between global and interface-specific rules. Although you can find global rules using the Global interface name, if you try to replace an interface name with the name “Global,” you are actually creating an interface-specific access rule that uses a policy object named Global.
- Rule Combiner—Interface-specific and global rules are never combined.

## Understanding Device Specific Access Rule Behavior

If you do not create an access rule policy, the following is the default behavior based on the type of device, and what happens when you create an access rule:

- IOS devices—Permit all traffic through an interface.

When you create an access rule permitting source A to destination B without configuring TCP/UDP inspection on the inspection rule table, or configuring the **established** advanced option on the rule, the device permits any packet from A to B. However, for any returning packet from B to A, the packet is not allowed, unless there is a corresponding access rule permitting that packet. If you configure TCP/UDP inspection on the traffic the inspection rule table, a rule permitting B to A is not needed in the access rule, as any returning packet from B to A automatically passes the device.

- ASA and PIX devices—Permit traffic from a higher-security interface to a lower-security interface. Otherwise, all traffic is denied.

If an access rule allows TCP/UDP traffic in one direction, the appliance automatically allows return traffic (you do not need to configure a corresponding rule for the return traffic), except for ICMP traffic, which does require a return rule (where you permit the reverse source and destination), or you must create an inspection rule for ICMP.

- FWSM devices—Deny all traffic entering an interface, permit all traffic leaving an interface.

You must configure access rules to allow any traffic to enter the device.

If you create any rules for an interface for any type of device, the device adds an implicit **deny any** rule at the end of the policy. It is a good practice for you to add this rule yourself so that you remember it is there. Adding the rule also allows you to get hit count information for the rule. For more information, see [Viewing Hit Count Details](#), on page 751.

---

**Tip** When you create the access rule policy, ensure that you include a rule that will permit access to the device from the Security Manager server, or you will not be able to manage the device using the product.

---

## Understanding Access Rule Address Requirements and How Rules Are Deployed

One of the complexities of creating access control lists using the operating system commands on the command line interface (CLI) is the fact that different operating systems have different IP address formats for source and destination addresses.

For example, Cisco IOS Software requires that you enter addresses using wildcard masks instead of subnet masks. To create a rule for the 10.100.10.0/24 network (subnet mask 255.255.255.0), you are required to enter the address as 10.100.10.0 0.0.0.255. The 0 and 1 have the reverse meaning in a wildcard mask that they have in a subnet mask. In ASA, PIX, and FWSM software, however, you use subnet masks, so you enter 10.100.10.0 255.255.255.251.

Security Manager simplifies addressing requirements for access rules: you always use the subnet mask. You are not even allowed to enter a wildcard mask. When you deploy the access rules to a device, Security Manager considers the operating system of the device and converts subnet masks to wildcard masks automatically when needed.

This makes it possible for you to create shared rules based on logical policies and to apply those rules to all of your devices. For example, there might be a set of access rules that you want all devices to use, in which case you can create the shared policy and assign it as the inherited policy for all devices. You do not have to worry about defining rules using the “right” syntax for the device type. You can use the same network/host objects that you use in other types of policies to identify targeted hosts and networks.

The specific CLI commands generated in deployed configurations are also based on the type of device. For IOS devices, the **ip access-list** command is used. For ASA, PIX, FWSM devices, the **access-list** or **ipv6 access-list** command is used and the **access-group** command binds it to the interface. With ASA, PIX, FWSM, and IOS 12.4(20)T+ devices, if you use network/host objects to identify the source or destination addresses

for a rule, the **object-group** command is used to create object groups for those network/host objects. Object groups are also created for service objects.

### Tips

- Because you can use network/host objects to identify a source or destination, and you can configure deployment optimization for rules, there is not always a one-to-one relationship between an access rule and ACEs in the CLI definition of an ACL.
- All access lists created from firewall rules are extended access lists (rather than standard). Security Manager applies a system-generated name to the ACL unless you specify a name for the ACL on the [Access Control Settings Page](#), on page 738. The name applies to the ACL that includes all of the rules related to the interface and direction for which the name is defined.
- There are several deployment options that control how object groups are deployed. This topic describes the default behavior. On the [Deployment Page](#), on page 522 (select **Tools > Security Manager Administration > Deployment**), you can deselect the option to create object groups from network/host objects. You can also optimize object groups during deployment (see [Optimizing Network Object Groups When Deploying Firewall Rules](#), on page 632), create new object groups from rules with multiple services or source and destination addresses, or remove unused object groups.
- The deployment options also include settings that control the names of ACLs generated from access rules and how many ACLs are created. By default, Security Manager creates a unique ACL for each interface, even if this means that several duplicate ACLs are created.

If you select **Enable ACL Sharing for Firewall Rules**, Security Manager can create a single ACL and apply it to multiple interfaces, thus avoiding the creation of unnecessary duplicate ACLs. However, ACL sharing occurs only if it can be done while preserving your ACL naming requirements:

- If you specify an ACL name for an interface and direction, that name is always used, even if it means a duplicate ACL must be created. For more information, see [Configuring Settings for Access Control](#), on page 737.
- If you select **Reuse existing names** for the Firewall Access-List Names property, the existing names are preserved (unless you override them in the access control settings policy). This means that you might end up with duplicate ACLs under different names if duplicate ACLs already exist on the device.

**Tip:** To maximize ACL sharing, ensure that you select **Reset to CS-Manager Generated Names** for the Firewall Access-List Names property, select **Speed** for the Optimize the Deployment of Access Rules For property, and that you do not configure ACL names in the access control settings policy.

For more detailed information about the **Enable ACL Sharing for Firewall Rules** property, see [Deployment Page](#), on page 522

- IPv4 and IPv6 ACLs cannot have the same name.

# Configuring Access Rules

Access rules policies define the rules for allowing traffic to pass through an interface. If you do not configure an access rules policy, the device behavior differs based on device type as explained in [Understanding Device Specific Access Rule Behavior](#) , on page 718.

**Note** Prior to the release of Security Manager 4.4 and versions 9.0 and later of the ASA, separate pages, policies and policy objects were provided for configuring IPv4 and IPv6 firewall rules and policies. With Security Manager 4.4 and ASA 9.0+, these policies and policy objects were “unified,” meaning one set of rules in which you can use either IPv4 or IPv6 addresses, or a mixture of both. (See [Policy Object Changes in Security Manager 4.4](#) , on page 11 for additional information.) However, for the earlier ASA versions, a separate page for IPv6 access rules is still provided in Device view, while in Policy view, IPv4 and unified versions of the access-rule policy types are provided. In addition, a utility that you can use to convert existing IPv4 policies is provided (see [Converting IPv4 Rules to Unified Rules](#) , on page 624). The following descriptions apply to all versions of the access rule table, except where noted. If you assign an IPv4 access-rule shared policy to a 9.0+ device, you will no longer be able to assign unified versions of those policies to that device. Likewise, if you assign a unified access-rule shared policy to a 9.0+ device, you will no longer be able to assign IPv4 versions of those shared policies to that device--the device will not be included in the list of available devices on the Assignments tab for the shared policy.

Before you configure access rules, consider the other types of firewall rules you will configure. Access rules are processed before all other types of rules except AAA rules. See the following topics for more information about things you should consider:

- [Understanding Access Rules](#) , on page 715
- [Understanding Global Access Rules](#) , on page 717
- [Understanding Access Rule Address Requirements and How Rules Are Deployed](#) , on page 719

## Before You Begin

You might have a set of access rules that you want to apply to all devices. To do this, you can create a shared rule and inherit its rules to each device’s access rules policy. For more information, see [Creating a New Shared Policy](#) , on page 219 and [Inheriting or Uninheriting Rules](#) , on page 211.

## Related Topics

- [Using Sections to Organize Rules Tables](#) , on page 616
- [Copying Policies Between Devices](#) , on page 197

- [Understanding Networks/Hosts Objects](#) , on page 308
- [Understanding Interface Role Objects](#) , on page 301
- [Understanding and Specifying Services and Service and Port List Objects](#) , on page 329

**Step 1** Do one of the following to open the [Access Rules Page](#) , on page 724:

- (Device view) Select **Firewall > Access Rules** (or **Firewall > Settings > IPv6 Access Rules**) from the Policies selector.
- (Policy view) Select **Firewall > Access Rules** (or **Firewall > Settings > IPv6 Access Rules**) from the Policy Type selector. Select an existing policy or create a new one.

**Step 2** Select the row after which you want to create the rule and click the **Add Row** button or right-click and select **Add Row**. This opens the [Add and Edit Access Rule Dialog Boxes](#) , on page 728.

**Tip** If you do not select a row, the new rule is added at the end of the local scope. You can also select an existing row and edit either the entire row or specific cells. For more information, see [Enabling and Disabling Rules](#) , on page 616. Special rules apply if you mix interface-specific and global rules in a policy; for more information, see [Understanding Global Access Rules](#) , on page 717.

**Step 3** Configure the rule. Following are the highlights of what you typically need to decide while configuring your rule. For specific information on configuring the fields, see [Add and Edit Access Rule Dialog Boxes](#) , on page 728.

- Permit or Deny—Whether you are allowing traffic that matches the rule or dropping it.
- Source and Destination addresses—If the rule should apply no matter which addresses generated the traffic or their destinations, use “All-Addresses” as the source or destination. If the rule is specific to a host or network, enter the addresses or network/host objects. For information on the accepted address formats, see [Specifying IP Addresses During Policy Definition](#) , on page 316.
- Source and Destination Security Groups (ASA 9.0+ only)—You can specify TrustSec security groups used to filter traffic in addition to the source and destination addresses. See [Selecting Security Groups in Policies](#) , on page 681, [Configuring TrustSec-Based Firewall Rules](#) , on page 681 and [Creating Security Group Objects](#) , on page 679 for more information about security groups.
- Source Users (ASA 8.4.2+ only)—You can further define the traffic source by specifying Active Directory (AD) user names (in the format NetBIOS\_DOMAIN\username), user groups (NetBIOS\_DOMAIN\user\_group), or identity user group objects that define the names and groups. The user specification is conjoined to the source address to limit the match to user addresses within the source address range. For more information, see [Configuring Identity-Based Firewall Rules](#) , on page 657 and [Creating Identity User Group Objects](#) , on page 654.
- Services—Use the IP service to apply to any traffic (for example, if you want to deny all traffic from a specific source). Otherwise, select the more specific service, which is a protocol and port combination, that you are targeting.
- Interfaces or Global—The interface or interface role for which you are configuring the rule, or Global to create global access rules on ASA 8.3+ devices (see [Understanding Global Access Rules](#) , on page 717).
- Advanced settings—Click **Advanced** to open the Advanced dialog box for configuring additional settings. You can configure the following options; for detailed information, see [Advanced and Edit Options Dialog Boxes](#) , on page 731.
  - Logging options. If you are using Security Manager or CS-MARS to monitor the device, ensure that you enable logging.
  - The direction of traffic to which this rule should apply (in or out). The default is in. You cannot change this setting for global rules.
  - The time range for the rule, which allows you to configure rules that work only for specific periods of time, such as during working hours. For more information, see [Configuring Time Range Objects](#) , on page 299.
  - IOS device options for fragmentation and allowing the return of traffic for established outbound sessions.

- Rule expiration dates and notification settings. For more information, see [Configuring Expiration Dates for Access Rules](#), on page 736.

**Step 4** Click **OK** when you are finished defining your rule.

**Note** You can enable conflict detection (see [Enable Conflict Detection](#), on page 747) to see if the new rule conflicts or overlaps with other rules. For more information, see [Using Automatic Conflict Detection](#), on page 742.

While adding or editing a rule, any two rules might become identical (example shown as 1 and 2 in [Figure 23: Identical Rules](#), on page 723) except for differences in time range and/or logging values (defined in [Advanced and Edit Options Dialog Boxes](#), on page 731)—

- Cisco Security Manager deploys only the rule that is at the bottom (2 in [Figure 23: Identical Rules](#), on page 723).
- Only rule (2) is used to identify configuration changes in preview configuration (see [Previewing Configurations](#), on page 422).
- If rule (2) has been deployed on the device, the preview configuration will not detect any changes.

**Figure 23: Identical Rules**

| No.             | Permit | Sources Network | Destinations Network | Service | Interface | Dir. | Options                           |
|-----------------|--------|-----------------|----------------------|---------|-----------|------|-----------------------------------|
| Local (5 Rules) |        |                 |                      |         |           |      |                                   |
| 1               | ✓      | ExamplePC1      | ExamplePC2           | IP      | inside    | in   | Critical/300<br>TimeRange_Example |
| 2               | ✓      | All-Addresses   | Example_Net1         | IP      | inside    | in   |                                   |
| 3               | ✓      | All-Addresses   | Example_Net2         | IP      | inside    | in   |                                   |
| 4               | ✓      | ExamplePC1      | ExamplePC2           | IP      | inside    | in   |                                   |
| 5               | ✓      | All-Addresses   | Example_Net3         | IP      | inside    | in   |                                   |

**Step 5** If you are required to find the bottom rule (example, (2) in [Figure 23: Identical Rules](#), on page 723), that prevents Cisco Security Manager from deployment of a top rule (1 in [Figure 23: Identical Rules](#), on page 723), do the following:

- [Enable Conflict Detection](#), on page 747 for the device.
- [Generate Report](#), on page 747 for the conflicts found.
- In the report, under the Rule No column, find the bottom rule (2), determine the rule number it conflicts with [rule (1)] and delete rule (1), if required.

**Step 6** If you did not select the right row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. For more information, see [Moving Rules and the Importance of Rule Order](#), on page 615. There are special restrictions for moving rules when you mix interface-specific and global rules; see [Understanding Global Access Rules](#), on page 717.

**Step 7** If you already have a large number of rules, consider analyzing and combining them before deploying the new rules. You can use the conflict detection tool to analyze your rules (see [Using Automatic Conflict Detection](#), on page 742). If analysis shows that you have a lot of redundant rules, right-click anywhere in the rules table and choose **Combine Rules** to combine them. You can either allow Security Manager to evaluate all rules for combination, or just the rules you select before starting the rule combination tool. For more information, see [Combining Rules](#), on page 618.

## Access Rules Page

Use the Access Rules page to configure access control rules for device interfaces. Access rules policies define the rules that allow or deny traffic to transit an interface. Typically, you create access rules for traffic entering an interface, because if you are going to deny specific types of packets, it is better to do it before the device spends a lot of time processing them. Access rules are processed before other types of firewall rules.

---

**Note** With the release of Security Manager 4.4 and versions 9.0 and later of the ASA, the separate policies and objects for configuring IPv4 and IPv6 access rules were “unified,” meaning one set of access rules in which you can use either IPv4 or IPv6 addresses, or a mixture of both. (See [Policy Object Changes in Security Manager 4.4](#), on page 11 for additional information.) In Policy view, IPv4 and unified versions of the access policy type are provided. In addition, a utility that you can use to convert existing IPv4 policies is provided (see [Converting IPv4 Rules to Unified Rules](#), on page 624). The following descriptions apply to all versions of the access rule table, except where noted.

---

Read the following topics before you configure access rules:

- [Understanding Access Rules](#), on page 715
- [Understanding Global Access Rules](#), on page 717
- [Understanding Device Specific Access Rule Behavior](#), on page 718
- [Understanding Access Rule Address Requirements and How Rules Are Deployed](#), on page 719
- [Configuring Access Rules](#), on page 721

---

**Tip** Disabled rules are grayed out. When you deploy the configuration, disabled rules are removed from the device. For more information, see [Enabling and Disabling Rules](#), on page 616.

---

### Navigation Path

To open the Access Rules page, do one of the following:

- (Device view) Select a device, then select **Firewall > Access Rules** (or **Firewall > Settings > IPv6 Access Rules**) from the Policies selector.
- (Policy view) Select **Firewall > Access Rules** (or **Firewall > Settings > IPv6 Access Rules**) from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Policies > Access Rules** (or **Edit Firewall Policies > IPv6 Access Rules**).

### Field Reference

**Note** For details on the fields and user interface elements available as part of the automatic conflict detection feature, see [Understanding the Automatic Conflict Detection User Interface](#) , on page 745.

**Table 186: Access Rules Page**

| Element                           | Description                                                                                                                                                                                                                                                                                     |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Expand all rows/Collapse all rows | Use these buttons to expand or collapse all sections in the rules table.<br><b>Note</b> The buttons are located in the upper-right corner of the Filter area above the access rules table.                                                                                                      |
| Conflict Indicator icons          | Identifies conflicts and provides a quick visual representation of the type of conflict. For more details, including types of conflicts and the actions you can take from this column, see <a href="#">Understanding the Automatic Conflict Detection User Interface</a> , on page 745.         |
| No.                               | The ordered rule number.                                                                                                                                                                                                                                                                        |
| Permit                            | Whether a rule permits or denies traffic based on the conditions set: <ul style="list-style-type: none"> <li>• Permit—Shown as a green check mark.</li> <li>• Deny—Shown as a red circle with slash.</li> </ul>                                                                                 |
| Sources                           | The sources of traffic for this rule; can be networks, security groups (ASA 9.0+ only), and users. Multiple entries are displayed on separate lines within the table cell.                                                                                                                      |
| Destinations                      | The destinations for this rule; can be networks and security groups (ASA 9.0+ only). Multiple entries are displayed on separate lines within the table cell.                                                                                                                                    |
| Service                           | The services or service objects that specify the protocol and port of the traffic to which the rule applies. Multiple entries are displayed on separate lines within the table cell. See <a href="#">Understanding and Specifying Services and Service and Port List Objects</a> , on page 329. |

| Element                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hit Count                           | <p>Number of times this rule has been “hit”; that is, number of times it has permitted or denied traffic; it is actually the sum of the hit counts for all access control entries (ACEs) created by the rule. This information is useful in debugging the deployed policies.</p> <p>Use the Refresh Hit Count button at the bottom of this page to update the hit information; opens the <a href="#">Hit Count Selection Summary Dialog Box</a> , on page 735.</p> <p><b>Note</b> The Hit Count of a duplicated ACE, either within the same rule or different rules, is always set to 0.</p> <p>You can right-click this cell and choose Show Hit Count Details to open the Hit Count Details pane at the bottom of the Configuration Manager window. See <a href="#">Viewing Hit Count Details</a> , on page 751 for more information.</p> |
| Last Hit Time                       | Timestamp for the most-recent hit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Interface                           | <p>The interfaces or interface roles to which the rule is assigned. Interface role objects are replaced with the actual interface names when the configuration is generated for each device. Multiple entries are displayed on separate lines within the table cell. See <a href="#">Understanding Interface Role Objects</a> , on page 301.</p> <p>For ASA 8.3+ devices, global rules are indicated with the name <b>Global</b> and a special icon to distinguish them from rules that use interface or interface role names (for an explanation of the icons, see <a href="#">Specifying IP Addresses During Policy Definition</a> , on page 316).</p>                                                                                                                                                                                    |
| Dir.                                | <p>The direction of the traffic to which this rule applies:</p> <ul style="list-style-type: none"> <li>• In—Packets entering the interface.</li> <li>• Out—Packets exiting the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Options                             | Any additional options configured for the rule. These include logging, time range, and some additional IOS rule options. See <a href="#">Advanced and Edit Options Dialog Boxes</a> , on page 731.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Category                            | The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Description                         | The description of the rule, if any.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Expiration Date                     | The date on which the rule expires. Expired rules show <b>Expired</b> in bold text. Expired rules are not automatically deleted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Last Ticket(s)                      | Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see <a href="#">Ticket Management Page</a> , on page 584).                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Page elements below the rules table |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Element                                                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Enable conflict detection<br>Generate Report<br>(neither option presented on the IPv6 Access Control page) | <p>Enable or disable automatic conflict detection. This feature is enabled by default and the setting is managed per user. Disabling conflict detection for one access rules table will also disable the feature for other access rules tables.</p> <p>You can disable conflict detection while creating your rule table or making large modifications and then re-enable it when you are ready to verify your changes. See <a href="#">Using Automatic Conflict Detection</a> , on page 742.</p> <p><b>Note</b> For details on the fields and user interface elements available as part of the automatic conflict detection feature, see <a href="#">Understanding the Automatic Conflict Detection User Interface</a> , on page 745 .</p> <p>If conflict detection is enabled, you can click the <b>Generate Report</b> button to create an HTML report of any rule conflicts detected. This report can be printed or exported to another application.</p> |
| Refresh Hit Count<br>(not presented on the IPv6 Access Control page)                                       | <p>Click this button to update the hit information displayed in the table; opens the <a href="#">Hit Count Selection Summary Dialog Box</a> , on page 735.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Query<br>(not presented on the IPv6 Access Control page)                                                   | <p>Click this button to run a policy query, which can help you evaluate your rules and identify ineffective rules. See <a href="#">Generating Policy Query Reports</a> , on page 625</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Find and Replace button<br>(binoculars icon)                                                               | <p>Click this button to search for various types of items within the table and to optionally replace them. See <a href="#">Finding and Replacing Items in Rules Tables</a> , on page 612.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Up Row and Down Row buttons<br>(arrow icons)                                                               | <p>Click these buttons to move the selected rules up or down within a scope or section. For more information, see <a href="#">Moving Rules and the Importance of Rule Order</a> , on page 615.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Add Row button                                                                                             | <p>Click this button to add a rule to the table after the selected row using the <a href="#">Add and Edit Access Rule Dialog Boxes</a> , on page 728. If you do not select a row, the rule is added at the end of the local scope. For more information about adding rules, see <a href="#">Adding and Removing Rules</a> , on page 604.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Edit Row button                                                                                            | <p>Click this button to edit the selected rule. You can also edit individual cells. For more information, see <a href="#">Editing Rules</a> , on page 605.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Delete Row button                                                                                          | <p>Click this button to delete the selected rule.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### Right-click Menu

A right-click menu is also available. This menu provides access to many of the functions listed above; the options presented depend on the location right-clicked:

- If you right-click a rule in the table, the options may include editing functions relative to the specific table cell right-clicked. For example, the command “Show Hit Count Details” is included when you right-click a Hit Count cell. See [Editing Rules](#) , on page 605 for more information.

- You can also navigate from a rule to events associated with that rule in either Event Viewer or CS MARS. For more information, see [Viewing Events for an Access Rule](#) , on page 2759 and [Viewing CS-MARS Events for an IPS Signature](#) , on page 2908.
- The Import Rules and Combine Rules options are also included in the right-click menu. See [Importing Rules](#) , on page 755 and [Combining Rules](#) , on page 618 for more information about these options.

## Add and Edit Access Rule Dialog Boxes

Use the Add and Edit Access Rule dialog boxes to add and edit security-device access rules.

---

**Note** With the release of Security Manager 4.4 and versions 9.0 and later of the ASA, the separate pages for configuring IPv4 and IPv6 access rules were unified. However, for the earlier ASA versions, a separate page for IPv6 access rules is still provided. The following descriptions apply to all versions of the page, except where noted.

---

Read the following topics before you configure access rules:

- [Understanding Access Rules](#) , on page 715
- [Understanding Global Access Rules](#) , on page 717
- [Understanding Device Specific Access Rule Behavior](#) , on page 718
- [Understanding Access Rule Address Requirements and How Rules Are Deployed](#) , on page 719
- [Configuring Access Rules](#) , on page 721

### Navigation Path

On the [Access Rules Page](#) , on page 724, click the **Add Row** button or select a row and click the **Edit Row** button.

---

**Note** Prior to Cisco Security Manager 4.13, the Add Access Rule dialog was populated with default values. Starting from 4.13, the user can customize the appearance of default values by updating the csm.properties file. For more information, see [Customizing defaults in the Add Access Rule dialog](#), on page 763

## Field Reference

*Table 187: Add and Edit Access Rule Dialog Boxes*

| Element     | Description                                                                                                                                                                                                                                                                                                                                        |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Rule | Check this box to enable this rule, which means the rule becomes active when you deploy the configuration to the device. Deselect to disable the rule while keeping the rule definition. Disabled rules are shown overlaid with hash marks in the rule table. See <a href="#">Enabling and Disabling Rules</a> , on page 616 for more information. |
| Action      | Whether the rule permits or denies traffic based on the conditions you define.                                                                                                                                                                                                                                                                     |

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sources      | <p>Provide traffic sources for this rule; can be networks, security groups, and users. You can enter values or object names, or Select objects, for one or more of the following types of sources:</p> <ul style="list-style-type: none"> <li>• Network – You can specify a various network, host and interface definitions, either individually or as objects. If you Select an interface object as a source, the dialog box displays tabs to differentiate between hosts/networks and interfaces.</li> </ul> <p>The “All-Address” objects do not restrict the rule to specific hosts, networks, or interfaces. These addresses are IPv4 or IPv6 addresses for hosts or networks, network/host objects, interfaces, or interface roles.</p> <p><b>Note</b> You can only specify a fully qualified domain name (FQDN) by providing an FQDN network/host object, or a group object that includes an FQDN object. You cannot directly type in an FQDN.</p> <p>See <a href="#">Understanding Networks/Hosts Objects</a> , on page 308, <a href="#">Specifying IP Addresses During Policy Definition</a> , on page 316 and <a href="#">Understanding Interface Role Objects</a> , on page 301 for additional information about these definitions.</p> <ul style="list-style-type: none"> <li>• Security Groups (ASA 9.0+) – Enter or Select the name or tag number for one or more source security groups for the rule, if any. See <a href="#">Selecting Security Groups in Policies</a> , on page 681, <a href="#">Configuring TrustSec-Based Firewall Rules</a> , on page 681 and <a href="#">Creating Security Group Objects</a> , on page 679 for more information about security groups.</li> <li>• Users – Enter or Select the Active Directory (AD) user names, user groups, or identity user group objects for the rule, if any. You can enter any combination of the following: <ul style="list-style-type: none"> <li>• Individual user names: NetBIOS_DOMAIN\username</li> <li>• User groups (note the double \): NetBIOS_DOMAIN\\user_group</li> <li>• Identity user group object names.</li> </ul> </li> </ul> <p>For more information, see:</p> <ul style="list-style-type: none"> <li>• <a href="#">Selecting Identity Users in Policies</a> , on page 656</li> <li>• <a href="#">Configuring Identity-Based Firewall Rules</a> , on page 657</li> <li>• <a href="#">Creating Identity User Group Objects</a> , on page 654</li> </ul> <p><b>Note</b> Enter more than one value in any of these fields by separating the items with commas.</p> <p>Each specification is combined with any others to limit traffic matches to only those flows that include all definitions. For example, specified user traffic originating from within a specified source address range.</p> |
| Destinations | <p>Provide traffic destinations for this rule; can be networks or security groups. As with Sources, you can enter values or object names, or Select objects, for one or more destinations of Network and Security Group (ASA 9.0+) type.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Services                        | <p>The services that define the type of traffic upon which to act. You can enter or Select any combination of service objects and service types (which are typically a protocol and port combination).</p> <p>Enter more than one value by separating the items with commas.</p> <p>For complete information on how to specify services, see <a href="#">Understanding and Specifying Services and Service and Port List Objects</a> , on page 329.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Interfaces<br>Global (ASA 8.3+) | <p>Specify whether you are creating an interface-specific or global rule. Global rules are available only for ASA 8.3+ devices, and are handled according to special rules (for detailed information, see <a href="#">Understanding Global Access Rules</a> , on page 717).</p> <p>If you select <b>Interfaces</b>, enter or Select the name of the interface or the interface role to which the rule is assigned, or click <b>Select</b> to select the interface or role from a list. An interface must already be defined to appear on the list.</p> <p>For bridge groups in routed mode, you can create access rules for both the Bridge Virtual Interface (BVI) and each bridge group member interface.</p> <p>Interface role objects are replaced with the actual interface names when the configuration is generated for each device. See <a href="#">Understanding Interface Role Objects</a> , on page 301. Global rules are created as a special global ACL that is not attached to specific interfaces, but are processed for all interfaces in the In direction after interface-specific rules.</p> |
| Description                     | An optional description of the rule (up to 1024 characters).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Category                        | The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Advanced button                 | Click this button to configure other settings for the rule, including logging configuration, traffic direction, time ranges, and rule expiration dates. For more information, see <a href="#">Advanced and Edit Options Dialog Boxes</a> , on page 731                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Advanced and Edit Options Dialog Boxes

Use the Advanced dialog box to configure additional settings for an access rule. These settings are displayed in three different cells of the access-rule table: direction, options, and rule expiration. You can then edit those settings directly by right-clicking the appropriate cell.

**Note** With the release of Security Manager 4.4 and versions 9.0 and later of the ASA, the separate pages for configuring IPv4 and IPv6 access rules were unified. However, for the earlier ASA versions, a separate page for IPv6 access rules is still provided. The following descriptions apply to all versions of the page, except where noted.

### Navigation Path

To access the Advanced dialog box:

- In the [Add and Edit Access Rule Dialog Boxes](#) , on page 728, click the **Advanced** button.

To access one of the Edit options dialog boxes:

- Right-click the Options or Expiration Date cell in an access rule (on the [Access Rules Page](#) , on page 724) and choose the related Edit command. To change the rule direction, right-click the Dir. cell and choose the opposite direction (in or out).

If you select multiple rows, your changes replace those options for all selected rules.

| Time Range                                                                  | <p>The name of a time range policy object that defines the times when this rule applies. The time is based on the system clock of the device. The feature works best if you use NTP to configure the system clock.</p> <p>Enter the name or Select the object. If the object that you want is not listed, click the Create button to create it.</p> <p><b>Note</b> Time range is not supported on FWSM 2.x or PIX 6.3 devices.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Options (IOS)<br>(IPv4 only; not presented on the IPv6 Access Control page) | <p>Additional options for IOS devices:</p> <ul style="list-style-type: none"> <li>• none—Do not apply.</li> <li>• Fragment—Allow fragmentation, which provides additional management of packet fragmentation and improves compatibility with NFS.</li> </ul> <p>By default, a maximum of 24 fragments is accepted to reconstruct a full IP packet. However, based on your network security policy, you might want to consider configuring the device to prevent fragmented packets from traversing the firewall.</p> <ul style="list-style-type: none"> <li>• Established—Allow outbound TCP connections return access through the device. This option works with two connections: an original connection outbound from a network protected by the device, and a return connection inbound between the same two devices on an external host.</li> </ul>                                                                                                                                              |
| Rule Expiration                                                             | <p>Lets you configure an expiration date for the rule. Click the calendar icon to select a date. For more information, see <a href="#">Configuring Expiration Dates for Access Rules</a>, on page 736.</p> <p>If you configure an expiration date, you can also configure the number of days before the rule expires to send out a notification of the pending expiration, and e-mail addresses to which to send the notifications. These fields are initially filled with the information configured on the Rule Expiration administrative settings page (select <b>Tools &gt; Security Manager Administration &gt; Rule Expiration</b>).</p> <p>You can change these options for an existing rule in the table on the <a href="#">Access Rules Page</a>, on page 724 by right-clicking the Expiration Date cell and choosing Edit Rule Expiration.</p> <p><b>Note</b> Expired rules are not automatically deleted. You must delete them yourself and redeploy the configuration to the device.</p> |

## Hit Count Selection Summary Dialog Box

Use the Hit Count Selection Summary dialog box to select the rules for which you want to refresh hit count information. Your options are limited by the rules you selected before clicking the Refresh Hit Count button. When you click OK in this dialog box, updated hit count information is obtained from the device, which can take some time, so you are given the option to abort the operation.

**Note** The Hit Count of a duplicated ACE, either within the same rule or different rules, is always set to 0.

**Tip** You can view detailed hit count information for a rule by right-clicking the Hit Count cell for that rule on the [Access Rules Page](#), on page 724. Detailed hit count information is displayed in the Hit Count Details window, as described in [Viewing Hit Count Details](#), on page 751.

### Navigation Path

(Device view only) On the [Access Rules Page](#), on page 724, select one access rule in the table for which you want detailed hit count information, then right-click the Hit Count column and choose Show Hit Count Details.

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Policy Selected | Identifies the selected policy. If you do not select a policy, this is Local, which means the rules defined specifically for the device. The policy might also be a scope within a shared or inherited policy.<br><br>The indication in this field does not actually limit the scope of your hit count report.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Rules Selected  | The rules for which you want to obtain hit count details; choose: <ul style="list-style-type: none"> <li>• Select the <b>rules</b> option to obtain information for only those rules you selected. You can select the rows related to the name of a scope, a section name, multiple individual rules, or create a filter and select all filtered rules. This is the default if any row is selected when you initiate the hit count report.</li> <li>• Select <b>All Rules</b> to get hit counts for all inherited, shared, and local rules. The option is not restricted to the scope indicated in the Policy Selected field.</li> </ul> <p>This is the only available option if you do not select any rules before initiating the hit count report.</p> |

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Fetch Data From | <p>Select one of the following options and then click <b>Refresh Hit Count</b>:</p> <ul style="list-style-type: none"> <li>• <b>Device</b>—Security Manager fetches the Hit Count information from the device and displays the same on the Access Rules policy page. Beginning from version 4.9, Security Manager stores the Hit Count information in its database for ASA and ASASM devices.</li> <li>• <b>History</b>—Security Manager fetches the latest Hit Count information for the particular ACEs from its database (the Hit Count history) and displays the same on the Access Rules policy page.</li> </ul> <p><b>NOTE:</b></p> <p>If there is an open activity the Hit Count data will not be persisted in the Security Manager database. This feature is supported in IPv4 Access Rules starting from ASASM/ASA version 8.3 and Unified Access Rules starting from ASASM/ASA version 9.0.</p> <p>If the Fetch Data From Device is based on Rules Selected option, the Hit Count persistence support will not be enabled. The support of Hit Count persistence will be enabled only if you choose the All Rules option within Fetch Data from Device.</p> <p>While fetching data From history, if the value of Hit Count is zero, Security Manager checks whether the rule was hit earlier based on the Hit Count History of the rule and displays its corresponding values. If Security Manager is not able to find the values of previous Hit from History, it displays the value of Hit Count as zero.</p> |

## Configuring Expiration Dates for Access Rules

A frequent use of access rules is to provide temporary access to a network. For example, you might configure an access rule to allow a partner access for the duration of a specific project. Ideally, you want to remove the access rule at the completion of the project. However, as access rule lists grow, it is hard to manage them and to remember which rules were meant to be temporary.

To help you deal with this problem, you can configure expiration dates for access rules. By configuring an expiration date, you can project when you believe the rule will no longer be needed.

Expiration dates are not hard and fast dates; Security Manager does not delete rules that reach their expiration date. Instead, when an expiration date is reached, Security Manager displays “Expired” in bold letters in the Expiration Date column for the rule. You can filter the access rules page based on the expiration date field, for example, filtering for “expiration date has passed” to see all expired rules.

If the rule is no longer needed, you can delete it (right-click and select **Delete Row**), or disable it (right-click and select **Disable**), and then redeploy the configuration to the device. You might want to initially disable the rule, which leaves the rule in the table (overlain with hash marks), in case you discover the rule really was still needed after all, saving you the time of recreating the rule. You then just need to re-enable the rule (right-click and select **Enable**) and redeploy the configuration.

When you configure an expiration date, you can also configure notification settings, specifying an e-mail address that should be notified when an expiration date is approaching. You can specify how many days before the expiration date to send the notification e-mail message to allow you time to evaluate the rule. The notification settings are initially filled with the values configured in the administration settings (select **Tools > Security Manager Administration > Rule Expiration**); you can enter different settings for a given rule.

To configure rule expiration:

- When creating a new rule, or editing an entire rule, click the **Advanced** button in the [Add and Edit Access Rule Dialog Boxes](#), on page 728 to get to the rule expiration settings.
- For existing rules, you can add or edit expiration settings without editing the entire rule. Right-click the **Expiration Date** cell for the rule and select **Edit Rule Expiration**. You can select multiple rows to configure the same rule expiration settings. For more information, see [Advanced and Edit Options Dialog Boxes](#), on page 731.

## Configuring Settings for Access Control

You can configure various settings that apply to security-device access control lists. These settings work in conjunction with your access rules policy. The main setting of interest is that you can configure your own ACL names for each interface/traffic direction combination, or for the global ACL on ASA 8.3+ devices. For PIX, ASA, and FWSM devices, you can also control the maximum number of concurrent flows and the related syslog interval.

You can also configure an interface to allow per-user downloadable ACLs for PIX, ASA, and FWSM devices. This allows you to configure user-based ACLs in your AAA server to override the ACLs defined on a device.

---

**Note** With the release of Security Manager 4.4 and versions 9.0 and later of the ASA, the separate pages for configuring IPv4 and IPv6 access control were unified. However, for the earlier ASA versions, a separate page for IPv6 settings is still provided. The following descriptions apply to all versions of the page, except where noted.

---

#### Related Topics

- [Configuring Access Rules](#), on page 721

---

**Step 1** Do one of the following to open the [Access Control Settings Page](#), on page 738:

- (Device view) Select **Firewall > Settings > Access Control** (or **Firewall > Settings > IPv6 Access Control**) from the Policies selector.
- (Policy view) Select **Firewall > Settings > Access Control** (or **Firewall > Settings > IPv6 Access Control**) from the Policy Type selector. Select an existing policy or create a new one.

**Step 2** Configure the global settings in the top part of the page. For PIX, ASA, and FWSM devices, you can define the maximum number of concurrent deny flows and the related syslog interval. For ASA 8.3+ devices, you can enable object group search to optimize ACL performance when converting from Checkpoint, but this setting is not recommended unless you have a memory-constrained device. (Not available on the IPv6 Access Control page.)

For specific information about these settings, and the platforms that support ACL compilation, see [Access Control Settings Page](#), on page 738.

**Step 3** For each interface on which you want to configure an ACL name, or enable per-user ACLs, add the interface to the interfaces table by clicking the **Add Row** button beneath the table and filling in the [Firewall ACL Setting Dialog Box](#), on page 740. Keep the following in mind:

- If you configure an ACL name, the name is applied to the specific interface and direction. Security Manager creates system-generated names for any interface/direction combinations that you do not specifically name.
- You can also specify the name of the global ACL for ASA 8.3+ devices.

You can edit existing entries in the list by selecting them and clicking **Edit Row**, or delete them by clicking **Delete Row**.

## Access Control Settings Page

Use the Access Control Settings page to configure settings to use in conjunction with your access rules policy. You can control some performance and logging features, and configure ACL names for individual interfaces.

**Note** With the release of Security Manager 4.4 and versions 9.0 and later of the ASA, the separate policies and objects for configuring IPv4 and IPv6 access control were “unified,” meaning one set of rules in which you can use either IPv4 or IPv6 addresses, or a mixture of both. However, for the earlier ASA versions, a separate page for IPv6 settings is still provided. (See [Policy Object Changes in Security Manager 4.4](#), on page 11 for additional information.) The following descriptions apply to all versions of the page, except where noted.

Thus, many of these settings apply only to specific device types or software versions. If you configure an option and apply the policy to unsupported device types, the option is ignored for those unsupported devices.

### Navigation Path

To open the Access Control Page, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > Access Control** (or **Firewall > Settings > IPv6 Access Control**) from the Policies selector.
- (Policy view) Select **Firewall > Settings > Access Control** (or **Firewall > Settings > IPv6 Access Control**) from the Policy Type selector. Create a new policy or select an existing policy.
- (Map view) Right-click a device and select **Edit Firewall Settings > Access Control** (or **Edit Firewall Settings > IPv6 Access Control**).

**Table 190: Access Control Settings Page**

| Element                                                                                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum number of concurrent flows (PIX, ASA, FWSM)<br><br>(not presented on the IPv6 Access Control page)     | The maximum number of concurrent deny flows that the device is allowed to create. Syslog message 106101 is generated when the device reaches the number. The range you should use depends on the amount of flash memory available in the device: <ul style="list-style-type: none"> <li>• More than 64 MB—Values are 1-4096. The default is 4096.</li> <li>• More than 16 MB—Values are 1-1024. The default is 1024.</li> <li>• Less than or equal to 16 MB—Values are 1-256. The default is 256.</li> </ul>                                                                                                                                                                                                      |
| Syslog interval (PIX, ASA, FWSM)<br><br>(not presented on the IPv6 Access Control page)                        | The interval of time for generating syslog message 106101, which alerts you that the security appliance has reached a deny flow maximum. When the deny flow maximum is reached, another 106101 message is generated if the specified number of seconds has passed since the last 106101 message. Values are 1-3600 milliseconds. The default is 300.                                                                                                                                                                                                                                                                                                                                                              |
| Enable Access List Compilation (Global)<br><br>(IPv4 only; also not presented on the IPv6 Access Control page) | Whether to compile access lists, which speeds up the processing of large rules tables. Compilation optimizes your policy rules and performance for all ACLs, but is supported on a limited number of older platforms: <ul style="list-style-type: none"> <li>• Routers (global configuration only): 7120, 7140, 7200, 7304, and 7500.</li> <li>• PIX 6.3 firewalls, in global mode or per interface.</li> </ul> <p>An ACL is compiled only if the number of access list elements is greater than or equal to 19. The maximum recommended number of entries is 16,000.</p> <p>To compile access lists, the device must have a minimum of 2.1 MB of memory. Access list compilation is also known as Turbo ACL.</p> |
| Enable Object Group Search (ASA 8.3+)<br><br>(not presented on the IPv6 Access Control page)                   | Whether to enable object group search on ASA 8.3+ devices, which optimizes ACL performance without expanding object groups. Object group search is mainly for use when migrating from Checkpoint to ASA, which can result in a large increase in the number of access rules, when you have a memory-constrained device (that is, you find during operations that memory runs low). <p>Enable Object Group Search option is enabled by default for ASA 9.18 and above devices.</p>                                                                                                                                                                                                                                 |

| Element                                                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Threshold Object Group Search<br><br>(IPv4 only; also not presented on the IPv6 Access Control page) | Check this box to enable the threshold limit on object group search. By default the threshold is not enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Access Control settings table                                                                               | <p>The table lists the interfaces for which you want to configure special processing. The <b>Interface Name</b> can be a specific interface or an interface role, or <b>Global</b> for global ACL settings on ASA 8.3+ devices.</p> <p>The main use of this table is to configure names for ACLs if you do not want Security Manager to configure system-generated names. The name applies to the ACL generated for an interface in a specific direction.</p> <p>You can also configure interface-level settings for per user downloadable ACLs, object group search, and ACL compilation.</p> <ul style="list-style-type: none"> <li>• To add an Access Control interface setting, click the Add Row button and fill in the <a href="#">Firewall ACL Setting Dialog Box</a> , on page 740.</li> <li>• To edit an Access Control interface setting, select it and click the Edit Row button.</li> <li>• To delete an Access Control interface setting, select it and click the Delete Row button.</li> </ul> |

**Note** CSM does not support forward reference options for the ASA devices. CSM does not discover the CLIs that are configured in the device whose reference links are not properly established. Those CLIs are categorized as unsupported and are not be managed via CSM.

## Firewall ACL Setting Dialog Box

Use the Firewall ACL Setting dialog box to configure settings for specific interfaces, interface roles, or global rules for use with security-device access rules policies.

### Navigation Path

Go to the [Access Control Settings Page](#) , on page 738 and click the **Add Row** button below the interface table, or select a row in the table and click the **Edit Row** button.

|-------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface<br>Global (ASA 8.3+)                                                                        | <p>Specify whether you are configuring settings for specific interfaces (or interface roles), or for global rules on ASA 8.3+ devices.</p> <p>If you select <b>Interface</b>, specify the name of the interface or interface role for which you are configuring settings. Enter the name or click <b>Select</b> to select it from a list or to create a new object.</p> <p>If you select Global, your only option is to specify the name of the global ACL.</p>                                                                                                                                                                                                                                                                          |
| Traffic Direction                                                                                     | <p>The direction of the traffic through the interface, In or Out. The settings you configure apply only to this direction, if direction matters.</p> <p>For global ACLs on ASA 8.3+ devices, the direction is always in.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| User Defined ACL Name<br>(checkbox not presented on the IPv6 Access Control page)<br>ACL Name         | <p>Whether you want to supply the name for the ACL. If you select this option, enter the name you want to use, which is applied to the ACL generated for the interface and direction combination. The name must be unique on the device.</p> <p>If you are configuring the name for the global ACL on ASA 8.3+ devices, the option is automatically selected; simply enter the desired name.</p> <p><b>Note</b> Make sure that the firewall rules ACL name is unique and is not the same name as the ACL object defined in the Policy Object Manager. For more information see <a href="#">Creating Access Control List Objects</a> , on page 281.</p> <p>If you do not configure a name, Security Manager generates a name for you.</p> |
| Enable Per User Downloadable ACLs (PIX, ASA, FWSM)<br>(not presented on the IPv6 Access Control page) | <p>Whether to enable the download of per-user ACLs to override the ACLs on the interface. User ACLs are configured in a AAA server; they are not configured in Security Manager. If there are no per-user ACLs, the access rules configured for the interface are applied to the traffic.</p> <p>The option is configured on the device for the specified interface only when the Traffic Direction is in.</p>                                                                                                                                                                                                                                                                                                                           |

| Element                                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Object Group Search (PIX 6.x)<br>(not presented on the IPv6 Access Control page)     | <p>Whether to enable object group search on a PIX 6.x interface, which reduces the memory requirement on the device to hold large ACLs. However, object group search impacts performance by making ACL processing slower for each packet.</p> <p>Object group search is recommended when you have very large object groups.</p> <p><b>Tip</b> If you are trying to configure object group search on ASA 8.3+ devices, the setting is on the <a href="#">Access Control Settings Page</a>, on page 738.</p>                                                              |
| Enable Access List Compilation (PIX 6.x)<br>(not presented on the IPv6 Access Control page) | <p>Whether to compile access lists on this interface for PIX 6.x devices. This setting overrides the equivalent global setting that you configure on the Access Control Settings page.</p> <p>ACL compilation speeds the processing of large rules tables and optimizes your policy rules and performance for the interface. An ACL is compiled only if the number of access list elements is greater than or equal to 19. The maximum recommended number of entries is 16,000.</p> <p>To compile access lists, the device must have a minimum of 2.1 MB of memory.</p> |

## Using Automatic Conflict Detection

Security Manager provides an Automatic Conflict Detection feature for access rules. You can use Automatic Conflict Detection to evaluate the logic of your access rules. When enabled, Automatic Conflict Detection identifies rules that overlap or conflict with other rules in the access rule policy. Use this information to identify rules that need to be deleted, moved, or edited.

This section contains the following topics:

- [Understanding Automatic Conflict Detection](#), on page 742
- [Understanding the Automatic Conflict Detection User Interface](#), on page 745
- [Resolving Conflicts](#), on page 750

## Understanding Automatic Conflict Detection

Security Manager provides an automatic conflict detection feature to help identify unnecessary redundant or duplicate rules. Certain conflicting rules might have no effect on a device after they are deployed; however, they create unnecessary clusters in the rules table. By detecting these rules, you can clean up the rule set to develop an easier to use and more efficient access rules policy.

Other conflicting rules, can create unwanted results to your network. By detecting these conflicting rules, you can identify rules that need to be deleted, moved, or edited to implement your security needs as intended.

---

**Note** The conflict detection feature will report on the first conflict between two rules. If there are additional rules in the table that also conflict with a rule, they will not be reported until the first conflict is resolved.

---

Conflicts detected by Security Manager are categorized in the following way:

- **Redundant Object**—An element in a field of a rule is a subset of one or more elements in the same field of the rule. In the following example, the source cell has two network objects: *net-group2* and *net-group1*. Since *net-group2* is a sub-set of *net-group1*, it is a redundant object and can safely be removed:

```
object-group network net-group1
network-object 10.2.0.0 255.255.0.0
object-group network net-group2
network-object 10.2.1.1 255.255.255.255
```

- **Redundant Rule**—Two rules apply the same action to the same type of traffic, and removing the base rule would not change the ultimate result. For example, if a rule permitting FTP traffic for a particular network were followed by a rule allowing IP traffic for that same network, and there were no rules in between denying access, then the first rule is redundant and can be deleted.

The following is a simple example of redundant rules:

```
access-list acl permit ip 2.1.1.1 255.255.255.255 any
access-list acl permit ip 2.1.1.0 255.255.255.0 any
```

- **Partially Redundant Rule**—A portion of a compound rule is redundant to a rule or a portion of a compound rule that follows it.
- **Shadowed Rule**—This is the reverse of a redundant rule. In this case, one rule will match the same traffic as another rule such that the second rule will never be applied to any traffic because it comes later in the access list. If the action for both rules are the same, you can delete the shadowed rule. If the two rules specify different actions for traffic, you might need to move the shadowed rule or edit one of the two rules to implement your desired policy. For example, the base rule might deny IP traffic, and the shadowed rule might permit FTP traffic, for a given source or destination.

The following is a simple example of shadowed rules:

```
access-list acl permit ip 1.0.0.0 255.0.0.0 any
access-list acl permit ip 1.1.0.0 255.255.0.0 any
```

---

**Note** Duplicate rules are reported as shadowed rules by the automatic conflict detection feature.

---

- **Partially Shadowed Rule**—A portion of a compound rule is shadowed by a rule before it. If the action for both rules are the same, you can delete the portion of the rule that is shadowed. If the two rules specify different actions for traffic, you might need to move the shadowed rule or edit one of the two rules to implement your desired policy.

### Scope of Automatic Conflict Detection

When detecting conflicts, Security Manager evaluates the following pieces of information in your access rules:

- source
- destination
- services
- users
- interfaces

**Note** Beginning with version 4.23, Cisco Security Manager introduces the following new enhancements to the Conflict Detection feature:

- Conflict Detection is triggered only when specific fields are updated. For example Source, Destination, Security group tag, User interface and traffic detection fields in the rule policy.
- For ACL modifications, Conflict Detection gets triggered in the background when detected and does not affect the user interface.
- You can now perform upto 5 changes simultanously for the ACL policies and also see its progress. When you try to perform another change, a pop-up message appears indicating that you have to wait till the previous change is validated before proceeding.
- Security manager instantly frees up the memory space consumed, when the conflict detection option is disabled, and this enables optimized memory usage and reduces the possibility of overload. To perform this, you can make the parameter changes to the client LAX file to enable security manager clear more space.
- To enable Security Manager free up more space when Conflict Detection is disabled, you can make the following changes to the Client LAX file:

```
# LAX.NL.JAVA.OPTION.ADDITIONAL
# required for optimized garbage collection
lax.nl.java.option.additional=-client -Djdk.tls.client.protocols="TLSv1.2" -XX:+UseG1GC

-XX:NewRatio=3 -XX:PermSize=64m -XX:MaxPermSize=128m -XX:+HeapDumpOnOutOfMemoryError
-XX:HeapDumpPath=./logs -XX:+UseCompressedOops -Xdebug
-Xrunjdpw:transport=dt_socket,address=5005,server=y,suspend=n
```

- Conflict Detection deep scanning requires additional time and memory usage when compared to Cisco Security Manager 4.16. Therefore, when need you can disable this functionality by setting `fwsvc.Legacy_4_16_RuleAnalysis` to true in Cisco Security Manager properties.

---

**Note** The following notes apply to Conflict Detection:

- Conflict detection is only available for access rules in the Access Rules policy for a device or shared policy. Conflict detection is not available for access rules that are part of other policies, such as AAA or inspection rules.
  - If a rule contains an FQDN network/host object, the FQDN object is ignored, but the rule is otherwise included in the analysis.
  - Disabled rules are not evaluated during conflict detection.
  - Conflict detection does not consider time ranges when evaluating access rules. Make sure that such rules truly conflict before removing any rules flagged during conflict detection.
-

## Understanding the Automatic Conflict Detection User Interface

The Automatic Conflict Detection feature is tightly coupled with the access rules table to make identifying conflicts and then resolving those conflicts faster and easier. When conflict detection is enabled, additional user interface elements are available for navigating between the conflicts and for resolving those conflicts.

---

**Note** For information on the standard elements of the Access Rules page, see [Access Rules Page](#) , on page 724.

---

Figure 24: Automatic Conflict Detection

|                               |                              |
|-------------------------------|------------------------------|
| 1 Conflict Indicator icons    | 2 Enable Conflict Detection  |
| 3 Generate Report button      | 4 Annotation Display Options |
| 5 Conflict navigation bar     | 6 Conflict Details area      |
| 7 Conflict Navigation buttons |                              |

**Conflict Indicator Icons**

The Conflict Indicator icons are used to identify conflicts and to provide a quick visual representation of the type of conflict. The following table details the available icons:

**Note** For an explanation of the types of conflicts, see [Understanding Automatic Conflict Detection](#), on page 742.

|             |                                                                                                                                                                    |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|             | Redundant Object                                                                                                                                                   |
|             | Redundant Rule                                                                                                                                                     |
|             | Partially Redundant Rule                                                                                                                                           |
|             | Shadowed Rule                                                                                                                                                      |
|             | Partially Shadowed Rule                                                                                                                                            |
| <b>Note</b> | If an access rule has multiple conflicts or if it has a user note attached to it, the conflict indicator icon for that rule will have a small plus sign (+) on it. |

You can perform the following actions using the Conflict Indicator icon:

- Hover the mouse pointer over the **Conflict Indicator** icon to view a description of the conflict including any user notes attached to the conflict.
- Click the **Conflict Indicator** icon, or right-click the icon and select **Show Conflict Detail**, to open the Conflict Details pane for the selected conflict.
- Right-click the **Conflict Indicator** icon for a redundant object and select **Remove Redundant Object** to remove the redundant object from a rule.
- Right-click the **Conflict Indicator** icon and select **Add User Note** to open the Add User Note dialog box for the selected conflict. You can use the Add User Note dialog box to enter a note about the conflict that can later be included in the Rule Analysis Detail Report.

**Note** User notes are not saved when leaving the access rules page or after editing a rule that has a user note.

### Enable Conflict Detection

The Enable Conflict Detection option controls whether automatic conflict detection is enabled. Conflict detection is enabled by default but can be disabled by deselecting this option. The setting is managed per user and enabling or disabling conflict detection for one access rules table, will also enable or disable the feature for other access rules tables.

### Generate Report

If conflict detection is enabled, you can click the **Generate Report** button to create an HTML report of the conflicts that can be printed or exported to another tool. The Rule Analysis Detail Report shows details of all the conflicts in your rules table and includes any user notes that were entered for the conflicts. It does not use the settings you selected in the Annotation Display Options dialog box and does not consider the filter settings defined for the table.

**Note** User notes are not saved when leaving the access rules page or after editing a rule that has a user note.

When you first open the Access Rules page, the Generate Report button is replaced with a progress bar. After conflict analysis has completed, the Generate Report button becomes available along with the other conflict detection features.

### Annotation Display Options button

Click the **Annotation Display Options** button to open the Annotation Display Options dialog box, which is used for selecting the types of conflicts that should be reported. For an explanation of the types of conflicts, see [Understanding Automatic Conflict Detection](#), on page 742.

Disabling a certain type of conflict does not remove those rules from the access rules table; it only turns off the rule conflict notification for those types of conflicts. To hide or show only conflicting rules of a certain type, you can use the table filter feature. For example, if you only wanted to see redundant and partially redundant rule conflicts, you could set up the following advanced filter:

You can hover the mouse pointer over the Annotation Display Options button to view a summary of the conflicts for each type and also to see which conflict types are disabled.

**Note** The Annotation Display Options that you select remain in effect until those options are changed. Be sure to verify these settings whenever you are working on resolving conflicts.

### Conflict Navigation Bar

Use the Conflict navigation bar to navigate to a conflict. You can use the Previous Conflict and Next Conflict buttons on the Conflict navigation bar to step through the conflicts. You can also click on one of the conflict locators in the Conflict navigation bar to move directly to a specific conflict. This is particularly helpful when working with large rules tables.

---

**Tip** Hovering over a conflict locator provides a quick summary of the conflict.

---

The conflict locators are color-coded as follows:

- **Red locators**—Redundant objects
- **Blue locators**—Redundant and partially redundant rules
- **Black locators**—Shadowed and partially shadowed rules

### Conflict Details Area

The Conflict Details pane shows details for the selected conflict. The pane can be docked and undocked as needed. If the Conflict Details pane is docked while the Policy Object Manager pane is also docked, you can navigate between the two features using the tabs at the bottom of the window.

The conflicting rules are shown together in a table for easier direct comparison. The type of conflict is shown above the table. A suggested action is shown below the table for all conflicts except partially redundant rules and partially shadowed rules, which must be resolved manually. Links are provided for direct navigation to the rules involved. Policy objects that are part of the conflicting rules can be expanded by clicking on them to see the object contents. Click again to collapse the policy object.

You can use the links provided to navigate to the conflicting rules. You can also click the link under Action to have Security Manager perform the suggested action automatically.

### Conflict Navigation Buttons

The Previous Conflict and Next Conflict buttons at the top of the Conflict Details pane allow you to step through the conflicts that need to be resolved without leaving the Conflict Details pane.

## Resolving Conflicts

The following procedure explains how to use the Automatic Conflict Detection feature to resolve conflicts in your access rules.

---

**Tip** You can use the Combine Rules tool to have Security Manager evaluate your rules and find ways to combine them into more efficient rules. For more information, see [Combining Rules](#), on page 618.

---

### Related Topics

- [Understanding Automatic Conflict Detection](#), on page 742

- [Understanding Access Rules](#), on page 715
- [Understanding Device Specific Access Rule Behavior](#), on page 718
- [Understanding Access Rule Address Requirements and How Rules Are Deployed](#), on page 719
- [Configuring Access Rules](#), on page 721

---

### Step 1

Do one of the following:

- (Device view) Select **Firewall > Access Rules** from the Policy selector.
- (Policy view) Select **Firewall > Access Rules** from the Policy Type selector and select an existing policy.

This opens the [Access Rules Page](#), on page 724. If conflict detection is enabled, the access rules will be analyzed for conflicts after the table has been loaded. If conflict detection is not enabled, select **Enable conflict detection** to begin the conflict analysis.

The analysis progress is shown below the rules table. With the exception of the conflict detection features, you can perform functions on the rules table while the rules are being analyzed. After analysis has completed, the conflict detection features are enabled.

### Step 2

Make sure that the rules you are interested in analyzing are being shown in the rules table. This includes expanding sections and making sure that if you are using filters that they are set correctly. Any rules that are being filtered or are in a section that is collapsed will not be included in the conflict detection analysis.

**Tip** You can use the Expand all rows/Collapse all rows buttons located in the upper-right corner of the Filter area above the access rules table, to quickly expand or collapse all sections in the rules table.

### Step 3

Click the **Annotation Display Options** button, which is located above the Conflict navigation bar to the right of the vertical scroll bar, to open the Annotation Display Options dialog box. Verify that the types of conflicts you want detected are all enabled, and then click **OK**.

**Tip** You can hover the mouse pointer over the Annotation Display Options button to view a summary of the conflicts for each type and also to see which conflict types are disabled.

**Note** The Annotation Display Options that you select remain in effect until those options are changed. Be sure to verify these settings whenever you are working on resolving conflicts.

### Step 4

If you would like to print or save a copy of the conflicts that are found in the rule table, click **Generate Report**.

The Rule Analysis Detail Report is opened in your browser. The Rule Analysis Detail Report shows details of all the conflicts in your rules table. It does not use the settings you selected in the Annotation Display Options dialog box and does not consider the filter settings defined for the table. You can save the report or print it as needed.

**Step 5** Use the Conflict navigation bar to navigate to a conflict. You can use the Previous Conflict and Next Conflict buttons on the Conflict navigation bar to step through the conflicts. You can also click on one of the conflict locators in the Conflict navigation bar to move directly to a specific conflict. This is particularly helpful when working with large rules tables.

**Tip** Hovering over a conflict locator provides a quick summary of the conflict.

The conflict locators are color-coded as follows:

- **Red locators**—Redundant objects
- **Blue locators**—Redundant and partially redundant rules
- **Grey locators**—Shadowed and partially shadowed rules

**Step 6** Click on the **Conflict Indicator** icon for the selected conflict to open the Conflict Details pane. For more information on the Conflict Indicator icons, see [Understanding the Automatic Conflict Detection User Interface](#), on page 745.

The Conflict Details pane shows details for the selected conflict. The conflicting rules are shown together in a table for easier direct comparison. The type of conflict is shown above the table. A suggested action is shown below the table for all conflicts except partially redundant rules and partially shadowed rules, which must be resolved manually. Links are provided for direct navigation to the rules involved. Policy objects that are part of the conflicting rules can be expanded by clicking on them to see the object contents. Click again to collapse the policy object.

**Step 7** Use the links provided to navigate to the rules and resolve the conflict as needed or click the link under Action to have Security Manager perform the suggested action automatically.

**Note** If you do not want to resolve the conflict at this time, you can enter a note about the conflict by right-clicking the **Conflict Indicator** icon to the left of the conflict in the access rule table and then selecting **Add User Note**. User notes are included in the Rule Analysis Detail Report, but are not saved when leaving the access rules page or after editing a rule that has a user note.

**Step 8** Use the Conflict navigation bar or the **Previous Conflict** and **Next Conflict** buttons at the top of the Conflict Details pane to access additional conflicts that need to be resolved.

**Step 9** If there are any remaining conflicts that you do not want to resolve at this time, you can click **Generate Report** to print or save a copy of the remaining conflicts, if desired.

---

## Viewing Hit Count Details

Use Hit Count Details window to view information about the number of times an access rule was applied to traffic. These rules are the ones that become interface ACLs on the device. The hit count results do not show counts for any other type of ACL (for example, those used with class maps or AAA rules).

For access rules on ASA 8.3(1) devices and later, the detailed hit count report also shows the last time the access rule policy was applied to traffic. This information is helpful for determining rules that might have been superseded by other policy changes.

Use the hit count information to help you debug your access rules. The information can help you identify rules that are never hit (which might mean you do not need them, or that they are duplicates of rules higher in the ACL), and rules that are hit often (which means you might want to refine the rules).

---

**Tip** You can click the Refresh Hit Count button at the bottom of the page to update hit count information before viewing the details for a rule. See [Hit Count Selection Summary Dialog Box](#) , on page 735 for more information.

---

Consider the following points when analyzing the hit count details:

- You get best results if you deploy policies to the device before viewing hit counts. If you discover a device and then generate a hit count report before deployment, the results might be incomplete or hard to interpret. For example, an access rule might not have any hit count information.
- Hit count statistics are based on ACL, not on interface. If you select **Enable ACL Sharing for Firewall Rules** on the Security Manager Administration Deployment page (see [Deployment Page](#) , on page 522), any shared ACL provides statistics that are combined from all interfaces that share the ACL.
- If you enable network object group optimization, as described in [Optimizing Network Object Groups When Deploying Firewall Rules](#) , on page 632, you might not get good hit count information.
- If you enable ACL optimization, as described in [Optimizing Access Rules Automatically During Deployment](#) , on page 761, the hit count results might have problems matching ACEs from the device to access rules. Thus, when you select an access rule, you might not get any hit count results for it.
- FQDN network/host objects are ignored. You cannot obtain hit count information on these objects.
- Hit count and last hit time information is cleared when a device is restarted.
- The Hit Count of a duplicated ACE, either within the same rule or different rules, is always set to 0.

### Before You Begin

Hit count reports are subject to the following limitations:

- Hit count reports are device-specific. You can generate the report for one device at a time from Device view only. Ensure that you deploy policies to the device before generating the reports.
- If you enable object group search on an ASA 8.3+ device, you cannot use the Hit Count tool. Object group search is configured on the [Access Control Settings Page](#) , on page 738.
- Although you can select rules that include FQDN network/host objects, the objects are ignored in the hit count results.

### Navigation Path

(Device view only) From the [Access Rules Page](#) , on page 724, right-click the Hit Count cell for a rule in the table and choose **Show Hit Count Details**.

The Hit Count Details window opens as a pane at the bottom of the access rules table. Click the expand button on the right side of its title bar to view the hit count details in a separate window.

## Sample Hit Count Details Window

You can generate hit count reports to determine how often each rule in your access rule policy is matched to traffic. If an access rule is deployed as multiple access control entries (ACEs), for example, when you use interface roles to define rules and the roles apply to more than one interface, you can see the separate hit count

information for each ACE deployed. The hit count results do not show counts for any other type of ACL (for example, those used with class maps or AAA rules).

For access rules on ASA 8.3(1) devices and later, the hit count report also shows the last time the access rule policy was applied to traffic. This information is helpful for determining rules that might have been superseded by other policy changes.

Use the hit count information to help you debug your access rules. The information can help you identify rules that are never hit (which might mean you do not need them, or that they are duplicates of rules higher in the ACL), and rules that are hit often (which means you might want to refine the rules).

The following figures show an example of a hit count report and how to use the information.

- [Figure 25: Expanded Table, on page 754](#) shows the default view. The upper table lists the rules as they exist in your access rules policy, either all rules or just the ones you selected before generating the report. When you select a rule, the ACEs created on the device for that rule are listed in the expanded table in the lower half of the window. When you initially open the report, the expanded table shows the ACEs for all policies listed in the upper table.

Hit counts in the expanded table are for each ACE, whereas the count in the rules table is the sum of the hit counts for all ACEs created by the rule. Note that the expanded table for ASA/PIX/FWSM devices, and IOS devices lower than 12.4(20)T, shows hit counts for each element within any policy objects used in the rule, whereas for IOS 12.4(20)T+ devices, the information is only provided at the object group level.

- [Figure 26: Raw ACE Table, on page 755](#) shows the same ACEs in CLI format. These are the ACEs as they exist in the device configuration.

For more information about how to read and interpret hit count reports, see [Viewing Hit Count Details, on page 751](#).

**Figure 25: Expanded Table**

Specific Rule Selected

The screenshot displays the 'Hit Count Query Results' window. At the top, there is an 'Info' section with 'Select Device: ios189' and a 'Refresh Hit Count' button. Below this is the 'Selected Access Rules' table:

| Rule                      | Hit Count | Permit | Source     | Destination | Service     | Interface  | Dir. | Options     | Category |
|---------------------------|-----------|--------|------------|-------------|-------------|------------|------|-------------|----------|
| Local - Default_1_0       |           | ✓      | 10.0.0.0/8 | 10.1.1.0    | IGMP        | FastEth... | in   |             | None     |
| Local - Default_2_1671839 | 1671839   | ✓      | any        | any         | IP          | FastEth... | in   | Default/300 | None     |
| Local - Default_3_0       |           | ✓      | 10.0.0.0/8 | 10.1.1.0    | Microso...  | FastEth... | in   |             | None     |
| Local - Default_4_0       |           | ✓      | 10.0.0.0/8 | 10.1.1.0    | tcp/135-... | FastEth... | in   |             | None     |
| Local - Default_5_0       |           | ✓      | any        | any         | tcp         | FastEth... | in   | Default/300 | None     |

Below the table is a 'Choose:' dropdown menu set to 'Expand...'. The expanded table, 'Rule Results Expanded', is shown below:

| Rule            | Delta | Hit Count | Permit | Service | Interfaces | Dir... | Source A... | Source Port | Dest. Addresses | Destination Port | ACL Name   |
|-----------------|-------|-----------|--------|---------|------------|--------|-------------|-------------|-----------------|------------------|------------|

## Importing Rules

Typically, when you add a device to Security Manager, you discover policies from the device. This action populates your access rules policy with the access control entries (ACEs) from all active ACLs on the device.

If you find there are other ACLs that have ACEs you want included in your policy, you can define them directly in Security Manager.

Another alternative, however, is to import them by copying and pasting the CLI entries from a device running-configuration, or by typing in the desired commands. Using the Import Rules wizard, you can quickly create ACEs and associated policy objects from ACLs that you know already work. You might also want to use this method if you are more comfortable using CLI commands to define your rules.

The following steps describe using the Import Rules wizard to add CLI-based rules and preview the results.

- 
- Step 1** (Device view only) Select **Firewall > Access Rules** to open the [Access Rules Page](#) , on page 724.
- Step 2** Select the row after which you want to add the rules. The row must be within the Local scope. If you do not select a row, the rules are added at the end of the Local scope.
- Step 3** Right-click anywhere in the rules table and choose **Import Rules** to start the wizard.
- The first page—Enter Parameters—of the three-page wizard appears.

**Step 4** On the [Import Rules Wizard—Enter Parameters Page](#), on page 756:

- Enter the desired CLI information in the *running-configuration* format appropriate for the selected device. For examples of importable CLI-based rules, see [Examples of Imported Rules](#), on page 760.
- Specify whether you are creating an interface-specific rule (and enter the interface or interface role to which you want the rules to apply), or for ASA 8.3+ devices, a global rule (see [Understanding Global Access Rules](#), on page 717).
- Specify the traffic direction with respect to the interface (the direction is always In for global rules).

Beside access control rules, you should also include the CLI information for the following items if they are referred to by the rules. If you do not include these items, the named objects must already be defined in Security Manager for the import to be successful.

- Time range objects (the **time-range** command with its subcommands), which can create time range policy objects.
- Object groups for PIX, ASA, FWSM, and IOS 12.4(20)T+ devices (the **object-group** command with its subcommands), which can create network/host policy objects.

For ASA 8.3+ devices, you can also include the **object network** and **object service** commands. However, any object NAT configuration is not imported.

**Step 5** Click **Next** to process the rules and open the [Import Rules Wizard—Status Page](#), on page 758.

You are notified if your CLI input contains errors when you click the Next button. For some detailed tips about what commands you can enter, see [Import Rules Wizard—Enter Parameters Page](#), on page 756.

The CLI is evaluated and if importable, you are told the types of objects that were created from the CLI.

**Step 6** Click **Next** to view the rules and objects on the [Import Rules Wizard—Preview Page](#), on page 758, or click **Finish** to import the rules without previewing them.

The information on the Preview page is read-only. If the rules are acceptable, click **Finish**.

If you want to make changes, you can click the **Back** button to return to the Enter Parameters page of the wizard, or you can click **Finish** and edit the rules on the Access Rules page.

---

## Import Rules Wizard—Enter Parameters Page

Use the Import Rules wizard to import a set of access control entries from an ACL in device running-configuration format to your access rules policy. The command syntax you can enter is controlled by the type of device to which you are importing rules.

Beside access control rules, you should also include the CLI for the following items if they are referred to by the rules. If you do not include these items, the named objects must already be defined in Security Manager for the import to be successful.

- Time range objects (the **time-range** command with its subcommands).
- Object groups for PIX, ASA, FWSM, and IOS 12.4(20)T devices (the **object-group** command with its subcommands).

For ASA 8.3+ devices, you can also include **object network** and **object service** commands. However, any object NAT configuration is not imported.

### Navigation Path

(Device view only) Right-click anywhere in the rules table on the [Access Rules Page](#), on page 724 and choose **Import Rules**.

| Element                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLI                            | <p>The OS commands that define the rules and related objects that you want to import. These rules must be in running-configuration format, so they are best copied and pasted from a configuration (use Ctrl+V to paste into the field). You can also type in the commands; you will be prompted if they cannot be interpreted.</p> <p>You can import only one ACL at a time.</p> <p>To see some examples of the CLI you can import, see <a href="#">Examples of Imported Rules</a>, on page 760.</p> <p><b>Tips</b></p> <ul style="list-style-type: none"> <li>• If you refer to an object but do not include the CLI, the rule might be created but it will not use the object.</li> <li>• For PIX, FWSM, ASA, and IOS 12.4(20)T+, you can include object group and name commands.</li> <li>• If you import an ACL that is inactive, it is shown as disabled in Security Manager. If you deploy the configuration, it is removed from the device.</li> <li>• You can import extended ACLs for all device types, and standard ACLs for IOS devices. However, standard ACLs are converted to extended ACLs.</li> </ul> |
| Interface<br>Global (ASA 8.3+) | <p>Select whether you are importing an interface-specific or global rule. Global rules are available only for ASA 8.3+ devices, and are handled according to special rules (for detailed information, see <a href="#">Understanding Global Access Rules</a>, on page 717).</p> <p>If you select <b>Interfaces</b>, enter the name of the interface or the interface role for which you are defining this rule, or click <b>Select</b> to select the interface or role from a list, or to create a new role. An interface must already be defined to appear on the list. You can enter any combination of interface or interface role names, separated by commas.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Traffic Direction              | The direction of the traffic with respect to the interface, in or out.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Category                       | The category assigned to the rules. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Rules Imported         | The number of rules that will be imported.                                                                                                                                                                                                                                                                                                                                                                         |
| Policy Objects Created | The number of policy objects that will be created.                                                                                                                                                                                                                                                                                                                                                                 |
| Messages               | The warning, error, and informational messages, as indicated by the severity icon. Typical informational messages describe the policy objects created during the operation or the existing policy objects that were reused.<br><br>When you select an item, the Description box to the right describes the message in detail. The Action box to the right provides information on how you can correct the problem. |
| Abort button           | Click this button to stop the import operation.                                                                                                                                                                                                                                                                                                                                                                    |

## Import Rules Wizard—Preview Page

Use the Preview page of the Import Rules wizard to view the rules and objects that will be imported if you click Finish.

This preview is read-only; you cannot edit the rules or objects. If the rules or objects are not exactly what you want, you can click Finish to add the rules and objects, and then edit them from the access rules page. For example, you cannot import rule expiration dates, because those dates have meaning only in Security Manager.

The tabs on this dialog box appear only if the data you are importing includes items to be displayed on the tab.

**Tip** If your CLI refers to an object that does not exist, such as a time range, the object is not included in the rule. You can either go back and add the CLI for the object, or you can click Finish, create the object yourself, and edit the rule.

## Examples of Imported Rules

The following are some examples of CLI that you can import and the rules and policy objects that are created from them. For information on how to import rules, see [Importing Rules](#), on page 755.

### Example 1: Restrict a network from accessing FTP servers (ASA devices)

The following access list uses object groups and restricts the 10.200.10.0/24 network from accessing some FTP servers. All other traffic is allowed.

```
object-group network ftp_servers
network-object host 172.16.56.195
network-object 192.168.1.0 255.255.255.224
access-list ACL_IN extended deny tcp 10.200.10.0 255.255.255.0 object-group ftp_servers
access-list ACL_IN extended permit ip any any
```

This example creates a network/host object named ftp\_servers and two access rules.

| No. | Permit                                                                            | Source         | Destination | Service | Interface | Dir. | Category |
|-----|-----------------------------------------------------------------------------------|----------------|-------------|---------|-----------|------|----------|
| 1   |  | 10.200.10.0/24 | ftp_servers | TCP     | Ethernet0 | in   | None     |
| 2   |  | any            | any         | IP      | Ethernet0 | in   | None     |

### Example 2: Restrict web access during working hours (ASA devices)

The following example denies HTTP requests between the hours of 8 AM and 6 PM, which are typical work hours.

```
time-range no-http
periodic weekdays 8:00 to 18:00
access-list 101 deny tcp any any eq www time-range no-http
```

This example creates a time range object named no-http and one access rule.

| No. | Permit                                                                              | Source | Destination | Service | Interface | Dir. | Options | Category |
|-----|-------------------------------------------------------------------------------------|--------|-------------|---------|-----------|------|---------|----------|
| 1   |  | any    | any         | HTTP    | Ethernet0 | in   | no-http | None     |

### Example 3: Filtering on TCP and ICMP using port numbers (IOS devices)

In the following example, the first line of the extended access list named goodports permits any incoming TCP connections with destination ports greater than 1023. The second line permits incoming TCP connections to the Simple Mail Transfer Protocol (SMTP) port of host 172.28.1.2. The last line permits incoming ICMP messages for error feedback.

```
ip access-list extended goodports
permit tcp any 172.28.0.0 0.0.255.255 gt 1023
permit tcp any host 172.28.1.2 eq 25
permit icmp any 172.28.0.0 255.255.255.255
```

This example creates three access rules. Notice that the wildcard masks used in the IOS ACL syntax are converted to regular subnet masks. Security Manager automatically converts between standard network/host subnet mask designations and the wildcard masks required in IOS ACLs. Because ASA/PIX/FWSM requires the use of subnet masks in ACL commands, this makes it possible for you to create rules that can apply to all devices; Security Manager takes care of converting your rules to the correct syntax.

| No. | Per... | Source | Destination   | Service     | Interface | Dir. | Category |
|-----|--------|--------|---------------|-------------|-----------|------|----------|
| 1   | ✓      | any    | 172.28.0.0/16 | tcp/gt 1023 | Ethernet0 | in   | None     |
| 2   | ✓      | any    | 172.28.1.2    | SMTP        | Ethernet0 | in   | None     |
| 3   | ✓      | any    | any           | ICMP        | Ethernet0 | in   | None     |

#### Example 4: Standard ACLs restricting hosts (IOS devices)

In the following example, the workstation belonging to Jones is allowed access to Ethernet interface 0 and the workstation belonging to Smith is not allowed access:

```
ip access-list standard workstations
 remark Permit only Jones workstation through
 permit 172.16.2.88
 remark Do not allow Smith workstation through
 deny 172.16.3.13
```

This example creates two rules, converting the standard rules to extended rules (to any destination). The remarks are saved in the description field.

| No. | Permit | Source      | Destination | Service | Interface | Dir. | Description       |
|-----|--------|-------------|-------------|---------|-----------|------|-------------------|
| 1   | ✓      | 172.16.2.88 | any         | IP      | Ethernet0 | in   | Permit only Jo... |
| 2   | ✗      | 172.16.3.13 | any         | IP      | Ethernet0 | in   | Do not allow S... |

For more examples of ACLs in command language format, see the following:

- IOS Devices—[http://www.cisco.com/en/US/docs/ios/sec\\_data\\_plane/configuration/guide/sec\\_create\\_IP\\_apply.html#wp1027258](http://www.cisco.com/en/US/docs/ios/sec_data_plane/configuration/guide/sec_create_IP_apply.html#wp1027258).
- ASA Devices—[http://www.cisco.com/en/US/docs/security/asa/asa82/configuration/guide/acl\\_extended.html](http://www.cisco.com/en/US/docs/security/asa/asa82/configuration/guide/acl_extended.html).

## Optimizing Access Rules Automatically During Deployment

You can configure the system to optimize the access control lists (ACLs) that are created from your access rules policies when they are deployed to specific devices or to all devices. This optimization affects only the deployed policies, it does not make any changes to your access rules policy.

Optimization removes redundancies and conflicts and can combine multiple entries (ACEs) into single entries. Although the order of entries might change, the semantics of your policies are preserved; the optimized ACL accepts or denies the same set of packets as did its unoptimized form. Following are the basic cases where changes are made:

- Ineffective ACE—Where one entry is a subset of, or equal to, another entry, the ineffective ACE is removed. Consider the following example:

```
access-list acl_mdc_inside_access deny ip host 10.2.1.1 any
access-list acl_mdc_inside_access deny ip 10.2.1.0 255.255.255.0 any
```

The first ACE is actually a subset of the second ACE. ACL optimization will deploy only the second entry.

- Superset ACE—Where one entry is a superset of another and the order of the rules does not matter, the redundant rule is removed. Consider the following example:

```
access-list acl_mdc_inside_access permit tcp any any range 110 120
access-list acl_mdc_inside_access deny tcp any any range 115
```

The second ACE will never be hit. ACL optimization will remove the second ACE and deploy only the first one.

- **Adjacent ACEs**—Where two entries are similar enough that a single entry can do the same job. There can be no intervening rules that change which packets will hit each rule. Consider the following example:

```
access-list myacl permit ip 1.1.1.0 255.255.255.128 any
access-list myacl permit ip 1.1.1.128 255.255.255.128 any
```

The two ACEs are merged into one: `access-list myacl permit ip 1.1.1.0 255.255.255.0 any`.

By configuring ACL deployment optimization, you can create smaller ACLs that are more efficient, which can improve performance on devices with limited, non-expandable memory, such as the FWSM, which can be shared among multiple virtual contexts.

However, there are down sides to configuring ACL deployment optimization:

- Because optimization changes what would normally be deployed for your access rules, it is hard to correlate those rules to the actual deployed ACEs. This can make the results of the hit count tool unusable, and make it very difficult to correlate events in the Cisco Security Monitoring, Analysis and Response System application. If it is important to you that you can monitor your access rules using these tools, do not enable optimization. For more information, see [Viewing Hit Count Details , on page 751](#) and [Viewing CS-MARS Events for an IPS Signature , on page 2908](#).
- Optimization does not address inherent problems in your access rules policy. It is typically better to address redundancies and conflicts proactively by using the automatic conflict detection tool (see [Using Automatic Conflict Detection , on page 742](#)). You can also use the combine rules tool to optimize your rules in the access rules policy before you deploy them (see [Combining Rules , on page 618](#)).

If you decide to configure ACL deployment optimization, consider enabling it only for those devices that are memory constrained.

---

**Step 1** Log into Windows on the Security Manager server.

**Step 2** Use a text editor such as NotePad to open the `C:\Program Files\CSCOpX\MDC\athena\config\csm.properties` file. Locate the optimization section and read the instructions.

- To turn on full optimization for all devices, enter the following:

**OPTIMIZE.\*=full**

- To turn on full optimization for a specific device, replace the asterisk with the Security Manager display name for the device. For example, if the display name is `west_coast.cisco.com`, enter the following:

**OPTIMIZE.west\_coast.cisco.com=full**

- To turn on optimization but preserve the object groups used in the ACE, replace the full keyword with `preserve_og`. For example:

**OPTIMIZE.west\_coast.cisco.com=preserve\_og**

- If you do not want to allow the merger of adjacent entries, enter the following:

**AclOptimization.doMerge=false**

**Step 3** Save the file. The settings take effect immediately and will be applied to all subsequent deployment jobs.

You can generate optimization reports for deployment jobs by selecting **Capture Discovery/Deployment Debugging Snapshots to File**, which is located in **Tools > Security Manager Administration > Debug Options**.

The deployment results will show optimization results summarized as an informational message that includes the original number of ACEs before optimization and the number of ACEs after optimization. The results are saved to a file on the server in the C:\Program Files\CSCOpX\MDC\temp folder. A job ID is used as part of the file name.

---

## Customizing defaults in the Add Access Rule dialog

Prior to Cisco Security Manager 4.13, the Add Access Rule dialog was populated with default values. Starting from 4.13, the user can customize the appearance of default values by updating the csm.properties file.

To customize defaults in the Add Access Rule dialog, perform the following steps:

---

**Step 1** Close and exit the Cisco Security Manager interface.

**Step 2** Use a text editor such as NotePad to open the **C:\Program Files\CSCOpX\MDC\athena\config\csm.properties** file.

**Step 3** Locate the CustDesk.Rule property at the bottom of the csm.properties file and set the values as true or false, based on your requirements:

- CustDesk.Rule.Add.Op.Load.Intf.Default.Values - Set this value as true to load the interface information by default in the Add Access rule dialog.
- CustDesk.Rule.Add.Op.Load.Other.Default.Values - Set this value as true to load the other values by default in the Add Access rule dialog.

**Step 4** Save the file.

**Note** The settings do not take effect immediately. Restart the Cisco Security Manager services for the customized default values to take effect.

**Step 5** Launch the Cisco Security Manager interface again.

---

## CHAPTER 17

# Managing Firewall Inspection Rules

Inspection rules configure protocol inspection on a device. Inspection opens temporary holes in your access rules to allow return traffic for connections initiated within your trusted network. When traffic is inspected, the device also implements additional controls to eliminate mal-formed packets based on the inspected protocols.

**Note** From version 4.17, though Cisco Security Manager continues to support PIX, FWSM, and IPS features/functionality, it does not support any enhancements.

The device commands generated for inspection rules vary based on device type. For devices running ASA, PIX 7.0+, and FWSM 3.x+, access-list, policy-map, and class-map commands are used. For older FWSM and PIX 6.3 devices, fixup commands are used. For IOS devices, ip-inspect commands are used.

The following topics will help you work with inspection rules:

- [Understanding Inspection Rules](#) , on page 765
- [Configuring Inspection Rules](#) , on page 769
- [Inspection Rules Page](#) , on page 772
- [Configuring Protocols and Maps for Inspection](#) , on page 785
- [Configuring Settings for Inspection Rules for IOS Devices](#) , on page 880

## Understanding Inspection Rules

Inspection rules configure Context-Based Access Control (CBAC) inspection commands. CBAC inspects traffic that travels through the device to discover and manage state information for TCP and UDP sessions. The device uses this state information to create temporary openings to allow return traffic and additional data connections for permissible sessions.

CBAC creates temporary openings in access lists at firewall interfaces. These openings are created when inspected traffic exits your internal network through the firewall. The openings allow returning traffic (that would normally be blocked) and additional data channels to enter your internal network back through the firewall. The traffic is allowed back through the firewall only if it is part of the same session as the original traffic that triggered inspection when exiting through the firewall.

Inspection rules are applied after your access rules, so any traffic that you deny in the access rule is not inspected. The traffic must be allowed by the access rules at both the input and output interfaces to be inspected.

Whereas access rules allow you to control connections at layer 3 (network, IP) or 4 (transport, TCP or UDP protocol), you can use inspection rules to control traffic using application-layer protocol session information.

For all protocols, when you inspect the protocol, the device provides the following functions:

- Automatically opens a return path for the traffic (reversing the source and destination addresses), so that you do not need to create an access rule to allow the return traffic. Each connection is considered a session, and the device maintains session state information and allows return traffic only for valid sessions. Protocols that use TCP contain explicit session information, whereas for UDP applications, the device models the equivalent of a session based on the source and destination addresses and the closeness in time of a sequence of UDP packets.

These temporary access lists are created dynamically and are removed at the end of a session.

- Tracks sequence numbers in all TCP packets and drops those packets with sequence numbers that are not within expected ranges.
- Uses timeout and threshold values to manage session state information, helping to determine when to drop sessions that do not become fully established. When a session is dropped, or reset, the device informs both the source and destination of the session to reset the connection, freeing up resources and helping to mitigate potential Denial of Service (DoS) attacks.

The following topics provide more information about inspection:

- [Choosing the Interfaces for Inspection Rules](#) , on page 766
- [Selecting Which Protocols To Inspect](#) , on page 767
- [Understanding Access Rule Requirements for Inspection Rules](#) , on page 768
- [Using Inspection To Prevent Denial of Service \(DoS\) Attacks on IOS Devices](#) , on page 769
- [Configuring Protocols and Maps for Inspection](#) , on page 785
- [Configuring Inspection Rules](#) , on page 769
- [Configuring Settings for Inspection Rules for IOS Devices](#) , on page 880

## Choosing the Interfaces for Inspection Rules

Configure inspection on devices that protect internal networks. Use it with TCP, UDP, or more specific protocols. Inspect these applications if you want the application's traffic to be permitted through the device only when the traffic session is initiated from a particular side of the device (usually from the protected internal network).

---

**Tip** For IOS devices, you need to configure inspection explicitly, and you can identify the direction of traffic to be inspected. For ASA, PIX, and FWSM devices, you cannot identify the direction, and you need to configure inspection only if you do not want the inspection defaults. In the remaining discussion, statements concerning direction apply only to IOS devices. For ASA, PIX, and FWSM, simply configure inspection on the identified interface.

---

In many cases, you will configure inspection in one direction only at a single interface, which causes traffic to be permitted back into the internal network only if the traffic is part of a permissible (valid, existing) session. This is a typical configuration for protecting your internal networks from traffic that originates on the Internet.

You can also configure inspection in two directions at one or more interfaces. Configure inspection in two directions when the networks on both sides of the firewall should be protected, such as with extranet or intranet configurations, and to protect against DoS attacks. For example, if the device is situated between two partner companies' networks, you might want to restrict traffic in one direction for certain applications, and restrict traffic in the opposite direction for other applications. If you are protecting a web server in the DMZ zone, you might want to configure deep inspection on HTTP traffic to identify and reset connections that have undesirable characteristics.

You might want to configure your inspection rules on the outbound interfaces of your network, those that connect to the Internet or another uncontrolled network, while allowing unfiltered connections within the trusted network. Thus, your devices use resources for inspection only on sessions that travel over unsecured and therefore potentially dangerous networks.

## Selecting Which Protocols To Inspect

You can generically inspect TCP and UDP, which covers all applications that use these protocols. However, you can also inspect more specific protocols. In some cases, inspecting a specific protocol provides better service than generic TCP/UDP inspection. TCP and UDP inspection do not recognize application-specific commands, and therefore might not permit all return packets for an application, particularly if the return packets have a different port number than the previous exiting packet.

For example:

- Some protocols allow you to configure deep inspection. Deep inspection allows you to configure more specific rules for a traffic stream. For example, you can drop HTTP connections where the content type of the request and response do not match. For information on deep inspection and your configuration options, see [Configuring Protocols and Maps for Inspection](#) , on page 785.
- Protocols that negotiate return channels, such as FTP, should be specifically inspected. If you use simple generic TCP inspection of FTP traffic, the negotiated channels are not opened, and the connection will fail. If you want to allow FTP, ensure that you create a specific inspection rule for it.

Multimedia protocols also negotiate return channels and should be specifically inspected. These include H.323, RTSP (Real Time Streaming Protocol), and other application-specific protocols. Some applications also use a generic TCP channel, so you might also need to configure generic TCP inspection. Any generic TCP inspection rule should appear below a more specific inspection rule in the table (that is, any rule that specifies TCP or UDP should appear at the end of the inspection rule table).

## Understanding Access Rule Requirements for Inspection Rules

Access rules are applied before inspection rules. Therefore, you must ensure that your access rules do not prohibit traffic that you want inspected. Use the following guidelines:

- Permit inspected traffic to leave the network through the firewall.

All access rules that evaluate traffic leaving the protected network should permit traffic that will be inspected. For example, if Telnet will be inspected, then Telnet traffic should be permitted on all access rules that apply to traffic leaving the network.

- Deny inspected return traffic entering the network through the firewall.

For temporary openings to be created in an access list, the access list should deny inspected return traffic because the inspection engine will open up temporary holes in the access lists for this traffic. (You want traffic to be normally blocked when it enters your network.)

- Permit or deny traffic that cannot be inspected, or that you do not want to inspect, as required by your network.

For example, if you do not want to inspect ICMP traffic, but you want to allow some ICMP traffic, configure your access rules to allow the traffic in both directions. Consider permitting at least these ICMP message types: echo reply (for ping commands), time-exceeded (for trace route), packet-too-big (for path MTU discovery), traceroute (for trace route), and unreachable (to notify that a host cannot be found).

- Add an access rule entry denying any network traffic from a source address matching an address on the protected network.

This is known as anti-spoofing protection because it prevents traffic from an unprotected network from assuming the identity of a device on the protected network.

- Add an entry denying broadcast messages with a source address of 255.255.255.255.

This entry helps to prevent broadcast attacks.

# Using Inspection To Prevent Denial of Service (DoS) Attacks on IOS Devices

**Note** From version 4.17, though Cisco Security Manager continues to support PIX, FWSM, and IPS features/functionality, it does not support any enhancements.

Inspecting packets at the application layer, and maintaining TCP and UDP session information, provides a device with the ability to detect and prevent certain types of network attacks such as SYN-flooding. A SYN-flood attack occurs when a network attacker floods a server with a barrage of requests for connection and does not complete the connection. The resulting volume of half-open connections can overwhelm the server, causing it to deny service to valid requests. Network attacks that deny access to a network device are called denial-of-service (DoS) attacks.

Inspection helps to protect against DoS attacks in other ways. Inspection looks at packet sequence numbers in TCP connections to see if they are within expected ranges and drops any suspicious packets. You can also configure inspection to drop half-open connections, which require firewall processing and memory resources to maintain. Additionally, inspection can detect unusually high rates of new connections and issue alert messages.

For IOS devices, you can configure several inspection setting parameters to fine-tune your defenses against SYN flooding and half-open connections. Configure the **Firewall > Settings > Inspection** policy. For details about each setting, see [Configuring Settings for Inspection Rules for IOS Devices](#), on page 880.

Inspection can also help by protecting against certain DoS attacks involving fragmented IP packets. Even though the firewall prevents an attacker from making actual connections to a given host, the attacker can disrupt services provided by that host. This is done by sending many non-initial IP fragments or by sending complete fragmented packets through a router with an ACL that filters the first fragment of a fragmented packet. These fragments can tie up resources on the target host as it tries to reassemble the incomplete packets. To fine-tune fragment inspection, configure an inspection rule for the **fragment** protocol and configure the maximum number of fragments you want to allow and a timeout value.

- [Configuring Inspection Rules](#), on page 769

## Configuring Inspection Rules

Inspection rules policies identify the traffic that will be inspected through an interface. Inspection tracks permitted sessions and opens temporary holes in your access rules to allow return traffic.

Inspection rules are processed after access rules, so any traffic dropped by an access rule is not inspected. You can also use deny rules to selectively exclude certain types of traffic from inspection. For example, you might create a deny inspection rule to prevent a specific class of DNS traffic from being inspected, while all other DNS traffic is inspected. The basic procedure is:

- Add a new deny rule before the default inspection rule for the specific protocol. For the Match Traffic By option, select Source and Destination Address and Port. Next, define the specific type of traffic by providing Source and Destination Network IP addresses, and selecting the desired Service type (for example, DNS-TCP). Finally, in the third screen of the inspection-rule wizard, select the appropriate protocol (for example, DNS).
- Now edit the default inspection rule (below your new deny rule in the table). Again select Source and Destination Address and Port for the Match Traffic By option. Be sure this is a Permit rule, provide an all-addresses option as the source and destination addresses, and enter IP as the Service type. In the third screen, keep the selected protocol; configure or remove the related map, as necessary.

See [Inspection Rules Page , on page 772](#) and [Add or Edit Inspect/Application FW Rule Wizard , on page 775](#) for additional information about this process.

- [Understanding Map Objects , on page 306](#)

### Before You Begin

You might have a set of inspection rules that you want to apply to all devices. To do this, you can create a shared rule and inherit its rules to each device's inspection rules policy. For more information, see [Creating a New Shared Policy , on page 219](#) and [Inheriting or Uninheriting Rules , on page 211](#).

- 
- Step 1** Do one of the following to open the [Inspection Rules Page , on page 772](#):
- (Device view) Select **Firewall > Inspection Rules** from the Policy selector.
  - (Policy view) Select **Firewall > Inspection Rules** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** Select the row after which you want to create the rule and click the **Add Row** button or right-click and select **Add Row**. This opens the [Add or Edit Inspect/Application FW Rule Wizard , on page 775](#).
- Tip** If you do not select a row, the new rule is added at the end of the local scope. You can also select an existing row and edit either the entire row or specific cells. For more information, see [Editing Rules , on page 605](#).
- Step 3** Select whether to apply the rule to all interfaces on the device or to only the interfaces you specify.
- If you elect to specify interfaces, enter the interface name or interface role, or click **Select** to select it from a list. For IOS devices, you also can select whether the rule applies in the Out direction (traffic leaving the interface). Use the In direction for all other device types.
- Step 4** Select the criteria you want to use for matching traffic. This determines what gets inspected based on this rule.

- **Default Protocol Ports**—Select this option if the protocol you are inspecting uses the default ports on your network.

If you want to constrain the inspection based on the source or destination address, also select **Limit inspection between source and destination IP addresses** (available only for ASA, PIX 7.x+, and FWSM 3.x+ devices). When you click **Next**, you are prompted for the source and destination addresses. You can specify **any** for source or destination if you are interested only in configuring the other value.

- **Custom Destination Ports**—Select this option if you want to associate additional non-default TCP or UDP ports with a given protocol, for example, treating TCP traffic on destination port 8080 as HTTP traffic. When you click **Next**, you are prompted for the port or port range.
- **Destination Address and Port (IOS devices only)**—Select this option if you want to associate additional non-default TCP or UDP ports with a given protocol only when the traffic is going to certain destinations, for example, if you want to treat TCP traffic on destination port 8080 as HTTP only when the traffic is going to server 192.168.1.10. When you click **Next**, you are prompted for the destination address and the port information.
- **Source and Destination Address and Port (PIX 7.x+, ASA, FWSM 3.x+)**—Select this option for the same reason you would select Destination Address and Port for IOS devices, although you have the additional option of identifying the source of the traffic. When you click **Next**, you are prompted for the source and destination addresses and the service port information.

**Note** For FWSM 2.x and PIX 6.3(x), you can select either Default Inspection Traffic or Custom Destination Ports only.

**Step 5** Click **Next**. If you selected anything other than Default Protocol Ports, fill in the required addressing and port information explained above and click **Next**. See [Add or Edit Inspect/Application FW Rule Wizard, Step 2](#), on page 777.

**Step 6** On the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page](#), on page 781, select the protocol you want to inspect from the list. Ensure that the Device Type field indicates that inspection is supported for that protocol on the devices to which you are assigning the rule. (If you assign a rule to an unsupported device type, the rule is ignored but you will get a validation warning).

If the protocol you select allows additional configuration, the **Configure** button becomes active. Click it to view and select your options. For more information, see [Configuring Protocols and Maps for Inspection](#), on page 785.

For IOS devices only:

- If you selected **Custom Destination Ports** or **Destination Address and Port** as the traffic match, you can select **custom protocol** as the protocol name and click **Configure** to assign a name to the configuration.
- You can configure additional alert, audit, and timeout settings that override those set in the inspection settings policy. You can also specify whether to inspect router generated traffic for a limited number of protocols. For more information about inspection settings, see [Configuring Settings for Inspection Rules for IOS Devices](#), on page 880.

**Step 7** Click **Finish** to save the rule.

**Step 8** If you did not select the right row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. For more information, see [Moving Rules and the Importance of Rule Order](#), on page 615.

---

### What to do next

From ASA 9.9.1, for cluster mode devices which are enabled with Security Gateway feature, the following list of centralized inspections are disabled:

- DCERPC
- NetBIOS
- PPTP
- RADIUS
- RSH
- SUNRPC
- TFTP
- XDMCP

During preview config, if inspection rules are configured for the unsupported devices, a validation error is displayed.

---

**Note** When there is rollback of device, the default dns policy-map configuration is automatically added to the device. Thus, after Cisco Security Manager processes the device rollback, on re-discovery of the device, the default dns-policy-map configuration is discovered in Cisco Security Manager.

---

## Inspection Rules Page

Use the Inspection Rules page to configure inspection rules for device interfaces. Inspection examines traffic that travels through the device to discover and manage state information for TCP and UDP sessions. The device uses this state information to create temporary openings to allow return traffic and additional data connections for permissible sessions.

---

**Note** With the release of Security Manager 4.4 and versions 9.0 and later of the ASA, the separate policies and objects for configuring IPv4 and IPv6 inspection rules were “unified,” meaning one set of inspection rules in which you can use either IPv4 or IPv6 addresses, or a mixture of both. (See [Policy Object Changes in Security Manager 4.4](#), on page 11 for additional information.) In Policy view, IPv4 and unified versions of the inspection policy type are provided. In addition, a utility that you can use to convert existing IPv4 policies is provided (see [Converting IPv4 Rules to Unified Rules](#), on page 624). The following descriptions apply to all versions of the inspection rule table, except where noted. If you assign an IPv4 inspection-rule shared policy to a 9.0+ device, you will no longer be able to assign unified versions of those policies to that device. Likewise, if you assign a unified inspection-rule shared policy to a 9.0+ device, you will no longer be able to assign IPv4 versions of those shared policies to that device--the device will not be included in the list of available devices on the Assignments tab for the shared policy.

---

Inspection rules are processed after your access rules. Thus, any traffic denied by an access rule is never inspected.

Read the following topics before you configure inspection rules:

- [Understanding Inspection Rules](#), on page 765
- [Choosing the Interfaces for Inspection Rules](#), on page 766

- [Selecting Which Protocols To Inspect](#) , on page 767
- [Understanding Access Rule Requirements for Inspection Rules](#) , on page 768
- [Using Inspection To Prevent Denial of Service \(DoS\) Attacks on IOS Devices](#) , on page 769
- [Configuring Inspection Rules](#) , on page 769

**Tip** Disabled rules are shown with hash marks covering the table row. When you deploy the configuration, disabled rules are removed from the device. For more information, see [Enabling and Disabling Rules](#) , on page 616.

### Navigation Path

To access the Inspection Rules page, do one of the following:

- (Device view) Select a device, then select **Firewall > Inspection Rules** from the Policy selector.
- (Policy view) Select **Firewall > Inspection Rules** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Policies > Inspection Rules**.

### Field Reference

*Table 196: Inspection Rules Page*

| Element                           | Description                                                                                                                                                                                                                                                          |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Expand all rows/Collapse all rows | Use these buttons to expand or collapse all sections in the rules table.<br><b>Note</b> The buttons are located in the upper-right corner of the Filter area above the inspection rules table.                                                                       |
| Conflict Indicator icons          | Identifies conflicts and provides a quick visual representation of the type of conflict. For more details, including types of conflicts and the actions you can take from this column, see <a href="#">Understanding Automatic Conflict Detection</a> , on page 742. |
| No.                               | The ordered rule number.                                                                                                                                                                                                                                             |

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Permit             | <p>Whether a rule identifies traffic that should be inspected based on the conditions set:</p> <ul style="list-style-type: none"> <li>• <b>Permit</b>—Identifies traffic that will be inspected. Shown as a green check mark.</li> <li>• <b>Deny</b>—Exempts the traffic from inspection. Your access rules will determine if the traffic is allowed or blocked. Shown as a red circle with slash.</li> </ul>                                                                                                                                                                  |
| Sources            | The sources of traffic for this rule; can be networks, security groups (ASA 9.0+ only), and users. Multiple entries are displayed on separate lines within the table cell.                                                                                                                                                                                                                                                                                                                                                                                                     |
| Destinations       | The destinations for this rule; can be networks and security groups (ASA 9.0+ only). Multiple entries are displayed on separate lines within the table cell.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Traffic Match      | <p>The type of matching used in the rule:</p> <ul style="list-style-type: none"> <li>• <b>default-inspection</b>—The rule inspects traffic based on the default port.</li> <li>• <b>TCP,UDP/port number</b>—The rule inspects traffic based on a custom port number.</li> <li>• <b>Service</b>—The rule inspects traffic based on a service specification or service object. Multiple entries are displayed as separate subfields within the table cell. See <a href="#">Understanding and Specifying Services and Service and Port List Objects</a> , on page 329.</li> </ul> |
| Interface          | The interfaces or interface roles to which the rule is assigned. <b>Global</b> indicates that the rule is assigned to all interfaces. Interface role objects are replaced with the actual interface names when the configuration is generated for each device. Multiple entries are displayed as separate subfields within the table cell. See <a href="#">Understanding Interface Role Objects</a> , on page 301.                                                                                                                                                             |
| Dir.               | <p>The direction of the traffic to which this rule applies:</p> <ul style="list-style-type: none"> <li>• <b>In</b>—Packets entering the interface.</li> <li>• <b>Out</b>—Packets exiting the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                             |
| Inspected Protocol | The protocol to be inspected and possibly some configuration settings for the protocol. You can right-click this cell and choose Edit Inspected Protocol to edit this; see <a href="#">Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page</a> , on page 781 for more information.                                                                                                                                                                                                                                                                         |
| Time Range         | The time range policy object assigned to the rule. This object defines the time window within which inspection occurs.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Category           | The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Description        | The description of the rule, if any.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Last Ticket(s)                            | Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see <a href="#">Ticket Management Page</a> , on page 584). |
| Page elements below the rules table       |                                                                                                                                                                                                                                                                                                                                                                                           |
| Query                                     | Click this button to run a policy query, which can help you evaluate your rules and identify ineffective rules. See <a href="#">Generating Policy Query Reports</a> , on page 625                                                                                                                                                                                                         |
| Find and Replace button (binoculars icon) | Click this button to search for various types of items within the table and to optionally replace them. See <a href="#">Finding and Replacing Items in Rules Tables</a> , on page 612.                                                                                                                                                                                                    |
| Up Row and Down Row buttons (arrow icons) | Click these buttons to move the selected rules up or down within a scope or section. For more information, see <a href="#">Moving Rules and the Importance of Rule Order</a> , on page 615.                                                                                                                                                                                               |
| Add Row button                            | Click this button to add a rule to the table after the selected row using the <a href="#">Add or Edit Inspect/Application FW Rule Wizard</a> , on page 775. If you do not select a row, the rule is added at the end of the local scope. For more information about adding rules, see <a href="#">Adding and Removing Rules</a> , on page 604.                                            |
| Edit Row button                           | Click this button to edit the selected rule. You can also edit individual cells. For more information, see <a href="#">Editing Rules</a> , on page 605.                                                                                                                                                                                                                                   |
| Delete Row button                         | Click this button to delete the selected rule.                                                                                                                                                                                                                                                                                                                                            |

## Add or Edit Inspect/Application FW Rule Wizard

Use the Add or Edit Inspect/Application FW Rule wizard to add and edit inspection rules. The wizard steps you through the process of configuring an inspection rule based on your selection in the **Match Traffic By** group on this page.

Read the following topics before you configure inspection rules:

- [Understanding Inspection Rules](#) , on page 765
- [Choosing the Interfaces for Inspection Rules](#) , on page 766
- [Selecting Which Protocols To Inspect](#) , on page 767
- [Understanding Access Rule Requirements for Inspection Rules](#) , on page 768
- [Using Inspection To Prevent Denial of Service \(DoS\) Attacks on IOS Devices](#) , on page 769
- [Configuring Inspection Rules](#) , on page 769

### Navigation Path

From the [Inspection Rules Page](#) , on page 772, click the **Add Row** button or select a row and click the **Edit Row** button.

### Related Topics

- [Add or Edit Inspect/Application FW Rule Wizard, Step 2](#) , on page 777
- [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page](#) , on page 781
- [Understanding Interface Role Objects](#) , on page 301
- [Editing Rules](#) , on page 605

### Field Reference

*Table 197: Add and Edit Inspect/Application FW Rule Wizard Step 1: Traffic Match Method*

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Rule             | Whether to enable the rule, which means the rule becomes active when you deploy the configuration to the device. Disabled rules are shown overlain with hash marks in the rule table. For more information, see <a href="#">Enabling and Disabling Rules</a> , on page 616.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Apply the Rule to       | <p>The interface to which the rule applies:</p> <ul style="list-style-type: none"> <li>• All Interfaces—Apply the rule to all interfaces. The rule becomes a global rule on ASA, PIX, and FWSM devices. For IOS devices, the rule is configured for each interface in the In direction.</li> <li>• Interface (PIX 7.x+, ASA, FWSM 3.x+, IOS)—Apply the rule only to those interfaces identified in the Interfaces field. Enter the name of the interface or the interface role, or click <b>Select</b> to select the interface or role from a list, or to create a new role. An interface must already be defined to appear on the list.</li> </ul> <p>For IOS devices only, you can select the direction of the traffic to which this rule applies, either traffic entering an interface (<b>In</b>) or exiting it (<b>Out</b>). For other devices, leave <b>In</b> as the direction.</p> |
| <b>Match Traffic By</b> | <p>How you want to identify the traffic to inspect. If you select something other than Default Protocol Ports (by itself), you are prompted for the other port or address information when you click <b>Next</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Element                                                                                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Default Protocol Ports<br>Limit inspection between source and destination IP addresses (PIX 7.x+, ASA, FWSM 3.x+) | <p>Inspect traffic based on the default ports assigned to a protocol. You will select a protocol on the next page ( <a href="#">Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page</a> , on page 781).</p> <p>You can also select <b>Limit inspection between source and destination IP addresses</b> to configure the inspection to occur only between a specified source and destination. Do not select this option if you want to inspect a protocol without applying any constraints to the inspected traffic.</p> <p>If you also select this option, the next page of the wizard is described in <a href="#">Add or Edit Inspect/Application FW Rule Wizard, Step 2</a> , on page 777.</p> |
| Custom Destination Ports                                                                                          | <p>Inspect traffic based on specified non-default TCP or UDP destination ports. Select this option if you want to associate additional TCP or UDP traffic with a given protocol, for example, treating TCP traffic on destination port 8080 as HTTP traffic.</p> <p>You will specify the protocol and port(s) on the next page of the wizard; see <a href="#">Add or Edit Inspect/Application FW Rule Wizard, Step 2</a> , on page 777.</p>                                                                                                                                                                                                                                                                          |
| Destination Address and Port (IOS devices only)                                                                   | <p>Inspect traffic on IOS devices based on destination IP address and port. Select this option if you want to associate additional non-default TCP or UDP ports with a given protocol only when the traffic is going to certain destinations, for example, if you want to treat TCP traffic on destination port 8080 as HTTP only when the traffic is going to server 192.168.1.10.</p>                                                                                                                                                                                                                                                                                                                              |
| Source and Destination Address and Port (PIX 7.x, ASA, FWSM 3.x)                                                  | <p>Inspect traffic on PIX 7.x+, ASA, and FWSM 3.x+ devices based on source and destination IP addresses and services. Select this option for the same reason you would select Destination Address and Port for IOS devices, although you have the additional option of identifying the source of the traffic.</p> <p>You will specify the action, sources, destinations, and Services on the next page of the wizard; see <a href="#">Add or Edit Inspect/Application FW Rule Wizard, Step 2</a> , on page 777 .</p>                                                                                                                                                                                                 |
| Category                                                                                                          | <p>The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Description                                                                                                       | <p>An optional description of the rule (up to 1024 characters).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Add or Edit Inspect/Application FW Rule Wizard, Step 2

The options presented on the second page of the Inspect/Application FW Rule Wizard depend on your **Match Traffic By** selection on the first page (see [Add or Edit Inspect/Application FW Rule Wizard](#) , on page 775). The possibilities are as follows:

- If you select Default Protocol Ports on the first page and *do not* select Limit inspection between source and destination IP addresses, the second page consists of the options described in [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page](#) , on page 781.
- If you select Default Protocol Ports on the first page and *do* select Limit inspection between source and destination IP addresses, the second page consists of the options described in the second table in this

section. (The third page will consist of the options described in [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page](#), on page 781.)

- If you select Custom Destination Ports on the first page, the second page consists of the options described in the first table in this section. (The third page will consist of the options described in [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page](#), on page 781.)
- If you select Source and Destination Address and Port on the first page, the second page consists of the options described in the second table in this section. (The third page will consist of the options described in [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page](#), on page 781.)

### Navigation Path

From the [Add or Edit Inspect/Application FW Rule Wizard](#), on page 775, select a Match Traffic By option and click Next.

### Field Reference

The following table describes the options presented on page 2 of the Inspect/Application FW Rule Wizard after you have selected **Custom Destination Ports** on the first page of the wizard (described in [Add or Edit Inspect/Application FW Rule Wizard](#), on page 775).

**Table 198: Add and Edit Inspect/Application FW Rule Wizard Step 2: Protocol and Port Page**

| Element  | Description                                                                                                                                                               |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol | The protocol for the ports you are specifying, either TCP, UDP, or both TCP/UDP.<br>When configuring Custom Destination Ports for an IOS device, you must select TCP/UDP. |

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ports   | <p>The port(s) used by the traffic you want to inspect. Valid values range from 1 to 65535.</p> <ul style="list-style-type: none"> <li>• Single—Specify one port number only.</li> <li>• Range—Specify a range of ports, for example, 10000-11000.</li> </ul> <p>When configuring custom ports, be aware that port ranges might not be supported on all platforms or OS versions. Any conflicts are identified during policy validation, not while you are editing this rule.</p> <p><b>Tip</b> If you specify a port or port range that conflicts with a pre-defined port mapping, the device does not allow the port to be remapped.</p> |

The following table describes the options presented on page 2 of the Inspect/Application FW Rule Wizard after you have selected **Default Protocol Ports** and **Limit inspection between source and destination IP addresses** on the first page of the wizard, and when you select **Source and Destination Address and Port** on the first page. The first page of the wizard is described in [Add or Edit Inspect/Application FW Rule Wizard](#), on page 775.

**Table 199: Add and Edit Inspect/Application FW Rule Wizard Step 2: Action, Sources, Destinations, and Services Page**

| Element | Description                                                                                                                                                                                                                                                                                                                                                                 |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action  | <p>Whether you are identifying traffic that should be inspected based on the conditions set. Typically, you will create Permit rules.</p> <ul style="list-style-type: none"> <li>• Permit—Identifies traffic that will be inspected.</li> <li>• Deny—Exempts the traffic from inspection. Your access rules will determine if the traffic is allowed or blocked.</li> </ul> |

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sources      | <p>Provide traffic sources for this rule; can be networks, security groups, and users. You can enter values or object names, or Select objects, for one or more of the following types of sources:</p> <ul style="list-style-type: none"> <li>• Network – You can specify a various network, host and interface definitions, either individually or as objects. If you Select an interface object as a source, the dialog box displays tabs to differentiate between hosts/networks and interfaces.</li> </ul> <p>The “All-Address” objects do not restrict the rule to specific hosts, networks, or interfaces. These addresses are IPv4 or IPv6 addresses for hosts or networks, network/host objects, interfaces, or interface roles.</p> <p><b>Note</b> You can only specify a fully qualified domain name (FQDN) by providing an FQDN network/host object, or a group object that includes an FQDN object. You cannot directly type in an FQDN.</p> <ul style="list-style-type: none"> <li>• Security Groups (ASA 9.0+) – Enter or Select the name or tag number for one or more source security groups for the rule, if any.</li> <li>• Users – Enter or Select the Active Directory (AD) user names, user groups, or identity user group objects for the rule, if any. You can enter any combination of the following: <ul style="list-style-type: none"> <li>• Individual user names: NetBIOS_DOMAIN\username</li> <li>• User groups (note the double \): NetBIOS_DOMAIN\\user_group</li> <li>• Identity user group object names.</li> </ul> </li> </ul> <p><b>Note</b> Enter more than one value in any of these fields by separating the items with commas.</p> <p>Each specification is combined with any others to limit traffic matches to only those flows that include all definitions. For example, specified user traffic originating from within a specified source address range.</p> |
| Destinations | <p>Provide traffic destinations for this rule; can be networks or security groups. As with Sources, you can enter values or object names, or Select objects, for one or more destinations of Network and Security Group (ASA 9.0+) type.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Services     | <p>The services that define the type of traffic upon which to act. You can enter or Select any combination of service objects and service types (which are typically a protocol and port combination).</p> <p>Enter more than one value by separating the items with commas.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Time Range   | <p>The name of a time range policy object that defines the times when this rule applies. The time is based on the system clock of the device. The feature works best if you use NTP to configure the system clock.</p> <p>Enter the name or click <b>Select</b> to select the object. If the object that you want is not listed, click the <b>Create</b> button to create it.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page

Use the Inspect/Application FW Rule wizard's inspected protocol page to configure the protocol monitored by this inspection rule.

The options in this section are presented when you add or edit a firewall inspection rule, and when you right-click the Inspected Protocol cell of an existing rule in the table on the [Inspection Rules Page](#), on page 772.

---

**Note** Beginning with version 4.9, Security Manager supports SIP protocol for ASA cluster devices running the software version 9.4.0 or later.

---

### Navigation Path

Do one of the following:

- In the [Add or Edit Inspect/Application FW Rule Wizard](#), on page 775, click Next until you reach this page.
- To open the Edit Inspected Protocols dialog box, right-click the Inspected Protocol cell of an inspection rule and choose **Edit Inspected Protocol**. If you select multiple rows, your changes replace the inspected protocol defined for all selected rules.

| Protocols table                    | <p>Lists the protocols that can be inspected. You can select one protocol per rule. The list includes information on the device operating systems that allow inspection of the protocol; do not select protocols that are not supported by the device type to which you will apply the inspection rule.</p> <p><b>Tip</b> For IOS devices, if you selected Custom Destination Ports or Destination Address and Port for the match type on the first page of the wizard, you can select <b>custom protocol</b> and click Configure to give your protocol a name. For other device types, select the protocol that you associate with the ports previously specified.</p> <p>The Options column displays configured options for the selected protocol, if any.</p> <p>The Group column provides additional information on the use of some of the protocols.</p>                                                                                                                                                                 |
| Selected Protocol Configure button | <p>Displays the protocol you selected. If the protocol allows additional configuration, the Configure button becomes active; click it to see your options, and click the Help button in the dialog box that is opened for information about the options. For more information about protocols that allow configuration, see <a href="#">Configuring Protocols and Maps for Inspection</a>, on page 785.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Rule Settings (IOS)                | <p>Additional settings for the rule if it is used on devices running Cisco IOS software. If you select Use Default Inspection settings, the IOS defaults, or the settings defined in the inspection settings policy (see <a href="#">Configuring Settings for Inspection Rules for IOS Devices</a>, on page 880), are used. These are the settings you can enable or disable:</p> <ul style="list-style-type: none"> <li>• Alert—Whether to generate stateful packet inspection alert messages on the console.</li> <li>• Audit—Whether audit trail messages are logged to the syslog server or router.</li> <li>• Timeout—Whether to configure the length of time, in seconds, for which a session is managed while there is no activity. If you select Specify Timeout, enter the timeout value; the range is 5 to 43200 seconds.</li> <li>• Inspect Router Generated Traffic—Whether to inspect traffic that is generated by the device itself. This option is available for a limited number of the protocols.</li> </ul> |

## Configure DNS Dialog Box

Use the Configure DNS dialog box to configure settings for DNS inspection on PIX 7.0+, ASA, FWSM, and IOS devices.

### Navigation Path

Go to the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page](#), on page 781, select DNS in the protocols table, and click **Configure**.

*Table 201: Configure DNS Dialog Box*

| Element                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum DNS Packet Length      | The maximum DNS packet length. Values are 512 to 65535.                                                                                                                                                                                                                                                                                                                                                                           |
| DNS Map                        | The DNS policy map object that defines traffic match conditions and actions, protocol conformance policies, and filter settings. Enter the object name, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.                                                                                                                                              |
| Enable Dynamic Filter Snooping | Whether to allow the security appliance to snoop DNS packets in order to build a database of DNS lookup information. This information is used by botnet traffic filtering to match DNS names to IP addresses.<br><br>If you configure a botnet traffic filtering rules policy, select this option. Otherwise, do not select the option. For more information, see <a href="#">Botnet Traffic Filter Rules Page</a> , on page 913. |

## Configure SMTP Dialog Box

Use the SMTP dialog box to edit settings for Simple Mail Transfer Protocol (SMTP) inspection. SMTP is used to transfer email between servers and clients on the Internet.

SMTP inspection drops any packets with illegal commands. You can configure a maximum data length for packets. Enter a length in the range 0-4294967295.

### Navigation Path

Go to the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page](#) , on page 781, select SMTP in the protocols table, and click **Configure**.

## Configure ESMTP Dialog Box

Use the Configure ESMTP dialog box to edit settings for Extended Simple Mail Transport Protocol (ESMTP) inspection. You can configure these settings based on platform:

- IOS devices—You can configure a maximum data length for packets. Enter a length in the range 0-4294967295.
- ASA/PIX 7.x+ devices—You can specify an ESMTP policy map object to define deep inspection parameters. Enter the name of the object or click **Select** to select it from a list or to create a new object.

### Navigation Path

Go to the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page](#) , on page 781, select ESMTP in the protocols table, and click **Configure**.

## Configure Fragments Dialog Box

Use the Configure Fragments dialog box to edit settings for fragment inspection on IOS devices.

### Navigation Path

Go to the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page](#), on page 781, select fragment in the protocols table, and click **Configure**.

### Field Reference

*Table 202: Configure Fragments Dialog Box*

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum Fragments | The maximum number of unassembled packets for which state information (structures) is allocated by Cisco IOS software. Unassembled packets are packets that arrive at the router interface before the initial packet for a session. Values are 0-10000 state entries. The default is 256.<br><br><b>Note</b> Memory is allocated for the state structures, and setting this value to a larger number may cause memory resources to be exhausted. |
| Timeout (sec)     | The number of seconds that a packet state structure remains active. When the timeout value expires, the router drops the unassembled packet, freeing that structure for use by another packet. Values are 1-1000. The default timeout value is one second.                                                                                                                                                                                       |

## Configure IMAP or POP3 Dialog Boxes

Use the Configure IMAP or POP3 dialog boxes to edit settings for Internet Message Access Protocol (IMAP) or Post Office Protocol 3 (POP3) inspection on IOS devices.

- IMAP is a method for accessing electronic mail or bulletin board messages that are kept on a mail server that may be shared. It permits a client email program to access remote messages as though they were local.
- POP3 is used to receive email that is stored on a mail server. Unlike IMAP, POP retrieves mail only from a remote host.

### Navigation Path

Go to the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page](#), on page 781, select IMAP or POP3, and click **Configure**.

### Field Reference

*Table 203: Configure IMAP or POP3 Dialog Boxes*

| Element                                      | Description                                                                                                                                                                                    |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reset Connection on Invalid IMAP/POP3 packet | Whether to reset, or drop, the connection between the client and server if an invalid packet is encountered. The client will have to repeat the validation process to reconnect to the server. |
| Enforce Secure Authentication                | Whether to require that the client use a secure login to the server, that is, so that passwords are not sent in clear text.                                                                    |

## Configure RPC Dialog Box

Use the RPC dialog box to edit settings for RPC inspection on IOS devices. RPC inspection blocks traffic for all RPC programs except for those you specify. To allow more than one RPC program, create a rule for each program number you want to allow.

### Navigation Path

Go to the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page](#), on page 781, select RPC in the protocols table, and click **Configure**.

### Field Reference

*Table 204: Configure RPC Dialog Box*

| Element        | Description                                                                                                                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Program Number | The program number to permit. Values are 1-4294967295.                                                                                                                                                         |
| Wait Time      | The number of minutes to keep a hole in the firewall open to allow subsequent connections from the same source address to the same destination address and port. Values are 0-35791 minutes. The default is 0. |

## Custom Protocol Dialog Box

Use the Custom Protocol dialog box to assign a name to the protocol and port specification you made on the [Add or Edit Inspect/Application FW Rule Wizard, Step 2](#), on page 777 for IOS devices.

### Navigation Path

Go to the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page](#), on page 781, select custom protocol in the protocols table, and click **Configure**.

## Configure Dialog Box

Use the Configure dialog box to select a policy map object for HTTP or IM inspection. The maps used for these types of inspection differ depending on the operating system version used on the device. Select the desired version and then click **Select** to select the desired policy map object or to create a new one.

### Navigation Path

Go to the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page](#), on page 781, select HTTP or IM in the protocols table, and click **Configure**.

# Configuring Protocols and Maps for Inspection

When you configure inspection rules for a device, you select the protocols that you want to inspect. Some of these protocols allow additional configuration for deep inspection. Deep inspection allows you to specify additional requirements that packets must meet in order to traverse the device. For example, you can drop

HTTP connections where the content type of the request and response do not match. (For a full list of inspectible protocols, click **Add Row** on the Inspection Rule page and click Next to view the protocols list.)

What you can configure depends not only on the protocol but on the device's operating system and version number. Typically, your ability to fine-tune inspection is higher on an ASA device compared to an IOS device. (If you are configuring an IOS device and you want greater control over inspection, consider configuring zone-based firewall inspection; for more information, see [Understanding the Zone-based Firewall Rules](#), on page 931.)

Some deep inspection configuration is done directly in the inspection rule. However, for some protocols, you can configure the inspection rule to include a policy map that you create as an independent policy object. (You need to configure policy maps only if you want something other than the default inspection options.) You can configure these maps from the policy object selector dialog box while configuring the policy, or from the Policy Object Manager window (select **Manage > Policy Objects**).

For protocols that use policy maps, you can select the desired policy map, which defines the match conditions for the targeted traffic. For ASA, PIX, and FWSM devices, these policy maps might point to class maps that define the match conditions. To create these policy maps in the Policy Object Manager, select one of the maps listed in the following table in the **Maps > Policy Maps > Inspect** folder and review the detailed usage information in the references mentioned. For information on creating class maps, which are in the **Maps > Class Maps > Inspect** folder, see the references to the match criterion dialog boxes and [Configuring Class Maps for Inspection Policies](#), on page 790.

**Table 205: Configuring Protocols for Deep Inspection in Inspection Rules**

| Protocol   | Device Types        | Policy Map | Class Map(ASA, PIX, FWSM only) | Description and Match Criteria Reference                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------|---------------------|------------|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DNS        | ASA, PIX, FWSM, IOS | DNS        | DNS                            | Inspect traffic based on a wide variety of criteria using the class and policy map, which allow extensive control over DNS packets. In addition, you can configure a maximum length in the inspection rule, and enable dynamic DNS snooping for use with Botnet rules (on ASA devices). See the following topics: <ul style="list-style-type: none"> <li>• <a href="#">Configuring DNS Maps</a>, on page 794</li> <li>• <a href="#">DNS Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes</a>, on page 799</li> <li>• <a href="#">Configure DNS Dialog Box</a>, on page 782</li> </ul> |
| FTP Strict | ASA, PIX, FWSM, IOS | FTP        | FTP                            | Inspect traffic based on file name, type, server, user, or FTP command. See <a href="#">Configuring FTP Maps</a> , on page 805 and <a href="#">FTP Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes</a> , on page 806.                                                                                                                                                                                                                                                                                                                                                                |

| Protocol                    | Device Types                  | Policy Map                                                                  | Class Map(ASA, PIX, FWSM only) | Description and Match Criteria Reference                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------|-------------------------------|-----------------------------------------------------------------------------|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GTP                         | ASA, PIX, FWSM, IOS           | GTP                                                                         | GTP                            | Inspect traffic based on timeout values, message sizes, tunnel counts, and GTP versions traversing the security appliance. See <a href="#">Configuring GTP Maps , on page 809</a> and <a href="#">GTP Policy Maps Add or Edit Match Condition and Action Dialog Boxes , on page 813</a> .                                                                                                                                                                                                                                                                                                                                                                           |

The maps used differ based on the operating system and version.<br><br><b>For ASA/PIX 7.2+</b> , see <a href="#">Configuring HTTP Maps for ASA 7.2+ and PIX 7.2+ Devices , on page 829</a> and <a href="#">HTTP Class and Policy Map (ASA 7.2+/PIX 7.2+) Add or Edit Match Condition (and Action) Dialog Boxes , on page 831</a> .<br><br><b>For ASA/PIX 7.1.x, FWSM 3.x+, and IOS</b> , see <a href="#">Configuring HTTP Maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x and IOS Devices , on page 821</a> . |
| SIP                         | ASA, PIX, FWSM                | SIP (ASA, PIX, FWSM)                                                        | SIP (ASA, PIX, FWSM)           | Inspect traffic based on a wide variety of criteria. See <a href="#">Configuring SIP Maps , on page 849</a> and <a href="#">SIP Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes , on page 851</a>                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Skinny                      | ASA, PIX, FWSM, IOS           | Skinny                                                                      | (none)                         | Inspect traffic based on a wide variety of criteria. See <a href="#">Configuring Skinny Maps , on page 854</a> and <a href="#">Skinny Policy Maps Add or Edit Match Condition and Action Dialog Boxes , on page 856</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| SMTP                        | ASA, PIX 7.x+, FWSM 3.x+, IOS | (none)                                                                      | (none)                         | Inspect Simple Mail Transfer Protocol (SMTP) traffic and drop any that use illegal commands. You can configure a maximum data length for packets. See <a href="#">Configure SMTP Dialog Box , on page 783</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Protocol           | Device Types                  | Policy Map         | Class Map(ASA, PIX, FWSM only) | Description and Match Criteria Reference                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|-------------------------------|--------------------|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNMP               | ASA, PIX, FWSM 3.x+, IOS      | SNMP               | (none)                         | Inspect SNMP traffic based on SNMP version. See <a href="#">Configuring SNMP Maps</a> , on page 857.                                                                                                                                                                                                                                                                                                                                         |
| NetBIOS            | ASA, PIX 7.x+, FWSM           | NetBIOS            | (none)                         | Inspect NetBIOS traffic to translate IP addresses in the NetBIOS name service (NBNS) packets according to the security appliance NAT configuration. You can drop packets that violate the protocol. See <a href="#">Configuring NetBIOS Maps</a> , on page 847.                                                                                                                                                                              |
| IPSec Pass Through | ASA, PIX 7.x+                 | IPsec Pass Through | (none)                         | Inspect IPSec traffic and control whether ESP or AH traffic is allowed. See <a href="#">Configuring IPsec Pass Through Maps</a> , on page 846.                                                                                                                                                                                                                                                                                               |
| DCE/RPC            | ASA 7.2+, PIX 7.2+, FWSM 3.2+ | DCE/RPC            | (none)                         | Inspect traffic based on timeouts and enforcing the mapper service. See <a href="#">Configuring DCE/RPC Maps</a> , on page 791.                                                                                                                                                                                                                                                                                                              |
| IP options         | ASA 8.2(2)+                   | IP Options         | (none)                         | Allow IP packets that have certain options configured in the Options section of the IP header. In routed mode, packets that contain the router-alert option are allowed. Otherwise, if any option is set, packets are dropped. IP options are unnecessary for most communication, but the NOP (no operation) option might be used for padding, so you might want to allow it. See <a href="#">Configuring IP Options Maps</a> , on page 840. |
| IPv6               | ASA 8.4(2)+                   | IPv6               | (none)                         | Inspect IPv6 traffic based on the following types of extension headers found anywhere in an IPv6 packet: Hop-by-Hop Options, Routing (Type 0), Fragment, Destination Options, Authentication, and Encapsulating Security Payload. See <a href="#">Configuring IPv6 Maps</a> , on page 842 and <a href="#">IPv6 Policy Maps Add or Edit Match Condition and Action Dialog Boxes</a> , on page 844.                                            |
| ESMTP              | ASA, PIX 7.x+, FWSM 3.x+, IOS | ESMTP              | (none)                         | Inspect ESMTP traffic. For IOS, you can configure only maximum data length. For ASA, PIX, FWSM, you can inspect traffic based on a wide variety of criteria. See <a href="#">Configure ESMTP Dialog Box</a> , on page 783.                                                                                                                                                                                                                   |
| Fragment           | IOS                           | (none)             | (none)                         | Inspect traffic based on a maximum allowed number of unassembled packet fragments. See <a href="#">Configure Fragments Dialog Box</a> , on page 783.                                                                                                                                                                                                                                                                                         |

| Protocol                                                                 | Device Types       | Policy Map                              | Class Map(ASA, PIX, FWSM only) | Description and Match Criteria Reference                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------------------------------------|--------------------|-----------------------------------------|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IMAP (Internet Message Access Protocol)<br>POP3 (Post Office Protocol 3) | IOS                | (none)                                  | (none)                         | Inspect traffic based on invalid commands or clear text logins. See <a href="#">Configure IMAP or POP3 Dialog Boxes</a> , on page 784.                                                                                                                                                                                                                                                                                                                                |

## Configuring Class Maps for Inspection Policies

Use the Add and Edit Class Map dialog boxes to define class maps to be used in policy maps of the same type. The name of the dialog box indicates the type of map you are creating.

A class map defines application traffic based on criteria specific to the application. You then select the class map in the corresponding policy map and configure the action to take for the selected traffic. Thus, each class map must contain traffic that you want to handle in the same way (for example, to allow it or to drop it).

When configuring inspection rules for devices running ASA/PIX 7.2 or later, or FWSM, you can create class maps for the inspection of the following types of traffic: DNS, FTP, H.323, HTTP, IM, SIP, and ScanSafe.

You can also define class criteria in the related policy map. However, creating class maps allows you to reuse the map in multiple policy maps.

The following topics describe the available match criteria:

- [DNS Class and Policy Maps Add or Edit Match Condition \(and Action\) Dialog Boxes](#) , on page 799
- [FTP Class and Policy Maps Add or Edit Match Condition \(and Action\) Dialog Boxes](#) , on page 806
- [H.323 Class and Policy Maps Add or Edit Match Condition \(and Action\) Dialog Boxes](#) , on page 819
- [HTTP Class and Policy Map \(ASA 7.2+/PIX 7.2+\) Add or Edit Match Condition \(and Action\) Dialog Boxes](#) , on page 831
- [IM Class and Policy Map \(ASA 7.2+/PIX 7.2+\) Add or Edit Match Condition \(and Action\) Dialog Boxes](#) , on page 836
- [SIP Class and Policy Maps Add or Edit Match Condition \(and Action\) Dialog Boxes](#) , on page 851
- [Diameter Class and Policy Maps Add or Edit Match Condition \(and Action\) Dialog Boxes](#) , on page 863

### Navigation Path

Select **Manage > Policy Objects**, then select DNS, FTP, H.323 (ASA/PIX/FWSM), HTTP (ASA/PIX/FWSM), IM, SIP (ASA/PIX/FWSM), Diameter in the **Maps > Class Maps > Inspect** folder in the table of contents. Right-click inside the work area, then select **New Object**, or right-click a row, then select **Edit Object**.

## Configuring DCE/RPC Maps

Use the Add or Edit DCE/RPC Map dialog boxes to define a map for DCE/RPC inspection. A DCE/RPC inspection policy map lets you change the default configuration values used for DCE/RPC inspection.

DCE/RPC is a protocol widely used by Microsoft distributed client and server applications that allows software clients to execute programs on a server remotely.

This typically involves a client querying a server called the Endpoint Mapper listening on a well-known port number for the dynamically allocated network information of a required service. The client then sets up a secondary connection to the server instance providing the service. The security appliance allows the appropriate port number and network address and also applies NAT, if needed, for the secondary connection.

DCE/RPC inspection maps inspect for native TCP communication between the EPM and client on well-known TCP port 135. Map and lookup operations of the EPM are supported for clients. Client and server can be

located in any security zone. The embedded server IP address and port number are received from the applicable EPM response messages. Because a client may attempt multiple connections to the server port returned by EPM, multiple use of pinholes are allowed, which have user configurable timeouts.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > DCE/RPC** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

## DCE/RPC Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes

Use the Add or Edit DCE/RPC Match Criterion (for DCE/RPC class maps) or Match Condition and Action (for DCE/RPC policy maps) dialog boxes to do the following:

- Define the match criterion and value for a DCE/RPC class map.
- Select a DCE/RPC class map when creating a DCE/RPC policy map.
- Define the match criterion, value, and action directly in a DCE/RPC policy map.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

### Navigation Path

When creating a DCE/RPC class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for DCE/RPC, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring Class Maps for Inspection Policies](#) , on page 790.

When creating a DNS policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit DNS Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring DCE/RPC Maps](#) , on page 791.

You can use this option alone or with one of the other actions.</li> <li>• Reset and Log— Perform the reset and log actions.</li> </ul>                                                                     |

## Configuring DNS Maps

Use the Add and Edit DNS Map dialog boxes to define DNS Maps for inspection. A DNS map lets you change the default configuration values used for DNS application inspection.

DNS application inspection supports DNS message controls that provide protection against DNS spoofing and cache poisoning. You can configure rules for certain DNS types to be allowed, dropped, or logged, while others are blocked. For example, you can restrict zone transfer between servers.

The Recursion Desired and Recursion Available flags in the DNS header can be masked to protect a public server from attack if that server only supports a particular internal zone. In addition, DNS randomization can be enabled to avoid spoofing and cache poisoning of servers that either do not support randomization or that use a weak pseudo random number generator. Limiting the domain names that can be queried protects the public server further.

You can configure a DNS mismatch alert as notification if an excessive number of mismatching DNS responses are received, which could indicate a cache poisoning attack.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > DNS** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                            |
| Allow Value Override per Device Overrides Edit button                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.</p> <p>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p> |

## DNS Map Protocol Conformance Tab

Use the Protocol Conformance tab to define DNS security settings and actions for a DNS map.

### Navigation Path

Click the Protocol Conformance tab on the Add and Edit DNS Map dialog boxes. See [Configuring DNS Maps](#) , on page 794.

### Related Topics

- [Understanding Map Objects](#) , on page 306
- [Configuring Protocols and Maps for Inspection](#) , on page 785

### Field Reference

*Table 210: DNS Map Protocol Conformance Tab*

| Element                   | Description                                                                                                                                                                          |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable DNS Guard Function | Whether to perform a DNS query and response mismatch check using the identification field in the DNS header. One response per query is allowed to go through the security appliance. |

| Element                                                       | Description                                                                                                                                                                                     |
|---------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Generate Syslog for ID Mismatch                               | Whether to create syslog entries for excessive instances of DNS identifier mismatches.                                                                                                          |
| Randomize the DNS Identifier for DNS Query                    | Whether to randomize the DNS identifier in the DNS query message.                                                                                                                               |
| Enable NAT Rewrite Function                                   | Whether to enable IP address translation in the A record of the DNS response.                                                                                                                   |
| Enable Protocol Enforcement                                   | Whether to enable DNS message format check, including domain name, label length, compression, and looped pointer check.                                                                         |
| Enable DNS on TCP                                             | Whether to enable inspection of DNS over TCP traffic. Ensure that DNS/TCP port 53 traffic is part of the class to which you apply DNS inspection. The inspection default class includes TCP/53. |
| Require Authentication Between DNS Server (RFC2845)<br>Action | Whether to require authentication between DNS servers as defined in RFC 2845. If you select this option, select the action to take when there is no authentication.                             |

## DNS Map Filtering Tab

Use the Filtering tab to define DNS filtering settings and actions for a DNS map.

### Navigation Path

Click the Filtering tab on the Add and Edit DNS Map dialog boxes. See [Configuring DNS Maps](#), on page 794.

| Element                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Umbrella Connector Tag for Umbrella Policy | Select the check box and enter the DNS policy-map umbrella tag name. The tag name can be a maximum of 50 characters. Cisco Security manager throws an error message if the tag name is greater than 50 characters.<br><br><b>Note</b> If the Umbrella global policy is not configured, Cisco Security Manager displays activity validation error. For more information on Umbrella global policy configuration, see <a href="#">Configuring Umbrella Global Policy, on page 1926</a> .                                                              |
| Enable Fail-Open                                  | Select this check box if you want DNS resolution to work when the Umbrella DNSserver is unavailable.<br><br>When fail-open is selected, if the Cisco Umbrella DNS server is unavailable, Umbrella disables itself on this policy map and allows DNS requests to go to the other DNS servers configured on the system, if any. When the Umbrella DNS servers are available again, the policy map resumes using them. If you do not select this option, DNS requests continue to go to the unreachable Umbrella resolver and will not get a response. |

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Device ID       | <p>The device ID is generated after a successful registration of the device with the umbrella server. The ID is displayed in this field only after you rediscover the device in the Cisco Security Manager.</p> <p><b>Note</b> Whenever there is a change in the device ID, ensure to rediscover the device in Cisco Security Manager to be in sync with the change.</p>                                                                                                                                                                                                                                                        |
| Enable DNScrypt | <p>Select this check box to enable the DNS crypt in the Umbrella datapath. For every hour, the secret key is exchanged between the key exchange thread and the Umbrella resolver.</p> <p>Ensure that the Enable Umbrella Connector check box is selected. If the check box is not selected, an error message is displayed for configuration discrepancy.</p> <p><b>Note</b> If the Umbrella global policy is not configured, Cisco Security Manager displays activity validation error. For more information on Umbrella global policy configuration, see <a href="#">Configuring Umbrella Global Policy, on page 1926</a>.</p> |

## DNS Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes

Use the Add or Edit DNS Match Criterion (for DNS class maps) or Match Condition and Action (for DNS policy maps) dialog boxes to do the following:

- Define the match criterion and value for a DNS class map.
- Select a DNS class map when creating a DNS policy map.
- Define the match criterion, value, and action directly in a DNS policy map.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

### Navigation Path

When creating a DNS class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for DNS, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring Class Maps for Inspection Policies , on page 790](#).

When creating a DNS policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit DNS Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring DNS Maps , on page 794](#).

| Resource Record | Lists the sections to match: <ul style="list-style-type: none"> <li>• Additional—DNS additional resource record.</li> <li>• Answer—DNS answer resource record.</li> <li>• Authority—DNS authority resource record.</li> </ul> |

## Configuring ESMTP Maps

Use the Add and Edit ESMTP Map dialog boxes to define the match criterion and values for the ESMTP inspect map. An ESMTP policy map lets you change the default configuration values used for ESMTP inspection.

ESMTP inspection detects attacks, including spam, phishing, malformed message attacks, and buffer overflow/underflow attacks. It also provides support for application security and protocol conformance, which enforce the sanity of the ESMTP messages as well as detect several attacks, block senders/receivers, and block mail relay.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > ESMTP** from the Object Type selector. Right-click inside the table, then select **New Object** or right-click a row and select **Edit Object**.

For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.</p> <p>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p> |

## ESMTP Policy Maps Add or Edit Match Condition and Action Dialog Boxes

Use the Add or Edit Match Condition and Action dialog boxes to define the match criterion, value, and action for an ESMTP policy map.

The fields on this dialog box change based on the criterion you select. You can use the following criteria:

- Body Length—Matches the message body length.
- Body Line Length—Matches the length of a line in the message body.
- Commands—Matches ESMTP commands.
- Command Recipient Count—Matches the number of recipient email addresses.
- Command Line Length—Matches the number of characters of a command line.
- EHLO Reply Parameters—Matches the ESMTP EHLO reply parameters.
- Header Length—Matches the number of characters of the header.

- Header Line Length—Matches the number of characters of a line in the message header.
- To Recipients Count—Matches the number of recipients in the To field of the header.
- Invalid Recipients Count—Matches the number of invalid recipients in the header.
- MIME File Type—Matches the MIME file type.
- MIME Filename Length—Matches the number of characters of the filename.
- MIME Encoding—Matches the MIME encoding scheme.
- Sender Address—Matches the address of the sender.
- Sender Address Length—Matches the number of characters of the sender’s address.

### Navigation Path

In the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit ESMTP Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring ESMTP Maps](#), on page 802.

**Table 215: ESMTP Policy Maps Add and Edit Match Condition and Action Dialog Boxes**

| Element                                                                                                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion                                                                                                                                                  | Specifies which criterion of ESMTP traffic to match. The criteria are described above.                                                                                                                                                                                                                                                                                           |
| Type                                                                                                                                                       | Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn’t Match is selected on the string “example.com,” then any traffic that contains “example.com” is excluded from the map. <ul style="list-style-type: none"> <li>• Matches—Matches the criterion.</li> <li>• Doesn’t Match—Does not match the criterion.</li> </ul> |
| Action                                                                                                                                                     | The action you want the device to take for traffic that matches the defined criteria.                                                                                                                                                                                                                                                                                            |
| <b>Variable Fields</b><br>The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see. |                                                                                                                                                                                                                                                                                                                                                                                  |

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Greater Than Length | The length in bytes of the evaluated field. The criterion matches if the length is greater than the specified number, and does not match if the field is less than the specified number.<br><br>The dialog box indicates the valid range for the length, except for Body Length and Header length, which can be 1 to 4294967295.                                                                                                                                                                                                                                                                                                                                                                                                             |
| Commands            | The ESMTP command verbs you want to inspect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Greater Than Count  | The number of evaluated items. The criterion matches if the count is greater than the specified number, and does not match if the count is less than the specified number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Parameters          | The ESMTP EHLO reply parameters you want to inspect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Value               | The regular expression you want to evaluate. You can select one of the following: <ul style="list-style-type: none"> <li>• Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.</li> <li>• Regular Expression Group—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression group object.</li> </ul> |
| MIME Encoding       | The type of MIME encoding schemes you want to inspect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Configuring FTP Maps

Use the Add and Edit FTP Map dialog boxes to define the match criterion and values for an FTP inspect map. You can use an FTP map to block specific FTP protocol methods, such as an FTP PUT, from passing through the security appliance and reaching your FTP server.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > FTP** from the Object Type selector. Right-click inside the table, then select **New Object** or right-click a row, then select **Edit Object**.

Select the platform for which you intend to use this object and click <b>Validate</b> to determine if the object is configured in a way that will prevent policy deployment.                                                                                                                                                                                                                                                                    |

## FTP Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes

Use the Add or Edit FTP Match Criterion (for FTP class maps) or Match Condition and Action (for FTP policy maps) dialog boxes to do the following:

- Define the match criterion and value for an FTP class map.
- Select an FTP class map when creating an FTP policy map.
- Define the match criterion, value, and action directly in an FTP policy map.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

### Navigation Path

When creating an FTP class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for FTP, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring Class Maps for Inspection Policies](#), on page 790.

When creating an FTP policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit FTP Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring FTP Maps](#), on page 805.

| <p><b>Variable Fields</b></p> <p>The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Request Commands                                                                                                                                                      | <p>The FTP commands you want to inspect:</p> <ul style="list-style-type: none"> <li>• Append (APPE)—Appends to a file.</li> <li>• Delete (DELE)—Deletes a file at the server site.</li> <li>• Help (HELP)—Provides help information from the server.</li> <li>• Put (PUT)—FTP client command for the stor (store a file) command.</li> <li>• Rename From (RNFR)—Specifies rename-from filename.</li> <li>• Server Specific Command (SITE)—Specifies commands that are server specific. Usually used for remote administration.</li> <li>• Change to Parent (CDUP)—Changes to the parent directory of the current working directory.</li> <li>• Get (GET)—FTP client command for the retr (retrieve a file) command.</li> <li>• Create Directory (MKD)—Creates a directory.</li> <li>• Remove Directory (RMD)—Removes a directory.</li> <li>• Rename To (RNTO)—Specifies rename-to filename.</li> <li>• Store File with Unique Name (STOU)—Stores a file with a unique filename.</li> </ul> |
| Value                                                                                                                                                                 | <p>The regular expression you want to evaluate. You can select one of the following:</p> <ul style="list-style-type: none"> <li>• Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.</li> <li>• Regular Expression Group—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression group object.</li> </ul>                                                                                                                                                                                                                                        |

## Configuring GTP Maps

Use the Add and Edit GTP Map dialog boxes to define the match criterion and values for a GTP inspect map.

The GPRS Tunnel Protocol (GTP) provides uninterrupted connectivity for mobile subscribers between GSM networks and corporate networks or the Internet. GTP uses a tunneling mechanism to provide a service for carrying user data packets.

A GTP map object lets you change the default configuration values used for GTP application inspection. The GTP protocol is designed to provide security for wireless connections to TCP/IP networks such as the Internet. You can use a GTP map to control timeout values, message sizes, tunnel counts, and GTP versions traversing the security appliance.

Starting from version 4.18, Cisco Security Manager supports anti-replay feature of ASA 9.10.1. By enabling data packet replay, your network is protected from replay attacks.

**Tip** GTP inspection requires a special license. If you do not have the required license, you will see device errors if you try to deploy a GTP map.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > GTP** from the Object Type selector. Right-click inside the work area, then select **New Object**, or right-click a row and select **Edit Object**.

| Validate For<br>Validate button                             | <p>The device platforms for which to validate the object. Select the platform for which you intend to use this object and click <b>Validate</b> to determine if the object is configured in a way that will prevent policy deployment.</p>                                                                                                                                                                                                                                                           |

## Add and Edit Country Network Codes Dialog Boxes

Use the Add and Edit Country Network Codes dialog boxes to add Mobile Country Code (mcc) and Mobile Network Code (mnc) values to the GTP policy map. The codes can be 000 to 999.

### Navigation Path

From the Add and Edit GTP Map dialog boxes, click the **Add** button in the Country and Network codes table, or select a row and click the **Edit** button. See [Configuring GTP Maps](#), on page 809.

## Add and Edit Permit Response Dialog Boxes

Use the Add and Edit Permit Response dialog boxes to permit GTP responses from a GSN that is different from the one to which the response was sent.

Enter the name of a Network/Host policy object that defines the destination (**To Object Group**) and source (**From Object Group**) of the traffic. You can click **Select** to select the object from a list, where you can also create a new object by clicking the **Create** button in the Object Selector dialog box.

You cannot use the Network/Host object named “any.”

### Navigation Path

From the Add and Edit GTP Map dialog boxes, click the **Add** button in the Permit Response table, or select a row and click the **Edit** button. See [Configuring GTP Maps](#), on page 809.

## GTP Map Timeouts Dialog Box

Use the GTP Map Timeouts dialog box to set timeout values for a GTP Map.

### Navigation Path

From the Add and Edit GTP Map dialog boxes, click the **Edit Timeouts** button on the Parameters tab. See [Configuring GTP Maps](#), on page 809.

**Table 219: GTP Map Timeouts Dialog Box**

| Element                                                                     | Description                                                                                                                                                                                         |
|-----------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GSN Timeout (Prior to ASA 9.5(1))<br>Endpoint Timeout (ASA 9.5(1) or later) | The period of inactivity (hh:mm:ss) after which a GSN is removed. The default is 30 minutes. Enter 0 to never tear down immediately.                                                                |
| PDP Context Timeout                                                         | The maximum period of time allowed (hh:mm:ss) before beginning to receive the PDP context. The default is 30 minutes. Enter 0 to specify no limit.                                                  |
| Request Queue Timeout                                                       | The maximum period of time allowed (hh:mm:ss) before beginning to receive the GTP message. The default is 60 seconds. Enter 0 to specify no limit.                                                  |
| Signaling Connections Timeout                                               | The period of inactivity (hh:mm:ss) after which the GTP signaling is removed. The default is 30 minutes. Enter 0 to not remove the signal.                                                          |
| Tunnel Timeout                                                              | The period of inactivity (hh:mm:ss) after which the GTP tunnel is torn down. The default is 60 seconds (when a Delete PDP Context Request is not received). Enter 0 to never tear down immediately. |
| T3 Response Timeout                                                         | The maximum wait time for a response before removing the connection.                                                                                                                                |

## GTP Policy Maps Add or Edit Match Condition and Action Dialog Boxes

Use the Add or Edit Match Condition and Action dialog boxes to define the match criterion, value, and action for a GTP policy map.

The fields on this dialog box change based on the criterion you select.

### Navigation Path

In the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit GTP Map dialog box, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring GTP Maps](#), on page 809.

|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion                                                                                                                                                             | <p>Specifies which criterion of GTP traffic to match:</p> <ul style="list-style-type: none"> <li>• Access Point Name—Matches the access point name so you can define the access points to drop when GTP application inspection is enabled.</li> <li>• Message ID—Matches the numeric identifier for the message that you want to drop. By default, all valid message IDs are allowed.</li> <li>• Message Length—Matches the length of the UDP packet. Use this criterion to change the default for the maximum allowed message length for the UDP payload.</li> <li>• Version—Matches the GTP version.</li> <li>• MSISDN—Matches the MSISDN with regular expressions or class and drop all GTP packets that have matching MSISDN.</li> <li>• Selection Mode—Ranges between 0 and 3.</li> </ul> |
| Type                                                                                                                                                                  | <p>Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on the string "example.com," then any traffic that contains "example.com" is excluded from the map.</p> <ul style="list-style-type: none"> <li>• Matches—Matches the criterion.</li> <li>• Doesn't Match—Does not match the criterion.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                        |
| Action                                                                                                                                                                | <p>The action you want the device to take for traffic that matches the defined criteria.</p> <ul style="list-style-type: none"> <li>• Drop Packet—By default, all invalid packets or packets that failed during parsing are dropped.</li> <li>• Drop Packet and Log</li> <li>• Rate Limit</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <p><b>Variable Fields</b></p> <p>The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Access Point Name        | <p>The access points to act on when GTP application inspection is enabled.</p> <ul style="list-style-type: none"> <li>• Specified By—An access point name to be dropped. By default, all messages with valid APNs are inspected, and any APN is allowed.</li> <li>• Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.</li> <li>• Regular Expression Group—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression group object.</li> </ul> |
| ID type                  | <p>The numeric identifier of the message that you want to act on.</p> <ul style="list-style-type: none"> <li>• Value—A single message ID. The Value can be between 1 and 255.</li> <li>• Range—A range of message IDs. The Range can be between 1 and 255.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Minimum Length           | The minimum number of bytes in the UDP payload.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Maximum Length           | The maximum number of bytes in the UDP payload.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Version                  | <p>Beginning with version 4.9, Security Manager provides support for GPRS Tunnel Protocol (GTP) v2 and enhanced v1 in the GTP Map Object for ASA devices 9.5(1) or later. You can now configure separate message ID matching for GTPv1 and GTPv2.</p> <p>For ASA devices 9.5(1) or later, if you select Message ID as the Criterion, two options for Version, v1 and v2, are displayed. Select v1 or v2 and enter a single Value between 1 and 255, or a Range of values from 1 to 255.</p>                                                                                                                                                                                                                                                                                                                                                                                           |
| Version Type             | Prior to ASA version 9.5(1)—Use 0 to identify Version 0 and 1 to identify Version 1. Version 0 of GTP uses port 2123, while Version 1 uses port 3386. By default all GTP versions are allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Regular Expression       | Beginning with version 4.18, Cisco Security Manager allows configuring of MSISDN with regular expressions and drop all GTP packets that have matching MSISDN. This field appears when you select MSISDN in the Criterion drop-down.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Regular Expression Group | Beginning with version 4.18, Cisco Security Manager allows configuring of MSISDN with regular expressions class and drop all GTP packets that have matching MSISDN. This field appears when you select MSISDN in the Criterion drop-down.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Mode Value               | If Selection is selected in the Criterion drop-down, this field appears. Enter the mode value in the range of 0 – 3. This is a mandatory field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Configuring H.323 Maps

Use the Add and Edit H.323 Map dialog boxes to define the match criterion and values for an H.323 inspect map. An H.323 policy map lets you change the default configuration values used for H.323 inspection.

H.323 inspection supports H.323 compliant applications such as Cisco CallManager and VocalTec Gatekeeper. H.323 is a suite of protocols defined by the International Telecommunication Union for multimedia conferences over LANs. The security appliance supports H.323 through Version 4, including H.323 v3 feature Multiple Calls on One Call Signaling Channel.

With H.323 inspection enabled, the security appliance supports multiple calls on the same call signaling channel, a feature introduced with H.323 Version 3. This feature reduces call setup time and reduces the use of ports on the security appliance. The two major functions of H.323 inspection are as follows:

- NAT the necessary embedded IPv4 addresses in the H.225 and H.245 messages. Because H.323 messages are encoded in PER encoding format, the security appliance uses an ASN.1 decoder to decode the H.323 messages.
- Dynamically allocate the negotiated H.245 and RTP/RTCP connections.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > H.323 (ASA/PIX/FWSM)** from the Object Type selector. Right-click inside the work area, then select **New Object**, or right-click a row and select **Edit Object**.

### Field Reference

*Table 221: Add and Edit H.323 Map Dialog Boxes*

| Element        | Description                                                                 |
|----------------|-----------------------------------------------------------------------------|
| Name           | The name of the policy object. A maximum of 40 characters is allowed.       |
| Description    | A description of the policy object. A maximum of 200 characters is allowed. |
| Parameters tab |                                                                             |

| Element                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HSI Group table                                                 | <p>The HSI groups to include in the map. The group number, IP address of the HSI host, and IP addresses and interface names of the clients connected to the security appliance are shown in the table. Up to five HSI hosts per group, and up to ten end points per HSI group, are allowed.</p> <ul style="list-style-type: none"> <li>• To add a group, click the Add button and fill in the dialog box (see <a href="#">Add or Edit HSI Group Dialog Boxes</a> , on page 818).</li> <li>• To edit a group, select it and click the Edit button.</li> <li>• To delete a group, select it and click the Delete button.</li> </ul> |
| Call Duration Limit                                             | The call duration limit in seconds. The range is from 0:0:0 to 1163:0:0. A value of 0 means never timeout.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Enforce Presence of Calling and Called Party Numbers            | Whether to enforce calling and called party numbers used in call setup.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Allow the facility message before SETUP for H.460.18            | <p>Whether to allow the FACILITY message to be sent before the SETUP message as part of the Incoming Call Message Procedure.</p> <p><b>Note</b> H.460.18 defines a method for traversal of H.323 signaling across network address translators and firewalls.</p>                                                                                                                                                                                                                                                                                                                                                                  |
| Check State Transition on H.225 Messages                        | Whether to enable state checking validation on H.225 messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check State Transition on RAS Messages                          | Whether to enable state checking validation on RAS messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Create Pinholes on Seeing RCF Packets                           | <p>Whether to enable call setup between H.323 endpoints when the Gatekeeper is inside the network. The device opens pinholes for calls based on Registration Request/Registration Confirm (RRQ/RCF) messages. Because these RRQ/RCF messages are sent to and from the Gatekeeper, the calling endpoint's IP address is unknown and the device opens a pinhole through source IP address/port 0/0.</p> <p>This option is available for ASA 8.0(5)+ devices.</p>                                                                                                                                                                    |
| Check for H.245 Tunneling Action                                | Whether to enforce H.245 tunnel blocking and perform the action you select in the Action list box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Check RTP Packets for Protocol Conformance                      | Whether to check RTP packets flowing through the pinholes for protocol conformance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Payload Type must be Audio or Video based on Signaling Exchange | Whether to enforce the payload type to be audio or video based on the signaling exchange.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Element                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Allow Value Override per Device Overrides Edit button                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a>, on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a>, on page 244.</p> <p>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p> |

## Add or Edit HSI Group Dialog Boxes

Use the Add or Edit HSI group dialog boxes to add HSI groups to an H.323 policy inspection map.

### Navigation Path

From the Parameters tab on the Add and Edit H.323 Map dialog boxes, click the **Add Row** button in the HSI group table, or select a row and click the **Edit Row** button. See [Configuring H.323 Maps](#), on page 816.

### Field Reference

*Table 222: Add and Edit HSI Group Dialog Boxes*

| Element    | Description                                |
|------------|--------------------------------------------|
| Group ID   | The HSI group ID number (0 to 2147483647). |
| IP Address | The IP address of the HSI host.            |

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Endpoint table | <p>The end points associated with HSI group. You can add up to 10 end points per group. For each end point, you specify the IP address and interface policy group.</p> <ul style="list-style-type: none"> <li>To add an end point, click the Add button and fill in the dialog box (see <a href="#">Add or Edit HSI Endpoint IP Address Dialog Boxes</a>, on page 819).</li> <li>To edit an end point, select it and click the Edit button.</li> <li>To delete an end point, select it and click the Delete button.</li> </ul> |

## Add or Edit HSI Endpoint IP Address Dialog Boxes

Use the Add or Edit HSI Endpoint IP Address dialog box to add end points to an HSI group.

### Navigation Path

From the Add and Edit HSI Group dialog boxes, click the **Add Row** button in the end point table, or select a row and click the **Edit Row** button. See [Configuring H.323 Maps](#), on page 816.

### Field Reference

*Table 223: Add and Edit HSI Endpoint IP Address Dialog Boxes*

| Element      | Description                                                                                                                                                                                                                   |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Network/Host | The IP address of the end point host or network.                                                                                                                                                                              |
| Interface    | The Interface policy group that identifies the interface connected to the security appliance. Enter the name of a policy group, or click <b>Select</b> to select it from a list, where you can also create new policy groups. |

## H.323 Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes

Use the Add or Edit H.323 Match Criterion (for H.323 class maps) or Match Condition and Action (for H.323 policy maps) dialog boxes to do the following:

- Define the match criterion and value for an H.323 class map.
- Select an H.323 class map when creating an H.323 policy map.
- Define the match criterion, value, and action directly in an H.323 policy map.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

### Navigation Path

When creating an H.323 class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for H.323, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring Class Maps for Inspection Policies](#), on page 790.

When creating an H.323 policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit H.323 Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring H.323 Maps](#), on page 816.

| <b>Variable Fields</b>                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Element    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Value      | <p>The regular expression you want to evaluate. You can select one of the following:</p> <ul style="list-style-type: none"> <li>• Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.</li> <li>• Regular Expression Group—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression group object.</li> </ul> |
| Media Type | The type of media you want to inspect, audio, video, or data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Configuring HTTP Maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x and IOS Devices

**Note** From version 4.17, though Cisco Security Manager continues to support PIX, FWSM, and IPS features/functionality, it does not support any enhancements.

Use the Add and Edit HTTP Map dialog boxes to define HTTP maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x, and IOS devices.

The enhanced HTTP inspection feature, which is also known as an application firewall, verifies that HTTP messages conform to RFC 2616, use RFC-defined methods, and comply with various other criteria. This can help prevent attackers from using HTTP messages for circumventing network security policy.

When you enable HTTP inspection with an HTTP map, strict HTTP inspection with the action reset and log is enabled by default. You can change the actions performed in response to inspection failure, but you cannot disable strict inspection as long as the HTTP map remains enabled. Security Manager uses the **http-map** command to configure the map on the device.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > HTTP (ASA 7.1.x/PIX 7.1.x/FWSM3.x/IOS)** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

*Table 225: Add and Edit HTTP Map Dialog Boxes for ASA 7.1.x/PIX 7.1.x/FWSM 3.x/IOS Devices*

| Element                         | Description                                                                                                                                                                                                                                                                 |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                            | The name of the policy object. A maximum of 40 characters is allowed.                                                                                                                                                                                                       |
| Description                     | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                                 |
| General tab                     | Defines the action taken when non-compliant HTTP requests are received and to enable verification of content type. For a description of the options, see <a href="#">HTTP Map General Tab</a> , on page 822.                                                                |
| Entity Length tab               | Defines the action taken if the length of the HTTP content falls outside of configured targets. For a description of the options, see <a href="#">HTTP Map Entity Length Tab</a> , on page 824.                                                                             |
| RFC Request Method tab          | Defines the action that the security appliance should take when specific RFC request methods are used in the HTTP request. For a description of the options, see <a href="#">HTTP Map RFC Request Method Tab</a> , on page 825.                                             |
| Extension Request Method tab    | Defines the action taken when specific extension request methods are used in the HTTP request. For a description of the options, see <a href="#">HTTP Map Extension Request Method Tab</a> , on page 826.                                                                   |
| Port Misuse tab                 | Defines the action taken when specific undesirable applications are encountered. For a description of the options, see <a href="#">HTTP Map Port Misuse Tab</a> , on page 827.                                                                                              |
| Transfer Encoding tab           | Defines the action taken when specific transfer encoding types are used in the HTTP request. For a description of the options, see <a href="#">HTTP Map Transfer Encoding Tab</a> , on page 828.                                                                            |
| Category                        | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                 |
| Allow Value Override per Device | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244. |
| Overrides                       |                                                                                                                                                                                                                                                                             |
| Edit button                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                |

## HTTP Map General Tab

Use the General tab to define the action taken when non-compliant HTTP requests are received and to enable verification of content type.

### Navigation Path

Click the General tab on the Add and Edit HTTP Map dialog boxes for ASA 7.1.x/PIX 7.1.x/FWSM 3.x/IOS Devices. See [Configuring HTTP Maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x and IOS Devices](#) , on page 821.

### Related Topics

| Element                                                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Take action for non-RFC 2616 compliant traffic                                 | <p>Whether you want to configure the action to be taken for traffic that does not comply with RFC 2616. Possible actions are:</p> <ul style="list-style-type: none"> <li>• Allow Packet—Allow the message.</li> <li>• Drop Packet—Close the connection.</li> <li>• Reset Connection (default)—Send a TCP reset message to client and server.</li> </ul> <p>You can also select <b>Generate Syslog</b> to write a message to the syslog if non-compliant traffic is encountered.</p>                                                                                                                                                                                                                                                                                       |
| Verify Content-type field belongs to the supported internal content-type list. | <p>Whether you want to configure the action to be taken for traffic whose content type does not belong to the supported internal content-type list. Possible actions are:</p> <ul style="list-style-type: none"> <li>• Allow Packet—Allow the message.</li> <li>• Drop Packet—Close the connection.</li> <li>• Reset Connection (default)—Send a TCP reset message to client and server.</li> </ul> <p>You can also select these options:</p> <ul style="list-style-type: none"> <li>• <b>Verify Content-type field for response matches the ACCEPT field of request</b>—To also verify that the content type of the response matches the request.</li> <li>• <b>Generate Syslog</b>—To write a message to the syslog if non-compliant traffic is encountered.</li> </ul> |
| Override Global TCP Idle Timeout (IOS only)                                    | Whether to change the TCP idle timeout default setting. An IOS device terminates a connection if there is no communication activity after this length of time. If you select this option, specify the desired timeout value in seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Override Global Audit Trail Setting (IOS only)<br>Enable Audit Trail           | Whether to change the audit trail setting for IOS devices. If you select this option, you can select <b>Enable Audit Trail</b> to generate audit trail messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## HTTP Map Entity Length Tab

Use the Entity Length tab to enable inspection based on the length of the HTTP content.

### Navigation Path

Click the Entity Length tab on the Add and Edit HTTP Map dialog boxes for ASA 7.1.x/PIX 7.1.x/FWSM 3.x/IOS Devices. See [Configuring HTTP Maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x and IOS Devices](#), on page 821.

## HTTP Map Port Misuse Tab

Use the Port Misuse tab to enable port misuse application firewall inspection. The application categories you can configure are:

- IM—Instant Messaging. The applications checked for are Yahoo! Messenger, AIM, and MSN IM.
- P2P—Peer-to-peer applications. The Kazaa application is checked.
- Tunneling—Tunneling applications. The applications checked for are HTTPPort/HTTHost, GNU Httptunnel, GotoMyPC, Firethru, and Http-tunnel.com Client.

### Navigation Path

Click the Port Misuse tab on the Add and Edit HTTP Map dialog boxes for ASA 7.1.x/PIX 7.1.x/FWSM 3.x/IOS Devices. See [Configuring HTTP Maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x and IOS Devices](#), on page 821.

Table 230: HTTP Map Port Misuse Tab

| Element                                                                        | Description                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Available and Selected Application Categories                                  | The Available Application Categories list contains the categories for which you can define firewall inspection settings.                                                                                                                                                                                                                                                                               |
| Action                                                                         | To configure an action for a category, select it, then select an action and optionally select <b>Generate Syslog</b> if you want a message added to the syslog when an HTTP request containing the selected application is encountered. Click the >> button to add it to the Selected Categories list. (To remove a category from the selected list, select it and click the << button.)               |
| Generate Syslog                                                                | <p><b>Tip</b> You can select multiple categories at a time using Ctrl+click if the action and syslog requests are the same for each.</p> <p>The actions you can specify are:</p> <ul style="list-style-type: none"> <li>• Allow Packet—Allow the message.</li> <li>• Drop Packet—Close the connection.</li> <li>• Reset Connection (default)—Send a TCP reset message to client and server.</li> </ul> |
| Specify the action to be applied for the remaining available categories above. | Whether to define a default action for the categories for which you have not configured specific actions above. If you select this option, select the action and syslog setting to use for the default action.                                                                                                                                                                                         |

## HTTP Map Transfer Encoding Tab

Use the Transfer Encoding tab to enable inspection based on the transfer encoding type. The encoding types that you can configure are:

- Chunked—Identifies the transfer encoding type in which the message body is transferred as a series of chunks.
- Compressed—Identifies the transfer encoding type in which the message body is transferred using UNIX file compression.
- Deflate—Identifies the transfer encoding type in which the message body is transferred using zlib format (RFC 1950) and deflate compression (RFC 1951).
- GZIP—Identifies the transfer encoding type in which the message body is transferred using GNU zip (RFC 1952).
- Identity—Identifies connections in which no transfer encoding is performed in the message body.

### Navigation Path

Click the Transfer Encoding tab on the Add and Edit HTTP Map dialog boxes for ASA 7.1.x/PIX 7.1.x/FWSM 3.x/IOS Devices. See [Configuring HTTP Maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x and IOS Devices](#), on page 821.

## Configuring HTTP Maps for ASA 7.2+ and PIX 7.2+ Devices

**Note** From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

Use the Add and Edit HTTP Map dialog boxes to define the match criterion and values for the HTTP inspect map for ASA and PIX software releases 7.2 and later.

**Navigation Path**

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > HTTP (ASA 7.2+/PIX 7.2+)** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

| Overrides: None                                             | Shows that no overrides exist on the device. You must manually set overrides in order to change the display. For more information, see <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.<br><br><b>Note</b> Selecting Allow Value Override per Device does not automatically set overrides.                                                                                                                                                           |

## HTTP Class and Policy Map (ASA 7.2+/PIX 7.2+) Add or Edit Match Condition (and Action) Dialog Boxes

**Note** From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

Use the Add or Edit HTTP Match Criterion (for HTTP class maps) or Match Condition and Action (for HTTP policy maps) dialog boxes to do the following:

- Define the match criterion and value for an HTTP class map.
- Select an HTTP class map when creating an HTTP policy map.
- Define the match criterion, value, and action directly in an HTTP policy map.

These types of maps are used only for devices running ASA 7.2 or later, or PIX 7.2 or later, operating systems.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map. You can use the following criteria:

- Request/Response Content Type Mismatch—Specifies that the content type in the response must match one of the MIME types in the accept field of the request.
- Request Arguments—Applies the regular expression match to the arguments of the request.
- Request Body—Applies the regular expression match to the body of the request.
- Request Body Length—Specifies that the body length of the request be matched as greater than or less than the specified number of bytes.
- Request Header Count—Specifies that the number of headers in the request be matched as greater than or less than the specified number.

- Request Header Length—Specifies that the header length of the request be matched as greater than or less than the specified number of bytes.
- Request Header Field—Applies the regular expression match to the header of the request.
- Request Header Field Count—Applies the regular expression match to the header of the request based on a specified number of header fields.
- Request Header Field Length—Applies the regular expression match to the header of the request based on a specified field length.
- Request Header Content Type—Specifies the content type to evaluate in the content-type header field of the request.
- Request Header Transfer Encoding—Specifies the transfer encoding to evaluate in the transfer-encoding header field of the request.
- Request Header Non-ASCII—Specifies whether there are non-ASCII characters in the header of the request.
- Request Method—Specifies the method of the request to match.
- Request URI—Applies the regular expression match to the URI of the request.
- Request URI Length—Specifies that the URI length of the request be matched as greater than or less than the specified number of bytes.
- Response Body ActiveX—Specifies whether there is ActiveX content in the body of the request.
- Response Body Java Applet—Specifies whether there is a Java applet in the body of the request.
- Response Body—Applies the regular expression match to the body of the response.
- Response Body Length—Specifies that the body length of the response be matched as greater than or less than the specified number of bytes.
- Response Header Count—Specifies that the number of headers in the response be matched as greater than or less than the specified number.
- Response Header Length—Specifies that the header length of the response be matched as greater than or less than the specified number of bytes.
- Response Header Field—Applies the regular expression match to the header of the response.
- Response Header Field Count—Applies the regular expression match to the header of the response based on a specified number of header fields.
- Response Header Field Length—Applies the regular expression match to the header of the response based on a specified field length.
- Response Header Content Type—Specifies the content type to evaluate in the content-type header field of the response.
- Response Header Transfer Encoding—Specifies the transfer encoding to evaluate in the transfer-encoding header field of the response.
- Response Header Non-ASCII—Specifies whether there are non-ASCII characters in the header of the response.
- Response Status Line—Applies the regular expression match to the status line of the response.

### Navigation Path

When creating an HTTP class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for HTTP, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring Class Maps for Inspection Policies](#), on page 790.

When creating an HTTP policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit HTTP Map dialog boxes for ASA/PIX 7.2+ devices, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring HTTP Maps for ASA 7.2+ and PIX 7.2+ Devices](#), on page 829.

**Table 233: HTTP Class and Policy Maps (ASA 7.2+/PIX 7.2+) Add and Edit Match Condition and Action Dialog Boxes**

| Element                                                                                                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Match Type                                                                                                                                                 | Enables you to use an existing HTTP class map or define a new HTTP class map.                                                                                                                                                                                                                                                                                                                                                                 |
| Class Name<br>(Policy Map only)                                                                                                                            | <ul style="list-style-type: none"> <li>• Use Specified Values—You want to define the class map on this dialog box.</li> <li>• Use Values in Class Map—You want to select an existing HTTP class map policy object. Enter the name of the HTTP class map in the <b>Class Name</b> field. Click <b>Select</b> to select the map from a list or to create a new class map object.</li> </ul>                                                     |
| Criterion                                                                                                                                                  | Specifies which criterion of HTTP traffic to match. The criteria are described above.                                                                                                                                                                                                                                                                                                                                                         |
| Type                                                                                                                                                       | <p>Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on the string "example.com," then any traffic that contains "example.com" is excluded from the map.</p> <ul style="list-style-type: none"> <li>• Matches—Matches the criterion. For some criteria, this is the only available option.</li> <li>• Doesn't Match—Does not match the criterion.</li> </ul> |
| Action<br>(Policy Map only)                                                                                                                                | The action you want the device to take for traffic that matches the defined criteria. The types of action depend on the criterion you select.                                                                                                                                                                                                                                                                                                 |
| <b>Variable Fields</b><br>The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see. |                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Field Name          | <p>The name of the header field to evaluate. You can select one of the following:</p> <ul style="list-style-type: none"> <li>• Predefined—The predefined HTTP header fields.</li> <li>• Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Value               | <p>The regular expression you want to evaluate. You can select one of the following:</p> <ul style="list-style-type: none"> <li>• Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.</li> <li>• Regular Expression Group—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression group object.</li> </ul> <p>When you are evaluating the Request Header Transfer Encoding or Response Header Transfer Encoding criteria, you can also select these options:</p> <ul style="list-style-type: none"> <li>• Specified By—One of the following predefined types of transfer encoding: <ul style="list-style-type: none"> <li>• Chunked—The message body is transferred as a series of chunks.</li> <li>• Compressed—The message body is transferred using UNIX file compression.</li> <li>• Deflate—The message body is transferred using zlib format (RFC 1950) and deflate compression (RFC 1951).</li> <li>• GZIP—The message body is transferred using GNU zip (RFC 1952).</li> <li>• Identity—No transfer encoding is performed.</li> </ul> </li> <li>• Empty—The transfer-encoding field in request header is empty.</li> </ul> |
| Greater Than Length | <p>The length in bytes of the evaluated field. The criterion matches if the length is greater than the specified number, and does not match if the field is less than the specified number.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Greater Than Count  | <p>The number of evaluated items. | Content Type   | <p>The content type to evaluate as specified in the content-type header field. You can select one of the following:</p> <ul style="list-style-type: none"> <li>• Specified By—A predefined MIME type.</li> <li>• Unknown—The MIME type is not known. Select Unknown when you want to evaluate the item against all known MIME types.</li> <li>• Violation—The magic number in the body must correspond to the MIME type in the content-type header field.</li> <li>• Regular Expression, Regular Expression Group—The regular expression or regular expression group to evaluate. See the explanation for the Value field for an explanation of these options.</li> </ul> |
| Request Method | <p>The specified request method to match. You can select one of the following:</p> <ul style="list-style-type: none"> <li>• Specified By—The predefined request method.</li> <li>• Regular Expression, Regular Expression Group—The regular expression or regular expression group to evaluate. See the explanation for the Value field for an explanation of these options.</li> </ul>                                                                                                                                                                                                                                                                                   |

## Configuring IM Maps for ASA 7.2+, PIX 7.2+ Devices

**Note** From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

Use the Add and Edit IM Map dialog boxes to define settings for define an Instant Messenger (IM) inspect map for devices running ASA/PIX 7.2 or later. An IM map lets you change the default configuration values used for IM application inspection.

Instant Messaging causes concern due to its use of clear text when conducting business and the potential for network attacks and the spreading of viruses. Thus, you might want to block certain types of instant messages from occurring, while allowing others.

For ASA and PIX devices, IM application inspection provides detailed access control to control network usage. You can use regular expressions to help stop leakage of confidential data and the propagation of network threats. You can inspect Yahoo! Messenger or MSN Messenger traffic.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > IM (ASA 7.2+/PIX 7.2+)** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

A maximum of 200 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <p><b>Match Condition and Action Tab</b></p> <p>The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions.</p> <ul style="list-style-type: none"> <li>• To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see <a href="#">IM Class and Policy Map (ASA 7.2+/PIX 7.2+) Add or Edit Match Condition (and Action) Dialog Boxes</a> , on page 836).</li> <li>• To edit a criterion, select it and click the Edit button.</li> <li>• To delete a criterion, select it and click the Delete button.</li> </ul> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Category                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                            |
| Allow Value Override per Device Overrides Edit button                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.</p> <p>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p> |

## IM Class and Policy Map (ASA 7.2+/PIX 7.2+) Add or Edit Match Condition (and Action) Dialog Boxes

**Note** From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

Use the Add or Edit IM Match Criterion (for IM class maps) or Match Condition and Action (for IM policy maps) dialog boxes to do the following:

- Define the match criterion and value for an IM class map.

- Select an IM class map when creating an IM policy map.
- Define the match criterion, value, and action directly in an IM policy map.

These types of maps are used only for devices running ASA 7.2 or later, or PIX 7.2 or later, operating systems.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

### Navigation Path

When creating an IM class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for IM, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring Class Maps for Inspection Policies](#), on page 790.

When creating an IM policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit IM Map dialog boxes for ASA 7.2/PIX 7.2, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring IM Maps for ASA 7.2+, PIX 7.2+ Devices](#), on page 835.

| Match Type                      | Enables you to use an existing IM class map or define a new IM class map.                                                                                                                                                                                                                                                                                                             |
| Class Name<br>(Policy Map only) | <ul style="list-style-type: none"> <li>• Use Specified Values—You want to define the class map on this dialog box.</li> <li>• Use Values in Class Map—You want to select an existing IM class map policy object. Enter the name of the IM class map in the <b>Class Name</b> field. Click <b>Select</b> to select the map from a list or to create a new class map object.</li> </ul> |

| Element                                                                                                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion                                                                                                                                                             | <p>Specifies which criterion of IM traffic to match. The criteria are:</p> <ul style="list-style-type: none"> <li>• Filename—Matches the filename from IM file transfer service.</li> <li>• Client IP Address—Matches the source client IP address.</li> <li>• Client Login Name—Matches the client login name from IM service.</li> <li>• Peer IP Address—Matches the peer, or destination, IP address.</li> <li>• Peer Login Name—Matches the peer, or destination, login name from IM service.</li> <li>• Protocol—Matches IM protocols.</li> <li>• Service—Matches IM services.</li> <li>• File Transfer Service Version—Matches the IM file transfer service version.</li> </ul>                                                               |
| Type                                                                                                                                                                  | <p>Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on the string "example.com," then any traffic that contains "example.com" is excluded from the map.</p> <ul style="list-style-type: none"> <li>• Matches—Matches the criterion.</li> <li>• Doesn't Match—Does not match the criterion.</li> </ul>                                                                                                                                                                                                                                                                                                                                                             |
| Action<br>(Policy Map only)                                                                                                                                           | The action you want the device to take for traffic that matches the defined criteria.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <p><b>Variable Fields</b></p> <p>The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Value                                                                                                                                                                 | <p>The regular expression you want to evaluate. You can select one of the following:</p> <ul style="list-style-type: none"> <li>• Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.</li> <li>• Regular Expression Group—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression group object.</li> </ul> |
| IP Address                                                                                                                                                            | The IP address you want to match.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Protocol                                                                                                                                                              | The IM protocol, either MSN Messenger or Yahoo! Messenger.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Services                                                                                                                                                              | The IM services you want to inspect. Select one or more of the listed services.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Configuring IM Maps for IOS Devices

**Note** From version 4.17, though Cisco Security Manager continues to support PIX, FWSM, and IPS features/functionality, it does not support any enhancements.

Use the Add and Edit IM Map (IOS) dialog boxes to configure Instant Messaging (IM) inspection policy map objects for IOS devices. An IM map lets you change the default configuration values used for IM application inspection.

Instant Messaging causes concern due to its use of clear text when conducting business and the potential for network attacks and the spreading of viruses. Thus, you might want to block certain types of instant messages from occurring, while allowing others.

IM application inspection provides detailed access control to control network usage. It also helps stop leakage of confidential data and the propagation of network threats. The scope can be limited by identifying permitted or denied servers. Inspection of Yahoo! Messenger, MSN Messenger, and AOL instant messages are supported.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > IM (IOS)** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

| The tabs represent different IM service providers. The settings available on each tab are identical. You must configure the settings separately for each service provider. The descriptions of the following fields apply to each of the services: Yahoo!, MSN, and AOL. |                                                                                                                                                                                                                                                                              |
| Text Chat                                                                                                                                                                                                                                                                | How you want the text chat service to be handled, for example, allowed, denied, logged, or some combination.                                                                                                                                                                 |
| Other Services                                                                                                                                                                                                                                                           | How you want services other than text chat to be handled, for example, allowed, denied, logged, or some combination. IOS software recognizes all services other than text chat, such as voice-chat, video-chat, file sharing and transferring, and gaming as a single group. |

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Permit Servers                                        | The servers from which to permit traffic. Accepted formats are IP addresses, IP ranges, and hostnames separated by commas.                                                                                                                                                                                                                                                                                                                                                                      |
| Deny Servers                                          | The servers from which to deny traffic. Accepted formats are IP addresses, IP ranges, and hostnames separated by commas.                                                                                                                                                                                                                                                                                                                                                                        |
| Alert                                                 | Whether you want to enable or disable alerts. The default is to use the default inspection settings.                                                                                                                                                                                                                                                                                                                                                                                            |
| Audit                                                 | Whether you want to enable or disable an audit trail. The default is to use the default inspection settings.                                                                                                                                                                                                                                                                                                                                                                                    |
| Timeout                                               | A timeout for the service. You can use the default inspection settings, or you can elect to specify a timeout. If you select Specify Timeout, enter the timeout value in seconds.                                                                                                                                                                                                                                                                                                               |
| Category                                              | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                     |
| Allow Value Override per Device Overrides Edit button | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.<br><br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## Configuring IP Options Maps

Use the Add and Edit IP Options Map dialog boxes to define maps for the inspection of the options in an IP packet header on ASA 8.2(2)+ devices. The options field provides for control functions that are required in some situations but unnecessary for most common communications.

If you do not configure IP options inspection, the ASA device drops packets that have any options configured, with one exception. In routed mode, packets that contain the router alert option are allowed. (To disallow router alert packets, create an IP options map with router alert deselected, and configure an inspection rule to inspect IP Options using the policy map.)

---

**Tip** Because the no operation (NOP) option might be used as padding to ensure proper packet-header size and alignment, you might want to allow NOP.

---

For each option, you can select whether to:

- **Allow**—Allow the packet and do not change the IP header options field.
- **Clear**—Allow the packet and clear the option from the IP header options field.

If you do not select an option, the option is prohibited, and packets containing the option are dropped. Any option not listed here also results in a dropped packet; you cannot change this behavior.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > IP Options** from the Object Type selector. Right-click inside the work area, then select **New Object**, or right-click a row and select **Edit Object**.

### Field Reference

**Table 237: Add and Edit IP Options Map Dialog Boxes**

| Element                                                          | Description                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                                                             | The name of the policy object. A maximum of 128 characters is allowed.                                                                                                                                                                                                                                                                                                                |
| Description                                                      | A description of the policy object.                                                                                                                                                                                                                                                                                                                                                   |
| End of Options List                                              | End of Options List (EOOL), or IP Option 0, contains just a single zero byte and appears at the end of all options to mark the end of a list of options. This might not coincide with the end of the header according to the header length.                                                                                                                                           |
| No operation                                                     | No Operation (NOP), or IP Option 1, is used for padding. The Options field in the IP header can contain zero, one, or more options, which makes the total length of the field variable. However, the IP header must be a multiple of 32 bits. If the number of bits of all options is not a multiple of 32 bits, the NOP option is used as to align the options on a 32-bit boundary. |
| Router alert                                                     | Router Alert (RTRALT), or IP Option 20, notifies transit routers to inspect the contents of the packet even when the packet is not destined for that router. This inspection is valuable when implementing RSVP and similar protocols require relatively complex processing from the routers along the packet's delivery path.                                                        |
| Basic Security ( <i>ASA devices 9.5(1) or later</i> )            | IP-option Basic Security (number 130) from RFC 1108, default is to drop.                                                                                                                                                                                                                                                                                                              |
| Commercial Security ( <i>ASA devices 9.5(1) or later</i> )       | IP-option Commercial Security (number 134), default is to drop.                                                                                                                                                                                                                                                                                                                       |
| Default ( <i>ASA devices 9.5(1) or later</i> )                   | IP-option default configuration, default is drop.                                                                                                                                                                                                                                                                                                                                     |
| Experimental Flow Control ( <i>ASA devices 9.5(1) or later</i> ) | IP-option Experimental Flow Control (number 205), default is to drop.                                                                                                                                                                                                                                                                                                                 |

| Element                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Experimental Measurement ( <i>ASA devices 9.5(1) or later</i> ) | IP-option Experimental Measurement (number 10), default is to drop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Extended-Security ( <i>ASA devices 9.5(1) or later</i> )        | IP-option Extended Security (number 133) from RFC 1108, default is to drop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| IMI Traffic Descriptor ( <i>ASA devices 9.5(1) or later</i> )   | IP-option IMI Traffic Descriptor (number 144), default is to drop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Quick Start ( <i>ASA devices 9.5(1) or later</i> )              | IP-option Router Alert (number 25) from RFC 4782, default is to drop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Record Route ( <i>ASA devices 9.5(1) or later</i> )             | IP-option Record Route (number 7) from RFC 791, default is to drop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Time Stamp ( <i>ASA devices 9.5(1) or later</i> )               | IP-option Router Alert (number 68) from RFC 791, default is to drop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Note</b>                                                     | Beginning with version 4.9, Security Manager supports 10 new IP Options for ASA devices running the software version 9.5(1) or later. You can tune the inspection to allow, clear, or drop any standard or experimental options. You can also configure specific IP Options apart from the ones that are defined. For example, a value ranging between 0 and 255 can be used to configure an IP Option directly. Security Manager supports the CLI '[no] 0-255 allow   clear'. You can also set a default behavior for options not explicitly defined in an IP options inspection map. You now select which options to allow and optionally clear. For a list of IP options, with references to the relevant RFCs, see the IANA page, <a href="http://www.iana.org/assignments/ip-parameters/ip-parameters.xhtml">http://www.iana.org/assignments/ip-parameters/ip-parameters.xhtml</a> |
| Category                                                        | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Allow Value Override per Device Overrides Edit button           | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.<br><br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                                                                                                                                                                                                                                                                                                                                         |

## Configuring IPv6 Maps

Use the Add and Edit IPv6 Map dialog boxes to define the match criteria and values for an IPv6 inspect map. You can use an IPv6 map to selectively drop IPv6 packets based on following types of extension headers found anywhere in the IPv6 packet:

- Hop-by-Hop Options
- Routing (Type 0)
- Fragment

- Destination Options
- Authentication
- Encapsulating Security Payload

Service objects corresponding to these protocols are available in the Services table in the [Policy Object Manager](#) , on page 230.

**Note** With the release of Security Manager 4.4 and versions 9.0 and later of the ASA, the separate policies for configuring IPv4 and IPv6 inspection rules were unified. However, IPv6 maps are still provided in support of earlier versions.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > IPv6** from the Object Type selector. Right-click inside the table, then select **New Object** or right-click a row, then select **Edit Object**.

| <p><b>Match Condition and Action Tab</b></p> <p>The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions.</p> <p>These criteria entries are created and edited in the <a href="#">IPv6 Policy Maps Add or Edit Match Condition and Action Dialog Boxes</a> , on page 844.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Category                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                                                                                                |
| Allow Value Override per Device Overrides Edit button                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.</p> <p>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides in the <a href="#">Policy Object Overrides Window</a> , on page 247. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p> |

## IPv6 Policy Maps Add or Edit Match Condition and Action Dialog Boxes

Use the Add or Edit Match Condition and Action dialog boxes to define an Extension Header match criterion and action for an IPv6 policy map. The contents of the Extension Headers are not processed; an action is applied based solely on the presence of a specified EH type.

The fields in these dialog boxes change based on the criterion you select.

---

**Note** You can apply multiple match definitions to one IPv6 policy map.

---

### Navigation Path

In the Policy Object Manager, from the Match Condition and Action tab on the Add or Edit IPv6 Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring IPv6 Maps](#) , on page 842.

## Field Reference

**Table 239: IPv6 Policy Maps Add or Edit Match Condition and Action Dialog Boxes**

| Element   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion | <p>Choose the type of IPv6 Extension Header to match:</p> <ul style="list-style-type: none"> <li>• Authentication Header (AH)—Provides integrity and data-origin authentication for IP packets.</li> <li>• Destination Options Header—Used for IPv6 Mobility, as well as in support of certain applications.</li> <li>• Encapsulating Security Payload Header (ESP)—All information following the ESP header is encrypted and not accessible to intermediate network devices.</li> <li>• Fragment Header—Supports traffic-source fragmented-packet communications.</li> <li>• Hop-by-Hop Options Header—Optional information that must be examined by every node in the packet’s delivery path.</li> <li>• Header Count—The number of headers in the packet. When you choose this option, the following field appears; specify an upper bound for the number of headers: <ul style="list-style-type: none"> <li>• Greater Than Count—Enter a value between 0 and 255.</li> </ul> </li> </ul> <p>The packet is considered a match if the Header Count is greater than the specified number; it is not a match if the count is equal to, or less than the specified number.</p> <ul style="list-style-type: none"> <li>• Routing Header Type—Use this option to match one or EH types based on their header codes. When you choose this type, the following Value options appear; specify one or the other: <ul style="list-style-type: none"> <li>• Routing Type—Enter one Extension Header code; for example, <i>51</i> for Authentication Header.</li> <li>• Routing Type Field Range—Enter a starting value and an ending value to define a range of EH codes.</li> </ul> </li> <li>• Routing Header Address Count—The number of IP addresses embedded in the packet. When you choose this option, the following field appears; specify an upper bound for the number of addresses: <ul style="list-style-type: none"> <li>• Greater Than Count—Enter a value between 0 and 255.</li> </ul> </li> </ul> <p>The packet is considered a match if the address count is greater than the specified number; it is not a match if the count is equal to, or less than the specified number.</p> |
| Type      | Specifies that the map is applied only to traffic that matches the defined criteria.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Action    | <p>Choose the action you want the device to take for traffic that matches the defined criteria:</p> <ul style="list-style-type: none"> <li>• Drop Packet—Matching packets are dropped without notification.</li> <li>• Drop Packet and Log—Matching packets are logged and then dropped.</li> <li>• Log—Matching packets are logged and processing continues.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Configuring IPsec Pass Through Maps

Use the Add and Edit IPsec Pass Through Map dialog boxes to configure settings for the IPsec Pass Through Map policy object. An IPsec Pass Through policy map lets you change the default configuration values used for IPsec Pass Through inspection.

The IPsec Pass Through inspection engine lets the security appliance pass ESP (IP protocol 50) and AH (IP protocol 51) traffic that is formed between two hosts because of successful IKE (UDP port 500) negotiation without the requirement of specific ESP or AH access lists.

The ESP or AH traffic is permitted by the inspection engine with the configured idle timeout if there is an existing control flow and it is within the connection limit defined in the MPF framework. A new control flow is created for IKE UDP port 500 traffic with the configured UDP idle timeout if there is not one, or it uses the existing flow.

To ensure that the packet arrives into the inspection engine, a hole is punched for all such traffic (ESP and AH). This inspect is attached to the control flow. The control flow is present as long as there is at least one data flow (ESP or AH) established, but the traffic always flows on the same connection. Because this IKE connection is kept open as long as data flows, a rekey would always succeed. The flows are created irrespective of whether NAT is being used. However, PAT is not supported.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > IPsec Pass Through** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

| Name                                                            | The name of the policy object. A maximum of 40 characters is allowed.                                                                                                                                                                                                                             |
| Description                                                     | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                                                       |
| Allow ESP<br>Maximum ESP Tunnels per Client<br>ESP Idle Timeout | Whether to allow ESP traffic. If you select this option, you can configure the maximum number of ESP tunnels that each client can have and the amount of time that an ESP tunnel can be idle before it is closed (in hours:minutes:seconds format). The default timeout is 10 minutes (00:10:00). |
| Allow AH<br>Maximum AH Tunnels per Client<br>AH Idle Timeout    | Whether to allow AH traffic. If you select this option, you can configure the maximum number of AH tunnels that each client can have and the amount of time that an AH tunnel can be idle before it is closed (in hours:minutes:seconds format). The default timeout is 10 minutes (00:10:00).    |

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Category                                              | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                     |
| Allow Value Override per Device Overrides Edit button | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.<br><br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## Configuring NetBIOS Maps

Use the Add or Edit NetBIOS Map dialog boxes to define maps for NetBIOS inspection. A NetBIOS policy map lets you change the default configuration values used for NetBIOS inspection.

The NetBIOS inspection engine translates IP addresses in the NetBIOS name service (NBNS) packets according to the security appliance NAT configuration.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > NetBIOS** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

## Configuring ScanSafe Maps

Use the Add or Edit ScanSafe Map dialog boxes to define maps for ScanSafe inspection. A ScanSafe policy map lets you change the default configuration values used for ScanSafe inspection.

The fields on this dialog box change, depending upon whether you are creating a class map or a policy map.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > ScanSafe** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

## Configuring SIP Maps

Use the Add and Edit SIP Map dialog boxes to configure values used for SIP application inspection. A SIP inspection map lets you change the default configuration values used for SIP application inspection.

SIP is a widely used protocol for Internet conferencing, telephony, presence, events notification, and instant messaging. Partially because of its text-based nature and partially because of its flexibility, SIP networks are subject to a large number of security threats.

SIP application inspection provides address translation in message header and body, dynamic opening of ports and basic sanity checks. It also supports application security and protocol conformance, which enforce the sanity of the SIP messages, as well as detect SIP-based attacks.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > SIP (ASA/PIX/FWSM)** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.</p> <p>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p> |

## SIP Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes

Use the Add or Edit SIP Match Criterion (for SIP class maps) or Match Condition and Action (for SIP policy maps) dialog boxes to do the following:

- Define the match criterion and value for a SIP class map.
- Select a SIP class map when creating a SIP policy map.
- Define the match criterion, value, and action directly in a SIP policy map.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

### Navigation Path

When creating a SIP class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for SIP, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring Class Maps for Inspection Policies](#) , on page 790.

When creating a SIP policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit SIP Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring SIP Maps](#) , on page 849.

| Resource Method | <p>The request method you want to inspect:</p> <ul style="list-style-type: none"> <li>• <b>ack</b>—Confirms that the client has received a final response to an INVITE request.</li> <li>• <b>bye</b>—Terminates a call and can be sent by either the caller or the called party.</li> <li>• <b>cancel</b>—Cancels any pending searches but does not terminate a call that has already been accepted.</li> <li>• <b>info</b>—Communicates mid-session signaling information along the signaling path for the call.</li> <li>• <b>invite</b>—Indicates a user or service is being invited to participate in a call session.</li> <li>• <b>message</b>—Sends instant messages where each message is independent of any other message.</li> <li>• <b>notify</b>—Notifies a SIP node that an event which has been requested by an earlier SUBSCRIBE method has occurred.</li> <li>• <b>options</b>—Queries the capabilities of servers.</li> <li>• <b>prack</b>—Provisional response acknowledgment.</li> <li>• <b>refer</b>—Requests that the recipient REFER to a resource provided in the request.</li> <li>• <b>register</b>—Registers the address listed in the To header field with a SIP server.</li> <li>• <b>subscribe</b>—Requests notification of an event or set of events at a later time.</li> <li>• <b>unknown</b>—Uses a nonstandard extension that could have unknown security impacts on the network.</li> <li>• <b>update</b>—Permits a client to update parameters of a session but has no impact on the state of a dialog.</li> </ul> |

## Configuring Skinny Maps

Use the Add or Edit Skinny Map dialog boxes to define Skinny maps for Skinny inspection. A Skinny policy map lets you change the default configuration values used for Skinny inspection.

Skippy (SCCP) is a simplified protocol used in VoIP networks. Cisco IP Phones using SCCP can coexist in an H.323 environment. When used with Cisco CallManager, the SCCP client can interoperate with H.323 compliant terminals. Application layer functions in the security appliance recognize SCCP version 3.3. There are 5 versions of the SCCP protocol: 2.4, 3.0.4, 3.1.1, 3.2, and 3.3.2.

The security appliance supports all versions through 3.3.2. The security appliance supports PAT and NAT for SCCP. PAT is necessary if you have more IP phones than global IP addresses for the IP phones to use. By supporting NAT and PAT of SCCP Signaling packets, Skinny application inspection ensures that all SCCP signaling and media packets can traverse the security appliance.

Normal traffic between Cisco CallManager and Cisco IP Phones uses SCCP and is handled by SCCP inspection without any special configuration. The security appliance also supports DHCP options 150 and 66, which it

accomplishes by sending the location of a TFTP server to Cisco IP Phones and other DHCP clients. Cisco IP Phones might also include DHCP option 3 in their requests, which sets the default route.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > Skinny** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

## Skinny Policy Maps Add or Edit Match Condition and Action Dialog Boxes

Use the Add or Edit Match Condition and Action dialog boxes to define the match criterion, value, and action for a Skinny policy map.

### Navigation Path

In the Policy Object Manager, from the Match Condition and Action tab on the Add or Edit Skinny Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring Skinny Maps](#) , on page 854.

### Field Reference

*Table 246: Skinny Policy Maps Add and Edit Match Condition and Action Dialog Boxes*

| Element   | Description                                           |
|-----------|-------------------------------------------------------|
| Criterion | Specifies which criterion of Skinny traffic to match. |

| Element | Description                                                                                                                                                                                                                                                                                                                                                   |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type    | Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on 0xFFFF, then any traffic that has the message ID 0xFFFF is excluded from the map. <ul style="list-style-type: none"> <li>Matches—Matches the criterion.</li> <li>Doesn't Match—Does not match the criterion.</li> </ul> |
| ID Type | The hexadecimal value for the message ID to inspect: <ul style="list-style-type: none"> <li>Value—Matches a single hexadecimal value.</li> <li>Range—Matches a range of values.</li> </ul>                                                                                                                                                                    |
| Action  | The action you want the device to take for traffic that matches the defined criteria.                                                                                                                                                                                                                                                                         |

## Configuring SNMP Maps

Use the Add and Edit SNMP Map dialog boxes to define maps for SNMP inspection. An SNMP policy map lets you change the default configuration values used for SNMP application inspection.

SNMP application inspection lets you restrict SNMP traffic to a specific version of SNMP. Earlier versions of SNMP are less secure; therefore, denying certain SNMP versions may be required by your security policy. The security appliance can deny SNMP versions 1, 2, 2c, or 3. You control the versions permitted by creating an SNMP map. You then apply the SNMP map when you enable SNMP inspection.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > SNMP** from the Object Type selector. Right-click inside the work area, then select **New Object**, or right-click a row and select **Edit Object**.

## Configuring SCTP Maps

SCTP is a transport-layer protocol operating on top of IP in the protocol stack, similar to TCP and UDP. SCTP creates a logical communication channel, called an association, between two end nodes over multiple source or destination IP addresses. An association defines a set of IP addresses on each node (source and destination) and a port on each node. Any IP address can be used as either a source or a destination IP address of data packets in the association. Messages can be transmitted between a pair of IP addresses, which is defined as a stream.

If you have SCTP traffic going through the ASA, you can configure Cisco Security Manager to control access based on SCTP ports, and implement application layer inspection to enable connections and to optionally filter on payload protocol ID (PPID) to selectively drop, log, or rate limit applications.

You can refine your access rules by adding an SCTP inspect map and filtering on SCTP applications. You can selectively drop, log, or rate limit SCTP traffic classes based on the payload protocol identifier (PPID).

When you filter on PPID, keep the following in mind:

- PPIDs are in data chunks, and a given packet can have multiple data chunks. If a packet includes data chunks with different PPIDs, the packet will not be filtered, and the assigned action will not be applied to the packet.
- If you use PPID filtering to drop or rate-limit packets, be aware that the transmitter will resend any dropped packets. Although a packet for a rate-limited PPID might make it through on the next attempt, a packet for a dropped PPID will again be dropped. You might want to evaluate the eventual consequence of these repeated drops on your network.

Use the Add and Edit SCTP Map dialog boxes to define the match criteria and values for an SCTP inspect map. You can use an SCTP map to inspect packets based on the Payload PID criteria. You can perform the following actions on the packets, based on the PPID match criteria:

- No Action
- Drop Packet
- Log Packet
- Rate Limit

Service objects corresponding to the SCTP protocol are available in the Services table in the [Understanding Map Objects](#) , on page 306.

**Note** SCTP inspect maps are supported from Security Manager 4.10 and ASA versions 9.5.2 and later.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > SCTP** from the Object Type selector. Right-click inside the table, then select **New Object** or right-click a row, then select **Edit Object**.

## SCTP Policy Maps Add or Edit Match Condition and Action Dialog Boxes

Use the Add or Edit Match Condition and Action dialog boxes to define a Payload PID match criterion and action for a SCTP policy map. Repeat the process until you identify all PPIDs you want to selectively handle.

### Navigation Path

In the Policy Object Manager, from the Match Condition and Action tab on the Add or Edit IPv6 Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring IPv6 Maps](#), on page 842.

The corresponding name will be displayed in the match action table if it matches the default names. |
| Max. Payload PID                                                                                                                                                                                                                                 | (Optional) Enter a second, higher PPID to specify a range of PPIDs.                                                                                                                                                                                                                           |

| Element | Description                                                                                                                                                                                                                                                                                   |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action  | Choose the action based on the PPID in SCTP data chunks: <ul style="list-style-type: none"> <li>• Drop Packet—Drop and log all packets that match.</li> <li>• Log—Send a system log message.</li> <li>• Rate Limit— Limit the rate of messages. The rate is in packets per second.</li> </ul> |

## Configuring Diameter Maps

Diameter is an Authentication, Authorization, and Accounting (AAA) protocol used in next-generation mobile and fixed telecom networks such as EPS (Evolved Packet System) for LTE (Long Term Evolution) and IMS (IP Multimedia Subsystem). It replaces RADIUS and TACACS in these networks.

Diameter uses TCP and SCTP as the transport layer, and secures communications using TCP/TLS and SCTP/DTLS. It can optionally provide data object encryption as well. For detailed information on Diameter, see RFC 6733.

Diameter applications perform service management tasks such as deciding user access, service authorization, quality of service, and rate of charging. Although Diameter applications can appear on many different control-plane interfaces in the LTE architecture, the ASA inspects Diameter command codes and attribute-value pairs (AVP) for the following interfaces only:

- S6a: Mobility Management Entity (MME) - Home Subscription Service (HSS).
- S9: PDN Gateway (PDG) - 3GPP AAA Proxy/Server.
- Rx: Policy Charging Rules Function (PCRF) - Call Session Control Function (CSCF).

Diameter inspection opens pinholes for Diameter endpoints to allow communication. The inspection supports 3GPP version 12 and is RFC 6733 compliant.

You can use the Add and Edit Diameter Map dialog boxes to filter traffic based on application ID, command codes, and AVP, to apply special actions such as dropping packets or connections, or logging them. You can create custom AVP for newly-registered Diameter applications. Filtering lets you fine-tune the traffic you allow on your network. For more information see [Create and Add Custom AVPs, on page 865](#).

---

**Note** Diameter messages for applications that run on other interfaces will be allowed and passed through by default. However, you can configure a Diameter inspection policy map to drop these applications by application ID, although you can specify actions based on the command codes or AVP for these unsupported applications.

---

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > Diameter** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.</p> <p>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p> |

## Diameter Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes

Use the Add or Edit Diameter Match Criterion (for Diameter class maps) or Match Condition and Action (for Diameter policy maps) dialog boxes to do the following:

- Define the match criterion and value for a Diameter class map.
- Select a Diameter class map when creating a Diameter policy map.
- Define the match criterion, value, and action directly in a Diameter policy map.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

### Navigation Path

When creating a Diameter class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for Diameter, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring Class Maps for Inspection Policies](#) , on page 790.

When creating a Diameter policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit Diameter Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring Diameter Maps](#) , on page 861.

| Match Type<br>(Only Policy Map) | <p>Enables you to use an existing Diameter class map or define a new Diameter class map.</p> <ul style="list-style-type: none"> <li>• Use Specified Values—You want to define the class map on this dialog box.</li> <li>• Use Values in Class Map—You want to select an existing Diameter class map policy object. Enter the name of the Diameter class map in the <b>Class Name</b> field. Click <b>Select</b> to select the map from a list or to create a new class map object.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Criterion                       | <p>Specifies which criterion of Diameter traffic to match.</p> <ul style="list-style-type: none"> <li>• Application ID—Matches the application identifier, where the application identifier is the Diameter application name or number (0-4294967295) in the Begin Value field. If there is a range of consecutively-numbered applications that you want to match, you can include a second ID in the End Value field. You can define the range by application name or number, and it applies to all the numbers between the Begin Value and the End Value.</li> <li>• Command Code—Matches the command code, where code is the Diameter command code name or number (0-4294967295) in the Begin Value field. If there is a range of consecutively-numbered command codes that you want to match, you can include a second code in the End Value field. You can define the range by command code name or number, and it applies to all the numbers between the Begin Value and the End Value.</li> <li>• AVP—Matches the Attribute Value Pair. <ul style="list-style-type: none"> <li>• To match AVP based on attribute only, specify the name or number (1-4294967295) of an attribute-value pair. For the first code, you can specify the name of a custom AVP or one that is registered in RFCs or 3GPP technical specifications and is directly supported in the software in the Begin Value field. If you want to match a range of AVP, specify the second code by number only in the End Value field. If you want to match an AVP by its value, you cannot specify a second code. Specify the ID number of the vendor to also match, from 0-4294967295 in the Vendor ID field. For example, the 3GPP vendor ID is 10415, the IETF is 0.</li> <li>• To match AVP based on the value of the attribute, additionally specify the value of the attribute in the AVP Data Type field.</li> </ul> </li> </ul> <p><b>Note</b> You can create and add custom AVPs to new diameter applications. For more information see, <a href="#">Create and Add Custom AVPs</a>, on page 865</p> |

| Element                                                                                                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Create and Add Custom AVPs

Use the Add AVP dialog boxes to create and add custom AVPs. These can be registered with the IETF and added to new Diameter applications.

**Note** Cisco Security Manager does not allow you to edit a custom AVP object, once created. However the Device Override option allows you to edit the custom AVP for a particular device. If you want to change any parameter in the custom AVP object, you have to remove the custom AVP reference from the diameter building block (if it is referred), deploy to the device (if it is present in the device) and re-create the object with the required values and refer it back in the diameter building block and deploy it again.

### Navigation Path

When creating a custom AVP, in the Policy Object Manager, from the Add Match Criterion dialog box for Diameter, select **AVP in the Criterion**, then select **Begin Value and right click in the AVP Maps Selector dialog box to Add AVP**.

### Field Reference

*Table 252: Add AVP Dialog Boxes*

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Name        | The name of the custom AVP. A maximum of 32 characters is allowed.<br><b>Note</b> At least one character of the name must be an alphabet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Description | A description of the AVP. A maximum of 80 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| AVP Code    | Set a value for the AVP Code (256- 4294967295), that belongs to the specific vendor code address space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Data Type   | You can configure this only if the data type of the AVP is supported. For example, you can specify an IP address for AVP that have the address data type. Following are the specific syntax of the value option for the supported data types <ul style="list-style-type: none"> <li>• Address—Specify the IPv4 or IPv6 address to match. For example, 10.100.10.10 or 2001:DB8::0DB8:800:200C:417A</li> <li>• Diameter Identity, Diameter URI, Octet String, UTF8tString—Use regular expression or regular expression class objects to match these data types.</li> <li>• Enumerated—Specify a range of numbers in the Begin Range and End Range fields. The range is 0 - 4294967295.</li> <li>• Float32: decimal point representation with 8 digit precision</li> <li>• Float64: decimal point representation with 16 digit precision</li> <li>• Integer32: -2147483647 to 2147483647</li> <li>• Integer64: -9223372036854775807 to 9223372036854775807</li> <li>• Unsigned32: 0 to 4294967295</li> <li>• Unsigned64: 0 to 18446744073709551615</li> <li>• Time— Specify the start and end dates and time. Both are required. Time is in 24-hour format.</li> </ul> |

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Vendor ID                                             | Specify the ID number of the vendor, from 0-4294967295 in the Vendor ID field. For example, the 3GPP vendor ID is 10415, the IETF is 0.                                                                                                                                                                                                                                                                                                                                                     |
| Category                                              | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                 |
| Allow Value Override per Device Overrides Edit button | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.<br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## Create and Add TLS Proxy Objects

If a Diameter application uses encrypted data over TCP, inspection cannot see inside the packets to implement your message filtering rules. Thus, if you create filtering rules, and you want them to also apply to encrypted TCP traffic, you must configure a TLS proxy. You also need a proxy if you want strict protocol enforcement on encrypted traffic. This configuration does not apply to SCTP/DTLS traffic.

The TLS proxy acts as a man-in-the-middle. It decrypts traffic, inspects it, then encrypts it again and sends it to the intended destination. Thus, both sides of the connection, the Diameter server and Diameter client, must trust the ASA, and all parties must have the required certificates. You must have a good understanding of digital certificates to implement TLS proxy.

**Note** The TLS proxy feature is supported in multi-context devices for version ASA 9.7.1 and later.

You have the following options for configuring TLS proxy for Diameter inspection:

- Full TLS proxy—Encrypt traffic between the ASA and Diameter clients and the ASA and Diameter server. You have the following options for establishing the trust relationship with the server:
  - Use a static proxy client trustpoint. The ASA presents the same certificate for every Diameter client when communicating with the Diameter server. Because all clients look the same, the Diameter server cannot provide differential services per client. On the other hand, this option is faster than the LDC method.
  - Use local dynamic certificates (LDC). With this option, the ASA presents unique certificates per Diameter client when communicating with the Diameter server. This method gives the Diameter server better visibility into client traffic, which makes it possible to provide differential services based on client characteristics.
- TLS offload—Encrypt traffic between the ASA and Diameter client, but use a clear-text connection between the ASA and Diameter server. This option is viable if the Diameter server is in the same data center as the ASA, where you are certain that the traffic between the devices will not leave the protected area. Using TLS offload can improve performance, because it reduces the amount of encryption processing required. It should be the fastest of the options. The Diameter server can apply differential services based on client IP address only.

### Navigation Path

Select **Manage > Policy Objects**, then select **TLS Proxy** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

| Allow Value Override per Device Overrides Edit button                                                                                                                                                                                    | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.<br><br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                                         |

## Editing TLS Proxy Object

Cisco Security Manager does not allow you to edit a TLS proxy object, once created. However, the Device Override option allows you to edit the TLS proxy object for a particular device.

If you want to change any parameter in the TLS proxy object, you have to remove the TLS proxy reference from the diameter building block (if it is referred), deploy to the device (if it is present in the device) and re-create the object with a new name, with the required values and refer it back in the diameter building block and deploy it again.

To edit a TLS proxy in class-map, execute the following deployment procedure:

1. Remove the relevant class map with existing TLS proxy server from the device by navigating to Platform > Service Policy > Rules.
2. Deploy the relevant class map with new TLS proxy server to the device by navigating to Platform > Service Policy > Rules.

## Configuring LISP Maps

The Locator ID Separation Protocol (LISP) is a network architecture and protocol. LISP replaces a single IP address with two numbering spaces—Routing Locators (RLOCs), which are topologically assigned to network attachment points and used for routing and forwarding of packets through the network; and Endpoint Identifiers (EIDs), which are assigned independently from the network topology and used for numbering devices, and are aggregated along administrative boundaries.

LISP defines functions for mapping between the two numbering spaces and encapsulating traffic originated by devices using non-routable EIDs for transport across a network infrastructure that routes and forwards using RLOCs. LISP provides a set of functions for devices to exchange information that is used to map non-routable EIDs to routable RLOCs.

When considering the deployment of ACLs with LISP, the following aspects are important.

- LISP encapsulation utilizes a UDP header just prior to the LISP header for all packets to distinguish between two distinct packet groups: LISP control plane packets, which utilize a UDP destination port of 4342, and LISP data plane packets, which utilize a UDP destination port of 4341. ACLs may need to consider this distinction between these two groups of packets.
- LISP is an encapsulation protocol and, because ACLs only filter based on Layer 3 and Layer 4 header information, ACLs may need to be applied at a specific point or at several different points within the packet forwarding and LISP encapsulation process in order to implement a site security policy. The application point and direction of the ACL will dictate whether EID namespace or RLOC namespace is used within the ACL itself. Packets can be filtered using EID namespace just prior to LISP encapsulation or just after LISP decapsulation; packets can be filtered using RLOC namespace just after LISP encapsulation or just prior to LISP decapsulation.

You can use the Add and Edit LISP Map dialog boxes to filter traffic based on EID access-list and validation key. Filtering lets you fine-tune the traffic you allow on your network.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > LISP** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

## Configuring M3UA Maps

MTP3 User Adaptation (M3UA) is a client/server protocol that provides a gateway to the SS7 network for IP-based applications that interface with the SS7 Message Transfer Part 3 (MTP3) layer. M3UA makes it possible to run the SS7 User Parts (such as ISUP) over an IP network. M3UA is defined in RFC 4666.

M3UA uses SCTP as the transport layer. SCTP port 2905 is the expected port, although you can configure the signaling gateways to use a different port.

The MTP3 layer provides networking functions such as routing and node addressing, but uses point codes to identify nodes. The M3UA layer exchanges Originating Point Codes (OPC) and Destination Point Codes (DPC). This is similar to how IP uses IP addresses to identify nodes.

M3UA inspection provides limited protocol conformance. You can optionally apply access policy based on point codes or Service Indicators (SI). You can also apply rate limiting based on message class and type.

## M3UA Protocol Conformance

M3UA inspection provides the following limited protocol enforcement. Inspection drops and logs packets that do not meet requirements.

- Common message header. Inspection validates all fields in the common header.
  - Version 1 only.
  - Message length must be correct.
  - Message type class with a reserved value is not allowed.

- Invalid message ID within the message class is not allowed.
- Payload data message.
  - Only one parameter of a given type is allowed.
  - Data messages on SCTP stream 0 are not allowed.

## M3UA Inspection Limitations

M3UA inspection has the following limitations.

- NAT is not supported for IP addresses embedded in M3UA data.
- Segmented M3UA messages will not be inspected and are likely to be dropped.
- SCTP does not support multi-homing or multi-streaming. If you need to support multi-homed flows you need to create access lists to allow them.
- Stateful failover is not supported for call flows and messages. Any failure occurring during a call flow might cause packets to be dropped and calls to be disconnected.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > M3UA** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239                                                                                                                                      |

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Allow Value Override per Device Overrides Edit button | <p>Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a>, on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a>, on page 244.</p> <p>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p> |

## M3UA Policy Maps Add or Edit Match Condition and Action Dialog Boxes

Use the Match Condition and Action dialog boxes to define the match criterion, value, and action directly in a M3UA policy map.

The fields on this dialog box change based on the criterion you select while creating a policy map.

### Navigation Path

When creating a M3UA policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit M3UA Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring M3UA Maps](#), on page 871.

| Type    | <p>Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on the string "example.com," then any traffic that contains "example.com" is excluded from the map.</p> <ul style="list-style-type: none"> <li>• Matches—Matches the criterion.</li> <li>• Doesn't Match—Does not match the criterion.</li> </ul>                                                                             |
| Action  | <p>The action you want the device to take for traffic that matches the defined criteria.</p> <ul style="list-style-type: none"> <li>• Drop Packet—By default, all invalid packets or packets that failed during parsing are dropped.</li> <li>• Drop Packet and Log— Same as drop packet and additionally send a system log message.</li> <li>• Rate Limit— Limit the rate of messages. This option is available when the message criterion is selected.</li> </ul> |

## Configuring Regular Expression Groups

Use the Add and Edit Regular Expression Groups dialog boxes to define regular expression groups, which contain multiple regular expressions. Groups make it possible for you to create modular regular expressions and group them in multiple ways for various uses. The objects can be used in some inspection class maps and inspection policy maps.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Regular Expressions Groups** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

| Allow Value Override per Device<br>Overrides<br>Edit button | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.<br><br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## Add/Edit Regular Expressions

Use the Add and Edit Regular Expression dialog boxes to define regular expressions for use in class and policy inspection maps or in regular expression group policy objects. Regular expressions are also used in remote access SSL VPN client settings.

A regular expression matches text strings either literally as an exact string or by using metacharacters so you can match multiple variants of a text string. You can use regular expressions in various type of class and policy inspection maps to match various target items, for example, the content of certain application traffic such as the body text inside an HTTP packet.

### Navigation Path

- Select **Manage > Policy Objects**, then select **Maps > Regular Expressions** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.
- From the Client Settings tab of the SSL VPN Other Settings policy for ASA devices, click the **Add Secure Client Image** button for the Secure Client Image table, or select an image and click the **Edit Row** button. For detailed information on opening the tab, see [Configuring SSL VPN Secure Client Settings \(ASA\)](#), on page 1391. On the Add Secure Client Image dialog box, click **Select** to open the Regular Expressions Selector dialog box. To add a new regular expression, click the **Add (+)** button on the Regular Expressions Selector dialog box.

## Field Reference

**Table 258: Add and Edit Regular Expression Dialog Boxes**

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                                                  | The name of the policy object. A maximum of 40 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Description                                           | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Value                                                 | The regular expression, up to 100 characters in length. For information on the metacharacters you can use to build regular expressions, see <a href="#">Metacharacters Used to Build Regular Expressions</a> , on page 878.                                                                                                                                                                                                                                                                     |
| Category                                              | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                     |
| Allow Value Override per Device Overrides Edit button | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.<br><br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## Metacharacters Used to Build Regular Expressions

The following table explains the metacharacters you can use to build regular expressions in the Add and Edit Regular Expression dialog boxes (see [Add/Edit Regular Expressions](#), on page 877).

Keep the following tips in mind when creating regular expressions:

- If you enter any metacharacters in your text string that you want to be used literally, add the backslash (\) escape character before them. For example, “example\com”.
- If you want to match upper and lower case characters, enter text in both upper- and lowercase. For example, “cats” is entered as “[cC][aA][tT][sS]”.

**Table 259: Metacharacters Used to Build Regular Expressions**

| Character | Description   | Notes                                                                                                                                                                                                                                                                                                                                                              |
|-----------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| .         | Dot           | Matches any single character. For example, d.g matches dog, dag, dtg, and any word that contains those characters, such as doggonnit.                                                                                                                                                                                                                              |
| (exp)     | Subexpression | A subexpression segregates characters from surrounding characters, so that you can use other metacharacters on the subexpression. For example, d(o a)g matches dog and dag, but do ag matches do and ag. A subexpression can also be used with repeat quantifiers to differentiate the characters meant for repetition. For example, ab(xy){3}z matches abxyxyxyz. |

| Character | Description                | Notes                                                                                                                                                                                                                                                                                                                  |
|-----------|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           | Alternation                | Matches either expression it separates. For example, dog cat matches dog or cat.                                                                                                                                                                                                                                       |
| ?         | Question mark              | A quantifier that indicates that there are 0 or 1 of the previous expression. For example, lo?se matches lse or lose.                                                                                                                                                                                                  |
| *         | Asterisk                   | A quantifier that indicates that there are 0, 1 or any number of the previous expression. For example, lo*se matches lse, lose, loose, etc.                                                                                                                                                                            |
| +         | Plus                       | A quantifier that indicates that there is at least 1 of the previous expression. For example, lo+se matches lose and loose, but not lse.                                                                                                                                                                               |
| {x}       | Repeat Quantifier          | Repeat exactly x times. For example, ab(xy){3}z matches abxyxyxyz.                                                                                                                                                                                                                                                     |
|           | Minimum repeat quantifier  | Repeat at least x times. For example, ab(xy){2,}z matches abxyxyz, abxyxyxyz, etc.                                                                                                                                                                                                                                     |
| [abc]     | Character class            | Matches any character in the brackets. For example, [abc] matches a, b, or c.                                                                                                                                                                                                                                          |
| [^abc]    | Negated character class    | Matches a single character that is not contained within the brackets. For example, [^abc] matches any character other than a, b, or c. [^A-Z] matches any single character that is not an uppercase letter.                                                                                                            |
| [a-c]     | Character range class      | Matches any character in the range. [a-z] matches any lowercase letter. You can mix characters and ranges: [abcq-z] matches a, b, c, q, r, s, t, u, v, w, x, y, z, and so does [a-cq-z].<br><br>The dash (-) character is literal only if it is the last or the first character within the brackets: [abc-] or [-abc]. |
| “”        | Quotation marks            | Preserves trailing or leading spaces in the string. For example, “ test” preserves the leading space when it looks for a match.                                                                                                                                                                                        |
| ^         | Caret                      | Specifies the beginning of a line.                                                                                                                                                                                                                                                                                     |
| \         | Escape character           | When used with a metacharacter, matches a literal character. For example, \[ matches the left square bracket.                                                                                                                                                                                                          |
| char      | Character                  | When character is not a metacharacter, matches the literal character.                                                                                                                                                                                                                                                  |
| \r        | Carriage return            | Matches a carriage return 0x0d.                                                                                                                                                                                                                                                                                        |
| \n        | Newline                    | Matches a new line 0x0a.                                                                                                                                                                                                                                                                                               |
| \t        | Tab                        | Matches a tab 0x09.                                                                                                                                                                                                                                                                                                    |
| \f        | Formfeed                   | Matches a form feed 0x0c.                                                                                                                                                                                                                                                                                              |
| \xNN      | Escaped hexadecimal number | Matches an ASCII character using hexadecimal (exactly two digits).                                                                                                                                                                                                                                                     |

| Character | Description          | Notes                                                                                                          |
|-----------|----------------------|----------------------------------------------------------------------------------------------------------------|
| \NNN      | Escaped octal number | Matches an ASCII character as octal (exactly three digits). For example, the character 040 represents a space. |

## Configuring Settings for Inspection Rules for IOS Devices

**Note** From version 4.17, though Cisco Security Manager continues to support PIX, FWSM, and IPS features/functionality, it does not support any enhancements.

If you configure inspection rules, you can also configure inspection settings to change the default settings for some global inspection parameters for IOS devices. Most of the inspection settings relate to preventing or mitigating Denial of Service (DoS) attacks. The default settings for most of these options are appropriate for most networks, so configure this policy only if you need to adjust one or more settings. If you do not change a setting, it is not configured on the device (the default remains configured).

To open the Inspection settings page, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > Inspection** from the Policy selector.
- (Policy view) Select **Firewall > Settings > Inspection** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Settings > Inspection**.

The following table explains the available inspection settings.

**Table 260: Inspection Page**

| Element                         | Description                                                                                                                                                                                                 |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Global Timeout Values           |                                                                                                                                                                                                             |
| TCP Establish Timeout (seconds) | How long to wait for a TCP session to reach the established state before dropping the session, in seconds, from 1-2147483. The default is 30.                                                               |
| FIN Wait Time (seconds)         | How long to maintain TCP session state information after the firewall detects a FIN-exchange, in seconds, from 1-2147483. The FIN-exchange occurs when the TCP session is ready to close. The default is 5. |
| TCP Idle Time (seconds)         | How long to maintain a TCP session while there is no activity in the session, in seconds, from 1-2147483. The default is 3600 (one hour).                                                                   |

| Element                                                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UDP Idle Time (seconds)                                                                       | <p>How long to maintain a UDP session while there is no activity in the session, in seconds, from 1-2147483. The default is 30.</p> <p>When the software detects a valid UDP packet, the software establishes state information for a new UDP session. Because UDP is a connectionless service, there are no actual sessions, so the software approximates sessions by examining the information in the packet and determining if the packet is similar to other UDP packets (for example, it has similar source or destination addresses) and if the packet was detected soon after another similar UDP packet.</p> <p>If the software detects no UDP packets for the UDP session for the period of time defined by the UDP idle timeout, the software will not continue to manage state information for the session.</p>                                     |
| DNS Timeout (seconds)                                                                         | The length of time for which a DNS lookup session is managed while there is no activity, in seconds, from 1-2147483. The default is 5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| SYN Flooding DoS Attack Thresholds                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Maximum 1 Minute Connection Rate - low<br><br>Maximum 1 Minute Connection Rate - high         | The number of new unestablished sessions that causes the system to start and stop deleting half-open sessions. Ensure that you enter a lower number in the Low field than you enter in the High field. Possible values are from 1-2147483647 per minute. The default is 400 for low and 500 for high.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Maximum Incomplete Sessions Stop Threshold<br><br>Maximum Incomplete Sessions Start Threshold | The number of existing half-open sessions that will cause the software to start and stop deleting half-open sessions. Ensure that you enter a lower number in the stop field than you enter in the start field. Possible values are from 1-2147483647. The default is 400 for low and 500 for high.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Thresholds per Host                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Max Sessions Per Host                                                                         | <p>The number of half-open TCP sessions with the same host destination address that can exist at a time before the software starts deleting half-open sessions to the host. Possible values are 1-4294967295. The default is 50.</p> <p>A large number of half-open sessions can indicate there is a Denial of Service attack against the host.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Max Sessions Blocking Interval (min)                                                          | <p>If the maximum sessions per host threshold is reached, the blocking time to apply to help mitigate the potential TCP host-specific denial-of-service (DoS) attack. Possible values are 0-35791 minutes. The default is 0.</p> <ul style="list-style-type: none"> <li>• If the blocking time value is 0, the software deletes the oldest existing half-open session for the host for every new connection request to the host above the maximum session limit. This ensures that the number of half-open sessions to a given host will never exceed the threshold.</li> <li>• If the blocking time value is greater than 0, the software deletes all existing half-open sessions for the host, then blocks all new connection requests to the host. The software will continue to block all new connection requests until the block-time expires.</li> </ul> |

| Element                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Other                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Session Hash Table Size (buckets)              | <p>The size of the hash table in terms of buckets. Possible values for the hash table are 1024, 2048, 4096, and 8192. The default is 1024.</p> <p>You should increase the hash table size when the total number of sessions running through the device is approximately twice the current hash size; decrease the hash table size when the total number of sessions is reduced to approximately half the current hash size. Essentially, try to maintain a 1:1 ratio between the number of sessions and the size of the hash table.</p> |
| Enable Alert Messages                          | Whether to generate stateful packet inspection alert messages on the console.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Enable Audit Trail Messages                    | Whether audit trail messages are logged to the syslog server or router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Permit DHCP Passthrough (Transparent Firewall) | <p>Whether to permit a transparent firewall to forward DHCP packets across the bridge without inspection.</p> <p>Permitting DHCP passthrough overrides an ACL for DHCP packets, so DHCP packets are forwarded even if the ACL is configured to deny all IP packets. Thus, clients on one side of the bridge can get an IP address from a DHCP server on the opposite side of the bridge.</p>                                                                                                                                            |
| Block Non-SYN Packets                          | Whether to drop TCP packets that do not belong to an established session. These are TCP packets that do not initiate sessions, that is, the SYN bit is not set in them.                                                                                                                                                                                                                                                                                                                                                                 |
| Log Dropped Packets                            | Whether to create log messages for dropped packets to specify the reason for dropping them.                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## CHAPTER 18

# Managing Firewall Web Filter Rules

---

Web filter rules policies define policies for allowing or preventing web traffic based on the requested URL or the applet content of the traffic. For ASA, PIX, and FWSM devices, you can also filter FTP and HTTPS traffic.

How you configure web filter rules is different depending on whether the device uses ASA, PIX or FWSM software as opposed to Cisco IOS Software.

The following topics help you work with web filter rules:

- [Understanding Web Filter Rules](#) , on page 883
- [Configuring Web Filter Rules for ASA, PIX, and FWSM Devices](#) , on page 884
- [Configuring Web Filter Rules for IOS Devices](#) , on page 893
- [Configuring Settings for Web Filter Servers](#) , on page 898

## Understanding Web Filter Rules

Web filter rules policies define policies for allowing or preventing web traffic based on the requested URL or the applet content of the traffic. For ASA, PIX, and FWSM devices, you can also filter FTP and HTTPS traffic.

Web, or URL, filtering allows you to control which web sites and web content your users have access to. For example, you might consider some types of content to create a hostile work environment for the people in your organization (for example, web sites that provide pornography). You might consider some web sites to be unsafe and a source of potential viral applications. Using web filter rules, you can block access to these objectionable or unsafe sites.

To filter web requests, you should install an external web filtering server, either Websense or SmartFilter (N2H2). For ASA, PIX, and FWSM devices, these external servers are required for URL, FTP, or HTTPS filtering. For IOS devices, you can also use these servers, but additionally you can create local lists of allowed (always allowed) or blocked (always denied) URLs. You configure the filtering servers in the web filter settings policy; see [Configuring Settings for Web Filter Servers](#) , on page 898.

---

**Tip** For IOS devices, you have the option of configuring web filtering using zone-based firewall rules instead of web filter rules, which allows you the additional option of using Trend Micro web filtering servers. For more information, see [Managing Zone-based Firewall Rules](#), on page 929.

---

Beside filtering requests based on URL, you can do some applet filtering, stripping out ActiveX or Java applets. You might want to do this to prevent applet downloads from sites you otherwise want to allow if you do not fully trust the site. You can configure your rules to block these applets from specific sites while allowing them from trusted sites.

The policies and procedures for configuring web filter rules differs based on the device type. See the following topics for more information:

- [Configuring Web Filter Rules for ASA, PIX, and FWSM Devices](#) , on page 884
- [Configuring Web Filter Rules for IOS Devices](#) , on page 893

## Configuring Web Filter Rules for ASA, PIX, and FWSM Devices

**Note** From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functionality, it does not support any enhancements.

Web filter rules policies for ASA, PIX, and FWSM devices define how you want to handle HTTP, FTP, and HTTPS traffic. You can also filter ActiveX and Java applets. Web filter rules permit or deny traffic based on the Universal Resource Locator (URL) address in the web request. If you allow HTTP traffic in your access rules, you can subsequently deny (or drop) traffic if it is directed at an objectionable web or FTP site, or you can strip out ActiveX or Java applets from untrusted sources.

To configure web filtering rules for ASA, PIX, and FWSM devices:

1. Configure the rules that identify traffic that should be subject to filtering, and the traffic that should be exempt from filtering rules (see below for the procedure).
2. Configure web filter settings to identify the URL filtering server and other settings. For more information, see [Configuring Settings for Web Filter Servers](#) , on page 898.

### Related Topics

- [Understanding Web Filter Rules](#) , on page 883

- [Adding and Removing Rules](#) , on page 604
- [Editing Rules](#) , on page 605
- [Enabling and Disabling Rules](#) , on page 616
- [Moving Rules and the Importance of Rule Order](#) , on page 615
- [Understanding Networks/Hosts Objects](#) , on page 308
- [Understanding and Specifying Services and Service and Port List Objects](#) , on page 329

**Step 1** Do one of the following to open the [Web Filter Rules Page \(ASA/PIX/FWSM\)](#) , on page 885:

- Device view—Select **Firewall > Web Filter Rules** from the Policy selector.

- Policy view—Select **Firewall > Web Filter Rules (PIX/FWSM/ASA)** from the Policy Type select. Select an existing policy or create a new one.

**Step 2** Select the row after which you want to create the rule and click the **Add Row** button or right-click and select **Add Row**. This opens the [Add and Edit PIX/ASA/FWSM Web Filter Rule Dialog Boxes](#) , on page 888.

**Tip** If you do not select a row, the new rule is added at the end of the local scope. You can also select an existing row and edit either the entire row or specific cells. For more information, see [Editing Rules](#) , on page 605.

**Step 3** Configure the rule. Following are the highlights of what you typically need to decide. For specific information on configuring the fields, see [Add and Edit PIX/ASA/FWSM Web Filter Rule Dialog Boxes](#) , on page 888.

- Filtering and Type—Whether you are creating a rule that identifies traffic to be filtered (Filter) or exempted from an existing filter rule (Filter Except), and the type of filtering to be done:
  - URL—To filter traffic based on web address.
  - HTTPS—To filter web traffic to secure sites. This does not include SSL VPN traffic.
  - FTP—To filter FTP traffic.
  - ActiveX or Java—To remove ActiveX or Java applets. These options delete all entities within applet or object tags, so you might remove more than just ActiveX or Java applets.
- Source and Destination addresses—If the rule should apply no matter which addresses generated the traffic or their destinations, use “any” as the source or destination. If the rule is specific to a host or network, enter the addresses or network/host objects. For information on the accepted address formats, see [Specifying IP Addresses During Policy Definition](#) , on page 316.
- Service—Primarily defines the port that should be monitored. You must specify some type of TCP service. Typically, you would use the pre-defined services HTTP, HTTPS, or FTP, which should be the same as the type of filtering you are performing, but you can specify any TCP port on your network that might contain the traffic to be filtered.
- Options—The options you want to include, if any. The main options of interest are whether you want to allow traffic if the filtering servers are unavailable, and whether you want to truncate long URLs or URLs that have parameters. Truncating URLs that have parameters is typically a good idea, because if you are going to drop a URL, it is not normally because of a parameter value.

Click **OK** when you are finished defining your rule.

**Step 4** If you did not select the desired row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. Order is not as important for web filtering rules, however, because filter except rules always create exceptions to the related filter rule, whether they come before or after the filter rule. For more information, see [Moving Rules and the Importance of Rule Order](#) , on page 615.

---

## Web Filter Rules Page (ASA/PIX/FWSM)

---

**Note** From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functionality, it does not support any enhancements.

---

Use the Web Filter Rules page for ASA, PIX, and FWSM devices to configure web, or URL, filtering rules. Web filtering is a type of HTTP inspection. If your access rules allow HTTP traffic, you can configure rules to apply server-based web filtering to prevent users from accessing undesirable web servers.

When you configure web filter rules, also configure web filter settings in the **Firewall > Settings > Web Filter** policy. The settings identify the web filtering server and contain other settings that control the overall functioning of the policy. You must configure a web filtering server for your URL, FTP, or HTTPS filter rules to be deployed. For more information, see [Web Filter Settings Page](#), on page 899.

---

**Tip** Rules cannot overlap. For example, if you create two rules with the same, or overlapping, source, destination, and service, you cannot deploy them. Also, you should order any filter-except rules below the filter rule to which they are creating an exemption.

---

### Navigation Path

To access the Web Filter Rules page for ASA, PIX, and FWSM devices, do one of the following:

- (Device view) Select an ASA, PIX, or FWSM device, then select **Firewall > Web Filter Rules** from the Policy selector.
- (Policy view) Select **Firewall > Web Filter Rules (PIX/FWSM/ASA)** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click an ASA, PIX, or FWSM device and select **Edit Firewall Policies > Web Filter Rules**.

## Field Reference

**Table 261: Web Filter Rules Page (ASA, PIX, FWSM)**

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.                                       | The ordered rule number.                                                                                                                                                                                                                                                                                                                                                                                      |
| Source<br>Destination                     | The source and destination addresses for the rule. The “any” address does not restrict the rule to specific hosts, networks, or interfaces. These addresses are IP addresses for hosts or networks, network/host objects, interfaces, or interface roles. Multiple entries are displayed as separate subfields within the table cell. See <a href="#">Understanding Networks/Hosts Objects</a> , on page 308. |
| Service                                   | The services or service objects that specify the protocol and port of the traffic to which the rule applies. Multiple entries are displayed as separate subfields within the table cell. See <a href="#">Understanding and Specifying Services and Service and Port List Objects</a> , on page 329.                                                                                                           |
| Type                                      | The type of filtering action for the rule, either filtering the identified traffic, or exempting the identified traffic from filtering (Filter Except). For a full explanation, see <a href="#">Edit Web Filter Type Dialog Box</a> , on page 891.                                                                                                                                                            |
| Options                                   | Additional configuration options for the selected protocol, if any. For detailed descriptions, see <a href="#">Edit Web Filter Options Dialog Box</a> , on page 892.                                                                                                                                                                                                                                          |
| Category                                  | The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                     |
| Description                               | The description of the rule, if any.                                                                                                                                                                                                                                                                                                                                                                          |
| Last Ticket(s)                            | Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see <a href="#">Ticket Management Page</a> , on page 584).                     |
| Query                                     | Click this button to run a policy query, which can help you evaluate your rules and identify ineffective rules. See <a href="#">Generating Policy Query Reports</a> , on page 625                                                                                                                                                                                                                             |
| Find and Replace button (binoculars icon) | Click this button to search for various types of items within the table and to optionally replace them. See <a href="#">Finding and Replacing Items in Rules Tables</a> , on page 612.                                                                                                                                                                                                                        |
| Up Row and Down Row buttons (arrow icons) | Click these buttons to move the selected rules up or down within a scope or section. For more information, see <a href="#">Moving Rules and the Importance of Rule Order</a> , on page 615.                                                                                                                                                                                                                   |
| Add Row button                            | Click this button to add a rule to the table after the selected row using the <a href="#">Add and Edit PIX/ASA/FWSM Web Filter Rule Dialog Boxes</a> , on page 888. If you do not select a row, the rule is added at the end of the local scope. For more information about adding rules, see <a href="#">Adding and Removing Rules</a> , on page 604.                                                        |

| Element           | Description                                                                                                                                             |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| Edit Row button   | Click this button to edit the selected rule. You can also edit individual cells. For more information, see <a href="#">Editing Rules</a> , on page 605. |
| Delete Row button | Click this button to delete the selected rule.                                                                                                          |

## Add and Edit PIX/ASA/FWSM Web Filter Rule Dialog Boxes

**Note** From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functionality, it does not support any enhancements.

Use the Add and Edit PIX/ASA/FWSM Web Filter Rule dialog boxes to configuring web filtering rules for these types of devices.

### Navigation Path

From the [Web Filter Rules Page \(ASA/PIX/FWSM\)](#) , on page 885, click the **Add Row** button or select a row and click the **Edit Row** button.

### Field Reference

*Table 262: Add and Edit PIX/ASA/FWSM Web Filter Rule Dialog Boxes*

| Element     | Description                                                                                                                                                                                                                                                                                                                       |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Rule | Whether to enable the rule, which means the rule becomes active when you deploy the configuration to the device. Disabled rules are shown overlain with hash marks in the rule table. For more information, see <a href="#">Enabling and Disabling Rules</a> , on page 616.                                                       |
| Filtering   | The type of rule you are defining: <ul style="list-style-type: none"> <li>• Filter—The rule filters the identified type of traffic between source and destination.</li> <li>• Filter Except—The rule creates an exemption to a filter rule. The identified traffic between the source and destination is not filtered.</li> </ul> |

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type                    | <p>The type of traffic that should be filtered (or exempted from filtering) for this rule. For filtering that uses an external server, consult the documentation for your version of the server to determine if it supports that type of filtering. Configure the filtering server on the <a href="#">Web Filter Settings Page</a> , on page 899.</p> <ul style="list-style-type: none"> <li>• URL—HTTP traffic. Filtering is done using an external filtering server.</li> <li>• HTTPS—HTTPS traffic. This does not include traffic associated with an SSL VPN. Filtering is done using an external filtering server.</li> <li>• Java—Remove Java applets from HTTP traffic if they are identified on applet tags. The rule does not remove Java applets from SSL VPN traffic. If the applet tag spans packets, or the code in the tags is larger than the MTU, the Java applet is not removed.</li> <li>• ActiveX—Remove ActiveX or Java applets from HTTP traffic. The rule removes any item within object or applet tags, which might also remove images and multimedia objects. The rule might not remove applets from SSL VPN traffic. If the object tag spans packets, or the code in the tags is larger than the MTU, the object is not removed.</li> <li>• FTP—FTP traffic. Filtering is done using an external filtering server.</li> </ul> |
| Sources<br>Destinations | <p>The source or destination of the traffic. You can enter more than one value by separating the items with commas.</p> <p>You can enter any combination of the following address types to define the source or destination of the traffic. For more information, see <a href="#">Specifying IP Addresses During Policy Definition</a> , on page 316.</p> <ul style="list-style-type: none"> <li>• Network/host object. Enter the name of the object or click <b>Select</b> to select it from a list. You can also create new network/host objects from the selection list.</li> <li>• Host IP address, for example, 10.10.10.100.</li> <li>• Network address, including subnet mask, in either the format 10.10.10.0/24 or 10.10.10.0/255.255.255.0.</li> <li>• A range of IP addresses, for example, 10.10.10.100-10.10.10.200.</li> <li>• An IP address pattern in the format 10.10.0.10/255.255.0.255, where the mask is a discontinuous bit mask (see <a href="#">Contiguous and Discontiguous Network Masks for IPv4 Addresses</a> , on page 309).</li> </ul>                                                                                                                                                                                                                                                                                   |

| Element                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Services                                                                   | <p>The services that define the port number of the traffic to act on. You can enter more than one value by separating the items with commas.</p> <p>The service must use TCP. Your specification defines the port that you want filtered (the service name has no meaning). For example, if you want to filter port 80, use the HTTP service object. If HTTP traffic on your network uses a different port, specify TCP/port number (for example, TCP/8080). You can enter TCP by itself to filter all ports.</p> <p>You can enter any combination of service objects and service types (which are typically a protocol and port combination). If you type in a service, you are prompted as you type with valid values. You can select a value from the list and press Enter or Tab.</p> <p>For complete information on how to specify services, see <a href="#">Understanding and Specifying Services and Service and Port List Objects</a>, on page 329.</p> |
| Allow traffic if URL Filter Server unavailable<br>(URL, FTP, HTTPS only)   | Whether to permit unfiltered traffic on outbound connections if all of the URL filtering servers are unavailable. If you do not select this option, all affected outbound traffic (HTTP, FTP, or HTTPS) is blocked until at least one filtering server becomes available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Block connection to HTTP Proxy Server<br>(URL only)                        | Whether to prevent users from connecting to an HTTP proxy server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Truncate CGI request by removing CGI parameters<br>(URL only)              | When a URL has a parameter list starting with a question mark (?), such as a CGI script, whether to truncate the URL sent to the filtering server by removing all characters after and including the question mark.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Block outbound requests if absolute FTP path is not provided<br>(FTP only) | Whether to prevent interactive FTP sessions that do not provide the entire directory path when the user tries to change directories.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Long URL<br>(URL only)                                                     | <p>How to handle URLs that are longer than the maximum allowed by the filtering server: 4 KB for Websense, 3 KB for Smartfilter (N2H2). Many times, long URLs are due to parameter lists, and you can use the <b>Truncate CGI request by removing CGI parameters</b> option to handle those URLs. For other long URLs, select from the following options:</p> <ul style="list-style-type: none"> <li>• Drop—Drop the long URL request.</li> <li>• Truncate—Truncate the URL request to only the hostname or IP address portion of the URL.</li> <li>• Deny—Deny the URL request.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                     |

| Element     | Description                                                                                                                                               |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Category    | The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239. |
| Description | An optional description of the rule (up to 1024 characters).                                                                                              |

## Edit Web Filter Type Dialog Box

Use the Edit Web Filter Type dialog box to edit the type of filtering to be done by a web filter rule for ASA, PIX, and FWSM devices.

### Navigation Path

Right-click the Type cell in a web filter rule for ASA/PIX/FWSM (on the [Web Filter Rules Page \(ASA/PIX/FWSM\)](#), on page 885) and select **Edit Web Filter Type**. You can edit the type for one row at a time.

### Field Reference

**Table 263: Edit Web Filter Type Dialog Box**

| Element   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Filtering | <p>The type of rule you are defining:</p> <ul style="list-style-type: none"> <li>• Filter—The rule filters the identified type of traffic between source and destination.</li> <li>• Filter Except—The rule creates an exemption to a filter rule. The identified traffic between the source and destination is not filtered.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Type      | <p>The type of traffic that should be filtered (or exempted from filtering) for this rule. For filtering that uses an external server, consult the documentation for your version of the server to determine if it supports that type of filtering. Configure the filtering server on the <a href="#">Web Filter Settings Page</a>, on page 899.</p> <ul style="list-style-type: none"> <li>• URL—HTTP traffic. Filtering is done using an external filtering server.</li> <li>• HTTPS—HTTPS traffic. This does not include traffic associated with an SSL VPN. Filtering is done using an external filtering server.</li> <li>• Java—Remove Java applets from HTTP traffic if they are identified on applet tags. The rule does not remove Java applets from SSL VPN traffic. If the applet tag spans packets, or the code in the tags is larger than the MTU, the Java applet is not removed.</li> <li>• ActiveX—Remove ActiveX or Java applets from HTTP traffic. The rule removes any item within object or applet tags, which might also remove images and multimedia objects. The rule might not remove applets from SSL VPN traffic. If the object tag spans packets, or the code in the tags is larger than the MTU, the object is not removed.</li> <li>• FTP—FTP traffic. Filtering is done using an external filtering server.</li> </ul> |

## Edit Web Filter Options Dialog Box

Use the Edit Web Filter Options dialog box to edit the filtering options defined for a web filter rule for ASA, PIX, and FWSM devices.

The options displayed on this dialog box differ depending on the type of filtering configured for the rule. For some types, there are no options and the dialog box is empty. The reference table below includes all possible options.

### Navigation Path

Right-click the Options cell in a web filter rule for ASA/PIX/FWSM (on the [Web Filter Rules Page \(ASA/PIX/FWSM\)](#), on page 885) and select **Edit Web Filter Type**. You can edit the type for one row at a time.

|----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Allow traffic if URL Filter Server unavailable<br>(URL, FTP, HTTPS only)   | Whether to permit unfiltered traffic on outbound connections if all of the URL filtering servers are unavailable. If you do not select this option, all affected outbound traffic (HTTP, FTP, or HTTPS) is blocked until at least one filtering server becomes available.                                                                                                                                                                                                                                                                                                            |
| Block connection to HTTP Proxy Server<br>(URL only)                        | Whether to prevent users from connecting to an HTTP proxy server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Truncate CGI request by removing CGI parameters<br>(URL only)              | When a URL has a parameter list starting with a question mark (?), such as a CGI script, whether to truncate the URL sent to the filtering server by removing all characters after and including the question mark.                                                                                                                                                                                                                                                                                                                                                                  |
| Block outbound requests if absolute FTP path is not provided<br>(FTP only) | Whether to prevent interactive FTP sessions that do not provide the entire directory path when the user tries to change directories.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Long URL<br>(URL only)                                                     | How to handle URLs that are longer than the maximum allowed by the filtering server: 4 KB for Websense, 3 KB for Smartfilter (N2H2). Many times, long URLs are due to parameter lists, and you can use the <b>Truncate CGI request by removing CGI parameters</b> option to handle those URLs. For other long URLs, select from the following options: <ul style="list-style-type: none"> <li>• Drop—Drop the long URL request.</li> <li>• Truncate—Truncate the URL request to only the hostname or IP address portion of the URL.</li> <li>• Deny—Deny the URL request.</li> </ul> |

# Configuring Web Filter Rules for IOS Devices

**Note** From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Web filter rules policies for IOS devices define how you want to handle HTTP traffic. The web filter rules are a type of inspection rule that permits or denies traffic based on the Universal Resource Locator (URL) address in the web request. If you allow HTTP traffic on an interface in your access rules, you can subsequently deny (or drop) traffic if it is directed at an objectionable web site.

To configure web filtering rules for IOS devices:

1. Configure the interfaces that should filter web traffic (see below for the procedure).
2. Configure the local web filtering list to identify web sites that should always be permitted or denied (see below for the procedure).
3. Configure web filter settings to identify the URL filtering server and other settings. For more information, see [Configuring Settings for Web Filter Servers](#) , on page 898.

**Tip** You can also configure web filtering as a zone based firewall rule. For more information, see [Adding Zone-Based Firewall Rules](#) , on page 940.

## Related Topics

- [Understanding Web Filter Rules](#) , on page 883
- [Understanding Interface Role Objects](#) , on page 301
- [Understanding Networks/Hosts Objects](#) , on page 308

- 
- Step 1** Do one of the following to open the [Web Filter Rules Page \(IOS\)](#) , on page 894:
- Device view—Select **Firewall > Web Filter Rules** from the Policy selector.
  - Policy view—Select **Firewall > Web Filter Rules (IOS)** from the Policy Type select. Select an existing policy or create a new one.
- Step 2** Configure the interfaces on which you will filter HTTP traffic. Create rules for each interface on which you will enable filtering:
- a) Select the Web Filter Rules tab if it is not already selected and do one of the following to open the [IOS Web Filter Rule and Applet Scanner Dialog Box](#) , on page 896:
    - To create a new rule, right-click inside the work area and select **Add Row**.
    - To edit an existing rule, right-click the rule and select **Edit Row**.

- b) Identify the interface for which this rule applies. You can either enter the interface name or click **Select** to select it or an interface role from the list. Also configure the following:
- Traffic direction with respect to the interface—Typically, you want to select **In** so that undesired traffic is dropped before the device spends more time processing the packet.
  - Java applet scanning—If you enable web filtering on an interface, Java applets are inspected, which can affect performance. Typically, you want to enable Java applet scanning so that you can identify permitted and denied sources and avoid the scanning of denied applets. If you want to configure both permitted and denied sources for an interface, you must configure two rules for the interface.
- c) Click **OK** to add the rule to the web filtering rules table.

**Step 3**

(Optional) Configure the list of exclusive domains, which define the local filtering list. This list is applied before web requests are sent to the external web filtering server (defined on the [Web Filter Settings Page , on page 899](#)). If you know there are web sites that you will always permit (such as your organization's web site) or deny, configure them in the local list. Configure as many rules as needed to define the complete list.

- a) Click the **Exclusive Domains** tab and do one of the following to open the [IOS Web Filter Exclusive Domain Name Dialog Box , on page 897](#).
- To create a new rule, right-click inside the work area and select **Add Row**.
  - To edit an existing rule, right-click the rule and select **Edit Row**.
- b) Select whether you are permitting or denying the specified domains, and enter the domain names or host IP addresses. You can enter either full domain names (the names of specific web sites) or partial names (for entire domains you want to treat the same way).
- c) Click **OK** to add your exclusive domain rule to the policy.

## Web Filter Rules Page (IOS)

**Note** From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Use the Web Filter Rules page for IOS devices to configure web, or URL, filtering rules. Web filtering is a type of HTTP inspection. If your access rules allow HTTP traffic on an interface, you can configure rules to apply local and server-based web filtering to prevent users from accessing undesirable web servers.

When you configure web filter rules, also configure web filter settings in the **Firewall > Settings > Web Filter** policy. The settings identify the web filtering server and contain other settings that control the overall functioning of the policy. For example, you can use the settings policy to allow all web traffic if the filtering server becomes unavailable. For more information, see [Web Filter Settings Page , on page 899](#).

**Tip** You can also configure web filtering as a zone based firewall rule. For more information, see [Zone-based Firewall Rules Page , on page 987](#).

### Navigation Path

To access the Web Filter Rules page for IOS devices, do one of the following:

- (Device view) Select an IOS device and select **Firewall > Web Filter Rules** from the Policy selector.
- (Policy view) Select **Firewall > Web Filter Rules (IOS)** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click an IOS device and select **Edit Firewall Policies > Web Filter Rules**.

|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web Filter Rules tab  | <p>The URL filtering rules defined for the policy. Each rule shows the interface on which it is defined, whether the rule is applied to incoming or outgoing traffic, and the permitted or denied Java applet sources if Java applet scanning is enabled. You might have more than one rule for an interface if you configure both a permit and deny list for Java applet scanning.</p> <ul style="list-style-type: none"> <li>• To add a rule, click the Add Row button and fill in the <a href="#">IOS Web Filter Rule and Applet Scanner Dialog Box</a> , on page 896.</li> <li>• To edit a rule, select it and click the Edit Row button.</li> <li>• To delete a rule, select it and click the Delete Row button.</li> </ul>                                                                                                             |
| Exclusive Domains tab | <p>The local web filter list. This list is checked before web requests are sent to the filtering server and applies to all interfaces on which you configure web filtering.</p> <p>If you know there are specific domains that you will always allow (such as your organization's own domain name), or disallow, you can list them here. By configuring a local filter list, you can improve performance because the device does not need to wait for a response from the filtering server.</p> <ul style="list-style-type: none"> <li>• To add a domain, click the Add Row button and fill in the <a href="#">IOS Web Filter Exclusive Domain Name Dialog Box</a> , on page 897.</li> <li>• To edit a domain, select it and click the Edit Row button.</li> <li>• To delete a domain, select it and click the Delete Row button.</li> </ul> |

## IOS Web Filter Rule and Applet Scanner Dialog Box

**Note** From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Use the IOS Web Filter Rule and Applet Scanner dialog box to create web filtering rules for IOS devices.

### Navigation Path

To open this dialog box, select the Web Filter Rules tab on the [Web Filter Rules Page \(IOS\)](#), on page 894, click **Add Row** to create a new rule, or select a row and click **Edit Row** to edit an existing rule.

| Enable Web Filtering                               | Whether to enable the web filtering rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Interface                                          | <p>The interface or interface role to which the rule is assigned. Enter the name of the interface or the interface role, or click <b>Select</b> to select the interface or role from a list, or to create a new role. An interface must already be defined to appear on the list.</p> <p>Interface role objects are replaced with the actual interface names when the configuration is generated for each device. See <a href="#">Understanding Interface Role Objects</a>, on page 301.</p>                                                                                                                                                                                                                                              |
| Traffic Direction                                  | <p>The direction of the traffic to which this rule applies:</p> <ul style="list-style-type: none"> <li>• In—Packets entering an interface.</li> <li>• Out—Packets exiting an interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Java Applet Scanning<br>Enable Java Applet Scanner | <p>If you select <b>Enable Java Applet Scanning</b>, the device checks for the presence of Java applets in HTTP traffic coming from web servers to internal hosts. If a Java applet is present and the web server (applet source) is in the list of permitted sources, the Java applet is left unmodified in the HTTP traffic. Otherwise, the Java applets are removed from HTTP pages.</p> <p><b>Tip</b> When you enable web filtering, Java applets are inspected, which can affect performance. By enabling the Java applet scanner, you can identify a list of permitted or denied sources and avoid inspection for those applets. Even if you do not want to deny any sources, enable scanning and permit the <b>any</b> source.</p> |

| Element                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Permit Traffic<br>Applet Sources | <p>The list of permitted or denied source addresses for Java applets. To configure a list of permitted or denied sources:</p> <ul style="list-style-type: none"> <li>• Select either <b>Permit from Specified Sources</b> or <b>Deny from Specified Sources</b>. If you want to create both a permit and deny list, create two separate web filter rules. If you do not configure a permit list, all sources are denied.</li> <li>• Enter the list of permitted or denied addresses in the <b>Applet Sources</b> field. The list can include host IP addresses, network addresses, address ranges, or network/host objects, but cannot include domain names. Separate multiple addresses with commas. For more information on entering addresses, see <a href="#">Specifying IP Addresses During Policy Definition</a> , on page 316.</li> </ul> |

## IOS Web Filter Exclusive Domain Name Dialog Box

**Note** From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Use the IOS Web Filter Exclusive Domain Name dialog box to configure local web filtering rules for IOS devices. You can create a list of permitted or denied domain names or IP addresses. The device checks this list before forwarding web requests to your web filtering server.

Using local filtering saves the wait time for getting a response from the server when a user requests a web site that you know you will either always permit or always deny.

### Navigation Path

To open this dialog box, select the Exclusive Domains tab on the [Web Filter Rules Page \(IOS\)](#) , on page 894, click **Add Row** to create a new rule, or select a row and click **Edit Row** to edit an existing rule.

|---------|-----------------------------------------------------------------------------------|
| Traffic | Whether you want to permit access to the listed web sites or deny access to them. |

| Element     | Description                                                                                                                                                                                                                                                                                                                         |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Domain Name | <p>The domain names or host IP addresses of web sites that you are permitting or denying. Separate multiple entries with commas.</p> <p>For domain names, you can enter a full or partial name. For example, cisco.com covers all web servers on the cisco.com domain, whereas www.cisco.com specifies only the www web server.</p> |

## Configuring Settings for Web Filter Servers

Use the Web Filter settings policy to configure the web filter servers and other settings to use with your web filter rules policy. You can use Websense or Smartfilter (N2H2) filtering servers, or no external servers (for IOS devices).

You must install and configure the web filter servers as directed by the documentation for the server before configuring and deploying this policy. Security Manager cannot confirm that the servers exist or that they are configured correctly.

**Tip** These settings work only with the web filter rules policy. The web servers you configure here are not used with zone based firewall rules policies that configure web content filtering.

- [Configuring Web Filter Rules for IOS Devices](#) , on page 893

- 
- Step 1** Do one of the following to open the [Web Filter Settings Page](#) , on page 899:
- (Device view) Select **Firewall > Settings > Web Filter** from the Policy selector.
  - (Policy view) Select **Firewall > Settings > Web Filter** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** Select the type of web filtering server you use in the **Web Filter Server Type** field, and then add the servers to the table of web filtering servers. If you have more than one server, add them in priority order; the first server in the list is the primary server.
- To add a server, click the Add Row button and fill in the [Web Filter Server Configuration Dialog Box](#) , on page 902.
  - To edit a server, select it and click the Edit Row button.
  - To delete a server, select it and click the Delete Row button.
- Step 3** The bottom half of the settings policy includes device-specific options that you can also configure. For specific information on each setting, see [Web Filter Settings Page](#) , on page 899. The following is an overview of the settings:

- IOS devices—The most interesting setting is **Allow Traffic when Servers Unreachable**, which determines whether you allow any web connections if the filtering servers are unavailable. If you do not select this option, all web traffic is cut off if the servers go offline for any reason.

The remaining settings configure logging and cache size options.

- ASA, PIX, FWSM devices—These options configure the cache size and buffer limits used with the filtering servers. You can also control whether the cached responses include both source and destination (if you have different filtering policies per user) or destination only (one policy for all), as configured in the filtering server.

---

## Web Filter Settings Page

Use the Web Filter settings page to configure the web filter servers and other settings to use with your web filter rules policy.

You must install and configure the web filter servers as directed by the documentation for the server before configuring and deploying this policy. Security Manager cannot confirm that the servers exist or that they are configured correctly.

---

**Tip** These settings work only with the web filter rules policy. The web servers you configure here are not used with zone based firewall rules policies that configure web content filtering.

---

### Navigation Path

To access the Web Filter settings page, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > Web Filter** from the Policy selector.
- (Policy view) Select **Firewall > Settings > Web Filter** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Settings > Web Filter**.

If you do not select this option, all web access is prevented until the servers come back online.</p> <p>If you allow web traffic when the servers are down, the web requests are not filtered and access to all web servers is allowed.</p>                                                                                                                                                                                                                                                                                                                                   |
| Enable Alerts                          | Whether to generate stateful packet inspection alert messages on the console.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Enable Audit Trail                     | Whether audit trail messages are logged to the syslog server or router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Enable Web Filter Server Logging       | Whether to send system messages to the URL filtering server for logging. The device sends a log request immediately after the URL lookup request. The log request contains the URL, hostname, source IP address, and the destination IP address. The server records the log request into its own log server so you can view this information as necessary.                                                                                                                                                                                                                                                                                                                  |
| Cache Size                             | <p>The maximum number of destination IP addresses (and their authorization status) that can be cached in the device. The default value is 5000.</p> <p>When the cache reaches 80% full, the device starts removing older inactive entries.</p>                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Element                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum Requests                                       | The maximum number of outstanding requests that can exist at any given time. If the specified number is exceeded, new requests are dropped. The default is 1000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Packet Buffer                                          | <p>The maximum number of HTTP responses that can be stored in the packet buffer of the device while it waits for the web filter server to allow or deny the request. The device drops responses when the maximum is reached. The default (and maximum) value is 200.</p> <p>When users make web requests, the device simultaneously sends the request to the web site and to the web filtering server. If the response from the web site is received before the server provides a permit or deny response, the device keeps the request in the packet buffer until it gets a response from the server.</p> <p>The response is removed from the buffer when the server responds or if the device determines that the server is unavailable and you also selected <b>Allow Traffic when Servers Unreachable</b>.</p> |
| PIX/ASA/FWSM Specific Settings                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Cache Match Criteria                                   | <p>How to cache web requests:</p> <ul style="list-style-type: none"> <li>• Source and Destination—Cache entries are based on both the address initiating the request and the destination web address. Select this mode if users do not share the same filtering policy on the filtering server.</li> <li>• Destination—Cache entries are based on the destination web address. Select this mode if all users share the same filtering policy on the filtering server.</li> </ul>                                                                                                                                                                                                                                                                                                                                   |
| URL Buffer Memory<br>(ASA 7.2+, PIX 7.2+ only.)        | The size of the URL buffer memory pool in KB. Values are 2 to 10240.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Maximum Allowed URL Size<br>(ASA 7.2+, PIX 7.2+ only.) | <p>The maximum allowed URL size in KB for each URL being buffered. The possible values differ depending on server type:</p> <ul style="list-style-type: none"> <li>• Websense—From 2 to 4.</li> <li>• Smartfilter (N2H2)—2 or 3.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Cache Size                                             | <p>The size of the cache, in KB, for storing responses from the filtering server. Values are 1 to 128.</p> <p>Caching stores URL access privileges in memory on the security appliance. When a host requests a connection, the security appliance first looks in the URL cache for matching access privileges instead of forwarding the request to the Websense server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| URL Block Buffer Limit                                 | The size of the buffer for storing web server responses while waiting for a filtering decision from the filtering server. The values are 1 to 128, which specifies the number of 1550-byte blocks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Web Filter Server Configuration Dialog Box

Use the Web Filter Server Configuration dialog box to configure the external web filter servers you want to use with your Web Filter Rules policies. You can configure Websense or Smartfilter (N2H2) servers.

### Navigation Path

From the [Web Filter Settings Page](#), on page 899, click **Add Row** beneath the Web Filter Servers table, or select a row and click **Edit Row**.

| IP Address                     | The IP address of the web filter server.                                                                                                                                                                                                                                                                                                                                      |
| Timeout                        | The length of time, in seconds, that the device will wait for a response from the web filter server. The default is 5 seconds.<br><br>If the request times out, the device tries the next server, if you configure more than one.                                                                                                                                             |
| PIX/ASA/FWSM Specific Settings |                                                                                                                                                                                                                                                                                                                                                                               |
| Interface                      | The network interface where the authentication server resides, for example, FastEthernet0. If not specified, the default is inside.<br><br>Enter the name of the interface or the interface role that identifies it, or click <b>Select</b> to select the interface or role from a list, or to create a new role. An interface must already be defined to appear on the list. |
| Protocol                       | The protocol to use when communicating with the web filtering server. Select the option for which the server is configured: <ul style="list-style-type: none"> <li>• TCP (version 1)</li> <li>• TCP version 4</li> <li>• UDP version 4</li> </ul>                                                                                                                             |
| Connection Number              | (Optional) The maximum number of TCP connections allowed between the device and the server.                                                                                                                                                                                                                                                                                   |
| IOS Specific Settings          |                                                                                                                                                                                                                                                                                                                                                                               |
| Retransmit                     | The number of times the device will retransmit a request when the server does not respond. The default value is two times.                                                                                                                                                                                                                                                    |

| Element | Description                                                            |
|---------|------------------------------------------------------------------------|
| Port    | The port number that the server listens on. The default port is 15868. |

## CHAPTER 19

# Managing Firewall Botnet Traffic Filter Rules

Malware is malicious software that is installed on an unknowing host. Malware that attempts network activity such as sending private data (passwords, credit card numbers, key strokes, or proprietary data) can be detected by the Botnet Traffic Filter when the malware starts a connection to a known bad IP address. The Botnet Traffic Filter checks incoming and outgoing connections against a dynamic database of known bad domain names and IP addresses, and then logs any suspicious activity.

You can also supplement the Cisco dynamic database with blocked addresses of your choosing by adding them to a static block list; if the dynamic database includes blocked addresses that you think should not be blocked, you can manually enter them into a static allowed list. Addresses in the allowed list still generate syslog messages, but because you are only targeting blocked syslog messages, they are informational. If you do not want to use the Cisco dynamic database at all, because of internal requirements, you can use the static block list alone if you can identify all the malware sites that you want to target.

This chapter covers the following sections:

- [Understanding Botnet Traffic Filtering](#) , on page 905
- [Task Flow for Configuring the Botnet Traffic Filter](#) , on page 907
- [Botnet Traffic Filter Rules Page](#) , on page 913

## Understanding Botnet Traffic Filtering

### Botnet Traffic Filter Address Categories

Addresses monitored by the Botnet Traffic Filter include:

- **Known malware addresses**—These addresses are on the blocked list identified by the dynamic database and the static block list.
- **Known allowed addresses**—These addresses are on the allowed list. To be allowed, an address must be blocked by the dynamic database and also identified by the static allowed list.
- **Ambiguous addresses**—These addresses are associated with multiple domain names, but not all of these domain names are on the block list. These addresses are on the graylist.
- **Unlisted addresses**—These addresses are unknown, and not included on any list.

### Botnet Traffic Filter Actions for Known Addresses

You can configure the Botnet Traffic Filter to log suspicious activity, and you can optionally configure it to block suspicious traffic automatically.

Unlisted addresses do not generate any syslog messages, but addresses on the block list, allowed list, and graylist generate syslog messages differentiated by type.

### Botnet Traffic Filter Databases

The Botnet Traffic Filter uses two databases for known addresses. You can use both databases together, or you can disable use of the dynamic database and use the static database alone. This section includes the following topics:

- Information About the Dynamic Database
- Information About the Static Database

#### Information About the Dynamic Database

The Botnet Traffic Filter can receive periodic updates for the dynamic database from the Cisco update server. This database lists thousands of known bad domain names and IP addresses.

The security appliance uses the dynamic database as follows:

1. When the domain name in a DNS reply matches a name in the dynamic database, the Botnet Traffic Filter adds the name and IP address to the DNS reverse lookup cache.
2. When the infected host starts a connection to the IP address of the malware site, the security appliance sends a syslog message informing you of the suspicious activity.
3. In some cases, the IP address itself is supplied in the dynamic database, and the Botnet Traffic Filter logs any traffic to that IP address without having to inspect DNS requests.

---

**Note** To use the database, be sure to configure a domain name server for the security appliance so that it can access the URL. To use the domain names in the dynamic database, you need to enable DNS packet inspection with Botnet Traffic Filter snooping; the security appliance looks inside the DNS packets for the domain name and associated IP address.

---

#### Information About the Static Database

You can manually enter domain names or IP addresses (host or subnet) that you want to tag as bad names in a block list. You can also enter names or IP addresses in an allowed list, so that names or addresses that appear on both the allowed list and the dynamic block list are identified only as allowed list addresses in syslog messages and reports.

You can alternatively enable DNS packet inspection with Botnet Traffic Filter snooping. With DNS snooping, when an infected host sends a DNS request for a name on the static database, the security appliance looks inside the DNS packets for the domain name and associated IP address and adds the name and IP address to the DNS reverse lookup cache.

- [Botnet Traffic Filter Rules Page](#) , on page 913

# Task Flow for Configuring the Botnet Traffic Filter

To configure the Botnet Traffic Filter, follow these steps:

- 
- Step 1** Enable use of a DNS server.
- This procedure enables security appliance use of a DNS server. In multiple context mode, enable DNS per context. For more information, see [DNS Page](#) , on page 2020
- Step 2** Enable use of the dynamic database.
- This procedure enables database updates from the Cisco update server, and also enables use of the downloaded dynamic database by the security appliance. Disallowing use of the downloaded database is useful in multiple context mode so you can configure use of the database on a per-context basis.
- For more information, see [Configuring the Dynamic Database](#) , on page 908
- Step 3** (Optional) Add static entries to the database.
- This procedure lets you augment the dynamic database with domain names or IP addresses that you want to block or allow. You might want to use the static database instead of the dynamic database if you do not want to download the dynamic database over the Internet.
- For more information, see [Adding Entries to the Static Database](#) , on page 909
- Step 4** Enable DNS snooping.
- This procedure enables inspection of DNS packets, compares the domain name with those in the dynamic database or the static database (when a DNS server for the security appliance is unavailable), and adds the name and IP address to the DNS reverse lookup cache. This cache is then used by the Botnet Traffic Filter logging function when connections are made to the suspicious address.
- For more information, see [Enabling DNS Snooping](#) , on page 910
- Step 5** Enable traffic classification and actions for the Botnet Traffic Filter.
- This procedure enables the Botnet Traffic Filter, which compares the source and destination IP address in each initial connection packet to the IP addresses in the dynamic database, static database, DNS reverse lookup cache, and DNS host cache, and sends a syslog message for any matching traffic or drops that traffic.
- For more information, see [Enabling Traffic Classification and Actions for the Botnet Traffic Filter](#) , on page 911
- Step 6** Monitor and Mitigate Botnet Activity.
- After configuring the Botnet Traffic Filter on a device, the device will begin generating syslog messages to notify you of botnet activity. You should verify the syslog configuration on the device so that messages are appropriately logged and that notifications are sent as needed. As malicious traffic is identified, you will need to perform necessary actions to stop such traffic and to clean any infected computers that are generating the malicious traffic.
- For more information, see the following references:

- a. [Configuring Logging Policies on Firewall Devices](#), on page 2037
  - b. [Monitoring and Mitigating Botnet Activity](#), on page 2764
  - c. [Understanding Firewall Summary Botnet Reports](#), on page 2787
- 

## Configuring the Dynamic Database

This procedure enables database updates, and also enables use of the downloaded dynamic database by the security appliance.

In multiple context mode, you enable downloading of the dynamic database on the System context so that it is available to all security contexts. You can then decide, on a per-context basis, whether to enable use of the dynamic database or not.

By default, downloading and using the dynamic database is disabled.

### Related Topics

- [Enabling DNS Snooping](#), on page 910
- [Enabling Traffic Classification and Actions for the Botnet Traffic Filter](#), on page 911
- [Botnet Traffic Filter Rules Page](#), on page 913

### Before You Begin

Enable security appliance use of a DNS server (see [DNS Page](#), on page 2020). In multiple context mode, enable DNS per context.

---

### Step 1

Do one of the following:

- (Device view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy selector.
- (Policy view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy Type selector. Select an existing policy or create a new one.

**Note** For devices in multiple context mode, you enable downloading of the dynamic database on the System context and enable use of the dynamic database on each security context, as needed.

This opens the [Botnet Traffic Filter Rules Page](#), on page 913.

### Step 2

On the Dynamic Blocklist Configuration tab, select **Enable Dynamic Blocklist From Server** to enable downloading of the dynamic database.

**Note** In multiple context mode, you enable downloading of the dynamic database on the System context.

This setting enables downloading of the dynamic database from the Cisco update server. If you do not have a database already installed on the security appliance, it downloads the database after approximately 2 minutes. The update server determines how often the security appliance polls the server for future updates, typically every hour.

**Step 3** (Multiple context mode only) Click **Save** to save the changes to the System context. Then change to the context where you want to configure the Botnet Traffic Filter, select **Firewall > Botnet Traffic Filter Rules** for that context, and then proceed to [Step 4, on page 909](#).

**Step 4** On the Dynamic Blocklist Configuration tab, select **Use Dynamic Blocklist** to enable use of the dynamic database.

**Note** In multiple context mode, these settings are disabled on the System context.

---

## Adding Entries to the Static Database

The static database lets you augment the dynamic database with domain names, IP addresses, or network addresses that you want to block or allow. For more information, see [Understanding Botnet Traffic Filtering, on page 905](#).

### Related Topics

- [Permitlist/Blocklist Tab, on page 919](#)
- [Device Permitlist or Device Blocklist Dialog Box, on page 919](#)

- [Enabling DNS Snooping, on page 910](#)
- [Enabling Traffic Classification and Actions for the Botnet Traffic Filter, on page 911](#)
- [Botnet Traffic Filter Rules Page, on page 913](#)

### Before You Begin

- Enable security appliance use of a DNS server (see [DNS Page, on page 2020](#)). In multiple context mode, enable DNS per context.

---

**Step 1** Do one of the following:

- (Device view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy selector.
- (Policy view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy Type selector. Select an existing policy or create a new one.

**Note** For devices in multiple context mode, you configure the static database on the security context.

This opens the [Botnet Traffic Filter Rules Page, on page 913](#)

**Step 2** On the Permitlist / Blocklist tab, click the **Add Rows** button that corresponds with the type of entry you are adding (Permitlist or Blocklist).

This opens the [Device Permitlist or Device Blocklist Dialog Box](#) , on page 919.

- Step 3** In the Domain or IP Address field, enter one or more domain names, IP addresses, and IP address/netmasks. Enter multiple entries separated by commas or on separate lines. You can enter up to 1000 entries for each type.
- Step 4** Click **OK**.
- 

## Enabling DNS Snooping

This procedure enables inspection of DNS packets and enables Botnet Traffic Filter snooping, which compares the domain name with those on the dynamic database or static database, and adds the name and IP address to the Botnet Traffic Filter DNS reverse lookup cache. This cache is then used by the Botnet Traffic Filter logging function when connections are made to the suspicious address.

The default configuration for DNS inspection inspects all UDP DNS traffic on all interfaces, and does not have Botnet Traffic Filter snooping enabled. We suggest that you enable Botnet Traffic Filter snooping only on interfaces where external DNS requests are going. Enabling Botnet Traffic Filter snooping on all UDP DNS traffic, including that going to an internal DNS server, creates unnecessary load on the security appliance.

---

**Note** TCP DNS traffic is not supported.

---

- 
- Step 1** You must first configure DNS inspection for traffic that you want to snoop using the Botnet Traffic Filter. See [Managing Firewall Inspection Rules](#), on page 765.
- Step 2** While defining a new inspection rule or editing an existing inspection rule, select DNS as the protocol you want to inspect. The Configure button to the right of the Selected Protocol field becomes active.
- Step 3** Click **Configure**.  
This opens the [Configure DNS Dialog Box](#) , on page 782.
- Step 4** To enable DNS snooping, select **Enable Dynamic Filter Snooping**.
- Step 5** Click **OK**.
-

## Enabling Traffic Classification and Actions for the Botnet Traffic Filter

This procedure enables the Botnet Traffic Filter, which compares the source and destination IP address in each initial connection packet to the IP addresses in the dynamic database, static database, DNS reverse lookup cache, and DNS host cache, and sends a syslog message for any matching traffic. The Botnet Traffic Filter can also drop the connection when matching traffic is encountered. For a particular interface, you can specify only one enable rule that identifies the traffic that is subject to Botnet Traffic Filtering; however, you can specify multiple drop rules to identify traffic that should be dropped by the Botnet Traffic Filter.

The DNS snooping is enabled separately (see [Enabling DNS Snooping , on page 910](#)). Typically, for maximum use of the Botnet Traffic Filter, you need to enable DNS snooping, but you can use Botnet Traffic Filter logging independently if desired. Without DNS snooping for the dynamic database, the Botnet Traffic Filter uses only the static database entries, plus any IP addresses in the dynamic database; domain names in the dynamic database are not used.

### What You Need To Know About Botnet Traffic Classification ACLs

When you configure the enable and drop rules, you have the option of specifying an extended ACL policy object to limit the traffic to which Botnet Traffic Filtering will be applied. If you do not specify an ACL object, filtering is done for all traffic: this is equivalent to specifying an ACL with the single rule permit IP any any.

If you want to specify an ACL so that filtering is performed on less than all traffic, keep the following in mind:

- Permit rules identify the traffic that is subject to Botnet Traffic Filtering. In drop rules, permit entries identify the traffic that the ASA is allowed to drop.
- Deny rules identify the traffic that should not be subject to filtering. The Botnet Traffic Filter ignores traffic that matches deny entries.
- The ACL that you select for drop rules should be a subset of the ACL used in the enable rules for the interface. For traffic to be dropped, there must not only be a permit rule in the drop rule's ACL, the traffic must also fall under a permit rule in the enable rule's ACL. This is because the drop rule is not considered until traffic permitted in an enable rule has first been identified as blocked.

We recommend enabling the Botnet Traffic Filter on all traffic on the Internet-facing interface, and enabling dropping of traffic with a severity of moderate and higher.

### Related Topics

- [Traffic Classification Tab , on page 915](#)
- [BTF Enable Rules Editor , on page 916](#)
- [BTF Drop Rules Editor , on page 917](#)
- [Understanding Botnet Traffic Filtering , on page 905](#)
- [Task Flow for Configuring the Botnet Traffic Filter , on page 907](#)
- [Configuring the Dynamic Database , on page 908](#)
- [Adding Entries to the Static Database , on page 909](#)
- [Enabling DNS Snooping , on page 910](#)
- [Botnet Traffic Filter Rules Page , on page 913](#)

**Step 1**

Do one of the following:

- (Device view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy selector.
- (Policy view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy Type selector. Select an existing policy or create a new one.

**Note** For devices in multiple context mode, you configure traffic classification on the security context.

This opens the [Botnet Traffic Filter Rules Page](#), on page 913.

**Step 2**

To enable the Botnet Traffic Filter on specified traffic, follow these steps:

- a) On the Traffic Classification tab, click **Add Row** under the Enable Rules table.

This opens the [BTF Enable Rules Editor](#), on page 916.

- b) In the Interfaces field, specify the interface or interfaces on which you want to enable the Botnet Traffic Filter. Normally, you want to enable the Internet-facing interface only. To select the interfaces or interface role objects using the Interfaces Selector, click **Select** (see [Understanding Interface Role Objects](#), on page 301).

You can configure a global classification that applies to all interfaces by selecting the All Interfaces role object (selected by default). If you configure an interface-specific classification, the settings for that interface overrides the global setting.

- c) Do one of the following to identify the traffic that you want to monitor:

- To monitor all traffic, leave the ACL field blank.
- To specify the traffic that you want to monitor, click **Select** to the right of the ACL field to select an Access Control List object that identifies the traffic that you want to monitor. For example, you might want to monitor all port 80 traffic on the outside interface. For more information about Access Control List objects, see [Creating Access Control List Objects](#), on page 281.

**Note** You can specify only one enable rule per interface.

- d) Click **OK**.

The BTF Enable Rules Editor closes and the rule is added to the Enable Rules table.

**Step 3**

To automatically drop malware traffic, follow these steps:

**Note** You must enable the Botnet Traffic Filter for the traffic you want to automatically drop before creating a drop rule for that traffic.

- a) On the Traffic Classification tab, click **Add Row** under the Drop Rules table.

This opens the [BTF Drop Rules Editor](#), on page 917.

- b) In the Interfaces field, specify the interface or interfaces on which you want to drop traffic. There must be a corresponding enable rule for the interface. To select the interfaces or interface role objects using the Interfaces Selector, click **Select** (see [Understanding Interface Role Objects](#), on page 301).

You can configure a global classification that applies to all interfaces by selecting the All Interfaces role object (selected by default). If you configure an interface-specific classification, the settings for that interface overrides the global setting.

- c) Do one of the following to identify the traffic that you want to drop:

- To monitor all traffic, leave the ACL field blank.
  - To specify the traffic that you want to monitor, click **Select** to the right of the ACL field to select an Access Control List object that identifies the traffic that you want to monitor. For example, you might want to monitor all port 80 traffic on the outside interface. For more information about Access Control List objects, see [Creating Access Control List Objects](#) , on page 281.
- d) In the Threat Level area, choose one of the following options to drop traffic specific threat levels. The default level is a range between Moderate and Very High.
- Note** We highly recommend using the default setting unless you have strong reasons for changing the setting.
- Value—Specify the threat level you want to drop.
  - Range—Specify a range of threat levels.
- Note** Static block list entries are always designated with a Very High threat level.
- e) Click **OK**.
- The BTF Drop Rules Editor closes and the rule is added to the Drop Rules table.

- Step 4** To add more rules, repeat steps 2 and 3, as required. When finished adding rules, click **Save** to save your changes.
- Step 5** To treat graylisted traffic as block listed traffic for action purposes, on the Dynamic Blocklist Configuration tab, check the **Treat Ambiguous traffic as Blocklist** check box.
- If you do not enable this option, graylisted traffic will not be dropped if you configure a drop rule for that traffic.

---

## Botnet Traffic Filter Rules Page

You can use the Botnet Traffic Filter Rules page to define rules for identifying malicious traffic passing through your ASA security device.

The Botnet Traffic Filter Rules page is divided into three sections:

- [Dynamic Blocklist Configuration Tab](#) , on page 914
- [Traffic Classification Tab](#) , on page 915
- [Permitlist/Blocklist Tab](#) , on page 919

### Navigation Path

To access the Botnet Traffic Filter Rules page, do one of the following:

- (Device view) Select a device, then select **Firewall > Botnet Traffic Filter Rules** from the Policy selector.
- (Policy view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy Type selector. Select an existing policy or create a new one.
- (Map view) Right-click a device and select **Edit Firewall Policies > Botnet Traffic Filter Rules**.

The update server determines how often the security appliance polls the server for future updates, typically every hour.</p> <p><b>Note</b> If the device is in multiple context mode, configure this option on the System context for that device.</p> |
| Use Dynamic Blocklist                | <p>Enables use of the dynamic database for the Botnet Traffic Filter.</p> <p><b>Note</b> In multiple context mode, you configure use of the database on a per-context basis.</p>                                                                                                                                                                                                                                                                                         |
| Treat Ambiguous traffic as Blocklist | <p>When selected, graylisted traffic will be treated as block listed traffic for action purposes.</p> <p>If you do not enable this option, graylisted traffic will not be dropped if you configure a drop rule for that traffic.</p>                                                                                                                                                                                                                                     |

## Traffic Classification Tab

Use the Traffic Classification tab to view or to configure the traffic classification definitions for a device or shared policy and to identify malicious traffic that you want automatically dropped. Traffic classification definitions (enable rules) consist of an interface or interface role with an associated ACL that identifies the traffic that is monitored by the Botnet Traffic Filter. You can configure settings for specific interfaces or for interface roles. You can use the All Interfaces role object to enable botnet filtering globally (selected by default). If you configure an interface-specific classification, the settings for that interface override any settings defined for an interface role.

For a particular interface, you can specify only one enable rule that identifies the traffic that is subject to Botnet Traffic Filtering; however, you can specify multiple drop rules to identify traffic that should be dropped by the Botnet Traffic Filter.

**Note** We highly recommend configuring Dynamic Filter Snooping for proper functioning of the Botnet Traffic Filter. When in Device view, Cisco Security Manager provides a link at the bottom of the Traffic Classification tab that will take you directly to the Inspection Rules page so that you can enable Dynamic Filter Snooping. For more information, see [Enabling DNS Snooping](#), on page 910.

The columns in the tables summarize the settings for an entry and are explained in [BTF Enable Rules Editor](#), on page 916 and [BTF Drop Rules Editor](#), on page 917.

To configure traffic classification and actions:

- Click the **Add Row** button to add an interface or interface role to the table, and fill in the [BTF Enable Rules Editor](#), on page 916 or [BTF Drop Rules Editor](#), on page 917.

- Select an entry and click the **Edit Row** button to edit an existing entry.
- Select an entry and click the **Delete Row** button to delete it.

### Navigation Path

From the [Botnet Traffic Filter Rules Page](#) , on page 913, click the **Traffic Classification** tab.

## BTF Enable Rules Editor

Use the BTF Enable Rules Editor to specify the interfaces on which you want to enable the Botnet Traffic Filter and to identify the traffic that you want to monitor. You can specify only one enable rule per interface.

### Navigation Path

To access the BTF Enable Rules Editor, right-click inside the work area of the Enable Rules table on the Traffic Classification tab and then select **Add Row**, or right-click an existing entry and select **Edit Row**.

**Table 271: BTF Enable Rules Editor**

| Element    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interfaces | <p>The interfaces or interface roles on which you want to enable the Botnet Traffic Filter. Enter the name of the interface or the interface role, or click <b>Select</b> to select the interface or role from a list, or to create a new role. An interface must already be defined to appear on the list.</p> <p>You can use the All Interfaces role object to enable botnet filtering globally (selected by default). If you configure an interface-specific classification, the settings for that interface override the global settings.</p> <p>Interface role objects are replaced with the actual interface names when the configuration is generated for each device. See <a href="#">Understanding Interface Role Objects</a> , on page 301.</p> |
| ACL        | <p>Specifies the access-list to use for identifying the traffic that you want to monitor. If you do not specify an access list, by default you monitor all traffic.</p> <p>To specify the traffic that you want to monitor, click <b>Select</b> to the right of the ACL field to select an Access Control List object that identifies the traffic that you want to monitor. For example, you might want to monitor all port 80 traffic on the outside interface. For more information about Access Control List objects, see <a href="#">Creating Access Control List Objects</a> , on page 281.</p>                                                                                                                                                      |

## BTF Drop Rules Editor

Use the BTF Drop Rules Editor to identify malware traffic that you want to automatically drop. You can specify multiple drop rules per interface.

### Navigation Path

To access the BTF Drop Rules Editor, right-click inside the work area of the Drop Rules table on the Traffic Classification tab and then select **Add Row**, or right-click an existing entry and select **Edit Row**.

| Threat Level | <p>The Threat Level fields identify the threat level of malicious traffic that you want dropped. The default level is a range between Moderate and Very High.</p> <p><b>Note</b> We highly recommend using the default setting unless you have strong reasons for changing the setting.</p> <ul style="list-style-type: none"> <li>• Value—Specify the threat level you want to drop. <ul style="list-style-type: none"> <li>• Very-low</li> <li>• Low</li> <li>• Moderate</li> <li>• High</li> <li>• Very-high</li> </ul> </li> <li>• Range—Specify a range of threat levels.</li> </ul> <p><b>Note</b> Static blocked list entries are always designated with a Very High threat level.</p>                                                             |

## Permitlist/Blocklist Tab

Use the Permitlist/Blocklist tab to view or to configure the static database entries for a device or shared policy. The Device Blocklist contains domain names or IP addresses of malicious or undesirable sites. You can use the static block list to supplement the Cisco dynamic database, or you can use the static block list alone if you can identify all the malware sites that you want to target.

The Device Permitlist contains domain names or IP addresses of sites that are deemed to be acceptable. If the dynamic database includes blocked addresses that you think should not be blocked, you can manually enter them into a static allowed list. Static allowed list entries take precedence over entries in the static block list and the Cisco dynamic database. Addresses in the allowed list still generate syslog messages, but because you are only targeting blocked syslog messages, they are informational.

To configure the static database:

- Click the **Add Row** button to define static database entries using the [Device Permitlist or Device Blocklist Dialog Box](#) , on page 919.
- Select an entry and click the **Edit Row** button to edit an existing entry.

---

**Timesaver**

Select an entry and press **F2** or double-click on an entry in the Device Permitlist or Device Blocklist to edit that entry in place.

---

- Select an entry and click the **Delete Row** button to delete it.

### Navigation Path

From the [Botnet Traffic Filter Rules Page](#) , on page 913, click the **Permitlist/Blocklist** tab.

### Related Topics

## Device Permitlist or Device Blocklist Dialog Box

Use the Device Permitlist or Device Blocklist dialog box to manually define domain names or IP addresses that you want to add to the allowed lists (safe) or blocked lists (malicious). You can use the static block list to supplement the Cisco dynamic database or you can use the static block list alone if you can identify all the malware sites that you want to target. Names or addresses that appear on both the allowed list and the dynamic blocked list are identified only as allowed list addresses in syslog messages and reports.

Domain names can be complete (including the host name, such as [www.cisco.com](#)), or partial (such as [cisco.com](#)). For partial names, all web site hosts on that domain are either added to the allowed list or blocked list. You can also enter host IP addresses. Use a comma or new line to separate multiple entries.

### Navigation Path

From the [Permitlist/Blocklist Tab](#) , on page 919, click the **Add Rows** button beneath the Device Permitlist or Device Blocklist tables, or select an entry and click the **Edit Row** button.

## CHAPTER 20

# Working with ScanSafe Web Security

Security Manager provides integration with ScanSafe Web Security. ScanSafe Web Security is a cloud-based SaaS (Security as a Service) function that makes available its web security data centers at various locations worldwide. When ScanSafe Web Security is integrated with a router, selected HTTP and HTTPS traffic is redirected to ScanSafe Cloud for content scanning and for malware detection by other means. Also, you can use ScanSafe Web Security to provide differentiated services to particular users, user groups, and IPs.

Invoking ScanSafe Web Security from Security Manager, you can define policies and settings in the following areas:

- Content scanning settings
- Content scanning policies
- AAA server settings
- AAA policies

With ScanSafe Web Security integration in Security Manager you can copy and share most policies and framework-based policy features. The following table details the scope of support for scanning and AAA policy types.

| Supported Type        | Example                                                                                                                                                                       |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content Scan Settings | Primary server IP, secondary server IP, server timeouts                                                                                                                       |
| Content Scan Policies | Global allow list policies<br>Include/exclude user groups, default user configuration, default user group configuration<br>Interfaces that must have content scanning enabled |

| Supported Type      | Example                                                                                                                                                                                                                                                                                                                               |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AAA Server Settings | <p>Identity policy object used in http-basic and NTLM policy</p> <p>Http-basic and NTLM related timeouts</p> <p>Order of occurrence for proxy, http-basic, and NTLM</p> <p>LDAP server and LDAP attribute map configuration for IOS</p> <p><b>Note</b> Radius and TACAS servers are also supported.</p> <p>Per interface AAA list</p> |
| AAA Policies        | <p>Http-basic and NTLM admission rule support (authentication methods) now join the previously available Auth-Proxy method</p>                                                                                                                                                                                                        |

Security Manager does not support the following features:

- PAM configuration when inspect or ZBF rules for http/https are not present
- Auth-proxy using LDAP on older IOS versions. (That is, only IOS versions that support ScanSafe Web Security)
- Identity policy with auth-proxy as AAA method. (Support only for NTLM and http-basic.)
- Validation of Virtual Template number for identity policy creation
- Validation of the Secure Trust Point for LDAP server
- Inheritance of content scanning rules
- AD browsing of user groups and users
- Tool support for newer policies (such as policy query)
- Control tag policy

For more information on the ScanSafe Web Security product, go to <http://www.cisco.com/en/US/partner/products/ps11720/index.html>

This chapter covers the following sections:

- [Configuring ScanSafe Web Security, on page 922](#)
- [ScanSafe Web Security Page, on page 924](#)
- [ScanSafe Web Security Settings Page , on page 927](#)

## Configuring ScanSafe Web Security

Use the ScanSafe Web Security Settings page to define the settings for the default user group. As with other settings policies, you can share the default user group policy settings.

### Related Topics

- [ScanSafe Web Security Page, on page 924](#)

---

**Note** All steps are shown as performed from the Policy view.

---

To configure ScanSafe Web Security, perform the following steps:

- 
- Step 1** From the Policy Types selector, select **Firewall > ScanSafe Web Security**.  
The ScanSafe Web Security page appears with the Interfaces tab selected.
- Step 2** Enable those interfaces by which web requests are to be forwarded to the ScanSafe Web Security server by selecting them from the list in the **Available Interfaces** column and moving them to the **Selected Interfaces** column.
- Step 3** Select the **Permitlisting Regular Expressions** tab.
- Step 4** Select the **Notify Tower** checkbox to send notifications to the ScanSafe Web Security server regarding the allowed list. It is applicable to all allowed lists except that which is IP-based.  
(ScanSafe Web Security receives a warning when no regular expression is specified for allowed list.)
- Step 5** In the HTTP Host area specify the regular expressions to be allowed (using regular expression matching) by selecting them from the list in the **Available Regular Expressions** column and moving them to the **Selected Regular Expressions** column.
- Step 6** In the HTTP User Agent area specify the regular expressions to be allowed by selecting them from the list in the **Available Regular Expressions** column and moving them to the **Selected Regular Expressions** column.
- Step 7** Select the **Permitlisting ACLs** tab.
- Step 8** Specify the type of ACLs to operate upon by selecting either **Extended** or **Standard** from the Type list.
- Step 9** Specify the ACLs to add to the allowed list by selecting them from the list in the column on the left and moving them to the **Selected items** column.
- Step 10** Select the **User Groups** tab.
- Tip** You can use the User Groups page to define user groups, specify both the default user and default user group, and to include or exclude user groups. You can also edit or delete entries in all three of these lists.
- Step 11** Specify a default user by entering the user name in the **Default User** field (optional).
- Step 12** Specify a default user group by entering the user group name in the **Default User Group** field.
- Step 13** Include a user group by selecting the interface and then adding the user group to the Include list.
- Step 14** Exclude a user group by selecting the interface and then adding the user group to the Exclude list.
- Step 15** Select **Policy > Firewall > Settings > ScanSafe Web Security** from the policy selector.
- Step 16** With the **Details** tab selected, specify the Primary ScanSafe Server by entering the following values:
- IP Address/Name
  - HTTP Port (default 8080)

- HTTPS Port (default 8080)

**Step 17** With the **Details** tab selected, specify the Secondary ScanSafe Server by entering the following values:

- IP Address/Name (only a valid IP address or FQDN).
- HTTP Port (default 8080)
- HTTPS Port (default 8080)

**Step 18** Specify the **Server Timeout** period in seconds (default 300).

**Step 19** Specify the **Session Idle Timeout** period in seconds (default 300).

**Step 20** Specify the source address by doing *one* of the following:

- Click the **IP Address** button and then enter the IP address.
- Click the **Interface** button, and then click the **Select** button and browse the Interface Selector to select an interface.

**Note** A valid source IP or interface must be one of the interfaces on which ScanSafe Web Security is enabled (on the Firewall > ScanSafe Web Security page > Interface tab).

**Step 21** Enter the **License** and select the checkbox if it is encrypted.

**Tip** If Encrypted is not selected, the value entered must be 32 hexadecimal characters.

**Step 22** If desired, select the **Enable Logging** checkbox.

## ScanSafe Web Security Page

Security Manager provides integration with ScanSafe Web Security. ScanSafe Web Security is a cloud-based SaaS (Security as a Service) function that makes available its web security data centers at various locations worldwide. When ScanSafe Web Security is integrated with a router, selected HTTP and HTTPS traffic is redirected to ScanSafe Cloud for content scanning and for malware detection by other means. Also, you can use ScanSafe Web Security to provide differentiated services to particular users, user groups, and IPs.

Using ScanSafe Web Security in Security Manager, you can define settings and policies in the following areas:

- Content scanning settings
- Content scanning policies
- AAA server settings
- AAA policies

With ScanSafe Web Security integration in Security Manager you can copy and share most policies and framework-based policy features.

### Navigation Path

(Policy view) Select Firewall and open Settings from the Policy Type selector. Then click ScanSafe Web Security to open the ScanSafe Web Security Settings Page.

**Note** Configuration of the ScanSafe Web Security policies and settings is also possible by way of the Map view.

| Element                                          | Description                                                                                                                                                                                                                                                                         |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interfaces Tab                                   |                                                                                                                                                                                                                                                                                     |
| —Filter                                          | Details on using filters in Security Manager are found at <a href="#">Filtering Tables , on page 50.</a>                                                                                                                                                                            |
| Interfaces                                       | This tab allows you to select interfaces and Security Manager-defined interface roles on which web requests will be forwarded to the ScanSafe Web Security server for content scanning.                                                                                             |
| —Available Interfaces                            | Interfaces that are available to be selected for ScanSafe Web Security.                                                                                                                                                                                                             |
| —Selected Interfaces                             | Interfaces selected must be facing the WAN on which hosts' requests for web services are forwarded to ScanSafe Web Security server                                                                                                                                                  |
| -                                                | -                                                                                                                                                                                                                                                                                   |
| Permitlisting Regular Expressions Tab            |                                                                                                                                                                                                                                                                                     |
| —Notify Tower                                    | This checkbox, when selected, specifies that the ScanSafe Web Security tower must be notified regarding the allowed listing. It is applicable to all ACL-based allowed listing variants except IP-based allowed listing. The default behavior is that the notification is not sent. |
| —Available Regular Expressions (HTTP Host)       | Lists the regular expressions available and considered for delivery to the ScanSafe Web Security server.                                                                                                                                                                            |
| —Filter (HTTP Host)                              | Enables the administrator to filter allowed regular expressions sent to ScanSafe Web Security server by specifying include and exclude user group list. It operates on a match-all or match-any basis.                                                                              |
| —Selected Regular Expressions (HTTP Host)        | A host that matches the selected regular expressions is added to the allowed list, and is not redirected to the ScanSafe Web Security server.                                                                                                                                       |
| —Available Regular Expressions (HTTP User Agent) | An agent that matches the available regular expressions is added to the allowed list, and is not redirected to the ScanSafe Web Security server.                                                                                                                                    |

| Element                                         | Description                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| —Selected Regular Expressions (HTTP User Agent) | When configured, only regular expressions that are in the Selected Regular Expressions list are sent to ScanSafe Cloud.                                                                                                                                                                                        |
| Permitlisting ACLs Tab                          |                                                                                                                                                                                                                                                                                                                |
| —ACL Type                                       | Specifies the type of ACL Allowed Listing, either standard or extended.<br><br><b>Note</b> Standard ACLs used for allowed listing are discovered as extended ACLs. A prefix of "CSM_EXT_" is added to the ACL name. Standard ACLs are converted to extended ACLs as extended ACLs are complete and recommended |
| —Selected ACLS                                  | When configured, only regular expressions that are in the Selected Regular Expressions list are sent to ScanSafe Cloud.                                                                                                                                                                                        |
| User Groups Tab                                 |                                                                                                                                                                                                                                                                                                                |
| —Default User                                   | A global name that is sent to the ScanSafe Web Security server when there is no content-scan-session specific user name. Use it when you want the same content scan policy for all users in a branch office (for example).                                                                                     |
| —Default User Group                             | A global name that is sent to the ScanSafe Web Security server when there is no content-scan-session specific user name. Use it when you want the same content scan policy for all user groups in a branch office (for example).                                                                               |
| —Interface Specific Default User Groups         | Lists default user group for each interface.                                                                                                                                                                                                                                                                   |
| —Include/Exclude                                | You can use the Include and Exclude lists to specify the particular user groups to be included or excluded.                                                                                                                                                                                                    |

## Add and Edit Default User Groups Dialog Box

Use the Default User Groups dialog box to specify the default user group for a particular interface.

For details on these ScanSafe Web Security server configuration settings, see the [ScanSafe Web Security Settings Page](#), on page 927.

**Note** From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software.

### Field Reference

**Table 273: ScanSafe Web Security Settings**

| Element                                   | Description                                                                                 | Usage |
|-------------------------------------------|---------------------------------------------------------------------------------------------|-------|
| IP Address Name (Primary ScanSafe Server) | The primary FQDN or IP address of the server configured to operate ScanSafe Web Security.   | Both  |
| HTTP Port (Primary ScanSafe Server)       | Default primary port for proxied HTTP traffic (default=8080).                               | Both  |
| HTTPS Port (Primary ScanSafe Server)      | Default primary port for proxied HTTPS traffic (default=8080).                              | Both  |
| IP Address/Name (Backup ScanSafe Server)  | The secondary FQDN or IP address of the server configured to operate ScanSafe Web Security. | Both  |
| HTTP Port (Backup ScanSafe Server)        | Default secondary port for proxied HTTP traffic (default=8080).                             | Both  |
| HTTPS Port (Secondary ScanSafe Server)    | Default secondary port for proxied HTTPS traffic (default=8080).                            | Both  |

| Element                     | Description                                                                                                                                                 | Usage    |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| Server Timeout              | Polling timeout when checking the availability of the ScanSafe Web Security server.                                                                         | IOS Only |
| Session Idle Timeout        | Inactivity timeout of the ScanSafe Web Security server (default=300 seconds). Used to remove the session if it is found inactive.                           | IOS Only |
| On Failure                  | Determines the action to be taken (Drop all Traffic or Allow All Traffic) when both primary and secondary ScanSafe Web Security servers are found inactive. | IOS Only |
| IP Address (Source Address) | IP address from which a packet to the ScanSafe Web Security server originates from the router.                                                              | IOS Only |
| Interface (Source Address)  | Interface address from which a packet to the ScanSafe Web Security server originates from the router.                                                       | IOS Only |
| License                     | The license sent to the ScanSafe Web Security server (32 hexadecimal characters).                                                                           | Both     |
| Encrypted                   | When selected, enables the encryption. ASA does not accept encrypted license text to be configured.                                                         | IOS Only |
| Enable Logging Checkbox     | Enables IOS syslogs (default=not enabled).                                                                                                                  | IOS Only |
| Public Key File             | Name of the public key file                                                                                                                                 | ASA Only |
| Connection Retry Count      | Number of times that the system should retry connecting.                                                                                                    | ASA Only |

## CHAPTER 21

# Managing Zone-based Firewall Rules

The Zone-based Firewall feature (also known as Zone-based Policy Firewall) allows unidirectional application of IOS firewall policies between groups of interfaces known as “zones.” That is, interfaces are assigned to zones, and firewall rules are applied to specific types of traffic moving in one direction between the zones. Beginning with 4.16, Cisco Security Manager allows sub-interfaces to be assigned to zones. Zone-based firewalls enforce a secure inter-zone policy by default, meaning traffic cannot pass between security zones until an explicit policy allowing that traffic is defined.

The “zone” itself is an abstraction—multiple interfaces with the same or similar security requirements that can be logically grouped together. For example, router interfaces Ethernet 0/0 and Ethernet 0/1 might be connected to the local LAN. When viewed from a firewall perspective, these two interfaces are similar in that they represent the internal network, and they can be grouped into a single zone for the purposes of firewall configuration. Then you can specify firewall policies between that and other zones. These inter-zone policies offer considerable flexibility and granularity, so different inspection policies can be applied to multiple host groups connected to the same router interface.

---

**Note** The zone-based firewall feature is supported on IOS devices running 12.4(6)T or later, and ASR devices running 12.2(33) or later.

---

### A Simple Example

A security zone should be configured for each region of similar security within the network, so that all interfaces assigned to the same zone are protected with a similar level of security. For example, consider an access router with three interfaces:

- One interface is connected to the public Internet
- One interface is connected to a private LAN that must not be accessible from the public Internet
- One interface is connected to an Internet-service “demilitarized zone” (DMZ), where a Web server,

Domain Name System (DNS) server, and e-mail server must have access to the public Internet. Each interface in this network would be assigned to its own zone, as shown in the following figure.

Figure 27: Basic Security Zone Topology

This example configuration typically would have three main policies (sets of rules) defining:

- Private zone connectivity to the Internet
- Private zone connectivity to DMZ hosts
- Internet zone connectivity to DMZ hosts

Zone-based firewalls impose a prohibitive default security posture. In other words, for example, unless the DMZ hosts are specifically allowed access to other networks, those networks are protected against any undesired connections from the DMZ hosts. Similarly, unless access is specifically provided for Internet hosts to access the Private zone directly, the Private zone hosts are safe from unwanted access by Internet hosts.

In this simple example, each zone has only one member interface. If an additional interface is added to the Private zone, for example, the hosts connected to that new interface can immediately pass traffic to all hosts connected to the existing interface in the zone. Additionally, traffic to hosts in other zones is immediately controlled by existing Private zone policies.

In a more realistic example, you might allow varied access from the public Internet to specific hosts in the DMZ, and varied application-use policies for hosts in the protected LAN.

## Understanding the Zone-based Firewall Rules

Zones establish the security borders of your network. A zone defines a boundary where traffic is subjected to inspection or filtering as it crosses to another region of your network. The default zone-based firewall policy between zones is “deny all.” Thus, if no zone-based firewall rules are explicitly configured, all traffic moving between all zones is blocked.

Zone-based firewall rules apply specific actions—Drop, Pass, Inspect, and Content Filter—to various types of unidirectional traffic between pairs of zones. The direction of the traffic is determined by specifying a source and destination zone as part of each rule.

### Logging

Zone-based firewall rules offer syslog, alert, and audit-trail logging options. Most messages are logged to the router console unless a syslog server is configured. See [Logging on Cisco IOS Routers](#) , on page 2535 for information about configuring syslog logging.

### Important Points

Please note the following points regarding zones and zone-based firewall rules:

- Zone-based firewall rules are supported only on IOS devices running 12.4(6)T or later, and ASR devices running 12.2(33) or later.
- If a zone-based firewall rule and an IOS Inspection rule use the same interface, an error results.

The zone-based firewall model and the earlier interface-based inspection rules model are not mutually exclusive on the router, but they cannot be combined on any given interface. That is, an interface cannot be configured as a member of a security zone if it is configured with Inspection rules. Further, configuring a router to use both models at the same time is not recommended.

- An interface can be assigned to only one security zone, but zones can include multiple interfaces. If an interface is assigned to more than one zone, an error results.
- All traffic to and from a given interface is implicitly blocked when the interface is assigned to a zone (except traffic to and from other interfaces in the same zone, and traffic to any interface on the router). Thus, to permit traffic to and from a zone-member interface, one or more rules allowing or inspecting traffic must be configured between that zone and any other zone.
- Traffic is implicitly allowed to flow between interfaces that are members of the same zone. However, you can define rules that require inspection of traffic between same-zone members.

- The “Self” zone is a default zone that defines the router itself as a separate security zone, which you can specify as either the source or destination zone. The Self zone is the only exception to the default “deny all” policy. All traffic to any router interface is allowed until explicitly denied.

A zone-based firewall rule that includes the Self zone applies to local traffic—that is, traffic directed to the router, or to traffic generated by the router; it does not apply to traffic through the router. See [The Self Zone](#), on page 933 for more information.

- The Inspect action is not allowed in rules that apply to the Self zone.
- The Pass action permits traffic in one direction only. You must explicitly define rules for return traffic. However, with the Inspect action, return traffic is automatically allowed for established connections.
- Traffic cannot flow between a zone-member interface and any interface that is not a zone member.
- Interfaces that have not been assigned to a zone can still function as classical router ports and might still have other types of firewall rules configured on them.

However, if an interface is not part of your zone-based firewall policy, it might still be necessary to add that interface to a zone and configure a “pass all” policy (sort of a “dummy policy”) between that zone and any other zone to which inter-zone traffic flow is desired.

- Access-control list (ACL) rules applied on interfaces that are also zone members are processed before the zone rules are applied. Therefore, to continue using both rule types, it may be necessary to relax the interface ACLs to ensure certain traffic flows are processed by the zone-based rules.
- All interfaces in a zone must belong to the same Virtual Routing and Forwarding (VRF) instance. Zone-based rules can be configured between zones whose member interfaces are in separate VRFs. However, if traffic cannot flow between these VRFs, these rules will never be executed. See [Zones and VRF-aware Firewalls](#), on page 934 for more information.
- Zones are defined using Interface Role objects. If you change the definition of an interface role that you are using for a zone, you are changing the zone, which can affect existing traffic flows. In addition, if you use wildcards in the interface role to specify an interface name pattern, be aware that interfaces may automatically be added to the zone when you create new interfaces on the router.
- If zone-based firewall rules contain conflicting zone information, the first rule defined in the table takes precedence. Rules that do not reference valid zones are not deployed and an activity validation warning is shown.
- Empty zones result in activity validation errors for certain devices; refer to the following restriction lists.
- Source and destination zones cannot be the same for certain devices; refer to the following restriction lists.

---

**Note** From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software.

## The Self Zone

The router itself is defined as a separate security zone, with the fixed name **Self**, and since IOS firewalls support examination of traffic (TCP, UDP and H.323 only) that terminates or originates on the router (together known as “local” traffic), incoming and outgoing router traffic can be subject to rules in the same way as routed inter-zone traffic.

When an interface is assigned to a zone, the hosts connected to that interface are included in that zone. By default, traffic is allowed to flow between interfaces that are members of the same zone, while a default “deny-all” policy is applied to traffic moving between zones.

However, traffic flowing directly between other zones and the router’s IP interfaces (the Self zone) is implicitly allowed. This ensures that connectivity to the router’s management interfaces is maintained when a zone firewall configuration is applied to the router.

This also means that traffic flowing to and from the IP addresses of the router’s interfaces is not initially controlled by zone policies. If you wish to control traffic moving between the router interfaces and other zones, you must apply rules that block or allow this local traffic.

When configuring the rules for the Self zone, consider the following:

- All IP addresses configured on the router belong to the Self zone, regardless of interface zone membership.
- Traffic to and from the Self zone is unrestricted until you configure explicit rules to the contrary.

That is, when you configure a zone-based firewall rule that includes the Self zone, traffic between the Self zone and the other zone is immediately restricted in both directions. For example, if you define a rule affecting traffic from the “Private” zone to the Self zone, the router cannot originate any traffic to the Private zone until you define one or more rules for Self to Private.

Traffic between the router itself and other zones that are not included in the Self-zone rules remains unaffected.

- The Inspect action is not allowed in rules that apply to the Self zone.

When configuring restrictions on inbound Self-zone traffic, consider the necessary outbound traffic (including the routing and network management protocols). For example, if you restrict inbound traffic from a zone to the router itself, the routing protocols could stop working on all interfaces belonging to that zone.

## Using VPNs with Zone-based Firewall Policies

Recent enhancements to the IP Security (IPsec) VPN implementation simplify firewall policy configuration for VPN connectivity. IPsec Virtual Tunnel Interface (VTI) and GRE+IPsec allow the confinement of VPN site-to-site and client connections to a specific security zone by placing the tunnel interfaces in that security zone. Connections can be isolated in a VPN DMZ if connectivity must be limited by a specific policy. Or, if VPN connectivity is implicitly trusted, VPN connections can be placed in the same security zone as the trusted inside network.

To configure the router to use zone-based firewall rules with dynamic VPNs (those which dynamically create Tunnel/Loopback/Virtual interfaces):

- Define a zone specifically for the VPN interfaces.
- Enter this zone in the **VPN Zone** field on the VPN tab of the [Zone Based Firewall Page](#), on page 979.
- Create zone-based firewall rules to allow the VPN traffic, as appropriate.

If non-VTI IPsec is employed, you must exercise caution when you configure a zone-based firewall policy for VPN. The zone policy must specifically allow access to protected hosts by remote VPN hosts or clients if they are in a different zone than the ingress interface for encrypted VPN traffic. This access policy must be configured by including an access control list (ACL) enumerating the source IP addresses of the VPN clients, and the destination IP addresses of all protected hosts the VPN clients are allowed to reach. If the access policy is not properly configured, the policy could expose vulnerable hosts to hostile traffic.

Refer to this white paper on cisco.com “[Using VPN with Zone-Based Policy Firewall](#)” for further discussion of these topics.

## Zones and VRF-aware Firewalls

Cisco IOS firewalls are VRF-aware (Virtual Routing and Forwarding), providing management of IP address overlap across different VRFs, separate thresholds and timeouts for VRFs, and so forth. For application of zone-based firewall rules, all interfaces in a zone must belong to the same VRF.

When multiple VRFs are configured on a router and one interface provides common services to all the VRFs (for example, Internet service), you should place that interface in a separate zone. You can then define policies between the common zone and other zones. (There can be one or more zones per VRF.)

You can configure rules between two zones that contain different VRFs, as shown in the following illustration.

Figure 28: Zones and VRF

In this illustration:

- The interface providing common services is a member of the zone “common.”
- All of VRF A is in a single zone, “vrf\_A.”
- VRF B, which has multiple interfaces, is partitioned into two zones “vrf\_B\_1” and “vrf\_B\_2.”
- Zone Z1 does not have VRF interfaces.

Based on this configuration:

- You can specify policies between each of these zones and the common zone. Additionally, you can specify policies between each of the zones vrf\_A, vrf\_B\_n and Z1 if VRF route export is configured and the traffic patterns make sense.
- You can configure a policy between zones vrf\_A and vrf\_B\_1, but be sure that traffic can flow between them.
- You do not need to specify the global thresholds and timers on a per-VRF basis. Instead, parameters are supplied to the Inspect action through a parameter map.

## Understanding the Relationship Between Permit/Deny and Action in Zone-based Firewall Rules

When you create a zone-based firewall rule, you must specify two execution-related settings: Permit/Deny and an Action (Drop, Pass, Inspect, or Content Filter). To obtain the results you want, you must clearly understand the relationship between these two parameters:

- **Permit/Deny**—The Permit/Deny setting appears to correspond to Permit/Deny in an access control list (ACL) entry. However, in zone-based firewall rules, unlike in standard access rules, these keywords do not permit or deny traffic. Instead, they specify whether you want to apply an Action to the traffic flow defined by the Source, Destination, and Services fields, and they affect processing of related class maps.

- **Permit** – Applies the specified Action to traffic that matches the Source, Destination, and Services fields. (If protocols are listed in the Protocols table, the Action is further limited to those protocols.)

**Tip:** Essentially all of your zone-based rules should be Permit rules. This is the easiest configuration to understand—it means you are identifying the traffic to which you want the chosen Action applied.

- **Deny** – Exempts the traffic defined by the Source, Destination, and Services fields. (If protocols are listed in the Protocols table, the exemption is further limited to those protocols.) In other words, treat the traffic as not matching the rule. Instead, evaluate subsequent class maps (which are not the same as zone rules) for the zone pair and look for a subsequent map that matches the traffic. If no subsequent map matches the traffic, apply the default rule to the traffic (see [Changing the Default Drop Behavior](#), on page 977).

It is important to understand that there is not a one-to-one relationship between zone rules and class maps. Therefore, you cannot determine just by looking at the rules table how the rules will be converted to class maps. You must preview the configuration to see which subsequent rules might be applied to traffic that matches your Deny rule. (To preview the configuration, save your changes and select **Tools > Preview Configuration**. For more information, see [Previewing Configurations](#), on page 422).

In general, you might use a Deny rule to exempt a specific IP address within a subnet from a Permit rule you want to apply to the subnet in general; for example, exempting 10.100.10.1 from a rule applying to 10.100.10.0/24. However, it is much easier to create a Permit rule for the specific IP address and apply a desired Action, and ensure that the rule is listed above the general rule in the zone-based rules table.

If you decide to use Deny rules, be sure to also read [Troubleshooting Zone-based Rules and Configurations](#), on page 983.

- **Action**—The Action parameters define what happens to traffic that matches a Permit rule. These parameters are ignored for Deny rules, except to determine to which class map the rule is added.

When you create a Permit rule, traffic that matches the Source, Destination, Services, and Protocol fields is processed according to the Action you choose: drop the traffic (and optionally log it), pass the traffic (and optionally log it), inspect the traffic, or apply content filtering (for Web traffic only).

When you inspect traffic for some protocols, or perform content filtering, you have the option of specifying a policy map to use for deep inspection. The deep inspection policy map also specifies actions based on the deeper characteristics of the traffic. This additional inspection applies to packets that meet the requirements of the class map to which the assigned policy map refers. Packets that do not match the deep inspection class map are allowed. Thus, deep inspection might reset TCP connections if the policy map specifies that action.

The following table illustrates the relationship between Permit/Deny and the chosen Action in a zone-based firewall rule. The table uses the TCP service as an example, but the general explanation applies to the IP service as well. The result applies only to the From and To zones specified in the rule.

**Table 274: Relationship Between Permit/Deny and Action in Zone-based Rules**

| Permit / Deny | Service | Rule Action | Protocol | Result                |
|---------------|---------|-------------|----------|-----------------------|
| Permit        | TCP     | Pass        | (None)   | Pass all TCP traffic. |

| Permit / Deny | Service | Rule Action | Protocol | Result                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|---------|-------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Deny          | TCP     | Pass        | (None)   | Skip the rule and evaluate the next class map. Either a subsequent class map with a Permit rule is applied, or the class default rule is applied.<br><br>The Pass action is ignored.                                                                                                                                                                                                                                                                                                                                                                      |
| Permit        | TCP     | Drop        | (None)   | Drop all TCP traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Deny          | TCP     | Drop        | (None)   | Skip the rule and evaluate the next class map. Either a subsequent class map with a Permit rule is applied, or the class default rule is applied.<br><br>The Drop action is ignored.                                                                                                                                                                                                                                                                                                                                                                      |
| Permit        | TCP     | Pass        | DNS      | Only DNS traffic passes. Other TCP traffic is handled by subsequent rules.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Permit        | TCP     | Drop        | DNS      | DNS traffic is dropped. Other TCP traffic is handled by subsequent rules.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Deny          | TCP     | Pass        | DNS      | Skip the rule for DNS traffic and evaluate the next class map. Either a subsequent class map with a Permit rule is applied, or the class default rule is applied.<br><br>The Pass action is ignored.                                                                                                                                                                                                                                                                                                                                                      |
| Deny          | TCP     | Drop        | DNS      | Skip the rule for DNS traffic and evaluate the next class map. Either a subsequent class map with a Permit rule is applied, or the class default rule is applied.<br><br>The Drop action is ignored.                                                                                                                                                                                                                                                                                                                                                      |
| Permit        | TCP     | Inspect     | HTTP     | Allow and inspect HTTP traffic. If you specify a policy map for deep inspection, the action from the policy map is applied to any packets that match deep inspection parameters (for example, reset the connection for protocol violations).                                                                                                                                                                                                                                                                                                              |
| Deny          | TCP     | Inspect     | HTTP     | Skip the rule for HTTP traffic and evaluate the next class map. Either a subsequent class map with a Permit rule is applied, or the class default rule is applied.<br><br>The Inspect action is ignored.<br><br><b>Tip</b> If subsequent rules, or the class default, pass the traffic without inspection, you need to create a Permit/Pass rule in the other direction (or an access rule) to allow return traffic for the HTTP connection. If your intention is to prohibit HTTP connections, create a Permit/Drop rule instead of a Deny/Inspect rule. |

| Permit / Deny | Service | Rule Action    | Protocol | Result                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|---------|----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Permit        | TCP     | Content Filter | HTTP     | <p>Allow and inspect HTTP traffic, and apply URL filtering maps to selectively permit or deny Web connections based on the Web sites requested.</p> <p>If you specify a policy map for deep inspection, the action from the policy map is applied to any packets that match deep inspection parameters (for example, reset the connection for protocol violations).</p> <p>Thus, traffic can be dropped either because the Web site is added to the block list, or because the HTTP packets violate your deep inspection rules.</p> |
| Deny          | TCP     | Content Filter | HTTP     | <p>Skip the rule for HTTP traffic and evaluate the next class map. Either a subsequent class map with a Permit rule is applied, or the class default rule is applied.</p> <p>The Content Filter action is ignored.</p> <p><b>Tip</b> This type of rule can exempt the specified source/destination from content filtering if no subsequent class maps drop the traffic or apply content filtering. However, if you want to allow HTTP connections for this traffic, you must create a Permit/Inspect rule for the traffic.</p>      |

## Understanding the Relationship Between Services and Protocols in Zone-based Firewall Rules

When you create a zone-based firewall rule, there are two seemingly similar parameters which help identify the characteristics of the target traffic: Services and Protocols. The entries in these fields can provide very similar information, but it is used differently when constructing zone-based firewall policies in the device configuration. This section describes the recommended uses of these fields.

- **Services** – The Services field is used to define traffic protocol(s) in an access control list (ACL) entry. Along with the Sources and Destinations specified, this ACL entry is used by a class map to define the traffic to which you want to apply a policy. However, unlike in standard access rules, the Services information is not the primary means of identifying the traffic protocol. It is required only because ACLs must have a service designation for each entry.

In general, you can leave the default entry (IP) in the Services field for all of your zone-based firewall rules, using the Protocol table to identify specific protocols that you want to Drop, Pass, or Inspect.

If you do elect to specify a Service other than IP, ensure that your selection does not conflict with any protocols listed in the Protocol table. For example, do not specify UDP in the Services field, and then list a TCP-based protocol in the table. In general, for a given rule, if you specify a specific service in the Services field, do not enter any protocols in the Protocol table.

- **Protocol** – The Protocol table, in the Action area of the Add and Edit Zone Based Rule dialog boxes, is used to select one or more protocols, add custom port application mappings (if you specify non-default ports), and apply deep inspection policy maps. You can specify very specific protocols, such as DNS, general protocols such as TCP and UDP, and even custom protocols that identify ports you use for special applications.

As a general rule, leave Services set to IP and use the Protocol table to identify the protocols (which are also services) for all of your zone-based rules for the Drop, Pass, and Inspect actions. (The Content Filter action automatically uses the HTTP protocol, which you can configure but not change.) Following this approach will create a configuration that is as “clean” and easy to interpret (and troubleshoot) as possible.

For more detailed information on how these fields are used when generating device configurations, see [Troubleshooting Zone-based Rules and Configurations](#), on page 983.

## General Recommendations for Zone-based Firewall Rules

Zone-based firewall rules allow a wide variety of configurations. You can quickly generate a set of rules that will be very complex and difficult to analyze, because you can use the zone-based rules in place of the standard access rules, inspection rules, and Web filter rules.

When defining zone-based rules, strive to keep them as simple and straightforward as possible. Consider the following recommendations for helping to maintain simplicity in your zone-based firewall policy:

- Only use **Permit** rules. The chosen Action determines what happens to matched traffic, and **Deny** rules are difficult to analyze. For more information, see [Understanding the Relationship Between Permit/Deny and Action in Zone-based Firewall Rules](#), on page 935.
- The **Drop** and **Pass** rules are equivalent to standard interface access rules, but are applied to the specified zone pair. You can use either the Services field or the Protocol table to identify the type of traffic, but we recommend using the Protocol table exclusively. To drop traffic, specify **Permit** with the Action **Drop**.
- You do not need to first pass traffic before inspecting it. For example, if you want to allow HTTP traffic between zones, you need only a single Permit/Inspect rule; you do not need to first create a Permit/Pass rule. If you do use Pass rules, note that you must also create a Pass rule in the return direction if you want to allow returning traffic. In practice, you generally can avoid creating Pass rules, using only Inspect rules.
- You can use Permit/Pass and Permit/Drop rules to perform the same functions as standard access rules. Thus, you can eliminate your access rules policy and use only zone-based firewall rules.

However, because there are several tools available for analyzing interface access rules, and Security Manager allows you to use the same interface roles in zone-base rules and access rules, you might find it more convenient to create your Pass/Drop policies (which are Permit/Deny in standard access rules) in the access rules table instead of the zone rules table. Use the zone rules table primarily for zone-based Inspection and Content Filter rules.

- Use sections to organize the rules for each zone pair. Sections make it easy for you to see all of the rules for a pair, which can be critical if your rules have sequential dependencies. For more information on working with sections, see [Using Sections to Organize Rules Tables](#), on page 616.

# Developing and Applying Zone-based Firewall Rules

The following is a general overview of how to develop and apply zone-based firewall rules to your network.

- Consider your network, and its sub-networks, in terms of security zones—think about the security requirements of the various zones. As a general guideline, group router interfaces that are similar when viewed from a security perspective.
- Determine the types of traffic to be examined as it travels from one zone to another, decide how each type is to be examined and handled.
- Define zone-based firewall rules that implement these decisions. This process may include some or all of the following procedures, which you can perform prior to defining the rules themselves, or which you can perform as necessary during rule definition:
  - Define the zones by creating named Interface Role objects, assigning the appropriate interfaces and interface patterns to them.
  - Define/edit Port Application Mapping (PAM) settings for specific Layer 4 protocols and ports, and optionally specific networks and hosts.
  - Configure Deep Packet Inspection (DPI) policies for Layer 7 protocols—HTTP, IMAP, instant messaging (IM), and peer-to-peer (P2P).
  - Configure Protocol Info parameter maps; these define DNS servers that interact with the IM applications.
  - Configure Inspect parameter maps that define connection, timeout, and other settings for the Inspect action.
  - Define WebFilter parameter or policy maps for URL-based content filtering.

The following topics provide additional information about these procedures:

- [Understanding Map Objects](#) , on page 306
- [Configuring Content Filtering Maps for Zone-based Firewall Policies](#) , on page 964
- [Configuring Inspection Maps for Zone-based Firewall Policies](#) , on page 943

## Adding Zone-Based Firewall Rules

This procedure explains how to configure a zone-based firewall rule in Security Manager.

### Related Topics

- [Understanding the Zone-based Firewall Rules](#) , on page 931
- [Configuring Settings for Zone-based Firewall Rules](#) , on page 978
- [Understanding Map Objects](#) , on page 306
- [Enabling and Disabling Rules](#) , on page 616
- [Adding and Removing Rules](#) , on page 604

- [Moving Rules and the Importance of Rule Order](#) , on page 615

- 
- Step 1** Access the [Zone-based Firewall Rules Page](#) , on page 987 as follows:
- (Device view) Select an IOS router and then select **Firewall > Zone Based Firewall Rules** from the Policy selector.
  - (Policy view) Select **Firewall > Zone Based Firewall Rules** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** Click the Add Row button below the rules table, or right-click anywhere inside the table, and choose **Add Row** to open the Add Zone Based Firewall Rule dialog box.
- Refer to [Adding and Editing Zone-based Firewall Rules](#) , on page 990 for a complete description of this dialog box.
- Step 3** Define the base Traffic flow for this rule.
- Note** Together, the Permit/Deny, Sources, Destinations, and Services options can be thought of as defining a simple access rule that can be enhanced by the application of in-depth Action-related policies, and restricted to a specific direction between a specific pair of zones.
- a) Choose whether to Permit or Deny further processing of traffic that matches this rule. See [Understanding the Relationship Between Permit/Deny and Action in Zone-based Firewall Rules](#) , on page 935 for more information.
  - b) Optionally, provide Source and Destination hosts/networks or Security Groups (IOS 15.2(2)T+ and IOS-XE 3.5.x(15.2(1)S)+ only).  
  
By default, the traffic definition encompasses packets from “any” source, to “any” destination. You can use these fields to refine this base traffic definition by providing one or more source and destination hosts/networks. (See [Understanding Networks/Hosts Objects](#) , on page 308 and [Understanding Networks/Hosts Objects](#) , on page 308 for more information.)
  - c) Specify one or more Services (protocols) that indicate the type of traffic; for example, IP, TCP, etc.  
  
You can provide more than one Service; however, IP generally stands alone. (See [Understanding and Specifying Services and Service and Port List Objects](#) , on page 329.)
  - d) Provide the From Zone; that is, the only zone from which matched traffic can originate.
  - e) Provide the To Zone; that is, the only zone to which matched traffic can flow.  
  
Refer to [Understanding Interface Role Objects](#) , on page 301 for more information about zone/interface objects.  
  
**Note** Together, the From Zone and the To Zone constitute what is sometimes referred to as a “zone-pair.”
  - f) Click the Advanced button to add a time range, or to apply a packet-fragment or an established-connection restriction to this zone-based firewall rule.  
  
See [Zone-based Firewall Rule: Advanced Options Dialog Box](#) , on page 994 for more information about these options.
- Step 4** Specify the actions to be applied to traffic matching this definition by choosing a base Action, and supplying additional parameters as necessary.
- a) Choose a base Action:
    - **Drop** – Matching traffic is silently dropped; no notification of the drop is sent to the originating host.
    - **Drop and Log** – Matching traffic is dropped and a syslog message generated; no notification of the drop is sent to the originating host.
    - **Pass** – Traffic is forwarded. This action is unidirectional; Pass allows traffic in only the specified direction.

- **Pass and Log** – Traffic is forwarded and a syslog message generated.

**Note** The Pass actions do not track the state of connections or sessions within the traffic. Pass only allows the traffic in one direction. A corresponding rule must be defined to allow return traffic. The Pass actions are useful for protocols such as IPSec ESP, IPSec AH, ISAKMP, and other inherently secure protocols with predictable behavior. However, most application traffic is better handled in the zone-based firewall rules with the Inspect action.

- **Inspect** – This option offers state-based traffic control—the device maintains connection or session information for TCP and UDP traffic, meaning return traffic in reply to connection requests is permitted.

Choose this option to apply packet inspection based on your selected Layer 4 (TCP, UDP) and Layer 7 (HTTP, IMAP, instant messaging, and peer-to-peer) protocols. You also can edit the Port Application Mapping (PAM) settings for the selected protocols, and you can set up deep packet inspection (DPI) and provide additional protocol-related information for the Layer 7 protocols.

- **Content Filter** – Lets you configure HTTP content inspection (URL filtering) based on a WebFilter parameter map, or a WebFilter policy map. This action is generally equivalent to a Web Filter rule; however, zone-based firewall rules support additional advanced options, such as HTTP deep packet inspection (DPI).

The router intercepts HTTP requests, performs protocol-related inspection, and optionally contacts a third-party server to determine whether the requests should be allowed or blocked. You can provide a WebFilter parameter map, which defines filtering based on local URL lists, as well as information from an external SmartFilter (previously N2H2) or Websense server. Alternately, you can provide a WebFilter policy map that accesses Local, N2H2, Websense, or Trend Micro filtering data.

- b) For any Action except Content Filter, you can select and edit the specific traffic Protocol(s) to be considered:

Click Select next to the Protocol table to open the [Protocol Selector Dialog Box](#), on page 995. Select one or more protocols and click >> to move them to the Selected Protocol list. You can edit the Port Application Mapping (PAM) settings for the selected protocols; see [Configure Protocol Dialog Box](#), on page 996 for more information.

The Instant Messaging and Stun-ice protocols also allow selection of Protocol Info parameter maps. Further, when Inspect is the chosen Action, some protocols allow selection of deep-inspection policy maps.

See [Configuring Inspection Maps for Zone-based Firewall Policies](#), on page 943, and [Configuring Protocol Info Parameter Maps](#), on page 961 for more information.

**Note** It is not necessary to specify protocols for the Drop, Drop and Log, Pass, and Pass and Log actions. You can leave the Protocol table empty and pass or drop traffic based on the Sources, Destinations, and Services parameters.

- c) When the chosen Action is Content Filter, configure the URL filtering:

1. Click Configure next to the Protocol field to customize the HTTP PAM settings, and to apply an HTTP deep-inspection policy map. See the [Configure Protocol Dialog Box](#), on page 996 for more information
2. Select either WebFilter Parameter Map, or WebFilter Policy Map, and enter or Select the name of the appropriate WebFilter map. See [Configuring Content Filtering Maps for Zone-based Firewall Policies](#), on page 964 for more information.

- d) When the chosen Action is Inspect or Content Filter, you can enter or Select the name of an Inspect Parameter map to apply a customized set of connection, timeout, and other settings. See [Configuring Inspect Parameter Maps](#), on page 958 for more information.

**Step 5** (Optional) Enter a description to help you identify the rule.

- Step 6** (Optional) Under Category, select a category to help you identify this rule in the rules table. See [Using Category Objects](#), on page 239.
- Step 7** Click **OK** to close the Add Zone Based Firewall Rule dialog box and return to the Zone Based Firewall Rules table. The new rule is listed in the table.

---

## Configuring Inspection Maps for Zone-based Firewall Policies

When you configure zone-based firewall policies for a router, you can define rules to inspect traffic by choosing Inspect as the Action for the rule. You can then select the specific protocols to inspect.

For some protocols, you can select policy maps to perform deep inspection on packets that match your criteria. You can configure these maps from the policy object selector dialog box while defining the rule, or at any time in the Policy Object Manager window (select **Manage > Policy Objects**). In addition to policy maps, there are some parameter maps you can configure for inspection.

- For protocols that allow deep inspection, you can select a related policy map, which in turn incorporates class maps that define match conditions for the targeted traffic. To create these policy maps in the Policy Object Manager, select one of the available map types (which are listed in the following table) from the **Maps > Policy Maps > Inspect** folder, and review the detailed usage information in [Configuring Policy Maps for Zone-Based Firewall Policies](#), on page 962.

For information on creating class maps for use in your deep-inspection policy maps, see the references to the match criterion dialog boxes in the following table, as well as the topic [Configuring Class Maps for Zone-Based Firewall Policies](#), on page 945. These class maps are found in the **Maps > Class Maps > Inspect** folder in the Policy Object Manager.

- When Inspect (or Content Filter) is the chosen Action, you can also apply an Inspect Parameters map in the [Adding and Editing Zone-based Firewall Rules](#), on page 990. Zone-based firewall inspection includes several general settings, all of which have default values that are appropriate for most networks. If you want to adjust any of these settings, you must create an Inspect Parameters map. In the Policy Object Manager, select **Maps > Parameter Maps > Inspect > Inspect Parameters** and review the detailed usage information in [Configuring Inspect Parameter Maps](#), on page 958.

Table 275: Policy Objects for Zone-based Firewall Inspection Rules

| Protocol                                                                       | Minimum IOS Software Version | Policy Map            | Class Map                                                           | Parameter Map | Description and Match Criteria Reference                                                                                                                                                                                                                                                                                                                                                                  |

## Configuring Class Maps for Zone-Based Firewall Policies

Use the Add and Edit Class Map dialog boxes to define class maps to be used in policy maps of the same type. The name of the dialog box indicates the type of map you are creating.

A class map defines application traffic based on criteria specific to the application. You then select the class map in the corresponding policy map and configure the action to take for the selected traffic. Thus, each class map must contain traffic that you want to handle in the same way (for example, to allow it or to drop it).

When configuring zone-based firewall rules for devices running Cisco IOS Software, you can create class maps for the following purposes:

- For 12.4(6)T and higher, you can create classes for the inspection of the following types of traffic: H.323, HTTP, IMAP, POP3, SIP, SMTP, and Sun RPC. You can create classes for web filtering using the following class types: Local, N2H2 (SmartFilter), and WebSense. See the following topics for information on the match criteria:
  - [H.323 \(IOS\) Class Maps Add or Edit Match Criterion Dialog Boxes](#) , on page 949
  - [HTTP \(IOS\) Class Add or Edit Match Criterion Dialog Boxes](#) , on page 950
  - [IMAP and POP3 Class Maps Add or Edit Match Criterion Dialog Boxes](#) , on page 952
  - [SIP \(IOS\) Class Add or Edit Match Criterion Dialog Boxes](#) , on page 952
  - [SMTP Class Maps Add or Edit Match Criterion Dialog Boxes](#) , on page 954
  - [Sun RPC Class Maps Add or Edit Match Criterion Dialog Boxes](#) , on page 957
  - [Local Web Filter Class Add or Edit Match Criterion Dialog Boxes](#) , on page 957
  - [N2H2 and Websense Class Add or Edit Match Criterion Dialog Boxes](#) , on page 958
- For 12.4(9)T and higher, you can create classes for the inspection of the following types of traffic: AOL, eDonkey, FastTrack, Gnutella, ICQ, Kazaa2, MSN Messenger, Windows Messenger, and Yahoo Messenger. See the following topics for information on the match criteria:
  - [Zone-based Firewall IM Application Class Maps: Add or Edit Match Condition Dialog Boxes](#) , on page 948
  - [Zone-based Firewall P2P Application Class Maps: Add or Edit Match Condition Dialog Boxes](#) , on page 948
- For 12.4(20)T and higher, you can create classes for web filtering using the Trend policy object. Match criteria for Trend Content Filter class maps is described in the table below.

### Navigation Path

Select **Manage > Policy Objects**, then select any zone-based class map object in the folders in the **Maps > Class Maps** folder in the table of contents. Right-click inside the work area, then select **New Object**, or right-click a row, then select **Edit Object**.

A maximum of 40 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Description                                                                | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Match table<br>Match Type<br>(Except for Trend Content Filter class maps.) | <p>The Match table lists the criteria included in the class map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion and the criterion and value that is inspected.</p> <p>The name of the table indicates whether every one of the criteria must be met for the traffic to match the class (Match All), or whether matching any of the listed criteria is sufficient (Match Any). For the HTTP (IOS) and SMTP classes, you can choose whether to match all or any. When using a Match All table, if you add more than one criteria, ensure that you are not defining a set of characteristics that no traffic can match.</p> <p><b>Tip</b> Match All works for devices running Cisco IOS Software version 12.4(20)T or later only.</p> <ul style="list-style-type: none"> <li>• To add a criterion, click the Add button and fill in the Match Criterion dialog box. For more information, see the topics referenced above.</li> <li>• To edit a criterion, select it and click the Edit button.</li> <li>• To delete a criterion, select it and click the Delete button.</li> </ul> |
| Trend Content Filter Match Criteria                                        | <p>The match criteria for Trend Content Filter class maps differs from that of all other class maps. Instead of adding items to a table, you simply select the items you want from a list. Select the Enable checkbox for any of the Trend-Micro classifications on the following tabs. Traffic matches the class if it matches any of your selections.</p> <ul style="list-style-type: none"> <li>• Productivity Categories—Matches the traffic to the category to which the URL belongs. For example, you can target traffic associated with gambling or pornography.</li> <li>• Security Ratings—Matches the traffic to the security rating assigned to it by Trend-Micro. For example, you can target adware, which is traffic associated with advertising.</li> </ul> <p>See the Trend-Micro documentation for specific information on these categories or security classifications.</p>                                                                                                                                                                                                                                                    |
| Category                                                                   | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Element                                   | Description                                                                                                                                                                                                                                                                 |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Allow Value Override per Device Overrides | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244. |
| Edit button                               | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                |

## Zone-based Firewall IM Application Class Maps: Add or Edit Match Condition Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the various instant messenger (IM) application classes used with zone-based firewall policies to define a match criterion and value for the class map.

You can define a match for the following types of traffic:

- Any—Any type of traffic from the application except text chat traffic.
- Text-chat—Text chat traffic.

### Navigation Path

From the Add or Edit Class Maps dialog boxes for AOL, ICQ, MSN Messenger, Windows Messenger, or Yahoo Messenger classes, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies](#) , on page 945.

## Zone-based Firewall P2P Application Class Maps: Add or Edit Match Condition Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the various peer-to-peer (P2P) application classes used with zone-based firewall policies to define a match criterion and value for the class map.

### Navigation Path

From the Add or Edit Class Maps dialog boxes for eDonkey, FastTrack, Gnutella, or Kazaa2 classes, right-click inside the table and select **Add Row**, or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies](#) , on page 945.

## Field Reference

**Table 277: Zone-based Firewall P2P Application Class Maps Add or Edit Match Condition Dialog Boxes**

| Element   | Description                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion | Choose which criterion to match: <ul style="list-style-type: none"> <li>• File Transfer – Matches file-transfer traffic.</li> <li>• Search Filename – Matches the names of files for which the user is searching. You can use this criterion to block users from searching for particular files using eDonkey.</li> <li>• Text Chat – Matches eDonkey text chat traffic.</li> </ul> |
| Type      | Specifies that the map includes traffic that matches the criterion.                                                                                                                                                                                                                                                                                                                 |
| File Name | The name of the file associated with the traffic. You can use regular expressions to specify a name pattern. For information on the metacharacters you can use to build regular expressions, see <a href="#">Metacharacters Used to Build Regular Expressions</a> , on page 878.<br><br><b>Tip</b> eDonkey does not require a file name.                                            |

## H.323 (IOS) Class Maps Add or Edit Match Criterion Dialog Boxes

**Note** From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Use the Add or Edit Match Criterion dialog boxes for the H.323 (IOS) class used with zone-based firewall policies to define a match criterion and value for the class map. You can match traffic based on the H.323 protocol message type. Select the message that you want to match.

### Navigation Path

From the Add or Edit Class Maps dialog boxes for the H.323 (IOS) class, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies](#) , on page 945.

## HTTP (IOS) Class Add or Edit Match Criterion Dialog Boxes

**Note** From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Use the Add or Edit Match Criterion dialog boxes for the HTTP (IOS) class used with zone-based firewall policies to define a match criterion and value for the class map.

The fields on this dialog box change based on the criterion you select. You can use the following criteria:

- Request/Response Body Length, Request Body Length, Response Body Length—Specifies that the body length of the request, response, or both, is less than or greater than the specified number. This allows you to set a minimum or maximum message length.
- Request/Response Body, Request Body, Response Body—Applies a regular expression to match the body of the request, response, or both.
- Request/Response Header, Request Header, Response Header—You can match a regular expression against the header, test for repeated fields, check the content type, or check the total length or number of records in the header.
- Request/Response Protocol Violation—Matches non-compliant HTTP traffic.
- Request Argument, Request URI—Matches the length or content (with a regular expression) of the argument (parameters) or uniform resource identifier (URI) in a request message.
- Request Port Misuse—Matches the misuse of ports by certain types of applications.
- Response Body Java Applet—Matches Java applets in an HTTP connection.
- Response Header Status Line—Applies a regular expression to match the content of the status line in the header.

### Navigation Path

From the Add or Edit Class Maps dialog boxes for the HTTP (IOS) class, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies](#), on page 945.

**Table 278: HTTP (IOS) Class Add or Edit Match Criterion Dialog Boxes**

| Element                                                                                                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion                                                                                                                                                  | Specifies which criterion of HTTP traffic to match. The criteria are described above.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Type                                                                                                                                                       | Specifies that the map includes traffic that matches the criterion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Variable Fields</b><br>The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Less Than Length                                                                                                                                           | The minimum length in bytes of the evaluated field. The criterion matches if the length is less than the specified number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Greater Than Length                                                                                                                                        | The maximum length in bytes of the evaluated field. The criterion matches if the length is greater than the specified number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Header Option                                                                                                                                              | The type of header record. If you do not select a record type, the count or expression is applied to all records in the header. If you select a record type, those selections are applied only to the records of the selected type. If you select content type or transfer encoding, you can make additional selections related to those types.                                                                                                                                                                                                                                                                                                 |
| Request Method                                                                                                                                             | The request method you want to match.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Value (Content Type)                                                                                                                                       | If you select content-type in the Header Option field, you can select these types: <ul style="list-style-type: none"> <li>• Mismatch—Verifies the content-type of the response message against the accept field value of the request message.</li> <li>• Unknown—The content type is not known. Select Unknown when you want to evaluate the item against all known MIME types.</li> <li>• Violation—The content-type definition and the content type of the actual body do not match.</li> </ul>                                                                                                                                               |
| Encoding Type                                                                                                                                              | If you select transfer encoding in the Header Option field, you can select these types: <ul style="list-style-type: none"> <li>• All—All of the transfer encoding types.</li> <li>• Chunked—The message body is transferred as a series of chunks; each chunk contains its own size indicator.</li> <li>• Compress—The message body is transferred using UNIX file compression.</li> <li>• Deflate—The message body is transferred using zlib format (RFC 1950) and deflate compression (RFC 1951).</li> <li>• GZIP—The message body is transferred using GNU zip (RFC 1952).</li> <li>• Identity—No transfer encoding is performed.</li> </ul> |

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Greater Than Count | The maximum number of records allowed in the header. If you select a specific header option, the count applies to those types of records. If you do not select a specific header option, the count applies to the total number of records in the header without regard to type.                                                                                                                             |
| Regular Expression | The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.                                                                                                                                           |
| Port Misuse        | The type of request port misuse you want to match. Your options are: <ul style="list-style-type: none"> <li>• Any—Any of the listed types of misuse.</li> <li>• IM—Instant messaging protocol applications subject to inspection.</li> <li>• P2P—Peer-to-peer protocol applications subject to inspection.</li> <li>• Tunneling—Tunneling applications subject to inspection: HTTPPort/HTTPHost.</li> </ul> |

## IMAP and POP3 Class Maps Add or Edit Match Criterion Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the Internet Message Access Protocol (IMAP) and Post Office Protocol 3 (POP3) classes used with zone-based firewall policies to define a match criterion and value for the class map.

You can select the following criteria to identify matching traffic:

- Invalid Command—Matches commands that are not valid on a POP3 server or IMAP connection.
- Login Clear Text—Matches non-secure logins, where the password is being provided in clear text.

### Navigation Path

From the Add or Edit Class Maps dialog boxes for the IMAP or POP3 classes, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies](#), on page 945.

## SIP (IOS) Class Add or Edit Match Criterion Dialog Boxes

**Note** From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Use the Add or Edit Match Criterion dialog boxes for the SIP (IOS) class used with zone-based firewall policies to define a match criterion and value for the class map.

The fields on this dialog box change based on the criterion you select.

### Navigation Path

From the Add or Edit Class Maps dialog boxes for the SIP (IOS) class, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies](#), on page 945.

### Field Reference

**Table 279: SIP (IOS) Class Add or Edit Match Criterion Dialog Boxes**

| Element                                                                                                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion                                                                                                                                                  | Specifies which criterion of traffic to match. You can select from the following: <ul style="list-style-type: none"> <li>• Protocol Violation—Matches traffic that violates the protocol.</li> <li>• Request/Response Header Options—Matches a regular expression against the selected request or response header field.</li> <li>• Request Options—Matches the request method or matches a regular expression against the selected request header field.</li> <li>• Response Options—Matches a regular expression against the selected response header field or status message.</li> </ul> |
| Type                                                                                                                                                       | Specifies that the map includes traffic that matches the criterion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Variable Fields</b><br>The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Header                                                                                                                                                     | The type of header in the request or response message. The regular expression is matched against the content of headers of the selected type.                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Method             | <p>The request method you want to inspect:</p> <ul style="list-style-type: none"> <li>• ack—Acknowledges that the previous message is valid and accepted.</li> <li>• bye—Signifies the intention to terminate a call.</li> <li>• cancel—Terminates any pending request.</li> <li>• info—Communicates mid-session signaling information along the signaling path for the call.</li> <li>• invite—Sets up a call.</li> <li>• message—Sends an instant message.</li> <li>• notify—Informs subscribers of state changes.</li> <li>• options—Queries the capabilities of another user agent or a proxy server.</li> <li>• prack—Provides reliable transfer of provisional response messages.</li> <li>• refer—Indicates that the recipient should contact a third party using the contact information provided in the request.</li> <li>• register—Includes a contact address to which SIP requests for the address-of-record should be forwarded.</li> <li>• subscribe—Requests notification of an event or set of events at a later time.</li> <li>• update—Permits a client to update parameters of a session but has no impact on the state of a dialog.</li> </ul> |
| Status             | The regular expression is matched against the status line in the response.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Regular Expression | The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## SMTP Class Maps Add or Edit Match Criterion Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the SMTP classes used with zone-based firewall policies to define a match criterion and value for the class map.

**Tip** Only the Data Length criterion is available for routers running Cisco IOS Software lower than 12.4(20)T.

The fields on this dialog box change based on the criterion you select. You can use the following criteria:

- Data Length—Specifies that the data length of the traffic is greater than the specified number. You can match the data length of the traffic to determine if the data transferred in an SMTP connection exceeds the specified length in bytes. By default, inspection keeps data length below 20.
- Body Regular Expression—Applies a regular expression to match the content types and content encoding types for text and HTML in the body of an e-mail message. Only text or HTML that uses 7-bit or 8-bit

encoding is checked. The regular expression cannot be scanned in messages that use another encoding type (such as base64 or zip files).

- **Command Line Length**—Specifies that the length of the ESMTP command line not be greater than the specified number. Use this to thwart Denial of Service (DoS) attacks.
- **Command Verb**—Limits inspection to the selected SMTP or ESMTP command. If you configure inspection for SMTP, all commands are inspected unless you limit them.
- **Header Length**—Specifies that the length of the SMTP header is greater than the specified number. Use this to thwart DoS attacks by limiting the possible size of the header.
- **Header Regular Expression**—Applies a regular expression to match the content of the header of an e-mail message. For example, you can use this to test for particular patterns in the subject, from, or to fields.
- **Mime Content-Type Regular Expression**—Applies a regular expression to match the Multipurpose Internet Message Exchange (MIME) content type of an e-mail attachment. Use this to prevent the transmission of undesired types of attachments.
- **Mime Encoding**—Specifies the MIME encoding type for e-mail attachments that you want to inspect. You can use this to identify unknown or non-standard encodings to restrict their transmission.
- **Recipient Address**—Applies a regular expression to match the recipient of an e-mail message in the SMTP RCPT command. Use this to search for a non-existent recipient, which might help you identify the source of spam.
- **Recipient Count**—Specifies that the number of recipients for an e-mail message cannot be greater than the specified number. Use this to prevent spammers from sending e-mails to a large number of users.
- **Recipient Invalid Count**—Specifies that the number of invalid recipients for an e-mail message cannot be greater than the specified number. Use this prevent spammers from sending e-mails to a large number common names, where they are fishing for real addresses. SMTP typically replies with a “no such address” message when an address is invalid; by putting a limit on the number of invalid addresses, you can prevent these replies to spammers.
- **Reply EHLO**—Specifies the service extension parameter in an EHLO server reply. Use this to prevent a client from using a particular service extension.
- **Sender Address**—Applies a regular expression to match the sender of an e-mail message. Use this to block specific senders, such as known spammers, from sending e-mail messages through the device.

### Navigation Path

From the Add or Edit Class Maps dialog boxes for SMTP classes, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies](#), on page 945.

|----------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion                                                                                                                        | Specifies which criterion of SMTP traffic to match. The criteria are described above.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Type                                                                                                                             | Specifies that the map includes traffic that matches the criterion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Variable Fields</b>                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Greater Than Length                                                                                                              | The maximum length in bytes of the evaluated field. The criterion matches if the length is greater than the specified number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Greater Than Count                                                                                                               | The maximum number of recipients or invalid recipients allowed in the e-mail message. The criterion matches if the number is greater than the specified number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Verb Option<br>User Defined Format<br>(For the Command Verb criterion.)                                                          | The SMTP or ESMTP command that you want to inspect. If you select User Defined, you must enter the text string that corresponds to a word in the body of the e-mail message. The word cannot include spaces or special characters; only alphanumeric characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Service Extension Parameter<br>User Defined Format<br>(For the Reply EHLO criterion.)                                            | The service extension parameter of an EHLO server reply that you want to inspect. Select one of the well-known parameters, or select User Defined to specify a private extension in the User Defined Format field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Encoding Format<br>User Defined Format                                                                                           | The MIME encoding format for which you want to test. Encoding types are: <ul style="list-style-type: none"> <li>• 7-bit—ASCII encoding.</li> <li>• 8-bit—Used for the exchange of e-mail messages containing octets outside the 7-bit ASCII range.</li> <li>• base64—Encodes binary data by treating it numerically and translating it into a base 64 representation.</li> <li>• quoted-printable—Encoding that uses printable characters to transmit 8-bit data over a 7-bit data path.</li> <li>• binary—Encodes using only 0 and 1.</li> <li>• unknown—Encoding type is not known.</li> <li>• x-uuencode—Nonstandard encoding.</li> <li>• user defined—An encoding type you define. If you select User Defined, you must enter the text string that defines the encoding type you are looking for.</li> </ul> |

| Element            | Description                                                                                                                                                                                                                                                       |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Regular Expression | The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object. |

## Sun RPC Class Maps Add or Edit Match Criterion Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the Sun Remote Procedure Call (RPC) classes used with zone-based firewall policies to define a match criterion and value for the class map. You can enter the RPC protocol number that you want to match. See the Sun RPC documentation for information about protocol numbers.

### Navigation Path

From the Add or Edit Class Maps dialog boxes for Sun RPC classes, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies](#), on page 945.

## Local Web Filter Class Add or Edit Match Criterion Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the Local web filter class to define a match criterion and value for the class map.

### Navigation Path

From the Add or Edit Class Maps dialog boxes for the Local web filter class, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies](#), on page 945.

## Field Reference

*Table 281: Local Web Filter Class Add or Edit Match Criterion Dialog Boxes*

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion               | Specifies which criterion of traffic to match. You can select from the following: <ul style="list-style-type: none"> <li>• Server Domain—Matches traffic based on the name of the server. The URLF Glob parameter map you select should specify server domain names such as *.cisco.com or www.cisco.com.</li> <li>• URL Keyword—Matches traffic based on keywords in the URLs. A key word is any complete string that occurs between / characters in a URL. For example, in the URL segment www.cisco.com/en/US, en and US are examples of keywords.</li> </ul> |
| Type                    | Specifies that the map includes traffic that matches the criterion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| URLF Glob Parameter Map | The URLF Glob parameter map object that defines the URL patterns that you want to match. Ensure that the object you select has the appropriate content for the type of matching you selected.<br><br>Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new object.                                                                                                                                                                                                                      |

## N2H2 and Websense Class Add or Edit Match Criterion Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the N2H2 (SmartFilter) and Websense web filter classes to define a match criterion and value for the class map. The only match criterion available is to match any response from the SmartFilter or Websense server.

### Navigation Path

From the Add or Edit Class Maps dialog boxes for the N2H2 or Websense web filter class, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies](#), on page 945.

## Configuring Inspect Parameter Maps

Use the Add and Edit Inspect Parameter Map dialog boxes to define a parameter map for inspection for zone-based firewall policies on routers. If you configure the action of a zone-based firewall policy rule as Inspect or Content Filter, you can select an inspect parameter map to define connection, timeout, and other settings for the inspection action. If you do not select an inspect parameter map for a zone-based firewall rule, the system uses default values for these settings.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Parameter Maps > Inspect > Inspect Parameters** in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

### Field Reference

*Table 282: Add or Edit Inspect Parameter Map Dialog Boxes*

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                                      | The name of the policy object. A maximum of 40 characters is allowed.                                                                                                                                                                                                                                                                      |
| Description                               | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                                                                                                |
| DNS Timeout                               | The length of time, in seconds, for which a DNS lookup session is managed while there is no activity.                                                                                                                                                                                                                                      |
| ICMP Timeout                              | The length of time, in seconds, for which an inactive ICMP (Internet Control Message Protocol) session is maintained.                                                                                                                                                                                                                      |
| Max Incomplete Low<br>Max Incomplete High | The number of existing half-open sessions that will cause the software to start (at the high threshold) and stop (at the low threshold) deleting half-open sessions.<br><br>Ensure that you enter a lower number in the Low field than you enter in the High field, for example, 400 and 500. The default is unlimited half-open sessions. |
| One Minute Low<br>One Minute High         | The number of new unestablished sessions that causes the system to start and stop deleting half-open sessions. Ensure that you enter a lower number in the Low field than you enter in the High field. The default is unlimited.                                                                                                           |
| Max Sessions                              | The maximum number of inspection sessions on a zone pair, for example, 200. The default is unlimited.                                                                                                                                                                                                                                      |
| TCP FINWAIT Timeout                       | How long to maintain TCP session state information after the firewall detects a FIN-exchange, in seconds. The FIN-exchange occurs when the TCP session is ready to close.                                                                                                                                                                  |
| TCP SYNWAIT Timeout                       | How long to wait for a TCP session to reach the established state before dropping the session, in seconds.                                                                                                                                                                                                                                 |
| TCP Idle Timeout                          | How long to maintain a TCP session while there is no activity in the session, in seconds.                                                                                                                                                                                                                                                  |

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| TCP Max Incomplete Hosts                              | The threshold and blocking time (in minutes) for TCP host-specific denial-of-service (DoS) detection and prevention.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| TCP Max Incomplete Block Time                         | <p>The maximum incomplete hosts is the number of half-open TCP sessions with the same host destination address that can simultaneously exist before the software starts deleting half-open sessions to that host. An unusually high number of half-open sessions with the same destination host address could indicate that a DoS attack is being launched against the host.</p> <p>When the threshold is exceeded, half-open sessions are dropped based on the maximum incomplete block time:</p> <ul style="list-style-type: none"> <li>• If the block time is 0, the software deletes the oldest existing half-open session for the host for every new connection request to the host. This ensures that the number of half-open sessions to a given host never exceeds the threshold.</li> <li>• If the block time is greater than 0, the software deletes all existing half-open sessions for the host and then blocks all new connection requests to the host. The software continues to block all new connection requests until the block time expires.</li> </ul> <p>The software sends syslog messages whenever the specified threshold is exceeded and when blocking of connection initiations to a host starts or ends.</p> |
| UDP Idle Timeout                                      | <p>How long to maintain a UDP session while there is no activity in the session, in seconds.</p> <p>When the software detects a valid UDP packet, the software establishes state information for a new UDP session. Because UDP is a connectionless service, there are no actual sessions, so the software approximates sessions by examining the information in the packet and determining if the packet is similar to other UDP packets (for example, it has similar source or destination addresses) and if the packet was detected soon after another similar UDP packet.</p> <p>If the software detects no UDP packets for the UDP session for the period of time defined by the UDP idle timeout, the software will not continue to manage state information for the session.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Enable Alert                                          | Whether to generate stateful packet inspection alert messages on the console.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Enable Audit Trail                                    | Whether audit trail messages are logged to the syslog server or router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Category                                              | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Configuring Protocol Info Parameter Maps

Use the Add and Edit Protocol Info Parameter Map dialog boxes to define a parameter map for the inspection of Instant Messaging (IM) applications or the Stun-ice protocol for zone-based firewall policies on routers. If you configure the action of a zone-based firewall policy rule as Inspect, you must select a protocol info parameter map when you configure any of these applications: AOL, ICQ, MSN Messenger, Windows Messenger, Yahoo Messenger, Stun-ice. The protocol info parameter map defines the DNS servers that interact with these applications, which helps the instant messenger application engine to recognize the instant messenger traffic and to enforce the configured policy for that instant messenger application.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Parameter Maps > Inspect > Protocol Info Parameters** in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

| Allow Value Override per Device Overrides Edit button | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244. If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## Add or Edit DNS Server for Protocol Info Parameters Dialog Box

Use the Add or Edit DNS Server dialog box to identify DNS servers for which traffic will be permitted (and inspected) or denied. These servers are defined in a Protocol Info parameter map for use with the inspection of protocols that require them in a zone-based firewall policy.

You can identify a server using any of these types:

- **Server Name**—The name of the DNS server. You can use an asterisk (\*) as a wildcard character to match one or more characters. For example, if you want to identify all DNS servers on the cisco.com domain, you can specify \*.cisco.com.
- **IP Address**—The IP address of a single DNS server.
- **IP Address Range**—A range of IP addresses identifying any DNS server within the start and end addresses.

### Navigation Path

From the Add or Edit Protocol Info Parameter Map dialog boxes, click the **Add** button beneath the server table, or select a server and click the **Edit** button. See [Configuring Protocol Info Parameter Maps](#), on page 961.

## Configuring Policy Maps for Zone-Based Firewall Policies

Use the Add and Edit Policy Map dialog boxes for zone-based firewall policies to define the match criterion and values for an inspection map used in a zone-based firewall policy for a Cisco IOS router. You can create policy inspection maps for H.323 (IOS), HTTP (Zone based IOS), IM (Zone based IOS), IMAP, P2P, POP3, SIP (IOS), SMTP, and Sun RPC inspection, and the name of the dialog box indicates the type of map you are creating.

When defining the inspection map, you select class maps of the same type and define the action to take for matching traffic. You can configure the required class maps before creating the policy maps or while you are creating them.

### Navigation Path

Select **Manage > Policy Objects**, then any of the following items in the **Maps > Policy Maps > Inspect** folder in the table of contents: H.323 (IOS), HTTP (Zone based IOS), IM (Zone based IOS), IMAP, P2P, POP3, SIP (IOS), SMTP, and Sun RPC. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                                                  | The name of the policy object. A maximum of 40 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Description                                           | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Match All table                                       | <p>The Match All table lists class maps included in the policy map, and the action to take for traffic that matches the class. For traffic to match this class, all criteria defined in the selected class maps must be met.</p> <ul style="list-style-type: none"> <li>To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see <a href="#">Add or Edit Match Condition and Action Dialog Boxes for Zone-Based Firewall and Web Filter Policies</a>, on page 963).</li> <li>To edit a criterion, select it and click the Edit button.</li> <li>To delete a criterion, select it and click the Delete button.</li> </ul> |
| Category                                              | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Allow Value Override per Device Overrides Edit button | <p>Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a>, on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a>, on page 244.</p> <p>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p>                                                                                                                                                                |

## Add or Edit Match Condition and Action Dialog Boxes for Zone-Based Firewall and Web Filter Policies

Use the Add or Edit Match Condition and Action dialog boxes for zone-based firewall and web filter policies to select the class maps for inspection and to define the action to take for traffic that matches the class. This dialog box is used for the following types of policy maps: H.323 (IOS), HTTP (Zone based IOS), IM (Zone based IOS), IMAP, P2P, POP3, SIP (IOS), SMTP, Sun RPC, Web Filter.

The fields on this dialog box differ slightly depending on the type of policy map you are defining.

### Navigation Path

From the Add or Edit Policy Maps dialog boxes for Zone-Based Firewall Policies, right-click inside the match table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Policy Maps for Zone-Based Firewall Policies](#), on page 962.

| Match Type                                               | Indicates that you are selecting a class map. You must define class maps when creating policy maps for zone-based firewall policies.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Class Map<br>P2P, IM, and Web Filter<br>class map types. | The name of the class map for the type of policy map you are creating. Click <b>Select</b> to select the map from a list or to create a new class map object.<br><br>For P2P, IM, and Web Filter policy maps, you must also select the type of policy map you are creating. For example, in a P2P map you must select between eDonkey, FastTrack, Gnutella, and Kazaa2. In an IM (Zone Based IOS) map, you must select between AOL, MSN Messenger, Yahoo Messenger, Windows Messenger, and ICQ. In a Web Filter map, you must select between Local, N2H2, WebSense, and Trend. |
| Action                                                   | The action you want the device to take for traffic that matches the selected class.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

# Configuring Content Filtering Maps for Zone-based Firewall Policies

When you configure zone-based firewall policies for a router, you can define rules to filter Web content by choosing Content Filter as the Action for the rule.

To filter Web content, you must configure certain map objects, which you can do from the policy object selector dialog box while defining the rule, or at any time in the Policy Object Manager window (select **Manage > Policy Objects**).

The type of maps required depends on the technique you are using to filter content, and on the Cisco IOS software version you are using. You can filter content based on URL lists defined locally on the device, or you can use external filtering servers such as SmartFilter (N2H2), Websense, or Trend Micro.

**Tip** If you use an external server, you must have set up and configured the server appropriately based on the documentation for the type of server you select. If you use Trend Micro servers, you must specify the server details, and register the product and download certificates, on the Content Filtering tab of the Zone Based Firewall page (select Firewall > Settings > Zone Based Firewall). See [Zone-based Firewall Rules Page](#) , on page 987.

The following are requirements for the map objects used with zone-based content filtering:

- For devices running releases below 12.4(20)T, you must create a URL Filter parameter map. In the Policy Object Manager, select **Maps > Parameter Maps > Web Filter > URL Filter**, and review the detailed usage information in [Configuring URL Filter Parameter Maps , on page 971](#).
  - To perform local filtering on the router using lists of allowed (part of allow list) and denied (part of block list) hosts, create the lists on the Local Filtering tab. Any Web access request is first compared to these lists before the request is sent on to an external filtering server (if you have configured one). These lists contain either complete domain names (such as www.cisco.com), or partial names (such as cisco.com), but they do not include paths or page names, and you cannot use wildcards.
  - To use a SmartFilter (N2H2) or Websense server, configure the type of server you are using and its address information on the External Filter tab. You can also configure other settings that control communication with the server. You cannot configure a Trend Micro server using the URL Filter parameter map.
- For devices running release 12.4(20)T and later, the preferred approach is to use a Web Filter policy map. Although Web Filter policy maps are more complex, they provide added flexibility, and they let you access Trend Micro filtering servers. In the Policy Object Manager, select **Maps > Policy Maps > Web Filter > Web Filter**, and review the detailed usage information in [Configuring Web Filter Maps , on page 976](#).

A Web Filter policy map incorporates other types of maps. To create the policy map, you will need one or more of these other types of maps:

- **Parameter maps** – On the Parameters tab of the Add and Edit Web Filter Map dialog boxes, you can select parameter maps for the various types of Web filtering if you do not want to use the default settings. If you are using SmartFilter (N2H2) or Websense, you need to select a parameter map because the map identifies those servers. For Local and Trend Micro filtering, parameter maps configure some general settings, the most interesting of which is whether to display a message or Web page when a URL is blocked. In the Policy Object Manager, you can find parameter maps for Local, N2H2, Trend, and Websense in the **Maps > Parameter Maps > Web Filter** folder. For detailed usage information, see [Configuring Local Web Filter Parameter Maps , on page 966](#), [Configuring N2H2 or WebSense Parameter Maps , on page 968](#), or [Configuring Trend Parameter Maps , on page 970](#).

---

**Note** You configure Trend Micro server information on the Content Filtering tab of the Zone Based Firewall page (select Firewall > Settings > Zone Based Firewall). See [Zone-based Firewall Rules Page , on page 987](#).

---

- **Class maps for match conditions** – These class maps define the type of traffic you want to target and specify the action to be taken. You select a type of filtering (Local, SmartFilter/N2H2, Websense, or Trend Micro), specify the class map that identifies the targeted traffic, and choose an action (such as Allow, Reset, etc.) to be taken for that traffic. In the Policy Object Manager, you can find class maps for Local, N2H2, Trend, and Websense in the **Maps > Class Maps > Web Filter** folder.

These class-map configurations depend on the type of filtering:

**Local Filtering** – The Local WebFilter class map is a list of one or more URLF Glob parameter maps that specify either domain names or URL keywords that you want to target. A URL keyword is any text string delineated by forward-slash (/) characters in a URL. These class maps help you define allowed (part of allow

list) and denied (part of block list) URL lists for a WebFilter policy—create separate maps for each list. For detailed usage information, see [Configuring Class Maps for Zone-Based Firewall Policies](#), on page 945, [Local Web Filter Class Add or Edit Match Criterion Dialog Boxes](#), on page 957, and [Configuring URLF Glob Parameter Maps](#), on page 974.

**SmartFilter (N2H2) or Websense Filtering**—The class maps for N2H2 and Websense define any server response as the matching criterion. For detailed usage information, see [Configuring Class Maps for Zone-Based Firewall Policies](#), on page 945.

**Trend Micro Filtering** – The Trend class map lets you select various Productivity Categories and Security Ratings, as defined by Trend Micro, that you want to target. For detailed usage information, see [Configuring Class Maps for Zone-Based Firewall Policies](#), on page 945.

Besides the maps used to define content filtering, you can also configure the following maps for content filter rules:

- **Inspect Parameters maps** – Zone-based firewall inspection includes several general settings, all of which have default values that are appropriate for most networks. If you want to adjust any of these settings, you can create an Inspect Parameters map. In the Policy Object Manager, select **Maps > Parameter Maps > Inspect > Inspect Parameters**, and review the detailed usage information in [Configuring Inspect Parameter Maps](#), on page 958.
- **HTTP policy map** – If you want to use deep inspection on the individual HTTP packets in addition to Web filtering, you can configure an HTTP policy map by clicking **Configure** next to the Protocol field in the Action section of the [Adding and Editing Zone-based Firewall Rules](#), on page 990. The HTTP policy map incorporates HTTP class maps that define the type of traffic you want to match and then defines the action to take. For example, you can target traffic that includes Java applets. In the Policy Object Manager, select **Maps > Policy Maps > Inspect > HTTP (Zone Based IOS)**, and review the detailed usage information in [Configuring Policy Maps for Zone-Based Firewall Policies](#), on page 962, [HTTP \(IOS\) Class Add or Edit Match Criterion Dialog Boxes](#), on page 950, and [Configuring Class Maps for Zone-Based Firewall Policies](#), on page 945.

## Configuring Local Web Filter Parameter Maps

Use the Add and Edit Local Parameter Map dialog boxes to define a parameter map for local web filtering for zone-based firewall policies on routers. If you configure the action of a zone-based firewall policy rule as Content Filter, you can select a Web Filter policy map that incorporates a Local web filter parameter map (when you select Local for the parameter type on the Parameter tab). For more information about Web Filter policy maps, see [Configuring Web Filter Maps](#), on page 976.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Parameter Maps > Web Filter > Local** in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

| Name                                                  | The name of the policy object. A maximum of 40 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Description                                           | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Enable Alert                                          | Whether to generate stateful packet inspection alert messages on the console.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Enable Allow Mode                                     | Whether to allow or block URL requests when the URL filtering process does not have connectivity to a URL filtering database. When allow-mode is on, all unmatched URL requests are allowed; when off, all unmatched URL requests are blocked.                                                                                                                                                                                                                                                  |
| Block Page                                            | The web page you want to present to the user if the user attempts to access a page that you block. You can select from the following: <ul style="list-style-type: none"> <li>• None—The user is not presented with any information.</li> <li>• Message—The user is presented with the text message you enter in the edit box.</li> <li>• Redirect URL—The user is redirected to the URL you enter in the edit box.</li> </ul>                                                                   |
| Category                                              | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                     |
| Allow Value Override per Device Overrides Edit button | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.<br><br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## Configuring N2H2 or WebSense Parameter Maps

Use the Add and Edit N2H2 or Websense Parameter Map dialog boxes to define a parameter map for Smartfilter (N2H2) or Websense web filtering for zone-based firewall policies on routers. If you configure the action of a zone-based firewall policy rule as Content Filter, you can select a Web Filter policy map that incorporates an N2H2 or Websense web filter parameter map (when you select N2H2 or Websense for the parameter type on the Parameter tab). For more information about Web Filter policy maps, see [Configuring Web Filter Maps](#), on page 976.

### Navigation Path

Select **Manage > Policy Objects**, then select N2H2 or WebSense from the **Maps > Parameter Maps > Web Filter** folder in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

*Table 287: Add or Edit N2H2 or WebSense Parameter Map Dialog Boxes*

| Element                    | Description                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                       | The name of the policy object. A maximum of 40 characters is allowed.                                                                                                                                                                                                                                                                                                                                              |
| Description                | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                                                                                                                                                                        |
| URL Filtering Server Table | The list of URL filtering servers and their attributes. <ul style="list-style-type: none"> <li>• To add servers, click the Add button and fill in the Add External Filter dialog box (see <a href="#">Add or Edit External Filter Dialog Box</a>, on page 970).</li> <li>• To edit a server, select it and click the Edit button.</li> <li>• To delete a server, select it and click the Delete button.</li> </ul> |
| Enable Alert               | Whether to generate stateful packet inspection alert messages on the console.                                                                                                                                                                                                                                                                                                                                      |
| Enable Allow Mode          | Whether to allow or block URL requests when the URL filtering process does not have connectivity to a URL filtering database. When allow-mode is on, all unmatched URL requests are allowed; when off, all unmatched URL requests are blocked.                                                                                                                                                                     |

| Element                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Block Page                                                  | <p>The web page you want to present to the user if the user attempts to access a page that you block. You can select from the following:</p> <ul style="list-style-type: none"> <li>• None—The user is not presented with any information.</li> <li>• Message—The user is presented with the text message you enter in the edit box.</li> <li>• Redirect URL—The user is redirected to the URL you enter in the edit box.</li> </ul>                                                                 |
| Source Interface                                            | The interface whose IP address should be used as the source IP address when a TCP connection is established between the system and the URL filtering server.                                                                                                                                                                                                                                                                                                                                         |
| Maximum Cache Entries                                       | The maximum number of entries to store in the categorization cache. The default is 5000.                                                                                                                                                                                                                                                                                                                                                                                                             |
| Cache Life Time                                             | How long, in hours, an entry remains in the cache table. The default is 24.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Maximum Requests                                            | The maximum number of pending requests. The range is from 1 to 2147483647. The default is 1000.                                                                                                                                                                                                                                                                                                                                                                                                      |
| Maximum Responses                                           | The maximum number of HTTP responses that can be buffered. The range is from 0 and 20000. The default is 200.                                                                                                                                                                                                                                                                                                                                                                                        |
| Truncate Hostname<br>Truncate Script Parameters             | <p>Whether to truncate the URLs:</p> <ul style="list-style-type: none"> <li>• If you do not select an option, URLs are not truncated.</li> <li>• If you select Hostname, URLs are truncated at the end of the domain name.</li> <li>• If you select Script Parameters, URLs are truncated at the left-most question mark in the URL.</li> </ul> <p><b>Tip</b> Although you can select both options, it is illogical to do so.</p>                                                                    |
| Enable Server Log                                           | Whether to send information about HTTP requests to the URL filtering server's log server. The information includes the URL, the hostname, the source IP address, and the destination IP address.                                                                                                                                                                                                                                                                                                     |
| Category                                                    | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239F.                                                                                                                                                                                                                                                                                                                                         |

## Add or Edit External Filter Dialog Box

Use the Add or Edit External Filter dialog box to add a URL filtering server to an N2H2, Websense, or URL Filter parameter map policy object.

### Navigation Path

Click the **Add** button beneath the server table, or select a server and click the **Edit** button, from any of the following dialog boxes:

- Add or Edit N2H2 or WebSense Parameter Map dialog boxes. See [Configuring N2H2 or WebSense Parameter Maps](#) , on page 968.
- Add or Edit URL Filter Parameter Map dialog boxes. See [Configuring URL Filter Parameter Maps](#) , on page 971.

### Field Reference

*Table 288: Add or Edit External Filter Dialog Box*

| Element              | Description                                                                                                                               |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Server               | The fully-qualified domain name or IP address of the URL filtering server.                                                                |
| Port                 | The port that is listening for requests.                                                                                                  |
| Retransmission Count | The number of times the router retransmits the lookup request when a response is not received from the server. The range is from 1 to 10. |
| Timeout              | The number of seconds that the router waits for a response from the server. The range is from 1 to 300.                                   |
| Outside              | Whether the server is outside the network.                                                                                                |

## Configuring Trend Parameter Maps

Use the Add and Edit Trend Parameter Map dialog boxes to define a parameter map for Trend Micro web filtering for zone-based firewall policies on routers. If you configure the action of a zone-based firewall policy rule as Content Filter, you can select a Web Filter policy map that incorporates a Trend web filter parameter map (when you select Trend for the parameter type on the Parameter tab). For more information about Web Filter policy maps, see [Configuring Web Filter Maps](#) , on page 976.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Parameter Maps > Web Filter > Trend** in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

## Configuring URL Filter Parameter Maps

Use the Add and Edit URL Filter Parameter Map dialog boxes to define the parameters and match criterion and values for an inspection map used in a zone-based firewall policy for a router.

If you configure the action of a zone-based firewall policy rule as Content Filter, you can select a URL Filter parameter map to define web filtering parameters and match criteria. However, if the router is running Cisco IOS Software release 12.4(20)T or later, the recommended approach is to configure a Web Filter policy map along with parameter and class maps for the appropriate server type (local, N2H2, Trend, or Websense). For more information, see [Configuring Web Filter Maps](#), on page 976.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Parameter Maps > Web Filter > URL Filter** in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

| The fields on this tab define the properties for local URL filtering. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Permitlisted and Blocklisted Domains tables                           | <p>These tables define the domain names for which the software will not contact the external URL filtering server. Domain names on the allowed list are always allowed. Domain names on the blocked list are always blocked. Use these lists to identify entire domains that you want to allow without restriction (such as your company's web site) or block completely (such as pornography sites).</p> <p>Domain names can be complete (including the host name, such as www.cisco.com), or partial (such as cisco.com). For partial names, all web site hosts on that domain are either permitted or denied. You can also enter host IP addresses.</p> <ul style="list-style-type: none"> <li>• To add a domain name, click the Add button and fill in the Add Server dialog box (see <a href="#">Add or Edit URL Domain Name Dialog Box for URL Filter Parameters</a>, on page 974).</li> <li>• To edit a domain name, select it and click the Edit button.</li> <li>• To delete a domain name, select it and click the Delete button.</li> </ul> |
| Enable Alert                                                          | Whether to generate stateful packet inspection alert messages on the console.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## Add or Edit URL Domain Name Dialog Box for URL Filter Parameters

Use the Add URL Domain Name dialog box to add web site domain names to the allow lists (allowed) or block lists (not allowed).

Domain names can be complete (including the host name, such as www.cisco.com), or partial (such as cisco.com). For partial names, all web site hosts on that domain are either permitted or denied. You can also enter host IP addresses.

### Navigation Path

From the Add or Edit URL Filter Parameter Map dialog boxes, click the **Add** button beneath the allow list or block list tables, or select a name and click the **Edit** button. See [Configuring URL Filter Parameter Maps](#) , on page 971.

## Configuring URLF Glob Parameter Maps

Use the Add and Edit URLF Glob Parameter Map dialog boxes to define a parameter map for the inspection of URLs in a Local web filter class map.

A single URLF Glob should contain only segments of URLs that you want to block or allow. Your goal is to create class maps of allowed or block listed URLs. You can then define Local web filter policy maps to allow or block the identified URLs.

A single URLF Glob must also be limited to one of these types of URL segments:

- Strings that appear in the server name of a URL, which includes the name of the server and the domain name of the network. For example, www.cisco.com.
- Strings that appear in URL keywords, which are the strings that appear between / characters in a URL, or which are the file names. For example, in the URL segment www.cisco.com/en/US/, both en and US are keywords. The file name in a URL, such as index.html, is also considered a keyword.

You cannot use the characters /, {, }, and ? in a URLF glob.

To match a server name or URL keyword, the string in the URL must match exactly the string included in the URLF glob unless you use wildcard metacharacters to specify a variable string pattern. You can use the following metacharacters for pattern matching for either server names or URL keywords:

- \* (Asterisk). Matches any sequence of zero or more characters. For example, \*.edu matches all servers in the education domain, and you could use hack\* to block www.example.com/hacksite/123.html.

- `[abc]` (Character class). Matches any character in the brackets. The character matching is case sensitive. For example, `[abc]` matches a, b, or c, but not A, B, or C. Thus, you could use `www.[ey]xample.com` to block both `www.example.com` and `www.yxample.com`.
- `[a-c]` (Character range class). Matches any character in the range. The character matching is case sensitive. `[a-z]` matches any lowercase letter. You can mix characters and ranges; for example, `[abcq-z]` matches a, b, c, q, r, s, t, u, v, w, x, y, z, and so does `[a-cq-z]`. The dash (-) character is literal only if it is the last or the first character within the brackets, `[abc-]` or `[-abc]`.
- `[0-9]` (Numerical range class). Matches any number in the brackets. For example `[0-9]` matches 0, 1, 2, 3, 4, 5, 6, 7, 8, or 9. Thus, you can use `www.example[0-9][0-9].com` to block `www.example01.com`, `www.example33.com`, and `www.example99.com` (and so forth).

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Parameter Maps > Web Filter > URLF Glob Parameters** in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

A maximum of 40 characters is allowed.                                                                                                                                                                                                                                                                                                     |
| Description | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                                                                                                                               |
| Value       | <p>The server domains or keywords for the URLs you are targeting. Enter only one type of glob: either all server domains, or all URL keywords, but not a mixture of both.</p> <p>If you include more than one entry, separate the entries with new lines. For example, the following entries identify all government or education web servers:</p> <pre>*.gov *.edu</pre> |
| Category    | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                               |

| Element                                   | Description                                                                                                                                                                                                                                                                 |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Allow Value Override per Device Overrides | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244. |
| Edit button                               | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                |

## Configuring Web Filter Maps

Use the Add and Edit Web Filter Map dialog boxes to define the parameters and match criterion and values for an inspection map used in a zone-based firewall policy for a router.

If you configure the action of a zone-based firewall policy rule as Content Filter, you can select a Web Filter policy map to define web filtering parameters and match criteria. You can select Web Filter policy maps only for routers running Cisco IOS Software release 12.4(20)T and later. If you are configuring zone-based firewalls for routers running Cisco IOS Software release 12.4(6)T up to 12.4(20)T, you must configure a URL Filter parameter map instead of a Web Filter policy map. For more information, see [Configuring URL Filter Parameter Maps](#) , on page 971.

You can configure a mix of local and server-based web filtering. To do this, you should select a parameter map appropriate for the type of server you are using, and for the match criteria, an appropriate mix of local and server class maps. Do not mix class and parameter maps for different types of servers.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Web Filter > Web Filter** from the Object Type selector. Right-click inside the table and select **New Object** or right-click a row and select **Edit Object**.

| Category                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                     |
| Allow Value Override per Device<br>Overrides<br>Edit button                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.<br><br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## Changing the Default Drop Behavior

By default, all traffic between zones is dropped unless explicitly allowed. However, you can change this default behavior, as described in this section.

Security Manager converts the parameters—including class, parameter, and policy maps—that you supply for zone-based firewall rules into a series of IOS commands that the router will recognize. These are the so-called "CLI" (command line interface) configuration commands, which you can preview in separate window by choosing Tools > Preview Configuration. See [Previewing Configurations](#), on page 422 for more information. In addition, the section, [Troubleshooting Zone-based Rules and Configurations](#), on page 983, discusses an example of zone-based firewall CLI commands.

For the purposes of this discussion, the most interesting of these commands is **policy-map**, which is used to apply your zone policy for each pair of zones. That is, for any given zone-pair, all rules defining traffic (classes) and actions are applied within one policy-map. Further, Security Manager appends the current **class-default** class to the end of each policy-map's class list to capture any packets not processed by a zone rule.

The default class-default is drop—appending this class to each policy-map is how the implicit dropping of traffic between zones is accomplished. However, as mentioned, you can change this default behavior for any

zone-pair. For example, you might elect to pass all unmatched traffic, or you might change the default to drop and log so you can determine what traffic is not being matched by your existing rules.

---

**Note** The only options for the default behavior are Drop, Drop and Log, Pass, and Pass and Log.

---

If you want the default policy to continue to drop packets, you do not have to do anything in Security Manager. This rule is generated automatically. If you do want to change the default behavior for a zone-pair, you must provide a **Permit any any IP** rule (that is, Match: Permit; Sources: any; Destinations: any; Services: IP in the [Adding and Editing Zone-based Firewall Rules](#) , on page 990), with **Drop and Log, Pass**, or **Pass and Log** as the chosen Action. You must also ensure that this rule appears last in the list of rules for a zone pair. Security Manager interprets this as the intended class-default rule.

If your zone-based rules table includes a large number of rules, it might be difficult to ensure that this rule comes after all other rules for a zone pair. Here are a couple of techniques you can use to alleviate this:

- Use sections to organize the table, with one section per zone-pair. This will make it easier for you to order the rules for a zone-pair, as well as ensuring that the class-default rule comes last. For more information on working with sections, see [Using Sections to Organize Rules Tables](#) , on page 616.
- Create a shared zone-based rules policy that includes the class-default rule in the Default scope, and inherit this rule in the device's local zone-based rule policy. For more information on inheritance and creating shared policies, see [Inheriting or Uninheriting Rules](#) , on page 211 and [Creating a New Shared Policy](#) , on page 219.

## Configuring Settings for Zone-based Firewall Rules

Use the Zone Based Firewall settings page to: identify unreferenced zones; specify a zone for VPN interfaces; enable or disable WAAS support; maintain Trend Micro server and certificate information; and specify global Log settings.

---

**Note** From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software.

---

### Related Topics

- [Zone Based Firewall Page](#) , on page 979
- [Understanding the Zone-based Firewall Rules](#) , on page 931

---

**Step 1** Access the [Zone Based Firewall Page](#) , on page 979 as follows:

- (Device view) Select an IOS device and then select **Firewall > Settings > Zone Based Firewall** from the Policy selector.
- (Policy view) Select **Firewall > Settings > Zone Based Firewall** from the Policy Type selector. Select an existing policy or create a new one.

- Step 2** (Optional) On the Zones tab: add, edit and delete unreferenced zones.
- The Zones tab lists all unreferenced zones defined on the device; that is, zones without any associated interfaces, rules or policies. Unreferenced zones are usually found and listed during device discovery, but you also can create named, “empty” zones here.
- Step 3** (Optional) On the VPN tab, supply the name of the zone specifically set up for VPN traffic.
- This zone ensures that dynamic VPN traffic can be processed by the zone-based firewall rules on this router. See [Using VPNs with Zone-based Firewall Policies](#) , on page 934 for more information.
- Step 4** (Optional) On the WAAS tab, select Enable WAAS to enable Wide Area Application Services interoperability.
- If this option is not enabled, packets being optimized by a WAAS device may be dropped because WAAS increases the TCP packet sequence number during the TCP handshake. This behavior may be viewed as a possible attack by the IOS device.
- Step 5** (Optional) On the Content Filter Settings tab, provide server settings for Trend Micro-based content filtering.
- To use Trend Micro-based content filtering, you must configure contact information for the Trend Micro server on this tab of the Zone Based Firewall page. This tab also provides links to Trend Micro registration and certificate download. You must have an active subscription with Trend Micro to utilize this form of content filtering, and you must download and install a valid subscription certificate on this IOS device.
- For more information, see [Zone Based Firewall Page - Content Filter Tab](#) , on page 981.
- Step 6** (Optional) On the Global Parameters (ASR) tab, you can configure global, logging-related settings specific to ASR devices:
- Log Dropped Packets – Select this option to log all packets dropped by the device; syslog logging must be enabled to view the information.
  - Log Flow export timeout rate – NetFlow logs are created after a flow either expires or is timed out, and it is important to put a time limit on how long a flow can be active before expiring. This value is maximum number of minutes a flow can remain active before it is expired. The value can be any integer from 1 to 3600; the default is 30.
  - Log Flow export destination IP – The IP address or host name of the NetFlow collector to which flow data is to be sent.
  - Log Flow export destination port – The UDP port monitored by the NetFlow collector for flow data.

---

## Zone Based Firewall Page

Use the Zone Based Firewall page to configure and identify unreferenced zones, specify a VPN zone, enable or disable WAAS support, maintain Trend Micro server and certificate information, and specify global Log settings on supported ASR devices.

The following tabs are described in the table on this page:

- **Zones**
- **VPN**
- **WAAS**

- **Global Parameters (ASR)**

The **Content Filtering** tab is detailed in [Zone Based Firewall Page - Content Filter Tab](#) , on page 981.

### Navigation Path

To access the Zone Based Firewall page, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > Zone Based Firewall** from the Policy selector.
- (Policy view) Select **Firewall > Settings > Zone Based Firewall** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and choose **Edit Firewall Settings > Zone Based Firewall**.

## Zone Based Firewall Page - Content Filter Tab

To use Trend Micro-based content filtering, you must configure contact information for the Trend Micro server on this tab of the Zone Based Firewall page. This tab also provides links to Trend Micro registration and certificate download. You must have an active subscription with Trend Micro to utilize this form of content filtering, and you must download and install a valid subscription certificate on this IOS device.

### Navigation Path

To access the Zone Based Firewall page, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > Zone Based Firewall** from the Device selector.
- (Policy view) Select **Firewall > Settings > Zone Based Firewall** from the Policy selector.
- (Map view) Right-click a device and choose **Edit Firewall Settings > Zone Based Firewall**.

|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Trend Micro Server Settings                   |                                                                                                                                                                        |
| Cache-entry-lifetime (hrs)                    | How long, in hours, a look-up request to the Trend Micro server remains in the router's local URL cache table. The allowed range is 0 to 120; the default value is 24. |
| Cache-size (KBytes)                           | The maximum amount of memory to be used by the router's local URL cache. The allowed range is 0 to 120,000 KB; the default value is 250.                               |
| Server                                        | The fully-qualified domain name or IP address of the Trend Micro URL filtering server.                                                                                 |
| HTTP Port                                     | The port the Trend Micro server is listening to for HTTP requests. The default is 80.                                                                                  |
| HTTPS Port                                    | The port the Trend Micro server is listening to for HTTPS requests. The default is 443.                                                                                |
| Retransmission Count                          | The number of times the router retransmits a look-up request when a response is not received from the server. The range is 1 to 10.                                    |
| Retransmission Timeout                        | The number of seconds that the router waits for a response from the server. The range is 1 to 300.                                                                     |
| Alert                                         | Whether stateful packet inspection messages are copied to the syslog.                                                                                                  |
| Trend Micro Server Certificate Download Links |                                                                                                                                                                        |
| Link to download certificates                 | Opens the page for installing Trusted Authority Certificates on Cisco IOS Routers for Trend URL Filtering Support.                                                     |
| Link for product registration                 | Opens the page for Product License Registration. You must enter the Product Authorization Key and register the router.                                                 |

## Zone Dialog Box

Use the Add and Edit Zone dialog boxes to add and edit unreferenced zones—zones without any associated interfaces, rules or policies.

### Navigation Path

To access the Add and Edit Zone dialog boxes, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > Zone Based Firewall** from the Device selector. Right-click inside the Zones table, then select **Add Row**, or right-click a line item, then select **Edit Row**.
- (Policy view) Select **Firewall > Settings > Zone Based Firewall** from the Policy selector. Right-click inside the table, then select **Add Row**, or right-click a line item, then select **Edit Row**.
- (Map view) Right-click a device and select **Edit Firewall Policies > Settings > Zone Based Firewall Rules**.

Enter a zone name in the Zone field, or click **Select** to choose one from the Interfaces Selector dialog box.

## Troubleshooting Zone-based Rules and Configurations

Zone-based firewall rules are powerful, but also complex. Using zone rules, you can replace access rules, inspection rules, and Web filter rules with a single type of firewall rule. Because zone-based firewall rules can perform so many possible actions, the configuration generated from them uses many different types of configuration commands, including structures for access control lists (ACLs), class maps, and policy maps. There is no one-to-one correspondence between a zone-based firewall rule and a line in the configuration (unlike access rules, for example).

To illustrate this complexity, this topic describes the relationship between zone-based firewall rules and the configuration generated from them. You do not need to know any of the information in this topic to create and deploy zone-based firewall rules. However, if you are familiar with the CLI (command line interface), or if you find that your rules are generating undesired results, this information can help you understand and troubleshoot zone-based firewall rules.

Consider the set of rules shown in the following illustration. These rules form a policy for a single zone pair, affecting traffic moving from the Inside zone to the Outside zone. This is traffic from your internal network going to the Internet. The rules define the following actions:

- Drop all traffic from the 10.100.10.0/24 and 10.100.11.0/24 networks.
- Drop all FTP and FTPS traffic from the 10.100.12.0/24 network.
- Drop all peer-to-peer traffic from any network.
- Inspect (and allow) all FTP/FTPS traffic (except for that from 10.100.12.0/24, which is already dropped).
- Inspect all HTTP traffic using an additional deep-inspection policy map.
- And finally, perform generic inspection of all remaining TCP/UDP traffic.

Figure 29: Example of Zone-based Rules for a Zone Pair

| No.                         | Permit | Source         | Destination | Service | From Zone | To Zone | Inspected Protocol                                                 | Action  |
|-----------------------------|--------|----------------|-------------|---------|-----------|---------|--------------------------------------------------------------------|---------|
| Local - Mandatory (7 Rules) |        |                |             |         |           |         |                                                                    |         |
| 1                           | ✓      | 10.100.10.0/24 | any         | IP      | Inside    | Outside |                                                                    | Drop    |
| 2                           | ✓      | 10.100.11.0/24 | any         | IP      | Inside    | Outside |                                                                    | Drop    |

When you deploy these rules, Security Manager generates the following configuration. The bold letters are added for reference in the explanation that follows the configuration.

**A.**

```
class-map type inspect http match-any HTTPCmap
match req-resp protocol-violation
match request port-misuse any
!
```

**B.**

```
policy-map type inspect http HTTPpmap
class type inspect http HTTPCmap
reset
log
!
```

**C.**

```
class-map type inspect CSM_ZBF_CLASS_MAP_1
match access-group name CSM_ZBF_CMAP_ACL_1
!
```

**D.**

```
class-map type inspect match-any CSM_ZBF_CMAP_PLMAP_1
match protocol ftp
match protocol ftps
!
```

**E.**

```
class-map type inspect CSM_ZBF_CLASS_MAP_2
match access-group name CSM_ZBF_CMAP_ACL_2
match class-map CSM_ZBF_CMAP_PLMAP_1
!
```

**F.**

```
class-map type inspect match-any CSM_ZBF_CLASS_MAP_3
  match protocol bittorrent
  match protocol edonkey
  match protocol fasttrack
  match protocol icq
  match protocol kazaa2
!
```

**G.**

```
class-map type inspect CSM_ZBF_CLASS_MAP_4
  match protocol http
!
```

**H.**

```
class-map type inspect match-any CSM_ZBF_CLASS_MAP_5
  match protocol tcp
  match protocol udp
!
```

**I.**

```
policy-map type inspect CSM_ZBF_POLICY_MAP_1

```

**L.**

```
ip access-list extended CSM_ZBF_CMAP_ACL_2
 permit ip 10.100.12.0 0.0.0.255 any
!
```

The following list explains how the rules in Security Manager are converted to device-configuration commands, to aid your understanding of the relationship between the two. The list numbering corresponds to the rule numbers from the rules table in Security Manager (see the previous illustration):

1. This rule drops all traffic from the 10.100.10.0/24 network. The Permit, Source, Destination, and Service fields are used to create the first access control entry (ACE) in the ACL named CSM\_ZBF\_CMAP\_ACL\_1 defined in (K). This ACL is referenced from the class map CSM\_ZBF\_CLASS\_MAP\_1 defined in (C), which then defines the first drop rule in the policy map CSM\_ZBF\_POLICY\_MAP\_1, defined in (I).

The policy map (I) is used to define the zone service policy in (J). Because this policy map is how all of the rules are assigned to the zone pair, (J) is not mentioned again.

1. This rule drops all traffic from the 10.100.11.0/24 network. This rule is combined with rule 1 by adding an ACE to the ACL defined in (K). The rest of the configuration is identical to rule 1. Thus, rules 1 and 2 essentially become a single rule in the device configuration.
2. This rule drops all FTP/FTPS traffic from the 10.100.10.12/24 network. The Permit, Source, Destination, and Service fields are used to create the ACL named CSM\_ZBF\_CMAP\_ACL\_2 defined in (L). The Protocol table generates the class map CSM\_ZBF\_CMAP\_PLMAP\_1 defined in (D), which specifies the FTP and FTPS protocols. The ACL and FTP/FTPS class map are then used in a new class map, CSM\_ZBF\_CLASS\_MAP\_2 defined in (E), which completes the characterization of the traffic based on the combination of source and protocol. Finally, (E) is referenced in the policy map (I) as the second rule.
3. This rule drops peer-to-peer traffic from any source that uses any of these protocols: Bittorrent, eDonkey, FastTrack, ICQ, or Kazaa2. This rule prevents any of your internal servers from being used as a file-sharing source for these services. Because the rule applies to all sources and destinations for the default IP service, no ACL is required. Instead, the configuration starts with the class map CSM\_ZBF\_CLASS\_MAP\_3 defined in (F). This class map is referenced by the third drop rule in the policy map (I).
4. This rule inspects FTP/FTPS traffic from any source to any destination, which means these services are allowed. Note that rule 3, because it comes above rule 5, already drops FTP/FTPS traffic from the 10.100.12.0/24 network, so the combination of these rules means that FTP/FTPS traffic is inspected for all sources except 10.100.12.0/24. Because the Protocol table specifies the same protocols as it does for rule 3, no new class map is needed. Instead, the policy map (I) simply refers to the class map (D) as the fourth class type, but this time with the Inspect action.
5. This rule inspects HTTP traffic and applies a deep-inspection policy map named HTTPpmap. The HTTPpmap policy map (B) defines the action to take when traffic matches the criteria defined in the class map HTTPcmap (A). These maps specify that any HTTP connection that violates the HTTP protocol, or that misuses ports, should be reset (dropped) and a syslog entry generated. (Protocol violation and port misuse can characterize Denial of Service attacks.) The combination of (A) and (B) define the deep-inspection rules for this policy.

An additional class map, CSM\_ZBF\_CLASS\_MAP\_4, is needed to specify the HTTP protocol (G). Then, the fifth class type rule in the policy map (I) refers to class map (G) for inspection, and the service-policy command refers to the policy map (B) for deep inspection.

1. This rule provides generic inspection on TCP/UDP traffic, allowing and inspecting the remaining TCP/UDP traffic from the internal network to the Internet and back. The class map CSM\_ZBF\_CLASS\_MAP\_5 defined in (H) is generated from the Protocols table. This class map then becomes the next-to-last rule in the policy map (I).
2. Finally, there is an automatic rule, which appears as the final class-default rule in the policy map (I). This rule drops any traffic that does not match one of the class maps referenced in the policy map (I). For example, ICMP traffic from the internal network to the Internet will not be allowed. For information on configuring a different class-default rule, see [Changing the Default Drop Behavior](#), on page 977.

## Zone-based Firewall Rules Page

Zone-based firewall rules provide unidirectional application of firewall policies between groups of interfaces known as “zones.” That is, interfaces are assigned to zones, and specific inspection policies are applied to traffic moving between zones in one direction or the other.

A zone defines a boundary where traffic is subjected to specific restrictions as it crosses into another region of your network. The default zone-based firewall policy between zones is **deny all**. Thus, if no policy is explicitly configured, all traffic between zones is blocked.

---

**Note** From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software.

---

The Zone Based Firewall Rules page displays a list of currently configured zone-based firewall rules, and lets you add, edit and delete rules.

---

**Tip** Disabled rules are shown with hash marks covering the table row. When you deploy the configuration, disabled rules are removed from the device. For more information, see [Enabling and Disabling Rules](#), on page 616.

---

### Navigation Path

To access the Zone Based Firewall Rules page, do one of the following:

- (Device view) Select a device, then select **Firewall > Zone Based Firewall Rules** from the Policy selector.
- (Policy view) Select **Firewall > Zone Based Firewall Rules** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Policies > Zone Based Firewall Rules**.

|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description                               | The description of this rule, if provided. A maximum of 1024 characters is allowed.                                                                                                                                                                                                                                                                                                       |
| Last Ticket(s)                            | Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see <a href="#">Ticket Management Page</a> , on page 584). |
| Query button                              | To run policy queries, which can help you evaluate your rules and identify ineffective rules that you can delete. See <a href="#">Generating Policy Query Reports</a> , on page 625.                                                                                                                                                                                                      |
| Find and Replace button (binoculars icon) | Searches for values in rules tables, such as IP addresses and policy object names, to facilitate locating and making changes to rules in tables. See <a href="#">Finding and Replacing Items in Rules Tables</a> , on page 612.                                                                                                                                                           |
| Up button                                 | Moves the selected rule up one row in the table.                                                                                                                                                                                                                                                                                                                                          |
| Down button                               | Moves the selected rule down one row in the table.                                                                                                                                                                                                                                                                                                                                        |
| Add button                                | Opens the Add Zone-based Firewall Rule dialog box, where you can create a new rule.                                                                                                                                                                                                                                                                                                       |
| Edit button                               | Used to edit the selected rule in the table; opens the Edit Zone-based Firewall Rule dialog box.                                                                                                                                                                                                                                                                                          |
| Delete button                             | Deletes the selected rule from the table.                                                                                                                                                                                                                                                                                                                                                 |

## Adding and Editing Zone-based Firewall Rules

Use the Add and Edit Zone based Firewall Rule dialog boxes to add and edit zone-based firewall rules on Cisco IOS and ASR devices.

### Navigation Path

From the [Zone-based Firewall Rules Page](#), on page 987, click the **Add Row** button, or select a row and click the **Edit Row** button.

## Field Reference

**Table 296: Add and Edit Zone based Firewall Rule Dialog Boxes**

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Rule | When selected, the rule is enabled on the device after the configuration is generated and deployed. Deselect this option to disable the rule without deleting it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Traffic     | Define the traffic flow to which this rule is applied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Match       | Choose whether to Permit or Deny matched traffic. See <a href="#">Understanding the Relationship Between Permit/Deny and Action in Zone-based Firewall Rules</a> , on page 935 for additional information about this option.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Sources     | <p>Provide traffic sources for this rule; can be networks or security groups. You can enter values, enter object names, or select objects for one or more of the following types of sources:</p> <p><b>Note</b> Enter more than one value in any of these fields by separating the items with commas.</p> <ul style="list-style-type: none"> <li>• Network – You can specify various network, host, and IP address definitions, either individually or as objects. The “All-Address” objects do not restrict the rule to specific hosts or networks.</li> </ul> <p>See <a href="#">Understanding Networks/Hosts Objects</a>, on page 308 and <a href="#">Specifying IP Addresses During Policy Definition</a>, on page 316 for additional information about these definitions.</p> <p><b>Note</b> From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software.</p> <p>Each specification is combined with any others to limit traffic matches to only those flows that include all definitions. For example, specified user traffic originating from within a specified source address range.</p> |

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Destinations         | <p>Provide traffic destinations for this rule; can be networks or security groups. You can enter values, enter object names, or select objects for one or more of the following types of sources:</p> <p><b>Note</b> Enter more than one value in any of these fields by separating the items with commas.</p> <ul style="list-style-type: none"> <li>• Network – You can specify various network, host, and IP address definitions, either individually or as objects. The “All-Address” objects do not restrict the rule to specific hosts or networks.</li> </ul> <p>See <a href="#">Understanding Networks/Hosts Objects</a> , on page 308 and <a href="#">Specifying IP Addresses During Policy Definition</a> , on page 316 for additional information about these definitions.</p> <p><b>Note</b> From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software.</p> <p>Each specification is combined with any others to limit traffic matches to only those flows that include all definitions. For example, specified user traffic originating from within a specified source address range.</p> |
| Services             | <p>Specify the services that define the type of traffic to matched by this rule. You can enter any combination of service objects and service types (which are typically a protocol and port combination), separated by commas. See <a href="#">Understanding the Relationship Between Services and Protocols in Zone-based Firewall Rules</a> , on page 938 for additional information about this option.</p> <p>If you type in a service, you are prompted as you type with valid values. You also can click Select to select services from a list. For complete information on how to specify services, see <a href="#">Understanding and Specifying Services and Service and Port List Objects</a> , on page 329.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| From Zone<br>To Zone | <p>Basic zone-based firewall rules are unidirectional; that is, they define a traffic flow that moves in only one direction between two zones.</p> <p>Enter or select the zone from which traffic flows can originate for this rule, and enter or select the zone to which traffic can flow.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Advanced button      | <p>Opens the Advanced Options dialog box where you can select time-range options. See <a href="#">Zone-based Firewall Rule: Advanced Options Dialog Box</a> , on page 994.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Action               | <p>The action applied to traffic that matches this rule. Choose the desired Action:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Action: Drop, Drop and Log, Pass, Pass and Log | <ul style="list-style-type: none"> <li>• <b>Drop</b> – Silently drops all packets for the specified Services. The default action for all traffic.</li> <li>• <b>Drop and Log</b> – Matched traffic is logged and dropped.</li> <li>• <b>Pass</b> – The router forwards matched packets from the From Zone to the To Zone. Return traffic is not recognized, so you have to specify additional rules for return traffic. This option is useful only for protocols such as IPsec-encrypted traffic.</li> <li>• <b>Pass and Log</b> – Traffic is logged and forwarded.</li> </ul> <p>For any of these Actions, you can select one or more protocols to be matched by clicking the <b>Select</b> button next to the Protocol table to open the <a href="#">Protocol Selector Dialog Box</a> , on page 995. However, this is not necessary; you can leave the Protocol table empty and pass or drop traffic based on the Sources, Destinations, and Services parameters; in effect, these are standard access rules.</p> <p>The Protocol Selector dialog box also provides access to the <a href="#">Configure Protocol Dialog Box</a> , on page 996, where you can edit the Port Application Mapping (PAM) parameters for the selected protocol.</p> <p><b>Note</b> The Log options generate system-log messages; you must ensure that syslog logging is configured to capture these messages.</p>                                                                                                                                                                                                                                                                                                                |
| Action: Inspect                                | <p><b>Inspect</b> provides state-based traffic control—the device maintains connection or session information for TCP and UDP traffic, meaning return traffic in reply to connection requests is permitted.</p> <p>Choose this option to apply packet inspection based on your selected Layer 4 (TCP, UDP) and Layer 7 (HTTP, IMAP, instant messaging, and peer-to-peer) protocols. You also can edit PAM settings for the selected protocols, and you can set up deep packet inspection (DPI) and provide additional protocol-related information for the Layer 7 protocols. See <a href="#">Configuring Inspection Maps for Zone-based Firewall Policies</a> , on page 943 for more information.</p> <ol style="list-style-type: none"> <li>1. You can select one or more protocols for inspection by clicking the <b>Select</b> button next to the Protocol table to open the <a href="#">Protocol Selector Dialog Box</a> , on page 995.</li> <li>2. The Protocol Selector dialog box also provides access to the <a href="#">Configure Protocol Dialog Box</a> , on page 996, where you can create custom protocols, and edit the PAM and DPI parameters for the selected protocol.</li> <li>3. <b>Inspect Parameters</b> – You can apply a customized set of connection, timeout, and other settings by entering the name of an Inspect Parameter map in this field, or you can click Select to select one from a list. You also can create new Inspect Parameter maps from the selection-list dialog box; see <a href="#">Configuring Inspect Parameter Maps</a> , on page 958 for more information.</li> </ol> <p>If you do not specify an Inspect Parameters map, the default settings are used.</p> |

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action:<br>Content Filter | <p><b>Content Filter</b> provides URL filtering based on a supplied parameter or policy map. The router intercepts HTTP requests, performs protocol-related inspection, and optionally contacts a third-party server to determine whether the requests should be allowed or blocked. You can provide a WebFilter parameter map, which defines filtering based on local URL lists, as well as information from an external SmartFilter (previously N2H2) or Websense server. Alternately, you can provide a WebFilter policy map that accesses Local, N2H2, Websense, or Trend Micro filtering data.</p> <ol style="list-style-type: none"> <li>1. When <b>Content Filter</b> is the chosen Action, HTTP is the specified Protocol. You can click Configure to open the <a href="#">Configure Protocol Dialog Box</a>, on page 996, where you can edit the HTTP PAM settings, and apply an HTTP DPI map.</li> <li>2. Select <b>WebFilter Parameter Map</b>, or <b>WebFilter Policy Map</b>, and supply the name of an appropriate map. You can click the appropriate Select button to select the map from a list; you also can create new maps from the selection-list dialog box. See <a href="#">Configuring Content Filtering Maps for Zone-based Firewall Policies</a>, on page 964 for information about configuring these maps.</li> <li>3. <b>Inspect Parameters</b> – You can apply a customized set of connection, timeout, and other settings by entering the name of an Inspect Parameter map in this field, or you can click Select to select one from a list. You also can create new Inspect Parameter maps from the selection-list dialog box; see <a href="#">Configuring Inspect Parameter Maps</a>, on page 958 for more information.</li> </ol> <p>If you do not specify an Inspect Parameters map, the default settings are used.</p> |
| Description               | (Optional) You can enter a description of up to 1024 characters to help you identify the rule when viewing the rules table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Category                  | (Optional) You can assign a category to the rule, to help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Zone-based Firewall Rule: Advanced Options Dialog Box

Use the Zone-Based Firewall Rule Advanced Options dialog box to apply specific time-range information to a zone-based firewall rule.

### Navigation Path

In the Traffic section of the Add or Edit Zone based Firewall Rule dialog box, click the **Advanced** button.

| Time Range | <p>This feature lets you define time periods during which this zone-based firewall rule is active. If you do not specify a time range, the rule is immediately and always active.</p> <p>Enter the name of a time-range object, or click <b>Select</b> to choose one from a list in the Time Ranges Selector dialog box. You can create and edit time-range objects from this dialog box. For more information, see <a href="#">Configuring Time Range Objects</a> , on page 299.</p>                                                                                                                                                                                                                                                                                                                                                                                                          |
| Options    | <p>This feature lets you apply an initial-packet-fragment or an established-connection restriction to this zone-based firewall rule. Choose one of the following options:</p> <ul style="list-style-type: none"> <li>• <b>None</b>—No packet-fragment or established-connection restrictions are applied.</li> <li>• <b>Fragment</b> – If chosen, the rule is applied to non-initial packet fragments; the fragment is either permitted or denied accordingly. The white paper, “<a href="#">Access Control Lists and IP Fragments</a>”, provides additional information that is also relevant to zone-based firewall rules.</li> <li>• <b>Established</b> – For the TCP protocol only; requires an established connection. A match occurs if the TCP datagram has the ACK or RST control bits set. The non-matching case is that of the initial TCP datagram to form a connection.</li> </ul> |

## Protocol Selector Dialog Box

Use the Protocol Selector dialog box to specify one or more communication protocols as part of the definition of traffic for a zone-based firewall rule.

The Protocol Selector dialog box also provides access to the Configure Protocol dialog box, which you can use to create custom protocols and edit Port Application Mapping (PAM) parameters for existing protocols. The Configure Protocol dialog box is also where you select Deep Inspection policy maps, and Protocol Info parameter maps, for certain protocols. See [Configure Protocol Dialog Box](#) , on page 996 for more information.

### Navigation Path

The Protocol Selector dialog box can be accessed from the Add and Edit Zone based Firewall Rule dialog boxes (described in [Adding and Editing Zone-based Firewall Rules](#) , on page 990). In either dialog box, choose any Action except Content Filter and then click the Select button next to the Protocol table.

You can also open the Protocol Selector dialog box by right-clicking the Inspected Protocol column for any entry in the Zone Based Firewall Rules table, and then choosing Edit Protocols.

## Configure Protocol Dialog Box

Packet inspection can be configured in zone-based firewall rules by the selection of specific protocol objects, which define Port Application Mapping (PAM) parameters (Layer 4 protocols and ports, and optionally specific networks and hosts). A Layer 7 (HTTP, IMAP, Instant Messaging, and peer-to-peer) protocol can also include a deep-packet inspection policy specific to that protocol. Refer to [Adding and Editing Zone-based Firewall Rules](#), on page 990 for information about selecting protocols during zone-based firewall rule definition.

The Configure Protocol dialog box is used to edit existing protocol definitions, and to create custom definitions, for use with zone-based firewall rules. For example, if a protocol does not use its default ports for some or all networks, you can configure different port mappings.

### Navigation Path

The Configure Protocol dialog box is accessed from the [Protocol Selector Dialog Box](#), on page 995, as follows:

- Click the Create (+) button below the Selected Protocols list to create a new protocol.
- Select a protocol in the Selected Protocols list, and click the Edit (pencil) button to edit that protocol.

| Protocol Name            | The name of the selected protocol. If you are creating a custom protocol, you can enter a name of up to 19 characters. Custom protocol names must begin with <b>user-</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Enable Signature         | <p>This option is available only when editing the peer-to-peer (eDonkey, FastTrack, Gnutella, Kazaa2) protocols.</p> <p>Enabling this option means Network-based Application Recognition (NBAR) heuristics will be applied to the traffic to detect “telldates” that signify specific P2P application activity. These telldates includes port-hopping and other changes in application behavior to avoid traffic detection.</p> <p><b>Note</b> This level of traffic inspection comes at the price of increased CPU utilization and reduced network throughput capability.</p>                                                                 |
| Deep Inspection          | <p>This option is available only when editing the H.323, HTTP, IM (AOL, ICQ, MSN Messenger, Windows Messenger, and Yahoo Messenger), IMAP, P2P (eDonkey, FastTrack, Gnutella, Kazaa2), POP3, SIP, SMTP, Sun RPC protocols, and <b>Inspect</b> is the chosen Action for the zone-based firewall rule.</p> <p>Enter or Select the name of the Inspect policy map to be used with the selected protocol. See <a href="#">Configuring Inspection Maps for Zone-based Firewall Policies</a>, on page 943 for more information about these policy maps.</p>                                                                                          |
| Protocol Info            | <p>This option is available only when editing the Instant Messaging (AOL, ICQ, MSN Messenger, Windows Messenger, and Yahoo Messenger) and Stun-ice protocols.</p> <p>Enter or Select the name of the Protocol Info parameter map to be used with the selected protocol. These parameter maps define the DNS servers that interact with these applications, which helps the Instant Messaging (IM) application engine recognize the IM traffic and enforce the configured policy for that IM application.</p> <p>See <a href="#">Configuring Protocol Info Parameter Maps</a>, on page 961 for more information about these parameter maps.</p> |
| Port Application Mapping | These options let you customize the Port Application Mapping (PAM) parameters for the selected protocol.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Protocol                 | <p>Select the transport protocol(s) for this mapping:</p> <ul style="list-style-type: none"> <li>• TCP/UDP</li> <li>• TCP</li> <li>• UDP</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Ports                    | Enter any combination of a single port number, multiple port numbers, or a range of ports (for example, 60000-60005). Separate multiple entries with commas. Do not specify a range that overlaps already mapped ports.                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Element  | Description                                                                                                                                                                                                                                                                |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Networks | If this protocol/port mapping is only for specific networks or hosts, enter the names or IP addresses of the networks or hosts, or the names of the network/host objects. You can click Select to open the Networks/Hosts Selector. Separate multiple entries with commas. |

## CHAPTER 22

# Managing Traffic Zones

You can assign multiple interfaces to a traffic zone, which lets traffic from an existing flow exit or enter the ASA on any interface within the zone. This capability allows Equal-Cost Multi-Path (ECMP) routing on the ASA as well as external load balancing of traffic to the ASA across multiple interfaces.

### Non-Zoned Behavior

The Adaptive Security Algorithm takes into consideration the state of a packet when deciding to permit or deny the traffic. One of the enforced parameters for the flow is that traffic enters and exits the same interface. Any traffic for an existing flow that enters a different interface is dropped by the ASA.

Traffic zones let you group multiple interfaces together so that traffic entering or exiting any interface in the zone fulfills the Adaptive Security Algorithm security checks.

- [Why Use Zones? , on page 999](#)
- [ECMP Routing , on page 1000](#)
- [Understanding Traffic Zones , on page 1002](#)
- [Prerequisites for Traffic Zones , on page 1003](#)
- [Guidelines for Traffic Zones , on page 1004](#)
- [Configuring Traffic Zones , on page 1005](#)

## Why Use Zones?

### Asymmetric Routing

In the following scenario, a connection was established between an inside host and an outside host through ISP 1 on the Outside1 interface. Due to asymmetric routing on the destination network, return traffic arrived from ISP 2 on the Outside2 interface.

**Non-Zoned Problem:** The ASA maintains the connection tables on a per-interface basis. When the returning traffic arrives at Outside2, it will not match the connection table and will be dropped.

**Zoned Solution:** The ASA maintains connection tables on a per-zone basis. If you group Outside1 and Outside2 into a zone, then when the returning traffic arrives at Outside2, it will match the per-zone connection table, and the connection will be allowed.

### Lost Route

In the following scenario, a connection was established between an inside host and an outside host through ISP 1 on the Outside1 interface. Due to a lost or moved route between Outside1 and ISP 1, traffic needs to take a different route through ISP 2.

**Non-Zoned Problem:** The connection between the inside and outside host will be deleted; a new connection must be established using a new next-best route. For UDP, the new route will be used after a single packet drop, but for TCP, a new connection has to be reestablished.

**Zoned Solution:** The ASA detects the lost route and switches the flow to the new path through ISP 2. Traffic will be seamlessly forwarded without any packet drops.

### Load Balancing

In the following scenario, a connection was established between an inside host and an outside host through ISP 1 on the Outside1 interface. A second connection was established through an equal cost route through ISP 2 on Outside2.

**Non-Zoned Problem:** Load-balancing across interfaces is not possible; you can only load-balance with equal cost routes on one interface.

**Zoned Solution:** The ASA load-balances connections across up to eight equal cost routes on all the interfaces in the zone.

## ECMP Routing

The ASA supports Equal-Cost Multi-Path (ECMP) routing.

### Non-Zoned ECMP Support

Without zones, you can have up to three equal cost static or dynamic routes per interface. For example, you can configure three default routes on the outside interface that specify different gateways:

```
route outside 0 0 10.1.1.2
```

```
route outside 0 0 10.1.1.3
```

```
route outside 0 0 10.1.1.4
```

In this case, traffic is load-balanced on the outside interface between 10.1.1.2, 10.1.1.3, and 10.1.1.4. Traffic is distributed among the specified gateways based on an algorithm that hashes the source and destination IP addresses.

ECMP is not supported across multiple interfaces, so you cannot define a route to the same destination on a different interface. The following route is disallowed when configured with any of the routes above:

```
route outside2 0 0 10.2.1.1
```

### Zoned ECMP Support

With zones, you can have up to 8 equal cost static or dynamic routes across up to 8 interfaces within a zone. For example, you can configure three default routes across three interfaces in the zone:

```
route outside1 0 0 10.1.1.2
```

```
route outside2 0 0 10.2.1.2
```

```
route outside3 0 0 10.3.1.2
```

Similarly, your dynamic routing protocol can automatically configure equal cost routes. The ASA load-balances traffic across the interfaces with a more robust load balancing mechanism.

When a route is lost, the ASA seamlessly moves the flow to a different route.

### How Connections Are Load-Balanced

The ASA load balances connections across equal cost routes using a hash made from the packet 6-tuple (source and destination IP address, source and destination port, protocol, and ingress interface). Unless the route is lost, a connection will stay on the chosen interface for its duration.

Packets within a connection are not load-balanced across routes; a connection uses a single route unless that route is lost.

The ASA does not consider the interface bandwidth or other parameters when load balancing. You should make sure all interfaces within the same zone have the same characteristics such as MTU, bandwidth, and so on.

The load-balancing algorithm is not user configurable.

### Falling Back to a Route in Another Zone

When a route is lost on an interface, if there are no other routes available within the zone, then the ASA will use a route from a different interface/zone. If this backup route is used, then you may experience packet drops as with non-zoned routing support.

# Understanding Traffic Zones

## Interface-Based Security Policy

Zones allow traffic to and from any interface in the zone, but the security policy itself (access rules, NAT, and so on) is still applied per interface, not per zone. If you configure the same security policy for all interfaces within the zone, then you can successfully implement ECMP and load balancing for that traffic. For more information about required parallel interface configuration, see [Prerequisites for Traffic Zones](#), on page 1003.

## Supported Services for Traffic Zones

The following services are supported with zones:

- Access Rules
- NAT
- Service Rules, except for QoS traffic policing.
- Routing

You can also configure to- and from-the-box services (see below), although full zoned support is not available.

Do not configure other services (such as VPN or Botnet Traffic Filter) for interfaces in a traffic zone; they may not function or scale as expected.

---

**Note** For detailed information about how to configure the security policy, see [Prerequisites for Traffic Zones](#), on page 1003.

---

## Security Levels

The first interface that you add to a zone determines the security level of the zone. All additional interfaces must have the same security level. To change the security level for interfaces in a zone, you must remove all but one interface, and then change the security levels, and re-add the interfaces.

## Primary and Current Interface for the Flow

Each connection flow is built based on the initial ingress and egress interfaces. These interfaces are the *primary* interfaces.

If a new egress interface is used because of route changes or asymmetric routing, then the new interfaces are the *current* interfaces.

## Joining or Leaving a Zone

When you assign an interface to a zone, any connections on that interface are deleted. The connections must be reestablished.

If you remove an interface from a zone, any connections that have the interface as the primary interface are deleted. The connections must be reestablished. If the interface is the current interface, the ASA moves the connections back to the primary interface. The zone route table is also refreshed.

### To- and From-the-Box Traffic

- You cannot add management-only or management-access interfaces to a zone.
- For management traffic on regular interfaces in a zone, only asymmetric routing on existing flows is supported; there is no ECMP support.
- You can configure a management service on only one zone interface, but to take advantage of asymmetric routing support, you need to configure it on all interfaces. Even when the configurations are parallel on all interfaces, ECMP is not supported.
- The ASA supports the following to- and from-the-box services in a zone:
  - Telnet
  - SSH
  - HTTPS
  - SNMP
  - Syslog
  - BGP

### Overlapping IP Addresses Within a Zone

For non-zoned interfaces, the ASA supports overlapping IP address networks on interfaces so long as you configure NAT properly. However, overlapping networks are not supported on interfaces in the same zone.

- [Guidelines for Traffic Zones , on page 1004](#)
- [Configuring Traffic Zones , on page 1005](#)

## Prerequisites for Traffic Zones

- Configure all interface parameters including the name, IP address, and security level. Note that the security level must match for all interfaces in the zone. You should plan to group together like interfaces in terms of bandwidth and other Layer 2 properties.
- Configure the following services to match on all zone interfaces:
  - Access Rules—Apply the same access rule to all zone member interfaces, or use a global access rule.
  - NAT—Configure the same NAT policy on all member interfaces of the zone or use a global NAT rule.

Interface PAT is not supported.

---

**Note** When you use interface-specific NAT and PAT pools, the ASA cannot switch connections over in case of the original interface failure. If you use interface-specific PAT pools, multiple connections from the same host might load-balance to different interfaces and use different mapped IP addresses. Internet services that use multiple concurrent connections may not work correctly in this case.

---

- Service Rules—Use the global service policy, or assign the same policy to each interface in a zone.

QoS traffic policing is not supported.

---

**Note** For VoIP inspections, zone load balancing can cause increased out-of-order packets. This situation can occur because later packets might reach the ASA before earlier packets that take a different path. Symptoms of out-of-order packets include:—Higher memory utilization at intermediate nodes (firewall and IDS) and the receiving end nodes if queuing is used.—Poor video or voice quality. To mitigate these effects, we recommend that you use IP addresses only for load distribution for VoIP traffic.

---

- Configure routing with ECMP zone capabilities in mind.

## Guidelines for Traffic Zones

### Firewall Mode

Supported in routed firewall mode only. Does not support transparent firewall mode.

### Failover

- You cannot add the failover or state link to a zone.
- In Active/Active failover mode, you can assign an interface in each context to an asymmetrical routing (ASR) group. This service allows traffic returning on a similar interface on the peer unit to be restored to the original unit. You cannot configure both ASR groups and traffic zones within a context. If you configure a zone in a context, none of the context interfaces can be part of an ASR group.
- Only the primary interfaces for each connection are replicated to the standby unit; current interfaces are not replicated. If the standby unit becomes active, it will assign a new current interface if necessary.

### Clustering

You cannot add the cluster control link to a zone.

### Additional Guidelines

- You can create a maximum of 256 zones.
- You can only add physical interfaces to a zone.
- An interface can be a member of only one zone.
- You can include up to 8 interfaces per zone.
- The first interface that you add to a zone determines the security level of the zone. All additional interfaces must have the same security level.
- For ECMP, you can add up to 8 equal cost routes per zone, across all zone interfaces. You can also configure multiple routes on a single interface as part of the 8 route limit.

- [Understanding Traffic Zones , on page 1002](#)
- [Prerequisites for Traffic Zones , on page 1003](#)
- [Configuring Traffic Zones , on page 1005](#)

## Configuring Traffic Zones

You can assign multiple interfaces to a traffic zone, which lets traffic from an existing flow exit or enter the ASA on any interface within the zone. This capability allows Equal-Cost Multi-Path (ECMP) routing on the ASA as well as external load balancing of traffic to the ASA across multiple interfaces.

### Related Topics

- [Understanding Interface Role Objects , on page 301](#)

- [Understanding Traffic Zones , on page 1002](#)
- [Prerequisites for Traffic Zones , on page 1003](#)
- [Guidelines for Traffic Zones , on page 1004](#)

---

### Step 1

Do one of the following:

- (Device view) Select **Firewall** > **Settings** > **Zone** from the Policy selector.

- (Policy view) Select **Firewall > Settings > Zone** from the Policy Type selector. Select an existing policy or create a new one.

**Step 2** Click the **Add Row** button beneath the Zone table to open the Zone dialog box.

**Step 3** Enter the name of an interface role that identifies the interfaces that belong to the traffic zone you are configuring and then click **OK**. For more information about interface role object, see [Understanding Interface Role Objects](#), on page 301.

**Tip** You can click **Select** to select the interface role from a list of interface role objects or to define a new interface role object.

**Step 4** Click **Save** to save the changes.

---

## CHAPTER 23

# Managing Transparent Firewall Rules

Transparent firewall rules are access control rules for non-IP layer 2 traffic. You can use these rules to permit or drop traffic based on the Ethertype value in the layer-2 packet.

This chapter contains the following topics:

- [Configuring Transparent Firewall Rules](#) , on page 1007
- [Transparent Rules Page](#) , on page 1009

## Configuring Transparent Firewall Rules

Transparent firewall rules are access control rules for non-IP layer 2 traffic. You can use these rules to permit or drop traffic based on the Ethertype value in the layer-2 packet. These rules create Ethertype access control lists on the device. With transparent rules, you can control the flow of non-IP traffic across the device. (To control IP traffic, use access rules; see [Understanding Access Rules](#) , on page 715.)

Transparent firewalls are devices that you place within a single subnet to control traffic flow across a bridge. They allow you to insert a firewall on a subnet without renumbering your networks.

You can configure transparent rules only on the following types of interfaces:

- **IOS 12.3(7)T or later devices**—On layer-3 interfaces that are part of a bridge group:
  - Configure the interfaces you want to bridge as layer 3 in the **Interfaces > Interfaces** policy.
  - Configure a bridge group with two or more layer 3 interfaces in the **Platform > Device Admin > Bridging** policy (see [Bridging on Cisco IOS Routers](#) , on page 2427 and [Defining Bridge Groups](#) , on page 2428).
  - Create a bridge group virtual interface (BVI) using the same number as the bridge group (see [Bridge-Group Virtual Interfaces](#) , on page 2428). For example, if you create bridge group 12, create BVI12.
- **ASA, PIX 7.0+, FWSM devices**—On any interface when the device is running in transparent mode. If you are using multiple contexts, configure the rules on the individual security contexts.

There are several other bridging policies that you can configure in the **Platform > Bridging** policy group including: ARP table and ARP inspection, MAC table and the ability to disable MAC learning, and the ability to configure a management IP address so that you can remotely manage the device. For more detail about transparent firewalls, see [Configuring Bridging Policies on Firewall Devices](#), on page 1895 and [Interfaces in Routed and Transparent Modes](#) , on page 1809.

**Tip** On ASA, PIX, and FWSM in transparent mode, you must configure access rules to allow any IP traffic to pass through the device. Transparent rules control layer 2 non-IP traffic only.

Also, see [NAT in Transparent Mode](#) , on page 1030 for information about using network address translation on security devices.

You can also configure other types of firewall rules on these interfaces. The other types of rules apply to layer-3 and higher traffic.

**Tip** If you configure any transparent rule, an implicit **deny all** rule is added at the end of the rule list for each interface. You must ensure that you permit all desired traffic. You might want to include a **permit any** (for ASA/PIX/FWSM devices) or **permit 0x0000 0xFFFF** (for IOS devices) rule as the final rule in the table if your desire is simply to deny specific types of traffic, rather than permitting only specific types of traffic.

#### Related Topics

- [Adding and Removing Rules](#) , on page 604
- [Editing Rules](#) , on page 605
- [Enabling and Disabling Rules](#) , on page 616

- 
- Step 1** Do one of the following to open the [Transparent Rules Page](#) , on page 1009:
- (Device view) Select **Firewall > Transparent Rules** from the Policy selector for a supported device type.
  - (Policy view) Select **Firewall > Transparent Rules** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** Select the row after which you want to create the rule and click the **Add Row** button or right-click and select **Add Row**. This opens the [Add and Edit Transparent Firewall Rule Dialog Boxes](#) , on page 1011.
- Tip** If you do not select a row, the new rule is added at the end of the local scope. You can also select an existing row and edit either the entire row or specific cells. For more information, see [Editing Rules](#) , on page 605.
- Step 3** Configure the rule. Following are the highlights of what you typically need to decide. For specific information on configuring the fields, see [Add and Edit Transparent Firewall Rule Dialog Boxes](#) , on page 1011.
- Permit or Deny—Whether you are allowing traffic that matches the rule or dropping it.
  - Interfaces—The interface or interface role for which you are configuring the rule.
  - The direction of traffic to which this rule should apply (in or out). The default is in.
  - EtherType—The hexadecimal code or keyword (for ASA/PIX/FWSM only) that identifies the traffic. For a list of codes, see RFC 1700 at <https://www.ietf.org/rfc/rfc1700.txt> and search for “Ether Type.” For ASA/PIX/FWSM, you can select a keyword to identify some EtherTypes. For ASA/PIX/FWSM, the code must be 0x0600 at minimum.
  - Mask—For rules applied to IOS devices, you must also specify a mask to apply to the EtherType. Use 0xFFFF to have the EtherType interpreted literally.

If you want to create a single rule to apply to a group of EtherTypes, convert the EtherTypes to binary and calculate an appropriate mask where 1 means to interpret the EtherType literally, and 0 means that any value should be allowed in the position. You must then convert your mask into hexadecimal.

Click **OK** when you are finished defining your rule.

- Step 4** If you did not select the right row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. For more information, see [Moving Rules and the Importance of Rule Order](#) , on page 615.
- Step 5** (IOS devices only) If you are configuring transparent rules on an IOS device, you can forward DHCP traffic across the bridge without inspection. To configure this, select the **Firewall > Settings > Inspection** policy and select the **Permit DHCP Passthrough (Transparent Firewall)** option. This setting is not supported on all IOS versions, so carefully inspect validation results to see if it will be configured on your device.

---

## Transparent Rules Page

Use the Transparent Rules page to control access for non-IP layer-2 traffic. (To control IP traffic access, use access rules; see [Understanding Access Rules](#) , on page 715.)

Transparent rules are limited to transparent firewalls, which are ASA, PIX 7.0+, and FWSM devices running in transparent mode, or layer-3 interfaces that are part of a bridge group on IOS 12.3(7)T+ devices. When deployed, transparent rules become Ethertype access control lists.

Configure the same rules on all bridged interfaces to allow traffic to pass both ways through the device.

For more detailed information about configuring transparent firewalls and the device requirements for deploying these rules, see [Configuring Transparent Firewall Rules](#) , on page 1007.

---

**Tip** Disabled rules are shown with hash marks covering the table row. When you deploy the configuration, disabled rules are removed from the device. For more information, see [Enabling and Disabling Rules](#) , on page 616.

---

### Navigation Path

To access Transparent Rules, do one of the following:

- (Device view) Select **Firewall > Transparent Rules** from the Policy selector for a supported device type.
- (Policy view) Select **Firewall > Transparent Rules** from the Policy Type selector. Select an existing policy or create a new one.
- (Map view) Right-click a device and select **Edit Firewall Policies > Transparent Rules**.

## Field Reference

**Table 300: Transparent Rules Page**

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.                                       | The ordered rule number.                                                                                                                                                                                                                                                                                                                                                                               |
| Permit                                    | Whether a rule permits or denies traffic based on the conditions set: <ul style="list-style-type: none"> <li>• Permit—Shown as a green check mark.</li> <li>• Deny—Shown as a red circle with slash.</li> </ul>                                                                                                                                                                                        |
| EtherType                                 | The Ethernet packet type, which is the EtherType value in the packet. This can be a hexadecimal code or a keyword.                                                                                                                                                                                                                                                                                     |
| Mask                                      | The 16-bit hexadecimal mask for the EtherType (for IOS devices only). A mask of 0xFFFF indicates the EtherType is literal. Any other mask indicates the corresponding bits in the EtherType to ignore. You must convert the hexadecimal number to binary to fully interpret the mask (binary 1 means interpret the corresponding EtherType value literally, 0 means allow any value at that position). |
| Interface                                 | The interfaces or interface roles to which the rule is assigned. Interface role objects are replaced with the actual interface names when the configuration is generated for each device. Multiple entries are displayed as separate subfields within the table cell. See <a href="#">Understanding Interface Role Objects</a> , on page 301.                                                          |
| Dir.                                      | The direction of the traffic to which this rule applies: <ul style="list-style-type: none"> <li>• In—Packets entering the interface.</li> <li>• Out—Packets exiting the interface.</li> </ul>                                                                                                                                                                                                          |
| Category                                  | The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                              |
| Description                               | The description of the rule, if any.                                                                                                                                                                                                                                                                                                                                                                   |
| Last Ticket(s)                            | Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see <a href="#">Ticket Management Page</a> , on page 584).              |
| Up Row and Down Row buttons (arrow icons) | Click these buttons to move the selected rules up or down within a scope or section. For more information, see <a href="#">Moving Rules and the Importance of Rule Order</a> , on page 615.                                                                                                                                                                                                            |

| Element           | Description                                                                                                                                                                                                                                                                                                                                          |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Add Row button    | Click this button to add a rule to the table after the selected row using the <a href="#">Add and Edit Transparent Firewall Rule Dialog Boxes</a> , on page 1011. If you do not select a row, the rule is added at the end of the local scope. For more information about adding rules, see <a href="#">Adding and Removing Rules</a> , on page 604. |
| Edit Row button   | Click this button to edit the selected rule. You can also edit individual cells. For more information, see <a href="#">Editing Rules</a> , on page 605.                                                                                                                                                                                              |
| Delete Row button | Click this button to delete the selected rule.                                                                                                                                                                                                                                                                                                       |

## Add and Edit Transparent Firewall Rule Dialog Boxes

Use the Add and Edit Transparent Firewall Rule dialog boxes to add and edit transparent firewall rules, which are configured as EtherType access control lists on the device. Before you configure transparent rules, read [Configuring Transparent Firewall Rules](#), on page 1007.

### Navigation Path

From the [Transparent Rules Page](#), on page 1009, click the **Add Row** button or select a row and click the **Edit Row** button.

*Table 301: Add and Edit Transparent Firewall Rule Dialog Boxes*

| Element     | Description                                                                                                                                                                                                                                                                 |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Rule | Whether to enable the rule, which means the rule becomes active when you deploy the configuration to the device. Disabled rules are shown overlain with hash marks in the rule table. For more information, see <a href="#">Enabling and Disabling Rules</a> , on page 616. |
| Action      | Whether the rule permits or denies traffic based on the conditions you define.                                                                                                                                                                                              |

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interfaces        | <p>The interfaces or interface roles to which the rule is assigned. You must select only bridged, transparent interfaces (for more specific information, see <a href="#">Configuring Transparent Firewall Rules , on page 1007</a>).</p> <p>Enter the name of the interface or the interface role, or click <b>Select</b> to select the interface or role from a list, or to create a new role. An interface must already be defined to appear on the list.</p> <p>Interface role objects are replaced with the actual interface names when the configuration is generated for each device. See <a href="#">Understanding Interface Role Objects , on page 301</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Traffic Direction | <p>The direction of the traffic to which this rule applies:</p> <ul style="list-style-type: none"> <li>• In—Packets entering an interface.</li> <li>• Out—Packets exiting an interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| EtherType         | <p>The hexadecimal code or keyword (for ASA/PIX/FWSM only) that identifies the traffic based on the EtherType value in the packet. Enter or select the following:</p> <ul style="list-style-type: none"> <li>• The hexadecimal EtherType value. For a list of codes, see RFC 1700 at <a href="http://www.ietf.org/rfc/rfc1700.txt">http://www.ietf.org/rfc/rfc1700.txt</a> "Ether Type." <ul style="list-style-type: none"> <li>• IOS devices—You can enter any value from 0x0000 to 0xFFFF.</li> <li>• ASA/PIX/FWSM devices—The value must be 0x0600 or later.</li> </ul> </li> <li>• For ASA/PIX/FWSM devices, you can also select these keywords: <ul style="list-style-type: none"> <li>• bpdu—Spanning Tree Bridge Protocol Data Units</li> <li>• ipx—Internet Packet Exchange</li> <li>• mpls-unicast—Multi-Protocol Label Switching, unicast.</li> <li>• mpls-multicast—MPLS multicast.</li> <li>• isis—IS-IS pass-through</li> <li>• any—Any packet regardless of EtherType.</li> <li>• eii-ipx</li> <li>• raw-ipx</li> </ul> </li> </ul> <p><b>Tip</b> The keyword "isis" in the list above refers to IS-IS pass-through support, which is new in Security Manager 4.4. "IS-IS pass-through support" means that IS-IS traffic can flow through the ASA in transparent mode.</p> <p><b>Note</b> Beginning from 4.16, the ethertype dsap CLI is used to interpret the installed ACEs—regardless of whether it was created with ether type bpdu, ipx, or isis— in ether type dsap format. This feature is supported for ASA 9.9(1) and later devices.</p> |

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Wildcard Mask (IOS) | The mask is a 16-bit hexadecimal number that determines how the EtherType code is interpreted.<br><br>A mask of 0xFFFF indicates the EtherType is literal. Any other mask indicates the corresponding bits in the EtherType to ignore. You must convert the hexadecimal number to binary to fully interpret the mask (binary 1 means interpret the corresponding EtherType value literally, 0 means allow any value at that position). |
| Category            | The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                              |
| Description         | An optional description of the rule (up to 1024 characters).                                                                                                                                                                                                                                                                                                                                                                           |

## Edit Transparent EtherType Dialog Box

Use the Edit Transparent EtherType dialog box to edit the EtherType in a transparent firewall rule. Enter the hexadecimal code that identifies the traffic. For ASA/PIX/FWSM devices, you can also select the keyword for some types of traffic. For a list of codes, see RFC 1700 at <http://www.ietf.org/rfc/rfc1700.txt> and search for “Ether Type.” For a more detailed description of EtherType, see [Add and Edit Transparent Firewall Rule Dialog Boxes](#) , on page 1011.

For more information, see [Configuring Transparent Firewall Rules](#) , on page 1007.

### Navigation Path

Right-click the EtherType cell in a transparent rule (on the [Transparent Rules Page](#) , on page 1009) and select **Edit EtherType**. You can edit the EtherType for one row at a time.

## Edit Transparent Mask Dialog Box

Use the Edit Transparent Mask dialog box to edit the mask in a transparent firewall rule for an IOS device. The mask is a 16-bit hexadecimal number that determines how the EtherType code is interpreted.

A mask of 0xFFFF indicates the EtherType is literal. Any other mask indicates the corresponding bits in the EtherType to ignore. You must convert the hexadecimal number to binary to fully interpret the mask (binary 1 means interpret the corresponding EtherType value literally, 0 means allow any value at that position).

For more information, see [Configuring Transparent Firewall Rules](#) , on page 1007.

### Navigation Path

Right-click the Mask cell in a transparent rule (on the [Transparent Rules Page](#) , on page 1009) and select **Edit Mask**. You can edit the mask for one row at a time.

## CHAPTER 24

# Configuring Network Address Translation

**Note** From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches, PIX, FWSM, and IPS, it does not support any enhancements.

These topics provide conceptual information about network address translation (NAT) in general, and about translation types and various implementations:

- [Understanding Network Address Translation , on page 1015](#)
- [NAT Policies on Cisco IOS Routers , on page 1020](#)
- [NAT Policies on Security Devices , on page 1030](#)

## Understanding Network Address Translation

Address translation substitutes the real address in a packet with a mapped address that is routable on the destination network. As part of the process, the device also records the substitution in a translation database; these records are known as “xlate” entries. The appropriate xlate entry must exist to allow address translation on return packets—the substitution of the original real address for the mapped address; this procedure is sometimes referred to as “untranslation.” Thus, network address translation (NAT) actually consists of two steps: the translation of a real address into a mapped address, and the reverse translation for returning traffic.

One of the main functions of NAT is to enable private IP networks to connect to the Internet. Network address translation replaces a private IP address with a public IP address, translating the private addresses in the internal network into legal, routable addresses that can be used on the public Internet. In this way, NAT conserves public addresses; for example, NAT rules can be configured to utilize only one public address for the entire network in communications with the outside world.

Other functions of NAT include:

- Security – Keeping internal IP addresses hidden discourages direct attacks.
- IP routing solutions – Overlapping IP addresses are not a problem.
- Flexibility – You can change internal IP addressing schemes without affecting the public addresses available externally. For example, for a server accessible to the Internet, you can maintain a fixed IP address for Internet use, but internally, you can change the server address.

Cisco devices support both NAT, which provides a globally unique address for each outbound host session, and Port Address Translation (PAT), which provides the same single address combined with a unique port number, for up to 64,000 simultaneous outbound or inbound host sessions. The global addresses used for NAT come from a pool of addresses specifically designated for address translation. The unique global address that is used for PAT can be either one global address, or the IP address of a given interface.

The device translates an address when an existing NAT rule matches the specific traffic. If no NAT rule matches, processing for the packet continues. The exception is when you enable NAT control. NAT control requires that packets traversing from a higher security interface (inside) to a lower security interface (outside) match a NAT rule, or processing for the packet stops.

Cisco devices can perform NAT or PAT on both inbound and outbound connections. This ability to translate inbound addresses is called “Outside NAT” because addresses on the outside, or less secure, interface are translated to a usable inside IP address. Just as when you translate outbound traffic, you may choose dynamic NAT, static NAT, dynamic PAT, or static PAT. If necessary, you can use outside NAT together with inside NAT to translate the both source and destination IP addresses of a packet.

---

**Note** In this document, all types of translation are generally referred to as NAT; see [Types of Address Translation](#) , on page 1017 for descriptions of the various types. When describing NAT, the terms inside and outside represent the security relationship between any two interfaces. The higher security level is inside and the lower security level is outside.

---

The release of ASA version 8.3 provides a simplified, interface-independent approach to configuring network address translation, as compared to earlier ASA versions and other devices. See [About “Simplified” NAT on ASA 8.3+ Devices](#) , on page 1018 for more information.

## Types of Address Translation

The following table briefly describes the various types of address translation.

**Table 302: Types of Address Translation**

|                    |                                                                                                                                                                                                                                                                                                            |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Static NAT         | Fixed translation of real source addresses to specific mapped addresses—each source address is always translated to the same mapped address, regardless of IP protocol and port number.                                                                                                                    |
| Static PAT         | Fixed translation of real source addresses with specific TCP or UDP port numbers, to specific mapped addresses and ports. That is, each source address/port is always translated to the same mapped address/port.                                                                                          |
| Policy Static NAT  | Fixed translation of real source addresses to specific mapped addresses. Destination networks/hosts are also specified, and the service is always IP.                                                                                                                                                      |
| Policy Static PAT  | Fixed translation of real source addresses with specific TCP or UDP port numbers, to specific mapped addresses and ports. Destination networks/hosts and services are also specified.                                                                                                                      |
| Dynamic NAT        | Dynamic translation of real source addresses to mapped addresses obtained from a pool of shared addresses. Each source address can be mapped to any available address in the pool.                                                                                                                         |
| Dynamic PAT        | Translation of real source addresses to a single mapped address; singularity is provided by dynamic translation of related port numbers. That is, each real address/port combination is translated to the same mapped address, but assigned a unique port. This is sometimes referred to as “overloading.” |
| Policy Dynamic NAT | Dynamic translation of specific source-address/destination-address/service combinations on a given interface, using a pool of shared addresses. Translation direction—outbound or inbound—is also specified.                                                                                               |

|              |                                                                                                                                                                                 |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Identity NAT | The specified address is translated to itself—that is, it is effectively not translated; applies to outbound connections only. Identity NAT is a particular type of Static NAT. |
| NAT Exempt   | Translation is bypassed for specified source/destination address combinations; connections can be initiated in both the outbound and inbound directions.                        |

---

**Note** While certain of these types do not apply to ASA 8.3 and later devices, the ASA 8.3+ devices do provide a Dynamic NAT and PAT option, which is Dynamic NAT with a Dynamic PAT back-up feature.

---

## About “Simplified” NAT on ASA 8.3+ Devices

The release of ASA version 8.3 provides a simplified approach to configuring network address translation (NAT), as compared to earlier ASA versions and other devices. Configuration of NAT was simplified by replacing the earlier flow-based scheme with an “original packet” to “translated packet” approach.

All NAT rules on the device—static NAT, dynamic PAT, and dynamic NAT—are presented in a single table, and essentially the same dialog box is used to configure all NAT rules. The NAT rules are interface independent (that is, interfaces are optional), meaning the rules are independent of security levels also.

NAT rules are no longer dependent on security levels. A global address space consisting of all interfaces is available, and is specified using the keyword “any.” All Interface fields default to **any**, so unless a specific interface is provided, the rule is applicable to all interfaces.

### Network Object NAT

You also can define NAT properties on Host, Address Range, and Network objects, such that corresponding NAT rules are applied automatically to the designated security device. Using these objects means you need enter the necessary IP addresses, services, ports, and optional interfaces only once. These automatically generated, object-based rules are referred to as “Network Object NAT” rules. Note that these rules cannot be created or deleted from the rules table; you must edit the appropriate objects in the Policy Object Manager. You can, however, edit these rules from the rules table after they have been defined for the network object. For more information, see [Add or Edit Network/Host Dialog Box: NAT Tab](#), on page 1060.

---

**Note** Network Object NAT rules are not displayed in the Translation Rules table in Policy View because these rules are device-specific.

---

### The NAT Table

As mentioned, all NAT rules on a device are presented in a single table, which is divided into three sections: a “manual” section, the Network Object NAT rules section, and another manual-rules section. You can add, edit and order rules in both manual sections; the Network Object NAT rules are added and ordered automatically, and as mentioned, to edit these rules you must edit the related objects.

The NAT rules in the table are applied on a top-down, first-match basis. That is, a packet is translated only when it matches a NAT rule, and as soon as a match is made, regardless of its location or section, NAT rule processing stops.

You can use this table to organize and manage the manual rules—you can insert rules in any order, and you can re-order them. The two sections of manual rules are provided to let you order manual rules both before and after the automatic object rules.

Network Object NAT rules are automatically ordered such that static rules appear before dynamic rules. These two types are each further ordered as follows:

- Fewest number of IP addresses – Rules for objects with one IP address are listed before those for objects with two addresses, which are before those with three addresses, and so on.
- IP address numbers – For objects having the same number of IP addresses, the rules are arranged such that the IP addresses themselves are in numerical order, from lower to higher. For example, 10.1.1.1 rules are listed before 11.1.1.1 rules.
- Object names – If the IP address is the same, the rules are ordered by alphabetizing the object names.

And remember, translation is based on the first matching rule.

### Destination Translation

With manual static rules, in addition to source address translation, you also can configure destination address translation. Source and destination translation are defined at the same time, in the same dialog box. Again, while source translation can be static or dynamic, destination translation is always static, and is only available with manual rules.

### Bi-directional or Twice NAT

When creating a manual static rule, you can select the “Bi-directional” option, which will produce an entry in the rules table that actually represents two static NAT rules, encompassing both translation directions. That is, a static rule is created for the specified source/translated address pairing, along with a mirror rule for the translated address/source pairing.

For example, if Bi-directional is chosen when you create a static rule with Host1 in the Source field and Host2 in the Translated field, two lines are added to the rules table: one with Host1 being translated to Host2, and one with Host2 being translated to Host1.

This is sometimes referred to as “Twice NAT” because only one look-up is required to fetch and process what is in effect two rules.

### Many-to-one Addressing

Generally, static NAT rules are configured with one-to-one address mapping. However, you can now define static NAT rules in which many IP addresses map to a few or one IP address. Functionally, many-to-few is the same as many-to-one, but because the configuration is more complicated, we recommend creating a many-to-one rule for each address as needed.

Many-to-one addressing might be useful, for example, in a situation where a range of public IP addresses is used to reach a load balancer which redirects requests to an internal network.

# NAT Policies on Cisco IOS Routers

You can configure NAT policies on a Cisco IOS router from the following tabs on the NAT policy page:

- [NAT Page: Interface Specification](#) , on page 1020
- [NAT Static Rule Dialog Boxes](#) , on page 1022
- [NAT Page: Dynamic Rules](#) , on page 1025
- [NAT Page: Timeouts](#) , on page 1028

Network Address Translation (NAT) converts private, internal LAN addresses into globally routable IP addresses. NAT enables a small number of public IP addresses to provide global connectivity for a large number of hosts.

For more information, see [Understanding Network Address Translation](#) , on page 1015.

## Navigation Path

- (Device view) Select **NAT** from the Policy selector.
- (Policy view) Select **NAT (Router)** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## NAT Page: Interface Specification

Before creating NAT rules, you must define the “direction” of the traffic to be translated by specifying the Inside and Outside interfaces. Inside interfaces typically connect to a LAN that the router serves. Outside interfaces typically connect to your organization’s WAN or to the Internet. You must designate at least one Inside interface and one Outside interface to enable the router to perform network address translation.

The Inside and Outside designations are used when interpreting translation rules: addresses connected to the Inside interface are translated to addresses on the Outside interface. After these interfaces are defined, they are used in all static and dynamic NAT translation rules.

Use the Interface Specification tab of the NAT policy page to specify the Inside and Outside interfaces.

## Navigation Path

- (Device view) Select **NAT** from the Policy selector, then click the **Interface Specification** tab.
- (Policy view) Select **NAT (Router) > Translation Rules** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Interface Specification** tab.

## Defining the Inside and Outside Interfaces

In the **NAT Inside Interfaces** and **NAT Outside Interfaces** fields, enter or Select the names of the interfaces or interface roles for the Inside and Outside interfaces, respectively. Separate multiple names or roles with commas (for example, Ethernet1/1, Ethernet1/2). Note that you cannot enter the same name in both fields.

## NAT Page: Static Rules

You define a static NAT rule by specifying a local address that must be translated, as well as the global address to which it is translated. This is a static or fixed mapping—the local address is always translated to the same global address.

You can define static NAT rules that translate the addresses of single hosts, as well as static rules that translate multiple addresses in a subnet. When multiple local addresses must use the same global address, you must define the necessary port redirection information, which defines a different port for each local address using the global address.

---

**Note** We strongly recommend that you do not perform NAT on traffic that will be transmitted over a VPN. Translating addresses on this traffic causes it to be sent out unencrypted instead of encrypted over the VPN.

---

The procedure for creating a static rule depends on whether the address being translated represents a port, a single host, or an entire subnet:

- You define a **static NAT rule for a single host** by entering the original address to translate and the global address to which it is translated. The global address may be taken from an interface on the device.
- You define a **static NAT rule for a subnet** by entering one of the addresses in the subnet (including the subnet mask) as the original address, and one of the global addresses that you want to use as the translated address. The router configures the remaining addresses based on the subnet mask you provide.
- You define a **static NAT rule for a port** by entering the original IP address and the global address to which it should be translated. The global address may be taken from an interface on the device. In addition, you must select the protocol used by the port, as well as the local and global port numbers.

The Add Static NAT Rule and Edit Static NAT Rule dialog boxes are used to add and edit these rules. Refer to [NAT Static Rule Dialog Boxes](#) , on page 1022 for descriptions of the fields displayed in the table on this page.

### Before You Begin

- Define the inside and outside interfaces used for NAT. See [NAT Page: Interface Specification](#) , on page 1020.

### Navigation Path

- (Device view) Select **NAT** from the Policy selector, then click the **Static Rules** tab.

- (Policy view) Select **NAT (Router) > Translation Rules** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Static Rules** tab.

## NAT Static Rule Dialog Boxes

Use the Add/Edit NAT Static Rule dialog boxes to add or edit static address translation rules. Except for their titles, the two dialog boxes are identical.

### Navigation Path

Go to the [NAT Page: Static Rules, on page 1021](#) tab; click the **Add** button beneath the table to add a new rule, or select a rule in the table and click **Edit** to update that rule.

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Original Address   | <p>An IP address, or the name of a network/host object representing the address(es) to be translated. You can enter or Select the object name.</p> <p>Network/host objects are logical collections of IP addresses that represent networks, hosts, or both. See <a href="#">Understanding Networks/Hosts Objects</a> , on page 308 for more information.</p> <p><b>Note</b> Do not enter a local address belonging to this router, as it could cause Security Manager management traffic to be translated. Translating this traffic will cause a loss of communication between the router and Security Manager.</p>                                                                                                                                                                                                                                                                                                                              |
| Translated Address | <p>Use the options in this section of the dialog box to specify the address(es) to which the Original Address(es) are translated:</p> <ul style="list-style-type: none"> <li>• <b>Specify IP</b> – Select this option to specify an IP address, or the name of a network/host object that provides the translated address(es). Add an IP address, or the name of a network/host object, in the <b>Translated IP/Network</b> field. You can enter or Select the object name.</li> <li>• <b>Use Interface IP</b> – Select this option to specify that the IP address assigned to a particular interface be used as the translated address. Enter or Select the name of the desired <b>Interface</b>. (This is typically the interface from which translated packets leave the router.)</li> </ul> <p><b>Note</b> This option is not available when Static Network is the chosen rule type. Only one static rule may be defined per interface.</p>  |
| Port Redirection   | <p>These parameters specify port information for the address translations. Port address translation lets you to use the same public IP address for multiple devices as long as the port specified for each device is different.</p> <p><b>Note</b> These parameters are available only when Static Port is the chosen rule type.</p> <p><b>Redirect Port</b> – When Static Port is chosen as the rule type, this box is automatically checked; it cannot be changed. Enter the appropriate information in the following fields:</p> <ul style="list-style-type: none"> <li>• <b>Protocol</b> – The communications protocol used for these ports: TCP or UDP.</li> <li>• <b>Local Port</b> – The port number on the source network. Valid values range from 1 to 65535.</li> <li>• <b>Global Port</b> – The port number on the destination network that the router is to use for this translation. Valid values range from 1 to 65535.</li> </ul> |

| Element  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Advanced | <p>This section contains optional, advanced translation options.</p> <p><b>Note</b> The Advanced options are available only when the Specify IP option is the selected method for defining the translated address(es).</p> <ul style="list-style-type: none"> <li>• No Alias – When selected, disables automatic aliasing for the global IP address translation.</li> </ul> <p>If the NAT pool used as an inside global pool consists of addresses on an attached subnet, an alias is generated for that address so that the router can answer Address Resolution Protocol (ARP) requests for those addresses.</p> <p>When deselected, global address aliases are permitted.</p> <ul style="list-style-type: none"> <li>• No Payload – When selected, prohibits an embedded address or port in the payload from being translated.</li> </ul> <p>The payload option performs NAT between devices on overlapping networks that share the same IP address. When an outside device sends a DNS query to reach an inside device, the local address inside the payload of the DNS reply is translated to a global address according to the relevant NAT rule.</p> <p>You can disable this feature by selecting the No Payload option. Otherwise, embedded addresses and ports in the payload may be translated. See <a href="#">Disabling the Payload Option for Overlapping Networks</a>, on page 1024 for more information.</p> <ul style="list-style-type: none"> <li>• Create Extended Translation Entry – When checked, extended translation entries (addresses and ports) are created in the translation table. This lets you associate multiple global addresses with a single local address. This is the default.</li> </ul> <p>When this option is deselected, simple translation entries are created, allowing association of a single global address with the local address.</p> <p><b>Note</b> This option is not available when Static Port is the chosen rule type.</p> |

## Disabling the Payload Option for Overlapping Networks

Overlapping networks result when you assign an IP address to a device on your network that is already legally owned and assigned to a different device on the Internet or outside network. Overlapping networks can also result after the merger of two companies using RFC 1918 IP addresses in their networks. These two networks need to communicate, preferably without your having to re-address all their devices.

This communication is achieved as follows. The outside device cannot use the IP address of the inside device because it is the same as the address assigned to itself (the outside device). Instead, the outside device sends a Domain Name System (DNS) query for the inside device's domain name. The source of this query is the IP address of the outside device, which is translated to an address from a designated address pool. The DNS server located on the inside network replies with the IP address associated with the inside device's domain name in the data portion of the packet. The destination address of the reply packet is translated back to the outside device's address, and the address in the data portion of the reply packet is translated to an address from a different address pool. In this way, the outside device learns that the IP address for the inside device is one of the addresses from that second address pool, and it uses this address when it communicates with the inside device. The router running NAT takes care of the translations at this point.

To disable the translation of the address inside the payload, check the **No Payload** option when you create a static NAT rule based on a global IP translation.

## NAT Page: Dynamic Rules

Use the NAT Dynamic Rules tab of the router's NAT page to manage dynamic address translation rules. A dynamic address translation rule dynamically maps hosts to addresses, using either the IP address of a specific interface (with dynamic port translation), or the addresses included in an address pool that are globally unique in the destination network.

### Defining Dynamic NAT Rules

You define a dynamic NAT rule by first selecting an access control list (ACL) whose rules specify the traffic requiring translation.

Then, you must either select an interface with an IP address to which the addresses should be translated, or define a pool of addresses to be used. You define the pool by specifying a range of addresses and giving the range a unique name; you can specify multiple ranges. The router uses the available addresses in the pool (those not used for static translations, or for its own WAN IP address) for connections to the Internet or another outside network. When an address is no longer in use, it is returned to the address pool to be dynamically assigned later to another device.

If the addressing requirements of your network exceed the available addresses in your dynamic NAT pool, you can use the Port Address Translation (PAT) feature (also called Overloading) to associate many private addresses with one or a small group of public IP address, using port addressing to make each translation unique. With PAT enabled, the router chooses a unique port number for the IP address of each outbound translation slot. This feature is useful if you cannot allocate enough unique IP addresses for your outbound connections. Note that Port Address Translation does not occur until the address pool is depleted.

---

**Note** By default, Security Manager does not perform NAT on traffic that is meant to be transmitted over a VPN. Otherwise, any traffic appearing in both the NAT ACL and the crypto ACL defined on an interface would be sent out unencrypted because NAT is always performed before encryption. However, you can change this default setting.

---

---

**Tip** You can perform PAT on split-tunneled traffic on the spokes of your VPN topology directly from the Global VPN Settings page. There is no need to create a dynamic NAT rule for each spoke. Any NAT rules that you define on an individual device override the VPN setting. For more information, see [Configuring VPN Global NAT Settings](#), on page 1191.

---

The Add Dynamic NAT Rule and Edit Static NAT Rule dialog boxes are used to add and edit these rules. Refer to [NAT Dynamic Rule Dialog Box](#), on page 1026 for descriptions of the fields displayed in the table on this page.

### Before You Begin

- Define the inside and outside interfaces used for NAT. See [NAT Page: Interface Specification](#), on page 1020.

### Navigation Path

- (Device view) Select **NAT** from the Policy selector, then click the **Dynamic Rules** tab.

- (Policy view) Select **NAT (Router) > Translation Rules** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Dynamic Rules** tab.

## NAT Dynamic Rule Dialog Box

Use the Add/Edit NAT Dynamic Rule dialog boxes to add or edit dynamic address translation rules. Except for their titles, the two dialog boxes are identical.

### Navigation Path

Go to the [NAT Page: Dynamic Rules](#) , on page 1025 tab; click the **Add** button beneath the table to add a new rule, or select a rule in the table and click **Edit** to update that rule.

| Traffic Flow | <p>In the <b>Access List</b> field, enter or Select the name of the access control list (ACL) object whose entries define the addresses requiring dynamic translation.</p> <p><b>Note</b> Make sure that the specified ACL does not permit the translation of Security Manager management traffic over any device address on this router. Translating this traffic will cause a loss of communication between the router and Security Manager.</p> |

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Translated Address | <p>Use the options in this section of the dialog box to specify the method and address(es) used for dynamic translation:</p> <ul style="list-style-type: none"> <li>• <b>Use Interface IP</b> – Select this option to specify that the globally registered IP address assigned to a particular interface be used as the translated address; port addressing ensures each translation is unique. (The Enable Port Translation (Overload) option is checked automatically when you select Use Interface IP.)</li> </ul> <p>Enter or Select the name of the desired <b>Interface</b>. This is typically the interface from which translated packets leave the router, meaning the interface or interface role must represent an outside interface on the router (see <a href="#">NAT Page: Interface Specification , on page 1020</a>).</p> <ul style="list-style-type: none"> <li>• <b>Address Pool</b> – Select this option to base address translation on the addresses you specify in the <b>Network Ranges</b> pool.</li> </ul> <p>Enter one or more address ranges, including the prefix, using the format min1-max1/prefix (in CIDR notation), where “prefix” represents a valid netmask. For example, 172.16.0.0-172.31.0.223/12 .</p> <p>You can add as many address ranges to the address pool as required, but all ranges must share the same prefix. Separate multiple entries with commas.</p>                                                                                                                                                                                                                                                                        |
| Settings           | <p>This section contains two options</p> <ul style="list-style-type: none"> <li>• <b>Enable Port Translation (Overload)</b> – When selected, the router uses port addressing (PAT) if supply of global addresses in the address pool is depleted; when deselected, PAT is not used.</li> </ul> <p><b>Note</b> When you use select Use Interface IP in the Translated Address section, this box is checked automatically; it cannot be changed.</p> <ul style="list-style-type: none"> <li>• <b>Do Not Translate VPN Traffic (Site-to-Site VPN only)</b> – Deselect this option to allow address translation on traffic intended for a site-to-site VPN.</li> </ul> <p>When selected, address translation is not performed on VPN traffic. When deselected, the router performs address translation on VPN traffic in cases of overlapping addresses between the NAT ACL and the crypto ACL.</p> <p><b>Note</b> We strongly recommend that you not deselect this option, or any traffic defined in both the NAT ACL and the crypto ACL will be sent unencrypted. When you perform NAT into IPsec, we also recommend that you leave this option selected; it does not interfere with the translation of addresses arriving from overlapping networks.</p> <p>This setting applies only in situations where the NAT ACL overlaps the crypto ACL used by the site-to-site VPN. Because the interface performs NAT first, any traffic arriving from an address within this overlap would get translated, causing the traffic to be sent unencrypted. Leaving this box checked prevents that from happening.</p> <p><b>Note</b> This option does not apply to remote access VPNs.</p> |

## NAT Page: Timeouts

Use the NAT Timeouts tab of the router's NAT page to manage the timeout values for port address (overload) translations. These timeouts cause a dynamic translation to expire after a specified period of inactivity. In addition, you can use options on this page to place a limit on the number of entries allowed in the dynamic NAT table, and to modify the default timeout on all dynamic translations that do not include PAT processing.

### About Dynamic NAT Timeouts

Dynamic NAT translations have a timeout period for non-use, after which they expire and are purged from the translation table. If you enable the Overload feature for performing PAT, you can specify a variety of values that provide finer control over these timeouts, because each translation entry contains additional contextual information about the traffic using it.

For example, non-DNS translations time out by default after five minutes, but DNS translations time out after 1 minute. Further, TCP translations time out after 24 hours, unless an RST or FIN is seen on the stream, in which case they time out after one minute. You can change any of these timeout values.

---

**Note** If you disable the Port Translation (Overload) feature for all dynamic rules, you need not enter any PAT-related timeout values. However, you can still modify the default timeout value for non-PAT dynamic translations. (By default, all dynamic translations expire after 24 hours.) For more information about the Overload feature, see [NAT Dynamic Rule Dialog Box](#), on page 1026.

---

### Navigation Path

- (Device view) Select **NAT** from the Policy selector, then click the **Timeouts** tab.
- (Policy view) Select **NAT (Router)** > **Translation Rules** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Timeouts** tab.

### Field Reference

*Table 305: NAT Timeouts Tab*

| Element        | Description                                                                                                                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Max Entries    | The maximum number of entries allowed in the dynamic NAT table. You can enter a value between 1 and 2147483647, or you can leave the field blank (the default), which means that the number of entries in the table is unlimited. |
| Timeout (sec.) | The number of seconds after which dynamic translations expire; this does not apply to PAT (overload) translations. The default is 86400 seconds (24 hours).                                                                       |

| Element               | Description                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UDP Timeout (sec.)    | <p>The timeout value applied to User Datagram Protocol (UDP) ports. The default is 300 seconds (5 minutes).</p> <p><b>Note</b> This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see <a href="#">NAT Dynamic Rule Dialog Box</a> , on page 1026.</p>                                                                |
| DNS Timeout (sec.)    | <p>The timeout value applied to Domain Naming System (DNS) server connections. The default is 60 seconds.</p> <p><b>Note</b> This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see <a href="#">NAT Dynamic Rule Dialog Box</a> , on page 1026.</p>                                                                  |
| TCP Timeout (sec.)    | <p>The timeout value applied to Transmission Control Protocol (TCP) ports. The default is 86400 seconds (24 hours).</p> <p><b>Note</b> This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see <a href="#">NAT Dynamic Rule Dialog Box</a> , on page 1026.</p>                                                        |
| FINRST Timeout (sec.) | <p>The timeout value applied when a Finish (FIN) packet or Reset (RST) packet (both of which terminate connections) is found in the TCP stream. The default is 60 seconds.</p> <p><b>Note</b> This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see <a href="#">NAT Dynamic Rule Dialog Box</a> , on page 1026.</p> |
| ICMP Timeout (sec.)   | <p>The timeout value applied to Internet Control Message Protocol (ICMP) flows. The default is 60 seconds.</p> <p><b>Note</b> This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see <a href="#">NAT Dynamic Rule Dialog Box</a> , on page 1026.</p>                                                                 |
| PPTP Timeout (sec.)   | <p>The timeout value applied to NAT Point-to-Point Tunneling Protocol (PPTP) flows. The default is 86400 seconds (24 hours).</p> <p><b>Note</b> This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see <a href="#">NAT Dynamic Rule Dialog Box</a> , on page 1026.</p>                                               |
| SYN Timeout (sec.)    | <p>The timeout value applied to TCP flows after a synchronous transmission (SYN) message (used for precise clocking) is encountered. The default is 60 seconds.</p> <p><b>Note</b> This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see <a href="#">NAT Dynamic Rule Dialog Box</a> , on page 1026.</p>            |

# NAT Policies on Security Devices

The following topics describe configuring network address translation (NAT) options on managed security appliances: PIX firewalls, Firewall Service Modules (FWSMs) on Catalyst switches, pre-version-8.3 Adaptive Security Appliances (ASAs), and ASA 8.3+ devices. The topics are arranged as follows:

- [NAT in Transparent Mode](#) , on page 1030
- [Translation Options Page](#) , on page 1032
- **PIX, FWSM, and pre-8.3 ASA**
  - [Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices](#) , on page 1033
  - [Address Pools](#) , on page 1034
- **ASA 8.3+**
  - [Configuring NAT on ASA 8.3+ Devices](#) , on page 1050
  - [Translation Rules: ASA 8.3+](#) , on page 1051

## NAT in Transparent Mode

Using NAT on a security appliance operating in transparent mode eliminates the need for upstream or downstream routers to perform NAT for their networks. NAT in transparent mode has the following requirements and limitations:

- When the mapped addresses are not on the same network as the transparent firewall, you need to add a static route for the mapped addresses on the upstream router that points to the downstream router (through the security appliance).
- If the real destination address is not directly connected to the security appliance, you also need to add a static route on the security appliance for the real destination address that points to the downstream router. Without NAT, traffic from the upstream router to the downstream router does not need any routes on the security appliance because it uses the MAC address table. Using NAT, however, causes the security appliance to use a route look-up instead of a MAC address look-up, so it needs a static route to the downstream router.
- Because the transparent firewall does not have any interface IP addresses, you cannot use interface PAT.
- ARP inspection is not supported. Moreover, if for some reason a host on one side of the security appliance sends an ARP request to a host on the other side of the security appliance, and the initiating host real address is mapped to a different address on the same subnet, then the real address remains visible in the ARP request.

## CGNAT Map Page

Beginning with version 4.20, Cisco Security Manager supports Carrier-Grade NAT Mapping of Address and Port (CGNAT MAP) domains for ASA 9.13(1) devices operating in single, multi-context, and routed modes. This feature helps configure MAP domains using default or basic mapping rules.

**Note** CGNAT MAP is not supported in transparent mode.

### Navigation Path

- (Device view) Select **NAT > CGNAT MAP** from the Device Policy selector.
- (Policy View) Select **NAT (PIX/ASA/FWSM) > CGNAT MAP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click CGNAT MAP to create a new **CGNAT MAP** policy.

*Table 306:*

| Element              | Description                                                                                                        |
|----------------------|--------------------------------------------------------------------------------------------------------------------|
| Add Map Domain       | When selected, lets you add a map domain using basic or default mapping rules.                                     |
| Map Domain Name      | Enter the name of the map domain for which the mapping rule must be applied.                                       |
| Basic Mapping Rule   | Select the Basic Mapping Rule check box to specify the IPv4 and IPv6 prefixes, Share Ratio, and Start Port number. |
| Default Mapping Rule | Enter the IPv6 prefix to apply the default mapping rule.                                                           |

## Global Options Page

Security Manager version 4.9 supports Carrier Grade NAT to configure the block size and maximum blocks per host limit for port block allocation, for ASA devices 9.5(1) or later. Use the Global Options page to configure these options.

### Navigation Path

- (Device view) Select **NAT > Global Options** from the Device Policy selector.
- (Policy view) Select **NAT (PIX/ASA/FWSM) > Global Options** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click **Global Options** to create a new policy.

**Field Reference***Table 307: Global Options Page*

| Element                                 | Description                                                                                                                                                                   |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| xlate block-allocation size             | Enter a value between 32 and 4096. The default value is 512.                                                                                                                  |
| xlate block-allocation maximum-per-host | Enter a value between 1 to 8. The default value is 4.                                                                                                                         |
| xlate block-allocation interim logging  | Configure a timer interval to generate syslog for all the active port blocks allocated at that time for ASA 9.12(1) devices and later. Enter a value between 43200 to 604800. |

## Translation Options Page

Use the Translation Options page to set options that affect network address translation for the selected security appliance. These settings apply to all interfaces on the device.

**Navigation Path**

- (Device view) Select **NAT > Translation Options** from the Device Policy selector.
- (Policy view) Select **NAT (PIX/ASA/FWSM) > Translation Options** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click **Translation Options** to create a new policy.

|-----------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable traffic through the firewall without address translation | When selected, lets traffic pass through the security appliance without address translation. If this option is not selected, any traffic that does not match a translation rule will be dropped.<br><br><b>Note</b> This option is available only on PIX 7.x, FWSM 3.x, and ASA devices. |

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable xlate bypass                       | <p>When selected, establishment of NAT sessions for untranslated traffic is disabled (this feature is called “xlate bypass”).</p> <p><b>Note</b> This option is available only on FWSM 3.2 and later.</p> <p>By default, the FWSM creates NAT sessions for all connections even if NAT is not used. For example, a session is created for each untranslated connection even if NAT control is not enabled, if NAT exemption or identity NAT is used, or if you use same-security interfaces and do not configure NAT. Because there is a maximum number of NAT sessions (266,144 concurrent), these kinds of NAT sessions might cause you to run into the limit. To avoid reaching the limit, enable xlate bypass.</p> <p>If you disable NAT control and have untranslated traffic or use NAT exemption, or if you enable NAT control and use NAT exemption, then with xlate bypass, the FWSM does not create a session for those types of untranslated traffic. However, NAT sessions are still created in the following instances:</p> <ul style="list-style-type: none"> <li>• You configure identity NAT (with or without NAT control)—identity NAT is considered to be a translation.</li> <li>• You use same-security interfaces with NAT control. Traffic between same-security interfaces create NAT sessions even when you do not configure NAT for the traffic. To avoid NAT sessions in this case, disable NAT control, or use NAT exemption as well as xlate bypass.</li> </ul> |
| Do not translate VPN traffic              | When selected, VPN traffic passes through the security appliance without address translation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Clear translates for existing connections | <p>When selected, the translation slots assigned to dynamic translations and any associated connections are cleared following each session.</p> <p>Each session connecting through the security appliance, and undergoing some form of NAT or PAT, is assigned a translation slot known as an “xlate.” These translation slots can persist after the session is complete, which can lead to a depletion of translation slots, unexpected traffic behavior, or both.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices

**Note** From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functions, it does not support any enhancements.

The following sections describe configuring network address translation on PIX and FWSM devices, and on pre-8.3-version ASAs. (See [Configuring NAT on ASA 8.3+ Devices](#), on page 1050 for information about configuring NAT on ASA 8.3+ devices.)

- [Address Pools](#), on page 1034
- [Translation Rules: PIX, FWSM, and pre-8.3 ASA](#), on page 1035
  - [Translation Exemptions \(NAT 0 ACL\)](#), on page 1036

- [Dynamic Rules Tab](#) , on page 1038
- [Policy Dynamic Rules Tab](#) , on page 1040
- [Static Rules Tab](#) , on page 1042
- [General Tab](#) , on page 1048

## Address Pools

Use the Address Pools page to view and manage the global address pools used in dynamic NAT rules.

The Address Pool dialog box is used to add and edit these address pools. Refer to [Address Pool Dialog Box](#) , on page 1034 for descriptions of the fields displayed in the Global Address Pools table on this page.

### Navigation Path

- (Device view) Select **NAT > Address Pools** from the Device Policy selector.
- (Policy view) Select **NAT (PIX/ASA/FWSM) > Address Pools** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click **Address Pools** to create a new policy.

### Related Topics

- [Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices](#) , on page 1033

## Address Pool Dialog Box

Use the Address Pool dialog box to add or edit a global address pool for use in dynamic NAT rules.

### Navigation Path

You open the Address Pool dialog box by clicking the Add Row or Edit Row buttons on the [Address Pools](#) , on page 1034.

### Related Topics

- [Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices](#) , on page 1033

### Field Reference

*Table 309: Address Pools Dialog Box*

| Element        | Description                                                                                                                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name | Enter or Select the name of the device interface on which the mapped IP addresses will be used.                                                                                                                         |
| Pool ID        | Enter a unique identification number for this address pool, an integer between 1 and 2147483647. When configuring a dynamic NAT rule, you select a Pool ID to specify the pool of addresses to be used for translation. |

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP address ranges    | <p>Enter or Select the addresses to be assigned to this address pool. You can specify these addresses as follows:</p> <ul style="list-style-type: none"> <li>• Address range for dynamic NAT (e.g., 192.168.1.1-192.168.1.15)</li> <li>• Subnetwork (e.g., 192.168.1.0/24)</li> <li>• List of addresses separated by commas (e.g., 192.168.1.1, 192.168.1.2, 192.168.1.3)</li> <li>• Single address to use for PAT (e.g., 192.168.1.1)</li> <li>• Combinations of the above (e.g., 192.168.1.1-192.168.1.15, 192.168.1.25)</li> <li>• Names of hosts on the connected network; these will be resolved to IP addresses.</li> </ul> |
| Description          | Enter a description for the address pool.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Enable Interface PAT | When checked, port address translation is enabled on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Translation Rules: PIX, FWSM, and pre-8.3 ASA

**Note** From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functionality, it does not support any enhancements.

Use the Translation Rules page to define network address translation (NAT) rules on the selected device. The Translation Rules page consists of the following tabs:

- [Translation Exemptions \(NAT 0 ACL\)](#), on page 1036 – Use this tab to configure rules specifying traffic that is exempt from address translation.

**Note** Translation exemptions are only supported by PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules.

- [Dynamic Rules Tab](#), on page 1038 – Use this tab to configure dynamic NAT and PAT rules.

**Note** Dynamic translation rules are only supported by PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules.

- [Policy Dynamic Rules Tab](#), on page 1040 – Use this tab to configure dynamic translation rules based on source and destination addresses and services.

---

**Note** Policy dynamic rules are only supported by PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules.

---

- [Static Rules Tab , on page 1042](#) – Use this tab to configure static translation rules for a security appliance or shared policy.
- [General Tab , on page 1048](#) – Use this tab to view all current translation rules, listed in the order that they will be evaluated on the device.

---

**Note** The General tab is visible only for PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules and do not need to display summary information.

---

### Navigation Path

To access the Translation Rules page, do one of the following:

- (Device view) Select **NAT > Translation Rules** from the Device Policy selector.
- (Policy view) Select **NAT (PIX/ASA/FWSM) > Translation Rules** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click **Translation Rules** to create a new policy.

## Translation Exemptions (NAT 0 ACL)

Use the Translation Exemptions (NAT 0 ACL) tab of the Translation Rules page to view and specify rules that exempt traffic from address translation. Rules are evaluated sequentially in the order listed. The row number indicates the rule's position in the ordering of the list. You can use the Up Row and Down Row buttons to change the position of the selected rule.

The Add/Edit Translation Exemption (NAT-0 ACL) Rule dialog box is used to add and edit these rules. Refer to [Add/Edit Translation Exemption \(NAT-0 ACL\) Rule Dialog Box , on page 1037](#) for descriptions of the fields displayed in the table on this page.

---

**Note** Translation exemptions are only supported by PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules.

---

### Navigation Path

You can access the Translation Exemptions (NAT 0 ACL) tab from the [Translation Rules: PIX, FWSM, and pre-8.3 ASA , on page 1035](#) page.

### Related Topics

- [Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices , on page 1033](#)

  - [Table Columns and Column Heading Features](#) , on page 51

## Add/Edit Translation Exemption (NAT-0 ACL) Rule Dialog Box

Use the Add/Edit Translation Exemption (NAT-0 ACL) Rule dialog box to define and edit translation exemption rules on PIX, FWSM and pre-8.3 ASA devices in router mode, and FWSM 3.2 devices in transparent mode.

### Navigation Path

You can access the Add/Edit Translation Exemption (NAT-0 ACL) Rule dialog box from the Translation Exemptions (NAT 0 ACL) tab. See [Translation Exemptions \(NAT 0 ACL\)](#) , on page 1036 for more information.

### Related Topics

### Field Reference

**Table 310: Add/Edit Translation Exemption (NAT-0 ACL) Rule Dialog Box**

| Element               | Description                                                                                                                                                                                                                                                                                |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Rule           | If checked, the rule is enabled. Deselect this option to disable the rule without deleting it.                                                                                                                                                                                             |
| Action                | Select the action for this rule: <ul style="list-style-type: none"> <li>• exempt – The rule identifies traffic that is exempt from NAT.</li> <li>• do not exempt – The rule identifies traffic that is not exempt from NAT.</li> </ul>                                                     |
| Original: Interface   | Enter the name of (or Select) the device interface to which the rule applies.                                                                                                                                                                                                              |
| Original: Sources     | Enter IP addresses for (or Select) the source hosts and network objects to which the rule applies. Multiple entries must be separated by commas.<br><br>Note that this parameter is displayed in the Translation Exemptions (NAT 0 ACL) table under the column heading “Original Address.” |
| Translated: Direction | The rule can be applied to Inbound or Outbound traffic, as specified with this option.                                                                                                                                                                                                     |

| Element                     | Description                                                                                                                                                                                                                                                                                                 |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Traffic flow: Destinations  | Enter IP addresses for (or Select) the destination hosts and network objects to which the rule applies. Multiple entries must be separated by commas.                                                                                                                                                       |
| Category                    | To assign the rule to a category, choose the category from this list. Categories can help identify rules and objects using labels and color-coding. See <a href="#">Using Category Objects , on page 239</a> for more information.<br><br><b>Note</b> No commands are generated for the Category attribute. |
| Description                 | Enter a description of the rule.                                                                                                                                                                                                                                                                            |
| Advanced button (FWSM only) | Click to open the <a href="#">Advanced NAT Options Dialog Box , on page 1046</a> to configure advanced settings for this rule.                                                                                                                                                                              |

## Dynamic Rules Tab

Use the Dynamic Rules tab of the Translation Rules page to view and configure dynamic NAT and PAT rules. Rules are evaluated sequentially in the order listed. The row number indicates the rule's position in the ordering of the list. You can use the Up Row and Down Row buttons to change the position of the selected rule.

With dynamic NAT, internal IP addresses are dynamically translated using IP addresses from a pool of global addresses. With dynamic PAT, internal IP addresses are translated to a single mapped address by using dynamically assigned port numbers with the mapped address. Dynamic translations are often used to map local RFC 1918 IP addresses to addresses that are Internet-routable.

The Add/Edit Dynamic Translation Rule dialog box is used to add and edit these rules. Refer to [Add/Edit Dynamic Translation Rule Dialog Box , on page 1039](#) for descriptions of the fields displayed in the table on this page.

---

**Note** Dynamic translation rules are only supported by PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules.

---

### Navigation Path

You can access the Dynamic Rules tab from the Translation Rules page. For more information about the Translation Rules page, see [Translation Rules: PIX, FWSM, and pre-8.3 ASA , on page 1035](#).

---

**Note** By default, only standard Dynamic Rule elements are displayed in this table. Additional columns for elements defined in the Advanced NAT Options dialog box can be displayed by right-clicking any column heading. (All columns are displayed by default on the [General Tab , on page 1048](#)).

**Table 311: Add/Edit Dynamic Translation Rule Dialog Box**

| Element               | Description                                                                                                                                                                                                                                   |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Rule           | If checked, the rule is enabled. Deselect this option to disable the rule without deleting it.                                                                                                                                                |
| Original: Interface   | Enter the name or Select the device interface to which the rule applies.                                                                                                                                                                      |
| Original: Address     | Enter IP addresses for (or Select) the source hosts and network objects to which the rule applies. Multiple entries must be separated by commas.                                                                                              |
| Translated: Pool      | Enter (or Select) the ID number of the pool of addresses used for translation; clicking Select opens the <a href="#">Select Address Pool Dialog Box</a> , on page 1040.<br><br>Enter a value of zero to specify this as an identity NAT rule. |
| Translated: Direction | The rule can be applied to Inbound or Outbound traffic, as specified with this option.                                                                                                                                                        |
| Advanced button       | Click to open the <a href="#">Advanced NAT Options Dialog Box</a> , on page 1046 to configure advanced settings for this rule.                                                                                                                |

## Select Address Pool Dialog Box

The Select Address Pool dialog box presents a list of global address pools; these pools are defined and managed via the [Address Pools](#), on page 1034. Use this dialog box to select an address pool for use by a dynamic translation rule, or a policy dynamic translation rule.

### Navigation Path

You can access the Select Address Pool dialog box from the [Add/Edit Dynamic Translation Rule Dialog Box](#), on page 1039 when adding or editing a dynamic translation rule, or from the [Add/Edit Policy Dynamic Rules Dialog Box](#), on page 1041 when adding or editing a policy dynamic translation rule.

### Field Reference

*Table 312: Select Address Pool Dialog Box*

| Element           | Description                                                                                                                                              |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pool ID           | The identification number of the address pool.                                                                                                           |
| Interface         | The name of the device interface to which the address pool applies.                                                                                      |
| IP Address Ranges | The IP addresses assigned to the pool; “interface” in this list indicates PAT is enabled on the specified Interface.                                     |
| Description       | The description provided for the address pool.                                                                                                           |
| Selected Row      | This field identifies the pool currently selected in the list. When you click OK to close the dialog box, this pool is assigned to the translation rule. |

## Policy Dynamic Rules Tab

Use the Policy Dynamic Rules tab of the Translation Rules page to view and configure dynamic translation rules based on source and destination addresses and services. Rules are evaluated sequentially in the order listed. The row number indicates the rule’s position in the ordering of the list. You can use the Up Row and Down Row buttons to change the position of the selected rule.

The Add/Edit Policy Dynamic Rule dialog box is used to add and edit these rules. Refer to [Add/Edit Policy Dynamic Rules Dialog Box](#), on page 1041 for a description of the fields displayed in the table on this page.

**Note** Policy dynamic rules are only supported by PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules.

### Navigation Path

You can access the Policy Dynamic Rules tab from the Translation Rules page. See [Translation Rules: PIX, FWSM, and pre-8.3 ASA](#) , on page 1035 for more information.

---

**Note** By default, only standard Policy Dynamic Rule elements are displayed in this table. Additional columns for elements defined in the Advanced NAT Options dialog box can be displayed by right-clicking any column heading. (All columns are displayed by default on the [General Tab](#) , on page 1048.)

Multiple entries must be separated by commas.                                                                                                                                                       |
| Traffic flow: Services     | Enter (or Select) the services to which the rule applies. Multiple entries must be separated by commas.                                                                                                                                                                                                     |
| Category                   | To assign the rule to a category, choose the category from this list. Categories can help identify rules and objects using labels and color-coding. See <a href="#">Using Category Objects</a> , on page 239 for more information.<br><br><b>Note</b> No commands are generated for the Category attribute. |
| Description                | Enter a description of the rule.                                                                                                                                                                                                                                                                            |
| Advanced button            | Click to open the <a href="#">Advanced NAT Options Dialog Box</a> , on page 1046 to configure advanced settings for this rule.                                                                                                                                                                              |

## Static Rules Tab

Use the Static Rules tab of the Translation Rules page to view and configure static translation rules for a security appliance or shared policy. Rules are evaluated sequentially in the order listed. The row number indicates the rule’s position in the ordering of the list. You can use the Up Row and Down Row buttons to change the position of the selected rule.

With static translation, internal IP addresses are permanently mapped to a global IP address. These rules map a host address on a lower security-level interface to a global address on a higher security-level interface. For example, a static rule would be used for mapping the local address of a web server on a perimeter network to a global address that hosts on the outside interface would use to access the web server.

**Caution**

The order of Static NAT rules on a security device is important, and Security Manager preserves this ordering during deployment. However, security appliances do not support in-line editing of Static NAT rules. This means that if you move, edit, or insert a rule anywhere above the end of the list, Security Manager will remove from the device all Static NAT rules that follow the new or modified rule, and then re-send the updated list from that point. Depending on the length of the list, this can require substantial overhead, and may result in traffic interruption. Whenever possible, add any new Static NAT rules to the end of the list.

The Add/Edit Static Rule dialog box is used to add and edit these rules. Refer to [Add/Edit Static Rule Dialog Box](#) , on page 1043 for descriptions of the fields displayed in the table on this page.

**The “Nailed” Column in the Static Rules Table**

In addition to the columns representing parameters specified in the [Add/Edit Static Rule Dialog Box](#) , on page 1043, the Static Rules table displays a column labeled “Nailed.” This value is a product of device discovery; it cannot be changed in Security Manager.

The entry in the “Nailed” Column indicates whether TCP state tracking and sequence checking is skipped for the connection: true or false.

**Navigation Path**

You can access the Static Rules tab from the Translation Rules page. See [Translation Rules: PIX, FWSM, and pre-8.3 ASA](#) , on page 1035 for more information.

**Note**

By default, only standard Static Rules elements are displayed in this table. Additional columns for elements defined in the Advanced NAT Options dialog box can be displayed by right-clicking any column heading. (All columns are displayed by default on the [General Tab](#) , on page 1048.)

**Table 314: Add/Edit Static Rule Dialog Box**

| Element                               | Description                                                                                                                                                                                            |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Rule                           | If checked, the rule is enabled. Deselect this option to disable the rule without deleting it.                                                                                                         |
| Translation Type                      | Select the type of translation for this rule: NAT or PAT.                                                                                                                                              |
| Original Interface                    | Enter (or Select) the device interface connected to the host or network with original addresses to be translated.                                                                                      |
| Original Address                      | Enter (or Select) the source address to be translated.                                                                                                                                                 |
| Translated Interface                  | Enter (or Select) the interface on which the translated addresses are to be used.<br>To specify this as an identity NAT rule, enter the same interface in both this and the Original Interface fields. |
| Use Interface IP/Use Selected Address | Specify the address used for the Translated Interface: select Use Interface IP (address), or select Use Selected Address and enter an address, or Select a network/host object.                        |
| Enable Policy NAT                     | Select this option to enable Policy NAT for this translation rule.                                                                                                                                     |
| Dest Address                          | If Policy NAT is enabled, specify the destination addresses of the hosts or networks to which the rule applies.                                                                                        |

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Services        | <p>If Policy NAT is enabled, enter or Select the Services to which the rule applies.</p> <p><b>Note</b> For Static Policy NAT, IP is the only Service that can be specified.</p> <p>The syntax for service and service-object specification is:</p> <pre>{tcp   udp   tcp&amp;udp}/{source_port_number   port_list_object }/ {destination_port_number   port_list_object }</pre> <p>Note that if you enter only one port parameter, it is interpreted as the destination port (with a source port of “any”). For example, <b>tcp/4443</b> means tcp, source port any, destination port 4443, while <b>tcp/4443/Default Range</b> means tcp, source port 4443, and destination port Default Range (generally 1-65535).</p> <p>As with all text-entry fields, Security Manager may display auto-complete options. For example, if you type <b>tcp/</b> in this field, an auto-complete list of all Port Lists objects defined in Security Manager is displayed. This list will include system-generated objects such as DEFAULT RANGE, HTTPS and WEBPORTS.</p> <p>Refer to <a href="#">Configuring Port List Objects</a> , on page 331 for more information about Port Lists, and <a href="#">Configuring Service Objects</a> , on page 332 for more information about defining Services.</p> |
| Protocol        | <p>If PAT is the selected Translation Type, select the protocol, TCP or UDP, to which the rule applies.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Original Port   | <p>If PAT is the selected Translation Type, enter the port number to be translated.</p> <p>Note that this parameter is displayed in the Static Rules table under the column heading “Local Port.”</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Translated Port | <p>If PAT is the selected Translation Type, enter the port number to which the original port number will be translated.</p> <p>Note that this parameter is displayed in the Static Rules table under the column heading “Global Port.”</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Category        | <p>To assign the rule to a category, choose the category from this list. Categories can help identify rules and objects using labels and color-coding. See <a href="#">Using Category Objects</a> , on page 239 for more information.</p> <p><b>Note</b> No commands are generated for the Category attribute.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Description     | <p>Enter a description of the rule.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Advanced button | <p>Click to open the <a href="#">Advanced NAT Options Dialog Box</a> , on page 1046 to configure advanced settings for this rule.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### Edit Translated Address Dialog Box

Use the Edit Translated Address dialog box to change just the translated address assigned to a static translation rule. The translated address is the address to which the original address is changed. The interface’s IP address can be used, or you can enter a specific IP address. See [Static Rules Tab](#) , on page 1042 for more information about static rules and translated addresses.

For detailed information on editing firewall rules cells, see [Editing Rules](#) , on page 605.

### Navigation Path

Right-click the Translated Address cell in the Static Rules table (on the NAT > Translation Rules page) and choose **Edit Translated Address**.

## Advanced NAT Options Dialog Box

Use the Advanced NAT Options dialog box to configure the advanced connection settings—DNS Rewrite, Maximum TCP and Maximum UDP Connections, Embryonic Limit, Timeout (PIX 6.x), and Randomize Sequence Number—for NAT and Policy NAT. You can also configure these options for Translation Exemption (NAT 0 ACL) rules on an FWSM.

### Navigation Path

You can access the Advanced NAT Options dialog box by clicking the **Advanced** button when adding or editing a translation rule. See the following topics for more information:

- [Add/Edit Translation Exemption \(NAT-0 ACL\) Rule Dialog Box](#) , on page 1037
- [Add/Edit Dynamic Translation Rule Dialog Box](#) , on page 1039
- [Add/Edit Policy Dynamic Rules Dialog Box](#) , on page 1041
- [Add/Edit Static Rule Dialog Box](#) , on page 1043

## Field Reference

Table 315: Advanced NAT Options Dialog Box

| Element                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Translate the DNS replies that match the translation rule | <p>If checked, the security appliance rewrites DNS replies so an outside client can resolve the name of an inside host using an inside DNS server, and vice versa. For instance, if your NAT rule includes the real address of a host with an entry in a DNS server, and the DNS server is on a different interface from a client, then the client and the DNS server need different addresses for the host: one needs the mapped address and one needs the real address. This option rewrites the address in the DNS reply to the client.</p> <p>As an example, assume an inside web server, <code>www.example.com</code>, has the IP address <code>192.168.1.1</code>, which is translated to <code>10.1.1.1</code> on the outside interface of the appliance. An outside client sends a DNS request to an inside DNS server, which will resolve <code>www.example.com</code> to <code>192.168.1.1</code>. When the reply comes to the security appliance with DNS Rewrite enabled, the security appliance will translate the IP address in the payload to <code>10.1.1.1</code>, so that the outside client will get the correct IP address.</p> <p>Note that the mapped host needs to be on the same interface as either the client or the DNS server. Typically, hosts that need to allow access from other interfaces use a static translation, so this option is more likely to be used with a static rule.</p> |
| Max TCP Connections per Rule                              | Enter the maximum number of TCP connections allowed; valid values are 0 through 65,535. If this value is set to zero, the number of connections is unlimited.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Max UDP Connections per Rule                              | Enter the maximum number of UDP connections allowed; valid values are 0 through 65,535. If this value is set to zero, the number of connections is unlimited.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Max Embryonic Connections                                 | <p>Enter the number of embryonic connections allowed to form before the security appliance begins to deny these connections. An embryonic connection is a connection request that has not finished the necessary handshake between source and destination. Set this limit to prevent attack by a flood of embryonic connections. Valid values are 0 through 65,535. If this value is set to zero, the number of connections is unlimited.</p> <p>Any positive value enables the TCP Intercept feature. TCP Intercept protects inside systems from a DoS attack perpetrated by flooding an interface with TCP SYN packets. When the embryonic limit has been surpassed, the TCP Intercept feature intercepts TCP SYN packets from clients to servers on a higher security level. SYN cookies are used during the validation process and help to minimize the amount of valid traffic being dropped. Thus, connection attempts from unreachable hosts will never reach the server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Timeout                                                   | For PIX 6.x devices, enter a timeout value for this translation rule, in the format <code>hh:mm:ss</code> . This value overrides the default translation timeout specified in Platform > Security > Timeouts, unless this value is <code>00:00:00</code> , in which case translations matching this rule use the default translation timeout (specified in Platform > Security > Timeouts).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Randomize Sequence Number | <p>If checked, the security appliance randomizes the sequence numbers of TCP packets. Each TCP connection has two Initial Sequence Numbers (ISNs): one generated by the client and one generated by the server. The security appliance randomizes the ISN of the TCP SYN in both the inbound and outbound directions. Randomizing the ISN of the protected host prevents an attacker from predicting the next ISN for a new connection and potentially hijacking the new session.</p> <p>Disable this feature only if:</p> <ul style="list-style-type: none"> <li>• Another in-line security appliance is also randomizing initial sequence numbers and data is being scrambled.</li> <li>• You are using eBGP multi-hop through the security appliance, and the eBGP peers are using MD5. Randomization breaks the MD5 checksum.</li> <li>• You are using a WAAS device which requires that the security appliance not randomize the sequence numbers of connections.</li> </ul> <p>Disabling this option opens a security hole in the security appliance.</p> |

## General Tab

Use the General tab of the Translation Rules page to view a summary of all translation rules defined for the current device or shared policy. The translation rules are listed in the order that they will be evaluated on the device.

---

**Note** The General tab is only visible for PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules and do not need to display summary information.

---

### Navigation Path

You can access the General tab from the Translation Rules page. See for more information.

## Field Reference

**Table 316: General Tab - Translation Rules Summary Table**

| Element                 | Description                                                                                                                                                                                                                                                             |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Note</b>             | Hatching (a series of slanted lines) across an entry in the table indicates that rule is currently disabled. (See Enable Rule in <a href="#">Add/Edit Dynamic Translation Rule Dialog Box</a> , on page 1039 for information about enabling and disabling these rules.) |
| No.                     | Rules are evaluated sequentially in the order listed. This number indicates the rule's position in the ordering of the list.                                                                                                                                            |
| Type                    | The type of translation rule; for example, Static, Dynamic, Exemption, etc.                                                                                                                                                                                             |
| Action                  | Displays “exempt” if the rule is exempt from NAT.                                                                                                                                                                                                                       |
| Original Interface      | The ID of the device interface to which the rule is applied.                                                                                                                                                                                                            |
| Original Address        | The object names or IP addresses of the source hosts and networks to which the rule applies.                                                                                                                                                                            |
| Local Port              | The port number supplied by the host or network (for static PAT).                                                                                                                                                                                                       |
| Translated Pool         | The ID number of the address pool used for translation.                                                                                                                                                                                                                 |
| Translated Interface    | The interface on which the translated addresses are to be used.                                                                                                                                                                                                         |
| Translated Address      | The translated addresses.                                                                                                                                                                                                                                               |
| Global Port             | The port number to which the original port number will be translated (for static PAT).                                                                                                                                                                                  |
| Destination             | The object names and IP addresses of the destination hosts or networks to which the rule applies.                                                                                                                                                                       |
| Protocol                | The protocol to which the rule applies.                                                                                                                                                                                                                                 |
| Service                 | The services to which the rule applies.                                                                                                                                                                                                                                 |
| Direction               | The traffic direction (Inbound or Outbound) on which the rule is applied.                                                                                                                                                                                               |
| DNS Rewrite             | Whether the DNS Rewrite option is enabled: Yes or No. This option is set in the <a href="#">Advanced NAT Options Dialog Box</a> , on page 1046.                                                                                                                         |
| Maximum TCP Connections | The maximum number of TCP connections allowed to connect to the statically translated IP address. If zero, the number of connections is unlimited. This option is set in the <a href="#">Advanced NAT Options Dialog Box</a> , on page 1046.                            |

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Embryonic Limit           | The number of embryonic connections allowed to form before the security appliance begins to deny these connections. If zero, the number of connections is unlimited. A positive number enables the TCP Intercept feature.<br><br>This option is set in the <a href="#">Advanced NAT Options Dialog Box</a> , on page 1046.                                                                |
| Maximum UDP Connections   | The maximum number of UDP connections allowed to connect to the statically translated IP address. If zero, the number of connections is unlimited. This option is set in the <a href="#">Advanced NAT Options Dialog Box</a> , on page 1046.                                                                                                                                              |
| Timeout                   | For PIX 6.x devices, this is the timeout value for a static translation rule. This value overrides the default translation timeout specified in Platform > Security > Timeouts. A Timeout value of 00:00:00 here means that translations matching this rule should use the default translation timeout specified in Platform > Security > Timeouts.                                       |
| Randomize Sequence Number | Whether the security appliance will randomize the sequence number of TCP packets: Yes or No. This option is set in the <a href="#">Advanced NAT Options Dialog Box</a> , on page 1046, and is enabled by default.                                                                                                                                                                         |
| Category                  | The category to which the rule is assigned. Categories use labels and color-coding to help identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239 for more information.<br><br><b>Note</b> No commands are generated for the Category attribute.                                                                                                            |
| Description               | The description of the rule, if provided.                                                                                                                                                                                                                                                                                                                                                 |
| Last Ticket(s)            | Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see <a href="#">Ticket Management Page</a> , on page 584). |

## Configuring NAT on ASA 8.3+ Devices

The following section describes configuring network address translation on version 8.3 or later ASA devices:

- [Translation Rules: ASA 8.3+](#) , on page 1051
  - [Add and Edit NAT Rule Dialog Boxes](#) , on page 1053
  - [Add or Edit Network/Host Dialog Box: NAT Tab](#) , on page 1060
- [Per-Session NAT Rules: ASA 9.0\(1\)+](#) , on page 1064

See [Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices](#) , on page 1033 for information about configuring NAT on other security appliances. Refer to [About “Simplified” NAT on ASA 8.3+ Devices](#) , on page 1018 for general information about NAT rules, and the changes to NAT configuration implemented on the ASA 8.3.

---

**Note** You can create a NAT object only if you have the Modify privilege mapped to your role. Cisco Security Manager displays error message for authorization.

---

## Translation Rules: ASA 8.3+

Use the Translation Rules page to manage network address translation (NAT) rules on the selected ASA 8.3+ device. See [NAT Policies on Security Devices , on page 1030](#) for information about configuring Translation Rules on other security devices.

Two types of NAT rules are displayed in this table: “manual” rules added by you and any other users, and “automatic” rules generated and applied by Security Manager when an object with NAT properties is assigned to the device. These are referred to as “NAT rules” and “Network Object NAT rules,” respectively.

### Some Features of the Translation Rules Table

This Translation Rules table is a standard Security Manager rules table, as described in [Using Rules Tables , on page 602](#). For example, you can move, show and hide columns; you can re-order the manual rules; and you can right-click certain table cells to edit that parameter. In addition, the following features are specific to this Translation Rules table:

- All rules are assigned to one of three pre-defined sections in the table:
  - **NAT Rules Before** – These are rules you or another user have “manually” defined on the device. You can specify that a rule be added to this section by clicking the section heading before adding the rule, although if you do not specify a section, the new rule will be added to this section by default.
  - **Network Object NAT Rules** – These are rules generated and ordered automatically by Security Manager when network objects that include NAT properties are assigned to the device. See [Add or Edit Network/Host Dialog Box: NAT Tab , on page 1060](#) for information about assigning NAT properties to objects. See the section “The NAT Table” in [About “Simplified” NAT on ASA 8.3+ Devices , on page 1018](#) for information about how these rules are ordered.

---

**Note** This section is not displayed in the Translation Rules table in Policy View because these rules are device-specific.

---

- **NAT Rules After** – These also are rules you or another user have manually defined on the device. You can specify that a rule is added to this section by clicking the section heading before adding the rule.

The NAT rules listed in this table are processed on a first-match basis; therefore, order is important. Providing a manual section both before and after the automatic rules lets you ensure all your rules are in the appropriate order, since you can re-order rules only within their section. The rules in each section take precedence over the rules in the section below it. For example, the rules in the top, “Before” section take precedence over the rules in the Network Object NAT section, and so on.

- The type of each rule—Static, Dynamic PAT, or Dynamic NAT and PAT—is indicated visually in the table by presenting **(S)**, **(DP)**, or **(DNP)** in blue following the Source parameter in the “Translated” column.

- A Bi-directional rule is a static rule that actually consists of two paired rules, one each for outgoing and incoming translation of the specified source and destination values. Each Bi-directional rule entry in the rules table is presented as two lines.

For example, if Bi-directional is chosen when you create a static rule with Host1 in the Source field and Host2 in the Translated field, two lines are added to the rules table: one with Host1 being translated to Host2, and one with Host2 being translated to Host1.

- Standard rules table topics:
  - [Using Rules Tables , on page 602](#)
  - [Filtering Tables , on page 50](#)
  - [Table Columns and Column Heading Features , on page 51](#)

### Navigation Path

- (Device view) Select **NAT > Translation Rules** from the Device Policy selector.
- (Policy view) Select **NAT (PIX/ASA/FWSM) > Translation Rules** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click **Translation Rules** to create a new policy.

The Translation Rules page is displayed. Note that in Policy View, the Network Object NAT Rules section is not displayed because those rules are device-specific.

### Adding, Editing and Deleting Rules

To **add** a NAT rule:

1. Select the heading of the section to which the rule is to be added. If you do not select a heading, the rule will be added to *NAT Rules Before* by default.
2. Open the Add NAT Rule dialog box: either click the Add Row button at the bottom of the table, or right-click anywhere in the table (except on an existing rule entry) and choose Add Row from the pop-up menu.
3. Define the rule and then click OK to close the dialog box, adding the rule to the table.

To **edit** a NAT rule:

1. Open the Edit NAT Rule dialog box for the desired rule: either select the rule in the NAT rules table and then click the Edit Row button at the bottom of the table, or simply right-click the desired rule entry and choose Edit Row from the pop-up menu.
2. Edit the rule and then click OK to close the dialog box.

See [Add and Edit NAT Rule Dialog Boxes , on page 1053](#) for a complete description of the Add NAT Rule dialog box.

To **delete** a NAT rule, select the rule in the table and click the Delete Row button at the bottom of the table, or simply right-click the desired rule entry and choose Delete Row from the pop-up menu.

---

**Note** To remove a Network Object NAT rule from this table, you must uncheck the Add Automatic Address Translation NAT Rule option, or change the device to which the rule is assigned, in the related Edit Network Host dialog box. See [Add or Edit Network/Host Dialog Box: NAT Tab](#) , on page 1060 for additional information.

---

### Enabling and Disabling Rules

You can disable one or more consecutive rules without removing them from the table, as follows:

1. Select the rule(s) to be disabled. If selecting a contiguous block of rules, click the first and then Shift-click the last rule of the block.
2. Right-click a selected rule, and choose **Disable** from the pop-up menu.

Disabled rules are grayed-out in the table.

To re-enable one or one or more consecutive disabled rules, repeat this process, choosing **Enable** from the pop-up menu.

### Add and Edit NAT Rule Dialog Boxes

Use the Add NAT Rule dialog box to add a NAT rule to the selected ASA 8.3+ device; this dialog box is not available on earlier-version ASAs, nor on PIX or FWSM devices. Refer to [Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices](#) , on page 1033 for information about adding and editing NAT rules on those devices.

---

**Note** Except for their titles, the Add NAT Rule and Edit NAT Rule dialog boxes are identical, and the following descriptions apply to both.

---

### Navigation Path

To add a rule, select the section to which you want the rule added (NAT Rules Before or NAT Rules After), and then click the Add Row button below the rules table, or right-click anywhere inside the table and choose **Add Row** to open the Add NAT Rule dialog box. Note that if you do not select a section, the new rule is added to the NAT Rules Before section.

To edit a rule, select the rule and click the Edit Row button, or simply right-click the rule and choose the Edit Row command, to open the Edit NAT Rule dialog box for that rule.

## Field Reference

*Table 317: Add and Edit NAT Rule Dialog Boxes*

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source Interface      | <p>The name of the interface on which a packet may originate; this is the “real” interface. Defaults to “any,” which represents all interfaces. Enter or Select the desired interface.</p> <p><b>Note</b> In transparent firewall mode, you must set specific interfaces.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Destination Interface | <p><b>Destination Interface</b> – The name of the interface on which a packet may terminate; this is the “mapped” interface. Defaults to “any,” which represents all interfaces. Enter or Select the desired interface.</p> <p><b>Note</b> In transparent firewall mode, you must set specific interfaces.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Source NAT Type       | <p>The type of translation rule you are creating:</p> <ul style="list-style-type: none"> <li>• <b>Static</b> – Provides static assignment of real addresses to mapped addresses.</li> <li>• <b>Dynamic PAT (Hide)</b> – Provides dynamic assignment of multiple local addresses to a single global IP address and a unique port number, in effect “hiding” the local addresses behind the one global address.</li> <li>• <b>Dynamic NAT and PAT</b> – Provides dynamic assignment of real addresses to mapped addresses, and real ports to mapped ports.</li> </ul> <p>Selecting this option adds the PAT Pool Address Translation options to the dialog box. On devices operating in routed mode, this option also provides the fallthrough option described below.</p> <p><b>Note</b> This selection applies only to the specified source translation; destination translation is always static.</p> |
| Source Translation    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Original Source       | <p>The source address the NAT rule will translate. If this is a range or network, all addresses in the range or network are translated.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Translated Source<br>Address<br>Interface | <p>Whether the translation is based on an address or an interface on the device. Select either:</p> <ul style="list-style-type: none"> <li>• <b>Address</b> – Translate the original address using the Networks/Hosts object specified in the Translated Source field. This entry represents the pool of translation addresses: enter or Select the desired Networks/Hosts; defaults to the Original Source (which will produce an Identity NAT rule).</li> <li>• <b>Interface</b> – Translate the original address based on the interface specified in the Destination Interface field.</li> </ul> <p>For port address translation based on this interface, be sure to configure the options in the Service Translation section (in the Advanced panel of this dialog box).</p> <p>If the Destination Interface is not defined, the Address/Interface selection reverts to Address and the Original Source is inserted into the Address field. This produces an Identity NAT rule, meaning the specified address(es) are translated to themselves (effectively not translated); Identity NAT applies to outbound connections only.</p> <p><b>Note</b> These options are not available when Dynamic NAT and PAT is the selected Type, nor are they available on devices operating in transparent mode.</p> |

| Element                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PAT Pool Address Translation | <p>This option is available when Dynamic NAT and PAT is the selected Type. The related parameters let you specify a “pool” of IP addresses to be used for specifically for port address translation, as well as change the algorithm used for PAT mapping. Refer to <a href="#">PAT Pools and Round Robin Allocation</a> , on page 1059 for additional information about these features.</p> <p>Check the PAT Pool Address Translation box to enable the following options:</p> <ul style="list-style-type: none"> <li>• <b>Address or Interface</b> – Select Address to indicate that the PAT Pool Address field contains networks/hosts (or networks/hosts objects) for use as the PAT pool. Select Interface to provide a Fallthrough Interface.</li> <li>• <b>Address</b> – Enter or Select the desired Networks/Hosts or desired Interface according to your Address or Interface selection above.</li> <li>• <b>Use Round Robin Allocation</b> – Check this box to map addresses/ports using a “round-robin” approach. See <a href="#">PAT Pools and Round Robin Allocation</a> , on page 1059 for more information about this option.</li> <li>• <b>Extended PAT Table</b> (Available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1)) - Check this box to enable extended PAT. Extended PAT uses 65535 ports per service, as opposed to per IP address, by including the destination address and port in the translation information. Normally, the destination port and address are not considered when creating PAT translations, so you are limited to 65535 ports per PAT address. For example, with extended PAT, you can create a translation of 10.1.1.1:1027 when going to 192.168.1.7:23 as well as a translation of 10.1.1.1:1027 when going to 192.168.1.7:80. This option is available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1).</li> <li>• <b>Flat Port Range</b> (Available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1)) - Check this box to enable use of the entire 1024 to 65535 port range when allocating ports. When choosing the mapped port number for a translation, the ASA uses the real source port number if it is available. However, without this option, if the real port is not available, by default the mapped ports are chosen from the same range of ports as the real port number: 1 to 511, 512 to 1023, and 1024 to 65535. To avoid running out of ports at the low ranges, configure this setting. To use the entire range of 1 to 65535, also select <b>Include Reserve Ports</b>.</li> <li>• <b>Include Reserve Ports</b> (Available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1)) - Check this box to include the reserve ports, 1-1023, in the PAT range.</li> <li>• <b>Block Allocation</b> (Available for ASA 9.5(1) and later) – Check this box to allocate a block of ports per host. This feature is supported from Security Manager version 4.9 onwards for ASA devices 9.5(1) or later.</li> </ul> |

| Element                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

The Interface Selector list contains all interfaces currently defined on the device.</p> |
| Translated Destination                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>This entry represents the pool of destination addresses to use for translation: enter or select the desired Networks/Hosts object.</p> <p><b>Note</b> You can now enter or select an FQDN Singleton object for ASA 9.17(1) and above devices for the FPR-2000, FPR-4000, and FPR-9000 series platform.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <p><b>Service Translation</b></p> <p>Use the options in this section to configure port address translation.</p> <p>These service objects represent a service protocol (TCP or UDP), and one or more ports. The mapping of original ports to translated port is circular. That is, the first original value is mapped to the first translated value, and the second original value is mapped to the second translated value, and so on until all original values are translated. If the pool of translated port is exhausted before that point, mapping continues using the first translated value again. See <a href="#">Understanding and Specifying Services and Service and Port List Objects</a>, on page 329 for information about configuring service objects.</p> <p><b>Note</b> Service Translation and the following <b>Translate DNS replies that match this rule</b> option cannot be used together.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Original Service                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>Enter or select the Service object that defines the service(s) to be translated. Leave the Original Service field blank to configure translation of any service to the specified Translated Service.</p> <p><b>Note</b> The protocol specified in both Service objects must be the same.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Translate DNS replies that match this rule           | <p>When checked, addresses embedded in DNS replies that match this rule are rewritten.</p> <p>For DNS replies traversing from a mapped interface to a real interface, the Address (or “A”) record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the A record is rewritten from the real value to the mapped value. Note that DNS inspection must be enabled to support this functionality.</p>                                                                                                                                                                                                                                                                                                                                |
| Fallthrough to Interface PAT (Destination Interface) | When checked, dynamic PAT back-up is enabled. When the pool of dynamic NAT addresses is depleted, port address translation is performed, using the address pool specified in the Use Address field. This option is available only when Dynamic NAT and PAT is the chosen Type on devices operating in routed mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| IPv6                                                 | When selected, the IPv6 address of the interface is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Net to net mapping of IPv4 to IPv6                   | When checked, translates the first IPv4 address to the first IPv6 address, the second to the second, and so on. Without this option, the IPv4-embedded method is used where the 32-bits of the IPv4 address is embedded after the IPv6 prefix. For a one-to-one translation, you must select this option.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Do not proxy ARP on Destination Interface            | <p>Check this box to disable proxy ARP on the specified Destination Interface. This option is available only when Static is the chosen rule Type.</p> <p><b>Note</b> This option is available on ASA 8.4.2+ devices, only when Bidirectional is the chosen Direction.</p> <p>By default, all NAT rules include proxy ARP on the egress interface. A NAT Exempt rule is used to bypass NAT for both ingress and egress traffic, relying on route look-up to locate the egress interface. Thus, Proxy ARP should be disabled for NAT Exempt rules. (The NAT Exempt rules always take priority and appear above all other NAT rules in the Translation Rules table.)</p> <p><b>Note</b> You also can disable Proxy ARP on individual interfaces, as described in <a href="#">Configuring No Proxy ARP</a>, on page 2091.</p> |
| Perform route lookup for Destination Interface       | <p>If this option is selected, the egress interface is determined using route look-up instead of using the specified Destination Interface. Be sure this box is checked for a NAT Exempt rule. This option is supported only for Static Identity NAT.</p> <p><b>Note</b> This option is available on ASA 8.4.2+ devices, only when Bidirectional is the chosen Direction. The option is not available on devices operating in transparent mode.</p>                                                                                                                                                                                                                                                                                                                                                                       |

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Unidirectional | <p>This feature lets you configure a static NAT rule in a single direction only; or dual rules, one each for both directions (forward and reverse).</p> <p>When selected, a single static NAT is created, as specified by the other options in this dialog box. Dynamic rules are uni-directional by default.</p> <p>If deselected, two linked static NAT rules are created, encompassing both directions of the translation, as specified by the other options in this dialog box. Note that each bi-directional rule entry in the rules table consists of two lines.</p> |
| Description    | (Optional) Provide a description of the rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Category       | <p>(Optional) Choose a category to assign to the rule. Categories can help you organize and identify rules and objects; see <a href="#">Using Category Objects</a>, on page 239 for more information.</p> <p><b>Note</b> This option is not available when Dynamic NAT and PAT is the chosen rule Type.</p>                                                                                                                                                                                                                                                                |

## PAT Pools and Round Robin Allocation

Adaptive Security Appliances, version 8.4.2 and later, include two features that let you alter how port address translation (PAT) occurs: you can explicitly define a pool of IP addresses specifically for PAT, and you can select a “round robin” algorithm for port allocation during PAT.

These features simplify configuration of large numbers of PAT addresses, and help prevent a large number of connections from a single PAT address, which can appear to be part of a DoS attack.

### Explicit PAT Pool Definition

Prior to version 8.4.2, when you defined a Dynamic NAT and PAT rule, you provided a “pool” of IP addresses (in the Translated Source field of the Add/Edit NAT Rule dialog boxes) to be used for translation. This pool could consist of individual IP addresses, ranges of addresses, Networks/Hosts objects, or Network/Host group objects, and combinations thereof.

Ranges and objects with more than one IP address were considered to be in the “NAT Pool,” while individual IP addresses and group objects consisting of one or more individual addresses were considered to be part of the “PAT Pool.”

Address translation on the device would work its way through the NAT Pool until all available addresses were exhausted. Port address translation would then begin using the PAT Pool—assigning ports on the first IP address in the PAT Pool until all ports (approximately 64,000) are assigned, then assigning ports on the next address in the pool, and so on. When all ports are fully subscribed on all IP addresses in the PAT Pool, no further translation could occur.

On version 8.4.2 and later ASA devices, you can explicitly define a separate PAT Pool for a Dynamic NAT and PAT rule. If you do so, the first collection of addresses (defined in the Translated Source field) is considered the NAT Pool, while the PAT Pool addresses are specified in the PAT Pool Address Translation field.

---

**Note** If you do not explicitly specify a PAT Pool, address translation takes place as described for pre-8.4.2 devices.

---

Refer to [Add and Edit NAT Rule Dialog Boxes , on page 1053](#) for more information about the defining translation rules.

### Round Robin Port Assignment

On version 8.4.2 and later ASA devices, you also can specify an alternate method of port assignment during PAT processing. As mentioned earlier, PAT port numbers are assigned to a single IP address in succession until the final port number is assigned, and then the process begins again with the next available IP address in the pool.

However, a new parameter on 8.4.2 and later devices—Use Round Robin Allocation for PAT Pool—lets you specify “round robin” cycling through available IP addresses and port numbers. This method assigns an address/port combination using each successive address in the pool; it then uses the first address again with a different port, proceeds to the second address again, and so on.

Further, the round-robin algorithm incorporates two additional principles it will attempt to adhere to when assigning address/port combinations during PAT processing:

- If a specific source-to-destination mapping already exists, the algorithm attempts to use the existing translation for the new connection. If this is not possible (for example, when all ports for that IP address have been exhausted), the algorithm proceeds with standard round-robin cycling.
- If possible, the original source port number is used as the mapped port number. That is, if the port number of the address/port combination to be translated is 4904, for example, and 4904 is available with the next IP address in the PAT Pool, the translated address will be *PAT\_address* /4904. Note if this is not possible (that port is not available with the next PAT address), the algorithm proceeds with standard round-robin cycling.

---

**Note** If you do not explicitly specify Round Robin Allocation, port-allocation cycling occurs as described for pre-8.4.2 devices.

---

### Add or Edit Network/Host Dialog Box: NAT Tab

Use the NAT tab in any of the dialog boxes used to add or edit host, network, or address range objects to create or update object NAT rules. This NAT configuration is used only for ASA 8.3+ devices; if you use the object on any other type of device, the NAT configuration is ignored.

The NAT configuration is created as a device override and is not kept in the global object. Therefore, you must select the **Allow Value Override per Device** option if you configure these NAT options. (This option is selected automatically when you close the dialog box.)

This topic describes the fields on the NAT tab. For information about the fields on the General tab, see [Add or Edit Network/Host Dialog Box , on page 312](#).

### Navigation Path

Select the NAT tab on the [Add or Edit Network/Host Dialog Box , on page 312](#) when creating or editing a host, network, or address range object.

| PAT Pool Address Translation | <p>This option is available when Dynamic NAT and PAT is the selected Type. The related parameters let you specify a “pool” of IP addresses to be used for specifically for port address translation, as well as change the algorithm used for PAT mapping. Refer to <a href="#">PAT Pools and Round Robin Allocation</a> , on page 1059 for additional information about these features.</p> <p>Check the PAT Pool Address Translation box to enable the following options:</p> <ul style="list-style-type: none"> <li>• <b>Use Address</b> or <b>Use Interface</b> – Select Use Address to indicate that the PAT Pool Address field contains networks/hosts (or networks/hosts objects) for use as the PAT pool. Select Use Interface to provide a Fallthrough Interface.</li> <li>• <b>PAT Pool Address</b> – Enter or Select the desired Networks/Hosts or desired Interface according to your Address or Interface selection above.</li> <li>• <b>Use Round Robin Allocation for PAT Pool</b> – Check this box to map addresses/ports using a “round-robin” approach. See <a href="#">PAT Pools and Round Robin Allocation</a> , on page 1059 for more information about this option.</li> <li>• <b>Extended PAT Table</b> (Available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1)) - Check this box to enable extended PAT. Extended PAT uses 65535 ports per service, as opposed to per IP address, by including the destination address and port in the translation information. Normally, the destination port and address are not considered when creating PAT translations, so you are limited to 65535 ports per PAT address. For example, with extended PAT, you can create a translation of 10.1.1.1:1027 when going to 192.168.1.7:23 as well as a translation of 10.1.1.1:1027 when going to 192.168.1.7:80. This option is available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1).</li> <li>• <b>Flat Port Range</b> (Available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1)) - Check this box to enable use of the entire 1024 to 65535 port range when allocating ports. When choosing the mapped port number for a translation, the ASA uses the real source port number if it is available. However, without this option, if the real port is not available, by default the mapped ports are chosen from the same range of ports as the real port number: 1 to 511, 512 to 1023, and 1024 to 65535. To avoid running out of ports at the low ranges, configure this setting. To use the entire range of 1 to 65535, also select <b>Include Reserve Ports</b>.</li> <li>• <b>Include Reserve Ports</b> (Available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1)) - Check this box to include the reserve ports, 1-1023, in the PAT range.</li> </ul> |
| <b>Service Translation</b>   | <p>Use the options in this section of the Advanced panel to configure static port address translation:</p> <p>(Available for Static rules only.)</p> <p><b>Note</b>      Service Translation and the <b>Translate DNS replies that match this rule</b> option cannot be used together.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Element                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Protocol                                             | Whether a TCP or UDP port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Original Port                                        | The port on which the traffic enters the device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Translated Port                                      | The port number which is to replace the original port number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Translate DNS replies that match this rule           | <p>When checked, addresses embedded in DNS replies that match this rule are rewritten.</p> <p>For DNS replies traversing from a mapped interface to a real interface, the Address (or “A”) record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the A record is rewritten from the real value to the mapped value. Note that DNS inspection must be enabled to support this functionality.</p> <p><b>Note</b> This option and Service Translation cannot be used together.</p>                                                                                                                            |
| Fallthrough to Interface PAT (Destination Interface) | When checked, dynamic PAT back-up is enabled. When the pool of dynamic NAT addresses is depleted, port address translation is performed, using the address pool specified in the Use Address field. This option is available only when Dynamic NAT and PAT is the chosen Type on devices operating in routed mode.                                                                                                                                                                                                                                                                                                                                                                                    |
| IPv6                                                 | When selected, the IPv6 address of the interface is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Net to net mapping of IPv4 to IPv6                   | When checked, translates the first IPv4 address to the first IPv6 address, the second to the second, and so on. Without this option, the IPv4-embedded method is used where the 32-bits of the IPv4 address is embedded after the IPv6 prefix. For a one-to-one translation, you must select this option.                                                                                                                                                                                                                                                                                                                                                                                             |
| Do not proxy ARP on Destination Interface            | <p>Check this box to disable proxy ARP on the specified Destination Interface. This option is available only when Static is the chosen rule Type.</p> <p>By default, all NAT rules include proxy ARP on the egress interface. A NAT Exempt rule is used to bypass NAT for both ingress and egress traffic, relying on route look-up to locate the egress interface. Thus, Proxy ARP should be disabled for NAT Exempt rules. (The NAT Exempt rules always take priority and appear above all other NAT rules in the Translation Rules table.)</p> <p><b>Note</b> You also can disable Proxy ARP on individual interfaces, as described in <a href="#">Configuring No Proxy ARP</a>, on page 2091.</p> |
| Perform route lookup for Destination Interface       | <p>If this option is selected, the egress interface is determined using route look-up instead of using the specified Destination Interface. Be sure this box is checked for a NAT Exempt rule. This option is supported only for Static Identity NAT.</p> <p><b>Note</b> This option is not available on devices operating in transparent mode.</p>                                                                                                                                                                                                                                                                                                                                                   |

## Per-Session NAT Rules: ASA 9.0(1)+

Use the Per-Session NAT Rules page to configure per-session PAT rules on the selected ASA 9.0(1)+ device. By default, all TCP PAT traffic and all UDP DNS traffic uses per-session PAT. You can configure per-session rules to use multi-session PAT for specific traffic.

### Per-Session PAT vs. Multi-Session PAT (Version 9.0(1) and Later)

The per-session PAT feature improves the scalability of PAT and, for clustering, allows each member unit to own PAT connections; multi-session PAT connections have to be forwarded to and owned by the control unit. At the end of a per-session PAT session, the ASA sends a reset and immediately removes the xlate. This reset causes the end node to immediately release the connection, avoiding the TIME\_WAIT state. Multi-session PAT, on the other hand, uses the PAT timeout, by default 30 seconds. For "hit-and-run" traffic, such as HTTP or HTTPS, the per-session feature can dramatically increase the connection rate supported by one address. Without the per-session feature, the maximum connection rate for one address for an IP protocol is approximately 2000 per second. With the per-session feature, the connection rate for one address for an IP protocol is 65535/average-lifetime.

By default, all TCP traffic and UDP DNS traffic use a per-session PAT xlate. For traffic that can benefit from multi-session PAT, such as H.323, SIP, or Skinny, you can disable per-session PAT by creating a per-session deny rule.

### Some Features of the Per-Session NAT Rules Table

This Translation Rules table is a standard Security Manager rules table, as described in [Using Rules Tables](#), on page 602. For example, you can move, show and hide columns; you can re-order the rules; and you can right-click certain table cells to edit that parameter.

The NAT rules listed in this table are processed on a first-match basis; therefore, order is important.

### Navigation Path

- (Device view) Select **NAT > Per-Session NAT Rules** from the Device Policy selector.
- (Policy view) Select **NAT (PIX/ASA/FWSM) > Per-Session NAT Rules** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click **Translation Rules** to create a new policy.

The Per-Session NAT Rules page is displayed.

### Adding, Editing and Deleting Rules

To **add** a per-session NAT rule:

1. Select the rule under which the rule is to be added. If you do not select a heading, the rule will be added to the end of the table by default.
2. Open the Add Per-Session NAT Rule dialog box: either click the **Add Row** button at the bottom of the table, or right-click anywhere in the table and choose **Add Row** from the pop-up menu.
3. Define the rule and then click **OK** to close the dialog box, adding the rule to the table.

See [Add and Edit Per Session NAT Rule Dialog Boxes](#) , on page 1065 for a complete description of the Add Per-Session NAT Rule dialog box.

To **edit** a per-session NAT rule:

1. Open the Edit Per-Session NAT Rule dialog box for the desired rule: either select the rule in the Per-Session NAT rules table and then click the **Edit Row** button at the bottom of the table, or simply right-click the desired rule entry and choose **Edit Row** from the pop-up menu.
2. Edit the rule and then click **OK** to close the dialog box.

See [Add and Edit Per Session NAT Rule Dialog Boxes](#) , on page 1065 for a complete description of the Edit Per-Session NAT Rule dialog box.

To **delete** a per-session NAT rule, select the rule in the table and click the **Delete Row** button at the bottom of the table, or simply right-click the desired rule entry and choose **Delete Row** from the pop-up menu.

### Enabling and Disabling Rules

You can disable one or more consecutive rules without removing them from the table, as follows:

1. Select the rule(s) to be disabled. If selecting a contiguous block of rules, click the first and then Shift-click the last rule of the block.
2. Right-click a selected rule, and choose **Disable** from the pop-up menu.

Disabled rules are grayed-out in the table.

To re-enable one or one or more consecutive disabled rules, repeat this process, choosing **Enable** from the pop-up menu.

### Add and Edit Per Session NAT Rule Dialog Boxes

By default, all TCP PAT traffic and all UDP DNS traffic uses per-session PAT. To use multi-session PAT for traffic, you can configure per-session PAT rules: a permit rule uses per-session PAT, and a deny rule uses multi-session PAT.

For more information about per-session vs. multi-session PAT, see [Per-Session NAT Rules: ASA 9.0\(1\)+](#) , on page 1064.

### Defaults

By default, the following rules are installed:

- Permit TCP from any (IPv4 and IPv6) to any (IPv4 and IPv6)
- Permit UDP from any (IPv4 and IPv6) to domain

These rules do not appear in the rule table.

**Note** You cannot remove these rules, and they always exist after any manually-created rules. Because rules are evaluated in order, you can override the default rules. For example, to completely negate these rules, you could add the following: Deny TCP from any (IPv4 and IPv6) to any (IPv4 and IPv6) Deny UDP from any (IPv4 and IPv6) to domain

### Navigation Path

From the [Per-Session NAT Rules: ASA 9.0\(1\)+ , on page 1064](#) page, do one of the following:

- To add a rule, select the rule under which you want the rule added, and then click the **Add Row** button below the rules table, or right-click anywhere inside the table and choose **Add Row** to open the Add Per-Session NAT Rule dialog box.
- To edit a rule, select the rule and click the **Edit Row** button, or simply right-click the rule and choose **Edit Row** to open the Edit Per-Session NAT Rule dialog box for that rule.

## CHAPTER 25

# Managing Site-to-Site VPNs: The Basics

A virtual private network (VPN) consists of multiple remote peers transmitting private data securely to one another over an unsecured network, such as the Internet. Site-to-site VPNs use tunnels to encapsulate data packets within normal IP packets for forwarding over IP-based networks, using encryption to ensure privacy and authentication to ensure integrity of data.

In Cisco Security Manager, site-to-site VPNs are implemented based on IPsec policies that are assigned to VPN topologies. An IPsec policy is a set of parameters that define the characteristics of the site-to-site VPN, such as the security protocols and algorithms that will be used to secure traffic in an IPsec tunnel. Security Manager translates IPsec policies into CLI commands that can be deployed to the devices in the VPN topology. Several policy types might be required to define a full configuration image that can be assigned to a VPN topology, depending on the IPsec technology type.

The Site-to-Site VPN Manager defines and configures site-to-site VPN topologies and policies on Cisco IOS security routers, PIX Firewalls, Catalyst VPN Service Modules, and Adaptive Security Appliance (ASA) firewall devices.

---

**Tip** In ASA documentation, site-to-site VPNs are called LAN-to-LAN VPNs. These phrases are equivalent, and we use “site-to-site VPN” in this documentation.

---

You can access the Site-to-Site VPN Manager by selecting **Manage > Site-To-Site VPNs** or clicking the Site-To-Site VPN Manager button on the toolbar.

You can also configure shared policies in Policy view and view and configure topologies in Device view. In Policy View, you can assign IPsec policies to VPN topologies.

This chapter contains the following topics:

- [Creating or Editing Extranet VPNs](#) , on page 1142
- [Deleting a VPN Topology](#) , on page 1146

# Understanding VPN Topologies

A VPN topology specifies the peers and the networks that are part of the VPN and how they connect to one another. After you create a VPN topology, the policies that can be applied to your VPN topology become available for configuration, depending on the assigned IPsec technology.

Security Manager supports three main types of topologies—hub and spoke, point to point, and full mesh, with which you can create a site-to-site VPN. Not all policies can be applied to all VPN topologies. The policies that can be applied depend on the IPsec technology that is assigned to the VPN topology. In addition, the IPsec technology that is assigned to a VPN depends on the topology type. For example, the DMVPN and Easy VPN technologies can only be applied in a hub-and-spoke topology.

For more information, see [Understanding IPsec Technologies and Policies](#), on page 1075.

The following topics describe:

- [Hub-and-Spoke VPN Topologies](#), on page 1072
- [Point-to-Point VPN Topologies](#), on page 1073
- [Full Mesh VPN Topologies](#), on page 1074
- [Implicitly Supported Topologies](#), on page 1075

## Hub-and-Spoke VPN Topologies

In a hub-and-spoke VPN topology, multiple remote devices (spokes) communicate securely with a central device (hub). A separate, secured tunnel extends between the hub and each individual spoke.

The following illustration shows a typical hub-and-spoke VPN topology.

**Figure 30: Hub-and-spoke VPN Topology**

This topology usually represents an intranet VPN that connects an enterprise's main office with branch offices using persistent connections to a third-party network or the Internet. VPNs in a hub-and-spoke topology

provide all employees with full access to the enterprise network, regardless of the size, number, or location of its remote operations.

A hub is generally located at an enterprise's main office. Spoke devices are generally located at an enterprise's branch offices. In a hub-and-spoke topology, most traffic is initiated by hosts at the spoke site, but some traffic might be initiated from the central site to the spokes.

If the hub in a hub-and-spoke configuration becomes unavailable for any reason, IPsec failover transfers tunnel connections seamlessly to a failover (backup) hub, which is used by all spokes. You can configure multiple failover hubs for a single primary hub.

In a hub-and-spoke VPN topology, all IPsec technology types can be assigned except GET VPN.

## Point-to-Point VPN Topologies

In a point-to-point VPN topology, two devices communicate directly with each other, without the option of IPsec failover as in a hub-and-spoke configuration. To establish a point-to-point VPN topology, you specify two endpoints as peer devices. Because either of the two devices can initiate the connection, the assigned IPsec technology type can be only regular IPsec or IPsec/GRE.

In Security Manager, you can configure a special type of regular IPsec point-to-point VPN called an Extranet. An Extranet VPN is a connection between a device in your managed network and an unmanaged device, such as a router in your service provider's network, a non-Cisco device, or simply a device in your network that is being managed by a different group (that is, one that does not appear in the Security Manager inventory).

The following illustration shows a typical point-to-point VPN topology.

**Figure 31: Point-to-Point VPN Topology**

## Full Mesh VPN Topologies

A full mesh topology works well in a complicated network where all peers need to communicate with each other. In this topology type, every device in the network communicates with every other device through a unique IPsec tunnel. All devices have direct peer relationships with one another, preventing a bottleneck at the VPN gateway device, and saving the overhead of encryption and decryption on the device.

You can assign only Regular IPsec, IPsec/GRE, and GET VPN technologies to a full mesh VPN topology.

The following illustration shows a typical full mesh VPN topology.

**Figure 32: Full Mesh VPN Topology**

A full mesh network is reliable and offers redundancy. When the assigned technology is GRE and one device (or node) can no longer operate, all the rest can still communicate with one another, directly or through one or more intermediate nodes. With regular IPsec, if one device can no longer operate, a crypto access control list (ACL) that specifies the protected networks, is created per two peers.

GET VPN is based on the group trust model. In this model, group members register with a key server. The key server uses the Group Domain of Interpretation (GDOI) protocol for distributing the security policy and keys for encrypting traffic between the group members. Because you can configure a primary key server and secondary key servers that synchronize their policies with the primary one, if the primary key server becomes unavailable, a secondary key server can take over.

**Note** When the number of nodes in a full mesh topology increases, scalability may become an issue—the limiting factor being the number of tunnels that the devices can support at a reasonable CPU utilization.

## Implicitly Supported Topologies

In addition to the three main VPN topologies, other more complex topologies can be created as combinations of these topologies. They include:

- **Partial mesh**—A network in which some devices are organized in a full mesh topology, and other devices form either a hub-and-spoke or a point-to-point connection to some of the fully meshed devices. A partial mesh does not provide the level of redundancy of a full mesh topology, but it is less expensive to implement. Partial mesh topologies are generally used in peripheral networks that connect to a fully meshed backbone.
- **Tiered hub-and-spoke**—A network of hub-and-spoke topologies in which a device can behave as a hub in one or more topologies and a spoke in other topologies. Traffic is permitted from spoke groups to their most immediate hub.
- **Joined hub-and-spoke**—A combination of two topologies (hub-and-spoke, point-to-point, or full mesh) that connect to form a point-to-point tunnel. For example, a joined hub-and-spoke topology could comprise two hub-and-spoke topologies, with the hubs acting as peer devices in a point-to-point topology.

## Understanding IPsec Technologies and Policies

Security Manager provides seven types of IPsec technologies that you can configure on the devices in your site-to-site VPN topology—Regular IPsec, IPsec/GRE, GRE Dynamic IP, standard and large scale DMVPN, Easy VPN, and GET VPN. The assigned technology determines which policies you can configure for the VPN.

You assign an IPsec technology to a VPN topology during its creation. After an IPsec technology is assigned to a VPN topology, you cannot change the technology, other than by deleting the VPN topology and creating a new one. See [Defining the Name and IPsec Technology of a VPN Topology](#) , on page 1104.

The following topics explain some basic concepts about IPsec technologies and site-to-site VPN policies:

- [Understanding Mandatory and Optional Policies for Site-to-Site VPNs](#) , on page 1076

- [Overview of Site-to-Site VPN Policies](#) , on page 1078

- [Understanding and Configuring VPN Default Policies](#) , on page 1084
- [Using Device Overrides to Customize VPN Policies](#) , on page 1086
- [Understanding VRF-Aware IPsec](#) , on page 1086

## Understanding Mandatory and Optional Policies for Site-to-Site VPNs

Some site-to-site VPN policies are mandatory, which means that you must configure them to create a VPN topology or to save your changes when editing them. Most mandatory policies have predefined defaults, which you can use to complete the definition of a VPN topology, but you typically must edit the policies to ensure their settings work for your network.

Optional policies, which you need to configure only if you desire the services defined by the policy, do not come with predefined defaults.

**Tip** You can configure your own mandatory policy defaults by creating shared policies that specify the desired settings, and then by selecting these shared policies when creating a VPN. You can even make the shared policies the defaults for the Create VPN wizard. However, these default policies do not apply when you create Extranet VPNs; with Extranet VPNs, you must always configure the settings for mandatory policies as part of the normal wizard flow. In addition, you cannot create a default policy for IKEv2 Authentication. For more information, see [Understanding and Configuring VPN Default Policies](#) , on page 1084.

Some mandatory policies are mandatory only under certain conditions. For example, an IKEv1 preshared key policy is mandatory only if the default (mandatory) IKEv1 proposal uses preshared key authentication. If the selected IKE authentication method is Certificate (RSA Signature), an IKEv1 Public Key Infrastructure policy is mandatory (see [Deciding Which Authentication Method to Use](#) , on page 1155). If you allow IKEv2 negotiations in the topology, an IKEv2 Authentication policy is mandatory.

The following table lists the mandatory and optional policies for each predefined technology that you can assign to the devices in your site-to-site VPN topology.

**Table 320: Site-to-Site VPN IPsec Technologies and Policies**

| Technology                                                                                               | Mandatory Policies                                                                                                                                                                                                                             | Optional Policies                                                       |

## Overview of Site-to-Site VPN Policies

You can access site-to-site VPN policies by selecting **Manage > Site-To-Site VPNs**, or by clicking the **Site-To-Site VPN Manager** button on the toolbar, and then selecting the required policy in the Policies selector of the Site-to-Site VPN window. You can also access site-to-site VPN policies from Device view or Policy view. For more information, see [Accessing Site-to-Site VPN Topologies and Policies](#), on page 1090.

From version 4.21 onwards, Cisco Security Manager supports multi-peer crypto maps in site-to-site VPNs for IKEv2. However, you can set up a multi-peer crypto map only through Flex Config.

**Note** After you configure the multi-peer crypto map, deploy, and discover the VPN topology, the next crypto map in the sequence will not be generated. For deployments thereafter, single-peer crypto map will be negated and multi-peer crypto map will be generated.

The following is a summary of all of the site-to-site VPN policies, some of which you cannot create as shared policies. Note that some of these policies are documented in the sections that explain remote access VPNs, because the policies are used for both remote access and site-to-site VPNs. However, you must configure these policies separately for each type of VPN.

## Configuring Multi-Peer Crypto Maps in Site-to-Site VPNs for IKEv2

From version 4.21 onwards, Cisco Security Manager supports multi-peer crypto maps in site-to-site VPNs for IKEv2. However, you can set up a multi-peer crypto map only through Flex Config. You can create multi-peer crypto maps for P2P, Hub and Spoke, or Full Mesh topologies.

This procedure describes how to configure multi-peer crypto maps in site-to-site VPNs for P2P, Hub and Spoke, and Full Mesh topologies. For more information on site-to-site VPN topologies and policies, see [Accessing Site-to-Site VPN Topologies and Policies](#) , on page 1090.

---

**Step 1** Deploy the intended VPN topology - P2P, Hub and Spoke, or Full Mesh.

**Note:** Ensure the **Connection Type** is set to **Bidirectional** for Hub peer when using Hub-and-Spoke topology.

**Step 2** In **Tools > Security Manager Admin > Deployment**, uncheck the **Deploy only new or modified Flexconfigs** checkbox.

**Step 3** Click **Add FlexConfig**, select **Type** as **Append**, and enter the multi-peer CLI and the corresponding tunnel group CLI.

**Step 4** Enter the multi-peer support-specific CLI, as shown in the [Figure 33: Multi Peer-Specific and Tunnel-Group CLI](#).

Figure 33: Multi Peer-Specific and Tunnel-Group CLI

**Step 5** Do a preview configuration, deploy the new configuration, and rediscover the VPN topology for which you have configured the multi-peer crypto map using **Policy > Discover VPN Policies**.

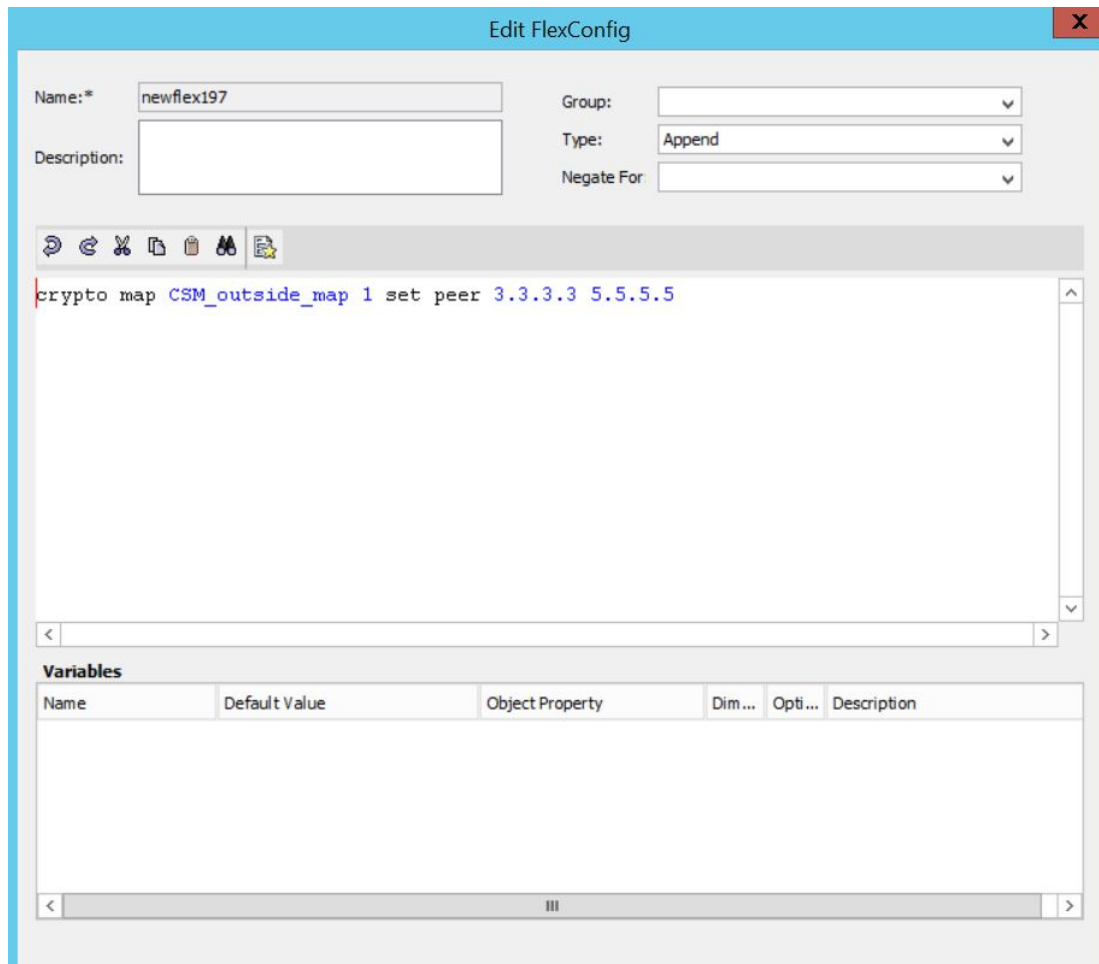

**Step 6** After rediscovering the VPN topology, the multi-peer cryptomap CLI is negated and added each time a new deployment is done. Refer the image below to see how the CLI gets negated.

Figure 34: CLI Negation

- Step 7** Ensure to remove the tunnel-group CLI and retain only the multi-peer CLI in Flex Configs for further deployments as shown below.

**Figure 35: Multi Peer-Specific CLI**

## Understanding Devices Supported by Each IPsec Technology

Each IPsec technology supports different devices as members of their topology. The following table describes the basic device support. These requirements are enforced when you select devices for a VPN; in some cases, the device lists are filtered to show only supported devices. In other cases, a device might be supported in one role (for example, as a spoke), but not supported in another role; in these cases, you can select the wrong device type, but you are prevented from saving the change (a message will explain the specific problem).

**Note** From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software.

**Tip** Some device models have NO-VPN versions, which do not support VPN configuration. Thus, although the 3845 model might be supported for a type of VPN, the 3845 NOVPN model is not supported. In addition, the Cisco Catalyst 6500 series ASA Services Module (running software release 8.5(x)) does not support any type of VPN.

**Table 321: Devices Supported by Each IPsec Technology**

| Technology                                                                                                                                                                                  | Supported Platforms                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Including Unmanaged or Non-Cisco Devices in a VPN

Your VPN might include devices that you cannot, or should not, manage in Security Manager. These include:

- Cisco devices that Security Manager supports, but for which your organization is not responsible. For example, you might have a VPN that includes spokes in networks managed by other organizations within your company, or a connection to a service provider or partner network.
- Non-Cisco devices. You cannot use Security Manager to create and deploy configurations to non-Cisco devices.

You have two options for handling these kinds of devices:

- If the connection is a regular IPsec point-to-point connection, you can configure the connection as an Extranet VPN as described in [Creating or Editing Extranet VPNs](#) , on page 1142.
- For other types of connections, you can include these devices in the Security Manager inventory as “unmanaged” devices. These devices can serve as endpoints in a VPN topology, but Security Manager does not discover any configurations from the device, nor does it deploy configurations to them.

When the Extranet VPN option will not work, you must do the following before you can add an unmanaged device to a VPN topology:

- Manually add the device as an unmanaged device to the device inventory using the procedure described in [Adding Devices by Manual Definition](#) , on page 92. Ensure that you make the following selections:
  - Select a Cisco device type that is comparable to the device you are adding in terms of VPN-supported technologies. The device type controls the types of VPN topologies to which you can add the device. For example, for GRE/DMVPN, you might select an integrated services router such as an 1800 or 2800 series, whereas in Easy VPN you could also select an ASA or PIX device if appropriate.
  - Deselect the **Manage in Cisco Security Manager** option. This is very important, because the default is to make all new devices managed devices. If you forget to do this while adding the device, you can deselect the option later on the General tab in the device properties (right-click the device and select **Device Properties**).
- Using the interface policy for the device, define the external VPN interface to which managed devices will point. Because the device is unmanaged, your definitions in this policy are never configured on the device; the policy simply represents what you have configured on the device outside of Security Manager.

## Understanding and Configuring VPN Default Policies

For most VPN policies that are mandatory, Security Manager includes “factory default” settings for the policies. These defaults are generic, and might not be appropriate for your network, but they do allow you to complete the creation of a VPN without having to stop and start over when you do not have the needed shared policy configured. Therefore, you can, and should, create your own default VPN policies for mandatory policies. You can also create defaults for certain optional policies.

Before configuring new defaults, consider the types of VPNs you are likely to configure, then review the types of policies for which you can create defaults. Select **Tools > Security Manager Administration**, then select **VPN Policy Defaults** from the table of contents. Select the tabs for the desired IPsec technologies to see which policies are available. If a policy is assigned Factory Default, or if this option is available from the drop-down list, the policy is mandatory; other policies are optional. You can also create default policies for remote access VPNs, and for site-to-site endpoint configurations. Click the **View Content** button next to a selected policy to see the policy definition.

The following procedure explains how to create and use VPN policy defaults.

### Tips

- When you configure VPN default policies, you are selecting shared policies. Although you can configure only one default per policy per IPsec technology, users can select different shared policies when configuring VPNs. Thus, you might want to configure more than one shared policy that users can select, and configure the most commonly-used policy as the default policy. For more information about how users can select different policies when configuring a VPN, see [Assigning Initial Policies \(Defaults\) to a New VPN Topology](#) , on page 1137.
- Although the IKEv2 Authentication policy is a mandatory policy for topologies that allow IKEv2 negotiations, there are no IKEv2 Authentication factory default settings, and you cannot create IKEv2 Authentication shared policies. Therefore, whenever you allow IKEv2 in a topology, you must manually configure the IKEv2 Authentication policy before the topology is valid.
- The Public Key Infrastructure policy is required for IKEv1 if you configure the IKE Proposal policy to use certificate authentication. However, there are no factory default settings for this policy, so if you intend to use certificate authentication for IKEv1, consider creating default Public Key Infrastructure policies.
- Keep in mind that any change to a shared policy affects all VPNs that are using the policy. This can make it easy to implement across-the-board changes that are required for every VPN. However, after creating the VPN, the user can switch from a shared policy to a local policy, so that any changes to the configuration must be done specifically for the VPN topology. For more information about shared policies, see [Managing Shared Policies in Policy View](#) , on page 215.
- These default policies do not apply when you create Extranet VPNs. With Extranet VPNs, you must always configure the settings for mandatory policies as part of the normal wizard flow.

---

**Step 1**

Create the default policies. All default policies are shared policies.

- a) In Policy view (select **View > Policy View**), select the policy for which you want to configure defaults. The policies are in the **Site-to-Site VPN** or **Remote Access VPN** folders.
- b) Click the **Create a Policy (+)** button at the bottom of the shared policy selector, enter a name for the policy, and click **OK**.
- c) Configure the desired settings. Click the **Help (?)** button in the toolbar to get reference information about the settings available in the selected policy.
- d) Repeat the process until you have created at least one shared policy for each policy for which you want to define a default policy.

**Step 2**

If desired, create defaults for the VPN endpoints. These defaults are interface role objects, which identify the interface names used for VPN connections (for example, GigabitEthernet0/1). Create separate roles for internal and external VPN interfaces.

- a) Select **Manage > Policy Objects** to open the [Policy Object Manager](#) , on page 230.
- b) Select **Interface Roles** from the table of contents.
- c) Click the **New Object (+)** button, enter the interface name patterns that identify the most commonly used interfaces for VPN internal or external interfaces in your network, and click **OK**.

For more information about interface roles and the wildcards you can use to configure them, see [Understanding Interface Role Objects](#) , on page 301 and [Creating Interface Role Objects](#) , on page 302.

**Step 3**

Submit the policies and policy objects to the database. You will have to resolve any validation errors.

- In non-Workflow mode, select **File > Submit**.
- In Workflow mode without an activity approver, select **Activities > Approve Activity**.

- In Workflow mode with an activity approver, select **Activities > Submit Activity**. You will have to wait for the activity to be approved before you can select the policies and objects as defaults.

**Step 4** Select your newly-configured policies and policy objects as VPN policy defaults.

- a) Select **Tools > Security Manager Administration**, and then select **VPN Policy Defaults** from the table of contents (see [VPN Policy Defaults Page](#), on page 586).
- b) Select the desired tabs, then select the policies you configured from the drop-down lists for each of the mandatory or optional policies for which you configured defaults.

On the S2S Endpoints tab, select the appropriate interface role objects.

- c) Click **Save** to save your defaults.

The next time a user runs the Create VPN wizard, the defaults you selected will be used as the wizard's defaults. Users can select any other shared policy or interface role to override the default.

---

## Using Device Overrides to Customize VPN Policies

Many VPN policies use Security Manager policy objects in their configuration. Policy objects are containers that allow you to create reusable configurations.

Because a VPN policy applies to every device in a VPN topology, you might need to make modifications to a policy object used in a policy for certain devices within the VPN topology. There might even be situations where you need to make modifications for all devices within a topology. You accomplish these modifications with device-level overrides on the policy objects.

For example, when defining a PKI policy, you need to select a PKI enrollment object. If the hub of your VPN uses a different CA server than the spokes, you must use device-level overrides to specify the CA server used by the hub. Although the PKI policy references a single PKI enrollment object, the actual CA server represented by this object differs for the hub, based on the device-level override you define.

To enable a policy object to be overridden, you must select the **Allow Override per Device** option in the policy object definition. You can then create device-level overrides. For more information about overriding a VPN policy object at the device level, see the following topics:

- [Understanding Policy Object Overrides for Individual Devices](#), on page 244
- [Allowing a Policy Object to Be Overridden](#), on page 245
- [Creating or Editing Object Overrides for a Single Device](#), on page 246
- [Creating or Editing Object Overrides for Multiple Devices At A Time](#), on page 246

## Understanding VRF-Aware IPsec

One obstacle to successfully deploying peer-to-peer VPNs is the separation of routing tables, and the use of overlapping addresses, which usually results from using private IP addresses in customer networks. The VRF-Aware IPsec feature, which introduces IPsec tunnel mapping to Multiprotocol Label Switching (MPLS) VPNs, solves this problem.

The VRF-Aware IPsec feature enables you to map IPsec tunnels to Virtual Routing Forwarding (VRF) instances, using a single public-facing address. A VRF instance defines the VPN membership of a customer

site attached to the Provider Edge (PE) router. A VRF comprises an IP routing table, a derived Cisco Express Forwarding (CEF) table, a set of interfaces that use the forwarding table, and a set of rules and routing protocol parameters that control the information that is included in the routing table. A set of routing and CEF tables is maintained for each VPN customer across the MPLS/VPN network.

Since each VPN has its own routing and forwarding table in the router, any customer or site that belongs to a VPN is provided access only to the set of routes contained within that table. Any PE router maintains a number of routing tables and a global routing table per VPN, which can be used to reach other routers in the provider network. Effectively, a number of virtual routers are created in a single physical router. Across the MPLS core to the other PE routers, this routing separation is maintained by adding unique VPN identifiers, such as the route distinguisher (RD).

---

**Note** VRF-Aware IPsec can also be configured on devices in a remote access VPN. For more information, see [Configuring Dynamic VTI/VRF Aware IPsec in Remote Access VPNs \(IOS Devices\)](#), on page 1476.

---

In Security Manager, you can configure VRF-Aware IPsec in your hub-and spoke VPN topology, with either a single device providing all functionality (“one-box” solution) or with multiple devices, each providing a part of the functionality (“two-box” solution). The solution of one device providing all the functionality can affect performance by overloading the system, whereas separating the functionality in a two-box solution provides better scaling for each function.

The following topics describe:

- [VRF-Aware IPsec One-Box Solution](#), on page 1087
- [VRF-Aware IPsec Two-Box Solution](#), on page 1088
- [Enabling and Disabling VRF on Catalyst Switches and 7600 Devices](#), on page 1090

For information on configuring VRF-aware IPsec, see [Configuring VRF Aware IPsec Settings](#), on page 1122.

## VRF-Aware IPsec One-Box Solution

In the one-box solution, IPsec tunnels terminate on a Cisco IOS router, which serves as the Provider Edge (PE) device. The PE device maps these tunnels to the appropriate MPLS/VPN network and serves as the IPsec Aggregator, by performing IPsec encryption and decryption from the Customer Edge (CE) devices.

---

**Note** The configuration of routing between the PE device and the MPLS cloud is done by Cisco IP Solution Center. See the [Cisco IP Solution Center MPLS VPN User Guide](#).

---

The following illustration shows the topology of a one-box solution.

Figure 36: VRF-Aware IPsec One-Box Solution

**Related Topics**

- [Understanding VRF-Aware IPsec , on page 1086](#)
- [Configuring VRF Aware IPsec Settings , on page 1122](#)
- [Defining the Endpoints and Protected Networks , on page 1107](#)

**VRF-Aware IPsec Two-Box Solution**

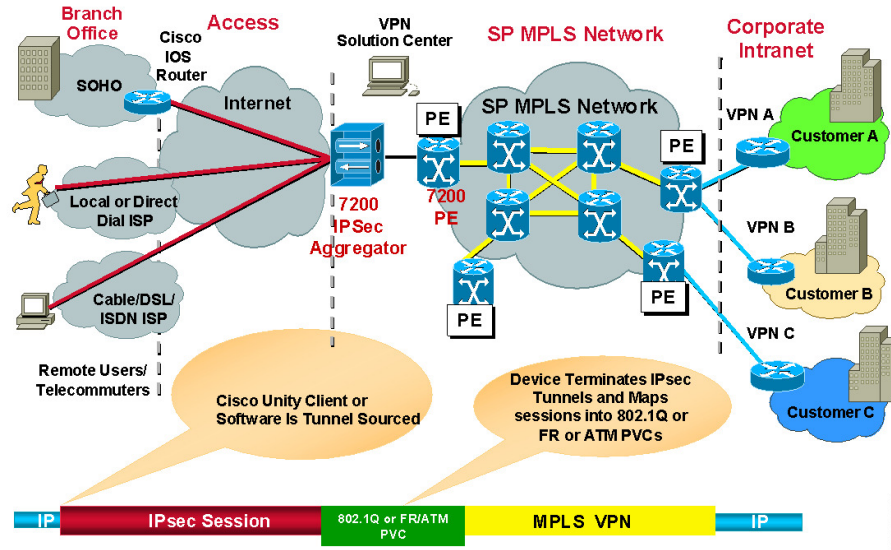

In the two-box solution, the PE device does just the MPLS mapping, while a separate IPsec Aggregator device does the IPsec encryption and decryption from the CEs.

**Note** Security Manager fully manages the IPsec Aggregator, including routing to the PE device. The PE device is fully managed by Cisco IP Solution Center. This includes routing between the PE device and the MPLS cloud, and routing from the PE to the IPsec Aggregator. For more information, see the [Cisco IP Solution Center MPLS VPN User Guide](#).

The following illustration shows the topology of a two-box solution.

Figure 37: VRF-Aware IPsec Two-Box Solution

Using the two-box solution, you configure VRF-Aware IPsec on devices in your VPN topology, as follows:

1. Configure the connection between the IPsec Aggregator and the PE device.

Create a hub-and-spoke VPN topology and assign an IPsec technology to it. In this topology, the hub is the IPsec aggregator, and the spokes may be Cisco IOS routers, PIX Firewalls, Catalyst VPN service modules, or Adaptive Security Appliance (ASA) devices. The IPsec Aggregator may be a security router or a Catalyst VPN service module. You then define the VRF parameters (VRF name and unique routing identifier) on the hub.

**Note** VRF-Aware IPsec supports the configuration of IPsec, GRE, or Easy VPN technologies on Cisco IOS routers and Catalyst VPN service modules. DMVPN is also supported, but only on Cisco IOS routers.

1. Specify the VRF forwarding interface (or VLAN for a Catalyst VPN service module) between the IPsec Aggregator and the PE device.
2. Define the routing protocol and autonomous system (AS) number to be used between the IPsec Aggregator and the PE. Available routing protocols include BGP, EIGRP, OSPF, RIPv2, and Static Route.

If the routing protocol defined between the IPsec Aggregator and the PE differs from the routing protocol used for the secured IGP, routing is redistributed to the secured IGP, using this routing protocol and AS number. Routing is also redistributed from the secured IGP to the PE.

**Note** Redistributing the routing is only relevant when IPsec/GRE or DMVPN is the selected technology.

## Enabling and Disabling VRF on Catalyst Switches and 7600 Devices

**Note** From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches, it does not support any enhancements as Cisco Catalyst switches is now End of Life.

Deployment fails when you change the virtual routing and forwarding (VRF) mode on the Catalyst switches and 7600 hub of an existing site-to-site VPN. For example, if you initially configured VRF in the Create VPN wizard and deployed, but later return to the Peers policy and deselect the Enable VRF Settings check box, deployment fails. (This setting is found in the VRF Aware IPsec tab of the Edit Endpoints dialog box; see [Configuring VRF Aware IPsec Settings](#) , on page 1122.) Deployment likewise fails if you try to enable VRF on a VPN that was not initially configured with it.

You cannot change the VRF mode on a Catalyst 6500/7600 during VPN operation. This restriction applies only to Catalyst 6500/7600 hubs, not to any other device type.

This restriction does not apply to changes made to the VRF settings themselves. For example, if VRF is configured on the VPN topology, you can return to the Peers policy and change the VRF name or route distinguisher.

If you need to change the VRF mode of a VPN, and you are using Catalyst 6500/7600 devices as hubs, use the following procedure.

### Related topics

- [Understanding VRF-Aware IPsec](#) , on page 1086
- [VRF-Aware IPsec One-Box Solution](#) , on page 1087
- [VRF-Aware IPsec Two-Box Solution](#) , on page 1088

- 
- Step 1** Delete the VPN topology from Security Manager.
  - Step 2** Deploy your changes.
  - Step 3** Reload (restart) the Catalyst 6500/7600 device.
  - Step 4** Right-click the device in Security Manager and select **Discover Policies on Device**. Perform a complete policy rediscovery.
  - Step 5** Open the Create VPN wizard and redefine the VPN topology. At this point, you can select a different VRF mode. See [Configuring VRF Aware IPsec Settings](#) , on page 1122 and [Creating or Editing VPN Topologies](#) , on page 1101.
- 

## Accessing Site-to-Site VPN Topologies and Policies

You can use the following methods to access and configure site-to-site VPN topologies and policies:

- **Site-to-Site VPN Manager**—This is the main tool for configuring VPN topologies. You can view a list of all site-to-site VPNs configured in Security Manager and edit their configurations and policies, including

device membership. For information on using this tool, see [Site-to-Site VPN Manager Window](#) , on page 1091.

- **Site-to-Site VPN policy in Device view**—When you select a device in device view, you can select the Site-to-Site VPN policy in the Policies selector to see a list of all site-to-site VPNs in which the device participates and edit those topologies. You can also create new VPNs, or select a VPN and open the Site-to-Site VPN Manager to edit the policies for the selected VPN. This device view policy is essentially a short-cut into the Site-to-Site VPN Manager. For more information about using this policy, see [Configuring VPN Topologies in Device View](#) , on page 1092.
- **Site-to-Site VPN folder in Policy view**—Policy view is used to create shared policies. Many of the site-to-site VPN policies are shareable. Thus, you can configure shared policies that you can assign to more than one VPN topology while configuring the topology in the Site-to-Site VPN Manager. You can configure shared policies as defaults for the Create VPN wizard, as described in [Understanding and Configuring VPN Default Policies](#) , on page 1084.

You can also create shared policies from the Site-to-Site VPN Manager window in much the same way you can create them from local policies in Device view, although all sharing commands in the Site-to-Site VPN Manager window are available only on the right-click context menu (when right-clicking a shareable policy).

For more information on creating shared policies in Policy view, see [Managing Shared Policies in Policy View](#) , on page 215.

## Site-to-Site VPN Manager Window

The Site-to-Site VPN Manager lists all site-to-site VPNs configured in Security Manager. The VPNs selector, in the upper left pane of the window, lists all existing VPN topologies (see [Understanding VPN Topologies](#) , on page 1072). An icon indicates the type of VPN (hub and spoke, point to point, or full mesh). To view or edit a topology, select it, and its policies are loaded into the policy selector in the lower left pane. Select a policy to see its definition in the right pane.

To open the Site-to-Site VPN Manager, click the **Site-To-Site VPN Manager** button on the toolbar or select **Manage > Site-To-Site VPNs**.

Use the Site-to-Site VPN Manager window to:

- Create, edit, and delete VPN topologies.
  - To create a VPN topology, click the **Create VPN Topology (+)** button above the VPN selector and select the type of topology you want to create from the options that are displayed. This action opens the Create VPN Wizard or the Create Extranet VPN wizard. For more information, see [Creating or Editing VPN Topologies](#) , on page 1101 or [Creating or Editing Extranet VPNs](#) , on page 1142.
  - To edit a VPN topology, select it and click the **Edit VPN Topology (pencil)** button, or right-click it and select **Edit**. This opens the Edit VPN or Edit Extranet VPN dialog box, which contains the most of the same pages as the Create VPN wizard in a tabbed layout.
  - To delete a VPN topology, select it and click the **Delete VPN Topology (trash can)** icon, or right-click it and select **Delete**. You are asked to confirm the deletion. See [Deleting a VPN Topology](#) , on page 1146.
- View detailed information about each VPN topology; select the topology, then select the VPN Summary policy. See [Viewing a Summary of a VPN Topology's Configuration](#) , on page 1138.

- View and configure the endpoints defined for a VPN topology. You can see endpoints on the Endpoints tab or when editing a VPN topology, or by selecting the **Peers** policy. For GET VPN topologies, there is no Peers policy; instead, use the **Key Servers** and **Group Members** policies to view and configure endpoints. For Extranet VPNs, the endpoints are on the Device Selection tab when editing the VPN, or also in the Peers policy.
- View and edit the policies assigned to a VPN topology, assign shared policies, or create shared policies from existing policies. For information on individual policies, see [Overview of Site-to-Site VPN Policies](#), on page 1078.

The options and methods for configuring shared policies from the Site-to-Site VPN Manager are the same as those from Device view, as explained in the sections under [Working with Shared Policies in Device View or the Site-to-Site VPN Manager](#), on page 201 and [Using the Policy Banner](#), on page 203. You can share, assign, unassign, edit assignments, and rename policies, but no VPN policies allow inheritance. To perform these tasks, select the VPN topology, then right-click the desired policy and select the desired command.

You can also use Policy view to configure shared VPN policies.

## Configuring VPN Topologies in Device View

Use the Site-to-Site VPN Device view policy to view and edit the site-to-site VPN topologies to which a device belongs, if any. You can edit the VPN policies and change whether the device participates in the topology. You can also create new VPN topologies.

This policy is essentially an access point for the Site-to-Site VPN Manager (see [Site-To-Site VPN Discovery](#), on page 1093).

To open this policy, in Device view, select the desired device and then select **Site-to-Site VPN** from the Policy selector.

The VPN topologies table lists all of the site-to-site VPNs to which this device belongs. Information includes the type of VPN, its name, IPSec technology, and description. Beginning with version 4.9, Security Manager also displays the Last Modified Ticket information for the VPN topologies. The VPN topologies that have been created or edited using the Ticket Management system will have the last Modified Ticket ID information available on this page. You can also filter the VPN topologies by the Last Modified Ticket ID.

- To add a VPN, click the **Create VPN Topology** button, or right-click in the table and select **Create VPN Topology** and select the type of topology you want to create from the options that are displayed. This action opens the Create VPN Wizard or the Create Extranet VPN wizard. For more information, see [Creating or Editing VPN Topologies](#), on page 1101 or [Creating or Editing Extranet VPNs](#), on page 1142.
- To edit a VPN, select it and click the **Edit VPN Topology** button, right-click the VPN and select **Edit VPN Topology**, or simply double-click the entry. This opens the Edit VPN or Edit Extranet VPN dialog box, which is a tabbed version of the Create VPN wizard (see [Creating or Editing VPN Topologies](#), on page 1101 or [Creating or Editing Extranet VPNs](#), on page 1142).
- To edit the policies for a VPN, select it and click the **Edit VPN Policies** button. The Site-to-Site VPN Window opens displaying information about the VPN topology; select the desired policy from the Policies selector to edit it.
- To delete a VPN, select it and click the **Delete VPN Topology** button, or right-click the VPN and select **Delete VPN Topology**. You are asked to confirm the deletion. For more information, see [Deleting a VPN Topology](#), on page 1146.

# Site-To-Site VPN Discovery

You can discover the VPN topologies that are already deployed in your network so that you can use Security Manager to manage them. Your VPN configurations are brought into Security Manager and displayed as site-to-site VPN policies.

Except for Extranet VPNs, you can also rediscover the configurations of existing VPN topologies that are already managed with Security Manager. For information about Site-to-Site VPN rediscovery, see [Rediscovering Site-to-Site VPNs](#) , on page 1100.

---

**Note** You can also discover configurations on devices in remote access VPNs that are already deployed in your network. See [Discovering Remote Access VPN Policies](#) , on page 1298.

---

These topics provide information about Site-to-Site VPN discovery:

- [Supported and Unsupported Technologies and Topologies for VPN Discovery](#) , on page 1093
- [Prerequisites for VPN Discovery](#) , on page 1094
- [VPN Discovery Rules](#) , on page 1095
- [Discovering Site-to-Site VPNs](#) , on page 1097
- [Defining or Repairing Discovered VPNs with Multiple Spoke Definitions](#) , on page 1099
- [Rediscovering Site-to-Site VPNs](#) , on page 1100

## Supported and Unsupported Technologies and Topologies for VPN Discovery

This topic lists the technologies and topologies that Security Manager can discover, as well as the VPN features that are provisioned by Security Manager but cannot be discovered.

### Supported Technologies for VPN Discovery

- IPsec, including LAN-to-LAN configurations on ASA devices.
- IPsec + GRE
- IPsec + GRE dynamic IP
- DMVPN
- Easy VPN
- GET VPN

### Supported Topologies for VPN Discovery

- Point to point
- Hub and spoke

- Full mesh
- Extranet VPN (point-to-point to an unmanaged device)

### VPN Features Provisioned by Security Manager but Unsupported for VPN Discovery

- Large Scale DMVPN with IPsec Terminator (high-concentration hub)
- VRF-Aware IPsec
- Dial backup
- IPsec and ISAKMP profiles for Easy VPN
- Easy VPN with High Availability
