## The Basics of Using Security Manager 73

### CHAPTER 1

## Getting Started With Security Manager 1

- Product Overview 1
  - Primary Benefits of Cisco Security Manager 2
  - Security Manager Policy Feature Sets 4
  - Security Manager Applications Overview 6
  - Device Monitoring Overview 7
  - IPv6 Support in Security Manager 8
    - Configuring IPv6 on Security Manager Server 9
    - Configuring IPv6 Policies 9
    - Policy Object Changes in Security Manager 4.4 11
  - Logging In to and Exiting Security Manager 11
    - Understanding User Permissions 12
    - Logging In to the Cisco Security Management Suite Server 12
    - Logging In to and Exiting the Security Manager Client 13
  - Using Configuration Manager - Overview 14
    - Configuration Manager Overview 15
      - Device View Overview 15
      - Policy View Overview 17
      - Map View Overview 18
    - Task Flow for Configuring Security Policies 19
    - Policy and Policy Object Overview 20
    - Workflow and Activities Overview 20
      - Working in Workflow Mode 21
      - Working in Non-Workflow Mode 22

Comparing Workflow Modes	22
Using the JumpStart to Learn About Security Manager	24
Completing the Initial Security Manager Configuration	25
Configuring an SMTP Server and Default Addresses for E-Mail Notifications	27
Changing Workflow Modes	28
Understanding Basic Security Manager Interface Features	29
Menu Bar Reference for Configuration Manager	29
File Menu (Configuration Manager)	30
Edit Menu (Configuration Manager)	31
View Menu (Configuration Manager)	32
Policy Menu (Configuration Manager)	32
Map Menu (Configuration Manager)	33
Manage Menu (Configuration Manager)	35
Tools Menu (Configuration Manager)	35
Activities Menu (Configuration Manager)	37
Tickets Menu (Configuration Manager)	37
Launch Menu (Configuration Manager)	38
Help Menu (Configuration Manager)	39
Toolbar Reference (Configuration Manager)	40
Using Global Search	43
Using Selectors	46
Filtering Items in Selectors	47
Create Filter Dialog Box	48
Using Wizards	49
Using Tables	50
Filtering Tables	50
Table Columns and Column Heading Features	51
Using Text Fields	51
Understanding ASCII Limitations for Text	51
Finding Text in Text Boxes	52
Navigating Within Text Boxes	52
Selecting or Specifying a File or Directory in Security Manager	52
Troubleshooting User Interface Problems	53
Accessing Online Help	54

---

**CHAPTER 2****Preparing Devices for Management 55**

- Understanding Device Communication Requirements 55
- Setting Up SSL (HTTPS) 57
  - Setting Up SSL (HTTPS) on PIX Firewall, ASA and FWSM Devices 57
  - Setting Up SSL on Cisco IOS Routers 58
- Setting Up SSH 60
  - Critical Line-Ending Conventions for SSH 60
  - Testing Authentication 61
  - Setting Up SSH on Cisco IOS Routers, Catalyst Switches, and Catalyst 6500/7600 devices 61
  - Preventing Non-SSH Connections (Optional) 63
- Setting Up AUS or Configuration Engine 64
  - Setting Up AUS on PIX Firewall and ASA Devices 64
- Configuring Licenses on Cisco ASA Devices 65
- Configuring Licenses on Cisco IOS Devices 66
- Initializing IPS Devices 67

---

**CHAPTER 3****Managing the Device Inventory 69**

- Understanding the Device Inventory 69
  - Understanding the Device View 69
  - Understanding Device Names and What Is Considered a Device 71
  - Understanding Device Credentials 73
  - Understanding Device Properties 74
- Adding Devices to the Device Inventory 75
  - Working with Device Clusters 77
  - Adding Devices from the Network 80
    - Device Information Page – Add Device from Network 82
    - Service Module Credentials Dialog Box 86
    - IPS Module Discovery Dialog Box 87
  - Adding Devices from Configuration Files 89
    - Device Information Page—Configuration File 90
  - Adding Devices by Manual Definition 92
    - Device Information Page—New Device 93
  - Adding Devices from an Inventory File 97

Device Information Page—Add Device from File	99
Working with the Device Inventory	102
Adding, Editing, or Deleting Auto Update Servers or Configuration Engines	103
Server Properties Dialog Box	104
Available Servers Dialog Box	106
Adding or Changing Interface Modules	107
Viewing or Changing Device Properties	107
Device Properties: General Page	108
Device Credentials Page	112
Device Groups Page	117
Group Information Page	118
License Information Page	120
Policy Object Override Pages	122
Changing Critical Device Properties	122
Image Version Changes That Do Not Change the Feature Set in Security Manager	123
Changes That Change the Feature Set in Security Manager	124
Showing Device Containment	126
Cloning a Device	126
Deleting Devices from the Security Manager Inventory	128
Device Delete Validation Dialog Box	129
Working with Device Groups	129
Understanding Device Grouping	130
Edit Device Groups Dialog Box	131
Creating Device Group Types	132
Creating Device Groups	132
Deleting Device Groups or Group Types	133
Adding Devices to or Removing Them From Device Groups	133
Working with Device Status View	134

---

**CHAPTER 4**
**Managing Activities 139**

Understanding Activities	139
Benefits of Activities	140
Activity Approval	141
Activities and Locking	141

Activities and Multiple Users	142
Understanding Activity/Ticket States	142
Working with Activities/Tickets	146
Accessing Activity Functions in Workflow Mode	147
Accessing Ticket Functions in Non-Workflow Mode	148
Activity/Ticket Manager Window	149
Creating an Activity/Ticket	153
Responding to the Activity/Ticket Required Dialog Box	153
Opening an Activity/Ticket	154
Closing an Activity/Ticket	155
Viewing Change Reports	156
Selecting a Change Report in Non-Workflow Mode with Ticket Management Disabled	157
Validating an Activity/Ticket	158
Submitting an Activity for Approval (Workflow Mode with Activity Approver)	159
Approving or Rejecting an Activity (Workflow Mode)	160
Discarding an Activity/Ticket	161
Viewing Activity/Ticket Status and History	163

---

**CHAPTER 5**

<b>Managing Policies</b>	<b>165</b>
Understanding Policies	165
Settings-Based Policies vs. Rule-Based Policies	166
Service Policies vs. Platform-Specific Policies	166
Local Policies vs. Shared Policies	167
Understanding Rule Inheritance	168
Inheritance vs. Assignment	170
Policy Management and Objects	171
Understanding Policy Locking	172
Understanding Locking and Policies	173
Understanding Locking and VPN Topologies	174
Understanding Locking and Objects	174
Customizing Policy Management for Routers and Firewall Devices	175
Discovering Policies	176
Discovering Policies on Devices Already in Security Manager	179
Create Discovery Task and Bulk Rediscovery Dialog Boxes	183

Viewing Policy Discovery Task Status	186
Discovery Status Dialog Box	187
Policy Discovery Status Page	189
Frequently Asked Questions about Policy Discovery	191
Managing Policies in Device View and the Site-to-Site VPN Manager	194
Policy Status Icons	195
Performing Basic Policy Management	195
Configuring Local Policies in Device View	195
Copying Policies Between Devices	197
Unassigning a Policy	200
Working with Shared Policies in Device View or the Site-to-Site VPN Manager	201
Using the Policy Banner	203
Policy Shortcut Menu Commands in Device View and the Site-to-Site VPN Manager	204
Sharing a Local Policy	205
Sharing Multiple Policies of a Selected Device	206
Unsharing a Policy	208
Assigning a Shared Policy to a Device or VPN Topology	209
Adding Local Rules to a Shared Policy	210
Inheriting or Uninheriting Rules	211
Cloning (Copying) a Shared Policy	212
Renaming a Shared Policy	213
Modifying Shared Policy Definitions in Device View or the Site-to-Site VPN Manager	213
Modifying Shared Policy Assignments in Device View or the Site-to-Site VPN Manager	214
Managing Shared Policies in Policy View	215
Policy View Selectors	217
Policy View—Shared Policy Selector Options	218
Creating a New Shared Policy	219
Modifying Policy Assignments in Policy View	219
Deleting a Shared Policy	221
Managing Policy Bundles	222
Creating a New Policy Bundle	222
Cloning a Policy Bundle	223
Renaming a Policy Bundle	224
Assigning Policy Bundles to Devices	224

---

**CHAPTER 6****Managing Policy Objects 227**

- Selecting Objects for Policies 228
- Policy Object Manager 230
  - Policy Object Manager: Undocking and Docking 234
  - Policy Object Manager Shortcut Menu 234
- Working with Policy Objects—Basic Procedures 235
  - Creating Policy Objects 235
  - Editing Objects 239
  - Using Category Objects 239
  - Cloning (Duplicating) Objects 240
  - Viewing Object Details 241
  - Generating Object Usage Reports 241
  - Deleting Objects 243
  - Managing Object Overrides 244
    - Understanding Policy Object Overrides for Individual Devices 244
    - Allowing a Policy Object to Be Overridden 245
    - Creating or Editing Object Overrides for a Single Device 246
    - Creating or Editing Object Overrides for Multiple Devices At A Time 246
    - Deleting Device-Level Object Overrides 248
    - Overridable Objects in Security Manager 249
  - Importing and Exporting Policy Objects 251
- Understanding AAA Server and Server Group Objects 254
  - Supported AAA Server Types 255
  - Additional AAA Support on ASA, PIX, and FWSM Devices 256
  - Predefined AAA Authentication Server Groups 258
  - Default AAA Server Groups and IOS Devices 259
  - Creating AAA Server Objects 260
  - Add or Edit AAA Server Dialog Box 261
    - AAA Server Dialog Box—RADIUS Settings 263
    - AAA Server Dialog Box—TACACS+ Settings 266
    - AAA Server Dialog Box—Kerberos Settings 267
    - AAA Server Dialog Box—LDAP Settings 268
    - AAA Server Dialog Box—NT Settings 271

AAA Server Dialog Box—SDI Settings	272
AAA Server Dialog Box—HTTP-FORM Settings	273
Add and Edit LDAP Attribute Map Dialog Boxes	274
Add and Edit LDAP Attribute Map Value Dialog Boxes	275
Add and Edit Map Value Dialog Boxes	276
Creating AAA Server Group Objects	276
AAA Server Group Dialog Box	278
Creating Access Control List Objects	281
Creating Extended Access Control List Objects	282
Creating Standard Access Control List Objects	284
Creating Web Access Control List Objects	285
Creating Unified Access Control List Objects	287
Add or Edit Access List Dialog Boxes	288
Add and Edit Extended Access Control Entry Dialog Boxes	289
Add and Edit Standard Access Control Entry Dialog Boxes	292
Add and Edit Web Access Control Entry Dialog Boxes	294
Add and Edit Unified Access Control Entry Dialog Boxes	296
Configuring Time Range Objects	299
Recurring Ranges Dialog Box	300
Understanding Interface Role Objects	301
Creating Interface Role Objects	302
Interface Role Dialog Box	303
Specifying Interfaces During Policy Definition	304
Using Interface Roles When a Single Interface Specification is Allowed	305
Handling Name Conflicts between Interfaces and Interface Roles	306
Understanding Map Objects	306
Understanding Networks/Hosts Objects	308
Contiguous and Discontiguous Network Masks for IPv4 Addresses	309
Creating Networks/Hosts Objects	311
Add or Edit Network/Host Dialog Box	312
Using Unspecified Networks/Hosts Objects	315
Specifying IP Addresses During Policy Definition	316
VM Attribute Policies	318
Communication between the VM attribute agent and vCenter	318

Attribute Agent States	319
Guidelines for Configuring vCenter Virtual Machines	319
Configuring VM Attribute Policies	320
Understanding Pool Objects	321
Add or Edit IPv4 Pool Dialog Box	321
Add or Edit IPv6 Pool Dialog Box	322
Add or Edit MAC Address Pool Dialog Box	323
Add or Edit NET Pool Object Dialog Box	324
Add or Edit DHCPv6 Pool Dialog Box	325
Configuring SAML Identity Provider	327
Adding or Editing SAML Identity Provider	327
Understanding and Specifying Services and Service and Port List Objects	329
Configuring Port List Objects	331
Configuring Service Objects	332
How Policy Objects are Provisioned as Object Groups	335
How Network/Host, Port List, and Service Objects are Named When Provisioned As Object Groups	336
How Service Objects are Provisioned as Object Groups	337

---

**CHAPTER 7**
**Managing Flexconfigs 339**

Understanding FlexConfig Policies and Policy Objects	340
Using CLI Commands in FlexConfig Policy Objects	340
Using Scripting Language Instructions	341
Scripting Language Example 1: Looping	341
Scripting Language Example 2: Looping with Two-Dimensional Arrays	342
Example 3: Looping with If/Else Statements	342
Understanding FlexConfig Object Variables	343
Example of FlexConfig Policy Object Variables	344
FlexConfig System Variables	345
Predefined FlexConfig Policy Objects	358
Configuring FlexConfig Policies and Policy Objects	363
A FlexConfig Creation Scenario	363
Creating FlexConfig Policy Objects	366
Add or Edit FlexConfig Dialog Box	367

Create Text Object Dialog Box 369

Add or Edit Text Object Dialog Box 370

FlexConfig Undefined Variables Dialog Box 371

Property Selector Dialog Box 372

Editing FlexConfig Policies 373

FlexConfig Policy Page 374

Values Assignment Dialog Box 375

FlexConfig Preview Dialog Box 376

Troubleshooting FlexConfigs 376

**CHAPTER 8**

**Managing Deployment 379**

Understanding Deployment 379

Overview of the Deployment Process 379

Deployment in Non-Workflow Mode 382

Deployment Task Flow in Non-Workflow Mode 382

Job States in Non-Workflow Mode 383

Deployment in Workflow Mode 383

Deployment Task Flow in Workflow Mode 383

Job States in Workflow Mode 385

Deployment Job Approval 386

Deployment Jobs and Multiple Users 386

Including Devices in Deployment Jobs or Schedules 386

Understanding Deployment Methods 387

Deploying Directly to a Device 387

Deploying to a Device through an Intermediate Server 388

Deploying to a File 389

Understanding How Out-of-Band Changes are Handled 390

Handling Device OS Version Mismatches 391

Overview of the Deployment Manager and Configuration Archive 392

Understanding What You Can Do with the Deployment Manager 393

Deployment Manager Window 393

Deployment Workflow Commentary Dialog Box 398

Deployment Schedules Tab, Deployment Manager 398

Configuration Archive Window 401

Working with Deployment and the Configuration Archive	403
Viewing Deployment Status and History for Jobs and Schedules	403
Tips for Successful Deployment Jobs	405
Deploying Configurations in Non-Workflow Mode	406
Edit Deploy Method Dialog Box	408
Warning - Partial VPN Deployment Dialog Box	409
Deployment Status Details Dialog Box	410
Deploying Configurations in Workflow Mode	412
Creating and Editing Deployment Jobs	413
Submitting Deployment Jobs	416
Approving and Rejecting Deployment Jobs	417
Deploying a Deployment Job in Workflow Mode	418
Discarding Deployment Jobs	419
Deploying Configurations Using an Auto Update Server or CNS Configuration Engine	420
Deploying Configurations to a Token Management Server	421
Previewing Configurations	422
Detecting and Analyzing Out of Band Changes	424
Exceptions to Out of Band Change Detection	426
Exceptions to Out of Band Change Detection	427
OOB (Out of Band) Changes Dialog Box	427
OOB Re-sync. Tool	429
Redeploying Configurations to Devices	432
Aborting Deployment Jobs	434
Creating or Editing Deployment Schedules	434
Schedule Dialog Box	436
Add Other Devices Dialog Box	437
Suspending or Resuming Deployment Schedules	438
Adding Configuration Versions from a Device to the Configuration Archive	439
Viewing and Comparing Archived Configuration Versions	439
Configuration Version Viewer	440
Viewing Deployment Transcripts	442
Rolling Back Configurations	443
Understanding Configuration Rollback	443
Understanding Rollback for Devices in Multiple Context Mode	444

Understanding Rollback for Failover Devices 445

Understanding Rollback for Catalyst 6500/7600 Devices 445

Understanding Rollback for IPS and IOS IPS 446

Commands that Can Cause Conflicts after Rollback 448

Commands to Recover from Failover Misconfiguration after Rollback 449

Rolling Back Configurations to Devices Using the Deployment Manager 450

Using Rollback to Deploy Archived Configurations 451

Performing Rollback When Deploying to a File 452

**CHAPTER 9**

**Troubleshooting Device Communication and Deployment 455**

Testing Device Connectivity 455

    Device Connectivity Test Dialog Box 457

Managing Device Communication Settings and Certificates 458

    Multiple Certificate Authentication Support 458

    Manually Adding SSL Certificates for Devices that Use HTTPS Communications 459

    Security Certificate Rejected When Discovering Device 460

    Invalid Certificate Error During Device Discovery 461

    Troubleshooting SSH Connection Problems 461

    Troubleshooting Device Communication Failures 462

Resolving Red X Marks in the Device Selector 463

Troubleshooting Deployment 464

    Changing How Security Manager Responds to Device Messages 464

    Memory Violation Deployment Errors for ASA 8.3+ Devices 466

    Error While Attempting to Remove Unreferenced Object 466

    Security Manager Unable to Communicate With Device After Deployment 466

    Updating VPNs That Include Routing Processes 467

    Mixing Deployment Methods with Router and VPN Policies 468

    Deployment Failures for Routers 469

    Deployment Failures for Catalyst Switches and Service Modules 470

        Changing How Security Manager Deploys Configurations to Multiple-Context FWSM 472

    Deployment Failures to Devices Managed by AUS 472

    Device Communication Deployment 473

    Deployment Fails on Entry of Unrecognized Characters 473

    Troubleshooting the Setup of Configuration Engine-Managed Devices 473

---

<b>CHAPTER 10</b>	<b>Managing Security Manager Server</b>	<b>477</b>
	Overview of Security Manager Server Management and Administration	477
	Managing a Cluster of Security Manager Servers	478
	Overview of Security Manager Server Cluster Management	478
	Splitting a Security Manager Server	479
	Synchronizing Shared Policies Among Security Manager Servers	480
	Exporting the Device Inventory	481
	Exporting the Device Inventory from the Security Manager Client	482
	Supported CSV Formats for Inventory Import/Export	485
	Exporting the Device Inventory from the Command Line	486
	Exporting Shared Policies	487
	Importing Policies or Devices	489
	Installing Security Manager License Files	492
	Certificate Trust Management	493
	Working with Audit Reports	495
	Understanding Audit Reports	495
	Generating the Audit Report	496
	Using the Audit Report Window	497
	Purging Audit Log Entries	499
	Taking Over Another User's Work	499
	Changing Passwords for the Admin or Other Users	500
	Backing up and Restoring the Security Manager Database	500
	Backing Up the Server Database	500
	Restoring the Server Database	502
	Generating Data for the Cisco Technical Assistance Center	504
	Creating Diagnostics Files for the Cisco Technical Assistance Center	504
	Generating Deployment or Discovery Status Reports	506
	Generating a Partial Database Backup for the Cisco Technical Assistance Center	506

**PART II**
**Firewall Services and NAT 593**

---

**CHAPTER 12**
**Introduction to Firewall Services 595**

Overview of Firewall Services	595
Understanding the Processing Order of Firewall Rules	596
Understanding How NAT Affects Firewall Rules	597
ACL Names Preserved by Security Manager	598
ACL Naming Conventions	599
Resolving User Defined ACL Policy Naming Conflicts	601
Resolving ACL Name Conflicts Between Policies	601
Managing Your Rules Tables	602
Using Rules Tables	602
Adding and Removing Rules	604
Editing Rules	605
Adding or Editing Address Cells in Rules Tables	607
Adding or Editing User Cells in Rules Tables	608
Adding or Editing Services Cells in Rules Tables	608
Adding or Editing Interfaces or Zones Cells in Rules Tables	609
Editing Category Cells in Rules Tables	610
Editing Description Cells in Rules Tables	610

- Showing the Contents of Cells in Rules Tables 610
- Finding and Replacing Items in Rules Tables 612
  - Find and Replace Dialog Box 613
- Moving Rules and the Importance of Rule Order 615
- Enabling and Disabling Rules 616
- Using Sections to Organize Rules Tables 616
  - Add and Edit Rule Section Dialog Boxes 618
- Combining Rules 618
  - Combine Rules Selection Summary Dialog Box 620
  - Interpreting Rule Combiner Results 621
  - Example Rule Combiner Results 623
- Converting IPv4 Rules to Unified Rules 624
- Generating Policy Query Reports 625
  - Querying Device or Policy Dialog Box 626
  - Interpreting Policy Query Results 629
  - Example Policy Query Result 631
- Optimizing Network Object Groups When Deploying Firewall Rules 632
- Expanding Object Groups During Discovery 635

---

**CHAPTER 13**

- Managing Identity-Aware Firewall Policies 637**
  - Overview of Identity-Aware Firewall Policies 637
    - User Identity Acquisition 638
    - Requirements for Identity-Aware Firewall Policies 639
    - Configuring the Firewall to Provide Identity-Aware Services 641
  - Configuring Identity-Aware Firewall Policies 642
    - Enabling Identity-Aware Firewall Services 643
      - Identifying Active Directory Servers and Agents 643
      - Configuring Identity Options 651
    - Creating Identity User Group Objects 654
    - Selecting Identity Users in Policies 656
    - Configuring Identity-Based Firewall Rules 657
    - Configuring Cut-Through Proxy 659
    - Collecting User Statistics 661
    - Filtering VPN Traffic with Identity-Based Rules 662

Monitoring Identity Firewall Policies 662

---

**CHAPTER 14**

**Managing TrustSec Firewall Policies 665**

Overview of TrustSec Firewall Policies 665

    Understanding SGT and SXP Support in Cisco TrustSec 666

    Roles in the Cisco TrustSec Solution 667

    Security Group Policy Enforcement 667

    About Speaker and Listener Roles 670

    Prerequisites for Integrating an ASA with Cisco TrustSec 670

Configuring TrustSec Firewall Policies 672

    Configuring Cisco TrustSec Services 672

        Configuring Security Exchange Protocol (SXP) Settings 673

        Defining SXP Connection Peers 677

    Creating Security Group Objects 679

    Selecting Security Groups in Policies 681

    Configuring TrustSec-Based Firewall Rules 681

Monitoring TrustSec Firewall Policies 682

---

**CHAPTER 15**

**Managing Firewall AAA Rules 683**

Understanding AAA Rules 683

Understanding How Users Authenticate 684

Configuring AAA Rules for ASA, PIX, and FWSM Devices 686

Configuring AAA Rules for IOS Devices 689

AAA Rules Page 691

    Add and Edit AAA Rule Dialog Boxes 695

    Edit AAA Option Dialog Box 701

    AuthProxy Dialog Box 701

    Edit Server Group Dialog Box 701

AAA Firewall Settings Policies 702

    AAA Firewall Settings Page, Advanced Setting Tab 702

        Interactive Authentication Configuration Dialog Box 706

        Clear Connection Configuration Dialog Box 707

    AAA Firewall Page, MAC-Exempt List Tab 708

        Firewall AAA MAC Exempt Setting Dialog Box 709

AAA Page	710
Firewall AAA IOS Timeout Value Setting	712

**CHAPTER 16**

<b>Managing Firewall Access Rules</b>	<b>715</b>
Understanding Access Rules	715
Understanding Global Access Rules	717
Understanding Device Specific Access Rule Behavior	718
Understanding Access Rule Address Requirements and How Rules Are Deployed	719
Configuring Access Rules	721
Access Rules Page	724
Add and Edit Access Rule Dialog Boxes	728
Advanced and Edit Options Dialog Boxes	731
Hit Count Selection Summary Dialog Box	735
Configuring Expiration Dates for Access Rules	736
Configuring Settings for Access Control	737
Access Control Settings Page	738
Firewall ACL Setting Dialog Box	740
Using Automatic Conflict Detection	742
Understanding Automatic Conflict Detection	742

<b>CHAPTER 35</b>	<b>Using Map View 1585</b>
Understanding Maps and Map View	1585
Understanding the Map View Main Page	1586

Map Toolbar	1588
Using the Navigation Window	1589
Maps Context Menus	1589
Managed Device Node Context Menu	1589
Multiple Selected Nodes Context Menu	1590
VPN Connection Context Menu	1591
Layer 3 Link Context Menu	1591
Map Object Context Menu	1591
Map Background Context Menu	1592
Access Permissions for Maps	1593
Working With Maps	1593
Creating New or Default Maps	1594
Opening Maps	1594
Saving Maps	1595
Deleting Maps	1595
Exporting Maps	1595
Arranging Map Elements	1596
Panning, Centering, and Zooming Maps	1596
Selecting Map Elements	1597
Searching for Map Nodes	1597
Using Linked Maps	1598
Setting the Map Background Properties	1598
Displaying Your Network on the Map	1599
Understanding Map Elements	1599
Displaying Managed Devices on the Map	1601
Showing Containment of Catalyst Switches, Firewalls, and Adaptive Security Appliances	1601
Using Map Objects To Represent Network Topology	1602
Add Map Object and Node Properties Dialog Boxes	1603
Select Policy Object Dialog Box	1603
Interface Properties Dialog Box	1604
Creating and Managing Layer 3 Links on the Map	1604
Select Interfaces and Link Properties Dialog Boxes	1605
Add Link Dialog Box	1605
Managing VPNs in Map View	1606

Displaying Existing VPNs on the Map	1606
Creating VPN Topologies in Map View	1606
Editing VPN Policies or Peers From the Map	1607
Managing Device Policies in Map View	1607
Performing Basic Policy Management in Map View	1608
Managing Firewall Policies in Map View	1608
Managing Firewall Settings in Map View	1609

**PART IV**

**IPS Configuration 1611**

---

**CHAPTER 36**

**Getting Started with IPS Configuration 1613**

Understanding IPS Network Sensing	1613
Capturing Network Traffic	1614
Correctly Deploying the Sensor	1616
Tuning the IPS	1616
Overview of IPS Configuration	1617
Identifying Allowed Hosts	1620
Configuring SNMP	1621
General SNMP Configuration Options	1623
SNMPv3 Users Tab	1624
Add SNMPv3 User Dialog Box	1624
SNMP Trap Configuration Tab	1625
SNMP Trap Communication Dialog Box	1626
Managing User Accounts and Password Requirements	1627
Understanding IPS User Roles	1628
Understanding Managed and Unmanaged IPS Passwords	1629
Understanding How IPS Passwords are Discovered and Deployed	1629
Configuring IPS User Accounts	1631
Add User and Edit User Credentials Dialog Boxes	1632
Configuring User Password Requirements	1633
Configuring AAA Access Control for IPS Devices	1634
Identifying an NTP Server	1636
Identifying DNS Servers	1637
Identifying an HTTP Proxy Server	1638

IPS SSHv2 Known Host Keys	1638
Add or Edit Known Host RSA Key Dialog Box	1639
Configuring IPS SSHv1 Fallback Settings	1639
Configuring the External Product Interface	1640
External Product Interface Dialog Box	1641
Posture ACL Dialog Box	1642
Configuring IPS Logging Policies	1643
IPS Health Monitor	1644
Configuring IPS Security Settings	1646

---

**CHAPTER 37**

<b>Managing IPS Device Interface</b>	<b>1647</b>
Understanding Interfaces	1647
Understanding Interface Modes	1648
Promiscuous Mode	1648
Inline Interface Mode	1649
Inline VLAN Pair Mode	1649
VLAN Group Mode	1650
Deploying VLAN Groups	1651
Configuring Interfaces	1652
Understanding the IPS Interfaces Policy	1652
Viewing a Summary of IPS Interface Configuration	1654
Configuring Physical Interfaces	1655
Modify Physical Interface Map Dialog Box	1656
Configuring Bypass Mode	1658
Configuring CDP Mode	1659
Configuring Inline Interface Pairs	1659
Configuring Inline VLAN Pairs	1660
Configuring VLAN Groups	1662

---

**CHAPTER 38**

<b>Configuring Virtual Sensors</b>	<b>1665</b>
Understanding the Virtual Sensor	1665
Advantages and Restrictions of Virtualization	1667
Inline TCP Session Tracking Mode	1668
Understanding Normalizer Mode	1668

- Assigning Interfaces to Virtual Sensors 1668
- Identifying the Virtual Sensors for a Device 1669
- Defining A Virtual Sensor 1669
  - Virtual Sensor Dialog Box 1671
- Editing Policies for a Virtual Sensor 1673
- Deleting A Virtual Sensor 1674

---

**CHAPTER 39**

**Defining IPS Signatures 1677**

- Understanding Signatures 1677
  - Obtaining Detailed Information About a Signature 1678
  - Understanding Signature Inheritance 1679
  - IPS Signature Purge 1679
- Configuring Signatures 1680
  - Signatures Page 1680
    - Apply Signature Threat Profiles 1685
    - Signature Shortcut Menu 1686
    - Edit, Add, Replace Action Dialog Boxes 1688
    - Edit Fidelity Dialog Box 1689
  - Viewing Signature Update Levels 1689
  - Enabling and Disabling Signatures 1690
  - Editing Signatures 1691
    - Edit Signature or Add Custom Signature Dialog Boxes 1692
  - Adding Custom Signatures 1695
    - Engine Options 1697
  - Cloning Signatures 1699
    - Regular Expressions in Custom Signatures 1699
  - Editing Signature Parameters (Tuning Signatures) 1700
    - Edit Signature Parameters Dialog Box 1702
    - Editing the Component List for Meta Engine Signatures 1706
    - Obsoletes Dialog Box 1707
- Configuring Signature Settings 1707

---

**CHAPTER 40**

**Configuring Event Action Rules 1711**

- Understanding the IPS Event Action Process 1711

Understanding IPS Event Actions	1712
Configuring Event Action Filters	1714
Tips for Managing Event Action Filter Rules	1716
Event Action Filters Page	1717
Filter Item Dialog Box	1719
Configuring Event Action Overrides	1722
Add or Edit Event Action Rule Dialog Box	1724
Configuring Risk Rating Policy Objects	1725
Add or Edit Risk Rating Dialog Box	1726
Configuring IPS Event Action Network Information	1727
Configuring Target Value Ratings	1728
Target Value Rating Dialog Box	1729
Understanding Passive OS Fingerprinting	1730
Configuring OS Identification (Cisco IPS 6.x and Later Sensors Only)	1731
OS Map Dialog Box	1732
Configuring Settings for Event Actions	1733

---

**CHAPTER 41**
**Managing IPS Anomaly Detection 1737**

Understanding Anomaly Detection	1737
Worm Viruses	1738
Anomaly Detection Modes	1738
Anomaly Detection Zones	1739
Knowing When to Turn Off Anomaly Detection	1740
Configuring Anomaly Detection Signatures	1740
Configuring Anomaly Detection	1742
Configuring Anomaly Detection Learning Accept Mode	1744
Understanding Anomaly Detection Thresholds and Histograms	1746
Configuring Anomaly Detection Thresholds and Histograms	1747
Dest Port or Protocol Map Dialog Box	1748
Histogram Dialog Box	1749

---

**CHAPTER 42**
**Configuring Global Correlation 1751**

Understanding Global Correlation	1751
Understanding Reputation	1752

Understanding Network Participation	1753
Global Correlation Requirements and Limitations	1754
Configuring Global Correlation Inspection and Reputation	1755
Configuring Network Participation	1757

**CHAPTER 43****Configuring Attack Response Controller for Blocking and Rate Limiting 1759**

Understanding IPS Blocking	1759
Strategies for Applying Blocks	1761
Understanding Rate Limiting	1762
Understanding Router and Switch Blocking Devices	1762
Understanding the Main Blocking Sensor	1764
Configuring IPS Blocking and Rate Limiting	1765
Blocking Page	1766
General Tab, IPS Blocking Policy	1768
User Profile Dialog Box	1770
Primary Blocking Sensor Dialog Box	1771
Router, Firewall, Cat6K Device Dialog Box	1771
Router Block Interface Dialog Box	1773
Cat6k Block VLAN Dialog Box	1774
Never Block Host or Network Dialog Boxes	1775

**CHAPTER 44****Managing IPS Sensors 1777**

Managing IPS Licenses	1777
Updating IPS License Files	1777
Redeploying IPS License Files	1778
Automating IPS License File Updates	1779
Managing IPS Updates	1780
Configuring the IPS Update Server	1780
Checking for IPS Updates and Downloading Them	1781
Automating IPS Updates	1782
Manually Applying IPS Updates	1783
Managing IPS Certificates	1786
Rebooting IPS Sensors	1788

<b>CHAPTER 45</b>	<b>Configuring IOS IPS Routers</b>	<b>1789</b>
	Understanding Cisco IOS IPS	1789
	Understanding IPS Subsystems and Support of IOS IPS Revisions	1790
	Cisco IOS IPS Signature Scanning with Lightweight Signatures	1790
	Router Configuration Files and Signature Event Action Processor (SEAP)	1791
	Cisco IOS IPS Limitations and Restrictions	1791
	Overview of Cisco IOS IPS Configuration	1792
	Initial Preparation of a Cisco IOS IPS Router	1793
	Selecting a Signature Category for Cisco IOS IPS	1794
	Configuring General Settings for Cisco IOS IPS	1795
	Configuring IOS IPS Interface Rules	1797
	IPS Rule Dialog Box	1798
	Pair Dialog Box	1799
<b>PART V</b>	<b>PIX/ASA/FWSM Device Configuration</b>	<b>1801</b>
<b>CHAPTER 46</b>	<b>Managing Firewall Devices</b>	<b>1803</b>
	Firewall Device Types	1803
	Default Firewall Configurations	1806
	Configuring Firewall Device Interfaces	1807
	Understanding Device Interfaces	1807
	Interfaces in Routed and Transparent Modes	1809
	Interfaces in Single and Multiple Contexts	1809
	About Asymmetric Routing Groups	1810
	Understanding ASA 5505 Ports and Interfaces	1811
	Configuring Subinterfaces (PIX/ASA)	1811
	Configuring Redundant Interfaces	1813
	Configuring EtherChannels	1814
	Configuring VNI Interfaces	1819
	Configuring Loopback Interface	1826
	Configuring Tunnel Interface	1827
	Establishing Regular IPSec VPN Tunnel	1830
	Configuring IPSec Policy for Tunnel Interface	1831

Configuring VLAN Interface	1834
Managing Device Interfaces, Hardware Ports, and Bridge Groups	1837
Add/Edit Interface Dialog Box (PIX 6.3)	1838
Add/Edit Interface Dialog Box (PIX 7.0+/ASA/FPR/FWSM)	1842
Add/Edit Interface Dialog Box: Cisco Firepower 9000 (General and Advanced tabs)	1852
Configuring Hardware Ports on an ASA 5505	1879
Add/Edit Bridge Group Dialog Box	1881
Advanced Interface Settings (PIX/ASA/FWSM)	1886
Enabling Traffic between Interfaces with the Same Security Level	1888
Managing the PPPoE Users List	1889
Managing VPDN Groups	1890
VXLAN	1891
Configuring VXLAN Policy	1891

**CHAPTER 47****Configuring Bridging Policies on Firewall Devices 1895**

About Bridging on Firewall Devices	1895
Bridging Support for FWSM 3.1	1897
ARP Table Page	1898
Add/Edit ARP Configuration Dialog Box	1899
ARP Inspection Page	1900
Add/Edit ARP Inspection Dialog Box	1900
Managing the IPv6 Neighbor Cache	1901
MAC Address Table Page	1902
Add/Edit MAC Table Entry Dialog Box	1903
MAC Learning Page	1903
Add/Edit MAC Learning Dialog Box	1904
Management IP Page	1905
Management IPv6 Page (ASA 5505)	1906

**CHAPTER 48****Configuring Device Administration Policies on Firewall Devices 1909**

About AAA on Security Devices	1909
Preparing for AAA	1910
Local Database	1911
AAA for Device Administration	1912

AAA for Network Access	1912
AAA for VPN Access	1912
Configuring AAA - Authentication Tab	1913
Authorization Tab	1915
Accounting Tab	1916
Configuring Banners	1918
Configuring Boot Image/Configuration Settings	1919
Images Dialog Box	1920
Configuring CLI Prompt	1921
Setting the Device Clock	1922
Enabling/Disabling FIPS	1924
Enabling Customer Success Network	1925
Configuring Umbrella Global Policy	1926
Configuring Device Credentials	1927
Managing Mount Points	1928
Add/Edit Mount Point Configuration Dialog Box	1929
IP Client	1930
Add/Edit IP Client Dialog Box	1931
App Agent	1931

---

**CHAPTER 49**

<b>Configuring Device Access Settings on Firewall Devices</b>	<b>1933</b>
Configuring Console Timeout	1933
HTTP Page	1934
HTTP Configuration Dialog Box	1935
Configuring ICMP	1936
Add and Edit ICMP Dialog Boxes	1937
Configuring Management Access	1938
Configuring Management Session Quota Limits	1939
Configuring Secure Shell Access	1940
Add and Edit SSH Host Dialog Boxes	1941
Configuring SSL - Basic and Advanced tabs	1941
Reference Identities	1947
Add/Edit Reference Identity Dialog Box	1947
Configuring SNMP	1948

SNMP Terminology	1949
SNMP Version 3	1949
SNMP Page	1951
SNMP Trap Configuration Dialog Box	1953
Add/Edit SNMP Host Access Entry Dialog Box	1956
Add/Edit SNMP Host Group Entry Dialog Box	1957
Add/Edit SNMP Group Entry Dialog Box	1958
Add/Edit SNMP User Entry Dialog Box	1960
Add/Edit SNMP User List Entry Dialog Box	1962
Telnet Page	1963
Telnet Configuration Dialog Box	1964

**CHAPTER 50****Configuring Failover 1965**

Understanding Failover	1966
Active/Active Failover	1967
Stateful Failover	1969
Basic Failover Configuration	1969
Adding A Security Context to Failover Group 2	1972
Additional Steps for an Active/Standby Failover Configuration	1973
Exporting the Certificate to a File or PKCS12 data	1973
Importing the Certificate onto the Standby Device	1974
Failover Policies	1974
Failover Page (PIX 6.3)	1975
Edit Failover Interface Configuration Dialog Box (PIX 6.3)	1976
Failover Page (FWSM)	1978
Advanced Settings Dialog Box	1980
Failover Page (ASA/PIX 7.0+)	1982
Settings Dialog Box	1986
Failover Page (Security Context)	1992
Bootstrap Configuration for LAN Failover Dialog Box	1992

**CHAPTER 51****Configuring Hostname, Resources, User Accounts, and SLAs 1995**

Hostname Page	1995
Resource Management on Multi-context FWSMs	1996

Resources Page	1997
Add and Edit Resource Dialog Boxes	1998
Configuring User Accounts	2001
Add/Edit User Account Dialog Boxes	2002
Monitoring Service Level Agreements (SLAs) To Maintain Connectivity	2002
Creating Service Level Agreements	2003
Configuring SLA Monitor Objects	2004

**CHAPTER 52****Configuring Server Access Settings on Firewall Devices 2007**

AUS Page	2007
Add and Edit Auto Update Server Dialog Boxes	2009
DHCP Relay Page	2010
Add and Edit DHCP Relay Agent Configuration Dialog Boxes	2012
Add and Edit DHCP Relay Server Configuration Dialog Boxes	2013
DHCP Relay IPv6 Page	2013
Add and Edit DHCP Relay IPv6 Agent Configuration Dialog Boxes	2014
Add and Edit DHCP Relay IPv6 Server Configuration Dialog Boxes	2015
Configuring DHCP Servers	2016
DHCP Server Page	2016
Add and Edit DHCP Server Interface Configuration Dialog Boxes	2018
Add/Edit DHCP Server Advanced Configuration Dialog Box	2019
DNS Page	2020
Add DNS Server Group Dialog Box	2022
Add DNS Server Dialog Box	2023
Add DNS Group Map Dialog Box	2024
Configuring DDNS	2024
Add/Edit DDNS Interface Rule Dialog Box	2025
DDNS Update Methods Dialog Box	2026
NTP Page	2027
NTP Server Configuration Dialog Box	2028
SMTP Server Page	2029
TFTP Server Page	2030

**CHAPTER 53****Configuring FXOS Server Access Settings on Firepower 2100 Series Devices 2031**

HTTPS Page	2031
Add and Edit HTTPS Dialog Boxes	2032
SSH Page	2032
Add and Edit SSH Dialog Boxes	2033
SNMP Page	2034
Add and Edit SNMP Dialog Boxes	2034
<hr/>	
<b>CHAPTER 54</b>	<b>Configuring Logging Policies on Firewall Devices 2037</b>
NetFlow Page	2037
Add and Edit Collector Dialog Boxes (NetFlow)	2038
Embedded Event Manager	2039
Add and Edit Applet Dialog Boxes	2041
Add and Edit Syslog Configuration Dialog Boxes	2043
Add and Edit Action Configuration Dialog Boxes	2044
E-Mail Setup Page	2044
Add/Edit Email Recipient Dialog Box	2045
Event Lists Page	2045
Message Classes and Associated Message ID Numbers	2046
Add/Edit Event List Dialog Box	2047
Add/Edit Syslog Class Dialog Box	2047
Add/Edit Syslog Message ID Filter Dialog Box	2048
Logging Filters Page	2049
Edit Logging Filters Dialog Box	2050
Configuring Logging Setup	2052
Logging Setup Page	2052
Configuring Rate Limit Levels	2054
Rate Limit Page	2055
Add/Edit Rate Limit for Syslog Logging Levels Dialog Box	2056
Add/Edit Rate Limited Syslog Message Dialog Box	2056
Configuring Syslog Server Setup	2057
Syslog Relay Configuration	2059
Server Setup Page	2059
Logging Levels	2062
Add/Edit Syslog Message Dialog Box	2062

	Defining Syslog Servers	2063
	Syslog Servers Page	2065
	Add/Edit Syslog Server Dialog Box	2066
<b>CHAPTER 55</b>	<b>Configuring Multicast Policies on Firewall Devices</b>	<b>2069</b>
	Enabling PIM and IGMP	2069
	Configuring IGMP	2070
	IGMP Page - Protocol Tab	2071
	Configure IGMP Parameters Dialog Box	2072
	IGMP Page - Access Group Tab	2073
	Configure IGMP Access Group Parameters Dialog Box	2073
	IGMP Page - Static Group Tab	2074
	Configure IGMP Static Group Parameters Dialog Box	2075
	IGMP Page - Join Group Tab	2075
	Configure IGMP Join Group Parameters Dialog Box	2076
	Configuring Multicast Routes	2076
	Add/Edit MRout Configuration Dialog Box	2077
	Configuring Multicast Boundary Filters	2078
	Add/Edit MBoundary Configuration Dialog Box	2078
	Add/Edit MBoundary Interface Configuration Dialog Box	2079
	Configuring PIM	2079
	PIM Page - Protocol Tab	2080
	Add/Edit PIM Protocol Dialog Box	2080
	PIM Page - Neighbor Filter Tab	2081
	Add/Edit PIM Neighbor Filter Dialog Box	2082
	PIM Page - Bidirectional Neighbor Filter Tab	2082
	Add/Edit PIM Bidirectional Neighbor Filter Dialog Box	2083
	PIM Page - Rendezvous Points Tab	2084
	Add/Edit Rendezvous Point Dialog Box	2084
	PIM Page - Route Tree Tab	2086
	PIM Page - Request Filter Tab	2087
	Add/Edit Multicast Group Rules Dialog Box	2088
	PIM Page - Bootstrap Router Tab	2089
	Add/Edit Bootstrap Router Dialog Box	2090

---

<b>CHAPTER 56</b>	<b>Configuring Routing Policies on Firewall Devices</b>	<b>2091</b>
	Configuring No Proxy ARP	2091
	Configuring BGP	2092
	About BGP	2093

# CHAPTER 1

## Getting Started With Security Manager

- [Product Overview](#) , on page 1
- [Logging In to and Exiting Security Manager](#) , on page 11
- [Using Configuration Manager - Overview](#) , on page 14
- [Using the JumpStart to Learn About Security Manager](#) , on page 24
- [Completing the Initial Security Manager Configuration](#) , on page 25
- [Understanding Basic Security Manager Interface Features](#) , on page 29
- [Accessing Online Help](#) , on page 54

### Product Overview

**Note** From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software, including the following devices:

- Cisco Catalyst 6500 and 7600 Series Firewall Services Modules ([EOL8184](#))
- Cisco Catalyst 6500 Series Intrusion Detection System Services Module 2 ([EOL8843](#))
- Cisco Intrusion Prevention System: IPS 4200, 4300, and 4500 Series Sensors ([EOL9916](#))
- Cisco SR 500 Series Secure Routers ([EOL7687](#), [EOL7657](#))
- PIX Firewalls ([EOL](#))

**Caution** From version 4.18, Cisco Security Manager does not support SFR from ASA 9.10(1) onwards for ASA 5512, ASA 5506, ASA 5506H and ASA 5506W models. Therefore, if you upgrade to 9.10(1) through Image Manager, the exiting SFR configuration will be lost.

Cisco Security Manager (Security Manager) enables you to manage security policies on Cisco security devices. Security Manager supports integrated provisioning of firewall, and VPN (site-to-site, remote access, and SSL) services across ASA security appliances.

For a complete list of devices and OS versions supported by Security Manager, please refer to [Supported Devices and Software Versions for Cisco Security Manager](#) on Cisco.com.

Security Manager also supports provisioning of many platform-specific settings, for example, interfaces, routing, identity, QoS, logging, and so on.

Security Manager efficiently manages a wide range of networks, from small networks consisting of a few devices to large networks with thousands of devices. Scalability is achieved through a rich feature set of shareable objects and policies and device grouping capabilities.

Security Manager supports multiple configuration views optimized around different task flows and use cases.

The following topics provide an overview of Security Manager:

- [Primary Benefits of Cisco Security Manager](#) , on page 2
- [Security Manager Policy Feature Sets](#) , on page 4
- [Security Manager Applications Overview](#) , on page 6
- [Device Monitoring Overview](#) , on page 7
- [IPv6 Support in Security Manager](#) , on page 8

## Primary Benefits of Cisco Security Manager

These are the primary benefits of working with Security Manager:

- **Scalable network management**—Centrally administer security policies and device settings for either small networks or large scale networks consisting of thousands of devices. Define policies and settings once and then optionally assign them to individual devices, groups of devices or all the devices in the enterprise.
- **Provisioning of multiple security technologies across different platforms**—Manage VPN, firewall, and IPS technologies on routers, security appliances, Catalyst devices and service modules, and IPS devices.
- **Provisioning of platform-specific settings and policies**—Manage platform-specific settings on specific device types. For example: routing, 802.1x, EzSDD, and Network Admission Control on routers, and device access security, DHCP, AAA, and multicast on firewall devices.
- **VPN wizards**—Quickly and easily configure point-to-point, hub-and-spoke, full-mesh, and Extranet site-to-site VPNs across different VPN device types. Quickly and easily configure remote access IPsec and SSL VPNs on ASA, IOS, and PIX devices.
- **Multiple management views**—Device, policy, and map views enable you to manage your security in the environment that best suits your needs.
- **Reusable policy objects**—Create reusable objects to represent network addresses, device settings, VPN parameters, and so on, then use them instead of manually entering values.
- **Device grouping capabilities**—Create device groups to represent your organizational structure. Manage all devices in the groups concurrently.
- **Policy inheritance**—Centrally specify which policies are mandatory and enforced lower in the organization.
- **Role-based administration**—Enable appropriate access controls for different operators.

- **Workflow**—Optionally allow division of responsibility and workload between network operators and security operators and provide a change management approval and tracking mechanism.
- **Ticket Management**—Associate a ticket ID with policy changes, easily add and update comments pertaining to those changes, and quickly navigate to an external change management system from Security Manager.
- **Single, consistent user interface for managing common firewall features**—Single rule table for all platforms (router, PIX, ASA, and FWSM).
- **Image management**—Complete image management for ASA devices. Facilitates at every stage of image upgrade of devices by: downloading and maintaining image repository, evaluating images, analyzing impact of upgrades, preparing and planning reliable and stable device upgrades, and ensuring sufficient fallback and recovery mechanisms.
- **Intelligent analysis of firewall policies**—The conflict detection feature analyzes and reports rules that overlap or conflict with other rules. The ACL hit count feature checks in real-time whether specific rules are being hit or triggered by packets.
- **Sophisticated rule table editing**—In-line editing, ability to cut, copy, and paste rules and to change their order in the rule table.
- **Discover firewall policies from device**—Policies that exist on the device can be imported into Security Manager for future management.
- **Flexible deployment options**—Support for deployment of configurations directly to a device or to a configuration file. You can also use Auto-Update Server (AUS), Configuration Engine, or Token Management Server (TMS) for deployment.
- **Rollback**—Ability to roll back to a previous configuration if necessary.
- **FlexConfig (template manager)**—Intelligent CLI configlet editor to manage features available on a device but not natively supported by Security Manager.
- **Integrated device monitoring and reporting**—Features for monitoring events on IPS, ASA, and FWSM devices and correlating them to the related configuration policies, and for creating security and usage reports. These features include the following stand-alone Security Manager applications:
  - **Event Viewer**—Event Viewer monitors your network for system log (syslog) events from ASA and FWSM devices, as well as security contexts and SDEE events from IPS devices and virtual sensors. Event Viewer collects these events and provides an interface by which you can view them, group them, and examine their details in near real time.
  - **Report Manager**—Report Manager lets you collect, display and export a wide variety of network usage and security information for ASA and IPS devices, and for ASA-hosted remote-access IPsec and SSL VPNs. These reports aggregate security data such as top sources, destinations, attackers, victims, as well as security information such as top bandwidth, duration, and throughput users. Data is available for hourly, daily, and monthly periods. (Report Manager aggregates information collected from devices monitored by the Event Manager service. Thus, to view reports about a device, you must be monitoring that device in Event Viewer.)

---

**Note** Report Manager does not report FWSM events even though Event Viewer works with FWSM.

---

- **Health and Performance Monitor**—Health and Performance Monitor (HPM) periodically polls monitored ASA devices, IPS devices, and ASA-hosted VPN services for key health and performance data, including critical and non-critical issues, such as memory usage, interface status, dropped packets, tunnel status, and so on. This information is used for alert generation and email notification, and to display trends based on aggregated data, which is available for hourly, daily, and weekly periods.

---

**Note** Health and Performance Monitor does not monitor FWSM devices.

---

- **Dashboard**—The Dashboard is a configurable launch point for Security Manager that makes IPS and FW tasks more convenient for you. In addition to the original dashboard, you can create new, additional dashboards, and you can customize all dashboards. By using the dashboard, you can accomplish in one place many tasks that are found in several other areas of Security Manager, such as the IPS Health Monitor page, Report Manager, Health and Performance Monitor, and IP Intelligence Settings. For detailed information on the dashboard, see [Dashboard Overview, on page 2861](#).

Additional features let you monitor devices from Security Manager using other closely related applications, including Cisco Security Monitoring, Analysis and Response System (CS-MARS), Cisco Performance Monitor, and device managers such as ASDM (read-only versions of which are included with Security Manager).

## Security Manager Policy Feature Sets

Security Manager provides the following primary feature sets for configuration policies:

### Firewall Services

Configuration and management of firewall policies across multiple platforms, including IOS routers, ASA/PIX devices, and Catalyst Firewall Service Modules (FWSMs). Features include:

- Access control rules—Permit or deny traffic on interfaces through the use of access control lists for both IPv4 and IPv6 traffic.
- Botnet Traffic Filter rules—(ASA only.) Filter traffic based on known malware sites and optionally drop traffic based on threat level.
- Inspection rules—Filter TCP and UDP packets based on application-layer protocol session information.
- AAA/Authentication Proxy rules—Filter traffic based on authentication and authorization for users who log into the network or access the Internet through HTTP, HTTPS, FTP, or Telnet sessions.
- Web filtering rules—Use URL filtering software, such as Websense, to deny access to specific web sites.
- ScanSafe Web Security—(Routers only.) Redirect HTTP/HTTPS traffic to the ScanSafe web security center for content scanning and malware protection services.
- Transparent firewall rules—Filter layer-2 traffic on transparent or bridged interfaces.
- Zone-based firewall rules—Configure access, inspection, and web filtering rules based on zones rather than on individual interfaces.

For more information, see [Introduction to Firewall Services, on page 595](#).

### Site-to-Site VPN

Setup and configuration of IPsec site-to-site VPNs. Multiple device types can participate in a single VPN, including IOS routers, PIX/ASA devices, and Catalyst VPN Service Modules. Supported VPN topologies are:

- Point to point
- Hub and spoke
- Full mesh
- Extranet (a point-to-point connection to an unmanaged device)

Supported IPsec technologies are:

- Regular IPsec
- GRE
- GRE Dynamic IP
- DMVPN
- Easy VPN
- GET VPN

For more information, see [Managing Site-to-Site VPNs: The Basics, on page 1071](#).

#### **Remote Access VPN**

Setup and configuration of IPsec and SSL VPNs between servers and mobile remote workstations running Cisco VPN client or Secure Client software. For more information, see [Managing Remote Access VPNs: The Basics, on page 1287](#).

#### **Intrusion Prevention System (IPS) Management**

Management and configuration of Cisco IPS sensors (appliances and service modules) and IOS IPS devices (Cisco IOS routers with IPS-enabled images and Cisco Integrated Services Routers).

For more information, see [Overview of IPS Configuration , on page 1617](#) and [Overview of Cisco IOS IPS Configuration , on page 1792](#).

#### **Features Specific to Firewall Devices (PIX/ASA/FWSM)**

Configuration of advanced platform-specific features and settings on PIX/ASA devices and Catalyst FWSMs. These features provide added value when managing security profiles and include:

- Interface configuration
- Identity-aware firewall settings
- Device administration settings
- Security
- Routing
- Multicast
- Logging
- NAT

- Bridging
- Failover
- Security contexts

For more information, see [Managing Firewall Devices, on page 1803](#).

### Features Specific to IOS Routers

Configuration of advanced platform-specific features and settings on IOS routers. These features provide added value when managing security profiles and include:

- Interface configuration
- Routing
- NAT
- 802.1x
- NAC
- QoS
- Dialer interfaces
- Secure device provisioning

For more information, see [Managing Routers, on page 2323](#).

### Features Specific to Catalyst 6500/7600 Devices and Catalyst Switches

Configuration of VLAN, network connectivity, and service module features and settings on Catalyst 6500/7600 devices and on other Catalyst switches.

For more information, see [Managing Cisco Catalyst Switches and Cisco 7600 Series Routers, on page 2647](#).

### FlexConfigs

Flexconfig policies and policy objects enable you to provision features that are available on the device but not natively supported by Security Manager. They enable you to manually specify a set of CLI commands and to deploy them to devices using Security Manager's provisioning mechanisms. These commands can be either prepended or appended to the commands generated by Security Manager to provision security policies.

For more information, see [Managing Flexconfigs, on page 339](#).

## Security Manager Applications Overview

The Security Manager client has six main applications and one application designed for mobile devices:

- **Configuration Manager**—This is the primary application. You use Configuration Manager to manage the device inventory, create and edit local and shared policies, manage VPN configurations, and deploy policies to devices. Configuration Manager is the largest of the applications and most of the documentation addresses this application. If a procedure does not specifically mention an application, the procedure is using Configuration Manager. For an introduction to Configuration Manager, see [Using Configuration Manager - Overview , on page 14](#).

- **Event Viewer**—This is an event monitoring application, where you can view and analyze events generated from IPS, ASA, and FWSM devices that you have configured to send events to Security Manager. For information about using Event Viewer, see [Viewing Events, on page 2703](#).
- **Report Manager**—This is a reporting application, where you can view and create reports of aggregated information on device and VPN statistics. Much of the information is derived from events available through Event Viewer, but some of the VPN statistics are obtained by communicating directly with the device. For information about using Report Manager, see [Managing Reports, on page 2773](#).
- **Health & Performance Monitor**—The HPM application lets you monitor key health and performance data for ASA (including ASA-SM) devices, IPS devices, and VPN services by providing network-level visibility into device status and traffic information. This ability to monitor key network and device metrics lets you quickly detect and resolve device malfunctions and bottlenecks in the network. See [Health and Performance Monitoring, on page 2813](#) for more information about this application.
- **Image Manager**—The Image Manager application provides complete image management of ASA devices. It facilitates downloading, evaluating, analyzing, preparing, and planning image updates. It assesses image availability, compatibility, and impact on devices and provides scheduling, grouping, and change management of device updates. In addition, Image Manager includes capabilities for maintaining an image repository as well as for ensuring stable fallback and recovery mechanisms for image updates on ASA devices. For information about using Image Manager, see [Using Image Manager, on page 2917](#).
- **Dashboard**—The Dashboard is a configurable launch point for Security Manager that makes IPS and FW tasks more convenient for you. In addition to the original dashboard, you can create new, additional dashboards, and you can customize all dashboards. By using the dashboard, you can accomplish in one place many tasks that are found in several other areas of Security Manager, such as the IPS Health Monitor page, Report Manager, Health and Performance Monitor, and IP Intelligence Settings. For detailed information on the dashboard, see [Dashboard Overview, on page 2861](#).

You can open any of these applications directly from the Windows Start menu or a desktop icon, or you can open them from within any of these applications through the application's Launch menu. For information on opening applications, see [Logging In to and Exiting Security Manager, on page 11](#).

The Security Manager client has an additional application, CSM Mobile, which is designed specifically for mobile devices:

- **CSM Mobile**—CSM Mobile allows you to access device health summary information from mobile devices. The information available to you in this way is the same as that available in the Device Health Summary widget in the Dashboard: current high or medium severity active alerts generated by HPM. Alerts can be grouped by Alert-Description, Predefined-Category, Device, or Alert Technology. For more information on CSM Mobile, see [CSM Mobile, on page 2872](#). For more details on device health summary information, see [Dashboard Overview, on page 2861](#). For information on enabling or disabling CSM Mobile, see [CSM Mobile Page, on page 518](#).

## Device Monitoring Overview

Security Manager includes several facilities for monitoring devices:

- **Event Viewer**—This integrated tool allows you to view events on ASA, FWSM, and IPS devices and correlate them to the related configuration policies. This helps you identify problems, troubleshoot configurations, and then fix the configurations and redeploy them. For more information, see [Viewing Events, on page 2703](#).

- **Report Manager**—This is a reporting application, where you can view and create reports of aggregated information on device and VPN statistics. Much of the information is derived from events available through Event Viewer, but some of the VPN statistics are obtained by communicating directly with the device. For information about using Report Manager, see [Managing Reports, on page 2773](#).

For information on all of the types of reports available in Security Manager, see [Understanding the Types of Reports Available in Security Manager, on page 2774](#).

- **Health & Performance Monitor**—The HPM application lets you monitor key health and performance data for ASA (including ASA-SM) device [Health and Performance Monitoring, on page 2813](#) for more information about this application.
- **Dashboard**—The Dashboard is a configurable launch point for Security Manager that makes IPS and FW tasks more convenient for you. In addition to the original dashboard, you can create new, additional dashboards, and you can customize all dashboards. By using the dashboard, you can accomplish in one place many tasks that are found in several other areas of Security Manager, such as the IPS Health Monitor page, Report Manager, Health and Performance Monitor, and IP Intelligence Settings. For detailed information on the dashboard, see [Dashboard Overview, on page 2861](#).
- **Packet Tracer**—You can use this tool to test whether certain types of packets will be allowed to go through an ASA device. For more information, see [Analyzing an ASA or PIX Configuration Using Packet Tracer, on page 2885](#).
- **Ping, Trace route, and NS Lookup**—You can use ping and traceroute on a managed device to check whether there is a route between the device and a specific destination. You can use NS lookup to resolve addresses to DNS names. For more information, see [Analyzing Connectivity Issues Using the Ping, Trace Route, or NS Lookup Tools, on page 2888](#).
- **Cisco Prime Security Manager (PRSM) Integration**—You can “cross launch” PRSM from the Configuration Manager application. The PRSM application is used to configure and manage ASA CX devices. For more information, see [Launching Cisco Prime Security Manager or FireSIGHT Management Center, on page 2882](#).
- **Device Manager Integration**—Security Manager includes read-only copies of the various device managers, such as Adaptive Security Device Manager (ASDM). You can use these tools to view device status, but not to change the device configuration. For more information, see [Starting Device Managers, on page 2875](#).
- **Cisco Security Monitoring, Analysis and Response System (CS-MARS) Integration**—If you use the CS-MARS application, you can integrate it with Security Manager and view events in CS-MARS from Security Manager, and conversely, Security Manager policies related to events from CS-MARS. For more information, see [Integrating CS-MARS and Security Manager, on page 2899](#).

## IPv6 Support in Security Manager

Security Manager provides increasing support for IPv6 configuration, monitoring, and reporting.

Beginning with version 4.12, Security Manager supports communication from Security Manager server to the managed devices over either IPv6 address or IPv4 address. This feature is available only for firewall devices, that is, those devices where the OS type is either ASA or FWSM. To enable communication over IPv6 addresses, you must first enable IPv6 address on the Security Manager server. See [Configuring IPv6 on Security Manager Server, on page 9](#) for more information.

**Note** The communication between Security Manager server and Security Manager client is over IPv4 address only. IPv6 address is not supported for server to client communication. Also, if ACS server is used for authentication, the ACS must have IPv4 address. IPv6 communication to ACS server is not supported. Auto Update Server (AUS) does not support IPv6 addresses.

For versions prior to 4.12, to manage a device that supports IPv6 addressing with Security Manager, you must configure the device's management address as an IPv4 address. All communications between the device and Security Manager, such as policy discovery and deployment, use IPv4 transport. If the IPv6 policies are not appearing for a supported device, rediscover the device policies; if necessary, delete the device from the inventory and add it again.

## Configuring IPv6 on Security Manager Server

Follow these steps to configure IPv6 on Security Manager server for communicating with a device over IPv6 address.

- 
- Step 1** On the Security Manager server, go to **Start > Control panel > Network and Internet > Network Connections**.
- Step 2** Click the available Network Connection to open the **Ethernet Status** window. Click **Properties**. The Ethernet Properties window appears.
- Step 3** On the Networking tab, check the **Internet Protocol Version 6 (TCP/IPv6)** check box, and then click **Properties**. The Internet Protocol Version 6 (TCP/IPv6) Properties window appears.
- Step 4** Configure the IPv6 static address and DNS servers, and click **OK**.

**Note** You must configure Security Manager server hostname to resolve to IPv4 addresses only. The server hostname should not resolve to IPv6 address.

---

## Configuring IPv6 Policies

In general, you can configure IPv6 policies on the following types of device. In addition, you can monitor IPv6 alerts generated by IPS, ASA, and FWSM devices. For other types of devices, use FlexConfig policies to configure IPv6 settings. For more specific information on IPv6 device support, see the [Supported Devices and Software Versions for Cisco Security Manager](#) document on Cisco.com.

- **ASA**—Release 7.0+ when running in router mode; release 8.2+ when running in transparent mode. Both single and multiple security context devices are supported.
- **FWSM**—Release 3.1+ when running in router mode. Not supported in transparent mode. Both single and multiple security context devices are supported.
- **IPS**—Release 6.1+.

Following is a summary of the Security Manager features that support IPv6 addressing:

- **Policy Objects**—The following policy objects support IPv6 addresses:
  - **Networks/Hosts**. See [Understanding Networks/Hosts Objects](#), on page 308.
  - **Services**. This object includes predefined services for ICMP6 and DHCPv6, which you can use only with IPv6 policies. The other services apply to both IPv4 and IPv6. For more information on service

objects, see [Understanding and Specifying Services and Service and Port List Objects](#) , on page 329.

- **Firewall Services Policies**—The following Firewall Services policies and tools support IPv6 configurations:

- AAA Rules. See [Managing Firewall AAA Rules](#), on page 683.
- Access Rules. See [Configuring Access Rules](#) , on page 721.
- Inspection Rules. See [Managing Firewall Inspection Rules](#), on page 765.
- **Settings > Access Control**. See [Configuring Settings for Access Control](#) , on page 737.
- Tools:

Hit Count. See [Viewing Hit Count Details](#) , on page 751.

Find and Replace. See [Finding and Replacing Items in Rules Tables](#) , on page 612.

- **ASA and FWSM Policies**—The following ASA and FWSM policies support IPv6 configurations:
  - (ASA 7.0+ routed mode; ASA 8.2+ transparent mode; FWSM 3.1+ routed mode.) Interfaces: IPv6 tab of the Add Interface and Edit Interface dialog boxes. See [Configuring IPv6 Interfaces \(ASA/FWSM\)](#) , on page 1865.
  - (ASA only.) **Platform > Bridging > IPv6 Neighbor Cache**. See [Managing the IPv6 Neighbor Cache](#) , on page 1901.
  - (ASA 5505 8.2/8.3 only.) **Platform > Bridging > Management IPv6**. See [Management IPv6 Page \(ASA 5505\)](#) , on page 1906.
  - (ASA 8.4.2+ only.) **Platform > Device Admin > Server Access > DNS**. See [DNS Page](#) , on page 2020.
- **FlexConfig Policies**—There are two Firewall system variables that you can use to identify IPv6 ACLs on a device. For more information, see [FlexConfig System Variables](#) , on page 345.

There is also a predefined FlexConfig policy object that uses these variables, ASA\_add\_IPv6\_ACEs.

- **Event Viewer**—Events that include IPv6 addresses are supported, and the addresses are displayed in the same columns as IPv4 addresses: Source, Destination, and ILog Address (for IPS alerts). However, you must configure the device to use IPv4 for sending events to the Security Manager server. All event communications use IPv4 transport. For more information on Event Viewer, see [Viewing Events](#), on page 2703.
- **Dashboard**—On the Dashboard, all the widgets that use IP addressing support IPv6 addresses. However, as is true elsewhere in Security Manager, you must configure the device to use IPv4 for sending events to the Security Manager server. All event communications use IPv4 transport. For more information on the Dashboard, see [Dashboard Overview](#), on page 2861.
- **Report Manager**—Reports include statistics for IPv6 events collected by Event Management. For more information on Report Manager, see [Managing Reports](#), on page 2773.

## Policy Object Changes in Security Manager 4.4

Certain changes were made to a few policies and policy objects in Security Manager 4.4, in order to unify previously separate IPv4 and IPv6 elements. The most important of these changes are to the Networks/Hosts object (which itself represents a unification of the Networks/Hosts and the Networks/Hosts-IPv6 objects):

- The new Networks/Hosts object “All-IPv4-Addresses” replaces the IPv4 “any” network policy object. If you upgrade to Security Manager 4.4 from a previous version, all references to the IPv4 “any” network policy object will be changed to “All-IPv4-Addresses.”
- The new Networks/Hosts object “All-IPv6-Addresses” replaces the IPv6 “any” network policy object. If you upgrade to Security Manager 4.4 from a previous version, all references to the IPv6 “any” network policy object will be changed to “All-IPv6-Addresses.”
- The new Networks/Hosts object “All-Addresses” does not have a corresponding policy object in earlier versions of Security Manager. It is a new global “any” policy object, and it encompasses all IPv4 and IPv6 address ranges.

Other related changes include unification of IPv4 and IPv6 versions of device-specific policies such as Access Rules, Inspection Rules, and so on.

Further, when editing policies and objects, IPv4, IPv6, or mixed-mode (both IPv4 and IPv6) entries are automatically filtered in elements, such as dialog boxes, in which one or more of those entries is not appropriate to that element.

### Related Topics

- [Policy Object Manager](#) , on page 230
- [Understanding Networks/Hosts Objects](#) , on page 308

## Logging In to and Exiting Security Manager

Security Manager has two main interfaces:

- Cisco Security Management Suite home page—Use this interface to install the Security Manager client and to manage the server. You can also access other CiscoWorks applications you installed, such as Resource Manager Essentials (RME).
- Security Manager clients—Use these interfaces to perform most Security Manager tasks. You can log directly into any of six client applications: Configuration Manager, Event Viewer, Report Manager, Health & Performance Monitor, Image Manager, and Dashboard.

These topics describe how to log in to and exit these interfaces:

- [Understanding User Permissions](#) , on page 12
- [Logging In to the Cisco Security Management Suite Server](#) , on page 12
- [Logging In to and Exiting the Security Manager Client](#) , on page 13

## Understanding User Permissions

Cisco Security Manager authenticates your username and password before you can log in. After you are authenticated, Security Manager establishes your role within the application. This role defines your permissions (also called privileges), which are the set of tasks or operations that you are authorized to perform. If you are not authorized for certain tasks or devices, the related menu items, items in tables of contents, and buttons are hidden or disabled. In addition, a message tells you that you do not have permission to view the selected information or perform the selected operation.

Authentication and authorization for Security Manager is managed either by the CiscoWorks server or the Cisco Secure Access Control Server (ACS). By default, CiscoWorks manages authentication and authorization, but you can configure Security Manager to use your Cisco Secure ACS setup.

---

**Note** Beginning with version 4.21, Cisco Security Manager supports only TACACS+ authentication via Cisco Identity Services Engine (ISE), because ACS has reached its end of life.

---

When using ACS, if all of the ACS servers become unavailable, you cannot perform tasks in Security Manager. If you are logged in, you might be abruptly logged out of the system (without an opportunity to save changes) if you try to perform a task that requires ACS authorization. If this happens, you get a message stating this is the reason you are getting logged off. For details on configuring Security Manager and ACS integration, see [Integrating Security Manager with Cisco Secure ACS](#).

For more information about user permissions and AAA configuration, see the [Installation Guide for Cisco Security Manager](#).

For more information about authorization control in the Event Viewer and Report Manager applications, see the following topics:

- [Understanding Event Viewer Access Control](#) , on page 2706
- [Understanding Report Manager Access Control](#) , on page 2778

## Logging In to the Cisco Security Management Suite Server

Use the Cisco Security Management Suite home page, and CiscoWorks Common Services, to install the Security Manager client and to manage the server. You can also access other CiscoWorks applications you installed, such as RME.

---

**Note** The **Software Center > Software Update** feature in Common Services is not supported by Cisco Security Manager.

---

**Step 1** In your web browser, open one of these URLs, where *SecManServer* is the name of the computer where Security Manager is installed. Click **Yes** on any Security Alert windows.

- If you are not using SSL, open `http://SecManServer :1741`
- If you are using SSL, open `https://SecManServer :443`

The Cisco Security Management Suite login screen is displayed. Verify on the page that JavaScript and cookies are enabled and that you are running a supported version of the web browser. For information on configuring the browser to run Security Manager, see [Installation Guide for Cisco Security Manager](#).

- Step 2** Log in to the Cisco Security Management Suite server with your username and password. When you initially install the server, you can log in using the username **admin** and the password defined during product installation.
- Step 3** On the Cisco Security Management Suite home page, you can access at least the following features. Other features might be available depending on how you installed the product.
- Cisco Security Manager Client Installer—Click this item to install the Security Manager client. The client is the main interface for using the product.
  - Server Administration—Click this item to open the CiscoWorks Common Services Server page. CiscoWorks Common Services is the foundation software that manages the server. Use it to configure and manage back-end server features such as server maintenance and troubleshooting, local user definition, and so on.
  - CiscoWorks link (in the upper right of the page)—Click this link to open the CiscoWorks Common Services home page.
- Step 4** To exit the application, click **Logout** in the upper right corner of the screen. If you have both the home page and the Security Manager client open at the same time, exiting the browser connection does not exit the Security Manager client.

---

#### What to do next

---

**Note** To meet PCI compliance, TLS 1.0 is disabled from CSM server. Hence, CSM server will not allow any TLS 1.0 clients to connect. This change is not applicable for CSM server to device communication. Existing CSM server to device communication will be supported as is.

---

## Logging In to and Exiting the Security Manager Client

Use the Security Manager client to perform most Security Manager tasks.

---

**Tip** You must log into the workstation using a Windows user account that has Administrator privileges to fully use the Security Manager client applications. If you try to operate the applications with lesser privileges, you might find that some features do not work correctly.

---

#### Before You Begin

Install the client on your computer. To install the client, log into the Security Manager server as described in [Logging In to the Cisco Security Management Suite Server](#), on page 12, and then click **Cisco Security Manager Client Installer** and follow the instructions in the installation wizard.

- 
- Step 1** Select one of the following applications from the **Start > All Programs > Cisco Security Manager Client** menu:
- Configuration Manager

- Event Viewer
- Report Manager
- Health & Performance Monitor
- Image Manager
- Dashboard

**Tip** If the client was installed on the workstation, but it does not appear in your Start menu, it probably was installed by another user. To make Security Manager Client visible in the Start menu for every user of the client station, copy the Cisco Security Manager Client folder from Documents and Settings\

**Step 2** In the application's login window, select the server to which you want to log in, and enter your Security Manager username and password. Click **Login**.

The client logs in to the server and opens the application you selected based on the following conditions. Note that these conditions are per application, for example, if you have Configuration Manager open on one workstation, opening Event Viewer from a different workstation has no implications for your Configuration Manager session unless or until you start Configuration Manager from Event Viewer.

- In both Workflow and non-Workflow mode, you cannot log into the same server from a single workstation and have more than one active session using the same user account. You are reminded that you are already logged in and asked to reuse the existing open application.
- In both workflow modes, you can log into different servers using the same (or different) user name from the same workstation.
- In non-Workflow mode, for a given server, if the user name is logged in on a different workstation, the client on the other workstation is automatically logged out, and any unsaved changes are lost. Thus, do not share user accounts, and if you must log in from different workstations to the same server, be sure to save your changes before leaving an active client.
- In Workflow mode, you can log in using the same user account multiple times but only from different workstations. However, you cannot open the same activity in Configuration Manager at the same time in more than one client; you must open different activities. Activities do not apply when using Event Viewer or Report Manager.

**Tip** The client automatically closes if it is idle for 120 minutes. To change the idle timeout, in Configuration Manager, select **Tools > Security Manager Administration**, select **Customize Desktop** from the table of contents, and enter the desired timeout period. You can also disable the feature so that the client does not close automatically. All applications use the same timeout setting, and working in one application resets the timer for all other applications.

**Step 3** To exit the application, select **File > Exit**.

---

## Using Configuration Manager - Overview

These topics provide an overview of the different views in which you can work in Configuration Manager, the basic task flow for defining and deploying policies to devices, and some basic concepts:

- [Configuration Manager Overview](#), on page 15

- [Task Flow for Configuring Security Policies](#) , on page 19
- [Policy and Policy Object Overview](#) , on page 20
- [Workflow and Activities Overview](#) , on page 20

## Configuration Manager Overview

The Configuration Manager application provides three views in which you can manage devices and policies: Device view, Policy view, and Map view. You can switch between these views according to your needs using toolbar buttons or the View menu.

- Device view—Provides a device-centric view, where you configure policies on specific devices. For more information, see [Device View Overview](#) , on page 15.
- Policy view—Provides a policy-centric view, where you can create device-independent shared policies that you can assign to one or more devices. For more information, see [Policy View Overview](#) , on page 17.
- Map view—Provides a visual representation of your network, which is primarily useful for visualizing and configuring site-to-site VPNs. For more information, see [Map View Overview](#) , on page 18.

Each view presents a different way to access Configuration Manager functionality. What you can do, and how you do it, are determined by the view you select. In the Device and Policy views you see two selectors on the left and a work area on the right. In each of these, your selection in the upper selector determines what you can select in the lower selector. Your selection in the lower selector determines what you view in the work area. This design enables you to quickly and easily drill down to the network details that you want to view or edit.

Besides the main views, there are several additional tools used for configuring other items such as site-to-site VPNs and policy objects, or for monitoring devices. These tools are typically available from the Manage menu, although some are available on the Policy, Activities, Tools, or Launch menus. Some tools have related buttons in the toolbar. These tools open in a separate window so that you do not lose your place in the main view that you are currently using.

The following topics provide reference information about the basic features of the user interface:

- [Menu Bar Reference for Configuration Manager](#) , on page 29
- [Toolbar Reference \(Configuration Manager\)](#) , on page 40
- [Using Selectors](#) , on page 46
- [Using Wizards](#) , on page 49
- [Using Rules Tables](#) , on page 602
- [Using Text Fields](#) , on page 51
- [Accessing Online Help](#) , on page 54

## Device View Overview

Device view in Configuration Manager enables you to add devices to the Security Manager inventory and to centrally manage device policies, properties, interfaces, and so on. The following figure identifies the functional areas of the Device view.

This is a device-centric view in which you can see all devices that you are managing and you can select specific devices to view their properties and define their settings and policies.

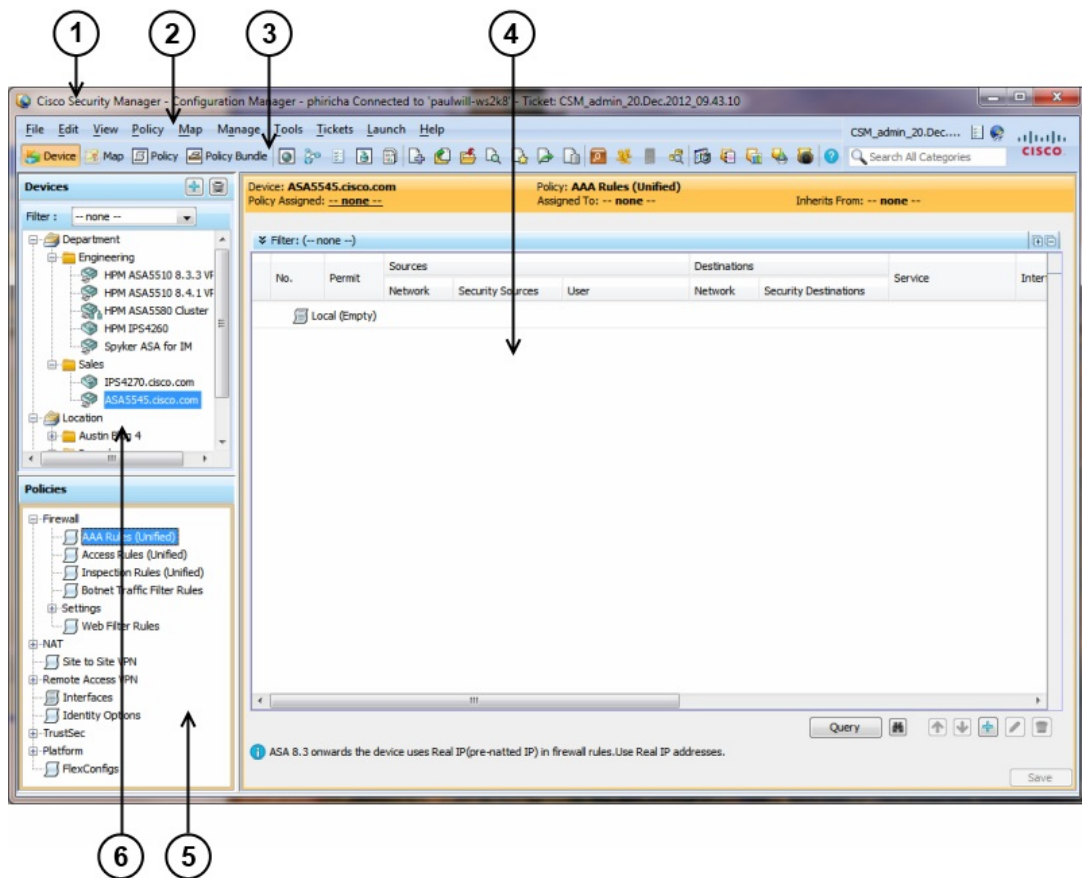

**Note** Security Manager also provides the ability to see the status of the devices in the Security Manager inventory. To access the Device Status View, select **View > Device Status View** or select one of the folder nodes in the Device selector. For more information, see [Working with Device Status View](#), on page 134.

In Device View, you can define security policies locally on specific devices. You can then share these policies to make them globally available to be assigned to other devices.

For more information, see [Understanding the Device View](#), on page 69.

**Figure 1: Device View Overview**

1 Title bar	2 Menu bar (see <a href="#">Menu Bar Reference for Configuration Manager</a> , on page 29)
3 Toolbar (see <a href="#">Toolbar Reference (Configuration Manager)</a> , on page 40)	4 Work area
5 Policy selector	6 Device selector (see <a href="#">Using Selectors</a> , on page 46)

The title bar displays the following information about Security Manager:

- Your login name.
- The name of the Security Manager server to which you are connected.
- If Workflow mode is enabled, the name of the open activity.

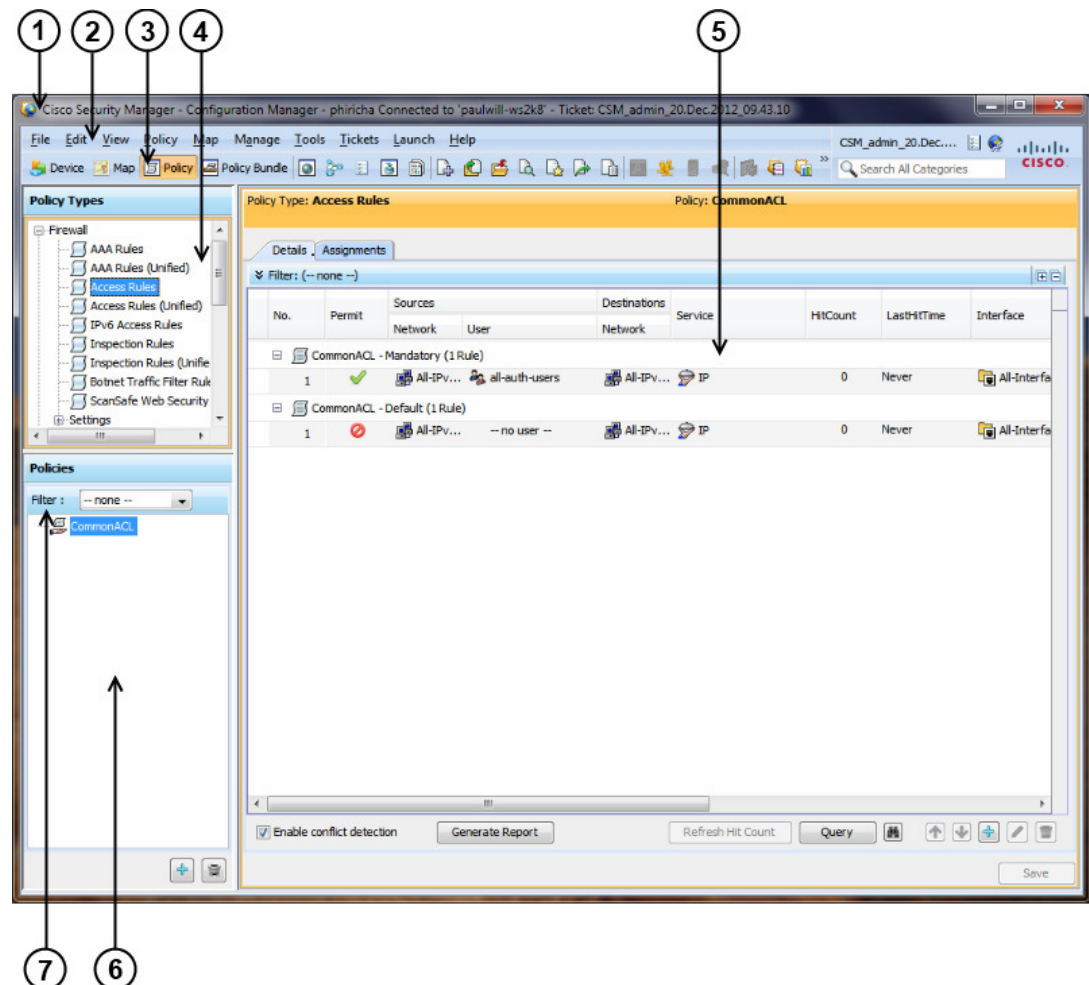

## Policy View Overview

Policy view in Configuration Manager enables you to create and manage reusable policies that can be shared among multiple devices. The following figure identifies the functional areas of the Policy view.

This is a policy-centric view in which you can see all the shareable policy types supported by Security Manager. You can select a specific policy type and create, view, or modify shared policies of that type. You can also see the devices to which each shared policy is assigned and change the assignments as required.

For more information, see [Managing Shared Policies in Policy View](#) , on page 215.

**Figure 2: Policy View Overview**

1 Title bar	2 Menu bar (see <a href="#">Menu Bar Reference for Configuration Manager</a> , on page 29 )
-------------	---

3	Toolbar (see <a href="#">Toolbar Reference (Configuration Manager)</a> , on page 40)	4	Policy type selector (see <a href="#">Using Selectors</a> , on page 46)
5	Work area	6	Shared policy selector
7	Policy filter		

## Map View Overview

Map view in Configuration Manager enables you to create customized, visual topology maps of your network, within which you can view connections between your devices and easily configure VPNs and access control settings. The following figure identifies the functional areas of the Map view.

Figure 3: Map View Overview

1	Title bar	2	Navigation Window
3	Menu bar (see <a href="#">Map Menu (Configuration Manager)</a> , on page 33)	4	Toolbar (see <a href="#">Toolbar Reference (Configuration Manager)</a> , on page 40)
5	Map toolbar (see <a href="#">Map Toolbar</a> , on page 1588)	6	Map

## Task Flow for Configuring Security Policies

The basic user task flow for configuring security policies on devices involves adding devices to the Security Manager inventory, defining the policies, and then deploying them to the devices. You perform these tasks in Configuration Manager. The following briefly describes the steps in a typical user task flow:

---

### Step 1 Prepare devices for management.

Before you can add a device to the Security Manager device inventory and manage it, you must configure some minimal settings on the device to enable Security Manager to contact it. For more information, see [Preparing Devices for Management, on page 55](#).

### Step 2 Add devices to the Security Manager device inventory.

To manage a device with Security Manager, you must first add it to the Security Manager inventory. Security Manager provides multiple methods to add devices: from the network (live devices), from an inventory file exported from another Security Manager server or CiscoWorks Common Services Device Credential Repository (DCR), or in Cisco Security Monitoring, Analysis and Response System (CS-MARS) format, or from a device configuration file. You can also add a device that does not yet exist in the network but which will be deployed in the future, by creating it in Security Manager.

When you add a device, you can also discover its interfaces and certain policies that were already configured on the device. Discovery brings the information into the Security Manager database for continued management with Security Manager in the future.

For more information, see [Managing the Device Inventory, on page 69](#).

### Step 3 Define security policies.

After you have added your devices, you can define the security policies you require. You can use Device view to define policies on specific devices. You can use Policy view to create and manage reusable policies that can be shared by any number of devices. When you make a change to a shared policy, the change is applied to all devices to which that policy is assigned.

To simplify and speed up policy definition, you can use policy objects, which are named, reusable representations of specific values. You can define an object once and then reference it in multiple policies instead of having to define the values individually in each policy.

**Note** If you are using Workflow mode, you must create an activity before you start defining policies. For more information, see [Workflow and Activities Overview , on page 20](#).

### Step 4 Submit and deploy your policy definitions.

Policy definition is done within your private view. Your definitions are not committed to the database and cannot be seen by other Security Manager users until you submit them. When you submit your policy definitions, the system validates their integrity. Errors or warnings are displayed to inform you of any problems that need to be addressed before the policies can be deployed to the devices.

Security Manager generates CLI commands according to your policy definitions and enables you to quickly and easily deploy them to your devices. You can deploy directly to live devices in the network (including dynamically addressed devices) through a secure connection, or to files that can be transferred to your devices at any time.

In non-Workflow mode, submitting and deploying your changes can be done in a single action. In Workflow mode, you first submit your activity and then you create a deployment job to deploy your changes.

For more information, see [Managing Deployment, on page 379](#).

---

## Policy and Policy Object Overview

A **policy** is a set of rules or parameters that define a particular aspect of network configuration. In Configuration Manager, you define policies that specify the security functionality you want on your devices. Security Manager translates your policies into CLI commands that can be deployed to the relevant devices.

Security Manager enables you to configure local policies and shared policies.

- **Local policies** are confined to the device on which they are configured; they are automatically assigned (applied) to the device when you configure them. Unconfigured policies (those whose default settings you do not change) are not considered to be assigned or configured. To remove a policy, you unassign it.
- **Shared policies** are named, reusable policies that can be assigned to multiple devices at once. Any changes you make to a shared policy are reflected on all devices to which that policy is assigned, so you do not have to make the change on each device.

When you add a device to the inventory, you can discover the existing policies configured on the device. Security Manager translates your device configuration into Security Manager policies, populates the relevant local policies, and assigns them to the device. **Policy discovery** ensures that you do not need to recreate your existing configurations in Security Manager terms. You can also rediscover policies on devices after you add them to the inventory if you change their configuration through the CLI.

When you create policies, you often have the option to use **policy objects**, which are reusable definitions of related sets of values. (Sometimes, you are required to use policy objects.) For example, you can define a network object called MyNetwork that contains a set of IP addresses in your network. Whenever you configure a policy requiring these addresses, you can simply refer to the MyNetwork network object rather than manually entering the addresses each time. Furthermore, you can make changes to policy objects in a central location and these changes will be reflected in all the policies that reference those objects.

For more detailed information, see [Managing Policies, on page 165](#) and [Managing Policy Objects, on page 227](#).

## Workflow and Activities Overview

To provide flexible, secure policy management while allowing your organization to implement change control processes, Security Manager provides three closely-related features in Configuration Manager:

- **Workflow/Non-Workflow modes**—Configuration Manager provides two modes of operation that scale to different organizational working environments: Workflow mode and non-Workflow mode (the default).
  - **Workflow Mode**—Workflow mode is for organizations that have division of responsibility between users who define security policies and those who administer security policies. It imposes a formal change-tracking and management system by requiring all policy configuration to be done within the context of an explicitly-created activity. A user can create multiple activities so that a single activity contains only logically-related policy changes. You can configure Workflow mode to require a separate approver, so that configuration changes cannot be made without oversight. After approval, the user defines a separate deployment job to push the policy changes to the devices. For more information, see [Working in Workflow Mode, on page 21](#).

- **Non-Workflow Mode**—In non-Workflow mode, you do not explicitly create activities. When you log in, Configuration Manager creates an activity for you or opens the one you were previously using if it was not submitted. You can define and save your policies, and then submit and deploy them in one step. For more information, see [Working in Non-Workflow Mode](#) , on page 22.

For information on selecting a mode, see [Changing Workflow Modes](#) , on page 28.

- **Activities or Configuration Sessions**—An activity (in non-Workflow mode, a configuration session), is essentially a private view of the Security Manager database. In Configuration Manager, you use activities to control changes made to policies and policy assignments. Adding devices to the inventory does not involve an activity, however, unless you discover policies that define security contexts (on multi-context firewall devices) or virtual sensors (on IPS devices). Isolating policy changes in activities helps prevent “work in progress” from accidentally making it into active device configurations. For more information about activities and configuration sessions, see [Understanding Activities](#) , on page 139 and [Working with Activities/Tickets](#) , on page 146.
- **Ticket Management**—Ticket management allows you to associate a Ticket ID with policy configuration changes made in Security Manager. Ticket management works in coordination with activities or configuration sessions depending on whether you have workflow mode enabled or not. If workflow mode is enabled, you can also enable ticket management so that a Ticket ID can optionally be associated with a specific activity. If workflow mode is not enabled, using ticket management makes it so that all changes must be done as part of a ticket and the ticket must be submitted before those changes can be deployed. In this respect, ticket management with workflow disabled is very similar to how activities function when workflow is enabled; however, no approval of submitted tickets is required.

For a comparison of the various modes of operation, see [Comparing Workflow Modes](#) , on page 22.

## Working in Workflow Mode

Workflow mode is an advanced mode of operation that imposes a formal change-tracking and change-management system. Workflow mode is suitable for organizations in which there is division of responsibility among security and network operators for defining policies and deploying those policies to devices. For example, a security operator might be responsible for defining security policies on devices, another security operator might be responsible for approving the policy definitions, and a network operator might be responsible for deploying the resulting configurations to a device. This separation of responsibility helps maintain the integrity of deployed device configurations.

You can use Workflow mode with or without an approver. When using Workflow mode with an approver, device management and policy configuration changes performed by one user are reviewed and approved by another user before being deployed to the relevant devices. When using Workflow mode without an approver, device and policy configuration changes can be created and approved by a single user, thus simplifying the change process.

---

**Note** Workflow mode works in the same manner whether Ticket Management is enabled or not. Enabling Ticket Management in Workflow mode simply enables the Ticket field for use with Activities. Entering a ticket ID is not required, but if one is used, the Ticket field can be configured to link to an external change management system. For more information, see [Ticket Management](#).

---

For information about enabling or disabling Workflow mode or enabling or disabling Ticket Management, see [Changing Workflow Modes](#) , on page 28.

In Workflow mode:

- A user must create an activity before defining or changing policy configurations in Configuration Manager. The activity is essentially a proposal to make configuration changes. The changes made within the activity are applied only after the activity is approved by a user with the appropriate permissions. An activity can either be submitted to another user for review and approval, or it can be approved by the current user. For detailed information about the process of creating, submitting, and approving activities, see [Managing Activities, on page 139](#).
- After the activity is approved, the configuration changes need to be deployed to the relevant devices. To do this, a user must create a *deployment job*. A deployment job defines the devices to which configurations will be deployed, and the deployment method to be used. A deployment job can either be submitted to another user for review and approval, or it can be approved by the current user. Deployment preferences can be configured with or without job approval. For more information, see [Managing Deployment, on page 379](#).

## Working in Non-Workflow Mode

Some organizations have no division of responsibility between users when defining and administering their VPN and firewall policies. These organizations can work in non-Workflow mode. When using non-Workflow mode, you do not explicitly create activities. When you log in, Configuration Manager creates an activity for you, also called a configuration session, or opens the activity you were using when previously logged in (the configuration session is automatically closed when you log out of Security Manager). This activity is transparent to the user and does not need to be managed in any way. When you submit your configuration changes to the database, this is equivalent to submitting and approving the activity in Workflow mode. In addition, when you submit and deploy configuration changes, Security Manager creates a deployment job for you as well. Like activities, deployment jobs are transparent and do not need to be managed.

When using non-Workflow mode, multiple users with the same username and password cannot be logged into Security Manager at the same time. If another user logs in with the same username and password while you are working, your session will be terminated and you will have to log in again.

### Ticket Management in Non-Workflow Mode

If your organization uses a change management system, Security Manager can associate the changes made to configurations with a ticket ID. Before making any configuration changes, you must open a ticket and the ticket must be submitted before the changes associated with that ticket are available to be deployed. Tickets can be opened and closed as needed, and you can discard a ticket if the changes associated with that ticket are no longer desired. Entering a ticket ID is not required, but if one is used, the Ticket field can be configured to link to an external change management system. For more information, see [Ticket Management](#).

Non-Workflow mode with Ticket Management enabled is the default mode for Security Manager. For information about enabling or disabling Workflow mode or enabling or disabling Ticket Management, see [Changing Workflow Modes , on page 28](#).

## Comparing Workflow Modes

The following table highlights the differences between the workflow modes.

**Note** Workflow mode works in the same manner whether Ticket Management is enabled or not. Enabling Ticket Management in Workflow mode simply enables the Ticket field for use with Activities. Entering a ticket ID is not required, but if one is used, the Ticket field can be configured to link to an external change management system. For more information, see Ticket Management.

**Table 1: Comparison Between Workflow Mode and Non-Workflow Mode in Configuration Manager**

Question	Non-Workflow Mode with Ticket Management Enabled	Non-Workflow Mode with Ticket Management Disabled	Workflow Mode
What is the default mode for Security Manager?	Default	Not Default	Not default
How do I know which mode is currently selected?	<p>Select <b>Tools &gt; Security Manager Administration &gt; Workflow</b>. If the <b>Enable Workflow</b> check box is selected, you are in Workflow mode.</p> <p>Select <b>Tools &gt; Security Manager Administration &gt; Ticket Management</b>. If the <b>Enable Ticketing</b> check box is selected, ticket management is enabled.</p>		
Must I explicitly create activities to make configuration changes?	You must explicitly create a Ticket before you can make configuration changes. Configuration Manager automatically creates an activity that is associated with that ticket.	No. Configuration Manager automatically creates an activity when you log in, or opens the previous session if you did not submit it before logging out.	Yes.
Must I explicitly create deployment jobs to deploy configurations to devices?	No. Configuration Manager creates a deployment job for you when you deploy configuration changes.	No. Configuration Manager creates a deployment job for you when you deploy configuration changes.	Yes.
How do I deploy my configuration changes to the devices?	<p>Do one of the following:</p> <ul style="list-style-type: none"> <li>• Select <b>File &gt; Deploy</b>.</li> <li>• Select <b>Manage &gt; Deployments</b> and click <b>Deploy</b> on the Deployment Jobs tab.</li> </ul>	<p>Do one of the following:</p> <ul style="list-style-type: none"> <li>• Click the <b>Submit and Deploy Changes</b> button in the Main toolbar.</li> <li>• Select <b>File &gt; Submit and Deploy</b>.</li> <li>• Select <b>Manage &gt; Deployments</b> and click <b>Deploy</b> on the Deployment Jobs tab.</li> </ul>	Select <b>Manage &gt; Deployments</b> and create a deployment job.

Question	Non-Workflow Mode with Ticket Management Enabled	Non-Workflow Mode with Ticket Management Disabled	Workflow Mode
At what stage are the CLI commands for my configuration changes generated?	When initiating deployment.	When initiating deployment.	When creating a deployment job.
How do I delete my current changes?	Select <b>Tickets &gt; Discard Ticket</b> to discard the currently-open ticket, or select the ticket in the Ticket Manager and click <b>Discard</b> .  If you have already started deploying devices, abort the deployment by selecting the job in the Deployment Manager and clicking <b>Abort</b> .	Select <b>File &gt; Discard</b> .  If you have already started deploying devices, abort the deployment by selecting the job in the Deployment Manager and clicking <b>Abort</b> .	Select <b>Activities &gt; Discard Activity</b> to discard the currently-open activity, or select the activity in the Activity Manager and click <b>Discard</b> .  If you already created a deployment job, select the job in the Deployment Manager and click <b>Discard</b> . If the job has already been deployed, you can abort the job by selecting <b>Abort</b> .
Can multiple users log into Security Manager at the same time?	Yes. Each user can open a different ticket and make configuration changes. A single user can log in multiple times, but the user must open separate tickets.	Yes, but only if each one has a different username. If a user with the same username logs into Security Manager, the first user is automatically logged out.	Yes. Each user can open a different activity and make configuration changes. A single user can log in multiple times, but the user must open separate activities.
What if another user is configuring the devices I want to configure?	You will receive a message indicating that the devices are locked. See <a href="#">Activities and Locking</a> , on page 141.		

## Using the JumpStart to Learn About Security Manager

The JumpStart is an introduction to Security Manager. It describes and illustrates the major concepts of using the product. Use the jumpstart to explore Security Manager features and capabilities.

The JumpStart opens automatically when you first launch Security Manager. To get to the JumpStart while you are working with Security Manager, select **Help > JumpStart** from the main menu in Configuration Manager.

The JumpStart contains the following navigation features:

- A table of contents, which is always visible in the upper right corner. Click an entry to open its page.

- Links in the page enable you to drill down to more detailed information in the JumpStart or to relevant information in the online help.

## Completing the Initial Security Manager Configuration

After you install Security Manager, there are several configuration steps you might want to perform to complete the installation. Although most of the features you initially configure have default settings, you should familiarize yourself with the features and decide if the default settings are the best settings for your organization.

The following list explains the features you might want to initially configure, with pointers to topics that provide more detailed information where appropriate. You can configure these features in any order, or delay configuring those that you do not yet need to use.

- Configure an SMTP server and default e-mail addresses. Security Manager can send e-mail notifications for several actions that occur in the system. For example, you can get an e-mail when your deployment job finishes reconfiguring network devices. For e-mail notifications to work, you must configure an SMTP server.

For information on configuring an SMTP server and setting the default e-mail addresses, see [Configuring an SMTP Server and Default Addresses for E-Mail Notifications](#), on page 27.

- Create user accounts. Users must log into Security Manager to use the product. However, if a user logs in with an account another user is already using, the first user is automatically disconnected. Thus, each user should have a unique account. You can create accounts local to the Security Manager server, or you can use your ACS system to manage user authentication. For more information, see the *Installation Guide for Cisco Security Manager*.
- Configure default deployment settings. When users deploy configurations to devices, they can select how the configurations should be deployed and how Security Manager should handle anomalies. However, you can select system-default settings that make it easier for users to follow your organization's recommendations. To set deployment defaults, in Configuration Manager, select **Tools > Security Manager Administration**, and then select **Deployment** from the table of contents to open the Deployment settings page (see [Deployment Page](#), on page 522).

The following deployment settings are of particular interest:

- **Default Deployment Method**—Whether configuration deployments should be written directly to the device or to a transport server, or if configuration files should be written to a specified directory on the Security Manager server. The default is to deploy configurations directly to the device or transport server, if one is configured for the device. However, if you have your own methods for deploying configuration files, you might want to select File as the default deployment method. For more information on deployment methods, see [Understanding Deployment Methods](#), on page 387.
- **When Out-of-Band Changes Detected**—How to respond when Security Manager detects that configuration changes were made on the device through the CLI rather than through Security Manager. The default is to issue a warning and proceed with the deployment, overwriting the changes that were made through the CLI. However, you can change this behavior to simply skip the check for changes (which means Security Manager overwrites the changes but does not warn you), or to cancel the deployment, thus leaving the device in its current state. For more information about handling out-of-band changes, see [Understanding How Out-of-Band Changes are Handled](#), on page 390.

- Allow Download on Error—Whether to allow deployment to continue if minor configuration errors are found. The default is to not allow deployment when minor errors are found.
- Select a workflow mode. The default mode is non-Workflow mode with Ticket Management enabled. In non-Workflow mode, users have more freedom to create and deploy configurations. However, if your organization requires a more transaction-oriented approach to network management, where separate individuals perform policy creation, approval, and deployment, you can enable Workflow mode to enforce your procedures. If you are using Workflow mode, ensure that you configure user permissions appropriately when you define user accounts to enforce your required division of labor. For information on the types of workflow you can use, see [Workflow and Activities Overview](#) , on page 20. For information on how to change workflow modes, see [Changing Workflow Modes](#) , on page 28.

---

**Tip** You can disable Ticket Management in non-Workflow mode to make most activity management tasks automatic.

---

- Configure default device communication settings. Security Manager uses the most commonly used methods for accessing devices based on the type of device. For example, Security Manager uses SSH by default when contacting Catalyst switches. If the default protocols work for the majority of your devices, you do not need to change them. For devices that should use a non-default protocol, you can change the protocol in the device properties for the specific devices. However, if you typically use a protocol that is not the Security Manager default (for example, if you use a token management server (TMS) for your routers), you should change the default setting. To change the default communication settings, in Configuration Manager, select **Tools > Security Manager Administration**, and select **Device Communication** from the table of contents. In the Device Connection Settings group, select the most appropriate protocols for each type of device. You can also change the default connection time out and retry settings. For more information about device communication settings, see [Device Communication Page](#) , on page 530.
- Select the types of router and firewall policies you will manage with Security Manager. When you manage IPS devices in Security Manager, you automatically manage the entire configuration. However, with routers and firewall devices (ASA, PIX, and FWSM), you can select which types of policies are managed by Security Manager. You can manage other parts of the device configuration using other tools (including the devices's CLI). By default, all security-related policies are managed. To change which policies are managed, in Configuration Manager, select **Tools > Security Manager Administration > Policy Management**. For detailed information about changing these settings and what you should do before and after making the change, see [Customizing Policy Management for Routers and Firewall Devices](#) , on page 175.
- Decide whether you want to use the Event Viewer to manage firewall and IPS events. You can configure the disk and location for collecting syslog events from devices, and the port number to use for syslog communication. If you do not want to use Security Manager for event management, you can turn off the feature, which is enabled by default. For more information on the configuration options, see [Event Management Page](#) , on page 536.
- Configure Security Manager for communication with Cisco Security Monitoring, Analysis and Response System (CS-MARS). If you use CS-MARS for monitoring your network, you can identify the servers to Security Manager and then access CS-MARS event information from within Security Manager. For information on configuring this cross-communication, see [Checklist for Integrating CS-MARS with Security Manager](#) , on page 2900.

## Configuring an SMTP Server and Default Addresses for E-Mail Notifications

Security Manager can send e-mail notifications for several types of events such as deployment job completion, activity approval, or ACL rule expiration. To enable e-mail notifications, you must configure an SMTP server that Security Manager can use for sending the e-mails. Then, you can configure e-mail addresses and notification settings on these settings pages (in Configuration Manager, select **Tools > Security Manager Administration** and select the page from the table of contents):

- **Workflow page**—For default e-mail addresses and notification settings for deployment jobs and activities. Users can override the defaults when managing deployment jobs and activities.
- **Rules Expiration page**—For default e-mail addresses and notification settings for ACL rule expiration. Rules expire only if you configure them with expiration dates.
- **IPS Updates page**—For the e-mail address that should be notified of IPS update availability.
- **Server Security page**—When you configure local user accounts (click **Local User Setup**), specify the user's e-mail address. This address is used as the default target for some notifications such as deployment job completion.
- **Event Management page**—When you configure an extended data storage location, you must specify at least one e-mail address. The email addresses receive notifications if problems arise with the use of the extended storage location. Also, if you are using the Syslog Relay Service, you can configure e-mail addresses that should be notified when the syslog relay service enters or exits CPU throttling.

**Tip**

If you are using ACS for user authorization, you might have already configured an SMTP server and system administrator e-mail address in the ACS integration procedure as described in the [Installation Guide for Cisco Security Manager](#). Security Manager sends a notification to this address if all ACS servers become unavailable.

**Note**

Beginning with version 4.21, Cisco Security Manager supports only TACACS+ authentication via Cisco Identity Services Engine (ISE), because ACS has reached its end of life.

**Step 1** Access CiscoWorks Common Services on the Security Manager server:

- If you are currently using the Security Manager client, the easiest way to do this is to select **Tools > Security Manager Administration**, select **Server Security** from the table of contents, and click any button on that page (for example, **Local User Setup**).
- You can use your web browser to log into the home page on the Security Manager server (<https://servername/CSCOnm/servlet/login/login.jsp>) and click **Server Administration**.

**Step 2** Click **Server > Admin** and select **System Preferences** from the table of contents.

**Step 3** On the System Preferences page, enter the host name or IP address of an SMTP server that Security Manager can use. The SMTP server cannot require user authentication for sending e-mail messages. The secure SMTP integration is not supported in CSM.

Also, enter an e-mail address that CiscoWorks can use for sending e-mails. This does not have to be the same e-mail address that you configure for Security Manager to use when sending notifications. If you are using ACS for authorization,

Security Manager sends an e-mail message to this address if all ACS servers become unavailable. This can alert you to a problem that needs immediate attention. The administrator might also receive e-mail messages from Common Services for non-ACS-related events.

**Step 4** Click **Apply** to save your changes.

## Changing Workflow Modes

You can change the workflow mode that Security Manager enforces if you have the appropriate administrator permissions. Changing the workflow mode has significant effects on users. Before making a change, be sure to understand the following:

- When you change the workflow mode, the change will take effect for all Security Manager users working from the same server.
- Before you can change from Workflow mode to non-Workflow mode, all activities in editable states (Edit, Edit Open, Submit, or Submit Open) must be approved or discarded, and all generated jobs must be deployed, rejected, discarded, or aborted so that the locks on the devices can be released. You do not have to do anything to jobs that are in the failed state.
- Before you can disable Ticket Management in non-Workflow mode, all tickets in editable states (Edit or Edit Open) must be submitted or discarded.
- If you change from Workflow mode to non-Workflow mode and then restore an earlier version of the database, Security Manager automatically changes to Workflow mode if the restored database has any activities in an editable state (Edit, Edit Open, Submit, or Submit Open). Approve or delete the editable activities, and then turn Workflow mode off again.
- When changing from non-Workflow mode to Workflow mode or enabling Ticket Management in non-Workflow mode, current configuration sessions are listed as activities/tickets in the Edit\_Open state, and these activities/tickets must now be explicitly managed.
- When Ticket Management is enabled or disabled, any other users logged into Security Manager are logged out.

For an explanation of workflow modes, see [Workflow and Activities Overview](#), on page 20.

**Step 1** In Configuration Manager, select **Tools > Security Manager Administration** and select **Workflow** from the table of contents to open the Workflow page (see [Workflow Page](#), on page 588).

**Step 2** Configure the workflow mode settings in the Workflow Control group. If you select Enable Workflow (to use Workflow mode), you can also select these options:

- **Require Activity Approval**—To enforce explicit approval of activities before policy changes are committed to the database.
- **Submitter can Approve Activity**— Instead of separating submission and approval roles, a submitter can also approve his/her own activity, when enabled.
- **Require Deployment Approval**—To enforce explicit approval of deployment jobs before they can be run.
- **Submitter can Approve Deployment Job**—When enabled, submitter can approve deployment jobs submitted by him/her.

- Step 3** Configure the e-mail notification settings. These are the default e-mail addresses for the e-mail sender (that is, Security Manager), the approvers, and another person or e-mail alias who should be notified when deployment jobs are complete. You also have the options to include the job deployer when sending notifications of job status, and to require that e-mail notifications are sent for deployment job status changes.
- Step 4** Click **Save** to save and apply changes.
- Step 5** Select **Workflow** from the table of contents to open the Ticket Management page (see [Token Management Page](#) , on page 585).
- Step 6** Configure the Ticket Management settings. If you select Enable Ticketing, you can also select these options:
- Note** See [Token Management Page](#) , on page 585 for detailed information on these fields.
- Ticket System URL—To provide linking between a Ticket ID and an external ticket management system.
  - Ticket History—Specify how long to keep information related to tickets.
- Step 7** Click **Save** to save and apply changes.
- 

## Understanding Basic Security Manager Interface Features

The following topics provide information about some basic interface features such as descriptions of the menu commands, toolbar buttons, and how to use common user interface elements. Many of the features described are used only in Configuration Manager.

- [Menu Bar Reference for Configuration Manager](#) , on page 29
- [Toolbar Reference \(Configuration Manager\)](#) , on page 40
- [Using Selectors](#) , on page 46
- [Using Wizards](#) , on page 49
- [Using Tables](#) , on page 50
- [Using Text Fields](#) , on page 51
- [Selecting or Specifying a File or Directory in Security Manager](#) , on page 52
- [Troubleshooting User Interface Problems](#) , on page 53

## Menu Bar Reference for Configuration Manager

The menu bar in Configuration Manager contains menus with commands for using Security Manager. Commands may become unavailable depending on the task you are performing.

The menus in the menu bar are described in the following topics:

- [File Menu \(Configuration Manager\)](#) , on page 30
- [Edit Menu \(Configuration Manager\)](#) , on page 31
- [View Menu \(Configuration Manager\)](#) , on page 32
- [Policy Menu \(Configuration Manager\)](#) , on page 32

- [Map Menu \(Configuration Manager\)](#) , on page 33
- [Manage Menu \(Configuration Manager\)](#) , on page 35
- [Tools Menu \(Configuration Manager\)](#) , on page 35
- [Launch Menu \(Configuration Manager\)](#) , on page 38
- [Activities Menu \(Configuration Manager\)](#) , on page 37
- [Tickets Menu \(Configuration Manager\)](#) , on page 37
- [Help Menu \(Configuration Manager\)](#) , on page 39

## File Menu (Configuration Manager)

The following table describes the commands on the File menu in Configuration Manager. The menu items differ depending on the workflow mode.

**Table 2: File Menu (Configuration Manager)**

Command	Description
New Device	Initiates the wizard to add a new device. See <a href="#">Adding Devices to the Device Inventory</a> , on page 75.
Clone Device	Creates a device by duplicating an existing device. See <a href="#">Cloning a Device</a> , on page 126
Delete Device	Deletes a device. See <a href="#">Deleting Devices from the Security Manager Inventory</a> , on page 128.
Save	Saves any changes made on the active page, but does not submit them to the Security Manager database.
Import	Import policies and devices exported from another Security Manager server. See <a href="#">Importing Policies or Devices</a> , on page 489.
Export	Export policies or devices so that they can be imported into another Security Manager server. A device export can include policy information, or it can be a simple CSV file that you can import into CiscoWorks Common Services Device Credential Repository (DCR) or Cisco Security Monitoring, Analysis and Response System (CS-MARS). See <a href="#">Exporting the Device Inventory from the Security Manager Client</a> , on page 482 and <a href="#">Exporting Shared Policies</a> , on page 487.
View Changes (non-Workflow mode only)	Opens the Activity Change Report (in PDF format) for the current configuration session.  To see changes for the current activity in Workflow mode, select <b>Activities &gt; View Changes</b> .

Command	Description
Validate (non-Workflow mode only)	Validates the changes you have saved. See <a href="#">Validating an Activity/Ticket</a> , on page 158. To validate the current activity in Workflow mode, select <b>Activities &gt; Validate Activity</b> .
Submit (non-Workflow mode only)	Submits all changes made since the last submission to the Security Manager database. To validate the current activity in Workflow mode, select <b>Activities &gt; Submit Activity</b> .
Submit and Deploy (non-Workflow mode only)	Submits all changes made since the last submission to the Security Manager database and deploys all changes made since the last deployment. See <a href="#">Understanding Deployment</a> , on page 379. In Workflow mode, you must have your activity approved and then create a deployment job to deploy changes to devices.
Deploy (non-Workflow mode only)	Deploys all changes made since the last deployment. See <a href="#">Understanding Deployment</a> , on page 379. In Workflow mode, you must have your activity approved and then create a deployment job to deploy changes to devices.
Discard (non-Workflow mode only)	Discards all configuration changes since the last submission. To validate the current activity in Workflow mode, select <b>Activities &gt; Discard Activity</b> .
Edit Device Groups	Edits device groups. See <a href="#">Working with Device Groups</a> , on page 129.
New Device Group	Adds a device group. See <a href="#">Creating Device Groups</a> , on page 132.
Add Devices to Group	Adds a device to a group. See <a href="#">Adding Devices to or Removing Them From Device Groups</a> , on page 133.
Print	Prints the active page. Not all pages can be printed. If the Print command is not available, you cannot print the active page.
Exit	Exits Security Manager.

## Edit Menu (Configuration Manager)

The following table describes the commands on the Edit menu in Configuration Manager. You can typically use these commands only when you are working with a table in a policy, and some work only for rules tables (see [Using Rules Tables](#) , on page 602).

Table 3: Edit Menu (Configuration Manager)

Command	Description
Cut	Cuts the selected row in a rules table and saves it on the clipboard.
Copy	Copies the selected row in a rules table and saves it on the clipboard.
Paste	Pastes the rules table row from the clipboard to the into the rules table after the selected row.
Add Row	Adds a row into the active table.
Edit Row	Edits the selected table row.
Delete Row	Deletes the selected table row.
Move Row Up Move Row Down	Moves the selected row up or down in the rules table. For more information, see <a href="#">Moving Rules and the Importance of Rule Order</a> , on page 615.
Global Search	Opens the Global Search window. For more information, see <a href="#">Using Global Search</a> , on page 43.

## View Menu (Configuration Manager)

The View menu in Configuration Manager contains commands to navigate within the user interface or to alter the toolbar.

Table 4: View Menu

Menu Command	Description
Device View	Opens Device view. See <a href="#">Device View Overview</a> , on page 15.
Device Status View	Opens the Device Status View window. See <a href="#">Working with Device Status View</a> , on page 134.
Map View	Opens Map view. See <a href="#">Map View Overview</a> , on page 18.
Policy View	Opens Policy view. See <a href="#">Policy View Overview</a> , on page 17.
Policy Bundle View	Opens Policy Bundle view. See <a href="#">Managing Policy Bundles</a> .
Customized Toolbar	Allows you to add or remove some optional buttons on the toolbar. For information on all the buttons that can appear on the toolbar, see <a href="#">Toolbar Reference (Configuration Manager)</a> , on page 40.

## Policy Menu (Configuration Manager)

The Policy menu in Configuration Manager contains commands for managing policies.

Table 5: Policy Menu (Configuration Manager)

Menu Command	Description
Share Policy	Saves the active local policy as a shared policy. See <a href="#">Sharing a Local Policy</a> , on page 205.
Unshare Policy	Saves the active shared policy as a local policy. See <a href="#">Unsharing a Policy</a> , on page 208.
Assign Shared Policy	Assigns shared policies to devices. See <a href="#">Assigning a Shared Policy to a Device or VPN Topology</a> , on page 209.
Unassign Policy	Unassigns the current policy from the selected device. See <a href="#">Unassigning a Policy</a> , on page 200.
Copy Policies Between Devices	Copies policies between devices. See <a href="#">Copying Policies Between Devices</a> , on page 197
Share Device Policies	Enables you to share local device policies. See <a href="#">Sharing a Local Policy</a> , on page 205.
Edit Policy Assignments	Edits assignment of shared policies to devices. See <a href="#">Modifying Policy Assignments in Policy View</a> , on page 219.
Clone Policy	Creates a copy of a policy with a new name. See <a href="#">Cloning (Copying) a Shared Policy</a> , on page 212.
Rename Policy	<a href="#">Renaming a Shared Policy</a> , on page 213
Add Local Rules	Adds local rules to a shared policy on a device. You must select a rule-based shared policy to use this command.
Inherit Rules	Edits policy inheritance. See <a href="#">Inheriting or Uninheriting Rules</a> , on page 211.
Discover Policies on Device	Discovers policies on a device. See <a href="#">Discovering Policies</a> , on page 176.
Discover VPN Policies	Opens the Discover VPN Policies wizard. See <a href="#">Site-To-Site VPN Discovery</a> , on page 1093.

## Map Menu (Configuration Manager)

The Map menu in Configuration Manager contains commands for using the Map view. The commands in this menu are available only when the Map view is open. For more information, see [Using Map View](#), on page 1585.

Table 6: Map Menu (Configuration Manager)

Menu Command	Description
New Map	Creates a map. See <a href="#">Creating New or Default Maps</a> , on page 1594.
Open Map	Opens a saved map or the default map. See <a href="#">Opening Maps</a> , on page 1594.

Menu Command	Description
Show Devices On Map	Selects the managed devices to show on the active map. See <a href="#">Displaying Managed Devices on the Map</a> , on page 1601.
Show VPNs On Map	Selects the VPNs to show on the active map. See <a href="#">Displaying Existing VPNs on the Map</a> , on page 1606.
Add Map Object	Creates a map object on the open map. See <a href="#">Using Map Objects To Represent Network Topology</a> , on page 1602.
Add Link	Creates a Layer 3 link on the open map. See <a href="#">Creating and Managing Layer 3 Links on the Map</a> , on page 1604.
Find Map Node	Finds nodes on the open map. See <a href="#">Searching for Map Nodes</a> , on page 1597.
Save Map	Saves the open map. See <a href="#">Saving Maps</a> , on page 1595.
Save Map As	Saves the open map with a new name. See <a href="#">Saving Maps</a> , on page 1595.
Zoom In	Zooms in on the map. See <a href="#">Panning, Centering, and Zooming Maps</a> , on page 1596.
Zoom Out	Zooms out from the map. See <a href="#">Panning, Centering, and Zooming Maps</a> , on page 1596.
Fit to Window	Zooms the open map to display the entire map. See <a href="#">Panning, Centering, and Zooming Maps</a> , on page 1596.
Display Actual Size	Zooms the open map to display at actual size. See <a href="#">Panning, Centering, and Zooming Maps</a> , on page 1596.
Refresh Map	Refreshes the open map with updated network data. See <a href="#">Creating New or Default Maps</a> , on page 1594.
Export Map	Exports the open map to a file. See <a href="#">Exporting Maps</a> , on page 1595.
Delete Map	Deletes the map you select from a list. See <a href="#">Deleting Maps</a> , on page 1595.
Map Properties	Displays or edits properties for the open map. See <a href="#">Setting the Map Background Properties</a> , on page 1598.
Show/Hide Navigation Window	Displays or hides the navigation window on the open map. See <a href="#">Using the Navigation Window</a> , on page 1589.
Undock/Dock Map View	Undocks the maps window, allowing you to use other features while keeping the map open. If the window is already undocked, the Dock Map View command reattaches the window to the primary Security Manager window. See <a href="#">Understanding the Map View Main Page</a> , on page 1586.

## Manage Menu (Configuration Manager)

The Manage menu in Configuration Manager contains commands that start tools that run in a window separate from the Security Manager main interface. This enables you to access features without closing the page from which you are currently working.

**Table 7: Manage Menu (Configuration Manager)**

Menu Command	Description
Policy Objects	Opens the Policy Object Manager, where you can view all available objects grouped according to object type; create, copy, edit, and delete objects; and generate usage reports, which describe how selected objects are being used by other Security Manager objects and policies. For information see <a href="#">Policy Object Manager</a> , on page 230.
Site-to-Site VPNs	Opens the Site-to-Site VPN Manager, where you can configure site-to-site VPNs. See <a href="#">Managing Site-to-Site VPNs: The Basics</a> , on page 1071.
Activities (Workflow mode only)	Opens the Activity Manager, where you can create and manage activities. See <a href="#">Activity/Ticket Manager Window</a> , on page 149.
Deployments	Opens the Deployment Manager, where you can deploy configurations and manage deployment jobs. See <a href="#">Managing Deployment</a> , on page 379
Configuration Archive	Stores archived device configuration versions and allows you to view, compare, and roll back from one configuration to another. See <a href="#">Configuration Archive Window</a> , on page 401.
Policy Discovery Status	Opens the Policy Discovery Status window, where you can see the status of policy discovery and device import. See <a href="#">Viewing Policy Discovery Task Status</a> , on page 186.
IPS	Manage IPS device certificates, which are required for device communications.
Audit Report	Generates an audit report according to parameters set in the audit report page. See <a href="#">Using the Audit Report Window</a> , on page 497.
Change Reports (non-Workflow mode only)	Allows you to generate a report of changes to devices, shared policies, and policy objects for a previous configuration session. See <a href="#">Viewing Change Reports</a> , on page 156.  To view changes for the current configuration session, select <b>File &gt; View Changes</b> .

## Tools Menu (Configuration Manager)

The To

Opens the Device Properties window, which provides general information about the device, including credentials, the group the device is assigned to, and policy object overrides. For more information, see [Understanding Device Properties](#) , on page 74.

ols menu in Configuration Manager contains commands that start tools that run in a window separate from the Security Manager main interface. This enables you to access features without closing the page from which you are currently working.

**Table 8: Tools Menu (Configuration Manager)**

Menu Command	Description
Device Properties	
Detect Out of Band Changes	Analyzes devices to determine if their configurations have changed since the last time Security Manager deployed configurations. You can use this information to ensure that you do not lose important configuration changes. See <a href="#">Detecting and Analyzing Out of Band Changes</a> , on page 424.
Packet Capture Wizard	Opens the Packet Capture wizard, where you can set up a packet capture on an ASA device.
Ping, TraceRoute and NSLookup	Opens the Ping, TraceRoute, and NSLookup tool, where you can use these troubleshooting commands. Ping and traceroute run on managed devices, whereas NSLookup runs on your client workstation. See <a href="#">Analyzing Connectivity Issues Using the Ping, Trace Route, or NS Lookup Tools</a> , on page 2888.
IP Intelligence	Opens the IP Intelligence tool, where you can access various pieces of information about an IPv4 address, such as the fully qualified domain name (FQDN), geographic location information, and WHOIS information. For more information on the IP Intelligence tool, see <a href="#">IP Intelligence</a> , on page 2897.  Before you can use any of the IP Intelligence features, you must enable and configure those features on the IP Intelligence Settings page (see <a href="#">IP Intelligence Settings Page</a> , on page 551).
Wall	Opens the Wall window, where you can send messages to all users who are logged in on the same Security Manager server. First, however, it must be enabled on the Wall Settings page. See <a href="#">Wall Settings Page</a> , on page 590.
Show Containment	Shows security contexts or service modules for a device. See <a href="#">Showing Device Containment</a> , on page 126.
Inventory Status	Shows device summary information for all devices. See <a href="#">Viewing Inventory Status</a> , on page 2873.
Catalyst Summary Info	Shows high-level system information, including any service modules, ports, and VLANs that Security Manager has discovered on the selected Catalyst switch. See <a href="#">Viewing Catalyst Summary Information</a> , on page 2648.
Apply IPS Update	Manually applies IPS image and signature updates. See <a href="#">Manually Applying IPS Updates</a> , on page 1783.
Preview Configuration	Displays the proposed changes, last deployed configuration, or current running configuration for specific devices. See <a href="#">Previewing Configurations</a> , on page 422.
Backup	Backs up the Security Manager database using CiscoWorks Common Services. See <a href="#">Backing up and Restoring the Security Manager Database</a> , on page 500.

Menu Command	Description
Security Manager Diagnostics	Gathers troubleshooting information to send to the Technical Assistance Center (TAC) if they request it. See <a href="#">Creating Diagnostics Files for the Cisco Technical Assistance Center</a> , on page 504.  <b>Tip</b> Beginning with Version 4.7 of Cisco Security Manager, you can select "Light Diagnostics" instead of the existing "General Diagnostics."
Security Manager Administration	Configures system-wide settings that control the functioning of Security Manager.

## Activities Menu (Configuration Manager)

The Activities menu in Configuration Manager contains commands for managing activities. It appears only when Workflow mode is enabled. For more detailed information about these commands, see [Accessing Activity Functions in Workflow Mode](#) , on page 147.

**Table 9: Activities Menu (Configuration Manager)**

Menu Command	Description
New Activity	Creates a new activity. See <a href="#">Creating an Activity/Ticket</a> , on page 153.
Open Activity	Opens an activity. See <a href="#">Opening an Activity/Ticket</a> , on page 154.
Close Activity	Closes the open activity. See <a href="#">Closing an Activity/Ticket</a> , on page 155.
View Changes	Opens the Activity Change Report (in PDF format). See <a href="#">Viewing Change Reports</a> , on page 156.
Validate Activity	Validates the open activity. See <a href="#">Validating an Activity/Ticket</a> , on page 158.
Submit Activity	Submits the open activity. See <a href="#">Submitting an Activity for Approval (Workflow Mode with Activity Approver)</a> , on page 159.
Approve Activity	Approves the open activity. See <a href="#">Approving or Rejecting an Activity (Workflow Mode)</a> , on page 160.
Reject Activity	Rejects the open activity. See <a href="#">Approving or Rejecting an Activity (Workflow Mode)</a> , on page 160.
Discard Activity	Discards the open activity. See <a href="#">Discarding an Activity/Ticket</a> , on page 161.

## Tickets Menu (Configuration Manager)

The Tickets menu in Configuration Manager contains commands for managing tickets. It appears only when Ticket Management is enabled in non-Workflow mode. For more detailed information about these commands, see [Accessing Activity Functions in Workflow Mode](#) , on page 147.

Table 10: Tickets Menu (Configuration Manager)

Menu Command	Description
New Ticket	Creates a new ticket. See <a href="#">Creating an Activity/Ticket</a> , on page 153.
Open Ticket	Opens an ticket. See <a href="#">Opening an Activity/Ticket</a> , on page 154.
Close Ticket	Closes the open ticket. See <a href="#">Closing an Activity/Ticket</a> , on page 155.
View Changes	Opens the Ticket Change Report (in PDF format). See <a href="#">Viewing Change Reports</a> , on page 156.
Validate Ticket	Validates the open ticket. See <a href="#">Validating an Activity/Ticket</a> , on page 158.
Submit Ticket	Submits the open ticket. See <a href="#">Understanding Activity/Ticket States</a> , on page 142.
Discard Ticket	Discards the open ticket. See <a href="#">Validating an Activity/Ticket</a> , on page 158.

## Launch Menu (Configuration Manager)

The Launch menu contains commands that start other applications.

Table 11: Launch Menu (Configuration Manager)

Menu Command	Description
Device Manager	Starts device managers for all supported devices, such as PIX security appliances, Firewall Services Modules (FWSM), IPS sensors, IOS routers, and Adaptive Security Appliance (ASA) devices. Device managers provide several monitoring and diagnostic features that enable you to get information regarding the services running on the device and a snapshot of the overall health of the system. See <a href="#">Starting Device Managers</a> , on page 2875.
Prime Security Manager	Launches the Cisco Prime Security Manager (PRSM) application, used to manage ASA CX devices. See <a href="#">Launching Cisco Prime Security Manager or FireSIGHT Management Center</a> , on page 2882 for more information.
FireSIGHT Management Center	Launches the FireSIGHT Management Center application, used to manage FirePOWER modules. See <a href="#">Launching Cisco Prime Security Manager or FireSIGHT Management Center</a> , on page 2882 for more information.
Dashboard	Opens the Dashboard, which is a configurable launch point for Security Manager that makes IPS and FW tasks more convenient for you. In addition to the original dashboard, you can create new, additional dashboards, and you can customize all dashboards. By using the dashboard, you can accomplish in one place many tasks that are found in several other areas of Security Manager, such as the IPS Health Monitor page, Report Manager, Health and Performance Monitor, and IP Intelligence Settings. For detailed information on the dashboard, see <a href="#">Dashboard Overview</a> , on page 2861.

Menu Command	Description
Event Viewer	<p>Opens the Event Viewer, where you can view and analyze device events. See <a href="#">Viewing Events, on page 2703</a> for more information.</p> <p>If you have already logged into another Security Manager application, Event Viewer is opened using the same user account; you are not prompted to log in. To open Event Viewer using a different user account, open the application from the Windows Start menu or desktop icon.</p>
Report Manager	<p>Opens the Report Manager, where you can generate and analyze security and usage reports. See <a href="#">Managing Reports, on page 2773</a> for more information.</p> <p>If you have already logged into another Security Manager application, Report Manager is opened using the same user account; you are not prompted to log in. To open Report Manager using a different user account, open the application from the Windows Start menu or desktop icon.</p>
Image Manager	<p>Opens the Image Manager, where you can manage the images on ASA devices. See <a href="#">Using Image Manager, on page 2917</a> for more information.</p> <p>If you have already logged into another Security Manager application, Image Manager is opened using the same user account; you are not prompted to log in. To open Image Manager using a different user account, open the application from the Windows Start menu or desktop icon.</p>
Health & Performance Monitor	<p>Opens the Health &amp; Performance Monitor (HPM), where you can view device status and traffic information across your network, and view and acknowledge device-specific alerts. See <a href="#">Health and Performance Monitoring, on page 2813</a> for more information.</p> <p>If you have already logged into another Security Manager application, HPM is opened using the same user account; you are not prompted to log in. To open HPM using a different user account, open the application from the Windows Start menu or desktop icon.</p>

## Help Menu (Configuration Manager)

The Help menu in Configuration Manager contains commands for accessing product documentation and training. For more information, see [Accessing Online Help , on page 54](#).

**Table 12: Help Menu (Configuration Manager)**

Menu Command	Description
Help Topics	Opens the online help system.
Help About This Page	Open online help for the active page.
JumpStart	Opens the JumpStart.
Security Manager Online	Opens the Security Manager web page on Cisco.com.
About Configuration Manager	Displays information about Configuration Manager.

## Toolbar Reference (Configuration Manager)

The main toolbar contains buttons that perform actions in Configuration Manager.

The buttons that appear on the main toolbar vary depending on whether Workflow/Ticket Management mode is enabled and how you have customized the toolbar. By selecting you can select some of the buttons included in the toolbar. Many buttons are on the toolbar permanently; you cannot remove them.

The following table presents all buttons.

**Table 13: Configuration Manager Toolbar**

Button	Description
 Device	Opens the Device view. For more information, see <a href="#">Understanding the Device View</a> , on page 69.
 Map	Opens the Map view. For more information, see <a href="#">Using Map View</a> , on page 1585.
 Policy	Opens the Policy view. For more information, see <a href="#">Managing Shared Policies in Policy View</a> , on page 215.
 Policy Bundle	Opens the Policy Bundle view. For more information, see <a href="#">Managing Policy Bundles</a> , on page 222.
	Opens the Policy Object Manager. For more information, see <a href="#">Managing Policy Objects</a> , on page 227.
	Opens the Site-to-Site VPN Manager. For more information, see <a href="#">Managing Site-to-Site VPNs: The Basics</a> , on page 1071.
	Opens the Deployment Manager. For more information, see <a href="#">Managing Deployment</a> , on page 379.
	Opens the Audit Report. For more information, see <a href="#">Understanding Audit Reports</a> , on page 495.
	(Non-Workflow mode with Ticket Management disabled only.) Submits and deploys changes. For more information, see <a href="#">Managing Deployment</a> , on page 379.
	Discovers configuration policies defined on the currently selected device. For more information, see <a href="#">Discovering Policies</a> , on page 176.
	Detects out-of-band changes, those made to the device outside of Security Manager, for the currently selected devices. For more information, see <a href="#">Detecting and Analyzing Out of Band Changes</a> , on page 424.

Button	Description
	<p>Opens the IP Intelligence tool, where you can access various pieces of information about an IPv4 address, such as the fully qualified domain name (FQDN), geographic location information, and WHOIS information. For more information on the IP Intelligence tool, see <a href="#">IP Intelligence, on page 2897</a>.</p> <p>Before you can use any of the IP Intelligence features, you must enable and configure those features on the IP Intelligence Settings page (see <a href="#">IP Intelligence Settings Page, on page 551</a>).</p>
	<p>Opens the Wall window, where you can send messages to all users who are logged in on the same Security Manager server. First, however, it must be enabled on the Wall Settings page.</p> <p>For more information, see <a href="#">Workflow Page, on page 588</a>.</p>
	<p>Shows high-level system information, including any service modules, ports, and VLANs that Security Manager has discovered on the selected Catalyst switch.</p> <p>For more information, see <a href="#">Viewing Catalyst Summary Information, on page 2648</a>.</p>
	<p>Previews the configuration for the currently selected device.</p> <p>For more information, see <a href="#">Previewing Configurations, on page 422</a>.</p>
	<p>Configures system-wide settings that control the functioning of Security Manager. For information, see <a href="#">Configuring Security Manager Administrative Settings, on page 509</a>.</p>
	<p>Opens the device manager for the currently selected device.</p> <p>For more information, see <a href="#">Starting Device Managers, on page 2875</a>.</p>
	<p>Launches the Cisco Prime Security Manager (PRSM) application, used to manage ASA CX devices. See <a href="#">Launching Cisco Prime Security Manager or FireSIGHT Management Center, on page 2882</a> for more information.</p>
	<p>Launches the FireSIGHT Management Center application, used to manage FirePOWER modules. See <a href="#">Launching Cisco Prime Security Manager or FireSIGHT Management Center, on page 2882</a> for more information.</p>
	<p>Opens the Dashboard application.</p> <p>For more information, see <a href="#">Dashboard Overview, on page 2861</a>.</p>
	<p>Opens the Event Viewer application.</p> <p>For more information, see <a href="#">Viewing Events, on page 2703</a>.</p>
	<p>Opens the Report Manager application.</p> <p>For more information, see <a href="#">Managing Reports, on page 2773</a>.</p>
	<p>Opens the Image Manager application.</p> <p>For more information, see <a href="#">Using Image Manager, on page 2917</a>.</p>

Button	Description
	Opens the Health & Performance Monitor application. For more information, see <a href="#">Health and Performance Monitoring, on page 2813</a> .
	Opens online help for the current page. For more information, see <a href="#">Accessing Online Help, on page 54</a> .
<b>Note</b>	The following buttons are not available in non-Workflow mode when Ticket Management is disabled.
	Opens the Activity Manager window in Workflow mode or the Ticket Manager window when Ticket Management is enabled in non-Workflow mode. You can use these windows to create and manage activities/tickets. For more information, see <a href="#">Activity/Ticket Manager Window, on page 149</a> .  For more information on the activity buttons, and the conditions under which they are enabled, see <a href="#">Accessing Activity Functions in Workflow Mode, on page 147</a> .  For more information on the ticket buttons, and the conditions under which they are enabled, see <a href="#">Accessing Ticket Functions in Non-Workflow Mode, on page 148</a> .
	Creates a new activity/ticket.
	Opens an activity/ticket.
	Saves all changes made while the activity/ticket was open and closes it.
	Evaluates all changes made in the activity/ticket and produces a Change Report in PDF format in a separate window. For more information, see <a href="#">Viewing Change Reports, on page 156</a> .
	Validates the integrity of changed policies within the current activity/ticket.
	(Workflow mode with an approver only.) Submits the activity for approval when using Workflow mode with an activity approver.  (Non-Workflow mode with Ticket Management enabled only.) Submits the ticket. Submitting the ticket saves the proposed changes to the database. Devices associated with the ticket are unlocked, meaning they can be included in policy definitions and changes in other tickets. You can submit a ticket when it is in the Edit or the Edit Open state.
	(Workflow mode only.) Approves the changes proposed in an activity.
	(Workflow mode only.) Rejects the changes proposed in an activity.
	Discards the selected activity/ticket.

## Using Global Search

Security Manager provides a global search feature to make finding and working with information that you are interested in easier. The Global Search feature allows you to search for devices, policy objects, policies, and tickets that contain a particular search string. The scope of the search can be limited to just devices, policy objects, policies, or tickets.

---

**Note** Search is only performed using data that has been committed. Changes that have not yet been submitted to the database will not be included in search results.

---

### Wildcard Matching

The search string supports the use of the following wildcard characters:

- **Asterisk (\*)**—matches zero or more characters
- **Question Mark (?)**—matches a single character

### Semantic Searching

If the search string that is entered is an IP address, Security Manager will perform a semantic search. For example, entering "192.168.0.0/16" in the search string will return items matching that subnet as well as any specific hosts or other subnets belonging to that subnet or to which that subnet belongs.

### Global Search Scope

Global search is supported only within a set of policies and policy objects, not all. The supported policies and the policy objects are the most frequently used policies and objects in the customer deployments. The policies and policy objects supported are:

- Devices: All Devices
- Policy Objects:
  - AAA Server Groups
  - AAA Servers
  - Access Control Lists
  - As Path Policies
  - ASA Group Policies
  - BFD Template
  - Categories

### Performing a Global Search

To perform a global search, do one of the following:

- Select **Edit > Global Search** or press **Ctrl+F** to open the Global Search window. Select the scope for the search in the drop-down list to the left of the search field, enter your search string in the search field, and then click **Search**.

---

**Note** If you are currently viewing a rule table, pressing **Ctrl+F** will open the Find and Replace dialog box instead of the Global Search window. Use one of the other methods to access the Global Search feature instead of the Find and Replace feature.

---

- Using the search field in the upper-right corner of the Configuration Manager window, select the scope for the search by clicking on the Search icon, enter your search string in the search field, and then press **Enter**.

The Global Search window displays the results matching your search criteria. Select the desired data type from the Category selector tree to see results for that category.

### Acting on Search Results

You can perform the following actions on the items returned from your search:

- **Export Data (All)**—Allows you to export the search results for the selected category in CSV format. Select the desired data type from the Category selector tree in the Global Search window to see results for that category, then click **Export** in the toolbar above the search results to export that table of data in CSV format.
- **Print (All)**—Allows you to print the search results for the selected category. Select the desired data type from the Category selector tree in the Global Search window to see results for that category, then click **Print** in the toolbar above the search results to print the table of data.
- **Device Properties (Devices)**—Allows you to view the device properties for devices returned in search results. Select the desired device group from the Category selector tree in the Global Search window to see results for that category. Select a device in the results table to highlight it, right-click the device, and then select **Device Properties**. The Device Properties dialog box for the selected device is displayed. For more information, see [Viewing or Changing Device Properties](#), on page 107.
- **Go To (Policies)**—Allows you to navigate to a policy from the search results. Select the desired policy type from the Category selector tree in the Global Search window to see results for that policy type. Select an item in the results table to highlight it, right-click the item, and then select **Go To**. The relevant policy for the selected item is displayed.

- **Filter (Policies)**—Allows you to filter the search results using the standard table filter. For more information, see [Filtering Tables](#) , on page 50.
- **View (Policy Objects)**—Allows you to view the policy object details for an object in the search results. Select the desired policy object type from the Category selector tree in the Global Search window to see results for that object type. Select an object in the results table to highlight it, then click **View** in the toolbar above the search results (or right-click the object and select **View**). The relevant Edit dialog box for the selected policy object is displayed in read-only mode.
- **Edit (Policy Objects)**—Allows you to edit a policy object from the search results. Select the desired policy object type from the Category selector tree in the Global Search window to see results for that object type. Select an object in the results table to highlight it, then click **Edit** in the toolbar above the search results (or right-click the object and select **Edit**). The relevant Edit dialog box for the selected policy object is displayed.

---

**Note** If a ticket or activity is not currently open, you will be prompted to create one or open an existing one before you can edit the policy object.

---

- **Find Usage (Policy Objects)**—Allows you to find which policies, objects, VPNs, and devices are using an object in the search results. Select the desired policy object type from the Category selector tree in the Global Search window to see results for that object type. Select an object in the results table to highlight it, then click **Find Usage** in the toolbar above the search results (or right-click the object and select **Find Usage**). The Object Usage dialog box for the selected policy object is displayed. For more information, see [Generating Object Usage Reports](#) , on page 241.
- **Show Ticket (Tickets)**—Allows you to navigate to the Ticket Manager window for a ticket returned in the search results. Select the desired ticket group from the Category selector tree in the Global Search window to see results for that category. Click the Ticket column in the results table for the ticket you want to view. The Ticket Manager window is displayed with the selected ticket highlighted. For more information, see [Activity/Ticket Manager Window](#) , on page 149.

## Using Selectors

Selectors appear in several places in the user interface; for example, the Device selector in Device view (see Figure 1-1). These tree structures enable you to select items (like devices) on which to perform actions. Several types of items can appear in a selector, depending on the task you are performing.

Items in selectors are presented in a hierarchy of folders. You can browse for items in a selector by expanding and collapsing folders, which can contain other folders, items, or a combination of folders and items. To expand and collapse a folder, click the +/- next to it.

To select an item, click it. If it is possible to perform actions on multiple items (for example, in a device selector), you can use Ctrl+click to select each item, or Shift+click on the first and last item to select all items between them. Many selectors support auto select, that is, when you type a single letter, the next folder or item in the selector that begins with that letter is selected.

You can right-click an item to see commands that you can use with the item. Some commands on the right-click menus are unique and not repeated on the regular menus.

Many times a device selector appears in a dialog box divided into two panes, Available Devices and Selected Devices. In these dialog boxes, you must select the devices in the available devices list and click >> to move

them to the selected list to actually select the devices. To deselect the devices, you select them in the selected devices list and click <<.

If a selector contains a large number of items, you can filter it to view a subset of those items. For more information, see [Filtering Items in Selectors](#) , on page 47.

## Filtering Items in Selectors

To view a subset of the items in a selector, you can create filters to display only those items that match the criteria you specify. You can have a maximum of 10 filters per user for each selector. After that, when you create another filter, that new filter replaces the oldest filter. There is no duplication check for filters that are created. You cannot delete filters manually.

A filter list appears above all selectors that can be filtered. From this list, you can do the following:

- Select a filter that you created previously.
- Select **None** to see the tree without any filters applied to it.
- Select **Create Filter** to create a filter.

Each filter can contain several filter rules. Each filter rule specifies a rule type, criteria, and values. You select whether items must match any or all filter rules before they can be displayed in the selector.

When you create a filter, the fields that you can filter on depend on the types of items displayed in the filter. However, the general procedure is the same for all selectors.

For information on filtering tables, see [Filtering Tables](#) , on page 50.

---

**Tip** When you filter a selector, that filter might remain applied to the selector when you open another window that includes the selector. For example, when you apply a filter to the Device selector in Device view, that filter is applied to the selector if you open the New Device wizard. If you have problems finding an item in a selector, check the Filter field to see if a filter is being applied.

---

---

**Step 1** Select **Create Filter** from the selector filter field to open the Create Filter dialog box.

**Step 2** Select one of the radio buttons to determine the matching criteria. The choices are:

- Match Any of the Following—Creates an OR relationship among the filter criteria. Policies matching any of your criteria are included in the filter.
- Match All of the Following—Creates an AND relationship among the filter criteria. Only those policies matching all your criteria are included in the filter.

**Step 3** Establish a filter rule by entering three criteria, as follows:

- From the first list, select the type to be filtered; for example, *Name* .
- From the next list, select the operating criteria for the filter; for example, *contains* .
- In the final field, enter or select a value on which to filter; for example *Cisco* .

**Step 4** Click **Add**.

**Tip** If you make a mistake in forming the filter rule, select the rule and click **Remove** to delete it.

**Step 5** Add any additional filter rules that you require. Click **OK** when you are finished.

The selector is filtered according to the new filter criteria, and the new filter is added to the filter list.

## Create Filter Dialog Box

Use the Create Filter dialog box to filter and display a subset items in a selector or a table. Creating filters helps you find items more easily when viewing large lists.

For more information on filtering, see these topics:

- [Filtering Items in Selectors](#) , on page 47
- [Filtering Tables](#) , on page 50

### Navigation Path

Do one of the following:

- Select **Create Filter** from the Filter field in a selector tree.
- Select **Advanced Filter** from the Filter field above a table.

### Field Reference

*Table 14: Create Filter Dialog Box*

Element	Description
Match All of the Following	<p>When you select this option an AND relationship is created among the filtering criteria you define. An item must satisfy every rule in the filter to be displayed in the list.</p> <p>For example, if you define the following criteria:</p> <ul style="list-style-type: none"> <li>• Name contains OSPF</li> <li>• Name contains West</li> </ul> <p>When you click OK, the filter is defined as: Name contains OSPF <b>and</b> Name contains West.</p>

Element	Description
Match Any of the Following	<p>When you select this option an OR relationship is created among the filtering criteria you define. An item must satisfy only one of the rules in the filter to be displayed in the list.</p> <p>For example, if you define the following criteria:</p> <ul style="list-style-type: none"> <li>• Name contains OSPF</li> <li>• Name contains RIP</li> </ul> <p>When you click OK, the filter is defined as: Name contains OSPF <b>or</b> Name contains RIP.</p>
Filter Type (First field.)	The type of property on which you are filtering. For tables, this is the column heading. You might have only one option for filtering certain lists (for example, you might only be able to filter by the name of the item).
Filter Operator (Second field.)	The relationship between the filter type and the filter value. The available options depend on the selected type.
Filter Value (Third field.)	The value on which you want to filter. Depending on the selected type, you either enter a text string in this field, or you select a value from the list.
Filter Content Area Add button Remove button	<p>The filter type, operator, and value that you have selected for each criterion.</p> <ul style="list-style-type: none"> <li>• To add a criterion, create it in the fields above this area and click <b>Add</b>.</li> <li>• To remove a criterion, select it and click <b>Remove</b>.</li> </ul>

## Using Wizards

Some tasks that you can perform with Security Manager are presented as wizards. A wizard is a series of dialog boxes (or steps) that enables you to perform a task. The current step number and the total number of steps in the wizard are displayed in the wizard title bar.

Wizards share the following buttons:

- **Back**—Returns to the previous dialog box. Enables you to review and modify settings that you defined in previous wizard steps.
- **Next**—Continues to the next dialog box. If this button is unavailable, you must define some required settings in the current dialog box before you can continue. Required settings are marked with an asterisk (\*).
- **Finish**—Finishes the wizard, saving the settings you defined. You can finish the wizard whenever this button is available. If this button is not available, you must define more settings.
- **Cancel**—Closes the wizard without saving any settings.
- **Help**—Opens online help for the wizard.

## Using Tables

Many policies in Security Manager use tables. A small number of policies use a specialized type of table called a rules table. Rules tables have extra features compared to standard tables; for more information, see [Using Rules Tables](#), on page 602.

Standard tables include these basic features:

- Table filter—You can filter the rows displayed to help you find items in a large table. For more information, see [Filtering Tables](#), on page 50.
- Table column headings—You can sort by column and move, show, and hide columns. For more information, see [Table Columns and Column Heading Features](#), on page 51.
- Table buttons—Use the buttons below the table to do the following:
  - Add Row button (+ icon)—Click this button to add an item to the table.
  - Edit Row button (pencil icon)—Select a row and click this button to edit its properties.
  - Delete Row button (trash can icon)—Select a row and click this button to delete it from the table.

## Filtering Tables

You can filter the items in a table to view a subset that satisfies specific criteria. Filtering a table does not change the contents of the table, but allows you to focus on just those entries that currently interest you. This is helpful for tables that have hundreds of entries.

To filter a table, use the Filter fields above the table. With these controls, you can do the following:

- To do simple filtering, select the column name on which you want to filter, select the relationship you are looking for (such as “begins with”), enter the desired text string (or in some cases, select one of the pre-defined options), and click **Apply**.

You can filter the results by selecting another criteria and clicking Apply. Your filters are added together, showing the results that satisfy all criteria. For example, you could first enter “Service begins with IP,” click Apply, then enter “Source contains 10.100.10.10,” and click Apply. The result would be a table that shows all rows where the service is IP AND the source includes 10.100.10.10 (it might include other IP addresses as well).

- To do advanced filtering, select **Advanced Filter** from the left most menu (the one that contains the column headings). This opens the Create Filter dialog box. Using this dialog box, you can create multiple filter criteria just as you can with the regular filter controls. However, you also have the option to create a list of disjointed, OR’ed criteria, by selecting **Match Any of the Following**, where you can say “show me all rows that have IP for service or 10.100.10.10 for source address.”
  - To add criteria, enter the criteria and click **Add**.
  - To remove criteria, select the undesired criteria and click **Remove**.

If you filter a table using the simple method, you can select Advanced Filter to alter your existing filter, adding or removing criteria as desired. The dialog box is filled with whatever filter criteria are currently applied to the table.

- The current filter is shown next to the Filter label in the filter control area. You can click **Clear** to remove the filter and show all rows.

- Any filter you apply is kept in the left most menu below the Advanced Filter entry. You can apply the filter by selecting it from the list. However, this list can have at most 10 entries. When you create your eleventh filter, your oldest filter is removed from the list. If you select a filter and add criteria, you are modifying that filter rather than creating a new one. You cannot delete the listed filters.

**Tip** Your filter is maintained for a given type of table even if you select another device or log out and subsequently log back in. For example, if you filter the Access Rules table for one device, it will be filtered the same way for other devices. When you clear the filter, it is cleared for the same type of table for all devices. Your filters do not affect what any other user sees.

## Table Columns and Column Heading Features

Tables contain columns, each of which has a column heading in the heading row. These columns and their headings include the following features:

- **Show/hide Columns**—Right-click the table heading row to open the context menu and then select **Show Columns**. This menu enables you to select which columns appear. Showing or hiding columns does not affect the content of items defined in the table; it affects only your view.

By default, the tables for some policies do not display all available columns.

- **Show Details/Show Summary**—Right-click the table heading row to open the context menu and then select either **Show Details** or **Show Summary**. This toggling menu enables you to select whether to view detailed or summarized information in the table.
- **Move columns**—Click and drag a column heading to move the column to a new position.
- **Resize columns**—Click a column heading divider (when the cursor turns into an arrow) and drag it to resize the column.
- **Sort by column headings**—Click a column heading to sort the table by that column's contents. Click the same column heading again to reverse the sort order. The sorted column has an arrow next to its heading.

## Using Text Fields

Text fields can be single- or multiple-line, depending on the purpose of the field. Text fields that can contain multiple text lines include several features to make them easier to use. The following topics describe limitations and features of text fields:

- [Understanding ASCII Limitations for Text](#) , on page 51
- [Finding Text in Text Boxes](#) , on page 52
- [Navigating Within Text Boxes](#) , on page 52

## Understanding ASCII Limitations for Text

Devices typically restrict text to ASCII characters. If you include non-ASCII characters in Security Manager text fields that are used to generate commands in a device configuration file, the presence of those characters can prevent the configuration file from loading on the device. For example, a non-ASCII character in an

interface description for an FWSM can prevent the device from loading the startup configuration when you restart the device.

The only places where you can include non-ASCII, non-English languages in device configurations is in the SSL VPN Bookmarks and SSL VPN Customization policy objects, which are used in configuring browser-based clientless SSL VPNs on ASA devices. For information on how you can support local languages for these objects, see [Localizing SSL VPN Web Pages for ASA Devices](#), on page 1409.

## Finding Text in Text Boxes

Use the Find dialog box to find text within a multiple line text field.

- 
- Step 1** Click in a multiple line text field.
  - Step 2** Press **Ctrl+F**. The Find dialog box opens.
  - Step 3** Enter text to search for in the Find what field.
  - Step 4** To specify the direction of the search, select either **Up** or **Down** in the Direction field.
  - Step 5** To match the case of the text you entered, select the **Match Case** check box.
  - Step 6** Click **Find**. The next occurrence of your search text is highlighted in the text field.
- 

## Navigating Within Text Boxes

Use the Goto line dialog box to navigate to a specific line in a multiple line text field.

- 
- Step 1** Click in a multiple line text field.
  - Step 2** Press **Ctrl+G**. The Goto line dialog box opens.
  - Step 3** Enter a line number in the Line number field.
  - Step 4** Click **OK**. The text field scrolls to the line number you entered.
- 

## Selecting or Specifying a File or Directory in Security Manager

Cisco Security Manager uses a standard file system browser to let you select a directory or file or to specify a file.

You will be able to choose between client and server file systems when performing the following file operations:

- Installing Security Manager license files
- Importing/exporting device inventory files
- Importing/exporting shared policies
- Creating the following file objects:
  - Cisco Secure Desktop Package
  - Plug-In—For browser plug-in files.
  - Secure Client Profile

- Secure Client Image
- Hostscan Image

For all other file operations, you can create or select files only on the Security Manager server--you cannot use a drive mounted on the server, and you cannot use your client system.

---

**Tip** You can control whether file operations are allowed on the Security Manager client from **Tools > Security Manager Administration > Customize Desktop**. For more information, see [Customize Desktop Page](#), on page 518.

---

Typically, to create or select a file, you click a **Browse** button to open a dialog box that has a title related to the action you are performing (for example, Choose Files when selecting configuration files). The Browse button appears on various dialog boxes throughout the product.

In the dialog box, use the folder tree on the left to navigate to the folder you want:

- If client-side file browsing is enabled and you are performing a function that supports client-side browsing (see above), select the tab that corresponds to the system you want to import from or export to.
- If you are selecting a file, find it in the folder tree and select it in the right pane. If the action you are taking allows you to select multiple files, use Ctrl+click to select files individually, or Shift+click to select a range of files. You might also need to select a file type to view only those files that apply to your action.
- If you are specifying (creating) a file, navigate to the folder in which you want to create the file, enter a file name, and select the appropriate file type.

---

**Note** The path and file name are restricted to characters in the English alphabet. Japanese characters are not supported. When selecting files on a Windows Japanese OS system, the usual file separator character \ is supported, although you should be aware that it might appear as the Yen symbol (U+00A5).

---

## Troubleshooting User Interface Problems

The following tips might help you resolve general user interface problems that you might encounter:

- **Interface appears to freeze** —Occasionally, when you go from a Security Manager dialog box to some other application (for example, to check your e-mail), when you come back to Security Manager, nothing you click on responds. It appears the interface is frozen.

This might be caused by an open dialog box that is covered by another Security Manager window. Until you close the dialog box, you will not be able to use any other window in the application. To find the hidden dialog box, press Alt+Tab, which opens a Windows panel that has icons for all currently open windows. Keep holding Alt, then press Tab repeatedly to cycle through the icons until you find the right one (the icon might be a generic Java icon rather than the Security Manager icon). You can also use your mouse to click the desired icon rather than using Tab to cycle through them.

- **Text and list elements missing, Java errors when clicking buttons**—If you change your Windows color scheme while running the Security Manager client, you must close and then restart the client. Otherwise, the behavior of the client can be unpredictable.

If you are experiencing these problems and you did not change the color scheme, try closing and restarting the application.

- **Dialog Box is too big for the screen**—The minimum screen resolution for the Security Manager client is actually bigger than the best screen resolution available on many laptops (for screen resolution requirements, see the client system requirements in the [Installation Guide for Cisco Security Manager](#)). Because some dialog boxes are quite large, if you run the client on a laptop, you might find the occasional dialog box that is too big to fit on your screen.

Usually, you can reposition the dialog box to get access to the OK, Cancel, and Help buttons. However, if you cannot get those buttons on the screen, you can use the following techniques to perform the same actions:

- **OK**—Put your cursor in a field near the bottom of the dialog box, then press Tab to move from field to field. Typically, the first off-screen field is the OK button. When the cursor highlight moves off screen, press Enter.

You can also put the cursor in a field that does not allow carriage returns (for example, the typical Name field) and press Enter. In many cases, this is the equivalent of clicking OK.

- **Cancel**—Click the X on the right side of the window's title bar.
- **Help**—Press F1.

## Accessing Online Help

To access online help for Security Manager, do one of the following:

- To open the main Security Manager online help page, select **Help > Help Topics**.
- To open context-sensitive online help for the active page, select **Help > Help About This Page** or click the ? button in the toolbar.
- To open context-sensitive online help for a dialog box, click **Help** in the dialog box.

---

**Tip** You must configure Internet Explorer to allow active content to run on your computer for the online help to open unblocked. In Internet Explorer, select **Tools > Internet Options** and click the **Advanced** tab. Scroll to the Security section, and select **Allow active content to run in files on My Computer**. Click **OK** to save the change. For a complete list of configuration requirements for Internet Explorer and Firefox browsers, see the [Installation Guide for Cisco Security Manager](#).

---

The online help page appears without any user authentication. Though the pages are opening with direct URL access, they are only static content pages and function within the Cisco Security Manager.

## CHAPTER 2

# Preparing Devices for Management

Before you start to manage a device using Security Manager, you should prepare the device with at least a minimal configuration. The following sections describe the basic device configurations needed for various transport protocols or device types.

- [Understanding Device Communication Requirements](#) , on page 55
- [Setting Up SSL \(HTTPS\)](#) , on page 57
- [Setting Up SSH](#) , on page 60
- [Setting Up AUS or Configuration Engine](#) , on page 64
- [Configuring Licenses on Cisco ASA Devices](#) , on page 65
- [Configuring Licenses on Cisco IOS Devices](#) , on page 66
- [Initializing IPS Devices](#) , on page 67

## Understanding Device Communication Requirements

Security Manager provides many different ways for you to manage devices. The easiest methods involve Security Manager directly contacting the devices. Security Manager might access a device during inventory or policy discovery, during configuration deployment, or in response to actions you take in Security Manager that request device contact (such as testing connectivity).

Because you can use off-line methods to add devices to the Security Manager inventory or to deploy configuration changes to the devices, configuring device communication settings for Security Manager's use is optional. However, you typically need to configure basic device communication settings on the devices to implement your off-line or customized configuration deployment tools.

In Security Manager, you can configure which transport protocol to use as the default for a type of device, and change it for specific devices that are configured to respond to a different protocol. Security Manager is configured with default protocols that are the most commonly-used protocols for that type of device. To change the default device communication setting for a type of device, select **Tools > Security Manager Administration** and select **Device Communication** from the table of contents (for more information, see [Device Communication Page](#) , on page 530). To change the transport setting for a specific device, modify its device properties as described in [Viewing or Changing Device Properties](#) , on page 107.

Security Manager can use these transport protocols:

- **SSL (HTTPS)**—Secure Socket Layer, which is an HTTPS connection, is the only transport protocol used with PIX Firewalls, Adaptive Security Appliances (ASA), and Firewall Services Modules (FWSM). It is also the default protocol for IPS devices and for routers running Cisco IOS Software release 12.3 or later

If you use SSL as the transport protocol on Cisco IOS routers, you must also configure SSH on the routers. Security Manager uses SSH connections to handle interactive command deployments during SSL deployments.

Cisco Security Manager was using OpenSSL for the Transport Layer Security (TLS) and Secure Sockets Layer (SSL) protocols. Beginning with version 4.13, Cisco Security Manager replaced OpenSSL version 1.0.2 with Cisco SSL version 6.x. Cisco SSL enables FIPS compliance over full FIPS Validation which results in fast and cost-effective connectivity. The Common Criteria mode in Cisco SSL allows easier compliance. Cisco SSL is feature-forward when compared to OpenSSL. The product Security Baseline (PSB) requirements for CiscoSSL ensures important security aspects such as credential and key management, cryptography standards, antispoofing capabilities, integrity and tamper protection, and session, data, and stream management and administration are taken care of.

For information on configuring SSL, see [Setting Up SSL \(HTTPS\)](#), on page 57

- SSH—Secure Shell is the default transport protocol for Catalyst switches and Catalyst 6500/7600 devices. You can also use it with Cisco IOS routers.

For information on configuring SSH, see [Setting Up SSH](#), on page 60.

- Telnet—Telnet is the default protocol for routers running Cisco IOS software releases 12.1 and 12.2. You can also use it with Catalyst switches, Catalyst 6500/7600 devices, and routers running Cisco IOS Software release 12.3 and later. See the Cisco IOS software documentation for configuring Telnet.
- HTTP—You can use HTTP instead of HTTPS (SSL) with IPS devices. HTTP is not the default protocol for any device type.
- SQL Anywhere—Up to version 4.20, Security Manager used SQL Anywhere version 12.x as the database. Beginning with version 4.21, Security Manager uses Sybase SQL Anywhere version 17.0.10.5855.
- TMS—Token Management Server is treated like a transport protocol in Security Manager, but it is not a real transport protocol. Instead, by configuring TMS as the transport protocol of a router, you are telling Security Manager to deploy configurations to a TMS. From the TMS, you can download the configuration to an eToken, plug the eToken into the router's USB bus, and update the configuration. TMS is available only for certain routers running Cisco IOS Software 12.3 or later.

For information on deploying configurations to a TMS and downloading them to a router, see [Deploying Configurations to a Token Management Server](#), on page 421.

Security Manager can also use indirect methods to deploy configurations to devices, staging the configuration on a server that manages the deployment to the devices. These indirect methods also allow you to use dynamic IP addresses on your devices. The methods are not treated as transport protocols, but as adjuncts to the transport protocol for the device. You can use these indirect methods:

- AUS (Auto Update Server)—When you add a device to Security Manager, you can select the AUS server that is managing it. You can use AUS with PIX Firewalls and ASA devices.

For information on configuring a device to use an AUS server, see [Setting Up AUS or Configuration Engine](#), on page 64.

- Configuration Engine—When you add a router to Security Manager, you can select the Configuration Engine that is managing it.

For more information on configuring a router to use a Configuration Engine server, see [Setting Up AUS or Configuration Engine](#), on page 64.

For information on adding devices that use AUS or Configuration Engine servers to Security Manager, and how to add the servers, see these topics:

- [Adding Devices to the Device Inventory](#) , on page 75
- [Adding, Editing, or Deleting Auto Update Servers or Configuration Engines](#) , on page 103

## Setting Up SSL (HTTPS)

With many devices, you can use the Secure Socket Layer (SSL) protocol, also known as HTTPS, to communicate with the device. When you deploy configurations with this protocol, Security Manager encrypts the configuration file before sending it to the device.

The following topics describe how to set up SSL on the devices:

- [Setting Up SSL \(HTTPS\) on PIX Firewall, ASA and FWSM Devices](#) , on page 57
- [Setting Up SSL on Cisco IOS Routers](#) , on page 58

## Setting Up SSL (HTTPS) on PIX Firewall, ASA and FWSM Devices

---

**Note** From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functionality, it does not support any enhancements.

---

This procedure describes the tasks to complete before you use SSL as the transport protocol for device management on PIX Firewall, ASA and FWSM devices.

---

**Step 1** Enter configuration mode.

**Example:**

```
hostname# config terminal
```

Respond to the prompts appropriately. Here are some tips:

- Enter **y** when the prompt asks if you want to preconfigure using interactive prompts.
- Enter the current enable password.
- Specify the time zone, year, month, day, and time.
- If the device:
  - Is new—Specify the network interface IP address and network mask that applies to the inside IP address of the device.
  - Exists—Verify that the interface IP address and mask are correct.
- If the device:
  - Is new—Specify the hostname and the domain name.

- Exists—Verify that the hostname and domain name are correct.
- When prompted for the IP address of the host that runs the PIX Device Manager, specify the IP address of the Security Manager server.
- Enter **yes** when the prompt asks if you want to write the above changes to Flash.

**Step 2** If you are configuring an ASA, specify the SSL/TLS protocol version the ASA uses when acting as a server. Beginning with version 4.8, Security Manager supports all SSL/TLS protocol versions, the latest certified version being TLS 1.2.

**Example:**

```
hostname(config)# ssl server-version any
```

**Step 3** Enable the HTTP server.

**Example:**

```
hostname(config)# http server enable
```

**Step 4** Specify the host or network authorized to initiate an HTTP connection to the device.

**Example:**

```
hostname(config)# http
 ip_address
 [netmask
 ] [if_name
```

**Step 5** Save the current configuration in Flash memory.

**Example:**

```
hostname(config)# write memory
```

Where:

- *ip\_address* —The IP address of the Security Manager server
- *netmask* —The network mask for the IP address.
- *if\_name* —The device interface name (default is **inside**) from which Security Manager initiates the HTTP connection.

## Setting Up SSL on Cisco IOS Routers

**Note** From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches, PIX, FWSM and IPS it does not support any enhancements.

This procedure describes the tasks to complete before you use SSL as the transport protocol for device management on Cisco IOS routers.

**Step 1** Enter configuration mode.

**Example:**

```
hostname# config terminal
```

**Step 2** Configure the hostname and domain name if the device is new.

**Example:**

```
router(config)# hostname  
name
```

```
hostname(config)# ip domain-name  
your_domain
```

**Step 3** Configure level 15 privilege. SSL requires that you must have level 15 privileges to log in to a Cisco IOS router.

**Example:**

```
hostname(config)# username  
username  
privilege 15 password 0  
password
```

**Step 4** Enable either local authorization or AAA authorization:

- Local authorization— If you are using AAA for authorization but would like to use local authorization, use the following commands to disable AAA authorization and AAA authentication at login, where *list-name* is a character string used to name the list of authorization methods, and to enable local authorization using the username you just configured:

**Example:**

```
hostname(config)# no aaa authorization network  
list-name  
  
hostname(config)# no aaa authentication login  
list-name  
hostname(config)#ip http authentication local
```

If you do not enter the **ip http authentication local** command, the default enable password is used for authentication.

- AAA authorization—Use the following commands to enable AAA authentication and authorization. The last two commands are necessary only if multiple AAA lists are defined; *list-name* is a character string used to name the list of authorization methods. These commands authenticate the user that is contacting the device using the HTTPS protocol.

**Example:**

```
hostname(config)#ip http authentication aaa  
  
hostname(config)#ip http authentication aaa login-authentication  
list-name  
hostname(config)# ip http authentication aaa exec-authorization  
list-name
```

**Step 5** Enable the HTTPS server.

**Example:**

```
hostname(config)# ip http secure-server
```

**Step 6** Exit configuration mode and return to Exec mode.

**Example:**

```
hostname(config)# exit
```

**Step 7** Verify that SSL is set up on the device. The Device should respond with an “enabled” status.

**Example:**

```
hostname# show ip http server secure status
```

## Setting Up SSH

**Note** From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches features/functionality, it does not support any enhancements.

You can use the Secure Shell (SSH) protocol to communicate with Cisco IOS Routers, Catalyst switches, and Catalyst 6500/7600 devices. This protocol provides strong authentication and secure communications over insecure channels. Security Manager supports both SSH versions 1.5 and 2. Once connected to the device, Security Manager determines which version to use and communicates using that version.

The following topics describe how to set up SSH on the supported devices:

- [Critical Line-Ending Conventions for SSH](#) , on page 60
- [Testing Authentication](#) , on page 61
- [Setting Up SSH on Cisco IOS Routers, Catalyst Switches, and Catalyst 6500/7600 devices](#) , on page 61
- [Preventing Non-SSH Connections \(Optional\)](#) , on page 63

## Critical Line-Ending Conventions for SSH

The following line-ending conventions for SSH must be observed to avoid system failure:

- Do not end banner message lines with “#”, “# ”, “>”, or “> ”. If your system requires a pound sign or greater-than sign at the end of a banner message, ensure that it is followed by two spaces
- Do not use banner message lines that contain only “Username: ” or “Password: ”
- Do not customize the device user EXEC mode prompt to not end with “>” or “#”.

## Testing Authentication

Before you set up SSH, you must test authentication without SSH to make sure the device can be authenticated. You can authenticate with a local username and password or with an authentication, authorization, and accounting (AAA) server running TACACS+ or RADIUS.

This procedure describes how to test authentication without SSH using a local or AAA server username and password.

---

**Step 1** Enter configuration mode.

**Example:**

```
router# config terminal
```

**Step 2** Specify that the local username and password should be used in the absence of AAA statements. On Cisco IOS routers, you can use the **login local** command on VTY lines instead of the **aaa new-model** command.

**Example:**

```
hostname(config)#aaa new-model
```

**Step 3** (Optional) Configure a user account in the local database of the device.

**Example:**

```
hostname(config)# username  
  name  
  password 0  
  password
```

**Step 4** Exit configuration mode and return to Exec mode.

**Example:**

```
hostname(config)# exit
```

**Step 5** Save the configuration changes.

**Example:**

```
hostname(config)# write memory
```

---

## Setting Up SSH on Cisco IOS Routers, Catalyst Switches, and Catalyst 6500/7600 devices

---

**Note** From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches, PIX, FWSM and IPS it does not support any enhancements.

---

This procedure describes the tasks required to set up SSH on Cisco IOS routers, Catalyst switches, and Catalyst 6500/7600 devices.

---

**Tip** You must configure SSH on Cisco IOS routers because Security Manager uses SSH connections to handle interactive command deployments during SSL deployments.

---

#### Related Topics

- [Critical Line-Ending Conventions for SSH](#) , on page 60
- [Testing Authentication](#) , on page 61
- [Preventing Non-SSH Connections \(Optional\)](#) , on page 63

---

**Step 1** Enter configuration mode.

**Example:**

```
router# config terminal
```

**Step 2** Configure the hostname and domain name if the device is new.

**Example:**

```
router(config)# hostname  
name
```

```
hostname(config)# ip domain-name  
your_domain
```

**Step 3** Generate the RSA key pair for the SSH session. When the device prompts you to enter the size of the modulus, we recommend that you enter 1024.

**Example:**

```
hostname(config)# crypto key generate rsa
```

**Step 4** (Optional) Set the timeout interval in minutes and the number of retries.

**Example:**

```
hostname(config)# ip ssh timeout  
time  
hostname(config)# ip ssh authentication-retries  
n
```

**Step 5** Exit configuration mode and return to Exec mode.

**Example:**

```
hostname(config)# exit
```

**Step 6** Save the configuration changes.

**Example:**

```
hostname# write memory
```

---

## Preventing Non-SSH Connections (Optional)

**Note** From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches, PIX, FWSM and IPS it does not support any enhancements.

---

After configuring SSH, you can configure the Cisco IOS routers, Catalyst switches, and Catalyst 6500/7600 devices to use SSH connections only.

### Related Topics

- [Critical Line-Ending Conventions for SSH](#) , on page 60
  - [Testing Authentication](#) , on page 61
  - [Setting Up SSH on Cisco IOS Routers, Catalyst Switches, and Catalyst 6500/7600 devices](#) , on page 61
- 

**Step 1** Enter configuration mode.

**Example:**

```
router# config terminal
```

**Step 2** Set up the router for Telnet access, specifying the first and last line numbers that can be used (numbers range from 0 to 1180, and the last number must be greater than the first number).

**Example:**

```
hostname(config)# line vty  
first_line last_line
```

**Step 3** Prevent non-SSH connections, such as Telnet.

**Example:**

```
hostname(config-line)# transport input ssh
```

**Step 4** Exit configuration mode.

**Example:**

```
hostname(config-line)# end
```

**Step 5** Save the configuration changes.

**Example:**

```
hostname# write memory
```

## Setting Up AUS or Configuration Engine

With many devices, you can use an intermediate transport server to stage configuration updates to the device. These transport servers can also allow you to manage devices that use dynamically assigned IP address (using a DHCP server) instead of static IP addresses. When you deploy configurations using a transport server, Security Manager deploys the configuration to the server, and the device retrieves the configuration from the server. You can use Auto Update Server, running the AUS protocol, or Cisco Configuration Engine, running the CNS protocol.

The following topics describe how to set up AUS or CNS on the devices:

- [Setting Up AUS on PIX Firewall and ASA Devices](#), on page 64

## Setting Up AUS on PIX Firewall and ASA Devices

**Note** From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

You can configure PIX firewalls and ASA devices to use the AUS protocol to contact an Auto Update Server or CNS Configuration Engine for configuration and image updates. When using Configuration Engine, the device uses the same AUS protocol used for Auto Update Server, so the configuration is the same. For an end-to-end explanation of how AUS/CE deployment works, see [Deploying Configurations Using an Auto Update Server or CNS Configuration Engine](#), on page 420.

You need to initially configure AUS settings on the device so that the device knows that it must contact the AUS/CE server for configuration updates. After the initial deployment, you can change these settings using the **Platform > Device Admin > Server Access > AUS** policy.

This procedure describes the tasks to complete before you use AUS or CNS as the transport protocol for device management on PIX firewall and ASA devices.

**Step 1** Enter configuration mode.

**Example:**

```
router# config terminal
```

**Step 2** Connect to the AUS. Specify a username and its password that can log into Security Manager. The port number is typically 443.

**Example:**

```
hostname(config)# auto-update server https://
username:password@AUSserver_IP_address:port
/autoupdate/AutoUpdateServlet
```

**Step 3** Specify the polling period for AUS.

**Example:**

```
hostname(config)# auto-update poll-period
  poll-period
  [retry-count
  ] [retry-period
  ]
```

Where:

- *poll-period* —The polling period interval between two updates. Default is 720 minutes (12 hours).
- *retry-count* —(Optional) The number of times to retry if the server connection attempt fails. Default is 0.

**Step 4** Configure the device to use the specified unique device ID to identify itself.

**Example:**

```
hostname(config)# auto-update device-id
  [ hardware-serial | hostname |
ipaddress
  [ if_name
  ] | mac-address
  [ if_name
  ] | string
  text
  ]
```

Where:

- *if\_name* —The device interface name (the default is **inside**).
- *text* —A unique string name.

**Step 5** Save the configuration changes.

**Example:**

```
hostname# write memory
```

---

## Configuring Licenses on Cisco ASA Devices

Devices that run Cisco ASA Software require Product Activation Keys for each feature license. Some licenses are optional, such as Botnet Traffic Filtering, and can be time-based. Other features are standard on some models, but optional on others, such as the Failover license, which is optional on the 5505 and 5510 models but standard on all other models.

You cannot install or activate ASA licenses through Security Manager. For configuring license on ASA, you must either configure it from ASA or ASDM and then add it to the Security Manager. For more details, see the licensing section in [Cisco ASA Series General Operations CLI Configuration Guide](#) or the [Cisco ASA Series General Operations ASDM Configuration Guide](#).

When you deploy configurations from Security Manager, the device must have active licenses for all features in the configuration or you will see deployment errors. In most cases, Security Manager does not prevent you

from configuring a feature based on the licenses that are active on a device. For example, you can configure Botnet Traffic Filtering for a device even if that device has a disabled Botnet license.

The exception is the Failover license on the 5505 and 5510 models. There is a device property that you can set to indicate whether there is an active Failover license on a device: License Supports Failover. You can set this property by double-clicking the device (in Device view) to open the Device Properties page; the option is on the General tab (see [Device Properties: General Page](#), on page 108). If you discover policies on the device, for example, when adding the device to the inventory using the Add Device From Network or Add Device from File (from an inventory file, not a configuration file) options, Security Manager determines the state of the Failover license and sets the property appropriately. You are responsible for ensuring that the property remains accurate. You will see deployment failures if the property is selected but the device has an inactive Failover license.

---

**Tip** If you add the device using the New Device or Configuration File options, you can set the License Supports Failover property while adding the device instead of waiting to set it in the device properties.

---

## Configuring Licenses on Cisco IOS Devices

Devices that run Cisco IOS Software require license files for various features, including security features. If these licenses are not installed on the device (such as the securityk9 package), Security Manager cannot configure commands that require a particular license level, and you will experience deployment failures when you try to deploy your policies to an unlicensed device.

Although you can use Security Manager to deploy and manage IPS licenses, you cannot use it to deploy and manage any other type of license. Configure these licenses directly on the device using the command line interface or use Cisco License Manager. Following is the general process for configuring licenses. For more information about configuring licenses, see Cisco IOS Software Activation Command Guide and Cisco IOS Software Activation Command Reference on Cisco.com.

1. obtain the licenses required for the features you want to use or you can use the evaluation licenses that come bundled with some devices. Use the **show license all** command to view the available licenses
2. Copy the purchased licenses to the flash storage on the device or put them on a TFTP server. For example, you could place the licenses on a TFTP server and use the **copy tftp flash0:** command to copy the files to the flash0 storage area
3. Use the **license install** command to install each purchased license. For example:

```
license install flash0:uc-base-CISCO2951-FHH1216P06Z.xml
```

Some licenses prompt you to read and accept a license agreement.

If you want to use an evaluation license, use the **license boot** command to enable them and then reload the device. You must accept the end-user license agreement before Security Manager can deploy configurations to the device.

- You can use the **show version**, **show license feature**, and **show license all** commands to check on your installed licenses

# Initializing IPS Devices

---

**Note** From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements.

---

To initialize an IPS device, you must configure the following settings. These are network settings, and only a user with administrator privileges on the IPS device can configure them:

- Sensor name
- IP address
- Netmask
- Default route
- Enable TLS/SSL (to enable TLS/SSL in the web server on the device)
- Web server port
- Use default ports

You configure these settings through the **setup** command in Intrusion Prevention System Device Manager (IDM) or in a command-line session, depending upon which platform is used by your IPS device. For a list of supported IPS platforms, see the supported devices and software versions information at the following URL: [http://www.cisco.com/en/US/products/ps6498/products\\_device\\_support\\_tables\\_list.html](http://www.cisco.com/en/US/products/ps6498/products_device_support_tables_list.html)

For detailed information on these settings, refer to the technical documentation for your IPS device.

---

**Note** For information on preparing an IOS IPS device for use, see [Initial Preparation of a Cisco IOS IPS Router](#), on page 1793.

---

## CHAPTER 3

# Managing the Device Inventory

---

The following topics describe how to manage the device inventory:

- [Understanding the Device Inventory](#) , on page 69
- [Adding Devices to the Device Inventory](#) , on page 75
- [Working with the Device Inventory](#) , on page 102
- [Working with Device Groups](#) , on page 129
- [Working with Device Status View](#) , on page 134

## Understanding the Device Inventory

Security Manager maintains an inventory of the devices that it manages. The inventory includes the information required to locate and log into the device, so that your policies can be deployed to the devices. The following topics describe some general concepts related to the device inventory:

- [Understanding the Device View](#) , on page 69
- [Understanding Device Names and What Is Considered a Device](#) , on page 71
- [Understanding Device Credentials](#) , on page 73
- [Understanding Device Properties](#) , on page 74

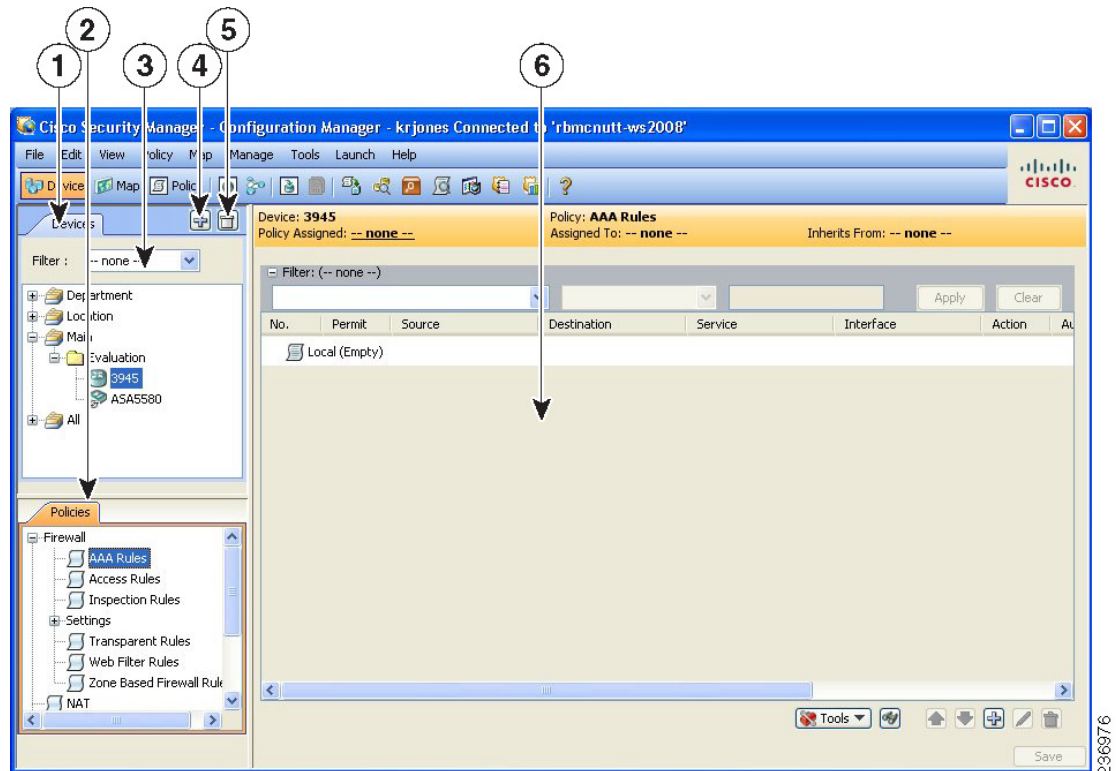

## Understanding the Device View

The Device View button opens the Devices page, from which you can add and delete devices from the Security Manager inventory and manage device policies, properties, and interfaces centrally.

This is a device-centric view in which you can see all devices that you are managing and you can select specific devices to view their properties and define their settings and policies. You can define security policies locally on specific devices. You can then share those policies to make them globally available to be assigned to other devices.

The Devices page contains two panes. The left pane contains two elements: the Device selector, located in the top left pane, and the Policy selector, located in the bottom left pane. The right pane is the main content area. The following illustration shows the Devices page.

Figure 4: Devices Page

**Device selector (1, 3, 4, 5)**—Contains the following:

- Add and Delete buttons (4, 5)—Enables you to add and delete devices from the Security Manager inventory.
- Filter field (3)—Enables you to display a subset of devices based on the filtering criteria you define. For details, see [Filtering Items in Selectors](#), on page 47.
- Device tree—Lists the device groups and devices that exist in the system. Each device type is represented by an icon. For information about the icons, see [Figure 5: Device Icons](#).

If you hover the mouse pointer over a device, detailed information about the device appears in a popup window. The information is a summary of the device properties (see [Device Properties: General Page](#), on page 108).

**Note** Beginning from version 4.8, Security Manager displays the updated version information of a device that has been upgraded using Auto Update Server (AUS). To enable this feature you must configure Security Manager details in the AUS user interface. If you hover the mouse over a device, the following message appears if AUS has successfully updated the device version:

"State Description: Version update is successfully completed by Auto Update Server. Check if any other configuration changes are required in Security Manager."

Figure 5: Device Icons

1	Adaptive Security Appliances (ASA)	5	Catalyst Switch
2	PIX Firewall	6	Catalyst 7600 Series Router
3	Catalyst security Services Modules: Firewall Services Module (FWSM) and ASA-SM	7	VPN 3000 Concentrator
4	Cisco IOS Router	8	Intrusion Prevention System (IPS)

- Shortcut menu options—When you right-click a device or device group, you get a menu of commands related to that device or group. These commands are shortcuts to commands available in the regular menus.

**Policy selector (2)**—Contains the following:

- Policy groups—Lists the policy groups that are supported on the selected device type. The policy groups that are displayed are dependent on four factors:
  - The type of device selected in the Device selector.
  - The operating system running on the device.
  - The target operating system version selected for determining which commands will be available for generated configurations.
  - Whether the device contains supported service modules.

For more information about policies, see [Understanding Policies](#), on page 165

- Shortcut menu options—When you right-click a policy, you get a menu of commands related to that policy. These commands are shortcuts to commands available in the regular menus.

**Contents pane (6)**—The main content area.

The information displayed in this area depends on the device you select from the Device selector and the option you select from the Policy selector.

## Understanding Device Names and What Is Considered a Device

Besides managing traditional devices, you can use Security Manager to manage virtual devices that you can define on some types of security devices. These virtual devices are treated as separate devices in the device

inventory, and they appear as separate entries in the device selectors. Because these virtual devices actually reside on a host physical device, many actions, such as deployment, will have to include the host device as well as the virtual device.

All physical devices appear in the device selectors. In addition, these are the types of virtual devices that appear in the device selectors:

- **Security Contexts**—You can define security contexts on PIX Firewall, FWSM, and ASA devices. Security contexts act as virtual firewalls. By default, security contexts appear in the device selectors using this naming convention: *host-display-name\_context-name*, where *host-display-name* is the display name of the device on which the context is defined, and *context-name* is the name of the security context. For example, the admin security context on the device named firewall12 would be called firewall12\_admin.

---

**Tip** You can control whether the display name is added to the context name using the **Prepend Device Name when Generating Security Context Names** property on the Discovery settings page (see [Discovery Page](#), on page 534). However, if you do not add the display name, it is very difficult to determine the hosting device for a context, and the context names are not sorted with the host device (they do not appear in a folder attached to the host device). If you do not add the display name, Security Manager adds a numeric suffix to the context name if more than one context of the same name is added to the inventory (for example, admin\_01, admin\_02), and these numbers are not related to the host device.

- 
- **Virtual Sensors**—You can define virtual sensors on IPS devices. Virtual sensors appear in device selectors using the *host-display-name\_virtual-sensor-name* naming convention, and there is not a discovery setting to control this convention.

---

**Tip** You can always change the display name for a virtual sensor, security context, or other type of device in the device's properties.

---

Besides the naming conventions for virtual devices, you also need to understand the relationship between various types of device names:

- **Display name**—The display name is simply the name that appears within Security Manager in device selectors. This name does not have to be related to any name actually defined on the device. When you add devices to the inventory, a display name is suggested based on the DNS name or IP address you enter, but you can use whatever naming convention you want to use.
- **DNS name**—The DNS name you define for a device must be resolvable by the DNS server configured for the Security Manager server.
- **IP address**—The IP address you define for a device should be the management IP address for the device.
- **Hostname**—When you discover a device, the hostname property that is shown in the device properties is taken from the device's configuration. If you add devices using configuration files, and a file does not contain a hostname command, the initial hostname is the name of the configuration file.

However, the hostname device property is not updated if you change the hostname on the device. There is a Hostname policy in the device platform policy area, and it is this Hostname policy that determines the hostname that is defined on the device.

## Understanding Device Credentials

Security Manager requires credentials for logging in to devices. You can provide device credentials in two ways:

- When you add a device manually or from network discovery. For more information, see these topics:
  - [Adding Devices from the Network](#) , on page 80
  - [Adding Devices by Manual Definition](#) , on page 92
- By editing the device properties. For more information, see [Viewing or Changing Device Properties](#) , on page 107.

You can provide the following device credentials:

- **Primary Credentials**—The username and password for logging into the device using SSH or Telnet. This information is required for device communication.
- **HTTP Credentials**—Some devices allow HTTP or HTTPS connections, and some devices (such as IPS devices) require it. By default, Security Manager uses the primary credentials for HTTP/HTTPS access, but you can configure unique HTTP/HTTPS credentials.
- **RX-Boot Mode**—(Optional) Some Cisco routers are designed to run from flash memory where they boot only from the first file in flash. This means that you must run an image other than the one in flash to upgrade the flash image. That image is a reduced command-set image referred to as RX-Boot (a ROM-based image).
- **SNMP Credentials**—(Optional) The Simple Network Management Protocol (SNMP) facilitates the exchange of management information between network devices. SNMP enables network administrators to manage network performance, find and solve network problems, and plan for network growth.

---

**Note** PIX/ASA/FWSM devices require that user names be at least four characters. Passwords can be three to 32 characters; we recommend that passwords be at least eight characters. For ASA devices running the software version 9.6(1) or later, you can enter a password up to 127 characters.

---

Rather than using device-based credentials, you can configure Security Manager to use the credentials you use when you log into Security Manager. You can then use the AAA server's accounting facilities to track configuration changes by user. Using user login credentials is suitable only if your environment is configured according to these standards:

- You use TACACS+ or RADIUS for change auditing. User-login credentials will be reflected in these accounting records. If you use device credentials, all changes made through Security Manager will come from the same account, regardless of which user made the change.
- User accounts are configured in the AAA server, and they have appropriate device-level access to perform configuration changes.
- You configure Security Manager and the managed devices to use the AAA server for authorization. For information on configuring Security Manager to use AAA, see the [Installation Guide for Cisco Security Manager](#) .
- You do not use one-time passwords.

If your network setup supports using user-login credentials, you can configure Security Manager to use them by selecting **Tools > Security Manager Administration**. Select **Device Communication** from the table of contents, and select **Security Manager User Login Credentials** in the **Connect to Device Using** field. The default is to use device credentials for all device access.

### Related Topics

- [Device Credentials Page](#) , on page 112
- [Adding Devices to the Device Inventory](#) , on page 75
- [Device Communication Page](#) , on page 530

## Understanding Device Properties

You define device properties when you add devices to Security Manager. Device properties are general information about the device, credentials, the group the device is assigned to, and policy overrides. You must provide some device property information, such as device identity and primary credentials, when you add the device, but you can add or edit the properties from the Device Properties dialog box.

To view the device properties, do one of the following in the Device selector:

- Double-click a device.
- Right-click a device and select **Device Properties**.
- Select a device and select **Tools > Device Properties**.

The Device Properties dialog box has two panes. The left pane contains a table of contents with these items:

- **General**—Contains general information about the device, such as device identity, the operating system running on the device, and device communication settings.
- **Credentials**—Contains device primary credentials (username, password, and enable password), SNMP credentials, Rx-Boot Mode credentials, and HTTP credentials.
- **Device Groups**—Contains the groups to which the device is assigned.
- **Cluster Information**—Contains detailed informatio for the cluster group, if any.
- **License Information**—Contains license status, license expiry date, and license fetch date information of the FPR-3100 series devices.

---

**Note** License information panel is visible only for FPR-3100 series devices in CSM 4.24.

---

- **Policy Object Overrides**—Contains global settings of certain types of reusable policy objects that you can override for this device.

When you select an item in the table of contents, the corresponding information is displayed in the right pane.

### Notes

- Security Manager does not assume that the DNS hostname that appears on the Device Properties page is the same as the hostname that you configured on the device.
- When you add a device to Security Manager, you must enter either the management IP address or the DNS hostname. Because it is not possible to determine the management interface and, therefore, the management IP address when you discover from a configuration file, the hostname in the configuration file is used as the DNS hostname. If the hostname is missing in the CLI of the configuration file, the configuration filename is used as the DNS hostname.
- When you discover a device from the network, the DNS hostname in the Device Properties page is not updated with the hostname configured on the device. Therefore, if you want to specify the DNS hostname for the device, you must specify it manually when you add the device to Security Manager or on the Device Properties page.

For more information about device properties, see [Viewing or Changing Device Properties](#), on page 107.

## Adding Devices to the Device Inventory

When you add a device to Security Manager, you specify the identifying information for the device, such as its DNS name and IP address. This information is added during device discovery. You can also bring in existing network configurations associated with a device by initiating policy discovery. For complete information on policy discovery, see [Discovering Policies](#), on page 176. Once you add the device, it appears in the Security Manager device inventory.

The New Device wizard guides you through the process of adding devices to the inventory. You can add devices from many different sources, and the path through the wizard differs significantly based on the method you are using.

---

**Note** Beginning with Cisco Security Manager 4.21, although ASA software enhancements and bug fixes are still supported, any hardware support for routers is not rendered, as Cisco IOS Software has reached its end of life.

---

To start the New Device wizard, from Device view, select **File > New Device**, or click the **Add** button in the device selector.

---

**Note** There is also another way to add devices. If you exported a .dev file from another Security Manager server, which contains not only a device inventory but also the policies and policy objects assigned to them, you can import the file using the **File > Import** command. For more information, see [Importing Policies or Devices](#), on page 489.

---

### Tips on Adding Devices and Service Modules

- For PIX Firewalls and FWSM and ASA devices that are configured for failover, add only the active unit to Security Manager. Ensure that the device is configured with a management IP address and use that address for discovery. When discovering Catalyst switches that contain more than one service module (FWSM or ASA-SM) configured for failover, when prompted, select **Do Not Discover Module** for the

failover modules. Security Manager always manages the active admin context, regardless of whether you added the primary or secondary failover service module.

- Security Manager can manage ASA clusters after they have been configured as a cluster using the CLI bootstrapping as defined in the ASA Configuration Guide (see [http://www.cisco.com/en/US/products/ps6120/products\\_installation\\_and\\_configuration\\_guides\\_list.html](http://www.cisco.com/en/US/products/ps6120/products_installation_and_configuration_guides_list.html)). All the members of a cluster are assigned individual IP addresses during the bootstrap process. When adding a cluster to Security Manager, you do so by discovering the cluster using the main cluster IP address. The main cluster IP address is a fixed address for the cluster that always belongs to the current control unit. This is not the control unit's individual IP Address. For more information about clusters, see [Working with Device Clusters](#), on page 77.
- Service modules are treated as separate devices. For most modules, you must add the service module separately from its host device. However, Security Manager can automatically discover FWSM or IDSM modules in a Catalyst 6500 device, so you need only add the parent device. (You cannot discover an ASA-SM during discovery of the parent device. You must add the ASA-SM separately.) The only exception is if you configure an FWSM or IDSM module to use a non-default port for HTTPS (SSL), in which case you must add the module separately.
- When adding an ASA-SM or FWSM that has multiple security contexts (they are running in multiple-context mode), do not add the security contexts individually using their management IP addresses. Instead, add the device using the admin context management address (this also adds the individual contexts). Then, configure Security Manager to deploy configurations to multiple-context devices serially as described in [Changing How Security Manager Deploys Configurations to Multiple-Context FWSM](#), on page 472.
- You cannot add devices beyond the device limits defined by your Security Manager license. For example, if you have a license for 50 devices, and there are 45 devices in the inventory, if you try to add a multiple-context ASA with 6 security contents, the device addition and discovery fails.

The following topics describe the various methods of adding devices:

- **Add Device from Network**—To add devices that are currently active on the network, see [Adding Devices from the Network](#), on page 80. Security Manager connects directly and securely to the device and discovers its identifying information and properties.
  - **Pros**—You need to specify minimal information about a device, and Security Manager obtains the detailed information directly from the device, ensuring accuracy.
  - **Cons**—You can add only one device at a time. You cannot add devices that have dynamic IP addresses, unless you determine the device's current IP address, add it using that address, and then update the device properties in Security Manager to identify the Configuration Engine that is managing the device.
- **Add from Configuration File**—To add devices by using a copy of the device configuration files, see [Adding Devices from Configuration Files](#), on page 89.
  - **Pros**—You can add more than one device at a time.
  - **Cons**—You cannot use this method to add Catalyst 6500/7600 or IPS devices. When adding groups of configuration files, all files must be for the same device type.

Also, you cannot successfully discover policies that require a connection with the device. For example, if a policy points to a file that resides on the device, adding the device using the configuration file will result in

a Security Manager configuration that includes the **no** form of the command, because Security Manager cannot retrieve the referenced file from the device. For example, the **svc image** command for web VPNs might be negated.

- **Add New Device**—To add a device that does not yet exist in the network, so that you can pre-provision it in Security Manager, see [Adding Devices by Manual Definition](#), on page 92. You can create the device in the system, assign policies to the device, and generate configuration files before installing the device hardware.
  - **Pros**—You can pre-provision devices that do not yet exist in the network.
  - **Cons**—You must specify more information than that required by any other method. If you create a Catalyst 6500 device, or a router that contains an IPS module, you should discover its modules by selecting **Policy > Discover Policies on Device**.
- **Add Device from File**—To add devices from an inventory file in comma-separated values (CSV) format, see [Adding Devices from an Inventory File](#), on page 97.
  - **Pros**—You can add multiple devices of different types at one time. You can reuse the inventory list from your other network management applications, including CiscoWorks Common Services, Cisco Security Monitoring, Analysis and Response System (CS-MARS), and other Security Manager servers. If you use a file exported from another Security Manager server, you can optionally add the devices without discovering policies, which is convenient for adding offline or standby devices.
  - **Cons**—You cannot use this method to update the properties of devices already defined in the inventory. Also, policy discovery can fail if you attempt to import more than 100 devices at one time, and might fail for even fewer devices. In the case of IPS devices, do not add more than four IPS devices at a time to avoid policy discovery failures.

## Working with Device Clusters

Clustering lets you group multiple devices together as a single logical device. A cluster provides all the convenience of a single device (management, integration into a network) while achieving the increased throughput and redundancy of multiple devices. Clustering is supported on ASA 5580 and 5585 devices running 9.0(1) or later and on ASA 5512-X, 5515-X, 5525-X, 5545-X and 5555-X devices running 9.1(4) or later.

---

**Note** From CSM 4.27, you can discover and deploy Secure Firewall 4200 series device cluster running with ASA 9.20(1).

---

Security Manager can manage ASA clusters after they have been configured as a cluster using the CLI bootstrapping as defined in the ASA Configuration Guide (see [http://www.cisco.com/en/US/products/ps6120/products\\_installation\\_and\\_configuration\\_guides\\_list.html](http://www.cisco.com/en/US/products/ps6120/products_installation_and_configuration_guides_list.html)).

All the members of a cluster are assigned individual IP addresses during the bootstrap process. When adding a cluster to Security Manager, you do so by discovering the cluster using the main cluster IP address. The main cluster IP address is a fixed address for the cluster that always belongs to the current control unit. This is not the control unit's individual IP Address.

---

**Note** You cannot convert a standalone device to a cluster in Security Manager by rediscovering the device after performing the necessary CLI bootstrapping. You must first delete the device from Security Manager, and then after performing the necessary CLI bootstrapping, you can add the cluster to Security Manager as a new device.

---

The cluster is represented as a single device in Security Manager. After the cluster has been added to Security Manager, you can finish configuring the cluster settings such as cluster interfaces and security policies.

---

**Note** Clustering has specific configuration requirements and restrictions. Please refer to the ASA documentation at [http://www.cisco.com/en/US/products/ps6120/products\\_installation\\_and\\_configuration\\_guides\\_list.html](http://www.cisco.com/en/US/products/ps6120/products_installation_and_configuration_guides_list.html) for detailed information about requirements, configuration recommendations, and performance information.

---

### Unsupported Features on ASA Clusters

These features cannot be configured with clustering enabled, and the commands will be rejected.

- Unified Communications
- Remote access VPN (SSL VPN and IPsec VPN)
- The following application inspections:
  - CTIQBE
  - GTP
  - H323, H225, and RAS
  - IPsec passthrough
  - MGCP
  - MMP
  - RTSP
  - SIP
  - SCCP (Skinny)
  - WAAS
  - WCCP
- Botnet Traffic Filter
- Auto Update Server
- DHCP client, server, relay, and proxy
- VPN load balancing
- Failover

- ASA CX module

### Centralized Features

The following features are only supported on the control unit, and are not scaled for the cluster. For example, you have a cluster of eight units (5585-X with SSP-60). The Other VPN license allows a maximum of 10,000 IPsec tunnels for one ASA 5585-X with SSP-60. For the entire cluster of eight units, you can only use 10,000 tunnels; the feature does not scale.

---

**Note** Traffic for centralized features is forwarded from member units to the control unit over the cluster control link; see "[Sizing the Cluster Control Link](#)" in the ASA documentation to ensure adequate bandwidth for the cluster control link. If you use the rebalancing feature, traffic for centralized features may be rebalanced to non-control units before the traffic is classified as a centralized feature; if this occurs, the traffic is then sent back to the control unit. For centralized features, if the control unit fails, all connections are dropped, and you have to re-establish the connections on the new control unit.

---

- Site-to-site VPN
- The following application inspections:
  - DCERPC
  - NetBios
  - PPTP
  - RADIUS
  - RSH
  - SUNRPC
  - TFTP
  - XDMCP
- Dynamic routing (spanned EtherChannel mode only)
- Multicast routing (individual interface mode only)
- Static route monitoring
- IGMP multicast control plane protocol processing (data plane forwarding is distributed across the cluster)
- PIM multicast control plane protocol processing (data plane forwarding is distributed across the cluster)
- Authentication and Authorization for network access. Accounting is decentralized.
- Filtering Services

### Features Applied to Individual Units

These features are applied to each ASA unit, instead of the cluster as a whole.

- QoS—The QoS policy is synced across the cluster as part of configuration replication. However, the policy is enforced on each unit independently. For example, if you configure policing on output, then the conform rate and conform burst values are enforced on traffic exiting a particular ASA. In a cluster with 8 units and with traffic evenly distributed, the conform rate actually becomes 8 times the rate for the cluster.
- Threat detection—Threat detection works on each unit independently; for example, the top statistics is unit-specific. Port scanning detection, for example, does not work because scanning traffic will be load-balanced between all units, and one unit will not see all traffic.
- Resource management—Resource management in multiple context mode is enforced separately on each unit based on local usage.
- IPS module—There is no configuration sync or state sharing between IPS modules. Some IPS signatures require IPS to keep the state across multiple connections. For example, the port scanning signature is used when the IPS module detects that someone is opening many connections to one server but with different ports. In clustering, those connections will be balanced between multiple ASA devices, each of which has its own IPS module. Because these IPS modules do not share state information, the cluster may not be able to detect port scanning as a result.

- [Group Information Page](#) , on page 118

## Adding Devices from the Network

One of the easiest and most reliable ways to add devices to the inventory is to identify devices that are active in the network. By providing the IP address (or DNS hostname) of a device, and the credentials required to log into it, Security Manager can obtain much of the information it needs directly from the device, ensuring the accuracy of the information.

#### Before You Begin

Before beginning this procedure, ensure the following preparations have been made:

- Prepare the devices to be managed by Security Manager. For more information, see [Preparing Devices for Management](#), on page 55.
- If you are using ACS for authentication, define the devices in ACS. See the [Installation Guide for Cisco Security Manager](#) .

#### Related Topics

- [Understanding the Device View](#) , on page 69
- [Working with Device Groups](#) , on page 129
- [Viewing or Changing Device Properties](#) , on page 107

- 
- Step 1** In Device view, select **File > New Device** or click the **New Device** button in the Device selector. The New Device wizard opens to the Choose Method page.
- Step 2** On the Choose Method page, select **Add Device from Network** and click **Next** to open the Device Information page.

- Step 3** On the Device information page, at minimum fill in the following fields. For a detailed explanation of all fields, see [Device Information Page – Add Device from Network](#) , on page 82.
- Enter either a hostname and DNS name, or an IP address (or both).
  - Enter a display name, which is the name that will appear in the Security Manager Device selector.
  - Select the correct operating system and version. If you are configuring a Catalyst switch or a 7600 router, ensure that you select **IOS - Catalyst Switch/7600** rather than one of the other IOS entries.
  - Select the transport protocol that should be used to log into the device, if the device is configured to use a protocol that differs from the default defined in Security Manager. The default is set on the Device Communication administration page (see [Device Communication Page](#) , on page 530).

Click **Next**.

- Step 4** On the Device Credentials page, enter the usernames and passwords required to log into the device. Enter at least the primary device credentials, which are the traditional User EXEC mode and Privileged EXEC mode passwords.

For information on the different types of credentials, see [Device Credentials Page](#) , on page 112.

**Tip** When you click Next or Finished from the Device Credentials page, Security Manager tests whether it can connect to the device. You cannot add the device unless the test succeeds. For more information, see [Testing Device Connectivity](#) , on page 455.

- Step 5** (Optional) Click **Next** to open the Device Grouping page, and select the device group to which the imported devices should be added (see [Device Groups Page](#) , on page 117).

- Step 6** Click **Finish**. Security Manager opens the Discovery Status dialog box where you can view the status of the device discovery and policy analysis (see [Discovery Status Dialog Box](#) , on page 187).

**Tip** If you are discovering policies while adding a device, carefully read any messages that are presented to you. These messages can contain important recommendations on the next steps you should take. We recommend that you immediately deploy the discovered configuration to a file so that Security Manager can take over ownership of the configuration. For more information about deployment methods, see [Understanding Deployment Methods](#) , on page 387.

- Step 7** If you are adding a device that contains modules, and Security Manager supports discovering modules for that type of device, you are notified when the discovery of the device chassis is complete and you are asked if you want to discover the device's modules. When you click **Yes**, you are prompted for this information:

- Catalyst 6500 service modules—The Service Module Credentials dialog box opens prompting for the following information, based on the modules contained in the chassis. For more information, see [Service Module Credentials Dialog Box](#) , on page 86.
  - FWSM—The management IP address (recommended), the username and passwords, and the type of discovery you want to perform. If the FWSM is the second device in a failover pair, select **Do Not Discover Module** for the failover module. (Security Manager always manages the active admin context, regardless of whether you added the primary or secondary failover service module.)
  - IDSM—The username and password and the type of discovery you want to perform.
  - ASA-SM—Discovering ASA service modules in a Catalyst 6500 through the chassis is not supported. You must directly add the ASA-SM using the management IP address of the ASA-SM.

**Note** Beginning with Cisco Security Manager 4.21, although ASA software enhancements and bug fixes are still supported, any hardware support for routers is not rendered, as Cisco IOS Software has reached its end of life.

- **IPS Router Module**—The type of discovery you want to perform, the management IP address, the username and password, and other SSL connection information. For more information, see [IPS Module Discovery Dialog Box](#) , on page 87.

You can skip discovery for any module you do not want to manage in Security Manager.

Click **OK**. You are returned to the Discovery Status dialog box, where you can view the progress of service module discovery. When finished, close the window and the device is added to the inventory list. A message will explain if you need to submit the activity for all devices to appear in the list (for example, individual security contexts defined on an ASA device).

- Step 8** If you added a device that is managed by an Auto Update Server or Configuration engine, with the device selected in the device selector, select **Tools > Device Properties**. Select the server used with the device in the Auto Update or Configuration Engine settings. You can add the server if it is not listed. For more information, see [Adding, Editing, or Deleting Auto Update Servers or Configuration Engines](#) , on page 103.

---

## Device Information Page – Add Device from Network

Use the New Device wizard's Device Information page for adding devices from the network to specify the device's identifying information.

---

**Note** From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software.

---

### Navigation Path

To start the New Device wizard, from Device view, select **File > New Device**, or click the **Add** button in the device selector.

## Field Reference

**Table 15: New Device Wizard, Device Information Page When Adding Devices from the Network**

Element	Description
Identity	
IP Type	<p>Whether the IP address for the device is static (defined on the device) or dynamic (supplied by a DHCP server). Depending on the IP type you select, the displayed fields differ.</p> <p>You can add only devices that have static IP addresses.</p> <p>If you want to add a device that uses dynamic addresses (supplied by a DHCP server), determine the current IP address for the device, use that address, and after adding the device, update its properties to change the IP Type to Dynamic and to identify the AUS or Configuration Engine that is managing the device.</p> <p><b>Note</b> Beginning with version 4.12, Security Manager server to device communication for ASA devices is supported over either IPv6 address or over IPv4 address. The IPv6 address is a 128-bit unique address. For IPv6 address, only Static IP Type is supported. Dynamic IP Type is not supported for IPv6 addresses.</p>
Hostname	<p>The DNS hostname for the device. Enter the DNS hostname if the IP address is not known.</p> <p><b>Note</b> You must enter either the DNS hostname or the IP address, or both.</p>
Domain Name	The DNS domain name for the device.
IP Address	<p>The management IP address of the device. The IP address must be in the dotted quad format, for example, 10.64.3.8.</p> <p><b>Note</b> You must enter either the IP address or the DNS hostname, or both.</p> <p><b>Note</b> Beginning with version 4.12, Security Manager server to device communication for ASA devices is supported over either IPv6 address or over IPv4 address. If a device is configured in dual stack, Security Manager would communicate with the device based on the device's IP address added in Security Manager. The IPv6 address is a 128-bit unique address.</p>
Display Name	<p>The name to display in the Security Manager Device selector. If you enter a hostname or IP address, it is entered automatically in this field, but you can change it.</p> <p>The maximum length is 70 characters. Valid characters are: 0-9; uppercase A-Z; lowercase a-z; and the following characters: _ - . : and space.</p> <p><b>Note</b> Two devices cannot have the same display name.</p>

Element	Description
OS Type	<p>The family of the operating system running on the device. You must be careful to select the correct type, because your selection affects how Security Manager tries to log into the device and obtain its configuration. The options are:</p> <ul style="list-style-type: none"> <li>• <b>IOS 12.3+</b>—For Cisco routers running Cisco IOS Software Release 12.3 or higher. Do not select this for Catalyst 6500/7600 or other Catalyst devices.</li> </ul> <p><b>Tip</b> Select this option for Aggregation Services Routers (ASR) even if they are running a version of 12.2. The ASR IOS releases are treated as higher releases.</p> <ul style="list-style-type: none"> <li>• <b>IOS - Catalyst Switch/7600</b>—For all Catalyst switches and 7600 devices.</li> <li>• <b>ASA</b>—For all ASA devices.</li> <li>• <b>FWSM</b>—For all FWSM devices.</li> <li>• <b>IPS</b>—For all devices running the IPS software.</li> <li>• <b>PIX</b>—For all PIX devices.</li> </ul> <p><b>Note</b> Beginning with version 4.12, Security Manager server to device communication for ASA devices is supported over either IPv6 address or over IPv4 address. This feature is available only for devices where the Operating System type is ASA or FWSM.</p>
Transport Protocol	<p>The protocol Security Manager should use when connecting to the device. Select a protocol that is configured on the device and for which you can supply credentials. Each device type has a default protocol that is the method normally used with the device.</p>
System Context	<p>Whether to discover the system execution space of a PIX Firewall 7, ASA, or FWSM device that is running in multiple-context mode. If you are discovering a device that hosts multiple security contexts, whether you select this checkbox has important implications in how you can configure the device in Security Manager. What gets discovered on the device also depends on whether you select the <b>Discover Policies for Security Contexts</b> checkbox.</p> <ul style="list-style-type: none"> <li>• Both <b>System Context</b> and <b>Discover Policies for Security Contexts</b> selected—This is the recommended selection. Security Manager discovers the system execution space and all of the security contexts defined on the device, and lists them in the device selector. The base display name represents the system execution space (for example, 10.10.11.24), whereas the security contexts are represented by nodes with the context name appended to the device name (for example, 10.10.11.24_admin), unless you changed the default naming convention configured on the Discovery page (see <a href="#">Discovery Page</a>, on page 534).</li> <li>• <b>System Context</b> selected, <b>Discover Policies for Security Contexts</b> deselected—The system execution space is discovered and added to the device selector. You can then discover the policies for the security contexts at a later time. This method might be appropriate if you have one group of people who discover inventory and another group that discovers policies.</li> <li>• Neither checkbox selected—Only the Admin context gets discovered and added to the device selector. You cannot discover the other security contexts or manage them.</li> </ul>

Element	Description
Discover Device Settings	
Discover	<p>The type of elements that should be discovered and added to the inventory. You have these options:</p> <ul style="list-style-type: none"> <li>• Policies and Inventory—Discover policies, interfaces, and service modules (if applicable). This is the default and recommended option.</li> </ul> <p>When policy discovery is initiated, the system analyzes the configuration on the device, then imports the configured service and platform policies. When inventory discovery is initiated, the system analyzes the interfaces on the device and then imports the interface list. If the device is a composite device, all the service modules in the device are discovered and imported.</p> <p>If you select this option, the checkboxes below are activated and you can use them to control the types of policies that are discovered.</p> <p><b>Note</b> During discovery, if you import an ACL that is inactive, it is shown as disabled in Security Manager. If you deploy the same ACL, it will be removed by Security Manager.</p> <ul style="list-style-type: none"> <li>• Inventory Only—Discovers interfaces and service modules (if applicable).</li> <li>• No Discovery—All discovery is skipped. No policy, interface, or service module information for the device is added to the device inventory.</li> </ul>
Platform Settings	Whether to discover the platform settings, which are also called platform-specific policy domains. Platform-specific policy domains exist on firewall devices and Cisco IOS routers. These domains contain policies that configure features that are specific to the selected platform. For more information, see <a href="#">Service Policies vs. Platform-Specific Policies</a> , on page 166.
Firewall Policies	Whether to discover firewall policies, which are also called firewall services. Firewall services include policies such as access rules, inspection rules, AAA rules, web filter rules, and transparent rules. For details see, <a href="#">Introduction to Firewall Services</a> , on page 595.
IPS Policies	Whether to discover IPS policies such as signatures and virtual sensors. For more information, see <a href="#">Overview of IPS Configuration</a> , on page 1617 or <a href="#">Overview of Cisco IOS IPS Configuration</a> , on page 1792.
RA VPN Policies	Whether to discover IPsec and SSL remote access VPN policies such as IKE proposals and IPsec proposals. This option is disabled if the device does not support remote access VPN configuration. For more information, see <a href="#">Managing Remote Access VPNs: The Basics</a> , on page 1287.
Discover Policies for Security Context	Whether to discover policies for security contexts. Security contexts apply to PIX Firewall, ASA, or FWSM devices. This field is active only if you select <b>Static</b> for IP Type and <b>System Context</b> .

## Service Module Credentials Dialog Box

Use the Service Module Credentials dialog box to add the credentials required to log into supported service modules in a Catalyst device.

The dialog box includes a group for each slot that contains a supported module, and the type of module is indicated. For example, a group might be called **Slot 3 (IDSM) Credentials**, which indicates that there is an IDSM in the third slot of the chassis.

---

**Note** Although Security Manager discovers VPN modules, the discovery is done through the chassis and no credentials are required. ASA service modules (ASA-SM) cannot be discovered through the chassis; you must add them individually.

---

### Navigation Path

After you discover policies on a Catalyst chassis that can contain service modules, you are asked if you want to discover its service modules. If you click **Yes**, this dialog box appears. You can perform policy discovery using any of these methods:

- When adding a device from the network. See [Adding Devices from the Network](#) , on page 80.
- When adding devices from an export file. See [Adding Devices from an Inventory File](#) , on page 97.
- When performing policy discovery on a device that is already in the inventory. See [Discovering Policies on Devices Already in Security Manager](#) , on page 179.

### Field Reference

**Table 16: Service Module Credentials Dialog Box**

Element	Description
Discovery Mode	<p>The types of policies to discovery for this module:</p> <ul style="list-style-type: none"> <li>• Discover Inventory and Policies—Discover inventory and security policies. This is the recommended option.</li> <li>• Discover Inventory Only—Do not discover security policies, but discover inventory, such as VLAN configuration, security contexts, and interfaces. You can discover the policy configuration later by right-clicking the service module and then selecting <b>Discover Policies on Device</b>.</li> <li>• Do Not Discover Module—Skip discovery on this module and do not add it to the inventory.</li> </ul>

Element	Description
Connect to FWSM	<p>How Security Manager should access the FWSM:</p> <ul style="list-style-type: none"> <li>• <b>Directly</b>—Connect to the FWSM using its management IP address. This is the recommended approach. It is the required method if you are connecting to a failover device; otherwise, Security Manager might connect to a standby FWSM after a failover.</li> <li>• <b>via Chassis</b>—Connect to the FWSM through the chassis. This method has the restriction that there should be fewer than 20 security contexts defined on the FWSM. Security Manager connects to the Catalyst device through SSH and then to the FWSM through the <b>session</b> command. The number of concurrent SSH sessions is limited on a Catalyst device, with a default of 5. Policy discovery uses one SSH session for each security context, so a large number of contexts might lead to connection failures. If you select <b>Directly</b>, Security Manager connects to the FWSM through SSL, which has a greater concurrent session limit.</li> </ul>
Management IP	<p>The management IP address for the service module.</p> <p>For FWSMs, this field is not available if you select <b>via Chassis</b> for the connection method.</p>
Username	<p>The user name for the service module.</p> <p>For FWSMs running in multiple-context mode, a footnote explains which context's username and password to enter, either the system or the admin context. If you are connecting to a multiple-context mode device through the switch chassis, you must configure the same username and password for both the system execution space and the admin context, and specify those credentials in this dialog box.</p> <p>User names be at least four characters. Passwords can be three to 32 characters; we recommend that passwords be at least eight characters. For ASA devices running the software version 9.6(1) or later, you can enter a password up to 127 characters.</p>
Password	<p>The User EXEC mode password for the service module. In the Confirm field, enter the password again.</p>
Enable Password (FWSM only)	<p>The Privileged EXEC mode password for the service module. In the Confirm field, enter the password again.</p>

## IPS Module Discovery Dialog Box

**Note** From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements.

Use the IPS Module Discovery dialog box to add the credentials required to log into an IPS module, such as an AIM-IPS or NME, on a router you are adding to the inventory.

### Navigation Path

After you discover policies on a router chassis that contains an IPS module, you are asked if you want to discover its modules. If you click **Yes**, this dialog box appears. You can perform policy discovery using any of these methods:

- When adding a device from the network. See [Adding Devices from the Network](#) , on page 80.
- When adding devices from an inventory file. See [Adding Devices from an Inventory File](#) , on page 97.
- When performing policy discovery on a device that is already in the network. See [Discovering Policies on Devices Already in Security Manager](#) , on page 179.

### Field Reference

**Table 17: IPS Module Discovery Dialog Box**

Element	Description
Discovery	The type of discovery for this module: <ul style="list-style-type: none"> <li>• Discover Inventory and Policies—Discover inventory and security policies. This is the recommended option.</li> <li>• Discover Inventory Only—Do not discover security policies, but discover inventory, such as virtual sensors and interfaces. You can discover the policy configuration later by right-clicking the module and selecting <b>Discover Policies on Device</b>.</li> <li>• Do Not Discover Module—Skip discovery on this module and do not add it to the inventory.</li> </ul>
IP Address	The management IP address for the module.
<b>HTTP Credentials Group</b>	
The credentials required to log into the module.	
Username	The username for the module.
Password	The password for the specified username. In the Confirm field, enter the password again.
HTTP Port	The port configured for HTTP access to the module. The default is 80.
HTTPS Port	The port configured for SSL (HTTPS) access to the module. The default is defined on the Device Communication page ( <b>Tools &gt; Security Manager Administration &gt; Device Communication</b> , for more information, see <a href="#">Device Communication Page</a> , on page 530). The port typically used is 443.  To override the default, deselect <b>Use Default</b> and enter the correct port number.
IPS RDEP Mode	The connection method to use for contacting IPS devices when making RDEP or SDEE connections (for event monitoring).

Element	Description
Certificate Common Name	The name assigned to the certificate. The common name can be the name of a person, system, or other entity that was assigned to the certificate. In the Confirm field, enter the common name again.

## Adding Devices from Configuration Files

You can add devices to the inventory by having Security Manager process the device configurations without logging into the devices. For each device, you must copy the device configuration to a file and put the file on the Security Manager server.

You cannot use this procedure to add IPS or Catalyst 6500/7600 devices to the inventory.

### Before You Begin

Before beginning this procedure, ensure the following preparations have been made:

- Prepare the devices to be managed by Security Manager. For more information, see [Preparing Devices for Management, on page 55](#).
- If you are using ACS for authentication, define the devices in ACS. See the [Installation Guide for Cisco Security Manager](#).
- Copy the device configuration files to a directory on the Security Manager server. You cannot use a mounted drive. Use a naming convention that will help you select the correct device type for each configuration.

---

**Note** Beginning with version 4.21, Cisco Security Manager supports only TACACS+ authentication via Cisco Identity Services Engine (ISE), because ACS has reached its end of life.

---

### Related Topics

- [Understanding the Device View , on page 69](#)
- [Working with Device Groups , on page 129](#)
- [Viewing or Changing Device Properties , on page 107](#)

---

**Step 1** In Device view, select **File > New Device** or click the **New Device** button in the Device selector. The New Device wizard opens to the Choose Method page.

**Step 2** On the Choose Method page, select **Add from Configuration File** and click **Next** to open the Device Information page (see [Device Information Page—Configuration File , on page 90](#)).

**Step 3** Select the device type for the configuration files from the Device Type selector, and select the appropriate system object ID. If you have configuration files for more than one device type, add them in batches based on device type.

**Note** Beginning from 4.26 version onwards, the Firepower device models FPR4K-SM-12, FPR4K-SM-24, FPR4K-SM-36, FPR4K-SM-44, FPR9K-SM-24, FPR9K-SM-24-NEB, FPR9K-SM-36, and FPR9K-SM-44 are not supported in CSM.

- Step 4** Click **Browse** and select the configuration files that contain the devices (of the specified type) that you want to add.
- Step 5** Select the appropriate discovery options to indicate which types of policies you want to discover, if any.
- Step 6** (Optional) Click **Next** and select the device groups to which the new devices should belong.
- Step 7** Click **Finish**. Security Manager opens the Discovery Status dialog box where you can view the status of the configuration file analysis (see [Discovery Status Dialog Box](#) , on page 187). When finished, close the window and the device is added to the inventory list.
- Tip** If you are discovering policies and get unexpected errors, it might be because the configuration file includes only the major Cisco IOS software version and not the point release information. Some policies defined on the device might use features that became available in a point release, which means that Security Manager might not recognize them as being supported. To resolve the problem, after adding the device, select it in the Device selector, right-click, and select **Device Properties**. On the General page, update the **Target OS Version** field with the software version closest to the one running on the device without being higher than it (you can get the version number using the **show version** command on the device's CLI). You can then rediscover policies by right-clicking and selecting **Discover Policies on Device**.
- Step 8** If you added a device that is managed by an Auto Update Server or Configuration engine, with the device selected in the device selector, select **Tools > Device Properties**. Select the server used with the device in the Auto Update or Configuration Engine settings. You can add the server if it is not listed. For more information, see [Adding, Editing, or Deleting Auto Update Servers or Configuration Engines](#) , on page 103.

## Device Information Page—Configuration File

Use the New Device wizard's Device Information page for adding devices from configuration files to select the configuration files and to specify policy discovery options.

### Navigation Path

To start the New Device wizard, from Device view, select **File > New Device**, or click the **Add** button in the device selector.

### Related Topics

- [Understanding the Device View](#) , on page 69
- [Adding Devices from Configuration Files](#) , on page 89

- [Discovery Status Dialog Box](#) , on page 187

### Field Reference

*Table 18: New Device Wizard, Device Information Page When Adding Devices from Configuration Files*

Element	Description
Device Type selector	Organizes the devices by device-type and device-family. Select the device type for the new device. You must select the correct device type for the configuration file you are adding.

Element	Description
System Object ID	The system object identifiers for the device type you selected from the Device Type selector. Select the correct ID for your device.
Configuration Files	<p>The configuration files from the devices you are adding to the inventory. You can specify more than one configuration file, but they must all be for the same device type. Separate the file names with commas.</p> <p>For ASA, PIX, and FWSM devices that have multiple security contexts, keep in mind that there are separate configuration files for each security context and the system execution space (the system context). Select the configuration file for the system execution space to add the base device.</p> <p>Click <b>Browse</b> to select the files from the Security Manager server, or manually type in the file names (including the full path). For information on selecting files, see <a href="#">Selecting or Specifying a File or Directory in Security Manager</a>, on page 52.</p>
Options	The additional options available on the device. Select IPS if the IPS feature is available on the device.
License Supports Failover (ASA 5505, 5510 only.)	<p>Whether an optional failover license is installed on the device. The option is active for ASA 5505 and 5510 devices only. Security Manager deploys failover policies to the device only if this option is selected.</p> <p><b>Tip</b> If you discover policies from the device, Security Manager determines the license status and sets this option appropriately.</p>
Discover Device Settings	
Discover	<p>The type of elements that should be discovered and added to the inventory. You have these options:</p> <ul style="list-style-type: none"> <li>• Policies and Inventory—Discover policies, interfaces, and service modules (if applicable). This is the default and recommended option.</li> </ul> <p>When policy discovery is initiated, the system analyzes the configuration file, then imports the configured service and platform policies. When inventory discovery is initiated, the system analyzes the interfaces defined in the file and then imports the interface list.</p> <p>If you select this option, the checkboxes below are activated and you can use them to control the types of policies that are discovered.</p> <p><b>Note</b> During discovery, if you import an ACL that is inactive, it is shown as disabled in Security Manager. If you deploy the same ACL, it will be removed by Security Manager.</p> <ul style="list-style-type: none"> <li>• Inventory Only—Discovers interfaces and service modules (if applicable).</li> <li>• No Discovery—All discovery is skipped. No policy, interface, or service module information for the device is added to the device inventory.</li> </ul>

Element	Description
Platform Settings	Whether to discover the platform settings, which are also called platform-specific policy domains. Platform-specific policy domains exist on firewall devices. These domains contain policies that configure features that are specific to the selected platform. For more information, see <a href="#">Service Policies vs. Platform-Specific Policies</a> , on page 166.
Firewall Policies	Whether to discover firewall policies, which are also called firewall services. Firewall services include policies such as access rules, inspection rules, AAA rules, web filter rules, and transparent rules. For details see, <a href="#">Introduction to Firewall Services</a> , on page 595.
IPS Policies	Whether to discover IPS policies such as signatures and virtual sensors. For more information, see <a href="#">Overview of IPS Configuration</a> , on page 1617 or <a href="#">Overview of Cisco IOS IPS Configuration</a> , on page 1792.
RA VPN Policies	Whether to discover IPsec and SSL remote access VPN policies such as IKE proposals and IPsec proposals. This option is disabled if the device does not support remote access VPN configuration. For more information, see <a href="#">Managing Remote Access VPNs: The Basics</a> , on page 1287.

## Adding Devices by Manual Definition

If a device is not yet active on the network, you can add it to Security Manager and preprovision a configuration for the device. In general, you should not use manual definition for a device that exists in the network, because it is much easier to use one of the other techniques for adding devices.

### Before You Begin

Before beginning this procedure, ensure the following preparations have been made:

- Prepare the devices to be managed by Security Manager. For more information, see [Preparing Devices for Management](#), on page 55.
- If you are using ACS for authentication, define the devices in ACS. See the [Installation Guide for Cisco Security Manager](#) .

### Related Topics

- [Understanding the Device View](#) , on page 69
- [Working with Device Groups](#) , on page 129
- [Viewing or Changing Device Properties](#) , on page 107

- 
- Step 1** In Device view, select **File > New Device** or click the **New Device** button in the Device selector. The New Device wizard opens to the Choose Method page.
- Step 2** On the Choose Method page, select **Add New Device** and click **Next** to open the Device Information page.
- Step 3** On the Device Information page, at minimum fill in the following fields. For a detailed explanation of all fields, see [Device Information Page—New Device](#) , on page 93.

- Select the device type from the Device Type selector at the left of the page, and select the system object ID at the bottom of the selector.
- In the IP Type field, select whether the device uses a static address (the IP address is defined on the device) or a dynamic one (the address is provided by a DHCP server).
- For devices with static addresses, enter either a DNS hostname and domain name, or an IP address (or both).
- Enter a display name, which is the name that will appear in the Security Manager Device selector.
- Ensure that the correct operating system and version are selected.
- If you use a server to manage configurations for the device, which is required for dynamically addressed devices, select the Auto Update Server or Configuration Engine that manages the device and enter the device identity string the server uses for the device. If the server is not listed, select **Add Server** and add it to the inventory. For information on adding servers, see [Adding, Editing, or Deleting Auto Update Servers or Configuration Engines](#) , on page 103.

When you are finished filling in the device information, click **Next** to proceed to the Device Credentials page.

**Step 4** (Optional) On the Device Credentials page, enter the usernames and passwords required to log into the device. Typically, you need to enter the primary device credentials, which are the traditional User EXEC mode and Privileged EXEC mode passwords. If you do not enter credentials, you can add them later on the Device Properties page.

For information on the different types of credentials, see [Device Credentials Page](#) , on page 112.

Click **Next**.

**Step 5** (Optional) On the Device Grouping page, select the group to which the device should belong, if any. See [Device Groups Page](#) , on page 117.

**Step 6** Click **Finish**. The device is added to the inventory.

**Tip** If you are adding a PIX, ASA, or FWSM device, you should discover the factory default settings for the device and its security contexts. For more information, see [Discovering Policies on Devices Already in Security Manager](#) , on page 179.

---

## Device Information Page—New Device

Use the New Device wizard's Device Information page for adding new devices (that do not yet exist in the network) to specify the device's identifying information.

### Navigation Path

To start the New Device wizard, from Device view, select **File > New Device**, or click the **Add** button in the device selector.

### Related Topics

- [Understanding the Device View](#) , on page 69

## Field Reference

**Table 19: New Device Wizard, Device Information Page When Adding New Devices**

Element	Description
Device Type	
Device Type selector	<p>Organizes the devices by device-type and device-family. Select the device type for the new device.</p> <p><b>Note</b> Beginning with version 4.26, the Firepower device models FPR4K-SM-12, FPR4K-SM-24, FPR4K-SM-36, FPR4K-SM-44, FPR9K-SM-24, FPR9K-SM-36, and FPR9K-SM-44 are not supported in CSM.</p> <p>Secure Firewall 3105 device support is introduced for ASA 9.19(1) and above devices in CSM.</p>
System Object ID	The system object identifiers for the device type you selected from the Device Type selector. Select the correct ID for your device.
Identity	
IP Type	<p>Whether the IP address for the device is static (defined on the device) or dynamic (supplied by a DHCP server). Depending on the IP type you select, the displayed fields differ.</p> <p><b>Note</b> Beginning with version 4.12, Security Manager server to device communication for ASA devices is supported over either IPv6 address or over IPv4 address. The IPv6 address is a 128-bit unique address. For IPv6 address, only Static IP Type is supported. Dynamic IP Type is not supported for IPv6 addresses.</p>
Hostname (Static IP only)	<p>The DNS hostname for the device. Enter the DNS hostname if the IP address is not known.</p> <p>The maximum length is 70 characters. Valid characters are: 0-9; uppercase A-Z; lowercase a-z; and hyphen (-).</p> <p><b>Note</b> You must enter either the DNS hostname or the IP address, or both. Two devices cannot have the same DNS hostname and domain name combination.</p>
Domain Name (Static IP only)	<p>The DNS domain name for the device.</p> <p>The maximum length is 70 characters. Valid characters are: 0-9; uppercase A-Z; lowercase a-z; period (.) and hyphen (-).</p>

Element	Description
IP Address (Static IP only)	<p>The management IP address of the device. The IP address must be in the dotted quad format, for example 10.64.3.8.</p> <p><b>Note</b> You must enter either the IP address or the DNS hostname, or both.</p> <p><b>Note</b> Beginning with version 4.12, Security Manager server to device communication for ASA devices is supported over either IPv6 address or over IPv4 address. If a device is configured in dual stack, Security Manager would communicate with the device based on the device's IP address added in Security Manager. The IPv6 address is a 128-bit unique address.</p>
Display Name	<p>The name to display in the Security Manager Device selector. If you enter a hostname or IP address, it is entered automatically in this field, but you can change it.</p> <p>The maximum length is 70 characters. Valid characters are: 0-9; uppercase A-Z; lowercase a-z; and the following characters: _ - . : and space.</p> <p><b>Note</b> Two devices cannot have the same display name.</p>
Operating System	
OS Type	<p>The type of operating system. Based on the device type, the OS type is selected automatically.</p> <p><b>Note</b> Beginning with version 4.12, Security Manager server to device communication for ASA devices is supported over either IPv6 address or over IPv4 address. This feature is available only for devices where the Operating System type is ASA or FWSM.</p>
Image Name	The name of the image that will run on the device.
Target OS Version	The target OS version for which you want to apply the configuration. This selection determines the type of commands used when Security Manager generates configuration files.
Options	The additional options available on the device. Select IPS if the IPS feature is available on the device.
Contexts	Whether the device hosts a single security context (Single) or multiple security contexts (Multi). This field is displayed only if the OS type is an FWSM, ASA, or PIX Firewall 7.0.
Operational Mode	<p>The mode in which the device is operating. This field is displayed only if the OS type is FWSM, ASA, or PIX Firewall 7.0+. The options available are: Transparent or Router. If you choose Multi for Contexts, this mode defaults to Mixed. Mixed applies only to ASA 9.0+ and FWSM 3.1+ devices, and ASA-SMs.</p> <p><b>Note</b> Beginning with Cisco Security Manager 4.21, although ASA software enhancements and bug fixes are still supported, any hardware support for routers is not rendered, as Cisco IOS Software has reached its end of life.</p>

Element	Description
FXOS Mode	<p>The FXOS mode in which the device is operating. The options available are Platform and Appliance. If you choose Appliance Mode, you can perform all end-user configuration either from the CLI, an on-box device such as ASDM, or from a multi-device manager such as Cisco Security Manager. The Platform Mode option is displayed only for Firepower 2000 series appliances.</p> <p><b>Note</b> Beginning with version 4.20, Security Manager supports Appliance Mode for Firepower 2000 and 1000 series appliances.</p>
<p><b>Auto Update or Configuration Engine</b></p> <p>This group is named differently depending on the device type you select:</p> <ul style="list-style-type: none"> <li>• Auto Update—For PIX Firewall and ASA devices.</li> <li>• Configuration Engine—For Cisco IOS Routers.</li> </ul> <p>Use these fields to identify the server that manages the device, if any. A server is required for a device with a dynamic IP address. You cannot define a server for Catalyst 6500/7600 or FWSM devices.</p> <p><b>Note</b> From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software.</p>	
Server	<p>The Auto Update Server or Configuration Engine that manages the device.</p> <p>You can add servers to the list by selecting <b>Add Servers</b>, which opens the Server Properties dialog box (see <a href="#">Server Properties Dialog Box</a>, on page 104). You can also edit the properties of a server by selecting <b>Edit Server</b>, which opens the Available Servers dialog box (see <a href="#">Available Servers Dialog Box</a>, on page 106).</p> <p>For more information on managing this list of servers, see <a href="#">Adding, Editing, or Deleting Auto Update Servers or Configuration Engines</a>, on page 103.</p>
Device Identity	The string value that uniquely identifies the device in Auto Update Server or the Configuration Engine.
Additional Fields	
Manage in Cisco Security Manager	<p>Whether Security Manager manages the device. This check box is selected by default.</p> <p>If the only function of the device you are adding is to serve as a VPN end point, deselect this check box. Security Manager will not manage configurations nor will it upload or download configurations on this device. For more information, see <a href="#">Including Unmanaged or Non-Cisco Devices in a VPN</a>, on page 1083.</p>

Element	Description
Security Context of Unmanaged Device	<p>Whether to manage a security context whose parent (the PIX Firewall, ASA, or FWSM device) is not managed by Security Manager.</p> <p>This field is active only if the device you selected in the Device selector is a firewall device, such as PIX Firewall, ASA, or FWSM and that firewall device supports security contexts.</p> <p>You can partition a PIX Firewall, ASA, or FWSM into multiple security firewalls, also known as security contexts. Each context is an independent system with its own configuration and policies. You can manage these standalone contexts in Security Manager, even though the parent device is not managed by Security Manager. For more information, see <a href="#">Configuring Security Contexts on Firewall Devices, on page 2307</a>.</p> <p><b>Note</b> If you select this check box, the available target OS version for the security module is displayed in the Target OS Version field.</p>
License Supports Failover (ASA 5505, 5510 only.)	<p>Whether an optional failover license is installed on the device. The option is active for ASA 5505 and 5510 devices only. Security Manager deploys failover policies to the device only if this option is selected.</p> <p><b>Tip</b> If you discover policies from the device, Security Manager determines the license status and sets this option appropriately.</p>

## Adding Devices from an Inventory File

You can add devices from an inventory file in comma-separated values (CSV) format. For example, an inventory file you exported from CiscoWorks Common Services Device Credential Repository (DCR) or another Security Manager server, or the seed file you used with Cisco Security Monitoring, Analysis and Response System (CS-MARS). For detailed information about the inventory file formats, see [Supported CSV Formats for Inventory Import/Export, on page 485](#).

### Tips

- This procedure explains how to use a CSV file for importing devices. If you have a .dev file, which includes not only the inventory but the policies and policy objects assigned to the devices, you cannot use this procedure. Instead, use the **File > Import** command and follow the instructions in [Importing Policies or Devices, on page 489](#).
- If you want to build an inventory file by hand, the easiest approach is to export the Security Manager inventory in the desired format and use that file as the basis for your inventory file.
- The devices you import cannot be duplicates of devices already in the device inventory. You cannot, for example, update device information in the inventory by re-importing the device.

### Before You Begin

Before beginning this procedure, ensure the following preparations have been made:

- Prepare the devices to be managed by Security Manager. For more information, see [Preparing Devices for Management, on page 55](#).

- If you are using ACS for authentication, define the devices in ACS. See the [Installation Guide for Cisco Security Manager](#).
- Put the inventory file you want to use on the Security Manager server. You cannot import devices from a file on your client system.
- If you are using a non-standard communication protocol for a type of device, update the global device communication properties to specify the correct protocol. For more information, see [Device Communication Page](#), on page 530.

### Related Topics

- [Understanding the Device View](#), on page 69
- [Working with Device Groups](#), on page 129
- [Viewing or Changing Device Properties](#), on page 107

**Step 1** In Device view, select **File > New Device** or click the **New Device** button in the Device selector. The New Device wizard opens to the Choose Method page.

**Step 2** On the Choose Method page, select **Add Device from File** and click **Next** to open the Device Information page (see [Device Information Page—Add Device from File](#), on page 99).

**Step 3** Click **Browse** and select the inventory file that contains the devices that you want to import. Make sure that you select the correct file type to indicate how the file is formatted.

Security Manager evaluates the contents of the inventory file and displays the list of devices in the import table. All devices that have the status Ready to Import are automatically selected. The list identifies the reasons the unselected devices cannot be imported. You can deselect any devices that you do not want to import.

To see detailed information on a device, select it in the import table. The details are displayed in the bottom pane. You can select different discovery options or transport settings per device.

**Tip** If you selected an inventory file in the Security Manager format, you have the option to import the devices without performing policy discovery. This makes it possible for you to add devices that are not currently active in the network. If you want to perform policy discovery on a device, select the device, select **Perform Device Discovery** in the bottom panel, and select your discovery options. You can select policy discovery settings for all devices in a folder by selecting the folder instead of individual devices. The other CSV formats require that you perform policy discovery during import.

When you are finished analyzing the list and modifying discovery and transport settings, click **Next** to continue to the optional step of selecting groups, or click **Finish** to complete the wizard. In either case, Security Manager attempts to log into each device and perform the discovery you selected unless you are using a CSV file in Security Manager format and elected not to perform discovery. For the other formats, Security Manager must be able to log into the device to add it to the inventory. The status is displayed in the Discovery Status dialog box (see [Discovery Status Dialog Box](#), on page 187).

**Tip** If you are discovering policies while adding a device, carefully read any messages that are presented. These messages can contain important recommendations on the next steps you should take. We recommend that you immediately deploy the discovered configuration to a file so that Security Manager can take ownership of the configuration. For more information about deployment methods, see [Understanding Deployment Methods](#), on page 387.

**Step 4** (Optional) On the Device Grouping page, select the device group to which the imported devices should be added (see [Device Groups Page](#), on page 117).

Click **Finish**.

**Step 5** If you are adding a device that contains modules and you are performing device discovery, and Security Manager supports discovering modules for that type of device, you are notified when the discovery of the device chassis is complete and you are asked if you want to discover the device's modules. When you click **Yes**, you are prompted for this information:

- Catalyst 6500 service modules—The Service Module Credentials dialog box opens prompting for the following information, based on the modules contained in the chassis. For more information, see [Service Module Credentials Dialog Box](#), on page 86.
  - FWSM—The management IP address (recommended), the user name and passwords, and the type of discovery you want to perform. If the FWSM is the second device in a failover pair, select **Do Not Discover Module** for the failover module. (Security Manager always manages the active admin context, regardless of whether you added the primary or secondary failover service module.)
  - IDSM—The user name and password and the type of discovery you want to perform.
  - ASA-SM—Discovering ASA service modules in a Catalyst 6500 through the chassis is not supported. You must directly add the ASA-SM using the management IP address of the ASA-SM.
- IPS Router Module—The type of discovery you want to perform, the management IP address, the user name and password, and other SSL connection information. For more information, see [IPS Module Discovery Dialog Box](#), on page 87.

You can skip discovery for any module you do not want to manage in Security Manager.

Click **OK**. You are returned to the Discovery Status dialog box, where you can view the progress of service module discovery.

---

## Device Information Page—Add Device from File

Use the New Device wizard's Device Information page for adding devices from an inventory file to select the file and to specify policy discovery options. The inventory file must be on the Security Manager server; you cannot use an inventory file on a client system.

The formats you can use for the inventory file are explained in [Supported CSV Formats for Inventory Import/Export](#), on page 485. Typically, the inventory file will have been exported from another Security Manager server, from a CiscoWorks Common Services server, or it will be the seed file used to populate the inventory of a Cisco Security Monitoring, Analysis and Response System (CS-MARS) server.

If you are trying to import devices using a .dev file, you need to use the File > Import command instead of this page. For more information, see [Importing Policies or Devices](#), on page 489.

---

**Tip** If you are adding devices that contain modules, for example, a Catalyst switch with an FWSM, you are prompted for module discovery information after you click **Finish**.

---

### Navigation Path

To start the New Device wizard, from Device view, select **File > New Device**, or click the **Add** button in the device selector.

### Field Reference

**Table 20: New Device Wizard, Device Information Page When Adding Devices from Inventory Files**

Element	Description
Import Devices From	The inventory file that contains the devices you want to import. Click <b>Browse</b> to select the file on the Security Manager server.  When selecting the file, you must also select the correct file type so that Security Manager can correctly evaluate the comma-separated values (CSV) file.
<p><b>Device Import Table</b></p> <p>After you select a file, Security Manager evaluates its contents and displays the list of devices defined in the file in the table in the upper pane of the page. Security Manager automatically selects all devices whose status is Ready to Import. Typically, these are the devices that do not already exist in the device inventory. The table contains the following columns.</p>	
Import	Select this checkbox to add the device to the inventory. You can select or deselect a folder to select or deselect all devices within the folder.
Display Name	The name that will be displayed in the Security Manager Device selector.
Host Name	The host name defined on the device.
Transport	The transport protocol that should be used to connect to the device.
Status	Whether Security Manager can import the device. Devices can be imported only if they have the status Ready to Import. For detailed information on a device's status, select it and read the expanded status information in the Status text box in the lower right corner of the page.
Device Type	The type of device.

Element	Description
<p><b>Details Pane</b></p> <p>Below the device import table is a pane that displays the details for the device selected in the table. The Identity information repeats the table fields. The Status text box displays an extended explanation of the import status.</p> <p>The Discover Device Settings and Transport groups let you specify how Security Manager should import the device. If you select a folder instead of a device, the settings you select apply to all devices in the folder. The settings are explained below.</p>	
Discover Device Settings	
Perform Device Discovery	<p>Whether to discover policies directly from the device:</p> <ul style="list-style-type: none"> <li>• If the inventory file is in Security Manager format, you must select Perform Device Discovery to discovery inventory and policies (otherwise, the device is added without being evaluated). If you are adding offline or standby devices, you can leave this option deselected to easily add the device to the inventory.</li> <li>• All other inventory file types require device discovery.</li> </ul>
System Context	<p>Whether the selected device is the system execution space on a device running in multiple context mode (that is, more than one security context is defined on the device). If the device is the system execution space, you must select this option for discovery to complete correctly.</p>
Discover	<p>The type of elements that should be discovered and added to the inventory. You have these options:</p> <ul style="list-style-type: none"> <li>• Policies and Inventory—Discover policies, interfaces, and service modules (if applicable). This is the default and recommended option.</li> </ul> <p>When policy discovery is initiated, the system analyzes the configuration on the device, then imports the configured service and platform policies. When inventory discovery is initiated, the system analyzes the interfaces on the device and then imports the interface list. If the device is a composite device, all the service modules in the device are discovered and imported.</p> <p>If you select this option, the checkboxes below are activated and you can use them to control the types of policies that are discovered.</p> <p><b>Note</b> During discovery, if you import an ACL that is inactive, it is shown as disabled in Security Manager. If you deploy the same ACL, it will be removed by Security Manager.</p> <ul style="list-style-type: none"> <li>• Inventory Only—Discovers interfaces and service modules (if applicable).</li> </ul>

Element	Description
Platform Settings	Whether to discover the platform settings, which are also called platform-specific policy domains. Platform-specific policy domains exist on firewall devices and Cisco IOS routers. These domains contain policies that configure features that are specific to the selected platform. For more information, see <a href="#">Service Policies vs. Platform-Specific Policies</a> , on page 166.
Firewall Policies	Whether to discover firewall policies, which are also called firewall services. Firewall services include policies such as access rules, inspection rules, AAA rules, web filter rules, and transparent rules. For details see, <a href="#">Introduction to Firewall Services</a> , on page 595.
IPS Policies	Whether to discover IPS policies such as signatures and virtual sensors. For more information, see <a href="#">Overview of IPS Configuration</a> , on page 1617 or <a href="#">Overview of Cisco IOS IPS Configuration</a> , on page 1792.
RA VPN Policies	Whether to discover IPsec and SSL remote access VPN policies such as IKE proposals and IPsec proposals. This option is disabled if the device does not support remote access VPN configuration. For more information, see <a href="#">Managing Remote Access VPNs: The Basics</a> , on page 1287.
Discover Policies for Security Contexts	For devices running in multiple-context mode, where more than one security context is defined on the device, whether to discover those security contexts.
<b>Transport</b>	
The transport settings determine the method Security Manager will use to contact the device. Each device type has a default method, but you can select your preferred transport method. The device must be configured to respond to the method you select. If you are not performing device discovery, the device is not contacted.	
Protocol	The protocol Security Manager should use when connecting to the device.
Server	For devices that use them, the name of the Auto Update Server (AUS) or Configuration Engine server the device uses to obtain configuration updates. The server must already be defined in Security Manager, or you must select the server from the import list, to import devices that use these servers.
Device Identity	For devices that use servers, the string value that uniquely identifies the device in the Auto Update Server or the Configuration Engine.

## Working with the Device Inventory

The following topics describe tasks related to managing the device inventory.

- [Adding, Editing, or Deleting Auto Update Servers or Configuration Engines](#) , on page 103
- [Adding or Changing Interface Modules](#) , on page 107
- [Viewing or Changing Device Properties](#) , on page 107
- [Changing Critical Device Properties](#) , on page 122

- [Showing Device Containment](#) , on page 126
- [Cloning a Device](#) , on page 126
- [Deleting Devices from the Security Manager Inventory](#) , on page 128

In addition to these topics, see the following related topics:

- [Adding Devices to the Device Inventory](#) , on page 75
- [Exporting the Device Inventory](#), on page 481
- [Importing Policies or Devices](#), on page 489

## Adding, Editing, or Deleting Auto Update Servers or Configuration Engines

If you want to use Security Manager to manage devices that use other servers to manage their configuration (for example, devices that have dynamic IP addresses supplied by a DHCP server, an address that might not stay constant between device reboots), you must identify the server in Security Manager. These are the servers you can use:

- Auto Update Server (AUS), which is used for upgrading device configuration files on PIX Firewall and ASA devices that use the auto update feature.
- Cisco Configuration Engine, which is used for upgrading device configuration files on Cisco IOS routers, ASA devices, and PIX Firewalls that use the configuration engine feature.

Security Manager cannot initiate direct communication with devices that acquire their interface addresses using DHCP because their IP addresses are not known ahead of time. Furthermore, these devices might not be running, or they might be behind firewalls and NAT boundaries when the management system must make changes. These devices connect to an Auto Update Server or Configuration Engine to get device information.

You can add AUS and Configuration Engine servers to the device inventory when you add devices manually or when you view device properties. You do not have to be adding or viewing the properties of a device that uses one of these servers, you just have to get to the appropriate field to access the controls to add, edit, or delete these servers.

You can also add these servers if you import them from an inventory file exported from CiscoWorks Common Services Device Credential Repository (DCR) or from another Security Manager server. If you import the server, you bypass the procedure described in this section. For more information about importing devices, see [Adding Devices from an Inventory File](#) , on page 97.

### Before You Begin

If you want to populate the Security Manager inventory with your list of AUS and Configuration Engine servers without respect to adding devices, the best approach is to use the New Device wizard and to select **Add New Device** as the add method. This approach is described in this procedure.

You can also add or edit servers by selecting a device in the Device selector and clicking **Tools > Device Properties**. Click **General** in the device properties table of contents. The Server field is in either the Auto Update or Configuration Engine groups. You can add or edit only the type of server identified in the group name.

**Tip** Security Manager cannot determine the software version running on a Configuration Engine when you add it. However, Security Manager cannot deploy configurations correctly to all versions of Configuration. Ensure that your Configuration Engines are running a supported release (see the release notes for this version of the product to see which Configuration Engine versions are supported at [http://www.cisco.com/en/US/products/ps6498/prod\\_release\\_notes\\_list.html](http://www.cisco.com/en/US/products/ps6498/prod_release_notes_list.html) ).

#### Related Topics

- [Adding Devices from the Network](#) , on page 80
- [Adding Devices by Manual Definition](#) , on page 92
- [Viewing or Changing Device Properties](#) , on page 107

- Step 1** Locate the field that allows you to identify and manage either AUS or Configuration Engine entries in the device inventory:
- a) Select **File > New Device** to open the New Device wizard, select **Add New Device** on the Choose Method page, and click **Next**.
  - b) On the Device Information page, select an ASA device from the Device Type selector, for example, Cisco ASA-5580 Adaptive Security Appliance. The **Server** field in the Auto Update group should include **Add Server** in the drop-down list. It will also include **Edit Server** if there are servers already defined. If these entries have specific server types (for example, Add Auto Update Server or Add Configuration Engine), then you will be limited to adding, editing, or deleting that type of server (in this case, select other types of devices to find the appropriate server type).

**Step 2** To add a new AUS or Configuration Engine server, select **Add Server** from the Server drop-down list to open the Server Properties dialog box (see [Server Properties Dialog Box](#) , on page 104).

**Step 3** To edit a server, select **Edit Server** from the Server drop-down list to open the Available Servers dialog box (see [Available Servers Dialog Box](#) , on page 106). You can then select the server and click **Edit**, which opens the Server Properties dialog box where you can make your changes.

From the Available Servers dialog box, you can also:

- Click **Create** to add a server.
- Select a server and click **Delete** to remove it from the inventory. You are asked to confirm the deletion. Make sure that the server is not being used by a device in the inventory.

## Server Properties Dialog Box

Use the Server Properties dialog box to specify the properties of an Auto Update Server or Configuration Engine.

Depending on how you open this dialog box, the title of the dialog box might specify the type of server (for example, Auto Update Server Properties or Configuration Engine Properties). The dialog boxes are essentially identical.

**Tip** Security Manager cannot determine the software version running on a Configuration Engine when you add it. However, Security Manager cannot deploy configurations correctly to all versions of Configuration. Ensure that your Configuration Engines are running a supported release (see the release notes for this version of the product to see which Configuration Engine versions are supported at [http://www.cisco.com/en/US/products/ps6498/prod\\_release\\_notes\\_list.html](http://www.cisco.com/en/US/products/ps6498/prod_release_notes_list.html) ).

### Navigation Path

To open this dialog box, do one of the following:

- Select **Add Server...** from the **Server** field in the Auto Update Server or Configuration Engine groups on the Device Information page of the New Device wizard when adding a device manually. The selection might also be named Add Auto Update Server or Add Configuration Engine.
- Select **Add Server...** from the **Server** field in the Auto Update Server or Configuration Engine groups on the Device Properties—General page. The selection might also be named Add Auto Update Server or Add Configuration Engine.
- Click **Create**, or select a server and click **Edit**, in the Available Servers dialog box (see [Available Servers Dialog Box](#) , on page 106).

### Related Topics

- [Available Servers Dialog Box](#) , on page 106
- [Device Information Page—New Device](#) , on page 93

### Field Reference

**Table 21: Server Properties Dialog Box**

Element	Description
Type	The type of server you are defining, either Auto Update Server or Configuration Engine. This field is displayed only if you are adding a server. You cannot change the type of an existing server. For new servers, this field is also not displayed if the title of the dialog box specifies the type of server you are adding.
Server Name	The DNS hostname of the server.
Domain Name	The DNS domain name of the server.
IP Address	The IP address of the server.

Element	Description
Display Name	The name to display in Security Manager for the server.
Username	The username for logging into the server.
Password	The password for accessing the server. In the Confirm field, enter the password again.
Port	The port number that the device managed by the Auto Update Server or Configuration Engine uses to communicate with the server. The port number is typically 443.
URN	<p>This field is displayed only for Auto Update Servers.</p> <p>The uniform resource name for the Auto Update Server. The URN is the name that identifies the resource on the Internet. The URN is part of a URL, for example, /autoupdate/AutoUpdateServlet. The full URL could be: https://: <i>server ip</i> :443/autoupdate/AutoUpdateServlet</p> <p>where:</p> <ul style="list-style-type: none"> <li>• <i>server ip</i> is the IP address of the Auto Update Server.</li> <li>• 443 is the port number of the Auto Update Server.</li> <li>• /autoupdate/AutoUpdateServlet is the URN of the Auto Update Server.</li> </ul>

## Available Servers Dialog Box

Use the Available Servers dialog box to add, edit, or delete an Auto Update Server or Configuration Engine.

Depending on how you open this dialog box, the title of the dialog box might specify the type of servers listed (for example, Available Auto Update Servers or Available Configuration Engines). The dialog boxes are essentially identical.

Each row represents a single server, and shows the display name for the server in Security Manager, its IP address, and DNS hostname and domain name. If the dialog box title does not include the server type, the Type field specifies AUS or CE (Configuration Engine).

- To add a server, click the **Create** button and fill in the Server Properties dialog box (see [Server Properties Dialog Box](#), on page 104).
- To edit the properties of a server, select it and click the **Edit** button.
- To delete a server, select it and click the **Delete** button. You are asked to confirm the deletion.

### Navigation Path

To open this dialog box, do one of the following:

- Select **Edit Server...** from the **Server** field in the Auto Update Server or Configuration Engine groups on the Device Information page of the New Device wizard when adding a device manually. The selection might also be named Edit Auto Update Server or Edit Configuration Engine.
- Select **Edit Server...** from the **Server** field in the Auto Update Server or Configuration Engine groups on the Device Properties—General page. The selection might also be named Edit Auto Update Server or Edit Configuration Engine.

### Related Topics

## Adding or Changing Interface Modules

Many devices allow you to add or change interface modules. When you make a change to the interface modules hosted in a device, you change the device's inventory.

If you add or change an interface card, you should rediscover the inventory on the device. Rediscovering inventory will replace the Interfaces policy (for routers, the Interfaces > Interfaces policy) and ensure that Security Manager has a correct view of the capabilities of the interfaces available on the device.

---

**Note** Inventory rediscovery is especially important for ASA 5580 devices in which you install a 4 GB Ethernet Fiber interface card. For other types of devices, you can usually make manual changes to the Interfaces policy, but rediscovering inventory is the easier and more reliable choice.

---

---

**Step 1** Right-click the device and select **Discover Policies on Device**.

**Step 2** In the Create Discovery Task dialog box, make at least these selections and click **OK** to start rediscovery:

- Discover from **Live Device**.
- Policies to discover: **Inventory**.

**Step 3** After discovery completes, edit the Interfaces or Interfaces > Interfaces policy as appropriate and verify that the policy reflects your desired configuration.

---

## Viewing or Changing Device Properties

When you add a device to the inventory, you specify at least some of the device's properties, such as names and credentials. For devices that are in the inventory, you can view and change the device properties.

### Related Topics

- [Understanding the Device View](#) , on page 69
- [Understanding Device Properties](#) , on page 74
- [Understanding Policies](#) , on page 165
- [Changing Critical Device Properties](#) , on page 122

---

**Step 1** In Device view, do one of the following in the Device selector to open the Device Properties dialog box:

- Double-click a device.
- Right-click a device and select **Device Properties**.
- Select a device and select **Tools > Device Properties**.

**Step 2** In the Device Properties dialog box, click these entries in the table of contents in the left pane to view or change the properties. You must click **Save** before moving from one page to another.

- **General**—General information about the device, such as the device identity, the operating system running on the device, and transport settings. For information about the fields, see [Device Properties: General Page](#), on page 108.
- **Credentials**—The device credentials required to log into the device. For information about the fields, see [Device Credentials Page](#), on page 112.
- **Device Groups**—The groups to which the device belongs. For information about the fields, see [Device Groups Page](#), on page 117.
- **Group Information**—Group details for the group, if any. For information about the fields, see [Group Information Page](#), on page 118.
- **License Information**—License details of the FPR-3100 series device. For more information about the fields, see [License Information Page](#).

**Note** License Information panel is visible only for the FPR-3100 series devices in CSM 4.24.

- **Policy Object Overrides**—The local overrides to policy objects for the device. Policy Object Overrides is a folder that contains the various policy object types that are available for the device. Click a specific policy object type to view the policy objects of that type used by the device and their overrides, if any. For more information about the fields, see [Policy Object Override Pages](#), on page 122.

---

## Device Properties: General Page

Use the Device Properties General page to add or edit information about the basic properties of the device.

### Navigation Path

- From the Device selector, right-click a device and select **Device Properties**, then click **General**.
- From the Device selector, double-click a device, then click **General**.
- Select a device and select **Tools > Device Properties**, then click **General**.

### Related Topics

- [Policy Object Override Pages](#) , on page 122

## Field Reference

**Table 22: Device Properties General Page**

Element	Description
Identity	
Device Type	The type of device.
IP Type	<p>Whether the IP address for the device is static (defined on the device) or dynamic (supplied by a DHCP server). Depending on the IP type you select, the displayed fields differ.</p> <p><b>Note</b> Beginning with version 4.12, Security Manager server to device communication for ASA devices is supported over either IPv6 address or over IPv4 address. The IPv6 address is a 128-bit unique address. For IPv6 address, only Static IP Type is supported. Dynamic IP Type is not supported for IPv6 addresses.</p>
Hostname (Static IP only)	<p>The DNS hostname for the device.</p> <p>This is not necessarily the same name that is configured as the hostname on the device. This property is not updated with the hostname specified in the Hostname device property. It is also not updated with the name defined in the device configuration if you rediscover the device.</p> <p>If you added the device to Security Manager by adding its configuration file, the hostname is initially set to the name specified in the configuration file. If no hostname is specified in the configuration, the name of the file is used as the DNS hostname.</p>
Domain Name (Static IP only)	The DNS domain name for the device.
IP Address (Static IP only)	<p>The management IP address of the device, for example 192.168.3.8.</p> <p><b>Note</b> You must enter either the IP address or the DNS hostname, or both.</p> <p><b>Note</b> Beginning with version 4.12, Security Manager server to device communication for ASA devices is supported over either IPv6 address or over IPv4 address. If a device is configured in dual stack, Security Manager would communicate with the device based on the device's IP address added in Security Manager. The IPv6 address is a 128-bit unique address.</p>
Display Name	<p>The name to display in the Security Manager Device selector.</p> <p>The maximum length is 70 characters. Valid characters are: 0-9; uppercase A-Z; lowercase a-z; and the following characters: _ - . : and space.</p>
Operating System	

Element	Description
OS Type	<p>The type of operating system. Based on the device type, the OS type is selected automatically.</p> <p><b>Note</b> Beginning with version 4.12, Security Manager server to device communication for ASA devices is supported over either IPv6 address or over IPv4 address. This feature is available only for devices where the Operating System type is ASA or FWSM.</p>
Image Name	The name of the image running on the device. The image name is updated whenever you deploy to the device or rediscover its policies.
Running OS Version	The version of the operating system running on the device.
Target OS Version	<p>The OS version on which you want to base the device's configuration. When creating a configuration file using the rules you configure, Security Manager uses commands available in the target OS version. This field is read-only for IPS devices.</p> <p>You cannot change the target OS version to a version that significantly changes the feature set available for the device. For more information, see <a href="#">Changes That Change the Feature Set in Security Manager</a> , on page 124.</p>
Options	A read-only field whose values are NONE or IPS. The value IPS indicates that the IPS feature is available on the device.
IPS Running OS Version	A read-only field that displays the version of IOS IPS running on the router. This field does not appear if the Options field has the value of NONE.
IPS Target OS Version	A read-only field that displays the target version of IOS IPS running on the router. This field does not appear if the Options field has the value of NONE.
Contexts	Whether the device hosts a single security context (Single) or multiple security contexts (Multi). This field is displayed only if the OS type is an FWSM, ASA, or PIX Firewall 7.0.
Operational Mode	The mode in which the device is operating. This field is displayed only if the OS type is FWSM, ASA, or PIX Firewall 7.0+. The options available are: Transparent or Router. If you choose Multi for Contexts, this mode defaults to Mixed. Mixed applies only to ASA 9.0+ and FWSM 3.1+ devices, and ASA-SMs.
FXOS Mode	<p>The FXOS mode in which the device is operating. The options available are Platform and Appliance. If you choose Appliance Mode, you can perform all end-user configuration either from the CLI, an on-box device such as ASDM, or from a multi-device manager such as Cisco Security Manager. The Platform Mode option is displayed only for Firepower 2000 series appliances.</p> <p><b>Note</b> Beginning with version 4.20, Security Manager supports Appliance Mode for Firepower 2000 and 1000 series appliances.</p>
Device Communication Settings	

Element	Description
Transport Protocol	<p>The transport protocol that Security Manager should use when accessing the device or deploying configurations to it. If you select <b>Use Default</b>, the transport protocol set in the Device Communication page (<b>Tools &gt; Security Manager Administration &gt; Device Communication</b>) is used (see <a href="#">Device Communication Page</a> , on page 530). You can select a different protocol if the device is not configured to use the default protocol.</p> <p>The available transport protocols differ depending on what the device type supports. For some device types, such as ASA, there is only one option, so the field is grayed out.</p>
CS-MARS Monitoring	
Monitored By	<p>The CS-MARS server that monitors this device, if any.</p> <p>Click <b>Discover CS-MARS</b> to have Security Manager determine which CS-MARS server is monitoring the device. If only one CS-MARS server is monitoring it, the field is updated with the server name. If there is more than one, you are prompted to select the CS-MARS server to use. Your selection determines which server is accessed when you try to view CS-MARS collected syslogs or events when viewing firewall access rules or IPS signatures in the policy rule tables for the device.</p> <p>Before you can discover a CS-MARS server for the device, the server must be register with Security Manager on the CS-MARS administration page (<b>Tools &gt; Security Manager Administration &gt; CS-MARS</b>). For more information, see <a href="#">CS-MARS Page</a> , on page 516.</p>
<p><b>Auto Update or Configuration Engine</b></p> <p>This group is named differently depending on the device type:</p> <ul style="list-style-type: none"> <li>• Auto Update—For PIX Firewall and ASA devices.</li> <li>• Configuration Engine—For Cisco IOS routers.</li> </ul> <p>Use these fields to identify the server that manages the device, if any. A server is required for a device with a dynamic IP address.</p>	
Server	<p>The Auto Update Server or Configuration Engine that manages the device. For AUS, this server should match the one defined in the AUS policy (see <a href="#">AUS Page</a> , on page 2007).</p> <p>You can add servers to the list by selecting <b>Add Servers</b>, which opens the Server Properties dialog box (see <a href="#">Server Properties Dialog Box</a> , on page 104. You can also edit the properties of a server by selecting <b>Edit Server</b>, which opens the Available Servers dialog box (see <a href="#">Available Servers Dialog Box</a> , on page 106.</p> <p>For more information on managing this list of servers, see <a href="#">Adding, Editing, or Deleting Auto Update Servers or Configuration Engines</a> , on page 103.</p> <p>For information on how these servers are used during deployment, see <a href="#">Deploying Configurations Using an Auto Update Server or CNS Configuration Engine</a> , on page 420.</p>

Element	Description
Device Identity	The string value that uniquely identifies the device in Auto Update Server or the Configuration Engine. For AUS, this ID should match the one defined in the AUS policy (see <a href="#">AUS Page</a> , on page 2007).
ASA-CX/FirePOWER Module	
Management IP	The management IP address of the ASA's CX or FirePOWER module; detected during device discovery, or after the module is added to the device. See <a href="#">Detecting ASA CX and FirePOWER Modules</a> , on page 2883 for more information.  This field is available only for an ASA CX or FirePOWER module already detected by Security Manager.
Manager Address	The IP address of the Cisco Prime Security Manager (PRSM) or FireSIGHT Management Center used to configure and manage the ASA-CX or FirePOWER module; detected during device discovery, or after the module is added to the device. See <a href="#">Launching Cisco Prime Security Manager or FireSIGHT Management Center</a> , on page 2882 for more information.  You can edit this address. However, Security Manager will not perform any validation of the address, and rediscovery or re-detection may alter this address.  This field is available only for an ASA CX or FirePOWER module already detected by Security Manager.
Manage in Cisco Security Manager	Whether Security Manager manages the device. Security Manager will not manage configurations nor will it upload or download configurations on this device.  You might want to include an unmanaged device in the inventory for these reasons: <ul style="list-style-type: none"> <li>• If the only function of the device is to serve as a VPN end point.</li> <li>• If the device is a security context that you are using for failover. Because you cannot delete security contexts for managed devices without actually deleting the context from the device itself, you must unmanage the failover contexts.</li> </ul>
License Supports Failover (ASA 5505, 5510 only.)	Whether an optional failover license is installed on the device. The option is active for ASA 5505 and 5510 devices only. Security Manager deploys failover policies to the device only if this option is selected.  <b>Tip</b> If you discover policies from the device, Security Manager determines the license status and sets this option appropriately.

## Device Credentials Page

Use the Device Credentials page to add or change the usernames and passwords that are required for device access. For information about device credentials, see [Understanding Device Credentials](#), on page 73.

The Credentials page is the same whether you are adding a new device (in the New Device wizard), or viewing an existing device's properties.

When adding a new device, you are prompted for credentials only when adding devices manually or from the network.

---

**Tip** In the New Device wizard, when you click **Next** or **Finish** when adding a device from the network, Security Manager tests whether it can connect to the device using these credentials. The Device Connectivity Test dialog box stays open while the test is in progress (see [Device Connectivity Test Dialog Box](#) , on page 457). If the test fails, click **Details** to see detailed error information. If you are adding devices that contain modules, for example, a Catalyst switch with an FWSM, you are then prompted for module discovery information.

---

---

**Important** For a Cisco Security Manager-managed device, when you intend to change the password in the **Device Properties** page, make sure you update the same in the **User Accounts** page also. When you fail to do so, although the initial phase of communication between Security Manager and the device is successful and even the **Test Connectivity** gets verified successfully, the deployment still fails, because the password configured in the **User Accounts** page gets updated in the **Device Properties** page. It is therefore recommended to ensure that credential updates are made *parallelly* in **Device Properties** and the **User Accounts** pages.

---

### Navigation Path

- For new devices, to start the New Device wizard, from Device view, select **File > New Device**, or click the **Add** button in the device selector.
- For existing devices, to open the device properties, double-click a device in the Device selector, then click **Credentials** on the Device Properties Page.

## Field Reference

*Table 23: Device Credentials Page*

Element	Description
<p><b>Primary Credentials</b></p> <p>Required for all device types. These credentials are used for SSH and Telnet connections, and for HTTP and HTTPS connections if you select <b>Use Primary Credentials</b> in the HTTP group.</p> <p>If you change the password for the specified user, or the enable password, in a device policy, Security Manager uses the old password to log in during deployment. After a successful deployment, the passwords in the device credentials are updated to the newly-deployed passwords. For information on updating the device policies related to these passwords, see the following topics:</p> <ul style="list-style-type: none"> <li>• ASA/PIX/FWSM devices— <a href="#">Configuring Device Credentials</a> , on page 1927</li> <li>• IPS devices— <a href="#">Configuring IPS User Accounts</a> , on page 1631</li> <li>• IOS devices— <a href="#">Defining Accounts and Credential Policies</a> , on page 2423</li> </ul>	
Username	<p>The user name for logging into the device. The user should have privilege level 15.</p> <p>If the device requires an enable password only to configure it, you can leave the Username and Password fields blank and enter just the Enable Password.</p> <p><b>Note</b> PIX/ASA/FWSM devices require that user names be at least four characters. Passwords can be three to 32 characters; we recommend that passwords be at least eight characters. For ASA devices running the software version 9.6(1) or later, you can enter a password up to 127 characters.</p>
Password	The password for logging into the device (User EXEC mode). In the Confirm field, enter the password again.
Enable Password	The password that activates enable mode (Privileged EXEC mode) on the device if the mode is configured on that device. In the Confirm field, enter the password again.
<p><b>HTTP Credentials</b></p> <p>Credentials for making HTTP or HTTPS connections to a device. Some devices support this type of connection, and other devices (such as IPS devices) require it.</p>	

Element	Description
Use Primary Credentials Username Password	<p>Whether Security Manager should use the configured primary credentials for HTTP and HTTPS connections. If the device uses different credentials for HTTP/HTTPS connections, deselect <b>Use Primary Credentials</b> and enter the username and password configured for HTTP/HTTPS. Reenter the password in the Confirm field.</p> <p><b>Note</b> PIX/ASA/FWSM devices require that user names be at least four characters. Passwords can be three to 32 characters; we recommend that passwords be at least eight characters. For ASA devices running the software version 9.6(1) or later, you can enter a password up to 127 characters.</p>
HTTP Port	The port to use for HTTP connections. The default is port 80. Change this setting only if the device is configured to accept HTTP connections on a different port.
HTTPS Port	<p>The port to use for HTTPS connections. The default is port 443 (unless a different default is configured in the Security Manager device communication settings). To change the default, first deselect <b>Use Default</b>. Change this setting only if the device is configured to accept HTTPS connections on a different port.</p> <p><b>Note</b> If you configure the local HTTP policy to be a shared policy and assign the HTTP policy to multiple devices, the HTTPS port number setting in the shared policy overrides the port number configured in the Device Credentials page for all devices to which the policy is assigned.</p>
IPS RDEP Mode	The connection method to use for contacting IPS devices when making RDEP or SDEE connections (for event monitoring).
Certificate Common Name	The name assigned to the certificate. The common name can be the name of a person, system, or other entity that was assigned to the certificate. In the Confirm field, enter the common name again.
Additional Fields and Buttons	
Authentication Certificate Thumbprint (Device properties only.)	<p>The certificate thumbprint for the device that is available in the Security Manager certificate data store. Click <b>Retrieve From Device</b> to obtain the current certificate from the device and to replace the one stored in Security Manager.</p> <p>For IPS devices, there are additional options for managing the certificate as described in <a href="#">Managing IPS Certificates</a>, on page 1786.</p>
RX-Boot Mode button	<p>Opens the <a href="#">RX-Boot Mode Credentials Dialog Box</a>, on page 116, where you can enter the credentials for booting the router from a reduced command-set image (RX-Boot).</p> <p>If these credentials are for a Cisco router that runs from flash memory (where it boots only from the first file in flash), you must run an image other than the one in flash to upgrade the flash image. The RX-Boot credentials are for running this other image.</p>

Element	Description
SNMP button	Opens the <a href="#">SNMP Credentials Dialog Box</a> , on page 116, where you can specify the SNMP community strings defined on the device.
Test Connectivity button (Device properties and manual device addition only.)	Tests whether Security Manager can connect to the device using the credentials you entered and the configured transport method. For more information about testing device connectivity, see <a href="#">Testing Device Connectivity</a> , on page 455.

### RX-Boot Mode Credentials Dialog Box

Use the RX-Boot Mode Credentials dialog box to add RX-Boot mode credentials, which are used for booting the router from a reduced command-set image (RX-Boot). Enter the RX-Boot Mode username and password; in the Confirm field, enter the password again.

#### Navigation Path

To open the RX-Boot Mode Credentials dialog box, click **RX-Boot Mode** in the [Device Credentials Page](#), on page 112 in either the New Device wizard (when adding a device manually or from the network), or the Device Properties page.

### SNMP Credentials Dialog Box

Use the SNMP Credentials dialog box to add SNMP credentials.

#### Navigation Path

To open the SNMP Credentials dialog box, click **SNMP** in the [Device Credentials Page](#), on page 112 in either the New Device wizard (when adding a device manually or from the network), or the Device Properties page.

#### Field Reference

*Table 24: SNMP Credentials Dialog Box*

Element	Description
<b>SNMP V2C</b>	
These are the credentials for devices running SNMP version 2.	
RO Community String	The read-only community string. In the Confirm field, enter the community string again.
RW Community String	The read-write community string. In the Confirm field, enter the community string again.
<b>SNMP V3</b>	
These are the credentials for devices running SNMP version 3.	
Username	The SNMP version 3 authentication user name.
Password	The SNMP version 3 authentication user password. In the Confirm field, enter the password again.

Element	Description
Auth Algorithm	The authorization algorithm for encrypting the password. You can choose MD5 or SHA-1.
Privacy Password	The SNMP version 3 encryption user password. In the Confirm field, enter the password again.
Privacy Algorithm	Specify the encryption level by choosing an encryption algorithm and version: <ul style="list-style-type: none"> <li>• DES – Apply the Data Encryption Standard cipher algorithm, using 56-bit keys..</li> <li>• 3DES – Use Triple DES; the Data Encryption Standard cipher algorithm is applied three times to each packet.</li> <li>• AES128 – Use the Advanced Encryption Standard with 128-bit keys.</li> <li>• AES192 – Use the Advanced Encryption Standard with 192-bit keys.</li> <li>• AES256 – Use the Advanced Encryption Standard with 256-bit keys.</li> </ul>
Engine ID	Enter the hexadecimal identifier for the SNMP v3 authorization agent in the device.

## Device Groups Page

Use the Device Groups page to assign the device to device groups. You can also edit or delete device groups from this page.

### Navigation Path

- For new devices, to start the New Device wizard, from Device view, select **File > New Device**, or click the **Add** button in the device selector.
- For existing devices, to open the device properties, double-click a device in the Device selector, then click **Device Groups** on the Device Properties Page.

### Related Topics

- [Understanding Device Grouping](#) , on page 130
- [Adding Devices to the Device Inventory](#) , on page 75
- [Understanding Device Properties](#) , on page 74
- [Discovery Status Dialog Box](#) , on page 187

## Field Reference

*Table 25: Device Grouping Page*

Element	Description
Group Types, such as Department and Location	<p>The group types defined in Security Manager, for example, Department or Location. Each field contains a list of the device groups defined within that group type. Select the device groups to which the device should belong.</p> <p>If you want to create a new device group, or group type, select <b>Edit Groups</b> from the drop-down list for any of the existing group types. This opens the Edit Device Groups page, where you can create new groups and group types or delete them (see <a href="#">Edit Device Groups Dialog Box</a> , on page 131).</p>
Set values as default	Whether to set the selected groups as the default groups. If you select this option, other devices you add are automatically added to these groups.

## Group Information Page

Use the Device Properties Group Information page to view details for a group.

### Navigation Path

- From the Device selector, right-click a device and select **Device Properties**, then click **Group Information**.
- From the Device selector, double-click a device, then click **Group Information**.
- Select a device and select **Tools > Device Properties**, then click **Group Information**.

### Related Topics

- [Working with Device Clusters](#) , on page 77
- [Understanding Device Properties](#) , on page 74
- [Device Credentials Page](#) , on page 112
- [Device Groups Page](#) , on page 117
- [Policy Object Override Pages](#) , on page 122

## Field Reference

*Table 26: Device Properties Group Information Page*

Element	Description
Group Details	
Device Type	The type of device.
Group Name	The name assigned to the Group.

Element	Description
Group Control	The group member name of the device that is serving as the control unit. <b>Note</b> Changes to the control unit are not automatically reflected in Security Manager.
Retrieve From Device	Use <b>Retrieve From Device</b> to update the control unit information.
Interface Mode	Whether the interfaces are configured for Layer 2 load balancing (Spanned EtherChannel) or Layer 3 load balancing (Individual).
Management IP Pool Range	Enter the IP address pool used for cluster management. You can provide this value for the device in user context. This field is mandatory, if Eventviewer is being used to monitor syslogs for a Multi-context ASA cluster.  If you leave this field blank, or enter an incorrect IP address pool, Eventviewer cannot categorize the syslogs for a specific context and drops the syslog events. <b>Note</b> Ensure that you enter valid IP addresses. Cisco Security Manager will not be validating the entered IP address pool.
Last Update in CSM	The date and time that group information was last updated for this group by Security Manager.
Group VPN Mode	Beginning from Cisco Security Manager 4.16, after discovering the Group device, group VPN mode will be displayed. This value will be Centralized or Distributed. <b>Note</b> This value is also displayed in the pop up window that appears when you hover the mouse pointer over the device in the device selector view.
Group VPN Backup	Beginning from Cisco Security Manager 4.16, the Group VPN Backup is displayed.  One of the following values will be displayed for distributed mode — <ul style="list-style-type: none"> <li>• Flat —When group VPN backup is on any other member</li> <li>• Remote Chassis — When group VPN backup is on a different chassis</li> </ul> Group VPN Backup information is not shown for centralized VPN mode. The value for this field in a centralized VPN mode is N/A. <b>Note</b> This value is also displayed in the pop up window that appears when you hover the mouse pointer over the device in the device selector view.
<b>Group Node Details</b>	
The Group Node Details table lists details for each device in the group.	
Group ID	The group ID of the group node.
Node Name	The member name of the group node.
Serial Number	The serial number of the group node.

Element	Description
CCL IP	The group control link IP address for the group node.
CCL MAC	The group control link MAC address for the group node.
Site ID	The site that the current group member belongs to. Configuring a site ID prevents MAC address flapping.

## License Information Page

You can monitor platform license subscription status, license expiry date, and license fetch date of the FPR-3100 series devices in the **Device properties** window.

### CSM License Scheduler

The CSM license scheduler runs daily, fetches the platform license details from the device, and updates the same in the CSM database. It is a background process that runs once for every 24 hours and the default time is 4:00 a.m. The license scheduler time in the CSM property file is customizable. The CSM property file is located in `..\CSCOpX\MDC\athena\configesm.properties`. The following are the three modes supported in the license scheduler:

- AM—You can enter any time between 0 and 11 and the scheduler runs at that specific time every morning.
- PM—You can enter any time between 1 and 12 and the scheduler runs at that specific time in the evening.
- AMPM—Use this if you follow 24-hour clock format and the scheduler runs at that specific time, respectively.

---

**Note** License scheduler starts when a service or a system restarts and cannot be stopped.

---

The updated license information gets reflected in the CSM in **Policy Header** and **Device Properties** under the **License Information** tab.

### Navigation Path

- From the Device selector, right-click an FPR-3100 series device and select **Device Properties**, then click **License Information**.
- From the Device selector, double-click an FPR-3100 series device, then click **License Information**.
- Select an FPR-3100 series device and select **Tools > Device Properties**, then click **License Information**.

---

**Note** License Fetch time for the Platform License information will not be displayed during DST.

---

### License subscription status in Device Properties

For FPR-3100 series devices, CSM handles different status of platform license subscription. The **License Details** are displayed under **License Information** in **Device Properties** page. The following are the status of license subscriptions supported:

Status	Description
Fresh Install	No license changes after the installation.
Eval Mode	Configuration changes done and license feature tier standard is configured. The available license validity is 90 days.
Eval Mode Expired	The evaluation mode validity is expired.
Compliant	Firepower device is registered with the Account and the licenses are sufficient.
Grace Period	Number of licenses on the Account is insufficient compared to the number of subscribed devices. Configuration changes deployment is valid till 90 days.
Grace Period Expired	Grace period expiration. <b>Tip</b> Connect to the Account to remediate or to unregister unnecessary devices.

**Note** FPR-3100 series devices, whose platform license has expired, triggers activity validation error on deployment. Activity validation error prevents you from managing the device, hence you must either upgrade the license to perform any deployment or delete the device from the CSM. Use the **Re-discovery via inventory** option to update the Platform License details in CSM at once.

### License subscription status in Policy Header

The **Platform License** for an FPR-3100 series device is displayed in color codes in the Policy Header GUI in CSM. The colour codes of license details are as follows:

- AUTHORIZED: BLACK
- GRACE PERIOD: ORANGE
- EVAL MODE: ORANGE
- EVAL EXPIRED: RED
- GRACE PERIOD EXPIRED: RED
- NO LICENSES IN USE: BLACK

---

**Note** Policy view does not display the license status for the FPR-3100 series devices.

---

## Policy Object Override Pages

You can override the global settings for many types of policy objects from the Device Properties window of a selected device. This enables you to customize the definition of an object on that device. For more information, see [Understanding Policy Object Overrides for Individual Devices](#) , on page 244.

The Policy Object Overrides folder in the table of contents includes all of the types of objects for which you can create overrides for the particular type of device. When you select an object type, the existing policy objects that are configured to allow device overrides appear in the table in the right pane, if any. If an object has an override already defined for the device, the Value Overridden? column contains a check mark.

You can create and manage overrides for these objects. Select an object and you can do the following:

- To create an override, click the Create Override button. This opens the edit dialog box for that type of object. Click the Help button for object-specific information.
- To edit an existing override, click the Edit Override button.
- To remove an override, click the Delete Override button.

### Navigation Path

Double-click a device in the Device selector, then click the desired policy object type in the **Policy Object Overrides** folder in the table of contents in the left pane.

### Related Topics

## Changing Critical Device Properties

You must use caution when changing the image version of a device, the device type, or the security context or operational mode of FWSM and ASA devices that are managed by Security Manager. In certain cases, these changes enable a different set of features for the device. As a result, some of the policies that you configured for the device in Security Manager might no longer apply.

The key device changes, their effect on the policies available in Security Manager, and the procedure you should follow to implement these device changes, are described in the following sections:

- [Image Version Changes That Do Not Change the Feature Set in Security Manager](#) , on page 123
- [Changes That Change the Feature Set in Security Manager](#) , on page 124

## Image Version Changes That Do Not Change the Feature Set in Security Manager

The following image version changes *do not* affect the types of policies available for that device in Security Manager:

- Upgrading from one IOS individual release number to another individual release number within the same Cisco IOS release; for example, upgrading from IOS 12.3(10) to 12.3(13).
- Upgrading from any IOS 12.1 image to any 12.2 image.
- Upgrading from any IOS 12.2 image to any 12.3 image.
- Upgrading from any IOS 15.0 image to any 15.1 image.
- Upgrading from any IOS 15.2 image to any 15.3 image.
- Upgrading from any PIX 6.x image to another PIX 6.x image.
- Upgrading from any PIX 7.x image to another PIX 7.x image, retaining the same security context and mode configuration.
- Upgrading from any ASA 7.x image to another ASA 7.x image, retaining the same security context and mode configuration.
- Upgrading from any ASA 8.0(x)-8.2(x) image to another ASA 8.0(x)-8.2(x) image, retaining the same security context and mode configuration.
- Upgrading from any FWSM 2.x image to another 2.x FWSM image, retaining the same security context and mode configuration.
- Upgrading from any FWSM 3.x image to another 3.x FWSM image, retaining the same security context and mode configuration.
- Upgrading a Catalyst 6500/7600 chassis from any IOS 12.x image to another IOS 12.x image.

---

**Note** This list applies only to images that are supported by Security Manager. For a list of supported images, see *Supported Devices and Software Versions for Cisco Security Manager* for this version of the product at [http://www.cisco.com/en/US/products/ps6498/products\\_device\\_support\\_tables\\_list.html](http://www.cisco.com/en/US/products/ps6498/products_device_support_tables_list.html).

---

For these cases, use the following procedure to change the image version.

### Related Topics

- [Understanding the Device View](#) , on page 69
- [Understanding Device Properties](#) , on page 74
- [Understanding Policies](#) , on page 165
- [Changes That Change the Feature Set in Security Manager](#) , on page 124

---

**Step 1** Upgrade the image version on the device.

**Step 2** In Device view, do one of the following in the Device selector to open the Device Properties dialog box:

- Double-click a device.

- Right-click a device and select **Device Properties**.
- Select a device and select **Tools > Device Properties**.

**Step 3** In the Device Properties dialog box, change the **Target OS Version** property on the General page to the updated version number and click **Save**.

## Changes That Change the Feature Set in Security Manager

These are the main types of device changes that affect the policy feature set available for a device:

- Image version changes—The following image version changes affect the types of policies available for that device in Security Manager:
  - Upgrading to ASA 8.4(x) or higher from an ASA 8.3(x) or lower release.
  - Upgrading to ASA 8.3(x) or higher from an ASA 8.2(x) or lower release.
  - Changes in the major version number for ASA, PIX, FWSM, and IPS devices. For example, upgrading an ASA from 8.x to 9.x, or downgrading an IPS device from 7.x to 6.x.
  - Upgrading from an IOS 12.1 or 12.2 image to an IOS 12.3 or 12.4 image.
  - Downgrading from an IOS 12.3 or 12.4 image to an IOS 12.1 or 12.2 image.
  - Upgrading to IOS 15.2 or higher from an IOS 12.3 or lower release.

If you make these changes, and you do not have any policies defined that are affected by the change, you might be able to change the target OS version of the device. Security Manager prevents you from changing the target OS version of a managed device to a version that changes the types of policies that are available for that device, and informs you when it cannot make the change (identifying the problem policies). Therefore, you must first delete the device from Security Manager, perform the image change, then add the device back.

Certain types of policies, such as access rules, are not affected by changes in image version or changes in platform type.

Changes to NAT policies that were introduced in the 8.3 and 9.0.1 ASA releases require that the NAT policies are rediscovered in Security Manager. This can be accomplished by deleting the device and then adding it back in to Security Manager, as described below, or you can rediscover just the NAT policies using the Discover Policies on Device feature. For more information on the Discover Policies on Device feature, see [Discovering Policies on Devices Already in Security Manager](#), on page 179.

**Note** If an ASA device was upgraded or downgraded from the current version to a higher or lower version outside of Security Manager, you should delete the device and then add it back in to Security Manager.

- Security context and operational mode changes—Changes that you make to the security context and operational mode settings on an FWSM or ASA device enable a different set of features on that device. These changes occur if you change the device from:
  - Single context to multiple context (or vice-versa).
  - Routed mode to transparent mode (or vice-versa).

Security Manager prevents you from changing the security context or operational mode settings of a managed device. Therefore, you must first delete the device from Security Manager, change the context or mode, then add the device back.

Certain policy types (for example, Banner, Clock, Console Timeout, and HTTP) are not affected by changes in operational mode. Other policy types (for example, ICMP, SSH, and TFTP, in addition to Banner and Clock) are not affected by changes in security context settings.

- Replacing device hardware—In some cases, you might replace a particular device but retain the original contact information (such as the IP address), for example:
  - Replacing a PIX firewall with a Cisco IOS router.
  - Replacing a PIX firewall with an ASA device.
  - Replacing a router with a firewall device.
  - Replacing a router with a new router of a different model.

In all of these cases, the new device changes the types of policies available for that device in Security Manager. Security Manager prevents you from modifying the hardware model of an existing device. Therefore, you must first delete the device from Security Manager, change the physical device, then add the device back.

Certain policy types (for example, access rules) are not affected by changes in device type.

We recommend that you share the policies configured on your device that will not be affected by the change before you remove it from Security Manager. This provides a useful method for reassigning the policies to the device (with any inheritance and policy object references intact) after you add it back to Security Manager. The following procedure describes how to do this.

#### Related Topics

- [Understanding the Device View](#) , on page 69
- [Understanding Device Properties](#) , on page 74
- [Understanding Policies](#) , on page 165
- [Image Version Changes That Do Not Change the Feature Set in Security Manager](#) , on page 123

- 
- Step 1** Submit and deploy all the changes you configured for the device in Security Manager. This ensures that the desired configuration is on the device before the image upgrade.
- Step 2** Share the local policies defined on the device:
- a) Right-click the device in the Device selector, then select **Share Device Policies**. By default, all policies configured on the device (local and shared) are selected for sharing in the Share Policies wizard.
  - b) Deselect the check box next to each existing shared policy, as indicated by the hand in the policy icon. You should do this because there is no need to create a copy of the shared policies that already exist; you will reassign the existing shared policies after the image version upgrade.
  - c) Enter a name for the shared policies. We recommend using the device name as a convenient means of identification. For example, if the device name is MyRouter, each shared policy is given the name MyRouter. Make a note of all the policies you are creating for this purpose.
  - d) Click **Finish**. The selected local policies become shared policies.
- Step 3** Delete the device from Security Manager.

- Step 4** Make the desired change to the device, for example, upgrade the image version, change the operational mode, or replace the device.
- Step 5** Add the device back to Security Manager and perform policy discovery.
- Step 6** Reassign the policies to the device:
- a) Right-click the first policy type displayed in the Device Policies selector, then select **Assign Shared Policy**.
  - b) In the Assign Shared Policy dialog box, do one of the following:
    - If a local policy was previously defined on the device, select the shared policy you created for this procedure and click **OK**.
    - If a shared policy of this type was previously assigned to the device, select it and click **OK**.
  - c) (Local policies only) Right-click the policy type again in the Device Policies selector, then select **Unshare Policy**.
  - d) Repeat the process for each policy type that is relevant to the device's configuration. If a shared policy is not available, this indicates that this is a policy type that was not available for the previous image version.
- Step 7** (Optional) Delete the shared policies created for this procedure from Policy view:
- a) Select **View > Policy View** or click the **Policy View** icon on the toolbar.
  - b) Select one of the policies you want to delete and click the **Assignments** tab in the work area to verify that the policy is not assigned to any devices.
  - c) Click the **Delete Policy** button beneath the Shared Policy selector to delete the policy.
  - d) Repeat the process for each policy type that you want to delete.

## Showing Device Containment

You can display the service modules, security contexts, and virtual sensors that are contained in devices that include them. Based on the type of device, you can view these contained elements:

- Catalyst 6500 devices—The IDSM and FWSM service modules, security contexts, and virtual sensors.
- For FWSM, PIX Firewall 7.0, and ASA devices—The security contexts defined on the device. For information about security contexts, see [Configuring Security Contexts on Firewall Devices, on page 2307](#).
- IPS devices—The virtual sensors defined on the device.

To view contained items, in Device view, select one of these types of devices and then select **Tools > Show Containment**, or right-click the device and select **Show Containment**. The Composite View dialog box opens and displays elements contained in the selected device, if any.

## Cloning a Device

A cloned (duplicate) device shares the configurations and properties of the source device. Cloning a device saves you time because you do not need to re-create configuration and properties on the new device.

The cloned device shares the device operating system version, credentials and grouping attributes with the source device, but it has its own unique identity, such as display name, IP address, hostname, and domain name. You can clone only one device at a time.

---

**Note** You cannot clone a Catalyst switch or a Catalyst 6500/7600 device.

---

#### Related Topics

- [Understanding the Device View](#) , on page 69
- [Copying Policies Between Devices](#) , on page 197

---

#### Step 1

Do one of the following:

- (Device view) Select the device and select **File > Clone Device**, or right-click the device in the Device selector and select **Clone Device**.
- (Map view) Right click a device and select **Clone Device**.

The Create a Clone of Device dialog box appears.

#### Step 2

Enter the IP address and names for the clone in the appropriate fields. Following are the available attributes:

- **IP Type**—Whether the device uses a static or dynamic (DHCP-provided) IP address. You cannot change the IP type when cloning a device.
- **Hostname**—(Static IP only.) The DNS hostname for the cloned device.
- **Domain Name**—(Static IP only.) The DNS domain name for the cloned device. If you do not provide the domain name, Security Manager uses the default domain name configured on the server.
- **IP Address**—The management IP address of the cloned device, for example, 10.10.100.1. If you do not know the IP address, enter the DNS hostname in the Hostname field. You must enter either the IP address or the hostname for devices with static IP addresses.

**Note** Beginning with version 4.12, Security Manager server to device communication for ASA devices is supported over either IPv6 address or over IPv4 address.

- **Display Name**—The name that appears in Security Manager device lists. The maximum length is 70 characters. Valid characters are: 0-9; uppercase A-Z; lowercase a-z; and the following characters: \_ - . : and space.
- **Device Identity**—(Dynamic IP only.) The string value that uniquely identifies the device in Auto Update Server or Configuration Engine. This field appears only if the device is configured to use one of these servers.
- **Clone VPN Assignments**—Whether to copy the VPN assignments defined for the device. This field is displayed only if the device supports VPN assignments.

You can clone the VPN assignments of a device that is a spoke in a hub-and-spoke configuration, or a device that participates in a full mesh topology. If you clone a spoke device, the new device is added to the VPN as a new spoke with the same policies. If you clone a device in a full mesh VPN, the new device is added to the full mesh VPN with the same policies. You cannot clone a device in a point-to-point VPN topology.

#### Step 3

Click **OK**. A clone of the source device with its unique display name is created in the Device selector.

---

## Deleting Devices from the Security Manager Inventory

If you do not want to continue managing a device in Security Manager, you can delete it from the inventory. Deleting a device from Security Manager does not change any configuration settings on the device.

---

**Tip** If someone is configuring policies on the device, locks will prevent you from deleting the device.

---

There are special considerations when deleting certain types of devices:

- If the device participates in a VPN, deleting the device removes it from the VPN. However, if removing the device invalidates the VPN topology, the entire VPN topology is also deleted when you delete the device. You are warned of this and given the opportunity to cancel the device deletion.
- For ASA, PIX, and FWSM devices running in multiple context mode, or for IPS devices that contain virtual sensors, deleting the device also deletes all of its security contexts or virtual sensors. You cannot delete an individual security context or virtual sensor using this procedure: instead, you must modify the appropriate policies on the hosting device to remove them.
- If you delete a device that contains managed service modules, the contained devices are also deleted. For example, if you added a Catalyst switch and its contained FWSM, if you delete the switch, the FWSM is also deleted. You are warned if contained devices will be deleted.

---

**Tip** Device deletion requires the removal of a lot of information from the database. If you delete a lot of devices at one time, it can take a while for the operation to complete. If you have a lot of devices to delete, consider deleting them in smaller groups.

---

**Step 1** In Device view, do one of the following:

- Select the devices you want to delete, or a device group if you want to delete all devices within the group, right-click and select **Delete Devices**. You can also click the **Delete Device** button (the trash can icon) above the device selector.
- Select **File > Delete Device**, then select the devices to delete in the Device Selector dialog box and click >> to move them to the selected devices list (which is pre-filled with any devices that were selected in the device tree). You can select a device group to delete all of its member devices. Click **OK** when finished.

**Tip** When you select a device group, you are deleting only the devices in the group, you are not deleting the group itself. For information on deleting device groups, see [Deleting Device Groups or Group Types](#), on page 133.

**Step 2** You are asked to confirm that you want to delete the devices.

Security Manager then validates whether the device can be deleted. If problems or potential problems are identified, they are listed in the [Device Delete Validation Dialog Box](#), on page 129. This dialog box shows errors (indicating devices that cannot be deleted) as well as warnings and informational messages.

You can elect to confirm the deletion of devices that have warnings or informational messages if you accept the consequences described in the message. The dialog box has an **OK** button if you can continue deleting all selected devices,

or a **Continue** button if there are any error messages. If you click **Continue**, you are deleting only those devices without error conditions. You are asked to confirm.

---

## Device Delete Validation Dialog Box

Use the Device Delete Validation dialog box to view error, warning, and informational messages during device deletion. For detailed information on deleting devices, see [Deleting Devices from the Security Manager Inventory](#) , on page 128.

Each row represents a device for which a validation issue arises when trying to delete it. Displayed are the message severity icon, device display name, and the result of validation, which indicates the reason why you cannot delete the device, or warnings or information about the perhaps unexpected consequences of deleting the device. If there are no messages for a device, it is not listed.

Double-click a row or select it and click the **Details** button to read longer messages. The information is displayed in the Device Delete Validation Details dialog box in a more readable format.

The message severity can be one of the following.

- **Error**—A problem was detected that will prevent you from deleting the device. For example, another user has a lock on a device.
- **Warning**—Proceed with caution. For example, deleting the device will invalidate a VPN topology, and if you continue, the VPN topology will also be deleted.
- **Information**—A minor problem exists. For example, deleting the device will delete it from a VPN.

To proceed with the device deletion, click the OK or Continue button, which is actually the same button:

- If the text says **OK**, then when you click it, all devices you selected for deletion are deleted.
- If the text says **Continue**, then there are errors for some of the devices you selected. If you click Continue, you will delete only those devices that do not have errors.

If all selected devices have errors, the button is greyed out and you must click Cancel. Resolve any errors before attempting to delete the devices.

### Navigation Path

This dialog box appears only if you try to delete devices and Security Manager determines that there are problems with the deletion.

## Working with Device Groups

You can create device groups to help you organize your devices for more effective device management. The following topics explain device groups and how to use them:

- [Understanding Device Grouping](#) , on page 130
- [Creating Device Group Types](#) , on page 132
- [Creating Device Groups](#) , on page 132
- [Deleting Device Groups or Group Types](#) , on page 133

- [Adding Devices to or Removing Them From Device Groups](#) , on page 133

## Understanding Device Grouping

Device groups are simple, arbitrary, organizational collections of devices that you create for more effective network visualization. They are not policy-sharing entities. They are distinct from the various policy object groups (for example AAA server group objects and user group objects). For information on policy objects, see [Managing Policy Objects, on page 227](#).

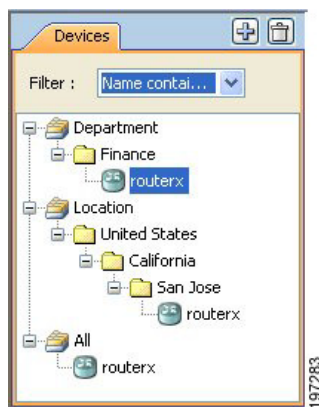

**Tip** If you have a large number of devices, grouping them can make it easier to select a subset of devices when you deploy changes to them. For example, if there is a set of devices that you know you will want to deploy changes to simultaneously, if you put them in a single device group, you just have to select the group in the deployment job. For more information about policy deployment, see [Managing Deployment, on page 379](#).

Device grouping enables you to view a subset of devices in the inventory. The device group hierarchy has two types of folders:

- **Device group types**—Group types are the highest level in the hierarchy. A group type can contain specific device groups, but it cannot contain devices, except for the All group type, which includes all devices in the inventory. Security Manager comes with the group types Department and Location predefined, but you do not need to use them, and you can delete them. You can create a maximum of 10 group types.
- **Device groups**—Device groups are subfolders within a group type folder. You can create multiple levels of nested device groups. You can place devices within device groups. However, a device can be in only one group within a group type. For example, in [Figure 6: Device Groups](#) under the group type, Location, you can assign routerx to San Jose, but you cannot assign routerx to San Jose and California.

[Figure 6: Device Groups](#) shows an example of nested device groups with devices in some of the groups. Notice that an individual device can reside in multiple groups. In this example, routerx is in the Finance group (under the Department group type), and also in the Location > United States > California > San Jose nested group. If you select routerx in any of these places, you are configuring a single device (the configurations are not tied to the grouping).

**Figure 6: Device Groups**

Security Manager lets you create or delete group and group types, and put devices in groups, in many locations in the interface:

- When adding devices to the inventory—The New Device wizard includes a Device Grouping page, where you can create device group types and select a group for the newly-added device. You can also select a default group to which all new devices are added.
- When viewing the device inventory in Device view—The File > Edit Device Groups command opens a dialog box where you can create or delete groups and group types. If you select a group or group type in the Device selector, the File menu and the right-click shortcut menu includes commands for adding groups or adding devices to groups.

To add devices to a group, or remove them from a group, select the group and select **File > Add Devices to Group**.

- When viewing the properties for a device—The Device Grouping page allows you to select the groups to which the device belongs, and to set defaults for devices added to the inventory. This is the only place where you can remove a device from a device group. Double-click a device in the Device selector to open the device properties.
- When using the administration pages—Select **Tools > Security Manager Administration > Device Groups** to open the administration page for device groups, where you can create or delete groups and group types, but you cannot add devices to groups here.

## Edit Device Groups Dialog Box

Use the Edit Device Groups dialog box to manage the device groups and group types defined in the device inventory.

#### Navigation Path

Do one of the following:

- Right-click a device group type or a device group in the Device selector and select **Edit Device Groups**.
- Select **File > Edit Device Groups**.
- From the Device Grouping page in the New Device wizard or for existing devices, the device properties, select **Edit Groups** from a group type list. See [Device Groups Page](#) , on page 117.

#### Related Topics

- [Understanding Device Grouping](#) , on page 130

## Field Reference

*Table 27: Edit Device Groups Dialog Box*

Element	Description
Groups	Displays the device groups and group types. To rename a group or type, select it and then click it again to make the text editable. Type in the new name and press Enter.
Add Type button	Click this button to create a new group type. The type is added with a default name. Overtyping the name and pressing Enter. You can have a maximum of 10 group types.
Add Group to Type button	Click this button to add a device group to the selected device group or group type.
Delete button (trash can)	Click this button to delete the selected device group or group type and all device groups that it contains. Deleting a device group or group type does not delete any devices it contains.

## Creating Device Group Types

This procedure describes the most direct method to create device group types. For information on other methods of adding group types, see [Understanding Device Grouping](#), on page 130.

Device group types are the top-level categories in your device group hierarchy. If you want to add a device group, see [Creating Device Group Types](#), on page 132.

### Related Topics

- [Understanding Device Grouping](#), on page 130
- [Deleting Device Groups or Group Types](#), on page 133
- [Adding Devices to or Removing Them From Device Groups](#), on page 133

- 
- Step 1** Select **File > Edit Device Groups**.  
The Edit Device Groups page opens (see [Edit Device Groups Dialog Box](#), on page 131).
- Step 2** Click **Add Type**. A new device group type entry is added to the selector.
- Step 3** Enter a name for the group type and press **Enter**.
- Step 4** Click **OK** to close the Edit Device Groups page.
- 

## Creating Device Groups

This procedure describes the most direct method to create device groups. For information on other methods of adding groups, see [Understanding Device Grouping](#), on page 130.

Device groups are the lower-level categories in your device group hierarchy, and are added either within a device group type (top-level) or within another device group. If you would rather add a device type group, see [Creating Device Group Types](#) , on page 132.

#### Related Topics

- [Understanding Device Grouping](#) , on page 130
- [Adding Devices to or Removing Them From Device Groups](#) , on page 133
- [Deleting Device Groups or Group Types](#) , on page 133

---

**Step 1** Select a device group or group type in the Device selector and select **File > New Device Group**, or right-click and select **New Device Group**.

The Add Group dialog box appears.

**Step 2** Enter a name for the device group and click **OK**. The new device group is added to the Device selector.

---

## Deleting Device Groups or Group Types

If you no longer need a device group or group type, you can delete it. The only group type that you cannot delete is the All group.

When you delete a group or group type, you delete any groups that are in it. However, you are not deleting any devices. The devices that are in the group remain in the inventory and can be found in other groups to which they belong (you can find all devices in the All group).

There are many ways to delete device groups and group types. This procedure explains the most direct way. For information on other methods of deleting them, see [Understanding Device Grouping](#) , on page 130.

---

**Step 1** In Device view, select **File > Edit Device Groups**. The Edit Device Groups page opens (see [Edit Device Groups Dialog Box](#) , on page 131).

**Step 2** Select the group type or group you want to delete and click the **Delete** button. You are asked to confirm the deletion.

---

## Adding Devices to or Removing Them From Device Groups

You must create a device group before you add devices to it. To create groups, see [Creating Device Groups](#) , on page 132.

#### Related Topics

- [Understanding Device Grouping](#) , on page 130
- [Filtering Items in Selectors](#) , on page 47

---

**Step 1** Select the device group in the Device selector, right-click and select **Add Devices to Group**. The Add Devices to Group dialog box appears.

- Step 2** To add devices to the group, select the devices in the Available Devices selector and click >> to move them to the Selected Devices list.
- To remove devices, select them in the Selected Devices list and click <<.
- Step 3** Click **OK**. The device group membership is adjusted to include the devices that were in the Selected Devices list.

## Working with Device Status View

You can use the Device Status View to quickly see the status of the devices in the Security Manager inventory. The Device Status View window aggregates information from several applications and tools within Cisco Security Manager. You can use the Device Status View to quickly see the status of all your devices or specific groups of devices and can easily navigate to the areas in Security Manager you need to act on that information.

**Caution** In some cases, for a particular device, Health and Performance Monitor displays a "critical" device status while Configuration Manager displays a "normal" device status. Restarting the services or the server does not resolve this discrepancy. For this reason, you should monitor device status in HPM in addition to Configuration Manager.

### Navigation Path

- Select **View > Device Status View**. The Device Status View window opens showing information for all devices.
- Select a device group in the Device selector. The Device Status View window opens showing information for the devices that are part of that device group or a subgroup.

**Figure 7: Device Status View**

## Field Reference

**Table 28: Device Status View**

Element	Description
<p><b>Device Status Summary Boxes</b></p> <p>The Device Status Summary boxes provide a high-level view of the overall status of the devices in the Device Status View. The counts shown in the summary boxes reflect the status for the devices in the currently selected device group. If you select View &gt; Device Status View or select the All devices group, then the summary boxes reflect the counts for all devices.</p> <p><b>Note</b> Filtering the device list in the Device Status View window will not affect the counts in the Device Status Summary boxes.</p>	
Health and Performance Monitor summary box	Shows the device counts for the Critical (red), Warning (yellow), and Normal (green) alert statuses.
Deployment Manager summary box	Shows the device counts for the Fail (red), Pending (yellow), and Pass (green) deployment statuses.
Device State summary box	Shows the device counts for the Critical (red), Warning (yellow), and Normal (green) device states.
<p><b>Device Status View Toolbar</b></p> <p>The Device Status View toolbar provides the following buttons:</p> <p><b>Note</b> These options are all also available from the right-click menu for a device.</p>	
	Allows you to export the device status information to a PDF file.
	Allows you to print the device status information.
	Shows alert status information for the selected device in the Health & Performance Monitor application. For more information, see <a href="#">Health and Performance Monitoring, on page 2813</a> .
	Shows monitoring information for the selected device in the Health & Performance Monitor application. For more information, see <a href="#">Health and Performance Monitoring, on page 2813</a> .
	Opens the Deployment Manager. For more information, see <a href="#">Managing Deployment, on page 379</a> .
	Opens the Image Manager application for the selected device. For more information, see <a href="#">Using Image Manager, on page 2917</a> .

Element	Description
	Opens the device manager for the selected device. For more information, see <a href="#">Starting Device Managers</a> , on page 2875.
	Launches the Cisco Prime Security Manager (PRSM) application for the selected device. See <a href="#">Launching Cisco Prime Security Manager or FireSIGHT Management Center</a> , on page 2882 for more information.
	Opens the Device Properties dialog box for the selected device. For more information, see <a href="#">Viewing or Changing Device Properties</a> , on page 107.
	Allows you to navigate to the selected device from the Device Status View window. For more information, see <a href="#">Understanding the Device View</a> , on page 69.
	Opens online help for the current page. For more information, see <a href="#">Accessing Online Help</a> , on page 54.
	Undocks the Device Status View window, which enables you to use other product features while keeping the window open.
	Docks the Device Status View window. <b>Note</b> If the selection has changed in the Device Selector, the Work area will reflect the current selection when the Device Status View window is docked.
<b>Table Filter</b>	
You can filter the list of devices displayed in the Device Status View table to help you find items meeting specific criteria. For more information, see <a href="#">Filtering Tables</a> , on page 50.	
Device Status Table	
Display Name	The display name for the device. This is the name used for display in the Security Manager Device selector and is not necessarily the same as the host name for the device.
Managed	Whether Security Manager manages the device.
Monitored	Whether the device is monitored by the Health and Performance Monitor.
Alerts	Indicates current alert level for the device; can be Normal (green), Warning (yellow), or Critical (red). You can hover over the alert indicator to view more details.

Element	Description
Connection	<p>Indicates HPM's ability to connect to/poll the device: Connected, Authentication Error, Certificate Mismatch Error, Connection error, Timeout during Read operation, or Service unavailable. You can hover over the alert indicator to view more details.</p> <p><b>Note</b> If the device is not selected as a Normal or Priority Monitored Device in HPM (Tools &gt; Device Selector), this status will not apply. Changes to Monitored Device selection may take several minutes to become effective and be reflected on screen.</p>
State	<p>Indicates the current state of the device. You can hover over the alert indicator to view more details.</p> <p>For ASA devices that are being monitored by the Health and Performance Monitor, the State column will also alert when possible out of band changes have been detected. Any out of band changes that occurred prior to monitoring the device in Health and Performance Monitor will not be reflected in the State column. For more information about out of band changes, see <a href="#">Understanding How Out-of-Band Changes are Handled</a>, on page 390 and <a href="#">Detecting and Analyzing Out of Band Changes</a>, on page 424.</p>
Deployment	Indicates the deployment method and the current deployment status for the device. Deployment status can be Fail (red), Pending (yellow), and Pass (green). You can hover over the alert indicator to view more details.
Additional Information	Shows additional information for the device, such as whether the device is in cluster mode. You can hover over the alert indicator to view more details.
IP Address	The management IP address of the device, for example 192.168.3.8.
Hostname.Domain	The DNS hostname and domain name for the device.
Target OS Version	The OS version on which you the device's configuration is based.
Running OS Version	The version of the operating system running on the device.
Device Type	The type of device.

## CHAPTER 4

# Managing Activities

Whether you are using Workflow or non-Workflow mode, all policy configuration is done within an activity, which is also called a configuration session in non-Workflow mode. In Workflow mode, you must explicitly create and manage activities, whereas in non-Workflow mode much of the activity creation and management is done automatically for you. However, in non-Workflow mode, you are in fact working within an activity whenever you modify policies, and so you should understand the basic activity concepts.

In non-Workflow mode with Ticket Management enabled, an activity is created automatically and transparently whenever you open a ticket. You must actively open and manage tickets in this mode.

The following topics provide information about activities:

- [Understanding Activities](#) , on page 139
- [Working with Activities/Tickets](#) , on page 146

## Understanding Activities

An activity is a temporary context within which you define policies and assign them to devices. You do not need to create an activity to import, create, or delete devices (unless you perform policy discovery as part of the action), or to perform various system management tasks.

The requirements for creating or opening activities differ depending on your Workflow mode:

- Non-Workflow mode with Ticket Management—An activity is created automatically and transparently whenever you open a ticket. If you do not explicitly open a ticket, you are prompted to create a new ticket or open an existing one whenever you perform an action that requires an activity. You must actively open and manage tickets in this mode.
- Non-Workflow mode without Ticket Management—An activity is created automatically and transparently for you whenever you define, modify, or assign policies to devices. The same activity is used until you submit your changes to the database, and is automatically closed and reopened as needed. You cannot actively open or manage activities in non-Workflow mode. These types of activities are also called configuration sessions.
- Workflow mode—If you do not explicitly open an activity, you are prompted to create a new activity or open an existing one whenever you perform an action that requires an activity. You must actively open and manage activities in Workflow mode.

**Note** Workflow mode works in the same manner whether Ticket Management is enabled or not. Enabling Ticket Management in Workflow mode simply enables the Ticket field for use with Activities. Entering a ticket ID is not required, but if one is used, the Ticket field can be configured to link to an external change management system. For more information, see Ticket Management.

When you create an activity, or one is created for you, you open a virtual copy of the Security Manager policy database. You define and assign policies within this copy. Changes that you made within this copy are only available within the copy. Other users in different activities cannot see these changes. After the activity is submitted and, in Workflow mode, approved, the changes within this copy are committed to the database so that all other users can view the changes. Then, you can create a deployment job to generate the relevant CLI commands and deploy them to the devices.

How you submit your activity changes differs depending on Workflow mode:

- Non-Workflow mode with Ticket Management (default)—Select **Tickets > Submit Ticket** to submit your changes to the policy database.
- Non-Workflow mode without Ticket Management—Select **File > Submit** to submit your changes to the policy database.
- Workflow mode—Select **Activities > Submit Activity** if you are working with an activity approver, or **Activities > Approve Activity** if you do not have a separate activity approver.

The following topics describe why activities are important and how they operate in Workflow mode:

- [Benefits of Activities](#) , on page 140
- [Activity Approval](#) , on page 141
- [Activities and Locking](#) , on page 141
- [Activities and Multiple Users](#) , on page 142
- [Understanding Activity/Ticket States](#) , on page 142

## Benefits of Activities

You use activities to control changes made to policies and policy assignments. Although how activities are implemented depends on the workflow settings you choose, all activities provide the following benefits:

- Audit trail—Activities track changes that are made in Security Manager. You can use this information to determine what changes were made and who made the changes as described in [Viewing Activity/Ticket Status and History](#) , on page 163. For both Workflow and non-Workflow mode, there is also an audit report that provides visibility into activities and other actions, as described in [Working with Audit Reports](#), on page 495.
- Safety mechanism—Activities provide a means for experimenting with changes. Because you are making the changes to a private database view, if you do not want to implement the changes, you can easily discard the activity or configuration session. For more information, see [Discarding an Activity/Ticket](#) , on page 161.

- Task isolation—The policies that are modified within an activity (or configuration session) are locked from being modified within other activities. This prevents conflicting changes that could make a policy unstable. For more information, see [Activities and Locking](#) , on page 141.

In addition, the changes you make within an activity are visible *only* within the activity. Other users see only the last approved committed configurations, unless they view your activity before you close it (in Workflow mode).

## Activity Approval

When you enable Workflow mode, you can choose to operate with or without an activity approver.

If your organization requires a different person with higher permissions to approve activities, you can enable workflow with an approver. When using Workflow mode with an approver, the activity must be approved by a person with the appropriate permissions so the policies can be committed to the database. This approval process at the policy definition level helps to ensure that no inappropriate configurations reach the network devices.

If you choose to operate without an approver, the person defining the policies has the permissions to approve them.

For information about enabling or disabling activity approval and changing the default activity approver, see [Workflow Page](#) , on page 588.

## Activities and Locking

To prevent multiple users from making conflicting changes, Security Manager obtains activity-level locks when a user performs certain actions within an activity or configuration session in Workflow or non-Workflow mode. This prevents two or more people from making changes to the same feature policy, policy assignment, or object at the same time.

Security Manager also uses locking to ensure that operations related to the committed configuration always run exclusive of one another. These operations can be divided into two categories:

Operations that change the committed configuration:

- Activity approval, which includes configuration session submission in non-Workflow mode.
- Device deletion.
- Editing device properties.

Operations that read the committed configuration:

- Configuration preview.
- Deployment (in non-Workflow mode).
- Creation of deployment job (in Workflow mode).
- Activity or configuration session validation.

If you are performing an operation that changes the committed configuration, no one can perform any of the operations in either list until this operation is complete. An error message is displayed to the user who tries, indicating the action and activity (or user, in non-Workflow mode) that has the lock. For example, if you are

approving an activity (which occurs automatically when an activity is submitted in non-Workflow mode), no one else can delete a device or validate a different activity until the approval is complete. This type of locking is particularly important in multi-user settings as it prevents multiple users from simultaneously making changes to the committed configuration.

If you are performing an operation that reads the committed configuration, no one can perform an operation that changes the committed configuration. For example, if you are validating an activity, another user cannot approve an activity. However, other users can perform another operation that reads the configuration. For example, if you are validating an activity, another user can create a deployment job. Similarly, if you are previewing the configuration before deployment, another user is permitted to do the same. This is because these two operations are limited to reading the committed configuration; they do not make any changes to it.

**Tip** Activity locking is broader in scope than policy locking, which is described in [Understanding Policy Locking](#), on page 172. Policy locking prevents two users from changing the same policy on the same device simultaneously.

### Related Topics

- [Validating an Activity/Ticket](#), on page 158

## Activities and Multiple Users

Only one user can define or change policies within an individual activity at one time. However, when Workflow mode is enabled or when Ticket Management is enabled in non-Workflow mode, multiple users can work in the activity in sequence. That is, if an activity or ticket is closed (but not yet approved or submitted for approval), another user can open it and make changes to it if they have the necessary privileges. Multiple users can work in parallel in different activities.

## Understanding Activity/Ticket States

Activities in Workflow mode and tickets in non-Workflow mode (when Ticket Management is enabled) can have the states described in the following table. The main states are shown in bold.

**Table 29: Activity/Ticket States**

<b>State</b>	<b>Description</b>
Edit	The activity/ticket was created, but the activity is not currently being edited. The activity/ticket can be opened or discarded while it is in the Edit state.

State	Description
<b>Edit Open</b>	<p>The activity/ticket is open for editing. Changes, such as defining and assigning policies, can be made in the activity/ticket. The policies, policy assignments (devices being assigned policies), and objects being configured or modified in the activity/ticket are locked. That is, they cannot be configured or modified within the context of another activity/ticket. An activity can be closed, discarded, submitted, or approved while it is in the Edit Open state. A ticket can be closed, discarded, or submitted while it is in the Edit Open state.</p> <p>The configuration changes can be seen only in the context of the activity/ticket.</p>
<b>Submitted</b> Submitted Open	<p>The activity was submitted for review and approval or the ticket was submitted. (In Workflow mode, this state is available only if you have activity approval required. For more information, see <a href="#">Workflow Page</a>, on page 588.) No further changes can be made within the activity/ticket. The policies, devices (through policy assignment), or objects affected by the policy changes remain locked to other activities/tickets.</p> <p>When an activity is submitted, an e-mail is sent to the approver. The approver can open the activity (in read-only mode, moving to the Submitted Open state) to review the changes within the activity, then approve or reject it. An approved activity moves to the approved state. A rejected activity returns to the Edit state.</p>
<b>Approved</b> (Workflow mode only)	<p>The activity was approved, and the corresponding configuration elements are now committed policy configurations. The devices affected by the policy changes are no longer locked to other activities. The activity can be deployed while it is in the Approved state.</p>
Approve Failed(Workflow mode only)	<p>The activity is placed in the Approve Failed state if errors occur during approval (for example, due to a power failure). If this happens, try to approve the activity again or reboot the server.</p>
Discarded	<p>Changes made to the activity/ticket since it was created were discarded and further changes to the activity/ticket are not allowed. Devices associated with the activity/ticket are unlocked and can now be used in a new activity/ticket. The activity/ticket remains in the table showing a Discarded state until it is purged from the system.</p>

Figure 8: Ticket Workflow, on page 144 shows the stages in the ticket workflow. Figure 9: Activity Workflow without an Approver, on page 145 shows the stages in the activity workflow without an approver. Figure 10: Activity Workflow with an Approver, on page 146 shows the stages in the activity workflow with an approver.

## Working with Activities/Tickets

The following topics provide information to help you use activities and configuration sessions:

- [Accessing Activity Functions in Workflow Mode](#) , on page 147
- [Accessing Ticket Functions in Non-Workflow Mode](#) , on page 148
- [Creating an Activity/Ticket](#) , on page 153
- [Opening an Activity/Ticket](#) , on page 154

- [Closing an Activity/Ticket](#) , on page 155
- [Viewing Change Reports](#) , on page 156
- [Validating an Activity/Ticket](#) , on page 158
- [Submitting an Activity for Approval \(Workflow Mode with Activity Approver\)](#) , on page 159
- [Approving or Rejecting an Activity \(Workflow Mode\)](#) , on page 160
- [Discarding an Activity/Ticket](#) , on page 161
- [Viewing Activity/Ticket Status and History](#) , on page 163

## Accessing Activity Functions in Workflow Mode

In Workflow mode, you can access activity management functions in the following ways:

- Select **Manage > Activities**. The Activity Manager window contains a list of existing activities and their states. From this window, you can create new activities, and open, close, submit, approve, reject, or discard existing activities. For more information, see [Activity/Ticket Manager Window](#) , on page 149.
- Click a button in the Activities portion of the main toolbar or select the equivalent command in the Activities menu. Whether a button or command is active depends on your user permissions, the state of the activity, and whether you are using workflow with or without an approver. The following table explains the buttons and commands and the conditions under which you can them.

**Note** If an activity is open, the activity name is displayed above the Global Search field in the upper right corner of the Configuration Manager interface. You can click the activity name to open the Activity Manager window.

**Table 30: Activities Tool Bar Buttons and Commands When Workflow Mode Is Enabled**

Button	Activities Menu Command	Description
	New Activity	Creates an activity.
	Open Activity	Opens an activity. You can open an activity when it is in the Edit or the Submitted state.  To open a submitted activity, you must have user privileges to approve or reject changes made in that activity. For more information, see the <a href="#">Installation Guide for Cisco Security Manager</a> .
	Close Activity	Saves all changes made while the activity was open and closes it.  You can close an activity when it is in the Edit Open or the Submit Open state.
	View Changes	Evaluates all changes made in the activity and produces an Activity Change Report in PDF format in a separate window. For more information, see <a href="#">Viewing Change Reports</a> , on page 156.

Button	Activities Menu Command	Description
	Validate Activity	Validates the integrity of changed policies within the current activity. By validating an activity, you can check for configuration errors that you might have introduced by your policy changes.
	Submit Activity	In Workflow mode with an activity approver, submits the activity for approval. You can submit an activity when it is in the Edit or the Edit Open state.
	Approve Activity	Approves the changes proposed in an activity. You can approve an activity when it is in the Submitted state when using an activity approver, or the Edit or Edit Open state when not using an approver. You must have user privileges to accept the changes proposed in an activity. For more information, see the <a href="#">Installation Guide for Cisco Security Manager</a> .
	Reject Activity	In Workflow mode with an activity approver, rejects the changes proposed in an activity. You can reject an activity when it is in the Submitted or Submitted Open state. You must have user privileges to deny changes proposed in an activity. For more information, see the <a href="#">Installation Guide for Cisco Security Manager</a> .
	Discard Activity	Discards the selected activity. The activity is discarded and later purged from the system after it exceeds the age for keeping activities as set under Tools > Security Manager Administration > Workflow. The activity state is shown as discarded until the activity is actually purged from the system.

## Accessing Ticket Functions in Non-Workflow Mode

In non-Workflow mode with Ticket Management enabled, you can access ticket management functions in the following ways:

- Select **Manage > Tickets**. The Ticket Manager window contains a list of existing tickets and their states. From this window, you can create new tickets, and open, close, submit, or discard existing tickets. For more information, see [Activity/Ticket Manager Window](#), on page 149.
- Click a button in the Tickets portion of the main toolbar or select the equivalent command in the Tickets menu. Whether a button or command is active depends on your user permissions and the state of the ticket. The following table explains the buttons and commands and the conditions under which you can them.

**Note** If a ticket is open, the ticket ID is displayed above the Global Search field in the upper right corner of the Configuration Manager interface. You can click the ticket ID to open the Ticket Manager window.

Table 31: Tickets Tool Bar Buttons and Commands When Ticket Management Is Enabled in Non-Workflow Mode

Button	Activities Menu Command	Description
	New Ticket	Creates a ticket.
	Open Ticket	Opens a ticket. You can open a ticket when it is in the Edit state.
	Close Ticket	Saves all changes made while the ticket was open and closes it. You can close a ticket when it is in the Edit Open state.
	View Changes	Evaluates all changes made in the ticket and produces a Ticket Change Report in PDF format in a separate window. For more information, see <a href="#">Viewing Change Reports</a> , on page 156.
	Validate Ticket	Validates the integrity of changed policies within the current ticket. By validating a ticket, you can check for configuration errors that you might have introduced by your policy changes.
	Submit Ticket	Submits the ticket. Submitting the ticket saves the proposed changes to the database. Devices associated with the ticket are unlocked, meaning they can be included in policy definitions and changes in other tickets. You can submit a ticket when it is in the Edit or the Edit Open state.
	Discard Ticket	Discards the selected ticket. The ticket is discarded and later purged from the system after it exceeds the age for keeping tickets as set under <b>Tools &gt; Security Manager Administration &gt; Ticket Management</b> . The ticket state is shown as discarded until the ticket is actually purged from the system. For more information, see <a href="#">Ticket Management Page</a> , on page 584.

## Activity/Ticket Manager Window

Activity management and ticket management are very similar processes. The primary difference between activities and tickets is that tickets do not use an approval process. For a comparison of the various modes of operation, see [Comparing Workflow Modes](#) , on page 22.

- **Activity Manager**—Use the Activity Manager window to create and manage activities and to view activity status and history. The upper pane lists the activities that have been created. Select an activity to view its details and history in the lower pane.
- **Ticket Manager**—Use the Ticket Manager window to create and manage tickets and to view ticket status and history. The upper pane lists the tickets that have been created. Select a ticket to view its details and history in the lower pane.

**Note** The Activity Manager window is available only if you are operating in Workflow mode. The Ticket Manager window is available only if you are operating in non-Workflow mode with Ticket Management enabled. In non-Workflow mode without Ticket Management enabled, Security Manager automatically and transparently manages activities. For information on selecting a mode, see [Changing Workflow Modes](#), on page 28.

### Navigation Path

- In non-Workflow mode with Ticket Management enabled, click the Ticket Manager button on the Main toolbar, or select **Manage > Tickets**.
- In Workflow mode, click the Activity Manager button on the Main toolbar, or select **Manage > Activities**.

### Field Reference

*Table 32: Activity/Ticket Manager Window*

Element	Description
*	Activities with unapproved changes (Edit, Edit Open, or Submitted state) or tickets with unsubmitted changes (Edit or Edit Open state) are flagged for easy identification.
Activity Ticket	The name of the activity or ID of the ticket. If Ticket Management is enabled in Workflow mode, both columns are displayed.  If Ticket Management is enabled, you can click the ticket ID to view details of the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see <a href="#">Ticket Management Page</a> , on page 584).
Last Modified	The date and time of the most recent change to the activity/ticket.
State	The state of the activity/ticket. For a list of states, see <a href="#">Understanding Activity/Ticket States</a> , on page 142.
User	The username of the person who last changed the state of the activity/ticket.
Last Action	The most recent action performed on the activity/ticket.
Create button	Click this button to create a new activity or ticket so that you can create or change policies or assign policies to devices. For more information, see <a href="#">Creating an Activity/Ticket</a> , on page 153.
Open button	Click this button to open the selected activity/ticket so that changes, such as defining and assigning policies, are captured within the activity/ticket. You can open an activity when it is in the Edit or the Submitted state. Submitted activities are opened read-only. You can open a ticket when it is in the Edit state. For more information, see <a href="#">Opening an Activity/Ticket</a> , on page 154.
Close button	Click this button to close the selected activity/ticket if you or others want to continue configuring policies at a later time. For more information, see <a href="#">Closing an Activity/Ticket</a> , on page 155.

Element	Description
Validate button	<p>Click this button to validate changes that you have made to the selected activity/ticket from the time you created it to the current time. Validating an activity/ticket checks policy integrity and deployability, and displays detailed error information if errors are detected. For more information, see <a href="#">Validating an Activity/Ticket</a> , on page 158.</p>
Submit button	<p>In Workflow mode with an activity approver, click this button to submit the selected activity. Submitting the activity sends notification that the activity is ready for review to the specified approver. You can submit an activity when it is in the Edit or the Edit Open state.</p> <p>In non-Workflow mode with Ticket Management enabled, click this button to submit the selected ticket. Submitting the ticket saves the proposed changes to the database. Devices associated with the ticket are unlocked, meaning they can be included in policy definitions and changes in other tickets. You can submit a ticket when it is in the Edit or the Edit Open state.</p> <p>You are prompted for a comment. For more information, see <a href="#">Submitting an Activity for Approval (Workflow Mode with Activity Approver)</a> , on page 159.</p>
Approve button (Activity Manager only)	<p>Click this button to approve the selected activity, which saves the proposed changes to the database. Devices associated with the activity are unlocked, meaning they can be included in policy definitions and changes in other activities. You must have appropriate user permissions to approve the activity.</p> <p>In Workflow mode without an approver, you can approve your own activities when they are in the Edit state. In workflow mode with an approver, you must submit your activity, and the approver can approve an activity only when it is in the Submitted state.</p> <p>You are prompted for an approval comment. For more information, see <a href="#">Approving or Rejecting an Activity (Workflow Mode)</a> , on page 160.</p>
Reject button (Activity Manager only)	<p>In Workflow mode with an activity approver, click this button to reject the changes proposed in the selected activity or activities. You must have appropriate user permissions to reject an activity. If the activity is rejected, the submitter can continue to make changes to the activity. Devices associated with the activity are not unlocked, meaning that they cannot be included in policy definitions or changes in another activity. You can reject an activity only when it is in the Submitted or the Submitted Open state.</p> <p>You are prompted for a rejection comment. For more information, see <a href="#">Approving or Rejecting an Activity (Workflow Mode)</a> , on page 160.</p>

Element	Description
Discard button	<p>Click this button to discard the selected activity/ticket. Devices associated with the activity/ticket are unlocked, meaning they can be used by other activities/tickets. Multiple activities/tickets can be discarded at the same time.</p> <p>You are prompted for a comment. For more information, see <a href="#">Discarding an Activity/Ticket</a> , on page 161.</p> <p>Discarded activities are removed from the system according to the settings defined in the Security Manager settings for Workflow. The activity state is shown as discarded until the activity is purged from the system. For more information, see <a href="#">Workflow Page</a> , on page 588.</p> <p>Discarded tickets are removed from the system according to the settings defined in the Security Manager settings for Ticket Management. The ticket state is shown as discarded until the ticket is purged from the system. For more information, see <a href="#">Ticket Management Page</a> , on page 584.</p>
View Changes	<p>Click this button to generate a report in PDF format for the selected activity/ticket. If the activity/ticket is closed, this button is grayed out. For more information, see <a href="#">Viewing Change Reports</a> , on page 156.</p>
Refresh button	<p>Click this button to refresh the information presented in the window.</p>
Details tab	<p>Displays detailed information for the selected activity/ticket. Besides the information repeated from the table, the details include this information:</p> <ul style="list-style-type: none"> <li>• Activity ID—The identification number assigned by Security Manager when you created the activity.</li> <li>• Ticket ID—The identification number entered when the ticket was created. You can click the Edit Ticket button next to the ticket ID to edit the ticket ID.</li> <li>• Created—The date and time the activity/ticket was created.</li> <li>• Last Modified—The date and time changes were last made to the activity/ticket.</li> <li>• Description—The description that was entered when the activity/ticket was created.</li> <li>• Comments History—Shows a history of the comments that were entered for this activity/ticket. The user that entered the comment is shown as well as the date and time the comment was entered. You can add and edit comments using the buttons below the Comments History table.</li> </ul>
History tab	<p>Displays a log of the changes that have been made to the selected activity/ticket. The information includes the state changes, the user who made the change, the date and time of the change (based on the Security Manager server time), and any comments the user entered to document the change.</p>

## Creating an Activity/Ticket

In Workflow mode, before you create or change policies or assign policies to devices, you must create an activity. In non-Workflow mode, if you have Ticket Management enabled, before you create or change policies or assign policies to devices, you must create a ticket.

**Tip** In non-Workflow mode with Ticket Management disabled, activities are created automatically when needed.

### Related Topics

- [Understanding Activities](#) , on page 139
- [Opening an Activity/Ticket](#) , on page 154

### Step 1

Do one of the following:

For activities:

- Click the **Create Activity** button in the activity toolbar.
- Select **Activities > New Activity**.
- Click **Create** in the Activity Manager window.

For tickets:

- Click the **Create Ticket** button in the tickets toolbar.
- Select **Tickets > New Ticket**.
- Click **Create** in the Ticket Manager window.

The Create Activity/Ticket dialog box appears.

### Step 2

In the Create Activity/Ticket dialog box, enter a name for the activity or keep the system-generated name. The default name contains the username, date, and time the activity/ticket was created. You can also enter a comment to describe the activity/ticket.

Ticket Management supports linking between a Ticket ID and an external ticket management system. For more information, see [Ticket Management Page](#) , on page 584.

**Tip** You can use a comma to separate multiple ticket IDs.

### Step 3

Click **OK**.

The activity/ticket is listed in the Activity/Ticket Manager window. For more information, see [Activity/Ticket Manager Window](#) , on page 149.

## Responding to the Activity/Ticket Required Dialog Box

When in Workflow mode, you must create or open an activity before you create or modify policies. When in non-Workflow mode, if Ticket Management is enabled, you must create or open a ticket before you create or

modify policies. If you attempt to perform an action that requires an activity or a ticket, and you have not created or opened one yet, you are prompted to do so with the Activity/Ticket Required dialog box.

You can choose from the following options:

- **Create a new activity/ticket**—Create a completely new activity/ticket, specifying an activity name or ticket ID and optionally a description of the purpose of the activity/ticket. The default activity/ticket name contains the username, date, and time the activity/ticket was created.
- **Open an existing activity/ticket**—To open the activity/ticket you select from the Activity/Ticket list. This option is displayed only if there are activities/tickets available in the Edit state.

### Related Topics

- [Creating an Activity/Ticket](#) , on page 153
- [Understanding Activity/Ticket States](#) , on page 142

## Opening an Activity/Ticket

In Workflow mode, you can open an existing activity if no one else has it opened. You might open an existing activity in the Edit state to make further policy changes, or you might open an existing activity in the Submitted state to review proposed policy changes before approving or rejecting it (if you have the appropriate permissions and you are working in Workflow mode with an approver).

You can make changes to activities in the Edit state, but you can only view activities in the Submitted state.

In non-Workflow mode, if you have Ticket Management enabled, you can open an existing ticket to make further policy changes if no one else has it opened.

To open an activity/ticket, do one of the following:

- For activities:
  - Click the **Open** button in the activity toolbar or select **Activities > Open Activity**. The Openable Activities dialog box lists all activities that can be opened, including the name of the activity, its state, and the username of the person who created the activity. Select the activity you want to open and click **OK**.
  - Select **Manage > Activities**. From the Activity Manager window, select the activity you want to open and click **Open**.
- For tickets:
  - Click the **Open** button in the tickets toolbar or select **Tickets > Open Ticket**. The Openable Tickets dialog box lists all tickets that can be opened, including the ticket ID, its state, and the username of the person who created the ticket. Select the ticket you want to open and click **OK**.
  - Select **Manage > Tickets**. From the Ticket Manager window, select the ticket you want to open and click **Open**.

---

**Tip** In non-Workflow mode with Ticket Management disabled, your previous configuration session is opened whenever needed until you submit it. A new activity is then created the next time you perform an action that requires an activity.

---

---

**Note** In Workflow mode and in non-Workflow mode with Ticket Management enabled, you are prompted to open or create an activity/ticket when you launch Security Manager.

---

#### Related Topics

- [Understanding Activities](#) , on page 139

## Closing an Activity/Ticket

You can close an activity without approving it (or submitting it for approval) or close a ticket without submitting it if you or others want to continue configuring policies at a later time.

A person with administrator privileges can close an activity/ticket opened by another user.

To close an open activity/ticket, do one of the following:

- For activities:
  - Click the **Close** button in the activity toolbar.
  - Select **Activities > Close Activity**.
  - Select **Manage > Activities**. From the Activity Manager window, click **Close**.
- For tickets:
  - Click the **Close** button in the tickets toolbar.
  - Select **Tickets > Close Ticket**.
  - Select **Manage > Tickets**. From the Ticket Manager window, click **Close**.

---

**Tip** In non-Workflow mode with Ticket Management disabled, your configuration session is closed whenever you log out. The same session is reopened the next time you log in.

---

## Viewing Change Reports

There are many places in the interface where you can open change reports. Typically, the button or command to generate the report is **View Changes**. These change reports provide detailed information about the policy and policy object changes, and the devices that were acted on, that have been made in an activity/ticket, whether you are operating in Workflow or non-Workflow mode.

The change report is in Adobe Acrobat (PDF) format. You can use all of the Acrobat features, including the bookmarks tab, to view the report.

If you discover a device or rediscover policies on a device, then subsequent policy changes in the same activity/ticket performed on that device are not listed in the activity change report. This is also true on a device that you clone from another device.

Following are some of the ways you can view change reports:

- Non-Workflow mode with Ticket Management:
  - Select **Tickets > View Changes**, or click the **View Changes** button in the toolbar, to view the changes made during the currently open ticket.
  - Highlight a ticket in the Ticket Manager window and click **View Changes** to view the changes made in that ticket
- Non-Workflow mode without Ticket Management:
  - Select **File > View Changes** to view the changes made during the current configuration session.
  - Select **Manage > Change Reports** to view the changes made during previous sessions (which are closed when you submit or discard your changes). Select a configuration session from the Change Report window and click **View Changes**. (See [Selecting a Change Report in Non-Workflow Mode with Ticket Management Disabled](#), on page 157.)
- Workflow mode:
  - Select **Activities > View Changes**, or click the **View Changes** button in the toolbar, to view the changes made during the currently open activity.
  - Highlight an activity in the Activity Manager window and click **View Changes** to view the changes made in that activity.
- In all modes, you can view changes from various dialog boxes when creating deployment jobs.

---

**Note** You must disable any popup-blocker applications you have running to ensure the activity report will open.

---

The following illustration shows a sample activity report.

Figure 11: Activity Change Report

**Activity Change Report**

User: cella  
 Session started on: 26-Oct-2006 00:49:16  
 Current state: Edit Open  
 Report created on: 26-Oct-2006 18:14:22

---

**Devices**

- router2600
  - Policy Objects Override
    - InterfaceRole

Operation	Category ID	Name Patterns	Comment	Patterns	Name
Add	None	Ethernet1 , Dialer0 , Serial0 , Async1 , Serial0 , Outside	External interfaces	Ethernet1 , Dialer0 , Serial0 , Async1 , Serial0 , Outside , Ethernet1 , Dialer0 , Serial0 , Async1 , Serial0 , Outside	External

**Shared Policies**

No changes

**Policy Objects**

- Ike

Operation	Category ID	Dh Group	Lifetime	Priority	Hash	Encryption	Authentication	Name
Add	None	1	86400	-1	SHA	aes-128	Preshared Key	New IKE Proposal

191242

The change report includes these elements:

- Activity name/Ticket ID—The name of the activity (or the user and session start date and time if it is unnamed) or the Ticket ID.
- Created by—The username of the person who created the activity/ticket, with the date and time.
- Current state—The current state of the activity.
- Report created on—The date and time the report was created.
- Devices section—A summary of the devices that were acted on in the activity/ticket (that is, they were added, modified, or deleted). Changes to local policies are displayed here.

Changes in this section and the other sections of the report are color-coded to help you identify changes:

- Green—Indicates a newly inserted item.
- Red—Indicates a deleted item or the old value of a changed item.
- Blue—Indicates the new value of a changed item.
- Shared Policies section—Changes to all shared policies are displayed here.
- Policy Bundles—Changes to all policy bundles are displayed here.
- Policy Objects—Changes to all policy objects are displayed here.
- VPN—Changes to VPN topologies and policies are displayed here, including newly discovered VPNs and deleted VPN topologies.

## Selecting a Change Report in Non-Workflow Mode with Ticket Management Disabled

In non-Workflow mode with Ticket Management disabled, you can view change reports for closed configuration sessions by selecting **Manage > Change Reports** and then selecting the session in the Change Report dialog box.

In non-Workflow mode with Ticket Management disabled, a configuration session is considered complete when you either submit or discard your changes. The Change Report dialog box lists all closed sessions,

showing the date and time the session was closed, the action that closed it (submitted or discarded), and the user name associated with the session. These sessions are equivalent to activities in Workflow mode. Select a session and click **View Changes** to view the report. For information on reading the report, see [Viewing Change Reports](#) , on page 156.

---

**Tip** To view the report for the current configuration session, close this dialog box and select **File > View Changes**.

---

## Validating an Activity/Ticket

In Workflow mode, Security Manager validates activities when you submit them for approval, or you can validate an activity at any time while you are creating and changing policies in an activity. After an activity is submitted, the validation report remains static.

In non-Workflow mode, Security Manager validates policies when you submit them to the database, when you try to deploy them, or when you validate them. The validation process reports on policy changes that were made up until the changes are submitted or deployed.

The validation process checks the following areas. If there are errors, you can display a detailed summary of the validation results.

- Policy integrity—There are no unresolvable references (for example, missing objects, unresolved interface roles, overrides of mandatory settings, and so on).
- Policy deployability—The platform, operating system, and configured features are supported by the target devices so that policies can be correctly translated into CLI commands.

If a policy contains options that require specific device types or operation system versions, you will see validation warnings for non-supported devices, but Security Manager will not generate the associated commands for unsupported devices. This allows you to create policies that apply to a wide range of devices without having to create policies that are too device-specific.

- FlexConfig integrity—There are no corrupted FlexConfig objects. If corrupted objects are found, a warning with a list of the corrupted FlexConfig objects results.
- FlexConfig syntax—If syntax errors are found, a warning with a list of affected FlexConfigs and their syntax errors results.
- FlexConfig object references—All object references are resolvable. If FlexConfig objects reference non-existent objects, a warning with a list of the missing objects results.

### Related Topics

- [Submitting an Activity for Approval \(Workflow Mode with Activity Approver\)](#) , on page 159
- [Deploying Configurations in Non-Workflow Mode](#) , on page 406

---

**Step 1** Do one of the following:

- In Workflow mode:
  - Open an activity, and then click the **Validate** button on the activity toolbar or select **Activities > Validate Activity**.

- Select **Manage > Activities**. From the Activity Manager window, select an activity, and then click **Validate**.
- In non-Workflow mode with Ticket Management enabled:
  - Open a ticket, and then click the **Validate Saved Changes** button on the tickets toolbar or select **Tickets > Validate Ticket**.
  - Select **Manage > Tickets**. From the Ticket Manager window, select a ticket, and then click **Validate**.
- In non-Workflow mode with Ticket Management disabled, select **File > Validate**, or try to preview or deploy policies.

Security Manager performs the validation and opens an informational message dialog box that summarizes the validation results. If there are no errors, validation passes. If there are errors or warnings, click **Details** to open the Validation dialog box, where you can view detailed information about the errors.

**Step 2** Evaluate the errors to determine how to fix them.

The Validation dialog box organizes the errors and warnings in two ways, which are displayed on separate tabs:

- **Errors tab**—The Errors tab organizes validation problems based on the type of error. Each error indicates the number of devices that are affected and the severity of the error.

Select an error in the upper pane, and a list of devices (with the type of device) that have the error appears in the lower left pane. The lower right pane describes the error, its cause, and what you might do to fix it.

- **Devices tab**—The Devices tab organizes validation problems based on the device. Each device indicates the number and types of errors and warnings for the device, and the device type. The device status indicates the worst problem in the device configuration (error or warning).

Select a device in the upper pane, and a list of the errors for that device appears in the lower left pane. Select an error and the lower right pane describes the error, its cause, and what you might do to fix it.

You must correct errors before submitting the activity. Security Manager does not allow an activity to be submitted with validation errors.

**Note** A validation warning (as opposed to an error) will not prevent activity approval or deployment.

---

## Submitting an Activity for Approval (Workflow Mode with Activity Approver)

In Workflow mode with an activity approver, you must submit activities for approval. When you submit the activity, the integrity and deployability of the activity is validated. For details about the validation process and report, see [Validating an Activity/Ticket](#), on page 158.

The activity is also closed so that it can be opened by the user who has the permissions to approve it. When the activity is approved, its configurations are committed to the Security Manager database, and they can be deployed to the devices.

When you submit an activity, Security Manager sends an e-mail to the relevant approvers to notify them that an activity requires approval.

If you are working in Workflow mode without an activity approver, you do not need to submit activities (in fact, you cannot submit them). You can approve the activity yourself. For more information about changing

activity approval settings, and configuring the e-mail addresses for notifications, see [Workflow Page](#), on page 588.

### Related Topics

- [Understanding Activities](#), on page 139
- [Opening an Activity/Ticket](#), on page 154
- [Understanding Activity/Ticket States](#), on page 142
- [Configuring an SMTP Server and Default Addresses for E-Mail Notifications](#), on page 27

- 
- Step 1** Do one of the following:
- Open an activity and click the **Submit Activity** button on the activity toolbar or select **Activities > Submit Activity**.
  - Select **Manage > Activities**. From the Activity Manager window, select an activity, then click **Submit**.

The Submit Activity dialog box opens.

- Step 2** In the Submit Activity dialog box, fill in the following fields:
- **Approver**—Enter the e-mail address of the person who should approve the activity if the default address is not the right one. This person receives notification of your submission.

The default e-mail address is set in Tools > Security Manager Administration > Workflow.

- **Comment**—Enter comments that will help the approver evaluate the activity.
- **Submitter**—Enter the e-mail address of the person submitting the approval request if the default address is not the right one. The field initially contains the e-mail address associated with the username you used to log into Security Manager. Notifications of activity state changes are sent to this address.

If desired, you can click the **View Changes** button to view a report in PDF format of the changes made in the activity. For more information, see [Viewing Change Reports](#), on page 156.

- Step 3** Click **OK**. The activity status changes to Submitted in the Activity Manager window and notifications are sent.
- Note** Security Manager warns you if the e-mail cannot be sent and you must contact the approver directly.
- 

## Approving or Rejecting an Activity (Workflow Mode)

Before the changes in an activity are committed to the database, you must approve the activity. If you have activity approval permissions, you can open an activity, review the policies and policy assignments, and then either approve or reject the activity.

If you are operating in Workflow mode without an approver, you can approve your own activities. When working without an approver, you cannot reject an activity, but you can discard it if you do not want to save your changes. In non-Workflow mode, you use the Submit and Discard commands on the file menu to submit (and automatically approve) or discard the configuration session.

In Workflow mode with an activity approver, the activity must be submitted before you can open it and approve it. In this mode, you can also reject the activity.

If you approve an activity, policies and policy assignments are committed to the database and are ready to be deployed to devices or files. Devices associated with the activity are unlocked, meaning they can be included in policy definitions and changes in other activities.

If you reject the activity, it is returned to the Edit state and the submitter can reopen the activity to make the necessary changes and resubmit it for approval. Devices associated with the activity are not unlocked, meaning that they cannot be included in policy definitions or changes in another activity.

---

**Note** After an activity is approved, changes cannot be undone. You must create a new activity and manually change policies and policy assignments to the desired state.

---

#### Related Topics

- [Understanding Activities](#) , on page 139
- [Opening an Activity/Ticket](#) , on page 154
- [Understanding Activity/Ticket States](#) , on page 142

---

#### Step 1

Perform the appropriate step below:

- To approve an activity, do one of the following:
  - Open an activity and click the **Approve Activity** button on the activity toolbar or select **Activities > Approve Activity** from the menu.
  - Select **Manage > Activities**. In the Activity Manager window, select an activity and click **Approve**.
- To reject an activity or multiple activities, do one of the following:
  - Open an activity and click the **Reject Activity** button on the activity toolbar or select **Activities > Reject Activity** from the menu.
  - Select **Manage > Activities**. In the Activity Manager window, select an activity or multiple activities and click **Reject**.

The Approve Activity, Reject Activity, or Reject Multiple Activities dialog box appears.

#### Step 2

In the Comment field, enter a brief explanation of why you are approving or rejecting the activity or activities. If you are rejecting, you might want to include suggested revisions.

#### Step 3

Click **OK** (for a single activity) or **Reject** (for multiple activities). The activity status changes to Approved or Edit (if rejected) in the Activity Manager window. For a description of the elements in the window, see [Activity/Ticket Manager Window](#) , on page 149.

---

## Discarding an Activity/Ticket

You can discard an activity/ticket (configuration session in non-Workflow mode) if it is no longer required. When you discard an activity/ticket, you delete all the policies and policy assignments that were defined within the activity. Those policies and policy assignments are not in the database; therefore, they cannot be deployed.

Discarded activities are removed from the system according to the settings defined in the Security Manager settings for Workflow and devices associated with the activity are unlocked, meaning they can be used by other activities. For more information, see [Workflow Page , on page 588](#).

Discarded tickets are removed from the system according to the settings defined in the Security Manager settings for Ticket Management and devices associated with the ticket are unlocked, meaning they can be used by other tickets. The ticket state is shown as discarded until the ticket is purged from the system. For more information, see [Ticket Management Page , on page 584](#).

---

**Note** When a ticket is discarded, Image Management jobs assigned to that ticket will not be discarded automatically. If required, you must search for pending Image Manager jobs with that ticket ID in Image Manager and delete those jobs.

---

### To discard an activity/ticket:

Workflow Mode—Do one of the following:

- To discard a single activity, do one of the following:
  - Open an activity, then click the **Discard** button on the activity toolbar or select **Activities > Discard Activity**.
  - Select **Manage > Activities**. From the Activity Manager window, select an activity, then click **Discard**. Only an activity in the Edit or Edit Open state can be discarded.

Using either method, you are prompted with the Discard Activity dialog box, which allows you to enter an optional comment to explain why you are discarding the activity. Enter a comment and click **OK** to discard it.

- To discard multiple activities, select **Manage > Activities**. From the Activity Manager window, select the activities you wish to discard, then click **Discard**. Only activities in the Edit or Edit Open state can be discarded.

You are prompted with the Discard Multiple Activities dialog box, which allows you to enter an optional comment to explain why you are discarding the activities. If you selected activities belonging to other users, you can choose to discard those activities or not using the Discard selected activities of other users as well check box. Enter a comment, select or deselect the Discard selected activities of other users as well check box as desired, and then click **OK** to discard the selected activities.

Non-Workflow Mode with Ticket Management Enabled—Do one of the following:

- To discard a single ticket, do one of the following:
  - Open a ticket, then click the **Discard** button on the tickets toolbar or select **Tickets > Discard Ticket**.
  - Select **Manage > Tickets**. From the Ticket Manager window, select a ticket, then click **Discard**. Only a ticket in the Edit or Edit Open state can be discarded.

Using either method, you are prompted with the Discard Ticket dialog box, which allows you to enter an optional comment to explain why you are discarding the ticket. Enter a comment and click **OK** to discard it.

- To discard multiple activities, select **Manage > Tickets**. From the Ticket Manager window, select the tickets you want to discard, then click **Discard**. Only tickets in the Edit or Edit Open state can be discarded.

You are prompted with the Discard Multiple Tickets dialog box, which allows you to enter an optional comment to explain why you are discarding the tickets. If you selected tickets belonging to other users, you can choose to discard those tickets or not using the Discard selected tickets of other users as well check box. Enter a comment, select or deselect the Discard selected tickets of other users as well check box as desired, and then click **OK** to discard the selected tickets.

Non-Workflow Mode with Ticket Management Disabled—Select **File > Discard** to discard the changes in the current configuration session.

### Related Topics

- [Understanding Activities](#) , on page 139
- [Opening an Activity/Ticket](#) , on page 154
- [Understanding Activity/Ticket States](#) , on page 142

## Viewing Activity/Ticket Status and History

In Workflow mode, you can view the status and history of changes for activities in the Activity Manager window. In non-Workflow mode with Ticket Management enabled, you can view the status and history of changes for tickets in the Ticket Manager window.

To open the window for activities, click the Activity Manager button in the toolbar or select **Manage > Activities**.

To open the window for tickets, click the Ticket Manager button in the toolbar or select **Manage > Tickets**.

The upper pane lists all available activities/tickets, including the current state of the activity/ticket. Select an activity/ticket to see additional information in the tabs in the lower pane:

- Details tab—Shows the date and time the activity/ticket was created, and its description.
- History tab—Shows the transaction history for the activity/ticket. Each time the state is changed, a record of the change is kept, including the user who made the change and any comments about the change.

## CHAPTER 5

# Managing Policies

---

The following topics describe the concept of policies in Cisco Security Manager, and how to use and manage them:

- [Understanding Policies](#) , on page 165
- [Discovering Policies](#) , on page 176
- [Managing Policies in Device View and the Site-to-Site VPN Manager](#) , on page 194
- [Managing Shared Policies in Policy View](#) , on page 215
- [Managing Policy Bundles](#) , on page 222

## Understanding Policies

In Security Manager, a policy is a set of rules or parameters that define a particular aspect of network configuration. You configure your network by defining policies on devices (which includes individual devices, service modules, security contexts, and virtual sensors) and VPN topologies (which are made up of multiple devices), and then deploying the configurations defined by these policies to these devices.

Several types of policies might be required to configure a particular solution. For example, to configure a site-to-site VPN, you might need to configure multiple policies, such as IPsec, IKE, GRE, and so forth.

Policies are assigned to one or more devices. After a policy is assigned to a device, any changes to the policy definition change the behavior of the device.

The following topics describe policies in more detail:

- [Settings-Based Policies vs. Rule-Based Policies](#) , on page 166
- [Service Policies vs. Platform-Specific Policies](#) , on page 166
- [Local Policies vs. Shared Policies](#) , on page 167
- [Understanding Rule Inheritance](#) , on page 168
- [Policy Management and Objects](#) , on page 171
- [Understanding Policy Locking](#) , on page 172
- [Customizing Policy Management for Routers and Firewall Devices](#) , on page 175

## Settings-Based Policies vs. Rule-Based Policies

Security Manager policies are structured as either rule-based policies or settings-based policies.

### Rule-Based Policies

Rule-based policies contain one or more rules that govern how to handle traffic on a selected device, such as the access rules and inspection rules defined as part of a firewall service. Rule-based policies can contain hundreds or even thousands of rules arranged in a table, each defining different values for the same set of parameters. The ordering of the rules is very important, as traffic flows are assigned the first rule whose definition matches the flow (known as first matching).

The structure of the rules table depends on whether you configure a local policy or a shared policy (see [Local Policies vs. Shared Policies](#), on page 167). If you configure a local rule-based policy for a single device, the policy contains a flat table of local rules. If you configure a shared rule-based policy (either in Device view or Policy view), the table is divided into two sections, Mandatory and Default. Mandatory rules always precede the default rules, and cannot be overridden by local or default rules. The Default section contains rules that can be overridden by mandatory and local rules. You can define rules in either the Mandatory or Default section and move rules between sections using cut-and-paste.

When you define certain types of rule-based policies, such as firewall service policies, you can create a policy hierarchy in which rules located at lower levels in the hierarchy acquire properties from the rules located above them. This is known as rule inheritance. For example, you can define a set of inspection rules that apply globally to all firewalls, while supplementing these rules with additional rules that can be applied to a subset of devices. By maintaining common rules in a parent policy, inheritance enables you to reduce the chance of introducing configuration errors that will cause deployment to fail. For more information, see [Understanding Rule Inheritance](#), on page 168.

### Settings-Based Policies

Settings-based policies contain sets of related parameters that together define one aspect of security or device operation. For example, when you configure a Cisco IOS router, you can define a quality of service (QoS) policy that defines which interfaces are included in the policy, the type of traffic on which QoS is applied, and the definition of how this traffic should be queued and shaped. Unlike rule-based policies, which can contain hundreds of rules containing values for the same set of parameters, you can define only one set of parameters for each settings-based policy defined on a device.

### Related Topics

- [Understanding Policies](#), on page 165

## Service Policies vs. Platform-Specific Policies

Security Manager policies are divided into several domains, each of which represents a major policy category. These domains can be divided into two categories: service policies and platform-specific policies.

Service policies are divided into the following policy domains:

- Firewall.
- Site-to-site VPN.
- Remote Access VPN.

- IPS service policies.

For example, the firewall policy domain contains policies for access rules, inspection rules, and transparent rules, among others. The site-to-site VPN policy domain contains policies for IKE proposals, IPsec proposals, and preshared keys, among others. Service policies can be applied to any kind of device, regardless of platform, although there may be some variation in policy definition depending on the device type.

Platform-specific policy domains contain policies that configure features that are specific to the selected platform. Not all platform-specific policies are directly related to security. For example, the Router policy domain contains routing policies, identity policies (Network Admission Control and 802.1x), policies related to device administration (DHCP, SNMP, device access), and other policies such as QoS and NAT.

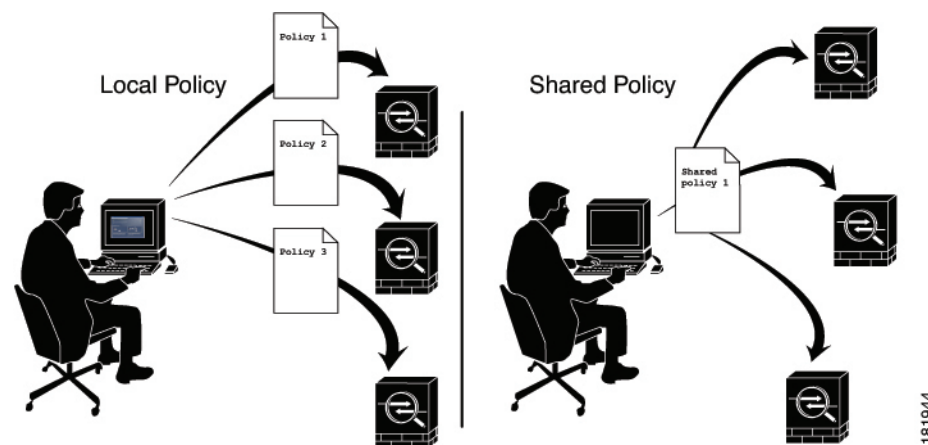

For routers and firewalls (ASA, PIX, FWSM), you can choose which platform-specific policies to manage. For more information, see [Customizing Policy Management for Routers and Firewall Devices](#), on page 175.

## Local Policies vs. Shared Policies

The policies that you configure on devices can either be local or shared. Local policies refer to policies that are defined for a single device. Any changes that you make to a local policy affect only that device. Local policies are well-suited to smaller networks and to devices requiring nonstandard configurations. For example, you might configure a local policy on a router that requires a different OSPF routing policy than the one used by the other routers in your network. For more information about the actions you can perform on local policies, see [Performing Basic Policy Management](#), on page 195.

As your network grows, maintaining local policies on each device greatly increases the effort required to manage these policies in a comprehensive and efficient manner. To meet this challenge, Security Manager features policy sharing. With policy sharing, you can create a single policy and assign it to multiple devices. For more information, see [Sharing a Local Policy](#), on page 205.

**Figure 12: Local vs. Shared Policies**

For example, if you want all the Cisco IOS routers in your network to implement the same Network Admission Control (NAC) policy, you need only define a single NAC policy and share it. You can then assign the shared policy to all the routers in your network with a single action. For more information, see [Modifying Shared Policy Assignments in Device View or the Site-to-Site VPN Manager](#), on page 214.

Any changes that you make to a shared policy are automatically applied to all the devices to which it is assigned. As a result, shared policies both streamline the process of policy creation and help maintain consistency and uniformity in your device configurations.

For more information about the actions you can perform on shared policies, see [Working with Shared Policies in Device View or the Site-to-Site VPN Manager](#), on page 201.

### Tips

- Shared policies can be grouped together to form policy bundles. Policy bundles make managing the assignment of shared policies easier especially when working with a large number of devices. For more information, see [Managing Policy Bundles](#), on page 222.
- In addition to sharing policies, you can choose to inherit the rules of a rule-based policy when defining another policy of the same type. This makes it possible, for example, to maintain a set of corporate access rules that apply to all firewall devices while providing the flexibility to define additional rules on individual devices as required. For more information, see [Understanding Rule Inheritance](#), on page 168.
- If you use more than one Security Manager server, you can maintain a consistent set of policies among the servers by regularly exporting shared policies from your primary server and importing them into the other servers. You must decide which server to use as the official policy source. For more information, see [Exporting Shared Policies](#), on page 487 and [Importing Policies or Devices](#), on page 489.
- In Version 4.7, Cisco Security Manager has added a new option to the available filtering choices in the Device Filter. This new option provides a filter for devices that have shared policies applied. To see this in the Security Manager GUI, navigate to **View > Device View > Filter: > Create Filter...** [in the dropdown list]. When the Create Filter dialog box appears, use the dropdown lists to select "Device," "has," and "Shared Policy," for a resulting filter of "Device has 'Shared Policy'".

### Shared Policies and VPNs

In the same way that shared policies facilitate device configuration, they also facilitate the configuration of VPNs. For example, you can create a shared IPsec proposal policy and assign it to multiple site-to-site VPNs. Any changes that you make to the shared policy affect all the VPNs to which the policy is assigned.

You can assign the shared policies to an existing VPN using the Site-to-Site VPN Manager; right-click a shareable policy and select **Assign Shared Policy**. This is done in much the same way as assigning shared policies in Device view. You can also configure shared policies as the default policies to use in the Create VPN wizard, as described in [Understanding and Configuring VPN Default Policies](#), on page 1084.

### Related Topics

- [Understanding Policies](#), on page 165

## Understanding Rule Inheritance

As described in [Local Policies vs. Shared Policies](#), on page 167, shared policies enable you to configure and assign a common policy definition to multiple devices. Rule inheritance takes this feature one step further by enabling a device to contain the rules defined in a shared policy *in addition to* local rules that are specific to that particular device. Using inheritance, Security Manager can enforce a hierarchy where policies at a lower level (called child policies) inherit the rules of policies defined above them in the hierarchy (called parent policies).

---

**Note** If a policy bundle includes a shared policy that inherits from other shared policies, those inherited rules are also applied to any devices on which the policy bundle is applied.

---

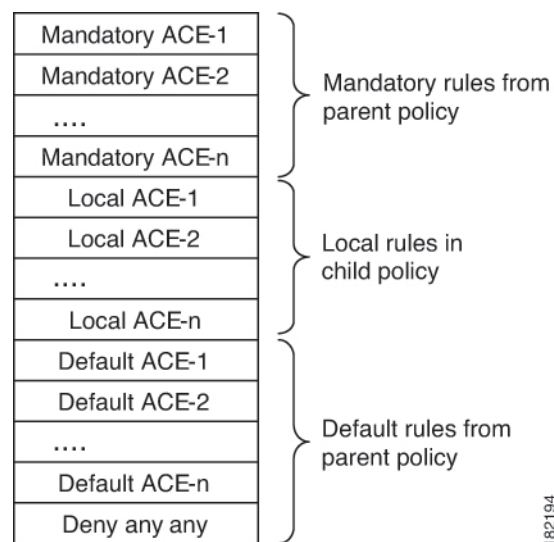

### Rule Order When Using Inheritance

As described in [Understanding Access Rules](#), on page 715, an access list (ACL) consists of rules (also called access control entries or ACEs) arranged in a table. An incoming packet is compared against the first rule in the ACL. If the packet matches the rule, the packet is permitted or denied, depending on the rule. If the packet does not match, the packet is compared against the next rule in the table and so forth, until a matching rule is found and executed.

This first-match system means that the order of rules in the table is of critical importance. When you create a shared access rule policy, Security Manager divides the rules table into multiple sections, Mandatory and Default. The Mandatory section contains rules that cannot be overridden by the local rules defined in a child policy. The Default section contains rules that *can* be overridden by local rules.

The below figure describes how rules are ordered in the rules table when using inheritance.

**Figure 13: Order of Rules When Using Inheritance**

### Benefits of Using Inheritance

The ability to define rule-based policies in a hierarchical manner gives you great flexibility when defining your rule sets, and the hierarchy can extend as many levels as required. For example, you can define an access rule policy for the device at a branch office that inherits rules from a parent policy that determines access at the regional level. This policy, in turn, can inherit rules from a global access rules policy at the top of the hierarchy that sets rules at the corporate level.

In this example, the rules are ordered in the rules table as follows:

```
Mandatory corporate access rules
  Mandatory regional access rules
    Local rules on branch device
  Default regional access rules
Default corporate access rules
```

The policy defined on the branch device is a child of the regional policy and a grandchild of the corporate policy. Structuring inheritance in this manner enables you to define mandatory rules at the corporate level that apply to all devices and that cannot be overridden by rules at a lower level in the hierarchy. At the same time, rule inheritance provides the flexibility to add local rules for specific devices where needed.

Having default rules makes it possible to define a global default rule, such as “deny any any”, that appears at the end of all access rule lists and provides a final measure of security should gaps exist in the mandatory rules and default rules that appear above it in the rules table.

### Inheritance Example

For example, you can define a mandatory worm mitigation rule in the corporate access rules policy that mitigates or blocks the worm to all devices with a single entry. Devices configured with the regional access rules policy can inherit the worm mitigation rule from the corporate policy while adding rules that apply at the regional level. For example, you can create a rule that allows FTP traffic to all devices in one region while blocking FTP to devices in all other regions. However, the mandatory rule at the corporate level always appears at the top of the access rules list. Any mandatory rules that you define in a child policy are placed after the mandatory rules defined in the parent policy.

With default rules, the order is reversed—default rules defined in a child policy appear before default rules inherited from the parent policy. Default rules appear after any local rules that are defined on the device, which makes it possible to define a local rule that overrides a default rule. For example, if a regional default rule denies FTP traffic to a list of destinations, you can define a local rule that permits one of those destinations.

### IPS Policy Inheritance

Event action filter policies for IPS devices can also use inheritance to add rules defined in a parent policy to the local rules defined on a particular device. The only difference is that although active and inactive rules are displayed together in the Security Manager interface, all inactive rules are deployed last, after the inherited default rules.

Signature policies for IPS devices use a different type of inheritance that can be applied on a per-signature basis. See [Configuring Signatures](#), on page 1680.

- [Understanding Global Access Rules](#), on page 717
- [Inheritance vs. Assignment](#), on page 170
- [Inheriting or Uninheriting Rules](#), on page 211

## Inheritance vs. Assignment

It is important to understand the difference between rule inheritance and policy assignment:

- Inheritance—When you inherit the rules from a selected policy, you do not overwrite the local rules that are already configured on the device. Instead, the inherited rules are *added* to the local rules. If the inherited rules are mandatory rules, they are added before the local rules. If the inherited rules are default rules, they are added *after* the local rules. Any changes that you make to the inherited rules in the parent policy are reflected in the policy that inherits those rules.

---

**Note** Inheritance works differently for IPS signature policies and signature event actions. For more information, see [Understanding Signature Inheritance](#) , on page 1679.

---

- **Assignment**—When you assign a shared policy to a device, you *replace* whatever was already configured on the device with the selected policy. This holds true whether the device previously had a local policy or a different shared policy of that type.

Therefore, when working with rule-based policies such as access rules, you must use discretion when choosing these options. Use inheritance to supplement the local rules on the device with additional rules from a parent policy. Use assignment to replace the policy on the device with a selected shared policy.

---

**Tip** To prevent overwriting your local rules by mistake, Security Manager displays a warning message when you select the Assigned Shared Policy option for a rule-based policy. The message provides you the option of inheriting the rules of the policy instead of assigning it. Choose the inheritance option if you want to preserve your local rules.

---

## Policy Management and Objects

Objects make it easier to configure policies in Security Manager by providing a set of values with a logical, easy-to-remember name that can be applied wherever it is needed. For example, you can define a network/host object called MyNetwork that contains a set of IP addresses in your network. Whenever you configure a policy requiring these addresses, you can simply refer to the MyNetwork object instead of manually entering the addresses each time.

When you define a policy, you can create objects on the fly by clicking the **Select** button next to any field that accepts an object as a value. For more information, see [Selecting Objects for Policies](#) , on page 228. You can also create and manage objects system-wide from the [Policy Object Manager](#) , on page 230.

Policy objects also are created when you discover policies that already exist on a device. You can discover policies when you add a device to the Security Manager inventory, or you can discover policies on devices that are already in the inventory, as described in [Discovering Policies](#) , on page 176. You can configure Security Manager to reuse already-defined policy objects for newly-discovered policies. For more information on configuring policy object settings for discovery, see [Discovery Page](#) , on page 534.

Certain types of objects enable you to override their predefined values at the device level, which enables you to use an object in a policy while retaining the ability to customize particular values. For more information, see [Understanding Policy Object Overrides for Individual Devices](#) , on page 244.

For more information about objects and how to use them when defining policies, see [Managing Policy Objects](#), on page 227.

### Related Topics

- [Understanding Policies](#) , on page 165

## Understanding Policy Locking

Security Manager has a policy locking mechanism that is useful in organizations where several people have the authority to make configuration changes. It prevents a potential situation in which two or more people are making changes to the same device, policy, policy assignment, or object at the same time. When a lock is applied, a message is displayed across the top of the work area to other users who access that device or policy.

---

**Tip** Security Manager also obtains activity (or configuration session) locks, which are broader in scope than policy locks, when users perform some actions. For more information, see [Activities and Locking](#) , on page 141.

---

### Lock Types

Security Manager uses two different types of locks:

- Policy content locks—Locks the content of a particular policy. The banner displayed above the work area reads:

*This data for this policy is locked by activity/user: <name>.*

The content lock prevents other users from making any changes to the configuration of the locked policy.

- Assignment locks—Locks the assignment of a policy type to a particular device. The banner displayed above the work area reads:

*The assignment of this policy is locked by activity/user: <name>.*

For a local policy, an assignment lock prevents other users from unassigning the policy or assigning a shared policy of the same type in place of the local policy. For a shared policy, an assignment lock prevents other users from assigning a different shared policy of the same type in place of one already assigned.

These locks can either work together or independently of one another, depending on the actions being performed by the user. If both locks are active at the same time, the banner displayed above the work area reads:

*This policy is locked by activity/user: <name>.*

See [Understanding Locking and Policies](#) , on page 173 for a summary of the effects locking has on the actions you can perform.

### Releasing Locks

After is locked is enabled, it remains in place until you either submit your changes (when working in non-Workflow mode) or submit and approve the activity (when working in Workflow mode). If you discard the activity, any locks generated by the activity are also discarded. For more information about workflow modes, see [Workflow and Activities Overview](#) , on page 20.

Keep in mind that:

- Locks are based on the device name, not the IP address of the device. Therefore, we recommend that you avoid defining two devices with different names but the same IP address in Security Manager. Any attempt to deploy to both devices, especially at the same time, leads to unpredictable results.
- In addition, locks do not extend across different operations. For example, locking does not prevent one user from deploying to the same device that is being discovered by a different user.

Additional details about locking can be found in the following sections:

- [Understanding Locking and Policies](#) , on page 173
- [Understanding Locking and VPN Topologies](#) , on page 174
- [Understanding Locking and Objects](#) , on page 174

## Understanding Locking and Policies

The following table summarizes the effects of policy locks in Security Manager.

**Note** The ability to modify policies and policy assignments is dependent on the user permissions assigned to the user. See the [Installation Guide for Cisco Security Manager](#).

**Table 33: Locking Summary**

If Another User or Activity...	You Cannot...	You Can...
Changes a policy definition	<ul style="list-style-type: none"> <li>• Modify the policy or assign it to other devices.</li> <li>• Unassign the policy (if it is a local policy)</li> </ul>	Unassign the policy from any device (if it is shared).
Changes the definition of a rule-based policy with descendants	<ul style="list-style-type: none"> <li>• Modify the parent policy or any of the descendants.</li> <li>• Assign the parent policy or any of its descendants to additional devices.</li> <li>• Change the rule inheritance of the parent policy or any of the descendants.</li> </ul>	Unassign the policy from any device.
Changes a policy assignment without changing its definition	Modify the policy. <b>Note</b> In Policy view, a content lock is placed on the policy. In Device view, an assignment lock is placed on those devices whose assignment is being changed by the other user.	Assign and unassign the policy from other devices.
Changes a policy definition and changes its assignment	Modify the policy or assign it to other devices.	Unassign the policy from any device.

### Related Topics

- [Understanding Policy Locking](#) , on page 172
- [Understanding Policies](#) , on page 165

## Understanding Locking and VPN Topologies

If you change the device assignment for a VPN topology, or make changes to a specific VPN policy, a lock is placed on the whole VPN topology, and on any other topologies in which the policy is shared. This means that other users cannot make changes to the device assignment, nor can they make changes to any of the VPN policies defined for those VPN topologies.

In order to view and modify site-to-site VPN policies, you must have the required permissions for each device in the VPN topology. You also need permissions to add a device to a VPN topology. If you have different levels of permissions to the devices in the VPN topology, the lowest permission level is applied to the entire topology. For example, if you have read/write permissions to the spokes in a hub-and-spoke topology, but read-only permissions to the device serving as the hub, you are granted read-only permission to the policies and devices in the hub-and-spoke topology. For more information about permissions, see [Installation Guide for Cisco Security Manager](#) .

---

**Note** Unassigning devices from a VPN topology also creates device locks in the VPN topology, which means that these devices cannot be deleted from the inventory. Other users cannot edit the device assignments for the topology until you deploy configurations to all affected devices, including those you remove. The device is not actually removed from the topology until you deploy configurations.

---

### Related Topics

- [Understanding Policy Locking](#) , on page 172
- [Managing Site-to-Site VPNs: The Basics](#), on page 1071

## Understanding Locking and Objects

When you create or modify a reusable object, that object is locked to prevent other users from modifying or deleting the same object. Additional rules for object locking include:

- An object lock does not prevent you from modifying the definition or assignment of a policy that uses that object.
- The lock placed on a policy does not prevent you from making changes to an object that is included in the policy definition.
- You can change the definition of any object even if it is part of a policy assigned to a device to which you do *not* have permissions.
- When an object makes use of other objects (such as network/host objects and AAA server group objects), the lock on the object does not prevent another user from modifying those other objects. For example, when you modify a AAA server group object, the lock on that object does not prevent another user from modifying any of the AAA servers that make up the AAA server group.

When an object is locked, users who try to modify that object see a read-only version of the relevant dialog box. When you are working in Workflow mode, a message indicates which activity has locked the object.

## Customizing Policy Management for Routers and Firewall Devices

When you manage Cisco IOS routers or ASA, PIX, or FWSM firewall devices, you have the option of selecting which policy types to manage with Security Manager and which policy types to leave unmanaged. Managing a policy type means that Security Manager controls the configuration of the policy and considers the information that it stores in its database about that policy to be the desired configuration. Security Manager does not configure unmanaged policy types, nor does it track configurations of these types that were configured using other methods. For example, if you decide not to manage SNMP policies, any SNMP configurations that you configured using CLI commands are unknown to Security Manager.

#### Caution

If you use AUS or CNS to deploy configurations to ASA or PIX devices, be aware that the device downloads a full configuration from AUS or CNS. Thus, reducing the policies managed by Security Manager actually removes the configurations from the device. If you intend to deselect some ASA/PIX policies for management to use other applications along with Security Manager to configure devices, do not use AUS or CNS.

The ability to customize policy management on routers and firewalls makes it possible, for example, to use Security Manager to manage DHCP and NAT policies while leaving routing protocol policies, such as EIGRP and RIP, unmanaged. These settings, which can be modified only by a user with administrative permissions, affect all Security Manager users.

Unmanaged policies are removed from both Device view and Policy view. Any existing policies of that type, local or shared, are removed from the Security Manager database.

To customize policy management for routers and firewalls, select **Tools > Security Manager Administration > Policy Management** to open the [Policy Management Page](#) , on page 575. The policy types are organized in folders, with router and firewall (which includes all ASA, PIX, and FWSM devices) handled separately. Select or deselect policy types as desired and click **Save**. Subsequent processing depends on whether you are changing a policy type to be managed or unmanaged:

- **Unmanaging a policy type**—If you unmanage a policy type, and any device of that type has that policy configured, you must unassign the policies before unmanaging them. Security Manager displays a list of all devices that have assigned policies of that type, including the policy name, device name, and the user or activity that has a lock on the policy. If you click **Yes** to continue unmanaging the policy, Security Manager obtains the required locks, unassigns the policies, and then unmanages the policy type.

If a lock could not be obtained for even one device, no policies are unassigned, the policy type is not unmanaged, and you are told of the problem. You can then either manually unassign the policies from the affected devices, or release the user or activity locks, and try again to unmanage the policy type.

---

**Note** Unmanaging a policy has no effect on the active configuration running on the device; Security Manager does not remove the configuration from the device. Instead, unmanaging the policy removes it from the database, and Security Manager no longer considers that part of the device configuration.

---

- **Managing a previously-unmanaged policy type**—If you start managing a policy type that you previously did not manage using Security Manager, it is possible that the active configuration on the device has commands controlled by the newly-managed policy type. **It is therefore important that you rediscover policies on all devices of that type (either all routers or all ASA, PIX, FWSM devices).** This ensures that Security Manager has the current configuration for these policies.

If you do not rediscover policies and leave the newly-managed policies unconfigured, on the next deployment to the device, the existing settings configured on the device are removed. For more information on discovering policies on devices already managed, see [Discovering Policies on Devices Already in Security Manager](#), on page 179.

---

**Note** Features that are unmanaged by Security Manager can still be modified manually with CLI commands or FlexConfigs. For more information about FlexConfigs, see [Managing Flexconfigs](#), on page 339.

---

## Discovering Policies

Policy discovery enables you to bring your existing network configuration into Security Manager to be managed. Policy discovery can be performed by importing the configuration of a live device or by importing a configuration file. If you import a configuration file, the file must have been generated by the device (for example, by using the **show run** command on Cisco IOS Software devices); you cannot discover configuration files in any other format.

You can initiate policy discovery when you add a device by selecting the relevant options in the New Device wizard. For more information, see [Adding Devices to the Device Inventory](#), on page 75.

You can also initiate policy discovery on existing devices from Device view. For more information, see [Discovering Policies on Devices Already in Security Manager](#), on page 179.

When you initiate policy discovery on a device, the system analyzes the configuration on the device and then translates this configuration into Security Manager policies and policy objects so that the device can be managed. Warnings are displayed if the imported configuration completes only a partial policy definition. If additional settings are required, you must go to the relevant page in the Security Manager interface to complete the policy definition. Warnings and errors are also displayed if the imported configuration is invalid.

After performing policy discovery, you must submit your changes (or approve your activity when working in Workflow mode) to have the information included in change reports and to make the information available to other users. If you make any changes to the discovered policies, you must deploy the changes to the device for them to take effect. For more information, see [Managing Deployment](#), on page 379.

---

**Tip** Use the Security Manager Administration window to configure discovery-related settings that apply to all devices. For more information, see [Discovery Page](#), on page 534.

---

## Policy Discovery and VPNs

In addition to performing discovery on individual devices, Security Manager allows you to discover the VPNs that are already deployed in your network. How you discover VPNs depends on the type of VPN being discovered:

- Site-to-Site VPNs—A wizard walks you through the discovery procedure step by step. For more information, see [Site-To-Site VPN Discovery](#) , on page 1093.

---

**Tip** We recommend that you deploy to a file immediately after discovering a Site-to-Site VPN. This enables Security Manager to assume full management of the relevant CLI commands that are configured on the device.

---

- IPsec and SSL Remote Access VPNs—You can discover IPsec and SSL VPNs when you discover policies on the device, either when you add the device to the inventory or if you discover policies on a device already in the inventory. Policies related to these VPNs are treated as regular device policies. However, when selecting discovery options, you must specifically select to discover RA VPN policies. For more information about remote access VPN policy discovery, see [Discovering Remote Access VPN Policies](#) , on page 1298. For more information about performing policy discovery, see [Adding Devices to the Device Inventory](#) , on page 75 and [Discovering Policies on Devices Already in Security Manager](#) , on page 179.

---

**Note** If you add a device using a configuration file, and discover security policies while adding the device, Security Manager cannot successfully discover policies that require that files be downloaded from the discovered device. This especially affects devices that include the **svc image** command in an SSL VPN configuration. Because Security Manager does not have the referenced file in its database, the **no** form of the command is generated for the discovered configuration.

---

## Policy Discovery and Cisco IOS Routers and Catalyst Devices

Security Manager supports a subset of the complete list of commands available in the Cisco IOS software, mostly centered on security-related commands. You can discover all supported Cisco IOS commands. Commands that are not supported are left in place unless they conflict directly with a policy configured in Security Manager. For more information about performing policy discovery on Cisco IOS routers, see [Discovering Router Policies](#) , on page 2325. For more information about performing policy discovery on Catalyst devices, see [Discovering Policies on Cisco Catalyst Switches and Cisco 7600 Series Routers](#) , on page 2647.

---

**Tip** We recommend that you deploy to a file immediately after discovering a Cisco IOS router or Catalyst device. This enables Security Manager to assume full management of the relevant CLI commands that are configured on the device.

---

## Policy Discovery and Firewall Security Contexts

When you add a device that has security contexts, you should discover all contexts and policies at the same time; otherwise, you will have to discover policies for each context separately. When you add the device, select **MULTI** for Context and do not select Security Context of Unmanaged Device. (If you select this option, only the admin context is imported, and it has no relationship to other security contexts on the device; select this option only if you want to manage the security context independently from the parent device). Depending

on how you add the device, you might need to select the option to discover security contexts. During discovery, Security Manager identifies each security context and adds it as a separate device to the device list, appending the security context name to the end of the parent's name; for example, if the parent is pix\_141, the admin context would be pix\_141\_admin. (You can control the naming convention for security contexts; for more information, see [Discovery Page , on page 534](#)). You can create new security contexts, or delete existing contexts, as well as create and delete policies for those contexts.

If you create multiple security contexts on FWSM, which are contained in Catalyst 6500 devices, and you are running IOS software on the chassis, add the chassis device using the SSH credentials for the chassis. Then Security Manager can identify each FWSM on the chassis, and give you the option to add each of them. During FWSM discovery, Security Manager discovers the security contexts for each FWSM, including the policies for the FWSM and for each context. However, if you are using the Catalyst OS on the device, you must discover each FWSM individually.

For more information about adding devices to the inventory, see [Adding Devices to the Device Inventory , on page 75](#).

### Policy Discovery and IPS Devices

When you discover policies on an IPS device, the virtual sensors defined on the device are also discovered along with the policies defined for the virtual sensors. If more than one virtual sensor uses the same policy, that policy is created as a shared policy and is assigned to the virtual sensors. Policies defined for a single virtual sensor, or only for the parent device, are created as local policies. You cannot discover policies just for an individual virtual sensor; you can discover policies only on the parent device. If policies are discovered on the parent device that are not assigned to any virtual sensors, those policies are created as shared policies that are not assigned to any device or virtual sensor.

After discovering an IPS device that contains virtual sensors, you must submit your changes to the database for the virtual sensors to appear in the device selector.

### Policy Discovery and Object Groups

When you perform policy discovery, any object groups already configured on PIX, ASA, FWSM, and IOS 12.4(20)T+ devices are brought into Security Manager as policy objects. For more information about how Security Manager policy objects are translated into object groups and vice-versa, see [How Policy Objects are Provisioned as Object Groups , on page 335](#).

In addition, **object network** and **object service** configurations on ASA 8.3+ devices are brought into Security Manager as host, network, or address range network/host objects, or service objects (as opposed to service group objects). The only exception is that address range objects that have the same address for the start and end range are instead created as host network/host objects.

---

**Note** For IOS devices, any objects discovered that are used by access control lists that are discovered as ACL objects are subsequently replaced during deployment by the contents of the object. Object groups used with ACL objects are not preserved, although they are discovered as Security Manager policy objects.

---

### Policy Discovery and Security Manager Policy Objects

When you perform policy discovery, Security Manager tries to reuse the policy objects that you have already created in Security Manager. Based on the contents of the device configuration, the following are the possible actions:

- Named policy objects in the configuration—Existing policy objects are reused if their content matches the configuration on the device.

If the contents of the named policy object does not match, the policy object is reused and a device-level override is created if **Allow Device Override for Discovered Policy Objects** is selected on the Discovery administration page. For more information, see these topics:

- [Understanding Policy Object Overrides for Individual Devices](#) , on page 244
- [Discovery Page](#) , on page 534
- Unnamed policy objects in the configuration—Existing policy objects are used if their content matches the configuration on the device. You can control this behavior by changing the value of the **Reuse Policy Objects for Inline Values** setting on the Discovery administration page.
- You can discover objects that have the same definition as existing objects, regardless of the setting you have defined for detecting redundant objects. For more information about this setting, see [Policy Objects Page](#) , on page 577.

For more information on policy objects, see [Managing Policy Objects](#), on page 227.

### Policy Discovery and Access Control Lists

Certain policies in Security Manager support only standard or only extended ACLs, even if both types are supported by the CLI. In such cases, policy discovery works as follows:

- If the Security Manager policy supports only extended ACLs (for example, firewall service policies), any standard ACLs configured on the device for that policy are imported as extended ACLs.
- If the Security Manager policy supports only standard ACLs (for example, SNMP traps on IOS routers), any extended ACLs configured on the device for that policy are imported as standard ACLs.

During the discovery process, Security Manager will show any inactive ACLs that are imported as disabled. If you later deploy these disabled ACLs, they are removed from the device configuration.

### Related Topics

- [Viewing Policy Discovery Task Status](#) , on page 186
- [Understanding Policy Object Overrides for Individual Devices](#) , on page 244

## Discovering Policies on Devices Already in Security Manager

When you add a device to the inventory, you can discover policies at the same time that you add the device. However, you can skip policy discovery and do it later, or rediscover policies after adding the device.

You might initiate policy discovery on existing devices when:

- You make changes to device configurations using CLI commands, for example, device upgrade. In such a situation, you can rediscover existing policies on the device to make sure that the Security Manager database has the most current information. We recommended you to enter out-of-band changes in Security Manager rather than performing a rediscovery. However, beginning with version 4.13, in a single discovery action, all the policies are properly discovered (as applicable for upgrade of ASA 8.x to 9.x).
- You want to discover a subset of policies (for example, platform-specific settings) that was not discovered when you first added the device to Security Manager.

- You want to import the factory-default configuration of a firewall device. For more information, see [Default Firewall Configurations](#) , on page 1806.

**Caution**

If you perform policy discovery on a device *after* configuring policies in Security Manager but before you deploy your changes, the discovered policies overwrite the undeployed changes. For example, if you select the option to discover platform-specific settings, the discovered configuration overwrites any platform-specific undeployed policies you configured in Security Manager. This is true even if the discovered configuration does not include the specific platform policy you configured. For example, discovering platform-specific settings overwrites any routing policies that you have configured for the device in Security Manager, even if the configuration you discover does not contain any routing information. Another result of rediscovery is that any shared policies that were configured on the device are replaced by the local policies that are discovered.

**Caution**

Under certain conditions, Security Manager may fail to discover ASA interfaces in system context. Specifically, if a rediscovery/deployment is done on the system context of a multiple context ASA without checking (selecting) "inventory," then Security Manager may fail to discover the interfaces on other security contexts. This can potentially result in Security Manager altering or altogether deleting interface configurations of other contexts in a subsequent deployment. To avoid this problem, simply be sure to select "inventory" when doing a rediscovery of the system context.

**Before You Begin**

Ensure that no one is configuring policies on the device or deploying configurations to the device. If you rediscover policies on a device while a deployment job is deploying configurations to the device, you might not be able to see the deployed changes after the rediscovery. Use the Deployment Manager to determine if there are active jobs that include the device before you rediscover policies (select **Manage > Deployments**). If you inadvertently rediscover policies during a deployment job, wait until the deployment job is completed and then discover policies again to ensure that Security Manager is synchronized with the device.

**Related Topics**

- [Viewing Policy Discovery Task Status](#) , on page 186
- [Discovering Policies](#) , on page 176
- [Frequently Asked Questions about Policy Discovery](#), on page 191
- [Understanding Policies](#) , on page 165
- [Managing Policies in Device View and the Site-to-Site VPN Manager](#) , on page 194
- [Managing Shared Policies in Policy View](#) , on page 215

**Step 1**

Decide whether you need to discover policies on a single device or if you want to discover policies on more than one device at a time. Policy discovery options vary based on how you start the discovery process.

- **Single device discovery**—If you need to discover policies related to any of the following, you can do it using only single-device discovery. (Note that single-device discovery is the type of discovery performed when you add a device to the inventory.)
  - Security context configurations for ASA, PIX, and FWSM devices running in multiple context mode.

- Virtual sensor configurations for IPS devices.
  - Service module information for Catalyst devices.
  - Policy discovery from a configuration file.
  - Policy discovery from the factory default configuration.
- **Bulk rediscovery**—If you need to discover policies for more than one device, you can perform bulk rediscovery. However, bulk rediscovery can be performed only on live devices (that is, devices currently running and accessible in your network), and you cannot discover security context, virtual sensor, or Catalyst service module configurations. (You can discover service modules if you select them directly instead of selecting the device that contains them.)

**Step 2** If you want to perform single-device discovery, do the following:

- a) In device view or map view, ensure that only one device is selected, then right-click and select **Discover Policies on Device**. This opens the Create Discovery Task dialog box.

**Tip:** If the dialog box is called Bulk Rediscovery, you need to close the dialog box and try again. Ensure that only a single device is selected and reissue the command. You must use the right-click menu; it is the only way to perform single-device discovery.

- b) Modify the discovery task name, if desired, and select the following discovery options. For detailed information, see [Create Discovery Task and Bulk Rediscovery Dialog Boxes](#), on page 183.

- **Discover From**—Whether you are discovering from a live device (which is active and accessible in the network), a configuration file (click **Browse** to select the file on the Security Manager server), or factory default configuration (for ASA, PIX, and FWSM devices running an OS version for which a factory default configuration exists). You can discover the default configuration only for devices that run in single-context mode or for individual security contexts.

**Tip:** We recommend that you use the Factory Default Configuration settings when you add PIX, ASA, and FWSM devices manually (as described in [Adding Devices by Manual Definition](#), on page 92). You should discover the default configuration for single-context mode devices and for each security context on a multiple-context mode device. For more information about factory-default policies, see [Default Firewall Configurations](#), on page 1806.

- **Discover Policies for Security Contexts**—Select this option for firewall devices running in multiple-context mode if you want to discover policies for the security contexts defined on them.
- c) Select the types of policies you want to discover. For more information about the difference between different types of policies, see [Service Policies vs. Platform-Specific Policies](#), on page 166.
    - **Detect ASA-CX/FirePOWER Module**—Determines if a CX or FirePOWER module is installed; see [Detecting ASA CX and FirePOWER Modules](#), on page 2883 for more information.
    - **Inventory**—Discovers basic device information (such as hostname and domain name), interfaces, and security contexts on devices running in multiple-context mode. On Cisco IOS routers, this option also discovers all interface-related policies, such as DSL, PPP, and PVC policies.
    - **Platform Settings**—Discovers platform-specific policies, such as routing policies.
    - **Firewall Services**—Discovers firewall services policies, such as access rules and inspection rules, on all platforms.
    - **NAT Policies**—Discovers network address translation (NAT) policies, such as address pools, static translation rules, and dynamic NAT/PAT. Discovery of NAT policies is supported on ASA, ASA-SM, PIX and FWSM devices.

- Routing Policies—Discovers routing policies for ASA devices.
- SSL Policy—Discovers SSL policy for ASA devices.
- RA VPN Policies—Discovers IPSec and SSL remote access VPN policies, such as IKE proposals and IPsec proposals.
- IPS—Discovers IPS policies, such as signatures and virtual sensors.

For more information, see [Create Discovery Task and Bulk Rediscovery Dialog Boxes](#) , on page 183.

- d) Click **OK**. The discovery task is initiated and the Discovery Status dialog box opens so you can view the task status (see [Discovery Status Dialog Box](#) , on page 187). You cannot perform other tasks in Security Manager while discovery is in progress.

**Step 3** If you want to perform bulk rediscovery, do the following:

- a) In device view, do one of the following:
- Select a device group, or multiple devices, then right-click and select **Discover Policies on Device**. Ensure that the Bulk Rediscovery dialog box opens.

**Tip:** If the dialog box is called Create Discovery Task, you need to close the dialog box and try again. Ensure that a device group or more than one device is selected and reissue the command.

- Select **Policy > Discover Policies on Device**. This opens the Device Selector dialog box. Select the devices you want to discover from the Available Devices list and click >> to move them to the Selected Devices list. Click **Next**.

**Note** If you use the right-click command, Security Manager assumes you have selected the desired devices. You can always click the **Back** button to go to the Device Selector screen and change the device list.

- b) Modify the discovery task name, if desired, and select discovery options. For detailed information, see [Create Discovery Task and Bulk Rediscovery Dialog Boxes](#) , on page 183.

The devices are organized in groups according to device type, with your device groups (if any) shown within each type:

- To change options for all devices of a given type, select the device type folder and modify the Discover Device Settings options. If the Discover drop-down list shows Multiple Values, then there are different discovery options selected for devices of that type. If you change the value, it changes for all devices. The check boxes for the policy types (explained above for single-device discovery) are available only if you select Policies and Inventory. Only options available for all devices in the selected group are shown, so you might need to select individual devices separately to select the most appropriate set of options.
- To change options for a single device, click the + icons next to folders to open them until you find the device, select the device, and then select the discovery options.

**Note** When the list of options is not expanded, all policies, namely the Platform Settings, Firewall Policies, NAT Policies and RA VPN, are discovered. However, when you expand the list of options, the discovery will be based on the options that you select from the available list.

- c) Click **Finish**. The discovery task is initiated and the Discovery Status dialog box opens so you can view the task status (see [Discovery Status Dialog Box](#) , on page 187). You cannot perform other tasks in Security Manager while discovery is in progress.

## Create Discovery Task and Bulk Rediscovery Dialog Boxes

Use the Create Discovery Task dialog box to have Security Manager discover the policies for a device that is already in the device inventory. Use the Bulk Rediscovery dialog box to discover policies on more than one device at a time. Your options for policy discover differ based on which dialog box you use. For detailed information on the procedure, including how to get to each of these dialog boxes, see [Discovering Policies on Devices Already in Security Manager](#), on page 179.

You can also discover policies when you add the device to the inventory. For more information about adding devices, see [Adding Devices to the Device Inventory](#), on page 75.

### Navigation Path

In Device view, select a device from the Device selector and do one of the following:

- Select **Policy > Discover Policies on Device** to perform bulk rediscovery.
- Right-click the device in the Device selector and select **Discover Policies on Device**. If a single device is selected, you get the Create Discovery Task dialog box. Otherwise, you are performing bulk rediscovery.

---

**Tip** You can also right click a device in Map view and select **Discover Policies on Device**.

---

Element	Description
Discovery Task Name	The name assigned to the discovery task. Security Manager automatically generates a name for the task based on the current date and time, but you can modify this name as desired.

Element	Description
Selected Devices table  (Bulk rediscovery only)	<p>The devices you selected for rediscovery. The devices are organized in groups according to device type, with your device groups (if any) shown within each type:</p> <ul style="list-style-type: none"> <li>• To change options for all devices of a given type, select the device type folder and modify the Discover Device Settings options. If the Discover drop-down list shows Multiple Values, then there are different discovery options selected for devices of that type. If you change the value, it changes for all devices. The check boxes for the policy types (explained above for single-device discovery) are available only if you select Policies and Inventory. Only options available for all devices in the selected group are shown, so you might need to select individual devices separately to select the most appropriate set of options.</li> <li>• To change options for a single device, click the + icons next to folders to open them until you find the device, select the device, and then select the discovery options.</li> </ul> <p><b>Tip:</b> To change which devices are selected for rediscovery, click <b>Back</b> to go to the Device Selector dialog box.</p>
Discover From Config. File  (Not available for bulk rediscovery)	<p>The source of policy information to be discovered:</p> <ul style="list-style-type: none"> <li>• Live Device—Discover policies directly from the device.</li> <li>• Config File—Discover policies from a configuration file. Specify the location of the file in the <b>Config File</b> field. Click <b>Browse</b> to select the file on the Security Manager server.</li> </ul> <p>You can discover policies only from configuration files that were generated from the device (for example, with the <b>show run</b> command). For more information, see <a href="#">Adding Devices from Configuration Files</a>, on page 89.</p> <ul style="list-style-type: none"> <li>• Factory Default Configuration—Performs discovery on a firewall device using a file containing the factory-default settings for that device. Security Manager automatically chooses the appropriate file for the selected device (shown in the Config File edit box). This option is available only if Security Manager has a default configuration for the OS version running on an ASA, PIX, or FWSM device. You can discover the default configuration only for devices that run in single-context mode or for individual security contexts. For more information, see <a href="#">Default Firewall Configurations</a>, on page 1806.</li> </ul>
Discover Policies for Security Contexts  (Not available for bulk rediscovery)	<p>Whether to discover policies for each security context that is configured on a firewall device running in multiple-context mode. This field applies only to PIX, ASA, and FWSM devices.</p> <p>When deselected, Security Manager treats the entire device as having a single set of policies configured in single-context mode.</p> <p>For more information about security contexts, see <a href="#">Configuring Security Contexts on Firewall Devices</a>, on page 2307.</p>

Element	Description
Policies to Discover (for single-device discovery)  Discover Device Settings (for bulk rediscovery)	<p>The policy types to discover on the selected device.</p> <p><b>Note</b> For bulk rediscovery, from the Discover drop-down menu, choose <b>Policies and Inventory</b> to enable the following options, <b>Inventory Only</b> to discover the inventory without discovering other policy types, or <b>Detect ASA-CX/FirePOWER Module</b> to determine if a CX or FirePOWER module is installed without discovering other policies. If the drop-down list has <b>Multiple Values</b> selected, this means that the devices in the selected group have different discovery options selected. If you change the selection, your change applies to all the devices in the group.</p> <p>The discovery options are:</p> <ul style="list-style-type: none"> <li>• Detect ASA-CX/FirePOWER Module—Determines if a CX module or FirePOWER module is installed; see <a href="#">Detecting ASA CX and FirePOWER Modules</a>, on page 2883 for more information.</li> <li>• Inventory—Includes device information such as the hostname and domain name, interfaces, and security contexts (for firewall devices running in multiple-context mode). On Cisco IOS routers, this option also discovers all interface-related policies, such as DSL, PPP, and PVC policies.</li> <li>• Platform Settings—Includes all platform-specific policies that can be configured on the selected device.</li> <li>• Firewall Services—Includes all firewall service policies. For more information, see <a href="#">Introduction to Firewall Services</a>, on page 595.</li> <li>• NAT Policies—Includes all network address translation (NAT) policies that are configured on the selected device, such as address pools, static translation rules, and dynamic NAT/PAT. Discovery of NAT policies is supported on ASA, ASA-SM, PIX and FWSM devices. For more information, see <a href="#">Configuring Network Address Translation</a>, on page 1015.</li> <li>• Routing Policies—Discovers routing policies for ASA devices. For more information, see <a href="#">Configuring Routing Policies on Firewall Devices</a>, on page 2091.</li> <li>• SSL Policy—Discovers SSL policy for ASA devices.</li> <li>• RA VPN Policies—Includes all IPsec and SSL remote access VPN policies that are configured on the selected device. This option is disabled if the device does not support remote access VPN configuration. For more information, see <a href="#">Managing Remote Access VPNs: The Basics</a>, on page 1287.</li> <li>• IPS Policies—Includes all IPS policies that are configured on the selected device. For more information, see <a href="#">Overview of IPS Configuration</a>, on page 1617 or <a href="#">Overview of Cisco IOS IPS Configuration</a>, on page 1792.</li> </ul>

Element	Description
	<p>Notes:</p> <ul style="list-style-type: none"> <li>• Routing Policies and SSL Policy options are applicable for Adaptive Security Appliance (ASA) devices only.</li> <li>• If you select Platform Settings as the policies to discover, the Routing Policies and SSL Policy which are sub options of Platform Settings, cannot be deselected.</li> <li>• To discover either Routing Policies or SSL Policy or both, you can deselect the Platform Settings option and then select either Routing Policies or SSL policy or both to discover only those policies.</li> <li>• For non-ASA devices, the Routing Policies and SSL Policy options may be listed but will always be unavailable for selection.</li> <li>• In bulk rediscovery, for transparent mode and system context you can select the Routing Policies option but no discovery will happen.</li> </ul>

## Viewing Policy Discovery Task Status

When you initiate policy discovery a discovery task is created. For each policy discovery initiation, only one task is created regardless of the number of devices being discovered.

You can view the status of the current policy discovery task in the Discovery Status dialog box, which opens automatically when the task is initiated. This dialog box provides updated status information about the discovery task, including summary information about the task and details about each device being discovered.

You can abort a discovery task, if required. When you perform policy discovery on a single device, aborting the task results in partial discovery. In such cases, we recommend deleting the information and starting again. When you perform policy discovery on multiple devices, any devices for which discovery was completed before you aborted the operation are fully discovered. Security Manager automatically discards the information for any partially discovered device.

The Discovery Status dialog box also displays the appropriate warning and error messages if any problems are encountered during the discovery process. For example, if the CLI commands in a configuration file do not define a complete Security Manager policy, a warning message is displayed that you must complete the policy definition in the relevant Security Manager policy page.

For more information, see [Discovery Status Dialog Box](#), on page 187.

To view information about previous discovery tasks, select **Manage > Policy Discovery Status** to open the Policy Discovery Status window. Select the discovery task in the top pane of the window, and the results of the task are displayed in the lower panes. For more information about using the Policy Discovery Status window, see [Policy Discovery Status Page](#), on page 189.

### Field Reference

**Table 35: Discovery Status Dialog Box**

Element	Description
Progress bar	Indicates what percentage of the discovery task on the current device has been completed.
Status	The current state of the discovery task.
Devices to be discovered	The total number of devices being discovered during this task. The number includes service modules, security contexts, and virtual sensors.
Devices discovered successfully	The number of devices discovered without errors.
Devices discovered with errors	The number of devices that generated errors during discovery.

Element	Description
Discovery Details table	<p>The devices that are being discovered. Select a device to see the messages generated during the discovery of that device in the message list below the summary list. Besides the device name, information in the table includes:</p> <ul style="list-style-type: none"> <li>• Severity—The overall severity level of the discovery task. For example, if the discovery task completed successfully, an Information icon is displayed. If the task failed, an Error icon is displayed.</li> <li>• State—The current state of the policy discovery task for the selected device: <ul style="list-style-type: none"> <li>• Device Added—The device has been added to Security Manager, but policy discovery has not yet started.</li> <li>• Discovery Started—Policy discovery has started.</li> <li>• Reading and Parsing Device Config—The policy discovery task is interpreting the device configuration.</li> <li>• Importing Objects—The policy discovery task is importing objects from the configuration.</li> <li>• Importing Policies—The policy discovery task is importing policies from the configuration.</li> <li>• Discovery Complete—Policy discovery has been completed successfully.</li> <li>• Discovery Failed—Policy discovery failed due to errors.</li> </ul> </li> <li>• Discovered From—The source of policy information. For example, when discovering from a configuration file, this field displays the name and path of the file.</li> </ul>
Messages list	The messages generated during the discovery for the selected device. Select a message to see detailed information in the fields to the right of the list.
Description	Additional information about the message selected in the message list.
Action	The steps you should take to resolve the described problem.
Generate Report button	Click this button to create a discovery status report for this job. The report is a PDF file, saved to your client system, that includes a summary of the job. You can use this report for your own purposes or to aid in troubleshooting a problem with Cisco TAC. For more information, see <a href="#">Generating Deployment or Discovery Status Reports, on page 506</a> .

Element	Description
Abort button	<p>Aborts the discovery task.</p> <p>If you abort the task when performing policy discovery on a single device, the result is partial discovery of that device. In such cases, we recommend deleting the information (for example, by discarding the activity) and starting again.</p> <p>If you abort the task when performing policy discovery on multiple devices, Security Manager automatically discards the information for any partially discovered device. Devices for which discovery was completed before you aborted the operation are fully discovered.</p>

## Policy Discovery Status Page

Use the Policy Discovery Status page to view the status of previous policy discovery and device addition tasks.

### Navigation Path

### Field Reference

*Table 36: Policy Discovery Status Page*

Element	Description
<b>Task Table</b>	
<p>The upper portion of the window lists the previous policy discovery or device addition tasks. Select a task to view detailed information about it in the lower portion of the window. The columns in the table provide overall status information for the task.</p> <p>When adding devices that contain security contexts, the context discovery appears as a separate Policy Discovery task.</p>	
Name	The name of the discovery or device addition task. This might be a system generated name or a name you specified when rediscovering device policies.
Type	The type of task, either Policy Discovery (when you rediscover device policies) or Add Device (when you add a device using the New Device wizard and elect to discover policies).
Start Time	The time the task started.
End Time	The time the task stopped.

Element	Description
Status	<p>The overall status of the task. One of the following:</p> <ul style="list-style-type: none"> <li>• Completed successfully—The task succeeded.</li> <li>• Completed with errors—The task was partially successful. This could occur if all policies were not discovered or if the device was added but no policies were discovered.</li> <li>• Completed with warnings—The task was successful but a minor problem occurred.</li> <li>• Failed—The task failed. No policies were discovered or no device was added because of errors or because you stopped discovery.</li> </ul>
Generate Report button	<p>Click this button to create a discovery status report for the selected job.</p> <p>The report is a PDF file, saved to your client system, that includes a summary of the job. You can use this report for your own purposes or to aid in troubleshooting a problem with Cisco TAC. For more information, see <a href="#">Generating Deployment or Discovery Status Reports, on page 506</a>.</p>
Refresh button	<p>Click this button to refresh the task list to update the information if there are tasks running in the background or if new tasks were created.</p>
Delete button	<p>Click this button to delete the selected task from the database. Deleting old tasks does not affect the related devices or discovered policies.</p>
<p><b>Discovery Details or Import Details Tables</b></p> <p>These tables display the devices included in the selected task. The name differs depending on the type of task (Discovery Details for Policy Discovery tasks, Import Details for Add Device tasks).</p> <p>Select a device to see the messages generated during the task for that device in the message list below the table.</p>	
Device	<p>The name of the device. If the name is followed by (deleted), the device is no longer in the Security Manager inventory.</p>
Config File (Import Details only)	<p>The location of the configuration file. This field is displayed only if you are importing from a configuration file.</p>
Task Type (Import Details only)	<p>One of the following:</p> <ul style="list-style-type: none"> <li>• Import only—Adding devices to Security Manager.</li> <li>• Import and Discover—Adding devices and discovering policies and inventory, or adding devices and discovering policies.</li> </ul>
Severity	<p>An icon for one of the following is displayed:</p> <ul style="list-style-type: none"> <li>• Error—The device addition or policy discovery failed.</li> <li>• Information—The device was added successfully or policy discovery was successful.</li> </ul>

Element	Description
State Details	<p>These fields have the same meaning, although different names are used in the Discovery Details and Import Details tables. The fields describe the status of the task for the device:</p> <ul style="list-style-type: none"> <li>• Device Added—The device was successfully added to the inventory.</li> <li>• Device Add Failed—The device was not added to the inventory.</li> <li>• Discovery Completed—Discovery succeeded and the discovered policies are added to the Security Manager database.</li> <li>• Discovery Failed—No policies were discovered because errors occurred.</li> </ul>
Discovered From (Discovery Details only)	<p>One of the following:</p> <ul style="list-style-type: none"> <li>• Live Device—Security Manager contacted the device to obtain configuration and policy information.</li> <li>• File—Security Manager obtained the configuration and policy information from a configuration file.</li> </ul>
Messages list	<p>The messages generated during the task for the selected device. Select a message to see detailed information in the fields to the right of the list. The severity icons have these meanings:</p> <ul style="list-style-type: none"> <li>• Error—A problem was detected.</li> <li>• Warning—A minor problem occurred during discovery.</li> <li>• Information—An informational message about the selected device.</li> </ul>
Description	Additional information about the message selected in the message list.
Action	The steps you should take to resolve the described problem.

## Frequently Asked Questions about Policy Discovery

These questions and answers describe how policy discovery processes your device configurations into Security Manager policies.

**Question:** How does policy discovery work?

**Answer:** After you select the device whose policies, settings, and interfaces (inventory) you want to discover, Security Manager obtains the running configuration (from live devices) or the supplied configuration (when discovering from configuration files) and translates the CLI into Security Manager policies and objects. The imported configuration is added to the Configuration Archive as the initial configuration for the device. After discovery, you can review the discovered policies and objects and decide whether to commit them to the database. If you dislike them, you can discard them instead. Please note that commit and discard affect all discovered devices as a group and cannot be implemented on a per-device basis.

**Question:** When should I discover policies?

**Answer:** Typically, you should discover policies when you add devices to Security Manager. However, if you are creating devices in Security Manager (instead of importing live devices or configuration files), you must perform policy discovery after adding the device. You should also perform policy discovery in order to synchronize Security Manager with any out-of-band changes that have been made to the device, for example through the CLI.

**Question:** How can I determine the results of the discovery?

**Answer:** When you initiate a discovery task, a window opens that shows you the discovery status and results. You can also view a history of discovery task results on the Policy Discovery Status page (select **Manage > Policy Discovery Status**).

**Question:** Does Security Manager show which commands are not discovered, and what can I do about them?

**Answer:** In the discovery status window, go to the Message Summary section, then select **Commands Not Discovered**. Any undiscovered commands are listed in the Description field. You can either remove the command from the device and repeat the discovery process, or continue. If you continue, Security Manager will remove the unsupported command in the next deployment.

If Security Manager does not support a command found on a device, the discovery is generally not aborted; however, if the device has any access control entries (ACEs) that refer to unsupported object groups, the discovery is aborted. Other error messages, such as **User groups not supported**, might also provide details about undiscovered commands. Read the information in the Action box for suggestions.

**Question:** How are discovered policies reflected in the user interface?

**Answer:** Security Manager converts the device commands into policies. There is no difference in appearance between a policy discovered from a device configuration and one defined directly in Security Manager.

**Question:** I am using Auto Update Server for my PIX or ASA devices. How do I discover policies?

**Answer:** If a device has a static IP address, you can discover policies from the device. If it has a dynamic IP address, you must discover policies from the device's configuration file (offline).

**Question:** I am using Cisco Secure ACS to manage authentication and authorization to Security Manager. How does this affect policy discovery?

**Answer:** You must add all managed devices to Cisco Secure ACS before you can perform policy discovery and manage these devices in Security Manager. This includes security contexts on PIX/ASA/FWSM devices. For more information, see the [Installation Guide for Cisco Security Manager](#).

**Question:** What should I do after discovering VPN or router platform policies?

**Answer:** Due to the way these features are discovered, Security Manager does not assume management of discovered VPN and router platform policies until after it deploys them. This means that if you discover a router, unassign one of its policies and deploy, no commands are removed from the router's configuration. We recommend, therefore, that you perform deployment to a file immediately after discovering VPN or router platform policies, *before* you make any changes to those policies. After this initial deployment, you can reconfigure these policies and deploy your changes as required.

**Question:** If I discover policies on a device and then deploy the policies from Security Manager without changing them, what is the difference between the original configuration on the device and the one that exists after the deployment?

**Answer:** Typically, there will be no differences between the new configuration and your original one, assuming you set up FlexConfigs for any unsupported CLI commands. However, in certain cases minor changes might occur in your ACL or object-group naming schemes. For more information, see [How Policy Objects are Provisioned as Object Groups](#), on page 335. In addition, any discovered objects that are not being used by a

policy are removed from the configuration. There can also be instances where the new configuration is functionally equivalent to the old one but does not use the same commands.

**Question:** How does Security Manager handle my current CLI naming schemes for ACLs and object groups?

**Answer:** When you discover policies from a device, Security Manager tries to use the same names you have used. However, depending on your naming scheme, some minor differences might occur between what you defined on your device and the policies created through discovery. Additionally, there is a possibility that a naming conflict can occur between an existing ACL or object on the device and the name required for the new policy or object; in this case, Security Manager generates a different name so as not to misconfigure the device. For example, if the name of a discovered object conflicts with an object of the same type that already exists in Security Manager, a suffix is added to the name of the new object to make it unique or a device-level override is created.

**Question:** Are all configuration commands discovered and brought into Security Manager?

**Answer:** No. Security Manager does not discover all device configuration commands. Instead, it discovers security policies. For any configuration commands not discovered, use the FlexConfig feature to include the commands that Security Manager does not support.

**Question:** If I rediscover policies on a device already in Security Manager, what happens to the policies assigned to the device?

**Answer:** If you rediscover policies on a device that you are already managing with Security Manager, the newly discovered policies replace the ones assigned to the device. All policies within the selected policy domain (firewall services, platform settings, or both) are replaced, not just the ones that are different on the device compared to the ones in the Security Manager database. If you assigned shared policies to the device, the assignment is removed and the shared policy is left unchanged (so that other devices that use the shared policy are not affected). After policy discovery, all policies assigned to the device are specific to that device; none of them are shared with other devices. If you want to use shared policies with the device, you must redo the assignments after policy discovery.

In addition, any customizations done to local policies are also lost. For example, if you used sections to organize rules-based firewall policies, the sections are removed and the rediscovered policy is a flat list of entries.

**Question:** Does Security Manager use existing policies and objects during policy discovery?

**Answer:** During policy discovery, Security Manager uses existing policy objects (ones that you already defined in Security Manager) when creating policies for the device. However, Security Manager does not reuse existing policies; all policies created during discovery are local to the device being discovered. Thus, you might find it beneficial to define your policy objects (such as network objects) before adding devices to Security Manager.

**Question:** After adding a device and discovering policies, I cannot submit my changes to the database; instead I get warnings such as “Connection Policies Not Set.” What must I do to complete the device addition?

**Answer:** When you add a device and discover policies (particularly when you add devices from configuration files), Security Manager warns you if the resulting configuration is incomplete in ways that will prevent it from successfully managing the device. Connection policies, for example, are simply the device credentials (user names and passwords) required to log into the device, as well as other connection-related configuration settings (such as HTTP settings). Because these missing settings result in an invalid configuration or prevent Security Manager from contacting and managing the device later, you are prevented from submitting the changes to the database. Ensure that you have complete and valid configurations for these settings, then resubmit your changes to the database.

**Question:** Why does the AAA policy not show the AAA configuration that I discovered on the device?

**Answer:** The AAA policy contains the default configurations for authentication, authorization, and accounting. Other AAA commands that specify a particular list name are mapped to the policies that reference them. If the list name is not referenced by a policy, it is not discovered.

**Question:** Why are parts of the AAA method list definitions configured on my router not discovered?

**Answer:** Security Manager does not support certain keywords, such as if-needed. Method lists containing these keywords are discovered without the keyword. If the default AAA definitions on the device contain unsupported keywords, the entire command is not discovered.

**Question:** Can I discover AAA servers on devices running IOS software that were configured using the server-private command?

**Answer:** Yes, you can discover these servers. However, Security Manager converts them into standard AAA servers that can be used globally or in multiple AAA server groups. The server-private command is not supported.

**Question:** What do I need to know about discovery and device hostnames?

**Answer:** When you discover a device, the hostname policy is populated with the hostname discovered on the device. However, the hostname listed in Device Properties is not updated with this value. Ensure that the hostname defined in the device properties is the correct DNS name for the device. For more information, see [Understanding Device Properties](#) , on page 74.

**Question:** Why does CSM remove policy descriptions of policy-maps from the discovered ASA policies?

**Answer:** During policy discovery, CSM does not move the policy-map description from the policies into its database. Hence, when you preview the configuration, the descriptions inside the policy-maps are blank. After deployment, the ASA displays the CSM deployed policy-maps without the descriptions.

## Managing Policies in Device View and the Site-to-Site VPN Manager

You can use Device view or the Site-to-Site VPN Manager to manage both local policies and shared policies, as described in the following sections:

- [Policy Status Icons](#) , on page 195
- [Performing Basic Policy Management](#) , on page 195
- [Working with Shared Policies in Device View or the Site-to-Site VPN Manager](#) , on page 201

To access Device view, select **View > Device View** or click the **Device View** button on the toolbar. To access the Site-to-Site VPN Manager, select **Manage > Site-to-Site VPNs** or click the **Site-to-Site VPN Manager** button on the toolbar.

### Related Topics

- [Understanding the Device Inventory](#) , on page 69
- [Managing Shared Policies in Policy View](#) , on page 215
- [Understanding Policies](#) , on page 165

## Policy Status Icons

You can learn the status of any policy in Security Manager at a glance by viewing the icon displayed next to the policy name.

**Table 37: Policy Status Icons**

Icon	Status
147969	The policy is not configured. Upon deployment, any policy of this type already present on the device is effectively removed.
147967	A local policy is configured. The definition of this policy affects only the device or VPN topology on which it is configured.
147968	A shared policy is configured. Any changes to the definition of this policy affect all of the devices or VPN topologies to which this policy is assigned.
	A policy bundle is configured. Any changes to the definition of this policy affect all of the devices or VPN topologies to which this policy is assigned, whether those policies are assigned using the same policy bundle, another policy bundle that includes the shared policy, or are assigned the shared policy directly and not through a policy bundle.

## Performing Basic Policy Management

The following topics describe the operations you can perform on local policies in Device view. Local policies are policies that are specific to the device or VPN topology on which they are configured. They are not shared by other network elements.

- [Configuring Local Policies in Device View](#) , on page 195
- [Copying Policies Between Devices](#) , on page 197
- [Unassigning a Policy](#) , on page 200 (This topic also applies to the Site-to-Site VPN Manager)

### Related Topics

- [Working with Shared Policies in Device View or the Site-to-Site VPN Manager](#) , on page 201
- [Managing Shared Policies in Policy View](#) , on page 215
- [Understanding Policies](#) , on page 165

## Configuring Local Policies in Device View

Use Device view to configure local platform and service policies on individual devices. Each policy defines a particular configuration or security task that the device can perform, such as NAT, OSPF routing or inspection

rules. Local policies are unnamed and are particular to the individual device on which they have been defined. Any changes that you make to a local policy do not affect other devices that Security Manager is managing.

When you configure a policy, a lock is placed on that policy to prevent other users from making changes to the same policy at the same time. See [Understanding Policy Locking](#), on page 172.

You can modify any local policy assigned to a particular device provided you have permissions to modify policies and to access that device. For more information about permissions, see the [Installation Guide for Cisco Security Manager](#).

After configuring a policy, you must deploy the changes to the device in order to make them active on that device. For more information, see [Managing Deployment](#), on page 379

### Related Topics

- [Understanding the Device View](#), on page 69
- [Managing Policies in Device View and the Site-to-Site VPN Manager](#), on page 194
- [Copying Policies Between Devices](#), on page 197
- [Working with Shared Policies in Device View or the Site-to-Site VPN Manager](#), on page 201

- 
- Step 1** In Device view, select a device from the Device selector, then select a policy for that device from the Device Policies selector. The details of the policy appear in the work area.
- Step 2** Modify the definition of the policy as required. Click the Help button to access information specific to the selected policy. For more information, see:
- [Managing Site-to-Site VPNs: The Basics](#), on page 1071
  - [Managing Remote Access VPNs: The Basics](#), on page 1287
  - [Introduction to Firewall Services](#), on page 595
  - [Overview of IPS Configuration](#), on page 1617
  - [Overview of Cisco IOS IPS Configuration](#), on page 1792
  - [Managing Routers](#), on page 2323
  - [Managing Firewall Devices](#), on page 1803
  - [Managing Cisco Catalyst Switches and Cisco 7600 Series Routers](#), on page 2647
- Step 3** Click **Save** to save your changes.
- If this is the first time you are configuring this policy on this particular device, the icon next to the selected policy changes to indicate that the policy is configured and assigned locally to the device. For more information about policy status icons, see .
- After you save the policy, the policy is configured but you are the only one who can view the changes. There are additional steps to take to commit your changes and to deploy them to the device. The exact changes depend on whether you are working in Workflow or non-Workflow mode. Before taking the additional steps, configure all of the policies that you want to deploy; you are not required to deploy policy changes one at a time.
- Following is a summary of the additional steps you need to take:
- Submit your changes. Submission updates the database on the Security Manager server with your changes.

- In non-Workflow mode, you submit changes by selecting **File > Submit**. You can also submit your changes and deploy them in a single step by selecting **File > Submit and Deploy**.
- In Workflow mode, if you are working with an activity approver, you submit your activity, and the changes are committed when the activity is approved. If you are not working with an activity approver, your changes are committed when you approve your own activity. For more information, see [Submitting an Activity for Approval \(Workflow Mode with Activity Approver\)](#), on page 159 and [Approving or Rejecting an Activity \(Workflow Mode\)](#), on page 160.

In both Workflow and non-Workflow mode, policies are validated when you submit them. For more information on validation, see [Validating an Activity/Ticket](#), on page 158.

- Deploy your changes. Deployment either updates the devices directly with the new configuration, creates configuration files that you can deploy yourself, or copies the configuration files to an intermediate server (Auto Update Server, Configuration Engine, or Token Management Server) from which the device retrieves the updates. The method you use depends on the requirements of your organization, and you can select different methods for each device. For general information about deployment, see [Working with Deployment and the Configuration Archive](#), on page 403. For the specific steps based on workflow mode, and information on the deployment methods, see the following topics:
  - [Deploying Configurations in Non-Workflow Mode](#), on page 406
  - [Deploying a Deployment Job in Workflow Mode](#), on page 418
  - [Deploying Configurations Using an Auto Update Server or CNS Configuration Engine](#), on page 420
  - [Deploying Configurations to a Token Management Server](#), on page 421
  - [Deploying Directly to a Device](#), on page 387
  - [Deploying to a Device through an Intermediate Server](#), on page 388
  - [Deploying to a File](#), on page 389

---

## Copying Policies Between Devices

You can streamline device configuration by copying multiple policies, or even a complete set of policies, from one device to other devices that support the selected policies. This makes it easy, for example, to quickly configure a new firewall device with the same policies configured on an existing firewall device.

When you copy policies between devices, those policies that are local on the source device are copied locally to the target device. Shared policies assigned to the source device are copied as shared policies to the target device as well.

### Tips

- If your intention is to assign a single shared policy to additional devices, we recommend that you use the assignment feature, rather than copying the policies. For more information about sharing policies in Device view, see [Modifying Shared Policy Assignments in Device View or the Site-to-Site VPN Manager](#), on page 214.

- To create a new device of the same type that shares the same configuration and properties (including the operating system version, credentials, and grouping attributes) as the source device, use the Clone Device feature. For more information, see [Cloning a Device](#) , on page 126.

### Related Topics

- [Managing Policies in Device View and the Site-to-Site VPN Manager](#) , on page 194
- [Configuring Local Policies in Device View](#) , on page 195
- [Understanding the Device View](#) , on page 69
- [Policy Status Icons](#) , on page 195
- [Filtering Items in Selectors](#) , on page 47

**Step 1** In Device view, do one of the following:

- Select **Policy > Copy Policies Between Devices**. The Copy Policies wizard starts at step 1, the Copy Policies from this Device page. Select the device that has the policies you want to copy and click **Next**.
- Right-click the device in the Device selector, then select **Copy Policies Between Devices**. The Copy Policies wizard selects the device as the source device and starts at step 2, the Select Policies to Copy page. You can change the source device by clicking **Back**.

**Tip** You can also right click a device in Map view and select **Copy Policies Between Devices**.

**Step 2** Select the policies you want to copy on the Select Policies to Copy page. Initially, most policies from the source device (both local and shared) that can be copied are selected. You can change the selection, however, if you select a policy that depends on another policy, you must select the dependant policies. Security Manager will prompt you if your selections are not valid.

Consider the following when selecting policies:

- Selecting the check box for a policy group selects all of the policies in that group.
- When you copy policies between firewall devices (ASA, PIX, FWSM), copying the failover policy automatically copies the interface policy and vice-versa.
- It is usually not a good idea to copy interface policies, because these policies can have specific IP addresses. Other types of policies that you should carefully consider before copying them include NAT, routing, or the IPS policy on IOS devices.
- If you select the security contexts policy (for FWSM, PIX Firewall, or ASA devices), you must submit your changes after copying the devices for the contexts to appear in the device selector. In non-Workflow mode, select **File > Submit**. In Workflow mode, submit your activity.

**Step 3** Use the policy object copy options to determine how policy objects are handled. These options are not mutually exclusive, and the combination you select has important implications on how the policies are defined on the target devices.

These are the possible combinations and their meanings:

- To ensure that the target devices have the same policy object settings as the source device, select both **Copy the Global Values of Policy Objects** and **Copy the Overridden Values of Policy Objects**.

- To ensure that if a policy object is used on the target device, its value is not overridden, select **neither** option. If a selected policy uses a policy object, and an equivalent policy on the target device uses the same policy object, the policy object's value defined on the target device is preserved. If the target device does not use the policy object, it is copied to the target using the policy object's global value (any overrides on the source device are ignored).
- To ensure that any policy objects on the target device use the policy object's global values, select **Copy the Global Values of Policy Objects** but deselect **Copy the Overridden Values of Policy Objects**. If the source device includes policies that use policy objects, only policies that use global values for the policy objects are copied. If the target device has an equivalent policy that uses local values for the policy object, the local values are replaced by the policy object's global values.
- To ensure that only policy objects with local values on the source device are copied to the target device, deselect **Copy the Global Values of Policy Objects** but select **Copy the Overridden Values of Policy Objects**. If the source device includes policies that use policy objects, only policies that override the policy object's global values are copied. The target devices get the source device's override value for the policy object.

The following table shows the possible outcomes when copying policy objects depending on which of the two options are selected:

Source Device	Target Device	User Option	Target device (copy result)
Global Definition	No reference	Any	Global Definition
Global Definition	Global Definition	Any	Global Definition
Global Definition	Device-level override	Neither option selected	Retains target device's override
		Copy the Global Values of Policy Objects only	Global Definition
		Copy the Overridden Values of Policy Objects only	Retains target device's override
		Both options selected	Global Definition
Device-level override	No reference	Neither option selected	Global Definition
		Copy the Global Values of Policy Objects only	Global Definition
		Copy the Overridden Values of Policy Objects only	Uses source device's override
		Both options selected	Uses source device's override
Device-level override	Global Definition	Neither option selected	Global Definition
		Copy the Global Values of Policy Objects only	Global Definition
		Copy the Overridden Values of Policy Objects only	Uses source device's override
		Both options selected	Uses source device's override

Source Device	Target Device	User Option	Target device (copy result)
Device-level override	Device-level override	Neither option selected	Retains target device's override
		Copy the Global Values of Policy Objects only	Retains target device's override
		Copy the Overridden Values of Policy Objects only	Uses source device's override
		Both options selected	Uses source device's override

Click **Next**.

**Step 4** Select the target devices to which you want to copy policies on the Copy Policies to these Devices page. Selecting the check box for a device group selects all of the devices in that group.

The device selector displays only those devices that support all of the policies you selected to copy. If you do not see all of the devices to which you want to copy policies, you can return to the policy selection page and deselect the more restrictive policies, and use the wizard a second time to copy the restrictive policies to the subset of devices that support them.

The device list is empty if no other device in the inventory can support all selected policies.

**Tip** After selecting devices, Click the **Preview** button to view a summary of the policies that will be copied. The summary shows the selected devices, the policies that will be copied to them, and any overrides that will be created, updated, or deleted due to the copied policies.

**Step 5** Click **Finish**. You are asked to confirm that you want to copy policies.

The policies are copied to the target devices. If the copy operation fails for any target device, the copy is undone for successful devices, and you are shown a list of reasons why the copy failed for each problem device. Typically, copy failures are because someone else has a lock on a policy or device, or you do not have the required permissions to a device.

## Unassigning a Policy

If you unassign a policy that has already been deployed to a device, in most cases the values that are defined for the policy are erased, effectively removing the policy from the device's planned configuration. When you perform deployment, the configuration for this feature that already exists on the device is removed.

The exact behavior depends on the type of policy that you unassign:

- Firewall service policies—If you unassign a policy, Security Manager erases the policy from the device.
- VPN policies:
  - Site-to-site VPN policies—You cannot unassign mandatory site-to-site VPN policies from the devices in the topology. If you unshare a mandatory policy, Security Manager assigns default values to the affected device. If you unassign an optional policy, Security Manager erases the configuration from the device. For more information, see [Understanding Mandatory and Optional Policies for Site-to-Site VPNs](#), on page 1076.
  - IPSec remote access VPN policies—If you unassign a policy, Security Manager erases the policy from the device, even if it is a mandatory policy. In most cases, deployment fails if you do not create a new definition for the mandatory policy. In those cases where deployment does not fail, the device will fail to establish VPN tunnels.

- SSL VPN policies—If you unassign a policy, Security Manager erases the policy from the device.
- Catalyst 6500/7600 or Catalyst switch policies—Interface and VLAN policies cannot be shared or unassigned. If you unassign a platform policy (such as IDSM settings or VLAN access lists) Security Manager removes the policy from the device.
- IPS policies—For all IPS device and service policies, a default policy is assigned to the device.
- PIX/ASA/FWSM policies—Policies that you cannot share with other devices cannot be unassigned from the device on which they are created. This includes interface, failover, security context, and resource policies. For other policy types (such as timeout policies), Security Manager makes a best effort to restore the system default configuration on the device.
- IOS router policies—Core connectivity policies, such as basic interface settings and accounts and credentials policies cannot be unassigned from the device on which they are created. If you unassign a device access policy that was used to define the password for configuring the device, you might prevent Security Manager from configuring that device in the future. For more information, see [User Accounts and Device Credentials on Cisco IOS Routers](#) , on page 2422.

If you unassign a VTY or console policy, Security Manager restores a default configuration to ensure continued communication with the device. For all other policy types, if you unassign the policy, Security Manager erases the configuration from the device.

#### Related Topics

- [Configuring Local Policies in Device View](#) , on page 195
- [Copying Policies Between Devices](#) , on page 197
- [Managing Policies in Device View and the Site-to-Site VPN Manager](#) , on page 194

---

#### Step 1

Do one of the following:

- (Device view) Select the device that has a policy you want to unassign.
- (Site-to-Site VPN Manager) Select the VPN topology that has a policy you want to unassign.

#### Step 2

Right-click the local policy and select **Unassign Policy**.

**Note** You can unshare a policy only if you have the Assign privilege mapped to your role. Cisco Security Manager displays error message for authorization.

You are asked to confirm that you want to unassign the current policy.

---

## Working with Shared Policies in Device View or the Site-to-Site VPN Manager

Sharing policies makes it possible to configure multiple devices with common policies, which provides greater consistency in your policy definitions and streamlines your management efforts. Any changes to a shared policy affect all the devices and VPN topologies to which the policy is assigned. This makes it easy, for example, to update all of your Cisco IOS routers with new quality of service policies by updating the shared Quality of Service policy assigned to these devices.

When working in Device view or the Site-to-Site VPN Manager, you can take a local policy (such as a policy created during device discovery) and share it. You can then assign the shared policy to as many devices or VPN topologies as you want (provided they are not locked by another user; see [Understanding Policy Locking](#), on page 172), and you can change these assignments at any time. You can also take these shared policies that were created from the local policy and add them to a policy bundle. For more information on policy bundles, see [Managing Policy Bundles](#), on page 222.

---

**Tip** If you have a device that you are using as a template for the creation of other devices, you can quickly create a policy bundle that can be used for device configuration based on the template device. To do so, first make all policies on the device shared policies (see [Sharing Multiple Policies of a Selected Device](#), on page 206), then create a policy bundle from those shared policies.

---

In addition, you can take a shared policy that is assigned to a device or VPN topology and turn it into a local policy for that particular device or topology. This enables you to create a special configuration that affects only that device or topology. Other devices or topologies assigned the shared policy continue to use the shared policy as before.

As an alternative to sharing local policies, you can create new shared policies and manage them at the network level using Policy view. For more information, see [Managing Shared Policies in Policy View](#), on page 215. After creating the shared policy and assigning it to devices or VPN topologies in Policy view, you can return to Device view or the Site-to-Site VPN Manager and perform additional operations on the policy as described in the sections that follow. Note that all shared policies that you create in Device view or the Site-to-Site VPN Manager automatically appear as shared policies in Policy view.

---

**Tip** In Device view or the Site-to-Site VPN Manager, if you edit a shared policy, your changes are applied to all devices or VPN topologies that share the policy. Thus, you do not need to go to Policy view to edit shared policies. You are warned when you try to edit a shared policy that this will happen, to ensure you do not inadvertently make a change to more devices or topologies than what you intend. If you need to change the policy for just one device or topology, you can unshare the policy before editing it, as described in [Unsharing a Policy](#), on page 208.

---

The following topics describe how to share policies and the operations that can be performed on them in Device view or the Site-to-Site VPN Manager:

- [Using the Policy Banner](#), on page 203
- [Policy Shortcut Menu Commands in Device View and the Site-to-Site VPN Manager](#), on page 204
- [Sharing a Local Policy](#), on page 205
- [Sharing Multiple Policies of a Selected Device](#), on page 206
- [Unsharing a Policy](#), on page 208
- [Assigning a Shared Policy to a Device or VPN Topology](#), on page 209
- [Adding Local Rules to a Shared Policy](#), on page 210

- [Understanding Policies](#) , on page 165
- [Managing Policies in Device View and the Site-to-Site VPN Manager](#) , on page 194

## Using the Policy Banner

When you view a device policy in Device view, or a site-to-site VPN policy in the Site-to-Site VPN Manager, there is a banner above the content of the policy in the work area. The banner provides information about whether the policy is local to the device or a shared policy. For shared policies, the banner also indicates the number of devices that use the policy. For policies that allow inheritance, the banner includes information about inheritance.

Messages might appear below the banner to indicate the following:

- That the policy is locked by another user. You cannot save changes to the policy until the other user submits (and approves) the changes, cancels an edit, or discards the changes.
- That the shared policy was imported. Imported policies might be re-imported at some point if the policy is managed on a different server. Any changes that you make are eliminated if the policy is imported again. Before editing the policy, ensure that you understand the protocols used in your organization for policy management and importation. You can control whether this message appears using an option on the Tools > Security Manager Administration > Policy Management page (see [Policy Management Page](#) , on page 575).

You can use the links in the banner to create shared policies, assign a shared policy, and configure policy inheritance. The following illustration shows an example of a device policy banner.

The fields in the policy banner have the following meanings and uses:

- **Policy Assigned**—The name of the policy assigned to this device or VPN. If the name has a link, you can assign a shared policy to the element by clicking the link. If there is no link, a shared policy cannot be assigned to this particular type of policy.
  - **Local**—The policy is a local policy (configured on this device only) rather than a shared policy.
  - **Specific policy name**—The shared policy is assigned to the device policy.
- **Assigned To**—If a shared policy is assigned, the number of devices or VPNs to which the policy is assigned. If no shared policy is assigned, **local device** or **this VPN** is indicated. If the name has a link, you can do the following:
  - **Local Device or This VPN links**—Click the link to create a shared policy from this local policy. You can then assign the shared policy to other devices or VPNs.
  - **Number of Devices or VPNs links**—Click the link to change the devices or VPNs assigned to the shared policy.

- **Inherits From**—The name of the policy from which this policy inherits rules. This field appears only for policies that allow inheritance. Click the link to specify a policy or set of policies from which the policy will inherit rules. For more information about inheritance, see [Understanding Rule Inheritance](#) , on page 168.

The field can contain these entries:

- **None**—The policy does not inherit rules from any other policy.
  - **Single policy name**—The policy inherits rules from this policy.
  - **Multiple policy names separated by > signs**—The policy inherits rules from the indicated hierarchy of policies.
- 
- **Policy Bundle Assigned**—The name of the policy bundle assigned to this device or VPN.

## Policy Shortcut Menu Commands in Device View and the Site-to-Site VPN Manager

When you right-click a policy in Device view or the Site-to-Site VPN manager, you get a list of commands that you can use on the policy. The shortcut command list includes only those commands available for the selected policy, so the list differs according to your selection.

The available commands depend on whether the policy:

- Is unassigned.
- Contains a local policy for that specific device or VPN topology.
- Contains a shared policy that might be assigned to multiple devices or VPN topologies.
- Can be shared. There are no shortcut commands for policies that cannot be shared between devices or topologies.

The current status of each policy type is indicated by the icon displayed next to the policy name. See [Policy Status Icons](#) , on page 195.

The following table provides a comprehensive list of the possible commands.

**Table 38: Policy Shortcut Commands**

Menu Command	Description
Commands available for both local and shared policies	
Assign Shared Policy	Assigns an existing shared policy to the selected device or VPN topology. If the policy is already assigned a shared policy, your selection assigns a new shared policy, replacing the existing selection. See <a href="#">Assigning a Shared Policy to a Device or VPN Topology</a> , on page 209.
Inherit Rules	Enables you to identify a shared policy from which to inherit rules, or to remove any inheritance from the child policy. Child policies inherit both the mandatory rules and default rules that are defined in the parent policy. See <a href="#">Inheriting or Uninheriting Rules</a> , on page 211.
Additional local policy commands	
Share Policy	Shares the local policy so that it can be assigned to other devices or VPN topologies. See <a href="#">Sharing a Local Policy</a> , on page 205.
Unassign Policy	Unassigns the policy from the device or VPN topology. When deployed, the configuration that corresponds to the settings defined in this policy is removed from the device or the devices in the topology. See <a href="#">Unassigning a Policy</a> , on page 200.
Additional shared policy commands	
Unshare Policy	Creates a local copy of the shared policy and assigns it to the device or VPN topology in place of the shared policy. See <a href="#">Unsharing a Policy</a> , on page 208.
Edit Policy Assignments	Enables you to change which devices or VPN topologies are assigned to this policy, not just the device or VPN topology you are currently viewing. See <a href="#">Modifying Shared Policy Assignments in Device View or the Site-to-Site VPN Manager</a> , on page 214.
Clone Policy	Creates a copy of a policy with a new name. Use this option to create a new policy with the same definition as the policy from which it was created, which you can then edit. See <a href="#">Cloning (Copying) a Shared Policy</a> , on page 212.
Rename Policy	Renames the selected policy. See <a href="#">Renaming a Shared Policy</a> , on page 213.

## Sharing a Local Policy

As your network grows, you might decide to convert a local policy into a shared policy that you can assign to multiple devices or VPN topologies (see [Local Policies vs. Shared Policies](#) , on page 167). Sharing a policy provides a streamlined management approach that ensures that all devices or topologies assigned to the policy are configured in a consistent manner. For example, if you configure a set of firewall inspection rules on a particular device, sharing that device's inspection rules policy makes it possible to assign that policy to other devices, eliminating the need to configure each device individually. See [Assigning a Shared Policy to a Device or VPN Topology](#) , on page 209.

In addition, having a shared policy enables you to update the configurations of each assigned device or topology at one time, saving time and promoting greater consistency across your set of managed devices.

When you share a policy, you must name the policy. (Local policies do not have names, because they are associated with only a single device or topology.) This enables you to identify this policy when managing shared policies in Policy view.

### Related Topics

- [Understanding the Device View](#) , on page 69
- [Policy Status Icons](#) , on page 195
- [Using the Policy Banner](#) , on page 203
- [Assigning a Shared Policy to a Device or VPN Topology](#) , on page 209

- [Inheriting or Uninheriting Rules](#) , on page 211
- [Working with Shared Policies in Device View or the Site-to-Site VPN Manager](#) , on page 201

---

**Step 1** In Device view or the Site-to-Site VPN Manager, select a policy from the Policies selector, then do one of the following:

- (Device view only) Select **Policy > Share Policy**.
- Right-click the policy and select **Share Policy**.
- Click the **local device/this VPN** link in the Assigned To field in the policy banner. A warning dialog box called Local Policies Cannot Be Assigned to Multiple Devices opens to inform you that you are viewing a local policy. Click **Share Policy** to continue.

The Share Policy dialog box is displayed.

**Step 2** Enter a name for the shared policy and click **OK**.

Policy names can contain up to 255 characters, including spaces and special characters.

---

## Sharing Multiple Policies of a Selected Device

With one procedure, you can share multiple policies configured on a particular device. When you perform this procedure, you can choose to share all the policies configured on the device or only some of them. For example, you can take all the firewall service policies defined on an ASA device and share them.

Initially, the resulting shared policies are assigned only to the device from which the procedure was performed. However, you can then assign these shared policies to additional devices as required. See [Modifying Shared Policy Assignments in Device View or the Site-to-Site VPN Manager](#) , on page 214.

This feature provides a convenient way to take the policies configured on a single device and use them as a template for configuring similar devices. For example, after you discover the devices at your branch offices,

you can take all the local access rules that you have configured on a similar device and share them with a single procedure so that you can assign them to the branch office devices.

---

**Tip** You can use this procedure to make all policies on the device shared policies and then create a policy bundle from those shared policies. This policy bundle can then be used to quickly configure new devices based on the template device.

---

---

**Tip** To create a new device of the same type that shares the same configuration and properties (including device operating system version, credentials, and grouping attributes) as the source device, create a clone of the device. For more information, see [Cloning a Device](#) , on page 126.

---

### Related Topics

- [Understanding the Device View](#) , on page 69
- [Copying Policies Between Devices](#) , on page 197
- [Sharing a Local Policy](#) , on page 205
- [Working with Shared Policies in Device View or the Site-to-Site VPN Manager](#) , on page 201
- [Unsharing a Policy](#) , on page 208
- [Filtering Items in Selectors](#) , on page 47

---

**Step 1** In Device view, do one of the following:

- Select **Policy > Share Device Policies**. The Share Policies wizard opens at the Share Policies from this Device page (step 1). Select the device whose policies you want to share and click **Next**.
- Right-click the device and select **Share Device Policies**. The Share Policies wizard opens at the Select Policies to Share page (step 2); you can click **Back** to go to step 1 and select a different device, if desired.

**Tip** You can also right click a device in Map view and select **Share Device Policies**.

**Step 2** On the Select Policies to Share page, select all policies that you want to share. Initially, all shareable policies configured on the device, whether local or shared, are selected. Deselect the check box next to each policy that you do not want to share.

Following are some tips:

- Local policies that are not checked remain local to the selected device.
- If you select a policy that is already shared, Security Manager creates a copy of that policy using the name that you define in the wizard.
- Selecting the check box for a policy group selects all of the policies in that group.
- If a policy is configured on the device, but you cannot select it (the check box is solid grey), it is an unshareable policy.

**Step 3** Enter a name for the shared policies. All policies are given the same name. You can later rename the individual policies. For more information, see [Renaming a Shared Policy](#) , on page 213.

If you select a policy that is already shared, Security Manager creates a copy of that policy using this name.

**Step 4** Click **Finish**. The selected policies become shared policies, which you can then assign to additional devices as needed. For more information, see [Modifying Shared Policy Assignments in Device View or the Site-to-Site VPN Manager](#) , on page 214.

## Unsharing a Policy

When you unshare a shared policy assigned to a particular device or VPN topology, you create a copy that becomes a local policy for that device or topology. This means that any subsequent changes made to the local policy affect only this particular device or topology. Other devices or topologies assigned the original shared policy continue to use the shared policy as before.

**Note** You can unshare a policy only if you have the Assign privilege defined for your role. Cisco Security Manager displays error message for authorization.

**Note** You cannot unshare a policy that is assigned to a device as part of a policy bundle. You must either unassign the policy bundle from the device or remove the shared policy from the policy bundle that is assigned to the device.

For example, Security Manager might be managing a BGP routing policy called MyBGP, which is assigned to 20 routers. If you decide that one of the routers (Router1) requires a variation of this policy, you can select the device, unshare the policy, and make the changes you need for that router. From that point on, Router1 has a local BGP policy while the other 19 routers continue to use the original shared policy, MyBGP.

### Related Topics

- [Understanding the Device View](#) , on page 69
- [Sharing a Local Policy](#) , on page 205
- [Managing Policies in Device View and the Site-to-Site VPN Manager](#) , on page 194
- [Working with Shared Policies in Device View or the Site-to-Site VPN Manager](#) , on page 201
- [Policy Status Icons](#) , on page 195

**Step 1** In Device view or the Site-to-Site VPN Manager, select a policy from the Policies selector, then do one of the following:

- (Device view only) Select **Policy > Unshare Policy**.
- Right-click the selected shared policy, then select **Unshare Policy**.

**Note** You can unshare a policy only if you have the Assign privilege mapped to your role. Cisco Security Manager displays error message for authorization.

- Step 2** Click **OK**. The shared policy is converted into a local policy for the selected device or VPN topology. The shared policy icon in the Policies selector is replaced by the local policy icon.
- 

## Assigning a Shared Policy to a Device or VPN Topology

You can replace any shareable policy (local or shared) assigned in Device view or the Site-to-Site VPN Manager with an existing shared policy of the same type. For example, if you have a local NAT policy assigned to a Cisco IOS router, you can assign a shared NAT policy in its place. Similarly, if a shared NAT policy was assigned to the router, you can replace it with a different shared NAT policy.

**Tip** You can use bundle shared policies together to make assigning those policies easier. For more information, see [Managing Policy Bundles](#) , on page 222.

---

If you are assigning a shared policy to replace a local, rule-based policy (for example, an inspection rules policy), any local rules that you configured are replaced by the rules defined in the shared policy. A warning message gives you the opportunity to preserve the local rules by inheriting the rules of the shared policy instead of assigning the shared policy in place of the local policy. For more information, see [Inheritance vs. Assignment](#) , on page 170.

**Tip** If you want to use the rules defined in the shared policy and still keep your local rules, we recommend that you select the Inherit Rules option instead of assigning the policy. For more information, see [Inheriting or Uninheriting Rules](#) , on page 211.

---

**Note** You can also inherit IPS signature policies and signature event actions, but inheritance works differently than for rules-based policies. For more information, see [Understanding Signature Inheritance](#) , on page 1679.

---

### Related Topics

- [Understanding the Device View](#) , on page 69
  - [Using the Policy Banner](#) , on page 203
  - [Unassigning a Policy](#) , on page 200
  - [Adding Local Rules to a Shared Policy](#) , on page 210
  - [Copying Policies Between Devices](#) , on page 197
  - [Working with Shared Policies in Device View or the Site-to-Site VPN Manager](#) , on page 201
- 

- Step 1** In Device view or the Site-to-Site VPN Manager, select a policy from the Policies selector, then do one of the following:
- (Device view only) Select **Policy > Assign Shared Policy**.
  - Right-click the policy in the Policies selector, then select **Assign Shared Policy**.
  - Click the link in the Policy Assigned field in the policy banner.

The Assign Shared Policy dialog box is displayed if there are any shared policies available for assignment.

- Step 2** Select a shared policy from the displayed list to assign to the device or VPN topology and click **OK**. If the policy does not allow inheritance, the shared policy is assigned to the selected device and you are finished.
- Step 3** If the policy allows inheritance, you are warned that the shared policy will replace the [Customize Desktop Page](#), on [page 518](#) current policy and given the option to inherit the rules instead with the Local Policy Will Be Replaced dialog box.

Your options are:

- **Assign Policy**—Assign the shared policy to replace the existing local policy. If you choose to assign, all local rules are removed and they cannot be retrieved.
- **Inherit From Policy**—Inherit the rules of the shared policy. If you choose to inherit, the inherited rules are added to the local rules that are already defined in the device's local policy. Use inheritance instead of assignment when the device needs to maintain the set of local rules already defined for it.

**Tip** You can select **Do not show this again** to save your selection and have it applied to all future times that you assign rule-based policies. Otherwise, you are prompted each time you assign policies so that you can make different selections based on the circumstances. If you select this option, you can turn it off by resetting it on the Customize Desktop administration settings page (see ).

## Adding Local Rules to a Shared Policy

After you assign a shared rule-based policy, such as access rules, to a device, you can define additional rules in the policy that are local to that device. Selecting this option creates an inheritance relationship, where the policy defined on the device inherits rules from the shared policy while adding rules that affect only this particular device. For more information about inheritance, see [Understanding Rule Inheritance](#), on [page 168](#).

Local rules that you add to a device do not affect the shared policy from which the device inherits its remaining rules. For example, if the shared policy `Access_Rules_South` is assigned to five devices and you define local rules on one of those devices, the access rules policy on that device consists of the rules defined in `Access_Rules_South` plus the local rules; the other four devices continue to use only the rules defined `Access_Rules_South`.

### Before You Begin

Assign a shared, rule-based policy to the device as described in [Assigning a Shared Policy to a Device or VPN Topology](#), on [page 209](#).

### Related Topics

- [Understanding the Device View](#), on [page 69](#)
- [Cloning \(Copying\) a Shared Policy](#), on [page 212](#)
- [Assigning a Shared Policy to a Device or VPN Topology](#), on [page 209](#)
- [Unsharing a Policy](#), on [page 208](#)
- [Working with Shared Policies in Device View or the Site-to-Site VPN Manager](#), on [page 201](#)

---

**Step 1** In Device view, select a device from the Device selector, then select a shared policy assigned to that device from the Device Policies selector. You must select a rule-based policy, such as access rules. The details of the policy appear in the work area.

**Step 2** Do one of the following:

- Select **Policy > Add Local Rules**.
- Right-click the policy, then select **Add Local Rules**.

A message is displayed indicating that the policy on this device is now defined as a child policy that inherits rules from the shared policy. If the shared policy in turn inherits rules from a different shared policy, those rules are automatically inherited as well.

**Note** To change the parent policy from which this policy inherits rules, see [Inheriting or Uninheriting Rules](#) , on page 211.

**Step 3** Click **OK** to confirm. In the work area, headings are added for local mandatory and default rules in addition to the mandatory and default rules inherited from the shared policy.

In the Device Policies selector, the status icon changes to the icon for a local policy. For more information, see [Policy Status Icons](#) , on page 195.

**Step 4** Define local rules as required.

**Tip** If you assign a shared policy after adding local rules, both the inherited rules and your local rules are replaced with the selected shared policy.

---

## Inheriting or Uninheriting Rules

This procedure describes how certain types of rule-based policies, such as access rules, can inherit rules from shared policies of the same type. Child policies inherit both the mandatory rules and default rules that are defined in the parent policy.

When working in Device view, you can then define additional rules that are local to the selected device. For more information, see [Adding Local Rules to a Shared Policy](#) , on page 210.

You can edit rule inheritance from either Device view or Policy view.

### Related Topics

- [Understanding the Device View](#) , on page 69
- [Managing Shared Policies in Policy View](#) , on page 215
- [Assigning a Shared Policy to a Device or VPN Topology](#) , on page 209
- [Understanding Rule Inheritance](#) , on page 168
- [Inheritance vs. Assignment](#) , on page 170
- [Using the Policy Banner](#) , on page 203
- [Understanding Policies](#) , on page 165

---

**Step 1** Select a local or shared rule-based policy in either Device view or Policy view, then do one of the following:

- Select **Policy > Inherit Rules**.
- Right-click the policy, then select **Inherit Rules**.
- (Device view only) Click the link in the Inherits From field in the policy banner.

The Inherit Rules dialog box is displayed, containing a list of all shared policies of the selected type, including any inheritance relationships among them.

**Step 2** Select the policy from which to inherit rules, or select **No Inheritance** to remove any inheritance from the child policy. The name of the parent policy is displayed below the selector.

For example, if you select an access rules policy called West Coast, your access policy inherits the rules of the West Coast policy. If the West Coast policy is a child policy of another access rules policy called US, your policy inherits the properties of the West Coast policy, which in turn inherits the properties of the US policy.

**Step 3** Click **OK** to save your definitions. The work area displays the inherited rules under the name of the parent policy and any local rules, if defined, under the name of the original shared policy.

---

## Cloning (Copying) a Shared Policy

You can clone an existing shared policy. This provides a useful shortcut for creating a new policy that is similar to an existing one; after creating the clone, you can modify it as required.

If you clone a rule-based policy with inheritance, the new policy contains the same inheritance properties as the policy from which it was created. For more information, see [Understanding Rule Inheritance](#), on page 168.

---

**Tip** If you clone a policy in Device view or the Site-to-Site VPN Manager, the new policy is assigned to the selected device or VPN topology. If you want to clone a policy without changing policy assignments, make the clone in Policy view.

---

### Related Topics

- [Understanding the Device View](#), on page 69
  - [Managing Shared Policies in Policy View](#), on page 215
  - [Renaming a Shared Policy](#), on page 213
  - [Deleting a Shared Policy](#), on page 221
- 

**Step 1** Select a shared policy in Device view, Policy view, or the Site-to-Site VPN Manager, then do one of the following:

- (Device or Policy view only) Select **Policy > Clone Policy**.
- Right-click the shared policy, then select **Clone Policy**.

The Clone Policy dialog box is displayed.

**Step 2** Enter a name for the new policy and click **OK**.

Names can contain up to 255 characters, including spaces and special characters.

---

## Renaming a Shared Policy

You can rename a shared policy. The new name is immediately reflected in all devices and VPN topologies to which the policy is assigned.

### Related Topics

- 

**Step 1** Select a shared policy in Device view, Policy view, or the Site-to-Site VPN Manager, then do one of the following:

- (Device or Policy view) Select **Policy > Rename Policy**.
- Right-click the policy, then select **Rename Policy**.

The Rename Policy dialog box is displayed.

**Step 2** Enter a new name for the selected policy and click **OK**.

Names can contain up to 255 characters, including spaces and special characters.

---

## Modifying Shared Policy Definitions in Device View or the Site-to-Site VPN Manager

You can modify any shared policy in Device view or the Site-to-Site VPN Manager by selecting one of the devices or VPN topologies to which the policy is assigned, making the necessary changes, and then saving these changes to the Security Manager server. Any changes made to a shared policy in Device view or the Site-to-Site VPN Manager automatically affect all devices to which the shared policy is assigned.

**Tip** To apply your changes only to the device or VPN topology that you are modifying, you must first unshare the policy (see [Unsharing a Policy](#) , on page 208). This action converts the policy to a local policy and prevents your changes from affecting other devices or topologies.

---

### Related Topics

- [Managing Policies in Device View and the Site-to-Site VPN Manager](#) , on page 194

- 
- Step 1** Do one of the following:
- (Device view) Select the device that has a shared policy you want to modify.
  - (Site-to-Site VPN Manager) Select the VPN topology that has a shared policy you want to modify.
- Step 2** Redefine the policy as required.
- Step 3** Click **Save**. You are asked to confirm that you want to save your changes, reminding you that the changes you made will be applied to all devices or topologies to which the policy is assigned.
- 

## Modifying Shared Policy Assignments in Device View or the Site-to-Site VPN Manager

You can modify the list of devices or VPN topologies assigned a particular shared policy as required. If you remove a device or topology from a policy assignment, that policy is effectively removed from the device's or topology's planned configuration. Upon deployment, any configuration of that type that exists on the device or topology is removed. For more information about the implications of unassigning a policy, see [Unassigning a Policy](#) , on page 200.

---

**Caution** Use the policy assignment feature with care, as unassigning a policy removes that configuration from the device or topology and can have unintended consequences. For example, if you unassign a device access policy from a Cisco IOS router and then deploy that change, you might prevent Security Manager from configuring that device in the future (see [User Accounts and Device Credentials on Cisco IOS Routers](#) , on page 2422).

---

Policy assignment can also be modified from Policy view. For more information, see [Modifying Policy Assignments in Policy View](#) , on page 219.

### Related Topics

- [Understanding the Device View](#) , on page 69

- [Inheritance vs. Assignment](#) , on page 170
- [Inheriting or Uninheriting Rules](#) , on page 211

- 
- Step 1** In Device view or the Site-to-Site VPN Manager, select a shared policy from the Policies selector, then do one of the following:
- (Device view only) Select **Policy > Edit Policy Assignments**.
  - Right-click the policy and select **Edit Policy Assignments**.
  - Click the *n* device/VPN link in the Assigned To field in the policy banner.
- Step 2** Modify the list of devices or VPN topologies to which the policy is assigned, as follows:
- To assign the selected policy to additional devices or topologies, select them from the Available Devices/VPNs list, then click >> to move them to the Assigned Devices list.
  - To unassign the selected policy from devices or topologies, select them from the Assigned Devices/VPNs list, then click << to return them to the Available Devices/VPNs list. Devices or topologies that are unassigned from the policy remove this policy from their running configuration during deployment.
- Tip** To assign a policy to all the devices in a device group, select the name of the device group, then click >>.
- Step 3** Click **OK** to save your assignment changes.
- 

## Managing Shared Policies in Policy View

Use Policy view to globally manage all the shared policies configured in Security Manager. Unlike Device view, which you use to manage all the policies configured on a selected device, Policy view enables you to manage all shared policies of a particular type regardless of device.

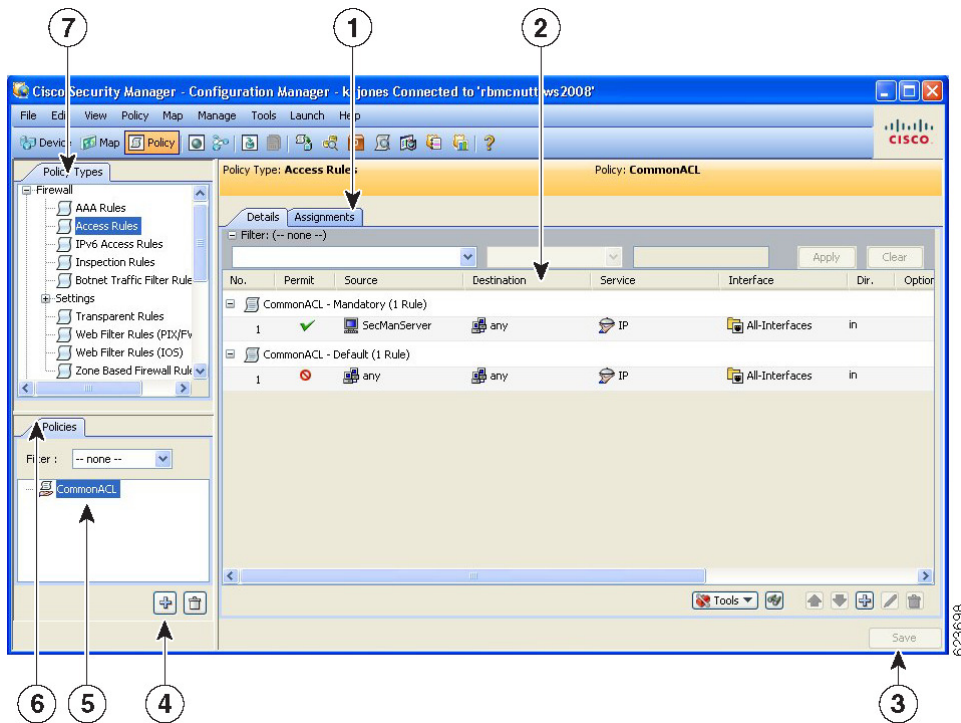

Policy view enables you to:

- Create new shared policies.
- Edit any policy configuration.
- Modify the list of devices or VPNs to which shared policies are assigned.
- Delete shared policies that are not assigned to any devices or VPNs.

To access Policy view, select **View > Policy View** or click the **Policy View** button on the toolbar.

The below figure shows the main areas of Policy view.

Figure 14: Policy View

1 Assignments tab	5 Shared Policy selector
2 Work area and Details tab	6 Shared Policy filter
3 Save button	7 Policy Type selector
4 Create a Policy and Delete a Policy buttons	

- **(7) Policy Type Selector**—Lists the policy types available in Security Manager, divided by category. Clicking a policy type in the selector displays all the shared policies defined for that type in the Shared Policy selector. To create a new policy, right click the policy type and select **New [policy type] Policy** or click the **Create a Policy** button in the shared policy selector. For more information, see [Policy View Selectors , on page 217](#).
- **(4, 5, 6) Shared Policy Selector**—Lists the shared policies that are defined for the selected type. Clicking a policy in the selector displays the definition of the policy and its assignments in the work area. For more information, see [Policy View Selectors , on page 217](#).

Right-click a policy in the selector to perform actions on the policy. For more information on the available commands, see [Policy View—Shared Policy Selector Options , on page 218](#).

Use the Filter field to filter the list of policies displayed in the selector. For more information about creating filters, see [Filtering Items in Selectors , on page 47](#).

- **(1, 2, 3) Work Area**—Contains two tabs:
  - **Details**—Use this tab to view and edit the definition of the selected policy. You can modify the definition as required; click **Save** in the work area to save your changes. Changes affect all devices or VPN topologies to which the policy is assigned. The information displayed on the Details tab is

identical to the information displayed in Device view or the Site-to-Site VPN Manager and can be modified in exactly the same way. See [Policy View Selectors](#) , on page 217.

- Assignments—Use this tab to view and edit the list of devices or VPNs to which a shared policy is assigned. For more information, see [Modifying Policy Assignments in Policy View](#) , on page 219.

### Related Topics

- [Working with Shared Policies in Device View or the Site-to-Site VPN Manager](#) , on page 201

## Policy View Selectors

Policy view contains two selectors. The upper selector displays all the policy types available for a selected policy domain. The root of the policy type selector is the policy domain name. To display the policy types for a different policy domain, click the root of the tree and select a different domain from the list.

Policy domains include:

- Firewall—Lists all policy types for configuring firewall services. See [Introduction to Firewall Services](#), on page 595.
- NAT (PIX/ASA/FWSM)—Lists all NAT policies configured on PIX, ASA, and FWSM devices. See [NAT Policies on Security Devices](#) , on page 1030.
- NAT (Router)—Lists all NAT policies configured on Cisco IOS routers. See [NAT Policies on Cisco IOS Routers](#) , on page 1020.
- Site-to-Site VPN—Lists all policy types for configuring site-to-site VPNs. See [Managing Site-to-Site VPNs: The Basics](#), on page 1071.
- Remote Access VPN—Lists all policy types for configuring remote-access IPSec and SSL VPNs. See [Managing Remote Access VPNs: The Basics](#), on page 1287.
- Catalyst Platform—Lists all policy types for configuring Catalyst switches and 7600 routers. See [Managing Cisco Catalyst Switches and Cisco 7600 Series Routers](#), on page 2647.
- IPS—Lists all policy types for configuring IPS devices. See [Overview of IPS Configuration](#) , on page 1617.
- IPS (Router)—Lists all policy types for configuring Cisco IOS IPS policies on IOS routers. See [Overview of Cisco IOS IPS Configuration](#) , on page 1792.
- PIX/ASA/FWSM Platform—Lists all policy types for configuring PIX/ASA/FWSM platform-specific policies. See [Managing Firewall Devices](#), on page 1803.
- Router Interfaces—Lists all policy types for configuring platform-specific Cisco IOS router interface policies. See [Managing Routers](#), on page 2323.
- Router Platform—Lists all policy types for configuring platform-specific Cisco IOS router policies. See [Managing Routers](#), on page 2323.
- FlexConfigs—Lists all FlexConfig policies. See [Managing Flexconfigs](#), on page 339.

You can expand and collapse the selector as required to view all the available policy types and subtypes. To create a new policy, right click the policy type and select **New [policy type] Policy** or click the Create a Policy button in the shared policy selector.

Selecting a policy type from the Policy Type selector displays all the shared policies of that type in the Shared Policy selector. Local policies configured in Device view are not displayed.

For example, when you select a configuration policy type, such as NAT translation rules, the Shared Policy selector displays a flat list of each shared policy of that type. If you select a rule-based policy type, such as firewall access rules, the Shared Policy selector displays a hierarchical tree of shared policies. This enables you to view the inheritance relationships among the various policies. The Shared Policy selector includes a shortcut menu with options for actions that can be performed on that policy, such as renaming it.

**Tip** You can create and apply a filter to shorten the list of policies displayed in the Shared Policy selector. For more information about filters, see [Filtering Items in Selectors](#) , on page 47.

## Policy View—Shared Policy Selector Options

Right-click a policy in the Shared Policy selector of Policy view to display a shortcut menu for performing functions on the selected policy.

### Related Topics

- [Policy View Selectors](#) , on page 217
- [Managing Shared Policies in Policy View](#) , on page 215

### Field Reference

*Table 39: Shared Policy Selector Options*

Menu Command	Description
Clone Policy	Creates a new shared policy with the same definition as the policy from which it was cloned. See <a href="#">Cloning (Copying) a Shared Policy</a> , on page 212.
Rename Policy	Renames the selected policy. See <a href="#">Renaming a Shared Policy</a> , on page 213.
Add to Policy Bundle	Allows you to add the selected shared policy to a policy bundle. See <a href="#">Managing Policy Bundles</a> , on page 222.
Inherit Rules	Applies only to rule-based policies such as access rules. Causes a rule-based policy to inherit the rules of a different shared policy of the same type. See <a href="#">Inheriting or Uninheriting Rules</a> , on page 211.
New [policy type] Policy	Creates a new shared policy of the selected type. See <a href="#">Creating a New Shared Policy</a> , on page 219.
Delete Policy	Deletes the selected shared policy. See <a href="#">Deleting a Shared Policy</a> , on page 221.

## Creating a New Shared Policy

Use Policy view to create a new shared policy. In most cases, the new policy starts out undefined, but in certain cases (for example, many site-to-site VPN policies, such as IPsec proposals and GRE modes) default values are supplied. In all cases, the new policy is not initially assigned to any devices. If the new policy is a rule-based policy that supports inheritance, it can be created as a child of an existing shared policy of the same type. For more information, see [Understanding Rule Inheritance](#) , on page 168.

**Tip** You can also create shared policies by converting local policies in Device view. For more information, see [Sharing a Local Policy](#) , on page 205.

### Related Topics

- [Importing Policies or Devices](#), on page 489
- [Managing Shared Policies in Policy View](#) , on page 215
- [Deleting a Shared Policy](#) , on page 221

---

**Step 1** In Policy view, select a policy type in the Policy Type selector.

**Step 2** Do one of the following:

- Right-click the policy type in the Policy Type selector, then select **New [policy type] Policy**.
- Right-click a policy in the Shared Policy selector, then select **New [policy type] Policy**.
- Click the **Create a Policy** button beneath the Shared Policy selector.

The Create a Policy dialog box is displayed.

**Step 3** Enter a name for the new policy. Policy names can contain up to 255 characters, including spaces and special characters. When creating a Translation Rules policy for NAT rules on security devices (PIX/ASA/FWSM), you must also choose a device software Version: **PIX/ASA 6.3-8.2** or **ASA 8.3 & Later**.

**Step 4** Click **OK**. The new policy appears in the Shared Policy selector.

To configure a definition for the new shared policy, click the Help button in the toolbar with the Details tab open to see information specific to the type of policy you are creating. To assign the new shared policy, see [Modifying Policy Assignments in Policy View](#) , on page 219.

---

## Modifying Policy Assignments in Policy View

Use the Assignments tab in Policy view to modify the list of devices or VPN topologies to which you assigned a selected shared policy. The Assignments tab shows a list of all devices that are currently assigned the selected shared policy. It also shows devices that are assigned the policy through inheritance.

Assigning a policy to a device or VPN overwrites any policy of the same type (local or shared) that was previously assigned to the device in Security Manager. When deployed, the newly assigned policy overrides

any policy of the same type that is already configured on the device, whether it was configured using Security Manager or using another method, such as the CLI.

When you unassign a shared policy from a device or VPN topology, Security Manager removes the policy from the planned configuration of that device or VPN topology. When the configuration defined by the policy is deployed, any configuration of the same type that is already configured on the device (including the devices in the VPN topology) is removed. For more information, see [Unassigning a Policy](#), on page 200.

Therefore, if your intention when performing unassign is to assign a different shared policy to a particular device or VPN topology, it is important to select the replacement policy and perform the assignment before performing deployment.

**Tip** Assigning a replacement policy is particularly important when you use a device access policy to configure the enable password or enable secret password on a Cisco IOS router. If you unassign this policy and fail to define a different password in its place before deployment, Security Manager might be unable to configure this device in the future. For more information, see [User Accounts and Device Credentials on Cisco IOS Routers](#), on page 2422.

Alternatively, you can return to Device view and replace the shared policy assigned to the device with a different shared policy. For more information, see [Assigning a Shared Policy to a Device or VPN Topology](#), on page 209.

**Note** If you unassign a mandatory site-to-site VPN policy, such as an IKE proposal policy, Security Manager automatically replaces it with a default policy. If you unassign a mandatory remote access VPN policy, you must manually configure a new policy of that same type or deployment will fail.

### Related Topics

- [Modifying Shared Policy Assignments in Device View or the Site-to-Site VPN Manager](#), on page 214
- [Managing Shared Policies in Policy View](#), on page 215

**Step 1** In Policy view, select a policy type from the Policy Type selector, then select a policy from the Shared Policy selector. For more information about using these selectors, see [Policy View Selectors](#), on page 217.

**Step 2** Click the **Assignments** tab in the work area.

The Assignments tab shows a list of all devices that are currently assigned the selected shared policy. It also shows devices that are assigned the policy through inheritance.

**Step 3** Modify the list of devices or VPNs to which the policy is assigned, as follows:

- To assign the selected policy to additional devices or VPNs, select one or more items from the Available Devices/VPNs list, then click >> to move them to the Assigned Devices/VPNs list.

**Tip** To assign a policy to all the devices in a device group, select the name of the device group, then click >>.

- To unassign the selected policy from devices or VPNs, select one or more items from the Assigned Devices/VPNs list, then click << to return them to the Available Devices/VPNs list.

**Note** Prior to the release of Security Manager 4.4 and versions 9.0 and later of the ASA, separate pages, policies and policy objects were provided for configuring IPv4 and IPv6 firewall rules and policies. With Security Manager 4.4 and ASA 9.0+, these policies and policy objects were combined or unified. However, for the earlier ASA versions, a separate page for IPv6 access rules is still provided in Device view, while in Policy view, IPv4 and unified versions of the AAA-, access- and inspection-rule policy types are provided. If you assign an IPv4 AAA-, access-, or inspection-rule shared policy to a 9.0+ device, you will no longer be able to assign unified versions of those policies to that device. Likewise, if you assign a unified AAA-, access-, or inspection-rule shared policy to a 9.0+ device, you will no longer be able to assign IPv4 versions of those shared policies to that device--the device will not be included in the list of available devices on the Assignments tab for the shared policy.

**Step 4** Click **Save** to save your assignment changes.

---

## Deleting a Shared Policy

Use Policy view to delete a shared policy from Security Manager.

Before you delete a shared policy, you should unassign it from any devices that use it, and configure replacement policies for those devices. If a shared policy is assigned to a device, when the policy is deleted the device no longer has a policy configured for the deleted shared policy, other than whatever defaults might exist for the policy type. For more information about removing assignments, see [Modifying Policy Assignments in Policy View](#), on page 219.

**Note** If a shared policy is part of a policy bundle that is assigned to a device, you must remove the assignment before you can delete the shared policy.

---

### Related Topics

- [Creating a New Shared Policy](#), on page 219
- [Cloning \(Copying\) a Shared Policy](#), on page 212
- [Managing Shared Policies in Policy View](#), on page 215

**Step 1** In Policy view, select a policy type from the Policy Type selector, then select the policy to delete from the Shared Policy selector. For more information about using these selectors, see [Policy View Selectors](#), on page 217.

**Step 2** Do one of the following:

- Right-click the policy, then select **Delete Policy**.
- Click the **Delete a Policy** button beneath the Shared Policy selector.

You are asked to confirm the deletion.

---

# Managing Policy Bundles

Policy bundles are collections of shared policies that can be managed as a group. Policy bundles make managing shared policies easier by allowing you to create the bundle one time and then assign all of the policies in the bundle to a new device at once. The shared policies that are part of the bundle function in the same way as other shared policies and modifying any of the shared policies that are part of a bundle affects all devices that are assigned that policy either directly or through a policy bundle.

When creating a policy bundle, you can only assign one shared policy of each type to the policy bundle. Multiple policy bundles can be assigned to a device as long as the policy types in those policy bundles do not overlap.

When assigning a policy bundle to a device, if local policies on that device are the same policy type as those contained in the policy bundle, you are given the option to inherit or replace the existing policies.

---

**Note** When you unassign a policy bundle, all policies that are part of that bundle are removed from the device. Local policies will be lost and cannot be retrieved.

---

This section contains the following topics:

- [Creating a New Shared Policy](#) , on page 219
- [Cloning a Policy Bundle](#) , on page 223
- [Renaming a Policy Bundle](#) , on page 224
- [Assigning Policy Bundles to Devices](#) , on page 224

## Creating a New Policy Bundle

You can use the Policy Bundle view to create new policy bundles. When creating a policy bundle, you can only assign one shared policy of each type to the policy bundle.

### Related Topics

- [Managing Policy Bundles](#) , on page 222
- [Cloning a Policy Bundle](#) , on page 223
- [Renaming a Policy Bundle](#) , on page 224
- [Assigning Policy Bundles to Devices](#) , on page 224

---

**Step 1** Use one of the following methods to create a policy bundle:

- In Policy Bundle view, do one of the following:
  - From the All Shared Policies view, select the shared policies that you would like to bundle, then right-click on a selected shared policy and select **Create Policy Bundle**.
  - Right-click an existing policy bundle in the Policy Bundle selector, then select **Create Policy Bundle**.

- Click the **Create a Policy Bundle** button beneath the Policy Bundle selector.
- To create a new policy bundle that includes all of the shared policies on a device, right-click a device in the Device selector in Device view, then select **Create Policy Bundle**.

The Create Policy Bundle dialog box is displayed.

**Step 2** Enter a name for the new policy bundle.

**Step 3** Click **OK**.

The policy bundle is added to the list of policy bundles in Policy Bundle view.

**Step 4** To configure the definition for a policy bundle, do any of the following:

- In Policy Bundle view:
  - To add shared policies to the bundle, select **All Shared Policies** in the Policy Bundle selector and then drag and drop the required shared policies onto the policy bundle.
  - To remove shared policies from the bundle, select the bundle in the Policy Bundle selector. Select the shared policy you want to remove on the Details tab of the Policy Bundle View window, and then click **Delete**.
- In Policy view, right-click the shared policy you want to add to a policy bundle, select **Add to Policy Bundle**, and then select the bundle to which you want to add the shared policy.

---

## Cloning a Policy Bundle

You can use Policy Bundle view to create a new policy bundle by cloning an existing bundle.

### Related Topics

- [Managing Policy Bundles](#) , on page 222
- [Creating a New Shared Policy](#) , on page 219
- [Renaming a Shared Policy](#) , on page 213
- [Assigning Policy Bundles to Devices](#) , on page 224

---

**Step 1** In Policy Bundle view, right-click an existing policy bundle in the Policy Bundle selector, then select **Clone Policy Bundle**.

The Clone Policy Bundle dialog box is displayed.

**Step 2** Enter a name for the new policy bundle.

**Step 3** Click **OK**.

The new policy bundle appears in the Policy Bundle selector.

---

## Renaming a Policy Bundle

You can rename existing policy bundles from the Policy Bundle view. Renaming a policy bundle will not affect device assignments.

### Related Topics

- [Managing Policy Bundles](#) , on page 222
- [Creating a New Shared Policy](#) , on page 219
- [Cloning a Policy Bundle](#) , on page 223
- [Assigning Policy Bundles to Devices](#) , on page 224

---

**Step 1** In Policy Bundle view, right-click an existing policy bundle in the Policy Bundle selector, then select **Rename Policy Bundle**.

The Rename Policy Bundle dialog box is displayed.

**Step 2** Enter a new name for the policy bundle.

**Step 3** Click **OK**.

The policy bundle name is updated in the Policy Bundle selector.

---

## Assigning Policy Bundles to Devices

You can modify the list of devices assigned a particular policy bundle as required. Multiple policy bundles can be assigned to a device as long as the policy types in those policy bundles do not overlap. When assigning a policy bundle to a device, if local policies on that device are the same policy type as those contained in the policy bundle, you are given the option to inherit or replace the existing policies.

---

**Note** If any of the policies that are part of a policy bundle are not compatible with the device to which you are assigning it, the bundle cannot be assigned.

---

If you remove a device from a policy bundle assignment, all policies that are part of that bundle are effectively removed from the device's planned configuration. Local policies will be lost and cannot be retrieved. Upon deployment, any configuration of that type that exists on the device is removed. For more information about the implications of unassigning a policy, see [Unassigning a Policy](#) , on page 200.

---

**Caution** Use the policy bundle assignment feature with care, as unassigning a policy bundle removes that configuration from the device and can have unintended consequences. For example, if you unassign a device access policy from a Cisco IOS router and then deploy that change, you might prevent Security Manager from configuring that device in the future (see [User Accounts and Device Credentials on Cisco IOS Routers](#) , on page 2422).

---

### Related Topics

- [Managing Policy Bundles](#) , on page 222
- [Creating a New Shared Policy](#) , on page 219
- [Cloning a Policy Bundle](#) , on page 223
- [Renaming a Policy Bundle](#) , on page 224

---

**Step 1** In Policy Bundle view, select an existing policy bundle in the Policy Bundle selector.  
The policy bundle details are displayed in the Policy Bundle main window.

**Step 2** Click the **Assignments** tab.

**Step 3** Modify the list of devices to which the policy bundle is assigned, as follows:

- To assign the selected policy bundle to additional devices, select them from the Available Devices list, then click >> to move them to the Assigned Devices list.
- To unassign the selected policy bundle from devices, select them from the Assigned Devices list, then click << to return them to the Available Devices/VPNs list. Devices or topologies that are unassigned from the policy remove this policy from their running configuration during deployment.

**Tip** To assign a policy to all the devices in a device group, select the name of the device group, then click >>.

**Step 4** Click **OK** to save your assignment changes.

The policy bundle name is updated in the Policy Bundle selector.

---

## CHAPTER 6

# Managing Policy Objects

---

Policy objects enable you to define logical collections of elements. They are reusable, named components that can be used by other objects and policies. Objects aid policy definition by eliminating the need to define that component each time you define a policy. When used, an object becomes an integral component of the object or policy. This means that if you change the definition of an object, this change is reflected in all objects and policies that reference the object.

Objects facilitate network updates, because you can identify objects separately but maintain them in a central location. For example, you can identify the servers in your network as a network/host object called MyServers, and the protocols to allow on these servers in a service object. You can then create an access rule that permits the MyServers network/host object to send and receive traffic for the services defined in the service object. If a change is made to these servers, you need only update the network/host or service object and redeploy, instead of trying to locate and edit each rule in which the servers are used.

Objects are defined globally. This means that the definition of an object is the same for every object and policy that references it. However, many object types (for example, interface roles) can be overridden at the device level. Thus, you can create an object that works for most of your devices, yet customize the object to match the configuration of a particular device that has slightly different requirements. For more information, see [Understanding Policy Object Overrides for Individual Devices](#) , on page 244.

# Selecting Objects for Policies

## Modifying Policies using Drag and Drop

If you are modifying an existing policy, you can easily update the policy definition by dragging and dropping objects from the Policy Object Manager onto the applicable field in the policy. You can select a range of objects from the Policy Object Manager window by selecting the first object in the range and then, with the Shift key pressed, selecting the last object in the range. You can select multiple objects by clicking those objects while keeping the Ctrl key pressed. You can also select a range of objects and then add additional objects to your selection by using the Ctrl key method. To drag multiple objects, press and hold the Ctrl key while dragging or drag using the right-mouse button.

## Creating Policies using Object Selector

When creating a policy, you often need to select one or more objects to include in the policy definition. For example, firewall policies make use of network/host objects, interface role objects, and service objects.

To include objects in policies, you can manually enter the object name or click the **Select** button to display an object selector dialog box. In certain cases, the object selector is prefiltered to display only the objects that are applicable to the policy that you are configuring. For example, when configuring a policy that requires a subnet, the object selector displays only those network/host objects that represent subnets, not network/host objects that represent single hosts. Object selectors make it easy for you to select which objects to include in a particular policy.

Additionally, object selectors enable you to create and edit objects of that type on the fly. This makes it easy to work with objects without leaving the policy you are defining to open the Policy Object Manager. For example, if when creating a dynamic NAT rule you discover that the ACL object you require does not exist, you can click the Create button to open the dialog box for creating an ACL object. When you finish creating the object, you are returned to the object selector with the new object selected and ready for inclusion in the policy. If you need to modify an existing object before using it, select it, click the Edit button and make your modifications, then click OK to save your changes; this returns you to the object selector.

When you create an object by opening the object editor from within a selector, the new object must conform to the requirements of the field from which the selector was opened. For example, if you open a selector from a field requiring a host and then decide to create a network/host object for that field, you must define the network/host object as a host.

There are two types of objects selectors—a simple list selector for policies that require you to select a single object, and a dual selector for policies that allow you to select multiple objects of a certain type. The following table explains these selectors and how to use them.

Table 40: Object Selectors

Element	Description
Type	<p>The type of object to display in the selector, if there is an option. For example:</p> <ul style="list-style-type: none"> <li>You can choose between network/host objects and interface roles when configuring sources and destinations in some rule-based policies.</li> <li>You can choose between standard and extended ACL objects when configuring some ACLs (for example, when configuring VLAN ACLs on Catalyst 6500/7600 devices).</li> </ul> <p><b>Tip</b> In some policies, if you select more than one type of object, they are displayed on different tabs within the field.</p>
Available [object type]	<p>Displays all objects that are relevant to the policy or object you are configuring.</p> <p>When selecting interfaces, be aware that there can be interfaces and interface roles with the same name. They can be distinguished by the icon displayed next to the name. For more information, see <a href="#">Specifying Interfaces During Policy Definition</a>, on page 304.</p> <p><b>Tip</b> You can quickly find an object inside a selector by clicking in the list box and then starting to type the name of the object.</p>
Selected [object type]	Displays the objects that you selected to apply to the policy or object that you are editing.
Multi-Object Selector Buttons	
>> button << button	<p>Moves the selected objects from one list to the other list in the direction indicated. You can select multiple objects by using Ctrl+click.</p> <p>You can also move objects between lists by double-clicking them or by selecting them and pressing Enter.</p>
Up/Down arrow buttons	For a limited number of object types, order matters. If the selector includes <b>Move Up</b> and <b>Move Down</b> buttons, arrange the objects in priority order. For example, when defining a method list for AAA, use the arrows to determine the order in which different types of AAA server groups are used.
Common Buttons	
Create button	<p>Click this button to create an object of this type.</p> <p><b>Tip</b> In a few cases, such as network/host and service objects, clicking this button opens a list from which you need to select a specific type for the object.</p>
Edit button	Click this button to edit the selected user-defined object. If you try to edit a system-defined object, it is opened in read-only mode.

# Policy Object Manager

Use the Policy Object Manager to:

- View all available objects grouped by object type.
- Create, copy, edit, and delete policy objects.
- Drag and drop objects onto existing policies to update the policy definition.
- Generate usage reports, which describe how selected objects are being used by other Security Manager objects and policies.

## Navigation Path

In Device view or Policy view, click the **Policy Object Manager** button on the toolbar, or choose **Policy Objects** from the **Manage** menu. (The Policy Object Manager cannot be opened from Map view.)

---

**Note** When you open the Policy Object Manager, it is initially displayed as a pane in the lower half of the current view to make dragging and dropping objects easier. You can “undock” this pane, making the Policy Object Manager a separate window; you also can “re-dock” the window. See [Policy Object Manager: Undocking and Docking](#) , on page 234 for more information.

---

## Field Reference

**Table 41: Policy Object Manager Window**

Element	Description
Object Type selector, or table of contents  (Left pane)	<p>Lists the object types available in Security Manager. When you select an object type, all existing objects of that type are listed in the table in the right pane.</p> <p>The objects are organized into three folders: Favorites, Recent Objects, and All Object Types. Click the arrow to left of a folder name to expand that folder.</p> <p>You can also specify your favorite object types and they will be presented in a separate list so that they can be more easily accessed. To add an object type to your favorites list, right-click the object and then select <b>Add to Favorites</b>. To remove an object type from your Favorites list, right-click the object and choose <b>Remove from Favorites</b>.</p> <p>Recent Objects is a list of the ten most recently modified objects. Click a recent object to see a summary of the object that includes the name, type, description, and last modified date. You can also access the View Object, Edit Object, and Find Usage buttons for the object.</p> <p>Expand the All Object Types folder to view all types of object available.</p>
<p><b>Policy Object Table (Right Pane)</b></p> <p>The policy object table in the right pane lists existing objects of the type selected in the table of contents. Using this table, you create new objects and work with existing ones. You can use the buttons below the table, or right-click within the table to see additional commands (see <a href="#">Policy Object Manager Shortcut Menu</a>, on page 234).</p> <p>Except for the Access Control Lists (ACL) object, there is one table per object type. For ACLs, there are tabs to separate Extended, Standard, Web, and Unified ACL objects. Select the appropriate tab to work with the desired object type.</p> <p>The columns in the table vary based on the type of object you select. You can alter the columns displayed in the table by right-clicking the table heading and selecting or deselecting columns in the Show Columns command. You can also sort the information by the contents in a column by clicking the column heading; click the heading to toggle between alphabetical and reverse alphabetical sorting.</p> <p>For detailed information on the settings that are displayed in the table, click the Create or Edit buttons below the table and click Help in the dialog box that is opened. The following section, “Table Columns,” is a description of the columns that you typically see.</p>	
Buttons Above Table	
Referenced	Select this option to view reference information for objects. When selected, a "Referenced" column is added to the table to display information on whether an object is being used by any policies or policy objects.
Find Usage	Use the Find Usage feature to view a report on the policies or policy objects that are using the selected object and any device overrides for the object. For more information, see <a href="#">Generating Object Usage Reports</a> , on page 241.

Element	Description
View Object	When a single object is selected in the table, you can click this button to open the Edit dialog box for that type of object in read-only mode to view the settings for that particular object.
Export	Use the Export feature to download a CSV file of the object data for the selected object type.
Print	Use the Print feature to print the object data for the selected object type.
Filter	Allows you to filter the rows displayed to help you find items in a large table. For more information, see <a href="#">Filtering Tables</a> , on page 50.
Table Columns	
*	<p>Indicates the policy object status:</p> <ul style="list-style-type: none"> <li>- Policy object has been locked for editing. Hover over the lock icon to see the user and ticket/activity that has the object locked.</li> <li>- Policy object has been modified in the current ticket/activity but the changes have not been submitted.</li> </ul> <p><b>Note</b> You can hover over the status icons to see details about the ticket/activity in which the policy object has been modified/locked and to navigate to that ticket/activity.</p>
Icon (unlabeled field)	The icon displayed for a policy object type identifies objects of that type wherever they appear, such as in rules tables. If the icon includes the image of a pencil, you can edit it.
Name	The name of the policy object.
Content	A summary of the object definition that might not include all defined settings.
Permit	For ACL objects, if the Access Control Entry (ACE) allows traffic, a check mark appears in the Permit column. If the action is deny, a red circle with a slash appears.
Category	The category object that is assigned to the object, if any. Categories help you organize and identify rules and objects. For more information, see <a href="#">Using Category Objects</a> , on page 239.
Overrides	<p>Whether a user can override the object properties at the device level. A check mark indicates that the object can be overridden. Not all object types are overridable.</p> <p>If an object has been overridden, the Overrides column displays the number of overrides for that object. You can click on the number to see the list of overrides.</p> <p>For more information about device overrides, see <a href="#">Managing Object Overrides</a> , on page 244.</p>

Element	Description
Referenced	<p>Whether the object is being used in any policy definitions. You can find out which policies or policy objects are using the selected object and any device overrides for the object using the Find Usage feature (see <a href="#">Generating Object Usage Reports</a> , on page 241).</p> <p><b>Note</b> To view reference information, make sure the Referenced option is selected on the toolbar above the Policy Object Table.</p> <p><b>Note</b> The Referenced column reports usage based on both committed data and uncommitted data across all activities/tickets, whereas as the Find Usage feature only reports usage based on committed data and data from the current activity/ticket.</p>
Description	The description for the object. If the column is too narrow to display the description, you can double-click the icon to view the description or mouse-over the icon.
Last Ticket(s)	<p>If ticketing is enabled, shows the Ticket ID of the ticket last used to modify the object. You can click on the</p> <p>If ticketing is enabled, shows the ticket(s) associated with last modification to the object. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see <a href="#">Ticket Management Page</a> , on page 584).</p>
Last Modified Date	Shows the date and time the object was last modified.
Buttons Below Table	
	<p>Click the New Object button to create a new object. The same icon is used for any button that adds an item to a table.</p> <p><b>Tip</b> In a few cases such as Networks/Hosts and Services objects, clicking this button opens a list from which you need to select a specific type for the object.</p> <p>Clicking this button opens a dialog box to create the object. Click the Help button in the dialog box for information on the selected object type. Also, see <a href="#">Creating Policy Objects</a> , on page 235.</p>
	<p>Click the Edit Object button to edit the selected object. The same icon is used for editing any object in a table.</p> <p>The dialog box used for editing the object is the same as the one used for creating the object. If you try to edit a system-defined default object, you are allowed only to view the object contents. Click the Help button in the dialog box for information on the settings. For more information, see <a href="#">Editing Objects</a> , on page 239.</p>
	Click the Delete Object button to delete the selected object. You can delete only user-defined objects that are not currently being used in a policy or another policy object. For more information, see <a href="#">Deleting Objects</a> , on page 243.

## Policy Object Manager: Undocking and Docking

Whenever you open the Policy Object Manager, it is initially displayed as a pane in the lower half of the current view to make dragging and dropping objects easier. You can “undock” this pane, making the Policy Object Manager a separate window, you can “re-dock” the window, and you can close the pane or window:

- To undock the Policy Object Manager from the current view in the Configuration Manager window, click the Undock Window button in the upper right corner of the pane’s title bar.
- To put the floating window back as a pane in the Configuration Manager window, click the Dock Frame button in the upper right corner of the Policy Object Manager window.
- To close either the pane or the floating window, click the Close button in its upper right corner.

### Navigation Path

In Device view or Policy view, click the **Policy Object Manager** button on the toolbar, or choose **Policy Objects** from the **Manage** menu. (The Policy Object Manager cannot be opened from Map view.)

## Policy Object Manager Shortcut Menu

Right-clicking inside the policy object table in the [Policy Object Manager](#) , on page 230 displays a shortcut menu for performing various functions on the selected object type.

### Field Reference

*Table 42: Policy Object Manager Shortcut Menu*

Menu Command	Description
New Object	Choose this command to create a new policy object. Click Help in the dialog box that is opened for information specific to the object type. Also, see <a href="#">Creating Policy Objects</a> , on page 235.  <b>Tip</b> For network/host and service objects, you need to also select an object type from the submenu.
Edit Object	Choose this command to edit the policy object selected in the table. If you select a system-defined default object, you are presented with a view-only look at the object definition. For more information, see <a href="#">Editing Objects</a> , on page 239.
Delete Object	Choose this command to delete the policy object selected in the table. You can delete only user-defined objects that are not being used in a policy or in another policy object. For more information, see <a href="#">Deleting Objects</a> , on page 243.
Enable/Disable Device Overrides	Choose the Enable Device Overrides command to enable device overrides on one or more devices on which overrides are disabled. Choose the Disable Device Overrides command to disable device overrides on one or more devices on which overrides are enabled.
Edit Device Overrides	Select this command to change the device-level overrides for this object using the <a href="#">Policy Object Overrides Window</a> , on page 247. You can create, edit, and delete overrides. For more information, see <a href="#">Managing Object Overrides</a> , on page 244.

Menu Command	Description
Clone Object	Select this command to create a copy of the policy object. For more information, see <a href="#">Cloning (Duplicating) Objects</a> , on page 240.
Copy Object	Choose this command to copy one or more selected objects to the system Clipboard. <b>Tip</b> You can also use <b>Ctrl+C</b> to copy objects.
Paste Object	Choose this command to paste the object(s) on the system Clipboard into another object. For example, you might add a host-type Networks/Hosts object to an existing group-type Networks/Hosts object. The two object types must be compatible. <b>Tip</b> You can also use <b>Ctrl+V</b> to paste objects.
Find Usage	Choose this command to generate a usage report for the selected object using the Object Usage dialog box. The usage report tells you where the object is currently being used. For more information, see <a href="#">Generating Object Usage Reports</a> , on page 241.
View Object	Choose this command to view the definition of the object using a read-only version of the edit dialog box for the object. For more information, see <a href="#">Viewing Object Details</a> , on page 241.

## Working with Policy Objects—Basic Procedures

The following topics describe the actions that you can perform on policy objects. Some tasks are limited to certain types of objects. For example, not all types of object can be overridden, you cannot edit predefined objects, and you cannot import or export all objects.

This section contains the following topics:

- [Creating Policy Objects](#) , on page 235
- [Editing Objects](#) , on page 239
- [Using Category Objects](#) , on page 239
- [Cloning \(Duplicating\) Objects](#) , on page 240
- [Viewing Object Details](#) , on page 241
- [Generating Object Usage Reports](#) , on page 241
- [Deleting Objects](#) , on page 243
- [Managing Object Overrides](#) , on page 244
- [Importing and Exporting Policy Objects](#) , on page 251

## Creating Policy Objects

Security Manager provides predefined policy objects of various types that you can use to define policies. Additionally, you can create your own objects, as required.

You can create objects in one of two ways:

- Using the Policy Object Manager window. This option is best suited for situations where you are defining one or more objects outside of the context of defining a particular policy. See [Policy Object Manager , on page 230](#).
- Using object selectors. When you define a policy that uses objects, object selectors include buttons for creating and editing objects so you don't have to leave the policy you are defining. This is frequently the best method to use, because during policy creation you are prompted for the specific type of object that applies to the situation, and you are more aware of the settings you need for the policy. See [Selecting Objects for Policies , on page 228](#).

---

**Tip** Your ability to create multiple objects with the same definition depends on a setting on the Policy Objects page in the Security Manager Administration window (select **Tools > Security Manager Administration**). By default, Security Manager warns you when you create an object whose definition is identical to that of an existing object, but it does not prevent you from proceeding. For more information, see [Policy Objects Page , on page 577](#).

---

#### Related Topics

- [Managing Policy Objects, on page 227](#)

### Step 1

Do one of the following:

- Select **Manage > Policy Objects** to open the [Policy Object Manager , on page 230](#). Select the type of object you want to create from the table of contents, right-click in the table and select **New Object**.
- While configuring a rule, click **Select** next to a field that allows or requires a policy object. In the object selector, click the **Create** button below the available objects list.

**Tip** In a few cases, such as network/host and service objects, clicking these buttons opens a list from which you need to select a specific type for the object.

The dialog box for adding the selected type of object opens. For more information about the individual types of objects, see the following topics:

- [Add or Edit User Group Dialog Box](#) , on page 1564
- [Configuring WINS/NetBIOS Name Service \(NBNS\) Servers To Enable File System Access in SSL VPNs](#) , on page 1416

**Step 2** Enter a name for the object and optionally a description of the object.

Object names are not case-sensitive and are limited to 128 characters. You can begin object names with a letter, a number, or an underscore. You can use a mix of letters, numbers, special characters, and spaces for the remainder of the object name.

Supported special characters include

- hyphens (-),
- underscores (\_),
- periods (.), and,
- plus signs (+).

Beginning with version 4.12, Security Manager allows you to use additional special characters including

- exclamation mark (!),
- at sign (@),
- hash sign (#),
- percent sign (%),
- ampersand sign (&), and,
- parentheses or round brackets ().

Security Manager does not support the following characters:

- caret character (^)
- dollar character (\$)

Some objects also support the use of colons (:) in the object name; however, objects with a colon in the name are not supported on IPS devices. If you share objects between different device types that include IPS devices, you should avoid using a colon (:) in the object name.

**Note** Certain object types, such as AAA server groups, ASA user groups, maps, network/host objects, service objects, and traffic flows, have different naming guidelines. For more details, refer to the online help when you are creating each object type.

**Step 3** Configure the settings specific to the type of object. Refer to the online help page for the dialog box.

**Step 4** (Optional) Under Category, select a category to help you identify this object in the Objects table. See [Using Category Objects](#) , on page 239.

**Step 5** (Optional) If the object type provides the option, select **Allow Value Override per Device** to allow the properties of this object to be redefined on individual devices. See [Allowing a Policy Object to Be Overridden](#) , on page 245.

**Step 6** Click **OK** to save the object.

---

## Editing Objects

You can edit any user-defined object as required. Changes that you make to the object are reflected in all policies (and other objects) that use the object. However, if an override for the object is already defined for a device, your edits are not reflected in the object used on those devices.

### Tips

- You cannot edit predefined objects, but you can copy them to create new objects. See [Cloning \(Duplicating\) Objects](#), on page 240.
- Messages appear at the top of the Edit dialog box to indicate the following situations:
  - That you have read-only access to the object. You cannot save changes to these objects.
  - That the policy object was imported using the procedure described in [Importing Policies or Devices](#), on page 489. Imported objects might be re-imported at some point if the shared policy that uses the object is managed on a different server. Any changes that you make are eliminated if the policy object is imported again. Before editing the object, ensure that you understand the protocols used in your organization for policy management and importation. You can control whether this message appears using an option on the **Tools > Security Manager Administration > Policy Management page** (see [Policy Management Page](#), on page 575).
- You can also edit objects when you define policies or objects that use this object type. For more information, see [Selecting Objects for Policies](#), on page 228.

### Before You Begin

Determine if the object is being used, and which policies, objects, and devices would be affected by the changes. You can generate a usage report for this purpose. See [Generating Object Usage Reports](#), on page 241.

### Related Topics

- [Creating Policy Objects](#), on page 235

- 
- Step 1** Select **Manage > Policy Objects** to open the [Policy Object Manager](#), on page 230.
  - Step 2** Select the object type from the table of contents.
  - Step 3** Right-click the object you want to edit and select **Edit Object**.
  - Step 4** Modify the fields in the Edit dialog box for that object type as required, then click **OK** to save your changes. Click the Help button for information specific to the type of object.
- 

## Using Category Objects

Categories provide an intermediate level of detail to objects. By assigning a category to an object, you can look for the name and color of a category to more easily identify rules and objects in rules tables. You can assign a category to a rule or object when you create the rule, or you can edit the rule or object to include category information later. No device configuration commands are generated for category assignments.

The benefits of assigning categories to policy objects are:

- Visibility is improved when you view rules tables using objects that are categorized.
- Objects can be filtered in the rules tables based on category, facilitating rule maintenance.

For example, you might want to create a network/host object and keep track of its use for administrative purposes. When you define this network/host object, you associate it with a category. When you view the access rules table, you can easily identify those rules that use your network/host object. You can also filter the table to display only those items associated with the category.

Security Manager includes a set of predefined categories. Although you cannot change the colors, you can change their names and descriptions. The following procedure explains how to change the name and description.

- 
- Step 1** Select **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager](#) , on page 230).
- Step 2** Select **Categories** from the Object Type selector.
- Step 3** Click **Edit Object** to open the Category Editor dialog box.
- Step 4** Modify the names and descriptions of the predefined category objects as required:
- Label—The color associated with the category.
  - Name—The category name. Names can have a maximum of 128 characters, including special characters and spaces.
  - Description—Additional information about the object (up to 1024 characters).
- Step 5** Click **OK** to save your changes.
- 

## Cloning (Duplicating) Objects

An alternative to creating a policy object from scratch is to clone, or duplicate, an existing object. The new object contains all the attributes of the copied object. You can then modify the name and all attributes as required.

Cloning is useful for creating objects that are based on predefined objects that cannot be edited.

### Related Topics

- [Working with Policy Objects—Basic Procedures](#) , on page 235

- 
- Step 1** Select **Manage > Policy Objects** to open the [Policy Object Manager](#) , on page 230.
- Step 2** Select the object type from the table of contents.
- Step 3** Right-click the object you want to duplicate and select **Clone Object**.
- The dialog box for that object type appears. The Name field contains the following default name for the new object: Copy of *name of copied object* . The remaining fields contain the same values as the copied object.
- Step 4** Modify the name of the new object and its configuration, as required. Click the Help button for information specific to that type of object.
- Step 5** Click **OK** to save your changes.
-

## Viewing Object Details

You can view contents of an object in read-only mode, even when the object is locked by another activity. This is useful when you need to view complete configuration details for complex objects whose definitions cannot be fully displayed in the Policy Object Manager window or when your user privileges allow you only to view object information.

### Related Topics

- [Working with Policy Objects—Basic Procedures](#) , on page 235

- 
- Step 1** Select **Manage > Policy Objects** to open the [Policy Object Manager](#) , on page 230.
- Step 2** Select the object type from the table of contents.
- Step 3** Right-click the object and select **View Object**.  
The dialog box for that object appears in read-only mode.
- 

## Generating Object Usage Reports

Before you make any changes to a policy object, you should determine if the object is being used. You can do this by viewing the Referenced column in the Policy Object Manager window. Select the Referenced button above the Policy Object Table to enable the Referenced column.

For objects that are referenced, you can generate usage reports that show which policies, objects, VPNs, and devices are using the selected object and would therefore be affected by changes to that object. Usage reports contain any references to the selected object in your current activity as well as references found in the data committed to the database.

---

**Note** The Referenced column reports usage based on both committed data and uncommitted data across all activities/tickets, whereas as the Find Usage feature only reports usage based on committed data and data from the current activity/ticket.

---

You can use either of these methods to generate usage reports:

- Policy Object Manager—Select **Manage > Policy Objects** to open the [Policy Object Manager](#) , on page 230. Select the type of object from the table of contents, right-click the object and select **Find Usage**.
- Firewall rules policies—Left-click an object in a firewall rules table, then right-click and select **Find Usage**.

The usage information is displayed in the Object Usage dialog box. Select the appropriate usage type above the table to view devices, policies, VPNs, or other objects that use the selected object.

For certain policies,

The following table describes the fields in the dialog box.

Table 43: Object Usage Dialog Box

Element	Description
Name Type Description	General information about the object for which you are finding usage is displayed at the top of the Object Usage dialog box.
Devices Policies Objects VPN	The type of references you want to view. For example, you can select Objects to view only references to the object from other objects.
Used By	The name of the device, policy, VPN, or object that is referencing the selected object.
Type	The type of item that is referencing the selected object. This can be a device, policy, VPN, or another object.
Usage	Indicates how the object is being referenced. For example, if a device is referencing the selected object, this column will indicate that it is a policy assigned to the device that is referencing the object.
Proximity	Indicates the relationship between the selected object and the item that it using it. For example: <ul style="list-style-type: none"> <li>• A policy that includes a network/host object in its definition has a <i>direct</i> relationship with the object and an <i>indirect</i> relationship with any other network/host objects contained within the object.</li> <li>• A device on which this policy is assigned references the network/host object <i>directly</i> and any other network/host objects contained within the object <i>indirectly</i>.</li> </ul>

Element	Description
Details Panel	<p>Shows additional details for certain types of references:</p> <ul style="list-style-type: none"> <li>• <b>Devices</b> - For supported policy types, device information is displayed in the Details panel.</li> <li>• <b>Policies</b> - For the following supported policy types, the actual rules referencing the object are presented in the Details panel: <ul style="list-style-type: none"> <li>• AAA Rules</li> <li>• Access Rules</li> <li>• IPv6 Access Rules</li> <li>• Inspection Rules</li> <li>• Translation Rules</li> <li>• Web Filter Rules (PIX/FWSM/ASA)</li> <li>• Zone Based Firewall Rules</li> </ul> </li> </ul> <p>You can navigate to the rule, export the rule data, or print the rule data from the Details panel.</p> <ul style="list-style-type: none"> <li>• <b>Objects</b> - Details for other objects that are referencing the specified object are presented in the Details panel. You can export the detailed information, print the information, view the object in read-only mode, edit the object, or even find usage for the object from the Details panel in the Object Usage dialog box.</li> </ul>

## Deleting Objects

You can delete user-defined objects only when they are not being used by policies or other objects. You cannot delete predefined objects. If you delete an object for which device-level overrides are defined, all overrides are also deleted.

**Tip** You might be prevented from deleting an unused object from the database, if, for example, you replace a local policy that used the object with a shared policy that does not. If object deletion fails, submit or discard all pending changes (in Workflow mode, submit or discard all pending activities), then try again to delete the object. Alternatively, you can leave unused objects in the database, because they will not affect your policies.

### Before You Begin

Determine if the object is currently being used and which policies, objects, and devices would be affected by the deletion. You need to remove all references to the object before you can delete it. You can generate a usage report for this purpose. See [Generating Object Usage Reports](#), on page 241.

- 
- Step 1** Select **Manage > Policy Objects** to open the [Policy Object Manager](#), on page 230.
- Step 2** Select the object type from the table of contents.

- Step 3** Right-click the object you want to delete and select **Delete Object**, or select the object and click the **Delete Object** button. You are asked to confirm the deletion.

## Managing Object Overrides

When you create a policy object, you can elect to allow the object to be overridden. This makes it possible to create a generic object to enable you to create general policies. For individual devices, you override the policy object definition to make the policy apply correctly to the device.

From the [Policy Object Manager](#) , on page 230, you can select a policy object that can be overridden and generate a table of device-level overrides that are defined for that global object. Right-click the object and select **Edit Device Overrides** to generate the table (see [Policy Object Overrides Window](#) , on page 247).

You can create device-level overrides in two places:

- In the Device Properties window of a selected device, which allows you to create and manage overrides for the selected device only. For more information, see [Creating or Editing Object Overrides for a Single Device](#) , on page 246.
- In the Policy Object Manager window, which allows you to create and manage overrides for more than one device at a time. For more information, see [Creating or Editing Object Overrides for Multiple Devices At A Time](#) , on page 246.

**Tip** If you override any part of the object definition at the device level, any subsequent changes made to the policy definition at the global level do not affect the device on which the object was overridden.

The following topics explain policy object overrides in more detail:

- [Understanding Policy Object Overrides for Individual Devices](#) , on page 244
- [Allowing a Policy Object to Be Overridden](#) , on page 245
- [Creating or Editing Object Overrides for a Single Device](#) , on page 246
- [Creating or Editing Object Overrides for Multiple Devices At A Time](#) , on page 246
- [Deleting Device-Level Object Overrides](#) , on page 248
- [Overridable Objects in Security Manager](#), on page 249

## Understanding Policy Object Overrides for Individual Devices

For many types of policy objects, you can elect to allow an object to be overridden for a particular device. Thus, you can create an object whose definition works for most devices, and then create modifications to the object for the few devices that need slightly different definitions. Or, you can create an object that needs to be overridden for all devices, but which allows you to create a single policy for all devices. Object overrides make it possible for you to create a smaller set of shared policies for use across your devices without giving up the ability to alter policies when needed for individual devices.

For example, you might want to deny ICMP traffic to the different departments in your company, each of which is connected to a different network. You can do this by defining an access rule firewall policy with a rule that includes a network/host object called Departmental Network. By allowing device override for this

object, you can then create overrides on each relevant device that specify the actual network to which that device is connected.

Device-level object overrides are especially important when the global object is included in the definition of a VPN policy, which applies to every device in the VPN topology. For example, you select a PKI enrollment object when defining a PKI policy on a site-to-site VPN. If the hub of your VPN uses a different CA server than the spokes, you must use device-level overrides to specify the CA server used by the hub. Although the PKI policy references a single PKI enrollment object, the actual CA server represented by this object will differ for the hub, based on the device-level override you define.

You can quickly tell if an object can be overridden by looking for the Overrides column in the objects table in the [Policy Object Manager](#), on page 230. A green checkmark indicates that you can create overrides for the object; the presence of the column indicates the object type allows overrides.

### Related Topics

- [Allowing a Policy Object to Be Overridden](#), on page 245
- [Creating or Editing Object Overrides for a Single Device](#), on page 246
- [Creating or Editing Object Overrides for Multiple Devices At A Time](#), on page 246
- [Deleting Device-Level Object Overrides](#), on page 248

## Allowing a Policy Object to Be Overridden

To create overrides for an object, the object must allow overrides. Not all object types allow overrides.

For those that do allow overrides, you define the object as allowing overrides by selecting **Allow Value Override per Device** when defining the object. After selecting this option, you must click **OK** to save the object before you can define any overrides. For more information on creating objects, see [Creating Policy Objects](#), on page 235.

You can also configure Security Manager to create device-level overrides for existing objects when you discover policies on devices that you add to the inventory. During discovery, if Security Manager determines that an existing object applies to a discovered policy, but that it is not a perfect fit, the object is used but a device-level override is created to account for the difference. For example, if you run policy discovery on a device that has an ACL with the same name as an ACL policy object in Security Manager, the name of the discovered policy object is reused, but a device-level override is created for the object. If you do not allow device-level overrides during discovery, a new policy object is created with a number appended to the name; this is the default.

To configure Security Manager to allow device overrides during discovery, select **Tools > Security Manager Administration > Discovery** and select **Allow Device Override for Discovered Policy Objects**.

---

**Note** To ensure that a specific policy object will be reused for device-level override during discovery, make sure the **Allow Value Override per Device** check box has been selected for the policy object in Policy Object Manager before policy discovery.

---

- [Creating or Editing Object Overrides for Multiple Devices At A Time](#) , on page 246
- [Deleting Device-Level Object Overrides](#) , on page 248

## Creating or Editing Object Overrides for a Single Device

You can create or edit device-level object overrides from the Device Properties window.

An override specifies a definition for a global object that affects only the selected device. For example, you can override the definition of a AAA server group object so that the object represents a different group of AAA servers for one device than the group it represents for other devices.

### Related Topics

- [Allowing a Policy Object to Be Overridden](#) , on page 245
- [Creating or Editing Object Overrides for Multiple Devices At A Time](#) , on page 246
- [Understanding Policy Object Overrides for Individual Devices](#) , on page 244
- [Deleting Device-Level Object Overrides](#) , on page 248

---

**Step 1** (Device view) Right-click a device in the Device selector and select **Device Properties**.

**Step 2** Select the object type you want to override from the **Policy Object Overrides** folder.

The table displays all objects of the selected type that can be overridden at the device level. If an object has an override already defined for the device, the Value Overridden? column contains a check mark.

**Step 3** Select the object whose override you want to change and do one of the following:

- Click the **Create Override** button, or right-click and select **Create Override**.
- Click the **Edit Override** button, or right-click and select **Edit Override**.

The dialog box for defining that type of object is displayed with the current properties (either the global properties or the local override).

**Step 4** Modify the definition of the object and click **OK** to save the device-level override. In the Device Properties window, a green check mark appears in the Value Overridden? column.

---

## Creating or Editing Object Overrides for Multiple Devices At A Time

You can create or edit device-level object overrides from the Policy Object Manager window.

This method enables you to create overrides on multiple devices at the same time, which is especially useful when creating overrides for several devices that participate in the same VPN topology. For example, if the spokes located in one part of the VPN use a different CA server than the spokes located in a different part of the VPN, you can override the PKI enrollment object that defines the server for these devices. This is a more convenient method than selecting each device individually from Device view and defining the override from the Device Properties window.

### Related Topics

- [Understanding Policy Object Overrides for Individual Devices](#) , on page 244
- [Allowing a Policy Object to Be Overridden](#) , on page 245
- [Creating or Editing Object Overrides for a Single Device](#) , on page 246
- [Deleting Device-Level Object Overrides](#) , on page 248

---

**Step 1** Select **Manage > Policy Objects** to open the [Policy Object Manager](#) , on page 230.

**Step 2** Select the object type you want to override from the table of contents, and then select the object to override.

**Tip** Not all types of object allow overrides, and not all objects are defined as overridable. Look for a green check mark in the Overridable column. If the object type allows overrides, but this object does not have a check mark, edit the object to enable object override (see [Allowing a Policy Object to Be Overridden](#) , on page 245).

**Step 3** Double-click the checkmark, or right-click the object and select **Edit Device Overrides**, to open the [Policy Object Overrides Window](#) , on page 247. The window contains a table listing each device for which an override is defined for the object.

**Tip** You can also edit the overridable object and click **Edit** next to the Overrides field.

**Step 4** Do one of the following:

- To add an override, click the **Create Override** button, select the devices to which you want to apply the override, and define the override.

The dialog boxes for creating and editing the override are the same ones used to create the object; click the Help button for information specific to the type of object.

The override you create applies to all policies on the device that use the object; you cannot override the object for one policy but not for another policy.

- To edit an override, select it and click the **Edit Override** button.

---

## Policy Object Overrides Window

Use the Policy Object Overrides window to view a list of all device-level overrides that are defined for the selected object. The content displayed in the table differs depending on the type of object, but it always includes the device name, object description, and category. Sometimes the content of the object is shown, including the overrides.

- To add an override, click the **Create Override** button. In the Create Overrides for Device window, select the devices from the available list and click >> to move them to the selected list. When you click **OK**, you are presented with the dialog box for defining your override, which applies to all newly selected devices. (You are not changing the override of the greyed out devices)

---

**Note** The available devices list shows the devices that have not already had overrides defined for the object. Devices with overrides are shown greyed out in the selected devices list.

---

The dialog boxes for creating and editing the override are the same ones used to create the object; click the Help button for information specific to the type of object.

The override you create applies to all policies on the device that use the object; you cannot override the object for one policy but not for another policy.

- To edit an override, select it and click the **Edit Override** button.
- To delete an override, select it and click the **Delete Override** button.

Deleting an override does not delete the object or remove the object from its device assignment. When you delete the override, the policies on the device that use the object start using the global definition for the object. This changes the meaning of the policies.

---

**Tip** You can also create and edit device-level overrides from the Device Properties window of a selected device. Using the Device Properties windows makes it easy for you to manage the overrides for all objects used by a single device. For more information, see [Creating or Editing Object Overrides for a Single Device](#), on page 246.

---

### Navigation Path

Open the [Policy Object Manager](#), on page 230. Select an object type that can be overridden (its object page contains a column called Overrides), then do one of the following:

- Double-click the green checkmark in the Overrides column.
- Right-click the object and select **Edit Device Overrides**.
- Edit the overridable object and click **Edit** next to the Overrides field.

## Deleting Device-Level Object Overrides

Deleting a device-level override restores the global definition of the object to the selected device. You can delete overrides from the Device Properties window or from the Policy Object Manager window:

- Deleting overrides from Device view—Right-click the device and select **Device Properties**, then select the object type from the **Policy Object Overrides** folder. Select the override you want to delete and click **Delete Override**.

- Deleting overrides from the Policy Object Manager—Select the object type from the table of contents, then right-click the object and select **Edit Device Overrides**. Select the override you want to delete and click **Delete Override**.

## Importing and Exporting Policy Objects

Security Manager includes a Perl script that you can use to export network/host, service, and port list policy objects so that you can import them into another Security Manager server. The information includes device-level overrides for policy objects that have them.

**Note** The command works with network/host objects that contain IPv4 addresses only. You cannot use the command to import network/host-IPv6 objects.

You can also manually create a CSV file that you can import. For example, you might obtain a list of IP addresses that identify networks or hosts that should be denied entry to your network. You can create a CSV file that will bulk-load the list as one or more network/host objects if that is easier than manually creating the object in the Policy Object Manager.

**Tip** Besides using this command, you can use other facilities to export and import policy objects that are assigned to shared policies or configured in local device policies. For more information, see the following topics: [Exporting the Device Inventory from the Security Manager Client, on page 482](#), [Exporting Shared Policies, on page 487](#), and [Importing Policies or Devices, on page 489](#).

The Perl command is located in \$NMSROOT\bin, which is typically C:\Program Files\CSCSp\bin. The syntax of the command is:

```
perl [path ]PolicyObjectImportExport.pl -u username -p password -o {import | export} [-a activity ] -t
object_type -f filename [-c {true | false}] [-d {true | false}] [-e {true | false}] [-g {true | false}] [-h]
```

### Syntax

<b>perl</b> [path ] <b>PolicyObjectImportExport.pl</b>	The Perl script command. Include the path to the PolicyObjectImportExport.pl file if the path is not defined in the system path variable.  <b>Tip</b> If you forget to include the “perl” command, the system accepts the input but does nothing and provides no feedback on your error. Use Ctrl+Z to return to the command prompt.
<b>-u</b> username	A Security Manager username. The data exported is limited by the permissions assigned to this user. The user must have Modify Objects permission for the import or export of policy objects, and additionally the Modify Devices permission for the import or export of device-level overrides.  If you are importing objects in non-Workflow mode, you must also have Submit and Approve privileges.
<b>-p</b> password	The user’s password.
<b>-o</b> {import   export}	The type of operation you are performing, either to import policy objects from an existing file, or to export policy objects to a CSV file. Only committed objects are exported.

<b>-a</b> <i>activity</i>	(Optional.) The name of a Workflow activity. If you do not specify a name, a new activity is created with the name <code>username_time</code> .
<b>-t</b> <i>object_type</i>	Object type, one of the following: <ul style="list-style-type: none"> <li>• <code>network</code>—For network/host objects.</li> <li>• <code>service</code>—For service objects.</li> <li>• <code>portlist</code>—For port-list objects.</li> </ul>
<b>-f</b> <i>filename</i>	The name of the CSV file. When exporting, if the file exists, it is overwritten.
<b>-c</b> {true   false}	(Optional.) When importing objects, whether to enable policy object conflict detection. <ul style="list-style-type: none"> <li>• <code>false</code>—An object is imported even if an existing object has the same content.</li> <li>• <code>true</code>—If an existing object has the same content as an imported object, the imported object is skipped. You must also select <b>Enforce</b> for the <b>When Redundant Objects Detected</b> option on the <a href="#">Policy Objects Page</a>, on page 577.</li> </ul>
<b>-d</b> {true   false}	(Optional.) How to handle device-level policy object overrides during either an import or export operation: <ul style="list-style-type: none"> <li>• <code>true</code>—Include all globally-defined objects and all device-level overrides of the objects.</li> <li>• <code>false</code>—Include only the global definitions of the policy objects. Do not include any device-level policy object override information. This is the default.</li> </ul>
<b>-e</b> {true   false}	(Optional.) Whether to “flatten” port-list objects in service objects and service-group objects: <ul style="list-style-type: none"> <li>• <code>true</code>—The names of any port-list objects found in service objects and service-group objects are replaced with the actual ports from the lists. That is, the two objects, port-list and service, or port-list and service-group, are “flattened” into a single service or service-group.</li> </ul> <p>Port-list objects are used in Security Manager to group sets of port definitions, and are used when defining service and service-group objects. However, port-list objects are not supported in PRSM.</p> <ul style="list-style-type: none"> <li>• <code>false</code>—Port-list objects in service and service-group objects are not flattened. This is the default.</li> </ul>

-g {true   false}	(Optional.) Whether to include object and object-group types in the CSV file: <ul style="list-style-type: none"> <li>• true—The final column in the file will be <b>Type</b> and it will indicate “Service” or “Network.”</li> <li>• false—The Type column is not included. This is the default.</li> </ul>
-h	(Optional.) Display the command line help. If you include this option, all other options are ignored.

### Importing Policy Objects

When you are importing objects, if an object refers to another object, that object must already be defined in Security Manager, or it must be defined in the same CSV file that you are importing. If the object is in the same CSV file, it must come before the object that refers to it. (Security Manager automatically sorts objects as required when exporting them.)

If Security Manager already has a policy object of the same name as one you are importing, the object is skipped and not imported. The name conflict can even occur if another user has created an object but not yet committed it for public viewing, so you might not be able to see the conflicting object. Security Manager creates only new objects, it does not update existing objects. Use the -c option to specify whether new objects can be created that have the same content as existing objects.

When you run the command, if there are any errors in the file, only the affected objects are not imported. Error messages indicate these problems as they occur, and Security Manager continues evaluating all records in the file. All correctly defined policy objects are imported, and the objects with errors are skipped. The total count and the names of the policy objects that are not imported are shown in the output screen.

After the import command completes, additional actions depend on the Workflow mode you are using:

- Workflow mode—You must log into Security Manager using the same username and password and submit the activity you specified during the import. The activity must be submitted and approved for the changes to take effect.
- Non-Workflow mode—The imported objects are automatically submitted and approved without action on your part. However, you will receive an error if the username you supplied does not have Submit and Approve privileges, and the import operation will fail.

### CSV File Format

All objects in a single file are of the same policy object type. The file is in standard comma-separated values (CSV) format. The first line has column headings. Each row represents a single policy object. The columns, left to right, are:

- Name—(Mandatory.) The name of the object.
- Node—The display name of the device on which an override of the policy object is defined. If the policy object is defined on the global level, the field is empty. When importing objects, if the display name does not match a device already in the Security Manager inventory, the object is skipped and not imported.
- Description—The description of the object, if any.
- Category—The category identifier of the object, if any. The category ID is from 10 to 19.

- Allow Override—Whether the object can be overridden. True if the policy object can be overridden on device level, False (or an empty field) if not.
- Group—The names of other policy objects with the same type referenced by this policy object. If there is more than one object, they are separated by commas. For example, network building block Net1 references network building block Net2 and Net3. The Group field of Net1 would have “Net2,Net3” as its value.
- Data—The content of the object.
- Subtype—The object subtype, if any, for network/host and service objects. For an explanation of network/host and service object types, see [Understanding Networks/Hosts Objects](#), on page 308 and [Understanding and Specifying Services and Service and Port List Objects](#), on page 329. Possible values are:
  - Blank, or space—The object is a group object, either network/host or service.
  - NH—(Network/host objects only.) Single host network/host object.
  - NF—(Network/host objects only.) Single fully-qualified domain name (FQDN) network/host object.
  - NN—(Network/host objects only.) Single network address network/host object.
  - NR—(Network/host objects only.) Single Address range network/host object.
  - SO—(Service objects only.) Single-service service object.
- Type—The type of object represented by this entry: “Network” or “Service.”

If there is no value for a particular field, that field is blank in the output. If there are multiple values for a field, the field is enclosed in double quotation marks.

## Understanding AAA Server and Server Group Objects

You use AAA server objects to identify the AAA servers used in your network. AAA enables devices to determine who the user is (authentication), what the user is permitted to do (authorization), and what the user actually did (accounting), as described below:

- Authentication—Authentication is the way a user is identified before being allowed access to the network and network services. It controls access by requiring valid user credentials, which are typically a username and password. All authentication methods, except for local, line password, and enable authentication, must be defined through AAA. You can use authentication alone or with authorization and accounting.
- Authorization—After authentication is complete, authorization controls the services and commands available to each authenticated user. Authorization works by assembling a set of attributes that describe what the user is authorized to perform. These attributes are compared to the information contained in a database for a given user and the result is returned to AAA to determine the user’s actual capabilities and restrictions. The database can be located locally on the access server or router or it can be hosted remotely on a RADIUS or TACACS+ security server. Were you not to use authorization, authentication alone would provide the same access to services to all authenticated users. You must use authorization together with authentication.
- Accounting—Accounting is used to track the services users are accessing, as well as the amount of network resources they are consuming. When AAA accounting is activated, the network access server reports user activity to the RADIUS or TACACS+ security server (depending on which security method

you have implemented) in the form of accounting records. Accounting information includes when sessions start and stop, usernames, the number of bytes that pass through the device for each session, the service used, and the duration of each session. This data can then be analyzed for network management, client billing, or auditing. You can use accounting alone or together with authentication and authorization.

AAA provides an extra level of protection and control for user access over using access rules (ACLs) alone. For example, you can create an access rule allowing all outside users to attempt to use Telnet on a server on the DMZ network. If you want only some users to actually reach the server (and you might not always know the IP addresses of these users, making it impossible to configure simple access rules), you can enable AAA to allow only authenticated or authorized users to make it through the network device (for example, the ASA or router). Thus, users must authenticate before reaching the Telnet server, where Telnet can also require a separate login.

AAA server objects are collected into AAA server group objects. Policies requiring AAA (such as Easy VPN, Remote Access VPNs, and router platform policies such as Secured Device Provisioning and 802.1x) usually refer to AAA server group objects. These objects contain multiple AAA servers that use the same protocol, such as RADIUS or TACACS+. In essence, AAA server groups represent collections of authentication servers focused on enforcing specific aspects of your overall network security policy. For example, you can group those servers dedicated to authenticating internal traffic, external traffic, or remote dial-in users, as well as servers that authorize the administration of your firewall devices.

The following topics describe how to work with AAA server objects:

- [Supported AAA Server Types](#) , on page 255
- [Additional AAA Support on ASA, PIX, and FWSM Devices](#) , on page 256
- [Predefined AAA Authentication Server Groups](#) , on page 258
- [Default AAA Server Groups and IOS Devices](#) , on page 259
- [Creating AAA Server Objects](#) , on page 260
- [Add or Edit AAA Server Dialog Box](#) , on page 261
- [Add and Edit LDAP Attribute Map Dialog Boxes](#) , on page 274
- [Creating AAA Server Group Objects](#) , on page 276

## Supported AAA Server Types

You can use AAA servers that use the RADIUS protocol with all devices, and the TACACS+ and LDAP protocols with all devices except IPS. For ASA, PIX, and FWSM devices, you can also use the protocols described in [Additional AAA Support on ASA, PIX, and FWSM Devices](#) , on page 256.

- **RADIUS**—Remote Authentication Dial-In User Service (RADIUS) is a distributed client/server system that secures networks against unauthorized access. In the Cisco implementation, RADIUS clients run on Cisco devices and send authentication requests to a central RADIUS server that contains all user authentication and network service access information.

You can use RADIUS with other AAA security protocols, such as TACACS+, Kerberos, and local username lookup, depending on what is supported by a particular device type. RADIUS is supported on all Cisco platforms, but some RADIUS-supported features run only on specified platforms.

Beginning with Cisco Security Manager 4.17, IPv6 is enabled in RADIUS protocol. This support is applicable only for ASA 9.9.2 devices and above. Users can now configure IPv6 Host Address for Radius authentication in the Add AAA Server dialog box (see, [Add or Edit AAA Server Dialog Box](#), on page 261). Activity validation is also introduced for unsupported device version.

- **TACACS+**—Terminal Access Controller Access Control System (TACACS+) is a security application that provides centralized validation of users attempting to gain access to a router or network access server. The goal of TACACS+ is to provide a methodology for managing multiple network access points from a single management service.

TACACS+ provides for separate and modular authentication, authorization, and accounting facilities. TACACS+ allows for a single access control server (the TACACS+ daemon) to provide each service independently.

- **LDAP**—Lightweight Directory Access Protocol (LDAP). The use of LDAP servers is specific to certain policies. For example, identity firewall configurations on ASA, VPN configurations on ASA, and ScanSafe configurations on IOS devices. For more information on using LDAP on ASA, see [Additional AAA Support on ASA, PIX, and FWSM Devices](#), on page 256.

### Related Topics

- [Additional AAA Support on ASA, PIX, and FWSM Devices](#), on page 256
- [Creating AAA Server Objects](#), on page 260
- [Understanding AAA Server and Server Group Objects](#), on page 254

## Additional AAA Support on ASA, PIX, and FWSM Devices

**Note** From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functionality, it does not support any enhancements.

In addition to supporting RADIUS and TACACS+, ASA, PIX 7.0+, and FWSM 3.1+ devices can support AAA servers running the following protocols. For more information, see the explanation of AAA usage in the configuration guides for the device type and operating system version that interests you.

- **Kerberos**—These devices can use Kerberos servers for authentication. 3DES, DES, and RC4 encryption types are supported.
- **NT**—These devices can use Windows Domain servers for NTLMv1 authentication.
- **SDI Servers**—SecureID servers from RSA Security, Inc. are known as SDI servers. When a user attempts to establish VPN access and the applicable tunnel-group policy specifies an SDI authentication server group, the ASA device sends the username and one-time password to the SDI server. The device then grants or denies user access based on the response from the server. Version 5.0 of SDI introduced the concept of SDI primary and secondary servers that share a single-node secret file (SECURID). As a result, when you configure an SDI server as a AAA server object, you must specify whether the server is version 5.0 or an earlier version.
- **LDAP**—These devices can use Lightweight Directory Access Protocol (LDAP) servers for VPN authorization and user group identification for identity-aware firewall policies. These devices support LDAP version 3 and are compatible with any v3 or v2 directory server. However, password management

is supported only on the Sun Microsystems JAVA System Directory Server and the Microsoft Active Directory.

With any other type of LDAP server (such as Novell or OpenLDAP), all LDAP functions are supported except for password management. Therefore, if someone tries to log in to one of these devices using one of these other servers for authentication and their password has expired, the device drops the connection and a manual password reset is required.

You can configure Simple Authentication and Security Layer (SASL) mechanisms to authenticate an LDAP client (in this case, the ASA, PIX, or FWSM device) to an LDAP server. These devices and LDAP servers can support multiple mechanisms. If both mechanisms (MD5 and Kerberos) are available, the ASA, PIX, or FWSM device uses the stronger mechanism, Kerberos, for authentication.

When user authentication for VPN access has succeeded and the applicable tunnel-group policy specifies an LDAP authorization server group, the ASA, PIX, or FWSM device queries the LDAP server and applies the authorizations it receives to the VPN session.

- **HTTP-Form**—These devices can use the HTTP Form protocol for single sign-on (SSO) authentication of WebVPN users only. Single sign-on support lets WebVPN users enter a username and password only once to access multiple protected services and Web servers. The WebVPN server running on the security appliance acts as a proxy for the user to the authenticating server. When a user logs in, the WebVPN server sends an SSO authentication request, including username and password, to the authenticating server using HTTPS. If the server approves the authentication request, it returns an SSO authentication cookie to the WebVPN server. The security appliance keeps this cookie on behalf of the user and uses it to authenticate the user to secure websites within the domain protected by the SSO server.

The following table describes the AAA services that are supported by each protocol:

**Table 44: AAA Services Supported by ASA, PIX, and FWSM Devices**

AAA Service	Database Type							
	Local	RADIUS	TACACS+	SDI	NT	Kerberos	LDAP	HTTP Form
Authentication of...								
VPN users	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes 1
Firewall sessions	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No
Administrators	Yes	Yes	Yes	Yes 2	Yes	Yes	Yes	No
Authorization of...								
VPN users	Yes	Yes	No	No	No	No	Yes	No
Firewall sessions	No	Yes 3	Yes	No	No	No	No	No
Administrators	Yes 4	No	Yes	No	No	No	No	No
Accounting of...								

VPN connections	No	Yes	Yes	No	No	No	No	No
Firewall sessions	No	Yes	Yes	No	No	No	No	No
Administrators	No	Yes 5	Yes	No	No	No	No	No
1. HTTP Form protocol supports single sign-on (SSO) authentication for WebVPN users only. 2. SDI is not supported for HTTP administrative access. 3. For firewall sessions, RADIUS authorization is supported with user-specific ACLs only, which are received or specified in a RADIUS authentication response. 4. Local command authorization is supported by privilege level only. 5. Command accounting is available for TACACS+ only.

## Predefined AAA Authentication Server Groups

There are several predefined AAA server groups that define an authentication method without specifying particular AAA servers. In policies such as IPSec proposals, you can use these predefined server groups to define the types of AAA authentication to perform and the order in which to perform them.

The below table describes the predefined AAA authentication server groups.

**Table 45: Predefined AAA Authentication Server Groups**

Name	Description
Enable	Uses the enable password defined on the device for authentication.
KRB5 KRB5-Telnet	Uses Kerberos 5 for authentication. Use KRB5-Telnet when using Telnet to connect. For Cisco IOS routers, you can use Kerberos 5 client configuration only on selected platforms running IOS Software versions that support this protocol. Server configuration is not supported. The device must include an Advanced series feature set (k9 crypto image).
If-Authenticated	Uses the if-authenticated method, which allows the user to access the requested function if the user is authenticated.
Line	Uses the line password defined on the device for authentication.
Local Local-case	Uses the local username database (defined on the device) for authentication. Use Local-case if you want the login to be case-sensitive.
None	Uses no authentication.

Name	Description
RADIUS	Use RADIUS or TACACS+ authentication. (Does not apply to Cisco IOS routers.)
TACACS+	These AAA server groups do not contain any AAA servers. To use one of them when defining a policy, you must create a device-level override and define the AAA servers to associate with the group. For more information, see <a href="#">Creating or Editing Object Overrides for a Single Device</a> , on page 246.

## Default AAA Server Groups and IOS Devices

IOS software enables you to define AAA servers either as members of AAA server groups or as individual servers. Security Manager, however, requires all AAA servers to belong to a AAA server group.

Therefore, when you discover an IOS device whose device configuration contains individual AAA servers that do not belong to a AAA server group, Security Manager creates the following server groups to contain these servers:

- For RADIUS: CSM-rad-grp
- For TACACS+: CSM-tac-grp

Both of these special AAA server groups are marked in the Policy Object Manager as the default groups for their protocol. This is indicated by the **Make this Group the Default AAA Server Group** check box.

These groups are created solely for the purpose of management by Security Manager. During deployment, the AAA servers in these special groups are deployed back to the IOS device as individual servers, *not* as part of the group.

You can also create your own default group. The default group can be used in most cases, except when you need to configure multiple AAA server groups that use the same protocol. For example, you might want to define multiple RADIUS groups so that one group can be used for authentication and another group for authorization. Service providers may want to define multiple groups with the same protocol in order to provide customer separation when using VRF.

---

**Note** If you use one of these default AAA server groups in a policy defined for a PIX/ASA/FWSM device, the AAA servers are deployed as a group to that device, not as individual servers. This is because all AAA servers on PIX/ASA/FWSM devices must belong to a AAA server group.

---

**Caution**

We recommend that you use caution when using these default AAA server groups in a policy definition. There are certain commands (for example, **ip radius** and **ip tacacs**, which are configured using the Interface field in the AAA Server dialog box) that can be defined once for each AAA server group and once for all individual AAA servers. Because the AAA servers in the default group are deployed to IOS devices as individual servers, you might inadvertently change the **ip radius** or **ip tacacs** settings for all the individual AAA servers configured on the device, including servers that are not being managed by Security Manager (and whose configurations would otherwise be left undisturbed).

**Related Topics**

- [Predefined AAA Authentication Server Groups](#) , on page 258
- [Creating AAA Server Group Objects](#) , on page 276
- [Understanding AAA Server and Server Group Objects](#) , on page 254

## Creating AAA Server Objects

You can create AAA server objects to populate the AAA server group objects that are referenced by policies such as AAA rules, Easy VPN, and 802.1x. In some cases, AAA server objects are used directly by a policy, such as in AAA policies on IPS devices.

When creating a AAA server object, you must specify the IP address or DNS name of the external AAA server and the protocol used by the server. The other settings required depend on the protocol.

**Note**

On PIX/ASA/FWSM devices, AAA objects in a device configuration that are not referenced by any policies are removed from the device during the next deployment. However, the predefined AAA objects named RADIUS and TACACS+ are never removed from PIX 6.3 devices, even if they are not referenced by any policies.

**Related Topics**

- [Creating Policy Objects](#) , on page 235
- [Supported AAA Server Types](#) , on page 255
- [Additional AAA Support on ASA, PIX, and FWSM Devices](#) , on page 256
- [Understanding AAA Server and Server Group Objects](#) , on page 254

- 
- Step 1** Select **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager](#) , on page 230).
- Step 2** Select **AAA Servers** from the Object Type selector.
- Step 3** Right-click in the work area, then select **New Object** to open the [Add or Edit AAA Server Dialog Box](#) , on page 261.
- Step 4** Enter a name for the object and optionally a description of the object.
- Step 5** Identify the AAA server:

- In the Host field, enter the IP address or for ASA or PIX 7.2+ devices, the host name of the AAA server. You can also enter the name of a network/host object that contains the host IP address, or click **Select** to select the object.
- Optionally, in the Interfaces field, enter the name of an interface or an interface role (which must resolve to a single interface name on the device) whose IP address should be used for all outgoing RADIUS or TACACS+ packets. Do not specify an interface for objects used on an IPS device.
- Optionally, enter the amount of time to wait until a AAA server is considered unresponsive.

**Step 6** Select the protocol used by the AAA server and configure protocol-specific properties. You can use RADIUS with all device types, and TACACS+ with all device types except for IPS devices. You can use the Kerberos, LDAP, NT, SDI, and HTTP-FORM protocols only with ASA, PIX 7.x+, and FWSM 3.1+ devices.

For details about the properties, see the following topics:

- RADIUS—See [AAA Server Dialog Box—RADIUS Settings](#) , on page 263.
- TACACS+—See [AAA Server Dialog Box—TACACS+ Settings](#) , on page 266.
- Kerberos—See [AAA Server Dialog Box—Kerberos Settings](#) , on page 267.
- LDAP—See [AAA Server Dialog Box—LDAP Settings](#) , on page 268.
- NT—See [AAA Server Dialog Box—NT Settings](#) , on page 271.
- SDI—See [AAA Server Dialog Box—SDI Settings](#) , on page 272.
- HTTP-FORM—See [AAA Server Dialog Box—HTTP-FORM Settings](#) , on page 273.

**Step 7** (Optional) Under Category, select a category to help you identify this object in the Objects table. See [Using Category Objects](#) , on page 239.

**Step 8** Click **OK** to save the object.

---

## Add or Edit AAA Server Dialog Box

Use Add or Edit AAA Server dialog box to create, copy, and edit a AAA server object. These objects are collected into AAA server group objects and identify the AAA servers that you want to use when defining various AAA policies. In some cases these objects are used directly in a AAA policy.

For a description of the protocols you can use, see [Supported AAA Server Types](#) , on page 255 and [Additional AAA Support on ASA, PIX, and FWSM Devices](#) , on page 256.

---

**Note** You cannot edit the protocol if the object is already included in a AAA server group.

---

### Navigation Path

Select **Manage > Policy Objects**, then select **AAA Servers** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

**Field Reference****Table 46: AAA Server Dialog Box—General Settings**

Element	Description
Name	The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects</a> , on page 235.
Description	An optional description of the object.
Host	<p>The address of the AAA server to which authentication requests will be sent. Specify one of the following:</p> <ul style="list-style-type: none"> <li>• <b>IP Address</b>—The IPv4 or IPv6 address of the AAA server. You can also enter the name of a network/host object that contains the host IP address, or click <b>Select</b> to select the object.</li> </ul> <p><b>Note</b> AAA- IPV6 hosts are only supported for the LDAP and TACACS+ protocols. Beginning with Cisco Security Manager 4.17, IPv6 hosts for the Radius protocol are supported on ASA 9.9(2) devices onwards.</p> <ul style="list-style-type: none"> <li>• <b>DNS Name (for PIX/ASA 7.2+ devices only)</b>—The DNS hostname of the AAA server, up to 128 characters. The hostname can contain alphanumeric characters and hyphens, but each element of the hostname must begin and end with an alphanumeric character.</li> </ul>
Interface	<p>The interface whose IP address should be used for all outgoing RADIUS or TACACS packets (known as the source interface). Enter the name of an interface or interface role, or click <b>Select</b> to select it from a list or to create a new interface role.</p> <p><b>Tips</b></p> <ul style="list-style-type: none"> <li>• If you enter the name of an interface, make sure the policy that uses this AAA object is assigned to a device containing an interface with this name.</li> <li>• If you enter the name of an interface role, make sure the role represents a single interface, not multiple interfaces.</li> <li>• Only one source interface can be defined for the AAA servers in a AAA server group. An error is displayed when you submit your changes if different AAA servers in the group use different source interfaces. See <a href="#">Creating AAA Server Group Objects</a> , on page 276.</li> <li>• You cannot specify an interface name for a AAA server used on an IPS device.</li> </ul>

Element	Description
Timeout	<p>The amount of time to wait for a response to a request until the AAA server is considered unresponsive. If there are other servers in the group, the next server is tried.</p> <ul style="list-style-type: none"> <li>• Cisco IOS routers—The range is 1-1000 seconds. The default is 5 seconds.</li> <li>• ASA/PIX 7.x+, FWSM 3.1+ devices—The range is 1-300 seconds. The default is 10 seconds.</li> <li>• PIX 6.3 firewalls—The range is 1-512 seconds. The default is 5 seconds.</li> <li>• IPS devices—The range is 1-512 seconds. The default is 3 seconds.</li> </ul>
Protocol	<p>The protocol used by the AAA server. The fields below the protocol list change depending on your selection.</p> <p>For specific information about the fields, see the topics indicated.</p> <ul style="list-style-type: none"> <li>• The following protocols are the most common: <ul style="list-style-type: none"> <li>• RADIUS—All device types. See <a href="#">AAA Server Dialog Box—RADIUS Settings</a> , on page 263.</li> <li>• TACACS+—All device types except IPS. See <a href="#">AAA Server Dialog Box—TACACS+ Settings</a> , on page 266.</li> </ul> </li> <li>• The following protocols are supported for ASA/PIX 7.x+ and FWSM 3.1+ devices; LDAP is supported on IOS devices that support ScanSafe policies: <ul style="list-style-type: none"> <li>• Kerberos—See <a href="#">AAA Server Dialog Box—Kerberos Settings</a> , on page 267.</li> <li>• LDAP—See <a href="#">AAA Server Dialog Box—LDAP Settings</a> , on page 268.</li> <li>• NT—See <a href="#">AAA Server Dialog Box—NT Settings</a> , on page 271.</li> <li>• SDI—See <a href="#">AAA Server Dialog Box—SDI Settings</a> , on page 272.</li> <li>• HTTP-FORM—See <a href="#">AAA Server Dialog Box—HTTP-FORM Settings</a> , on page 273.</li> </ul> </li> </ul>
Category	<p>The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.</p>

## AAA Server Dialog Box—RADIUS Settings

Use the RADIUS settings in the AAA Server dialog box to configure a RADIUS AAA server object.

### Navigation Path

Go to the [Add or Edit AAA Server Dialog Box](#) , on page 261 and select **RADIUS** in the Protocol field.

### Related Topics

- [AAA Server Group Dialog Box](#) , on page 278

## Field Reference

**Table 47: AAA Server Dialog Box—RADIUS Settings**

Element	Description
Key Confirm	<p>The shared secret that is used to encrypt data between the network device (client) and AAA server. The key is a case-sensitive, alphanumeric string of up to 127 characters. Special characters are permitted.</p> <p>The key you define in this field must match the key on the RADIUS server. Enter the key again in the Confirm field.</p> <p>Note the following:</p> <ul style="list-style-type: none"> <li>• A key is required for AAA server objects used in an IPS AAA policy. Otherwise, the key is optional.</li> <li>• Spaces are not permitted on PIX, ASA, or FWSM devices. Otherwise, they are permitted.</li> <li>• If you do not define a key, all traffic between the AAA server and its AAA clients is sent unencrypted.</li> </ul>
Authentication/Authorization Port	<p>The port on which AAA authentication and authorization are performed. The default is 1645.</p> <p><b>Tip</b> The default port for IPS devices is 1812, so you need to change this value if you are configuring the object for IPS and you want to use the default port.</p>
Accounting Port	<p>The port on which AAA accounting is performed. The default is 1646.</p>

Element	Description
RADIUS Password Confirm (ASA, PIX 7.x+, and FWSM 3.x+ devices only.)	<p>A case-sensitive, alphanumeric keyword of up to 127 characters that is common among users who access this RADIUS authorization server through this device. Enter the password again in the Confirm field.</p> <p>The RADIUS authorization server requires a password and username for each connecting user. The RADIUS server administrator must configure the RADIUS server to associate this password with each user authorizing to the server through this device. Be sure to provide this information to your RADIUS server administrator.</p> <p>If you do not specify a common user password, each user password is the username.</p> <p>Never use a RADIUS authorization server for authentication. Common passwords or usernames as passwords are less secure than assigning unique user passwords.</p> <p><b>Tips</b></p> <ul style="list-style-type: none"> <li>• The password applies to authorization servers only, not to authentication servers. For an authentication RADIUS servers, do not configure a common password.</li> <li>• Although the password is required by the RADIUS protocol and the RADIUS server for authorization, users do not need to know it. The device provides the password automatically.</li> </ul>
Retry Interval (ASA, PIX 7.x+, and FWSM 3.x+ devices only.)	<p>The interval between attempts to contact the AAA server. Values are:</p> <ul style="list-style-type: none"> <li>• ASA/FWSM devices—1 to 10 seconds.</li> <li>• PIX devices—1 to 5 seconds.</li> </ul>

Element	Description
ACL Netmask Convert (ASA, PIX 7.x+, and FWSM 3.x+ devices only.)	<p>The method for handling the netmask expressions that are contained in downloadable ACLs received from the RADIUS server. The ASA/PIX/FWSM expects downloadable ACLs to contain standard netmask expressions whereas devices using Cisco IOS Software expect downloadable ACLs to contain wildcard netmask expressions, which are the reverse of a standard netmask expression. A wildcard mask has ones in bit positions to ignore, zeros in bit positions to match. Translation of wildcard netmask expressions means that downloadable ACLs written for Cisco IOS routers can be used by ASA/PIX/FWSM devices without altering the configuration of the ACLs on the RADIUS server.</p> <p>Select one of the following options:</p> <ul style="list-style-type: none"> <li>• <b>Standard</b>—The security appliance assumes that all downloadable ACLs received from the RADIUS server contain only standard netmask expressions. No translation from wildcard netmask expressions is performed. This is the default.</li> <li>• <b>Auto-Detect</b>—The security appliance tries to determine the type of netmask expression used in the downloadable ACL. If it detects a wildcard netmask expression, it converts it to a standard netmask expression.</li> </ul> <p>This option is useful when you are uncertain how the RADIUS server is configured; however, wildcard netmask expressions with holes in them cannot be unambiguously detected and converted. For example, the wildcard netmask 0.0.255.0 permits anything in the third octet, but the device might not detect this expression as a wildcard netmask.</p> <ul style="list-style-type: none"> <li>• <b>Wildcard</b>—The security appliance assumes that all downloadable ACLs received from the RADIUS server contain only wildcard netmask expressions, which it converts to standard netmask expressions.</li> </ul>

## AAA Server Dialog Box—TACACS+ Settings

Use the TACACS+ settings in the AAA Server dialog box to configure a TACACS+ AAA server object.

### Navigation Path

Go to the [Add or Edit AAA Server Dialog Box](#), on page 261 and select **TACACS+** in the Protocol field.

### Related Topics

*Table 50: AAA Server Dialog Box—LDAP Settings*

Element	Description
Enable LDAP over SSL/Secure Communication	Whether to establish a secure SSL connection between the device and the LDAP server. <b>Tip</b> You must select this option when using a Microsoft Active Directory LDAP server in order to enable password management.
No Negotiation (IOS only.)	When selected, this checkbox precludes further negotiation and moves to accept the channels previously established and accepted.
Server Port	The port used for communicating with the AAA server. The default is 389.

Element	Description
Login Directory	<p>The name of the username or directory object in the LDAP hierarchy used for authenticated binding (maximum of 128 characters). Authenticated binding is required by some LDAP servers (including the Microsoft Active Directory server) before other LDAP operations can be performed. This field describes the authentication characteristics of the device. These characteristics should correspond to those of a user with administrator privileges.</p> <p>This string is case-sensitive. Spaces are not permitted in the string, but other special characters are allowed.</p> <p>Typically, this is a username such as DOMAIN\Administrator. However, you can use the more traditional format too, for example, cn=Administrator,OU=Employees,DC=example,DC=com.</p>
Login Password	<p>The case-sensitive, alphanumeric password for accessing the LDAP server (maximum of 64 characters). Spaces are not allowed.</p>
Encrypted (IOS)	<p>Whether the login password is encrypted.</p>
LDAP Hierarchy Location	<p>The base distinguished name (DN), which is the location in the LDAP hierarchy where the authentication server should be searching when it receives an authorization request. For example, OU=Cisco. The maximum length is 128 characters.</p> <p>The string is case-sensitive. Spaces are not permitted, but other special characters are allowed.</p>
PIX/ASA/FWSM Tab	
LDAP Scope	<p>The extent of the search the server should make in the LDAP hierarchy when it receives an authorization request. The available options are:</p> <ul style="list-style-type: none"> <li>• onelevel—Searches only one level beneath the base DN. This type of search scope is faster than a subtree search, because it is less comprehensive. This is the default.</li> <li>• subtree—Searches all levels beneath the base DN (that is, searches the entire subtree hierarchy). This option takes more time.</li> </ul>
LDAP Distinguished Name	<p>The Relative Distinguished Name attribute (or attributes) that uniquely identifies an entry on the LDAP server. Common naming attributes are Common Name (CN), sAMAccountName, userPrincipalName, and User ID (uid). The case-sensitive, alphanumeric string can be up to 128 characters. Spaces are not permitted in the string, but other special characters are allowed.</p>

Element	Description
SASL MD5 Authentication SASL Kerberos Authentication Kerberos Server Group	<p>These options establish a Simple Authentication and Security Layer (SASL) mechanism to authenticate an LDAP client (the ASA/PIX/FWSM device) with an LDAP server. If you do not select one of these options, the simple mechanism is used, and usernames and passwords are transmitted in clear text.</p> <p>You can define one or both SASL authentication mechanisms. When negotiating SASL authentication, the ASA/PIX/FWSM device retrieves the list of SASL mechanisms configured on the LDAP server and selects the strongest mechanism configured on both devices.</p> <ul style="list-style-type: none"> <li>• SASL MD5 Authentication—Whether to have the device send the LDAP server an MD5 value computed from the username and password. You must configure the LDAP server to store the user passwords in reversible manner, or the LDAP server will not be able to validate the passwords.</li> <li>• SASL Kerberos Authentication—Whether to have the device send the LDAP server the username and realm using the GSSAPI (Generic Security Services Application Programming Interface) Kerberos mechanism. This mechanism is stronger than the MD5 mechanism.</li> </ul> <p>If you select Kerberos, you must also enter the name of the Kerberos AAA server group used for SASL authentication. The maximum length is 16 characters.</p>
LDAP Server Type	<p>The type of LDAP server used for AAA:</p> <ul style="list-style-type: none"> <li>• Auto-Detect—The ASA/PIX/FWSM device tries to determine the server type automatically. This is the default.</li> <li>• Microsoft—The LDAP server is a Microsoft Active Directory server.</li> </ul> <p><b>Note</b> You must configure LDAP over SSL to enable password management with Microsoft Active Directory.</p> <ul style="list-style-type: none"> <li>• Sun—The LDAP server is a Sun Microsystems JAVA System Directory Server.</li> <li>• OpenLDAP—The server is an Open LDAP server. You can use this only with ASA/PIX 8.0+ devices.</li> <li>• Novell—The server is a Novell LDAP server. You can use this only with ASA/PIX 8.0+ devices.</li> </ul>
LDAP Attribute Map	<p>The LDAP attribute configuration to bind to the LDAP server. Enter the name of an LDAP attribute map policy object or click <b>Select</b> to select it from a list or to create a new object.</p> <p>LDAP attribute maps take the attribute names that you define and map them to Cisco-defined attributes. For more information, see <a href="#">Add and Edit LDAP Attribute Map Dialog Boxes</a> , on page 274.</p>

Element	Description
Group Base DN	<p>(Microsoft LDAP AD servers only.) The base designated name (DN) under which all user groups are defined. When the ASA contacts the AD server for user group membership, the search starts at this DN. All groups must reside under this DN in the LDAP directory hierarchy and no group can reside outside of this path, or the group will not be found. Specifying this location can decrease the time required to complete user group searches.</p> <p>The alphanumeric string is case-sensitive and can be up to 128 characters. Spaces are not permitted in the string, but other special characters are allowed.</p> <p>For example: DN=cisco, DN=com</p> <p><b>Tip</b> If you do not specify the group base DN, the LDAP Distinguished Name setting is used as the starting point for group searches.</p>
Group Search Timeout	(Microsoft LDAP AD servers only.) The maximum time to wait for a response from an Active Directory server queried for user group information, in seconds. The default is 10 seconds, the range is 1 to 300 seconds.
IOS Tab	
Secure Cipher	The encryption method to be used.
Attribute Map (IOS)	The name of the IOS attribute map the server employs.
Secure Trust Point	The name of a trust point for certificates.
Authentication bind-first	You can configure the sequence of search and bind of an authentication request with this option. The default is search first and then bind.
No Authorization Required	No authorization required for authentication requests.
Authentication Compare	Select this checkbox to replace the bind request with compare request for authentication. By default authentication request is performed with bind request.
User Object Filter	Specify the search filter user attribute type to be used in a search request. This helps in filtering out the requested user being searched.

## AAA Server Dialog Box—NT Settings

Use the NT settings in the AAA Server dialog box to configure an NT AAA server object.

**Note** This type of AAA server can be configured only on ASA, PIX 7.x+, and FWSM 3.1+ devices.

### Navigation Path

Go to the [Add or Edit AAA Server Dialog Box](#), on page 261 and select **NT** in the Protocol field.

Element	Description
Server Port	The port used for communicating with the AAA server. The default is 5500.
Retry Interval	The interval between attempts to contact the AAA server. Values range from 1 to 10 seconds. The default is 10 seconds.

Element	Description
SDI Server Version	The SDI server version: <ul style="list-style-type: none"> <li>• SDI-pre-5—All SDI versions before version 5.0</li> <li>• SDI-5—SDI version 5.0 or later.</li> </ul>
SDI pre-5 Secondary Server	(Optional) A secondary server to be used for authentication if the primary server fails when using an SDI version prior to 5.0. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select an object or create a new one.

## AAA Server Dialog Box—HTTP-FORM Settings

Use the HTTP-FORM settings in the AAA Server dialog box to configure an HTTP-Form AAA server object for single sign-on authentication (SSO).

**Note** This type of AAA server can be configured only on ASA, PIX 7.x+, and FWSM 3.1+ devices.

### Navigation Path

Go to the [Add or Edit AAA Server Dialog Box](#), on page 261 and select **HTTP-FORM** in the Protocol field.

### Related Topics

### Field Reference

*Table 53: AAA Server Dialog Box—HTTP-Form Settings*

Element	Description
Start URL	<p>The URL from which the WebVPN server of the security appliance should retrieve an optional pre-login cookie. The maximum URL length is 1024 characters.</p> <p>The authenticating web server might execute a pre-login sequence by sending a Set-Cookie header along with the login page content. The URL in this field defines the location from which the cookie is retrieved.</p> <p><b>Note</b> The actual login sequence starts after the pre-login cookie sequence.</p>

Element	Description
Action URI	<p>The Uniform Resource Identifier (URI) that defines the location and name of the authentication program on the web server to which the security appliance sends HTTP POST requests for single sign-on (SSO) authentication.</p> <p>The maximum length of the action URI is 2048 characters.</p> <p><b>Tip</b> You can discover the action URI on the authenticating web server by connecting to the web server's login page directly with a browser. The URL of the login web page displayed in your browser is the action URI for the authenticating web server.</p>
Username Parameter	<p>The name of the username parameter included in HTTP POST requests for SSO authentication. The maximum length is 128 characters.</p> <p>At login, the user enters the actual name value, which is entered into the HTTP POST request and passed on to the authenticating web server.</p>
Password Parameter	<p>The name of the password parameter included in HTTP POST requests for SSO authentication. The maximum length is 128 characters.</p> <p>At login, the user enters the actual password value, which is entered into the HTTP POST request and passed on to the authenticating web server.</p>
Hidden Values	<p>The hidden parameters included in HTTP POST requests for SSO authentication. They are referred to as hidden parameters because, unlike the username and password, they are not visible to the user.</p> <p>The maximum length of the hidden parameters is 2048 characters.</p> <p><b>Tip</b> You can discover the hidden parameters that the authenticating web server expects in POST requests by using an HTTP header analyzer on a form received from the web server.</p>
Authentication Cookie Name	<p>The name of the authentication cookie used for SSO by the security appliance. The maximum length is 128 characters.</p> <p>If SSO authentication succeeds, the authenticating web server passes this authentication cookie to the client browser. The client browser then authenticates to other web servers in the SSO domain by presenting this cookie.</p>

## Add and Edit LDAP Attribute Map Dialog Boxes

Use the Add and Edit LDAP (Lightweight Directory Access Protocol) Attribute Map dialog boxes to populate the attribute map with name mappings that translate Cisco LDAP attribute names to custom, user-defined attribute names.

If you are introducing a security appliance to an existing LDAP directory, your existing custom LDAP attribute names and values are probably different from the Cisco attribute names and values. Rather than renaming your existing attributes, you can create LDAP attribute maps that map your custom attribute names and values to Cisco attribute names and values. By using simple string substitution, the security appliance then presents you with only your own custom names and values. You can then bind these attribute maps to LDAP servers or remove them as needed. You can also delete entire attribute maps or remove individual name and value entries.

For more information regarding LDAP support on ASA, PIX, and FWSM devices, see [Additional AAA Support on ASA, PIX, and FWSM Devices](#), on page 256.

### Navigation Path

Select **Manage > Policy Objects**, then select **LDAP Attribute Map** from the Object Type selector. Right-click inside the table and select **New Object**, or right-click a row and select **Edit Object**.

### Related Topics

- [Creating AAA Server Objects](#), on page 260

### Field Reference

*Table 54: Add and Edit LDAP Attribute Map Dialog Boxes*

Element	Description
Name	The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects</a> , on page 235.
Description	An optional description of the object.
Attribute Map table	The table shows the mapped values. Each entry shows the customer map name, Cisco map name, and the attribute mapping of customer name to Cisco name. <ul style="list-style-type: none"> <li>• To add a mapping, click the <b>Add Row</b> button to open the <a href="#">Add and Edit LDAP Attribute Map Value Dialog Boxes</a>, on page 275.</li> <li>• To edit a mapping, select it and click the <b>Edit Row</b> button.</li> <li>• To delete a mapping, select it and click the <b>Delete Row</b> button.</li> </ul>
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244. If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.

## Add and Edit LDAP Attribute Map Value Dialog Boxes

Use the Add and Edit LDAP Attribute Map Value dialog boxes to populate the attribute map with value mappings that apply user-defined attribute values to the custom attribute name and to the matching Cisco attribute name and value.

### Navigation Path

From the [Add and Edit LDAP Attribute Map Dialog Boxes](#), on page 274, click the **Add Row** button to add a new mapping, or select a row and click the **Edit Row** button.

### Field Reference

*Table 55: Add and Edit LDAP Attribute Map Value Dialog Boxes*

Element	Description
Customer Map Name	The name of your attribute map that relates to the Cisco map.
Cisco Map Name	The Cisco attribute map name you want to map to the customer map name.
Customer to Cisco Map Value table	<p>The mappings of customer names to Cisco names.</p> <ul style="list-style-type: none"> <li>To add a mapping, click the <b>Add Row</b> button to open the <a href="#">Add and Edit Map Value Dialog Boxes</a>, on page 276.</li> <li>To edit a mapping, select it and click the <b>Edit Row</b> button.</li> <li>To delete a mapping, select it and click the <b>Delete Row</b> button.</li> </ul>

## Add and Edit Map Value Dialog Boxes

Use the Add and Edit Map Value dialog boxes to map a customer LDAP attribute value to a Cisco map value. Enter the value from your LDAP map that you want to equate with a Cisco value.

### Navigation Path

From the [Add and Edit LDAP Attribute Map Value Dialog Boxes](#), on page 275, click the **Add Row** button to add a new mapping, or select a row and click the **Edit Row** button.

## Creating AAA Server Group Objects

You can create AAA server group objects for Security Manager policies requiring AAA services, such as authentication and authorization. Each AAA server group object can contain multiple AAA servers, all of which use the same protocol, such as RADIUS or TACACS+. For example, if you want to use RADIUS to authenticate network access and TACACS+ to authenticate CLI access, you must create at least two AAA server group objects, one for RADIUS servers and one for TACACS+ servers.

In addition, only one source interface can be defined for the AAA servers in the group. An error is displayed when you submit your changes if different AAA servers in the group use different source interfaces.

**Note** The error is triggered by the actual interface defined as the source, not the name of the interface role that represents the interface. That is, two AAA servers can have different interface roles defined as the source interface as long as they both resolve to the same device interface. An error is also displayed if the interface role defined for the source interface matches more than one actual interface on the device.

The number of AAA server group objects that can be created and the number of AAA server objects that can be included in each group object depend on the selected platform. For example, ASA devices support up to 18 single-mode server groups (with up to 16 servers each) and 7 multi-mode server groups (with up to 4 servers each). PIX firewalls support up to 14 server groups, each containing up to 14 servers.

---

**Note** Security Manager includes a predefined AAA server group object that you can use when you perform authentication locally inside the Cisco IOS router.

---

---

**Tip** You can also create AAA server group objects when you define policies or objects that use this object type. For more information, see [Selecting Objects for Policies](#) , on page 228.

---

#### Related Topics

- [Creating Policy Objects](#) , on page 235

- [Default AAA Server Groups and IOS Devices](#) , on page 259
- [Understanding AAA Server and Server Group Objects](#) , on page 254

- 
- Step 1** Select **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager](#) , on page 230).
- Step 2** Select **AAA Server Groups** from the Object Type selector.
- Step 3** Right-click inside the work area, then select **New Object** to open the [AAA Server Group Dialog Box](#) , on page 278.
- Step 4** Enter a name for the object. The maximum name length is 16 characters if you plan to use this object with ASA, PIX, or FWSM devices and 128 characters for Cisco IOS routers. Spaces are not supported.
- Note** Cisco IOS routers do not support the following AAA server group names: RADIUS, TACACS, TACACS+. In addition, we do not recommend using an abbreviation of one of these names, such as rad or tac.
- Step 5** Select the protocol to be used by the servers in the group.
- Step 6** Enter the names of the AAA server policy objects that define the AAA servers to include in the group. Click **Select** to select the objects from a list filtered by the protocol you selected. You can also create new AAA server objects from the selection list. Separate multiple objects with commas.
- Step 7** Configure the additional options that you want:
- Make this Group the Default AAA Server Group—For IOS devices only, whether you are using this group as the default group. Use this option if you intend to have a single global server group for this protocol for all policies requiring AAA. For more information, see [Default AAA Server Groups and IOS Devices](#) , on page 259.
  - ASA 8.4(2+) devices—If you are creating a RADIUS group containing Active Directory agent servers, select **AD Agent Mode**. This option indicates that the servers in the group are not full-function RADIUS servers but instead provide AD agent functions for identity-aware firewall. Use this group in the Identity Options policy.
  - ASA, PIX, FWSM devices—Select options for how to handle AAA servers that stop responding, and for how to send accounting messages. For more information, see [AAA Server Group Dialog Box](#) , on page 278.

- Step 8** (Optional) Under Category, select a category to help you identify this object in the Objects table. See [Using Category Objects](#) , on page 239.
- Step 9** (Optional) Select **Allow Value Override per Device** to allow the properties of this object to be redefined on individual devices. See [Allowing a Policy Object to Be Overridden](#) , on page 245.
- Step 10** Click **OK** to save the object.

## AAA Server Group Dialog Box

Use the AAA Server Group dialog box to create, copy, and edit AAA server groups. When defining a policy that uses a AAA server for authentication, authorization, or accounting, you select the server by selecting the server group to which the server belongs.

### Navigation Path

Select **Manage > Policy Objects**, then select **AAA Server Groups** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

### Related Topics

- [Policy Object Manager](#) , on page 230

### Field Reference

*Table 56: AAA Server Group Dialog Box*

Element	Description
Name	<p>The object name (up to 16 characters when using this object with firewall devices; up to 128 characters for Cisco IOS routers). Object names are not case-sensitive. Spaces are not supported.</p> <p>Consider the following important points:</p> <ul style="list-style-type: none"> <li>• Cisco IOS routers do not support AAA server groups named RADIUS, TACACS, or TACACS+. In addition, we do not recommend using an abbreviation of one of these names, such as rad or tac.</li> <li>• If you define this AAA server group as the RADIUS or TACACS+ default group, any name you define here is automatically replaced in the device configuration by the default name (RADIUS or TACACS+) upon deployment.</li> </ul>
Description	An optional description of the object.

Element	Description
Protocol	The protocol used by the AAA servers in the group. For more information about these options, see <a href="#">Supported AAA Server Types</a> , on page 255 and <a href="#">Additional AAA Support on ASA, PIX, and FWSM Devices</a> , on page 256.
AAA Servers	The AAA server policy objects that comprise the server group. Enter the names of the objects or click <b>Select</b> to select them from a list that is filtered to show only those AAA server objects that use the selected protocol. Separate multiple objects with commas. You can also create new objects from the selection list.
Make this Group the Default AAA Server Group (IOS) (IOS devices only.)	<p>Whether to designate this AAA server group as the default group for the RADIUS or TACACS+ protocol. Select this option if you intend to use a single global group for the selected protocol for all policies on a specific device requiring AAA.</p> <p>Do not select this option if you intend to create multiple RADIUS or TACACS+ AAA server groups. Multiple groups can be used to separate different AAA functions (for example, use one group for authentication and a different group for authorization) or to separate different customers in a VRF environment.</p> <p><b>Note</b> When you discover an IOS router, any AAA servers in the device configuration that are not members of a AAA server group are placed in special groups called CSM-rad-grp (for RADIUS) and CSM-tac-grp (for TACACS+), both of which are marked as default groups. These two groups are created solely to enable Security Manager to manage these servers. During deployment, the AAA servers in these special groups are deployed back to the device as individual servers. For more information, see <a href="#">Default AAA Server Groups and IOS Devices</a> , on page 259.</p>
AD Agent Mode (ASA 8.4(2+) devices only.)	<p>Whether the servers in the group are Active Directory agents, which are used in identity-aware firewall configurations. You must select this option for an AD agent group to indicate that the group is not a full-function RADIUS server group.</p> <p>Use the AD agent group in the Identity Options policy. For more information, see <a href="#">Identifying Active Directory Servers and Agents</a> , on page 643.</p>
Dynamic Authorization (ASA 9.2(1+) devices only.)	<p>When using the RADIUS protocol, select the Dynamic Authorization check box to enable the RADIUS Dynamic Authorization Change of Authorization (CoA) services for the AAA server group.</p> <p>Specify the listening port for RADIUS CoA requests in the Port field. The valid range is 1024 to 65535 and the default value is 1700.</p> <p>Once defined, the corresponding RADIUS server group will be registered for CoA notification and the ASA will listen to the port for the CoA policy updates from the Cisco Identity Services Engine (ISE).</p>

Element	Description
Interim Account Update (ASA 9.2(1+) devices only.)	<p>When using the RADIUS protocol, select the Interim Account Update check box to enable the generation of RADIUS interim-accounting-update messages. Currently these messages are only generated when a VPN tunnel connection is added to a clientless VPN session. When this happens the accounting update is generated in order to inform the RADIUS server of the newly assigned IP address.</p> <p>Specify the length, in hours, of the interval between periodic accounting updates in the Interval field. The valid range is 1 to 120 and the default value is 24.</p>
Authorize only (ASA 9.2(1+) devices only.)	<p>When using the RADIUS protocol, select the Authorize only check box to enables authorize-only mode for the RADIUS server group. When this check box is selected, the common password configured for individual AAA servers is not required and does not need to be configured.</p>
Max Failed Attempts (PIX, ASA, FWSM devices only.)	<p>The number of connection failures that will be tolerated for any given server in the server group before that server is deactivated. The default is 3 attempts, the range is 1 to 5.</p>
Internal Realm ID (ASA 9.8(1) and above devices only)	<p>Enter a realm ID that corresponds to the RADIUS or LDAP protocol for the AAA server group policy object.</p> <p><b>Note</b> The realm ID is a unique value in the range of 1-65535; it is only applicable for RADIUS and LDAP protocols.</p>
Reactivation Mode (PIX, ASA, FWSM devices only.)	<p>The method to use when reactivating failed servers in the group:</p> <ul style="list-style-type: none"> <li>• Depletion—Reactivate failed servers only after all of the servers in the group are inactive. This is the default.</li> </ul> <p>When a server is deactivated, it remains inactive until all other servers in the group are inactive. When and if this occurs, all servers in the group are reactivated. This approach minimizes the occurrence of connection delays due to failed servers.</p> <p>If you configured a fallback method using the local database (for management access only) and all the servers in the group fail to respond, then the group is considered to be unresponsive, and the fallback method is tried. You can configure the Reactivation Deadtime value to determine the number of minutes that will elapse between the disabling of the last server in the group and the subsequent re-enabling of all servers.</p> <p>If you do not have a fallback method, the device continues to retry the servers in the group.</p> <ul style="list-style-type: none"> <li>• Timed—Reactivate failed servers after 30 seconds of downtime. This option is useful if the first server in the group is the primary server and you prefer that it be used whenever possible rather than the backup servers. This policy breaks down in the case of UDP servers. Because a connection to a UDP server will not fail, even if the server is not present, UDP servers are put back on line blindly. This could lead to slowed connection times or connection failures if a server group contains multiple servers that are not reachable.</li> </ul>

Element	Description
Reactivation Deadtime (PIX, ASA, FWSM devices only.)	When you select <b>Depletion</b> as the reactivation mode, the number of minutes that should elapse between the deactivation of the last server in the group and the reactivation of all the servers in the group. The default is 10, the range is 0 to 1440 minutes (24 hours).
Group Accounting Mode (PIX, ASA, FWSM devices only.)	When using the RADIUS or TACACS+ protocols, the method for sending accounting messages to the AAA servers in the group:  When using the server group for accounting (the protocol must be RADIUS or TACACS+), the method for sending accounting messages to the AAA servers in the group: <ul style="list-style-type: none"> <li>• Single—Accounting messages are sent to a single server in the group. This is the default.</li> <li>• Simultaneous—Accounting messages are sent to all servers in the group simultaneously. If you select this option, the ASA forces the use of <b>Timed</b> as the reactivation mode.</li> </ul>
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.  If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.

## Creating Access Control List Objects

An Access Control List (ACL) object is made up of one or more access control entries (ACEs), one or more ACL objects, or a combination of both. Each ACE is an individual permit or deny statement within an ACL. You can use ACL policy objects in several other policies and policy objects.

Beginning with Cisco Security Manager version 4.13, if an object group contains VM attribute and if it is applied to any other policies (except Access Rules), the deployment will fail. The VM Attribute Object is only applicable to the devices, which are ASA 9.7.1 or later, and when object-group-search access-control is enabled.

You can create the following types of ACL objects:

- **Extended** – Extended ACLs enable you to specify source and destination addresses and service (or traffic protocol), and, based on the protocol type, the ports (for TCP or UDP), or the ICMP type (for ICMP) can be specified. For information on extended ACL objects, see [Creating Extended Access Control List Objects](#) , on page 282.
- **Standard** – Standard ACLs use the source address for matching traffic. For information on standard ACL objects, see [Creating Standard Access Control List Objects](#) , on page 284.

- Web – Web ACLs use destination address and port or a URL filter. For information on Web Type ACL objects, [Creating Web Access Control List Objects](#), on page 285.
- Unified – Unified ACL objects let you use source networks/hosts, source security groups, users, destination source networks/hosts, destination security groups, and services to match traffic. Further, the network/host specifications can contain IPv4 addresses, IPv6 addresses, or a combination of both. (With the release of Security Manager 4.4 and the ASA 9.0+, the separate IPv4 and IPv6 addressing/objects were “unified.”) See [Creating Unified Access Control List Objects](#), on page 287 for more information these ACLs.
- Ethertype – EtherType ACLs apply to non-IP layer-2 traffic on bridge group member interfaces only, in routed and transparent modes. You can use these rules to permit or drop traffic based on the EtherType value in the layer-2 packet. With EtherType ACLs, you can control the flow of non-IP traffic across the device. See [Configuring Transparent Firewall Rules](#), on page 1007.

For reference information about the dialog boxes used with these objects, see [Add or Edit Access List Dialog Boxes](#), on page 288.

**Note** CSM has design-level constraints to the ACL objects on reference positions. Thus, the **Referenced** button in the **Policy Object Manager** table is disabled.

## Creating Extended Access Control List Objects

Extended access control lists allow you to permit or deny traffic from specific IP addresses to specific destination IP address and port, and specify the protocol of the traffic, such as ICMP, TCP, UDP, and so forth. Extended ACLs range from 100 to 199, and for devices running Cisco IOS Software Release 12.0.1 and later, 2000 to 2699.

Extended ACL example:

```
access-list 110 - Applied to traffic leaving the office (outgoing)
access-list 110 permit tcp 10.128.2.0 0.0.0.255 any eq 80
```

ACL 110 permits traffic originating from any address on the 10.128.2.0 network. The “All-IPv4-Addresses” statement means that the traffic is allowed to have any destination address with the limitation of going to port 80. The value of 0.0.0.0/255.255.255.255 can be specified as “All-IPv4-Addresses.”

Uses:

- Identifying addresses for NAT (policy NAT and NAT exemption)—Policy NAT lets you identify local traffic for address translation by specifying the source and destination addresses and ports in an extended access list. Regular NAT can only consider local addresses. An access list that is used with policy NAT cannot be configured to deny an access control entry (ACE).
- Identifying addresses for IOS dynamic NAT—For user-defined ACLs, the NAT plug-in generates its own ACL CLIs when deducing NAT traffic from VPN traffic.
- Filtering traffic that will be intercepted by Network Admission Control (NAC).
- Identifying traffic in a traffic class-map for modular policy—Access lists can be used to identify traffic in a class-map, which is used for features that support Modular Policy Framework such as TCP and general connection settings, inspection, IPS, and QoS. You can use one or more access lists to identify specific types of traffic.

- For transparent mode, enabling protocols that are blocked by a routed mode security appliance, including BGP, DHCP, and multicast streams. Because these protocols do not have sessions on the security appliance to allow return traffic, these protocols also require access lists on both interfaces.
- Establishing VPN access—You can use an extended access list in VPN commands to identify the traffic that should be tunneled on the device for an IPsec site-to-site tunnel or to identify the traffic that should be tunneled on the device for a VPN client. Use in conjunction with the policy objects and settings shown in the below table:

**Table 57: Policy Objects and Settings**

Policy Object	Device	Purpose
VPN Topology	Any	Selecting Protected Networks.
ASA User Group	ASA	Inbound Firewall Policy; Outbound Firewall Policy; Filter ACL.
Traffic Flow	ASA, PIX 7+	Service Policy Rules (MPC). The traffic flow BB (class-map) uses Extended ACL as one of its traffic match types.
User Group	<ul style="list-style-type: none"> <li>• IOS</li> <li>• Catalyst 6500/7600</li> <li>• PIX 6.3</li> </ul>	For Easy VPN, Split Tunnel ACL and Firewall ACL (IOS devices only).

**Related Topics**

- [Creating Access Control List Objects](#) , on page 281
- [Understanding Access Rule Address Requirements and How Rules Are Deployed](#) , on page 719
- [Creating Policy Objects](#) , on page 235
- [Understanding Networks/Hosts Objects](#) , on page 308
- [Understanding and Specifying Services and Service and Port List Objects](#) , on page 329

**Step 1** Choose **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager](#) , on page 230).

**Step 2** From the Object Type selector, select **Access Control Lists**.

The Access Control List page appears. The Extended tab is displayed by default.

**Step 3** Right-click inside the work area, then select **New Object**.

The Add Extended Access List dialog box appears (see [Add or Edit Access List Dialog Boxes](#) , on page 288).

**Step 4** Enter a name for the object and optionally a description of the object.

**Note** Make sure that the name of the ACL Object is unique and is not the same name as the Firewall Rules ACL defined in the Firewall ACL Setting. For more information, see [Firewall ACL Setting Dialog Box](#) , on page 740.

**Step 5** Right-click inside the table in the dialog box, then select **Add**.

The Add Extended Access Control Entry dialog box appears.

**Step 6** Create the access control entry:

- If you choose **Access Control Entry** for Type, specify the characteristics of the traffic that you want to match and whether you are permitting or denying the traffic. Enter the source addresses whence the traffic originates, the destination addresses whither the traffic travels, and the services that define the characteristics of the traffic. Click **Advanced** to define logging options. For detailed information about the fields on the dialog box, see [Add and Edit Extended Access Control Entry Dialog Boxes](#) , on page 289.
- If you choose **ACL Object**, select the object in the available objects list and click >> to add it to the list of selected objects.

**Step 7** Click **OK** to save your changes.

The dialog box closes and you return to the Add Extended Access List page. The new entry is shown in the table. If necessary, select it and click the up or down buttons to position it at the desired location.

**Step 8** (Optional) Under Category, select a category to help you identify this object in the Objects table. See [Using Category Objects](#) , on page 239.

**Step 9** Click **OK** to save the object.

## Creating Standard Access Control List Objects

A standard access control list allows you to permit or deny traffic from specific IP addresses. The destination of the packet and the ports involved can be anything. Standard IP ACLs range from 1 to 99.

Standard ACL example:

```
access-list 10 permit 192.168.2.0 0.0.0.255
```

Uses:

- Identifying OSPF route redistribution.
- Filtering users of a community string using SNMP.
- Configuring VLAN ACLs for a Catalyst 6500/7600 device.

### Related Topics

- [Creating Access Control List Objects](#) , on page 281
- [Understanding Access Rule Address Requirements and How Rules Are Deployed](#) , on page 719
- [Creating Policy Objects](#) , on page 235
- [Understanding Networks/Hosts Objects](#) , on page 308

**Step 1** Choose **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager](#) , on page 230).

**Step 2** From the Object Type selector, select **Access Control Lists**.

The Access Control List page appears.

**Step 3** Click the **Standard** tab.

**Step 4** Right-click inside the work area, then select **New Object**.

The Add Standard Access List dialog box appears (see [Add or Edit Access List Dialog Boxes](#) , on page 288).

**Step 5** Enter a name for the object and optionally a description of the object.

**Note** Make sure that the name of the ACL Object is unique and is not the same name as the Firewall Rules ACL defined in the Firewall ACL Setting. For more information, see [Firewall ACL Setting Dialog Box](#) , on page 740.

**Step 6** Right-click inside the table, then select **Add**.

The Add Standard Access Control Entry dialog box appears.

**Step 7** Create the access control entry:

- If you choose **Access Control Entry** for Type, specify the characteristics of the traffic that you want to match and whether you are permitting or denying the traffic. Enter the source addresses whence the traffic originates and select logging options. For detailed information about the fields on the dialog box, see [Add and Edit Standard Access Control Entry Dialog Boxes](#) , on page 292.
- If you choose **ACL Object**, select the object in the available objects list and click >> to add it to the list of selected objects.

**Step 8** Click **OK** to save your changes.

The dialog box closes and you return to the Add Standard Access List dialog box. The new entry is shown in the table. If necessary, select it and click the up or down buttons to position it at the desired location.

**Step 9** (Optional) Under Category, select a category to help you identify this object in the Objects table. See [Using Category Objects](#) , on page 239.

**Step 10** Click **OK** to save the object.

## Creating Web Access Control List Objects

Web ACLs, also referred to as WebVPN, let you establish a secure, remote-access VPN tunnel to the security appliance using a web browser. There is no need for either a software or hardware client. WebVPN provides easy access to a broad range of web resources and both web-enabled and legacy applications from almost any computer that can reach HTTPS Internet sites. WebVPN uses Secure Socket Layer Protocol and its successor, Transport Layer Security (SSL/TLS) to provide a secure connection between remote users and specific, supported internal resources that you configure at a central site.

The following table presents examples of Web VPN ACLs.

**Table 58: Examples of Web VPN ACLs**

Action	Filter	Effect
Deny	url http://*.yahoo.com/	Denies access to all of Yahoo!
Deny	url cifs://fileserver/share/directory	Denies access to all files in the specified location.

Action	Filter	Effect
Deny	url https://www.company.com/directory/file.html	Denies access to the specified file.
Permit	url https://www.company.com/directory	Permits access to the specified location
Deny	url http://*:8080/	Denies HTTPS access to anywhere via port 8080.
Deny	url http://10.10.10.10	Denies HTTP access to 10.10.10.10.
Permit	url any	Permits access to any URL. Usually used after an ACL that denies url access.

Uses:

- As a filter ACL in an ASA User Group policy object (under SSL VPN > Clientless).

### Related Topics

- [Creating Access Control List Objects](#) , on page 281
- [Understanding Access Rule Address Requirements and How Rules Are Deployed](#) , on page 719
- [Creating Policy Objects](#) , on page 235

**Step 1** Choose **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager](#) , on page 230).

**Step 2** From the Object Type selector, select **Access Control Lists**.

The Access Control List page appears.

**Step 3** Click the **Web** tab.

**Step 4** Right-click inside the work area and select **New Object**.

The Add WebType Access List dialog box appears (see [Add or Edit Access List Dialog Boxes](#) , on page 288).

**Step 5** Enter a name for the object and optionally a description of the object.

**Note** Make sure that the name of the ACL Object is unique and is not the same name as the Firewall Rules ACL defined in the Firewall ACL Setting. For more information, see [Firewall ACL Setting Dialog Box](#) , on page 740.

**Step 6** Right-click inside the access control entry table and choose **Add**.

The Add Web Access Control Entry dialog box appears.

**Step 7** Create the access control entry:

- If you choose **Access Control Entry** for Type, specify the characteristics of the traffic that you want to match and whether you are permitting or denying the traffic. You can filter based on the network destination of the traffic (Network Filter) or the web address (URL Filter). For detailed information about the fields on the dialog box, see [Add and Edit Web Access Control Entry Dialog Boxes](#) , on page 294.
- If you choose **ACL Object**, select the object in the available objects list and click >> to add it to the list of selected objects.

**Step 8** Click **OK** to save your changes.

The dialog box closes and you return to the Add WebType Access List page. The new entry is shown in the table. If necessary, select it and click the up or down buttons to position it at the desired location.

**Step 9** (Optional) Under Category, select a category to help you identify this object in the Objects table. See [Using Category Objects](#) , on page 239.

**Step 10** Click **OK** to save the object.

---

## Creating Unified Access Control List Objects

A unified access control list allows you to permit or deny traffic from specific networks, hosts, security groups, and users, destined for specific networks, hosts and security groups. You also specify the service(s) involved.

### Related Topics

- [Creating Access Control List Objects](#) , on page 281
  - [Understanding Access Rule Address Requirements and How Rules Are Deployed](#) , on page 719
  - [Creating Policy Objects](#) , on page 235
  - [Understanding Networks/Hosts Objects](#) , on page 308
- 

**Step 1** Choose **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager](#) , on page 230).

**Step 2** From the Object Type selector, select **Access Control Lists**.

The Access Control List page appears.

**Step 3** Click the **Unified** tab.

**Step 4** Right-click inside the work area, then select **New Object**.

The Add Unified Access List dialog box appears (see [Add or Edit Access List Dialog Boxes](#) , on page 288).

**Step 5** Enter a name for the object and optionally a description of the object.

**Note** Make sure that the name of the ACL Object is unique and is not the same name as the Firewall Rules ACL defined in the Firewall ACL Setting. For more information, see [Firewall ACL Setting Dialog Box](#) , on page 740.

**Step 6** Right-click inside the table in the dialog box, then choose **Add**.

The Add Unified Access Control Entry dialog box appears.

**Step 7** Create the access control entry:

- If you choose **Access Control Entry** for Type, specify the characteristics of the traffic that you want to match and whether you are permitting or denying the traffic. Enter the source addresses whence the traffic originates and select logging options. For detailed information about the fields on the dialog box, see [Add and Edit Unified Access Control Entry Dialog Boxes](#) , on page 296.
- If you choose **ACL Object**, select the object in the available objects list and click >> to add it to the list of selected objects.

**Step 8** Click **OK** to save your changes.

The dialog box closes and you return to the Add Unified Access List dialog box. The new entry is shown in the table. If necessary, select it and click the up or down buttons to position it at the desired location.

**Step 9** (Optional) Under Category, select a category to help you identify this object in the Objects table. See [Using Category Objects](#), on page 239.

**Step 10** Click **OK** to save the object.

## Add or Edit Access List Dialog Boxes

Use the Add and Edit Access List dialog boxes to define access control entries (ACEs) for an ACL object. From this page, you can change the order of the ACEs and ACL objects within the table, add or edit ACEs and ACL objects, and delete ACEs and ACL objects.

The title of the dialog box indicates the type of ACL you are creating: Extended, Standard, or Web Type. The dialog boxes are essentially the same, the difference being the columns displayed in the ACE table.

### Navigation Path

Select **Manage > Policy Objects**, then select **Access Control Lists** from the Object Type selector. Select the tab for the type of ACL object you want to create, and then right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

### Field Reference

*Table 59: Add and Edit Access List Dialog Boxes*

Element	Description
Name	The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects</a> , on page 235.
Description	An optional description of the object.

Element	Description
Access Control Entry table	<p>The access control entries (ACEs) and ACL objects that are part of the ACL. The table displays the name of the entry or object, description, options, services, and other attributes of the entry.</p> <p>In the Permit column, a green checkmark indicates that the entry permits traffic (typically, the traffic is considered a match for the service you are defining), whereas a red circle with a slash indicates that traffic is denied (typically, the traffic is considered to not match, and the service you are defining is not applied to the denied traffic).</p> <p>The source and, if applicable, destination addresses can be host IP addresses, network addresses, or network/host policy objects.</p> <ul style="list-style-type: none"> <li>• To add an ACE, click the Add button and fill in the dialog box for the type of ACL you are creating: <ul style="list-style-type: none"> <li>• <a href="#">Add and Edit Extended Access Control Entry Dialog Boxes</a> , on page 289</li> <li>• <a href="#">Add and Edit Standard Access Control Entry Dialog Boxes</a> , on page 292</li> <li>• <a href="#">Add and Edit Web Access Control Entry Dialog Boxes</a> , on page 294</li> </ul> </li> <li>• To edit an ACE, select it and click the Edit button.</li> <li>• To delete an ACE, select it and click the Delete button.</li> <li>• To change the position of an entry, select it and click the Up/Down arrow buttons as required. Entries are evaluated top to bottom, so correct positioning is crucial for you to get the results you intend.</li> </ul>
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.
Allow Value Override per Device Overrides Edit button	<p>Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.</p> <p>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p>

## Add and Edit Extended Access Control Entry Dialog Boxes

Use the Add or Edit Extended Access Control Entry dialog box to add an access control entry (ACE) or an ACL object to an Extended ACL object.

### Navigation Path

From the [Add or Edit Access List Dialog Boxes](#) , on page 288 for Extended ACL objects, click the **Add** button in the ACE table, or select a row and click the **Edit** button.

## Field Reference

**Table 60: Add and Edit Extended Access Control Entry Dialog Boxes**

Element	Description
Type	<p>The type of entry you are adding. The fields on the dialog box change based on your selection.</p> <ul style="list-style-type: none"> <li>• Access Control Entry—You want to define an ACE.</li> <li>• ACL Objects—You want to include an existing ACL object. You are presented with a list of available ACL objects. Select the objects you want to include and click the &gt;&gt; button to move them to the list of selected objects. You can remove an object by selecting it and clicking &lt;&lt;. You can also edit objects in the selected objects list.</li> </ul>
Action	<p>The action to take on traffic defined in the entry:</p> <ul style="list-style-type: none"> <li>• Permit—The service associated with this ACL is applied to this traffic. That is, the traffic is permitted to use the service.</li> <li>• Deny—The service associated with this ACL is not applied to this traffic. If there are multiple ACLs configured for a service, denied traffic is typically compared to the next ACL in the list; if it matches no permit entry in any ACL for the service, the service is not applied to the traffic. Whether the traffic is dropped from the network depends on the service.</li> </ul>
Category	<p>The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.</p>

Element	Description
Source Destination	<p>The source or destination of the traffic. You can enter more than one value by separating the items with commas.</p> <p>You can enter any combination of the following address types. For more information, see <a href="#">Specifying IP Addresses During Policy Definition</a> , on page 316.</p> <ul style="list-style-type: none"> <li>• Network/host object. Enter the name of the object or click <b>Select</b> to select it from a list. You can also create new network/host objects from the selection list.</li> </ul> <p>(ASA 8.4(2+) only.) You can select FQDN network/host objects to select traffic based on fully-qualified host names.</p> <ul style="list-style-type: none"> <li>• Host IP address, for example, 10.10.10.100.</li> <li>• Network address, including subnet mask, in either the format 10.10.10.0/24 or 10.10.10.0/255.255.255.0.</li> <li>• A range of IP addresses, for example, 10.10.10.100-10.10.10.200.</li> <li>• An IP address pattern in the format 10.10.0.10/255.255.0.255, where the mask is a discontinuous bit mask (see <a href="#">Contiguous and Discontiguous Network Masks for IPv4 Addresses</a> , on page 309).</li> </ul>
Users	<p>(ASA 8.4(2+) only.) The Active Directory (AD) usernames, user groups, or identity user group objects for the rule, if any. The user specification is conjoined to the source address to limit the match to user addresses within the source address range. You can enter more than one value by separating the items with commas.</p> <p>You can enter any combination of the following values.</p> <ul style="list-style-type: none"> <li>• Individual user names: NetBIOS_DOMAIN\username</li> <li>• User groups (note the double \): NetBIOS_DOMAIN\user_group</li> <li>• Identity user group object names.</li> </ul> <p>Click <b>Select</b> to select objects, users, or user groups from a list or to create new objects.</p> <p>For more information, see:</p> <ul style="list-style-type: none"> <li>• <a href="#">Selecting Identity Users in Policies</a> , on page 656</li> <li>• <a href="#">Configuring Identity-Based Firewall Rules</a> , on page 657</li> <li>• <a href="#">Creating Identity User Group Objects</a> , on page 654</li> </ul>
Services	<p>The services that define the type of traffic to act on. You can enter more than one value by separating the items with commas.</p> <p>You can enter any combination of service objects and service types (which are typically a protocol and port combination). If you type in a service, you are prompted as you type with valid values. You can select a value from the list and press Enter or Tab.</p> <p>For complete information on how to specify services, see <a href="#">Understanding and Specifying Services and Service and Port List Objects</a> , on page 329.</p>

Element	Description
Description	An optional description of the object.
Advanced button	<p>Click this button to define logging options for the entry:</p> <ul style="list-style-type: none"> <li>• For PIX, ASA, and FWSM devices, you can enable: <ul style="list-style-type: none"> <li>• Default logging—If a packet is denied, message 106023 is generated. If a packet is permitted, no message is generated.</li> <li>• Per ACE logging—If a packet is denied, message 106100 is generated. You can select the logging severity level for the messages, and the interval (in seconds from 1 to 600) for generating messages.</li> </ul> </li> <li>• For IOS devices, when you enable logging, informational messages about packets that match the entry are sent to the console. You can also elect to include the input interface and source MAC address or VC in the logging output.</li> </ul>

## Add and Edit Standard Access Control Entry Dialog Boxes

Use the Add or Edit Standard Access Control Entry dialog box to add an access control entry (ACE) or an ACL object to a Standard ACL object.

### Navigation Path

From the [Add or Edit Access List Dialog Boxes](#), on page 288 for Standard ACL objects, click the **Add** button in the ACE table, or select a row and click the **Edit** button.

## Field Reference

**Table 61: Add and Edit Standard Access Control Entry Dialog Boxes**

Element	Description
Type	<p>The type of entry you are adding. The fields on the dialog box change based on your selection.</p> <ul style="list-style-type: none"> <li>• Access Control Entry—You want to define an ACE.</li> <li>• ACL Objects—You want to include an existing ACL object. You are presented with a list of available ACL objects. Select the objects you want to include and click the &gt;&gt; button to move them to the list of selected objects. You can remove an object by selecting it and clicking &lt;&lt;. You can also edit objects in the selected objects list.</li> </ul>
Action	<p>The action to take on traffic defined in the entry:</p> <ul style="list-style-type: none"> <li>• Permit—The service associated with this ACL is applied to this traffic. That is, the traffic is permitted to use the service.</li> <li>• Deny—The service associated with this ACL is not applied to this traffic. If there are multiple ACLs configured for a service, denied traffic is typically compared to the next ACL in the list; if it matches no permit entry in any ACL for the service, the service is not applied to the traffic. Whether the traffic is dropped from the network depends on the service.</li> </ul>
Category	<p>The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.</p>
Source	<p>The source of the traffic. You can enter more than one value by separating the items with commas.</p> <p>You can enter any combination of the following address types. For more information, see <a href="#">Specifying IP Addresses During Policy Definition</a> , on page 316.</p> <ul style="list-style-type: none"> <li>• Network/host object. Enter the name of the object or click <b>Select</b> to select it from a list. You can also create new network/host objects from the selection list.</li> <li>• Host IP address, for example, 10.10.10.100.</li> <li>• Network address, including subnet mask, in either the format 10.10.10.0/24 or 10.10.10.0/255.255.255.0.</li> <li>• A range of IP addresses, for example, 10.10.10.100-10.10.10.200.</li> <li>• An IP address pattern in the format 10.10.0.10/255.255.0.255, where the mask is a discontinuous bit mask (see <a href="#">Contiguous and Discontiguous Network Masks for IPv4 Addresses</a> , on page 309).</li> </ul>
Description	<p>An optional description of the object.</p>
Log Option	<p>Whether to create log entries when traffic meets the entry criteria. ACL logging generates syslog message 106023 for denied packets. Deny packets must be present to log denied packets.</p>

## Add and Edit Web Access Control Entry Dialog Boxes

Use the Add or Edit Web Access Control Entry dialog box to add an access control entry (ACE) or an ACL object to a Web Type ACL object.

### Navigation Path

From the [Add or Edit Access List Dialog Boxes](#), on page 288 for Web Type ACL objects, click the **Add** button in the ACE table, or select a row and click the **Edit** button.

### Field Reference

**Table 62: Add and Edit Web Access Control Entry Dialog Boxes**

Element	Description
Type	<p>The type of entry you are adding. The fields on the dialog box change based on your selection.</p> <ul style="list-style-type: none"> <li>• Access Control Entry—You want to define an ACE.</li> <li>• ACL Objects—You want to include an existing ACL object. You are presented with a list of available ACL objects. Select the objects you want to include and click the &gt;&gt; button to move them to the list of selected objects. You can remove an object by selecting it and clicking &lt;&lt;. You can also edit objects in the selected objects list.</li> </ul>
Action	<p>The action to take on traffic defined in the entry:</p> <ul style="list-style-type: none"> <li>• Permit—The service associated with this ACL is applied to this traffic. That is, the traffic is permitted to use the service.</li> <li>• Deny—The service associated with this ACL is not applied to this traffic. If there are multiple ACLs configured for a service, denied traffic is typically compared to the next ACL in the list; if it matches no permit entry in any ACL for the service, the service is not applied to the traffic. Whether the traffic is dropped from the network depends on the service.</li> </ul>
Filter Destination	<p>Whether the entry specifies a network filter (host or network address) or a URL filter (web site address). Your selection changes the fields on the dialog box. The fields are described below.</p>

Element	Description
Destination (Network Filter only.)	<p>The destination of the traffic. You can enter more than one value by separating the items with commas.</p> <p>You can enter any combination of the following address types. For more information, see <a href="#">Specifying IP Addresses During Policy Definition</a>, on page 316.</p> <ul style="list-style-type: none"> <li>• Network/host object. Enter the name of the object or click <b>Select</b> to select it from a list. You can also create new network/host objects from the selection list.</li> <li>• Host IP address, for example, 10.10.10.100.</li> <li>• Network address, including subnet mask, in either the format 10.10.10.0/24 or 10.10.10.0/255.255.255.0.</li> <li>• A range of IP addresses, for example, 10.10.10.100-10.10.10.200.</li> <li>• An IP address pattern in the format 10.10.0.10/255.255.0.255, where the mask is a discontinuous bit mask (see <a href="#">Contiguous and Discontiguous Network Masks for IPv4 Addresses</a>, on page 309).</li> </ul>
Ports (Network Filter only.)	<p>The port numbers or port list policy objects that define the port the traffic uses, if you want to use port identification. You can enter more than one value by separating the items with commas.</p> <p>You can enter any combination of the following types:</p> <ul style="list-style-type: none"> <li>• Port list object. Enter the name of the object or click <b>Select</b> to select it from a list. You can also create new port list objects from the selection list.</li> <li>• Port number, for example, 80.</li> <li>• A range of ports, for example, 80-90.</li> </ul>
URL Filter (URL Filter only.)	<p>The Universal Resource Locator (URL), or web address, of the traffic. You can use an asterisk as a match-all wildcard. For example, http://*.cisco.com matches all servers on the cisco.com network. You can specify any valid URL.</p>
Logging	<p>The type of logging to use for this entry:</p> <ul style="list-style-type: none"> <li>• Select Log Disabled to not create log entries.</li> <li>• Select Default to use the default settings on the device.</li> <li>• All other available options enable logging and identify the log level that will be used.</li> </ul>
Logging Interval	<p>The interval of time, in seconds, used to generate logging messages, from 1 to 600. The default is 300. You can modify this field only if you select a logging level in the Logging field.</p>

Element	Description
Time Range	<p>The time range policy object that defines the time range associated with the entry. The time range defines the access to the device and relies on the device's system clock. For more information, see <a href="#">Configuring Time Range Objects</a> , on page 299.</p> <p>Enter the name of the object or click <b>Select</b> to select it from a list. You can also create new time range objects from the selection list.</p> <p><b>Note</b> Time range is not supported on FWSM 2.x or PIX 6.3 devices.</p>
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.
Description	An optional description of the object.

## Add and Edit Unified Access Control Entry Dialog Boxes

Use the Add or Edit Unified Access Control Entry dialog box to add an access control entry (ACE) or an ACL object to a Unified ACL object.

### Navigation Path

From the [Add or Edit Access List Dialog Boxes](#) , on page 288 for Unified ACL objects, click the **Add** button in the ACE table, or select a row and click the **Edit** button.

### Related Topics

- [Creating Unified Access Control List Objects](#) , on page 287

### Field Reference

**Table 63: Add and Edit Unified Access Control Entry Dialog Boxes**

Element	Description
Type	<p>The type of entry; the fields in the dialog box change based on your choice:</p> <ul style="list-style-type: none"> <li>• Access Control Entry—You want to define an ACE.</li> <li>• ACL Objects—You want to include one or more existing ACL objects. You are presented with a list of available ACL objects. Select the objects you want to include and click the &gt;&gt; button to move them to the list of selected objects. You can remove an object by selecting it and clicking &lt;&lt;. You can also edit an object in the selected objects list.</li> </ul>

Element	Description
Action	<p>The action to take on traffic defined in the entry:</p> <ul style="list-style-type: none"> <li>• <b>Permit</b>—The Services associated with the ACE are applied to this traffic. That is, the traffic defined by this entry is permitted to use the Services.</li> <li>• <b>Deny</b>—The Services associated with this ACE are not applied to this traffic. If there are multiple ACLs configured for a service, denied traffic is typically compared to the next ACE in the list; if it matches no permit entry in any ACL for the service, the service is not applied to the traffic. Whether the traffic is dropped from the network depends on the service.</li> </ul>
Source	<p>Provide traffic sources for this rule; can be networks and hosts. You can enter values or object names, or Select objects, for one or more of the following:</p> <ul style="list-style-type: none"> <li>• <b>Networks/Hosts</b> – You can specify a various network, host and interface definitions, either individually or as objects. If you Select an interface object as a source, the dialog box displays tabs to differentiate between hosts/networks and interfaces. Enter more than one value in any of these fields by separating the items with commas or ranges.</li> </ul> <p>The “All-Address” objects do not restrict the rule to specific hosts, networks, or interfaces. These addresses are IPv4 or IPv6 addresses for hosts or networks, network/host objects, interfaces, or interface roles.</p> <p><b>Note</b> (ASA 8.4.2+ only) You can only specify a fully qualified domain name (FQDN) by providing an FQDN network/host object, or a group object that includes an FQDN object. You cannot directly type in an FQDN.</p> <p>See <a href="#">Understanding Networks/Hosts Objects</a> , on page 308, <a href="#">Specifying IP Addresses During Policy Definition</a> , on page 316 and <a href="#">Understanding Interface Role Objects</a> , on page 301 for additional information about these definitions.</p> <p><b>Note</b> Enter the IPv6 addresses as comma separated values only. Preview configuration displays an error when IPv6 address is provided as a range.</p> <p>All Source, Source SG, and Users specifications area combined to limit traffic matches to only those flows that include all source definitions. For example, specified user traffic originating from within a specified source address range.</p>
Source SG	<p>(ASA 9.0+ only) Enter or Select the name or tag number for one or more source Security Groups for the ACE, if any. For more information about security groups, see:</p> <ul style="list-style-type: none"> <li>• <a href="#">Selecting Security Groups in Policies</a> , on page 681</li> <li>• <a href="#">Configuring TrustSec-Based Firewall Rules</a> , on page 681</li> <li>• <a href="#">Creating Security Group Objects</a> , on page 679</li> </ul>

Element	Description
Users	<p>(ASA 8.4.2+ only) Enter or Select the Active Directory (AD) user names, user groups, or identity user group objects for the ACE, if any. The user specification is conjoined to the source address to limit the match to user addresses within the source address range. You can enter more than one value by separating the items with commas.</p> <p>You can enter any combination of the following values:</p> <ul style="list-style-type: none"> <li>• Individual user names: NetBIOS_DOMAIN\username</li> <li>• User groups (note the double \): NetBIOS_DOMAIN\user_group</li> <li>• Identity user group object names.</li> </ul> <p>For more information, see:</p> <ul style="list-style-type: none"> <li>• <a href="#">Selecting Identity Users in Policies</a> , on page 656</li> <li>• <a href="#">Configuring Identity-Based Firewall Rules</a> , on page 657</li> <li>• <a href="#">Creating Identity User Group Objects</a> , on page 654</li> </ul>
Destination	<p>The source or destination of the traffic. You can enter more than one value by separating the items with commas.</p> <p><b>Note</b> Enter the IPv6 addresses as comma separated values only. Preview configuration displays an error when IPv6 address is provided as a range.</p> <p>Provide traffic destinations, and optionally destination security groups (ASA 9.0+ only), for this ACE. As with the source entries, you can enter values or object names, or Select objects, for one or more destinations.</p>
Destination SG	<p>(ASA 9.0+ only) Enter or Select the name or tag number for one or more source Security Groups for the ACE, if any. For more information about security groups, see:</p> <ul style="list-style-type: none"> <li>• <a href="#">Selecting Security Groups in Policies</a> , on page 681</li> <li>• <a href="#">Configuring TrustSec-Based Firewall Rules</a> , on page 681</li> <li>• <a href="#">Creating Security Group Objects</a> , on page 679</li> </ul>
Service	<p>The services that define the type of traffic to act on. You can enter more than one value by separating the items with commas.</p> <p>You can enter or Select any combination of service objects and service types (which are typically a protocol and port combination). If you type in a service, you are prompted as you type with valid values.</p> <p>For complete information on how to specify services, see <a href="#">Understanding and Specifying Services and Service and Port List Objects</a> , on page 329.</p>

Element	Description
Advanced button	Click this button to open the Advanced dialog box and define logging options for the ACE. For PIX, ASA, and FWSM devices, you can enable: <ul style="list-style-type: none"> <li>• Default logging—If a packet is denied, message 106023 is generated. If a packet is permitted, no message is generated.</li> <li>• Per ACE logging—If a packet is denied, message 106100 is generated. You can select the logging severity level for the messages, and the interval (in seconds from 1 to 600) for generating messages.</li> </ul>
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.
Description	An optional description of the object.

## Configuring Time Range Objects

Use the Add or Edit Time Range dialog box to create, edit, or copy a time range object.

You can create time range objects for use when creating time-based ACLs and some firewall rules. While similar to extended ACLs in function, time-based ACLs allow for access control based on time considerations. The time range applies to specific rules, and makes those rules active for the specific time period defined in the range. For example, you can implement a rule for typical work hours to allow or prevent certain types of access.

You can also use time range objects when defining ASA user groups to restrict VPN access to specific times during the week. For more information, see [ASA Group Policies SSL VPN Settings](#) , on page 1512.

Time range objects can rely on the device's system clock, but they work best when using Network Time Protocol (NTP) synchronization.

### Navigation Path

Select **Manage > Policy Objects**, then select **Time Ranges** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

### Field Reference

*Table 64: Time Range Dialog Box*

Element	Description
Name	The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects</a> , on page 235.
Description	An optional description of the object (up to 1024 characters).

Element	Description
Start Time End Time	<p>The overall starting and ending time for the time range object:</p> <ul style="list-style-type: none"> <li>• Start Now—Defines the time of deployment as the start time.</li> <li>• Never End—Defines no end time for the range.</li> <li>• Start At, End At—Defines a specific start or end date and time. Click the calendar icon to display a tool for selecting the date. Enter the time in the Time field using the 24-hour clock format, HH:MM.</li> </ul>
Recurring Ranges	<p>Recurring time periods that happen within the overall start and end times, if any. For example, if you want to create a time range object that defines work hours, you could select Start Now and Never End for the overall range, and enter a recurring range of weekdays from 08:00 to 18:00 hours.</p> <ul style="list-style-type: none"> <li>• To add a range, click the <b>New Recurring Range</b> button and fill in the <a href="#">Recurring Ranges Dialog Box</a> , on page 300.</li> <li>• To edit a range, select it and click the <b>Edit Recurring Range</b> button.</li> <li>• To delete a range, select it and click the <b>Delete Recurring Range</b> button.</li> </ul>
Category	<p>The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.</p>

## Recurring Ranges Dialog Box

Use the Recurring Ranges dialog box to add or edit recurring time intervals that are defined as part of a time range object. You can define as many recurring ranges as required.

### Navigation Path

Go to the Add or Edit Time Range dialog box and click the **New Recurring Range** button under Recurring Ranges, or select a range and click **Edit Recurring Range**. See [Configuring Time Range Objects](#) , on page 299.

## Field Reference

**Table 65: Recurring Ranges Dialog Box**

Element	Description
Specify days of the week and times during which this recurring range will be active	<p>Defines a recurring range that is based on specific days and times of the week. You can select from:</p> <ul style="list-style-type: none"> <li>• Every day</li> <li>• Weekdays</li> <li>• Weekends</li> <li>• On these days of the week—Select the specific days to include in the range.</li> </ul> <p>Also select the starting and ending time during the day. The default is all day.</p>
Specify a weekly interval during which this recurring range will be active	<p>Defines a recurring range for every week. Select the starting and ending day and time. For example, you can start the weekly period on Sunday and end it on Thursday.</p>

# Understanding Interface Role Objects

Interface Role objects have the following uses:

- Specifying multiple interfaces— Interface role objects allow you to apply policies to specific interfaces on multiple devices without having to manually define the names of each interface. Because most devices follow a standard naming convention for their interfaces, you can define a naming pattern that describes a particular interface type and then assign a policy to all interfaces matching that pattern.
- Zones—You use interface role objects to define the zones in a zone-based firewall rules policy.

For example, you might define an interface role with a naming pattern of DMZ\*. When you include this interface role in a policy, the policy is applied to all interfaces whose name begins with “DMZ” on the selected devices. As a result, you can, for example, assign a policy that enables anti-spoof checking on all DMZ interfaces to all relevant device interfaces with a single action. Interface roles can refer to any of the actual interfaces on the device, including physical interfaces, subinterfaces, and virtual interfaces, such as loopback interfaces.

Interface roles serve as an indirection entity between interfaces on the one hand and policies on the other. This enables you to apply policies to particular device interfaces based on the assigned role. Additionally, if you change the naming convention used for a particular interface type, you do not need to determine which policies are affected by the change. All you do is edit the interface role.

Interface roles are especially useful when you apply policies to new devices. As long as the devices you are adding share the same interface naming scheme as existing devices, the relevant policies can be extended to them without the need to make additional assignments.

Security Manager includes the following predefined interface roles:

- All-Interfaces—Includes every interface defined on a device.

- **Internal**—Includes only specific interfaces that are meant to be on the inside of a network. See the object definition for a list.
- **External**—Includes only specific interfaces that are meant to be on the outside of a network. See the object definition for a list.
- **Self**—Does not include any interfaces. The Self interface role is specific to zone-based firewall rules policies. The Self zone is the router itself. You can use it to identify traffic originating from the router, or traffic directed to the router. It does not include traffic passing through the router.

The following topics describe how to work with interface role objects:

- [Creating Interface Role Objects](#) , on page 302
- [Specifying Interfaces During Policy Definition](#) , on page 304
- [Using Interface Roles When a Single Interface Specification is Allowed](#) , on page 305
- [Handling Name Conflicts between Interfaces and Interface Roles](#) , on page 306
- [Managing Traffic Zones](#), on page 999

## Creating Interface Role Objects

You can create interface role objects that represent one or more interfaces on devices. You can then use these roles when you define policies that require interfaces or zones. When you create an interface role object, you must define the naming pattern of the device interfaces to include in the object. Interface roles can refer to any of the actual interfaces on the device, including physical interfaces, subinterfaces, and virtual interfaces.

**Tip** You can also create interface role objects when you define policies or objects that use this object type. For more information, see [Selecting Objects for Policies](#) , on page 228.

### Related Topics

- [Creating Policy Objects](#) , on page 235
- [Specifying Interfaces During Policy Definition](#) , on page 304
- [Understanding Interface Role Objects](#) , on page 301
- [Using Interface Roles When a Single Interface Specification is Allowed](#) , on page 305
- [Managing Object Overrides](#) , on page 244
- [Managing Traffic Zones](#), on page 999

**Step 1** Select **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager](#) , on page 230).

**Step 2** Select **Interface Roles** from the Object Type selector.

**Step 3** Right-click in the work area, then select **New Object**.

The Interface Role dialog box appears.

- Step 4** Enter a name for the object and optionally a description of the object. Names can be up to 128 characters, descriptions up to 1024.
- Step 5** Enter one or more naming patterns for the interface role object. The names are the complete or partial names of interfaces, subinterfaces, and other virtual interfaces. Separate multiple name patterns with commas.
- You can use these wildcards to create name patterns that apply to multiple interfaces:
- Use a period (.) as a wildcard for a single character. To use a period as part of the pattern itself, enter a backslash (\) before the period.
  - Use an asterisk (\*) as a wildcard for one or more characters at the end of the interface pattern.
- For example, **DMZ\*** would include all interfaces whose name begins with “DMZ”, while **DMZ.** would match interfaces such as DMZ1 and DMZ2, but would not match DMZ10.
- If the pattern does not include a wildcard, it must match the exact name of the interface. For example, the pattern **FastEthernet** will not match FastEthernet0/1 unless you include an asterisk at the end of the pattern.
- Step 6** (Optional) Under Category, select a category to help you identify this object in the Objects table. See [Using Category Objects](#), on page 239.
- Step 7** (Optional) Select **Allow Value Override per Device** to allow the properties of this object to be redefined on individual devices. See [Allowing a Policy Object to Be Overridden](#), on page 245.
- Step 8** Click **OK** to save the object.
- 

## Interface Role Dialog Box

Use the Interface Role dialog box to create, copy, or edit an interface role object. Interface Role objects have the following uses:

- Specifying multiple interfaces— Interface role objects allow you to apply policies to specific interfaces on multiple devices without having to manually define the names of each interface.
- Zones—You use interface role objects to define the zones in a zone-based firewall rules policy.

### Navigation Path

Select **Manage > Policy Objects**, then select **Interface Roles** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

## Field Reference

**Table 66: Interface Role Dialog Box**

Element	Description
Name	The name of the policy object. A maximum of 128 characters is allowed.
Description	A description of the policy object. A maximum of 1024 characters is allowed.
Interface Name Patterns	<p>The names to include in this interface role. The names are the complete or partial names of interfaces, subinterfaces, and other virtual interfaces. Separate multiple name patterns with commas.</p> <p><b>Note</b> For firewall devices, use the name assigned to the interface (for example, Inside, Outside, or DMZ) and not the hardware port identifier (for example, Ethernet0).</p> <p>You can use these wildcards to create name patterns that apply to multiple interfaces:</p> <ul style="list-style-type: none"> <li>• Use a period (.) as a wildcard for a single character. To use a period as part of the pattern itself, enter a backslash (\) before the period.</li> <li>• Use an asterisk (*) as a wildcard for one or more characters at the end of the interface pattern.</li> </ul> <p>For example, DMZ* would include all interfaces whose name begins with “DMZ”, while DMZ. would match interfaces such as DMZ1 and DMZ2, but would not match DMZ10.</p> <p>If the pattern does not include a wildcard, it must match the exact name of the interface. For example, the pattern “FastEthernet” will not match FastEthernet0/1 unless you include an asterisk at the end of the pattern.</p>
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.
Allow Value Override per Device Overrides Edit button	<p>Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.</p> <p>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p>

## Specifying Interfaces During Policy Definition

When you configure policies that require you to identify an interface, you have several options for specifying the interface:

- Enter the name of the interface manually, for example, Ethernet0.

To manually specify a subinterface as part of a policy definition, you must enter a backslash (\) before the period. For example, Ethernet0\1.

If you enter the period without the backslash, Security Manager treats the period as a wildcard for a single character. For example, if you want to define Ethernet1/1.0 as part of an access rule, you need to enter **Ethernet1/1\,0**. If you enter **Ethernet1/1.0** instead, the name matches interfaces named Ethernet1/1.0 and Ethernet1/1/0, because the period on its own is treated as a wildcard.

- Enter the name of an interface role manually. For more information about interface roles, see [Understanding Interface Role Objects](#) , on page 301.
- Select an interface or interface role from a list. By clicking **Select** next to the Interfaces field, you are prompted with a list of valid interface names and interface roles. Subinterfaces appear with a backslash before the period in their names.

By selecting from a list, you can ensure that your entry is valid. For more information, see [Selecting Objects for Policies](#) , on page 228.

When a policy allows multiple interfaces, separate entries with commas.

In policies and object selectors, icons distinguish between interfaces and interface roles. If you create interface roles with the same name as interfaces, be careful to select exactly what you want. The below table explains the icons.

**Table 67: Icons for Interfaces and Interface Roles**

Type	Icon
Interface	
Interface role If you can edit the role, a pencil image overlays the icon.	
Global “interface” on ASA 8.3+ devices, used for rules created as global instead of interface-specific.

## Using Interface Roles When a Single Interface Specification is Allowed

Interface role objects can match a variable number of actual interfaces defined on a device depending on how you define the role. Thus, for a particular device, an interface role might match zero, one, or more than one interface. When you use an interface role in a policy, Security Manager converts the role to commands that configure all interfaces defined on the device that match the role.

Many policies, however, require that you specify a single interface name. If you use an interface role in a situation where the policy allows a single interface name, you should define the interface role so that it matches a single interface. If you use an interface role that matches two or more interfaces on the device, Security

Manager selects the first interface on the device that matches the role, which might not be the interface you desire (or that will work properly).

- [Specifying Interfaces During Policy Definition](#) , on page 304
- [Understanding Interface Role Objects](#) , on page 301
- [Creating Interface Role Objects](#) , on page 302

## Handling Name Conflicts between Interfaces and Interface Roles

Under normal circumstances, you can configure an interface role that has the same name as an actual interface on the device. If you use object selectors when defining policies (see [Selecting Objects for Policies](#) , on page 228), both the interface and the interface role are listed as available choices, enabling you to select either option. If you type in this common name when you define a policy, Security Manager automatically associates the interface role with the policy, not the interface.

However, a naming conflict can occur under the following circumstances:

1. You type the name of an interface when defining a policy.
2. You later create an interface role that has the same name.
3. You type this name again when defining a policy.
4. You click **Select** to display the object selector, or **Save** to save the policy, or in some cases, **OK** to update the policy.

When this sequence of events occurs, the Interface Name Conflict dialog box opens automatically so that you can select whether you want to specify the interface or the interface role. The dialog box lists only those names for which there are conflicts.

## Understanding Map Objects

The objects in the Maps folder in the Policy Object Manager allow you to configure class, parameter, and policy maps for inspection rules, zone-based firewall rules, or IPS, QoS and connection rules policies. The types of maps you can use with these policies depends on the operating system running on the device as well as the specific version number, so typically it is best to configure the maps when you are configuring the policies.

---

**Tip** Devices enforce unique names for all configured maps. For example, you cannot use the same name for an FTP and DNS class map on the same device. If you select maps with the same name for a device, Security Manager automatically adds a numerical suffix to the duplicate names, for example, `dnsmap_1`.

---

The Maps folder contains the following folders. Subfolders organize the maps based on whether they are used for inspection or web content filtering.

- **Class Maps**—Layer 7 class maps used for identifying traffic that you want to act on.
- **Parameter Maps**—Parameter maps that configure settings used in zone-based firewall rules policies or other maps.
- **Policy Maps**—Layer 7 policy maps used for identifying the action to take on selected traffic.

Also included in the Maps folder are entries for TCP Map objects (a Layer 4 object), Regular Expression objects, and Regular Expression Group objects.

The following sections describe the different types of maps in more detail.

### Class Maps

Class maps are subordinate to policy maps. You cannot specify a class map directly in a device policy. Instead, you create a policy map to incorporate the class map. The class map itself defines the match conditions for the traffic that you want to target in an inspection rule or zone-based firewall rule.

- **ASA/PIX 7.2 and later, and FWSM devices**—You can create class maps for the inspection of DNS, FTP, HTTP, IM, and SIP traffic. You also have the option of defining the traffic match directly in the policy map object, but if you create separate class maps, you can reuse them in more than one policy map.
- **IOS 12.4(6)T and later devices**—You can create class maps for the inspection of IM applications (AOL, ICQ, MSN Messenger, Windows Messenger, and Yahoo Messenger), P2P applications (eDonkey, FastTrack, Gnutella, Kazaa2), H.323, HTTP, IMAP, POP3, SIP, SMTP, Sun RPC. You can also create class maps for filtering web content using the Local, N2H2, Trend, and Websense objects.

Unlike the class maps used for ASA/PIX/FWSM, you must create separate class maps and refer to them from the related policy maps. You can use these policy maps in zone-based firewall inspection or content filtering rules. For more information, see these topics:

- [Configuring Inspection Maps for Zone-based Firewall Policies](#) , on page 943
- [Configuring Content Filtering Maps for Zone-based Firewall Policies](#) , on page 964

To create class maps, see these topics:

- [Configuring Class Maps for Inspection Policies](#) , on page 790
- [Configuring Class Maps for Zone-Based Firewall Policies](#) , on page 945

To create the regular expressions and regular expression groups that you can use in class, parameter, and policy maps, see these topics:

- [Add/Edit Regular Expressions](#) , on page 877
- [Configuring Regular Expression Groups](#) , on page 876

### Parameter Maps

Parameter maps define settings that you can use in zone-based firewall inspection or content filtering rules, or in other policy map objects.

- Inspection—You can create Inspection Parameter maps for general zone-based firewall rule parameters, or Protocol Info Parameter maps for use with IM application inspection.
- Content Filtering—You can create the following parameter maps to define web content filtering: Local, N2H2, Trend, URL Filter, URLF Glob, Websense.

### Policy Maps

You can configure policy maps to alter the default actions of inspection or to configure web content filtering in zone-based firewall settings policies. Policy maps typically apply to applications that require special handling, perhaps due to embedded IP address information or the fact that the traffic opens secondary channels on dynamically assigned ports.

The policy map identifies the action to take on traffic that matches the conditions identified in the map. For most policy maps, you can specify traffic match conditions by referring to a class map. However, some policy maps require that you specify the match criteria within the policy map.

You can configure these types of policy maps:

- Inspection Rules—When configuring inspection rules, you can use Security Manager to create policy map objects for the following applications: DCE/RPC, DNS, ESMTP, FTP, GTP, H.323, HTTP, IM, IP options, IPsec, NetBIOS, SIP, Skinny, and SNMP. For more information, see [Configuring Protocols and Maps for Inspection](#), on page 785.
- Zone-Based Firewall Inspection Rules—When configuring zone-based firewall inspection rules, you can use Security Manager to create policy map objects for the following applications: H.323, HTTP, IM (includes AOL, ICQ, MSN Messenger, Windows Messenger, and Yahoo Messenger), IMAP, P2P (includes eDonkey, FastTrack, Gnutella, Kazaa2), POP3, SIP, SMTP, Sun RPC. For more information, see [Configuring Inspection Maps for Zone-based Firewall Policies](#), on page 943.
- Zone-Based Firewall Content Filtering Rules—When configuring zone-based firewall content filtering rules, you can use Security Manager to create Web Filter policy maps. You can also configure HTTP policy maps to inspect HTTP traffic. For more information, see [Configuring Content Filtering Maps for Zone-based Firewall Policies](#), on page 964.
- IPS, QoS and Connection Rules—When configuring this service policy, which is specific to PIX 7.x+ and ASA devices, you can customize TCP inspection using a TCP map. For more information, see [Configuring TCP Maps](#), on page 2301 and [Configuring Service Policy Rules on Firewall Devices](#), on page 2279.

## Understanding Networks/Hosts Objects

Networks/Hosts objects are logical collections of IP addresses that represent networks, hosts, or both.

**Note** As of Security Manager 4.4, there are no longer separate IPv4 and IPv6 Networks/Hosts objects—there is now a single, unified Networks/Hosts object, which may accept IPv4 addresses, IPv6 addresses, or both (in the case of group objects). However, group objects containing a mixture of IPv4 and IPv6 addresses can be assigned only to policies on ASA 9.0.1 and later devices. See [Policy Object Changes in Security Manager 4.4](#), on page 11 for more information.

When you create a Networks/Hosts object, you must choose the type of object, which defines and limits the type of addresses the object can contain:

- **Group** – You can include combinations of any of the following types of addresses:
  - Networks or subnets, specified by IPv4 addresses and subnet masks, or IPv6 prefixes and prefix lengths.
  - Ranges of IPv4 or IPv6 network addresses.
  - Individual hosts, specified by IPv4 or IPv6 addresses (but not a domain name).
  - Other network/host objects, selected from a list of existing Networks/Hosts objects, including fully qualified domain name (FQDN) objects.
- **FQDN** – (ASA 8.4(2+) only) This object can contain a single host's fully qualified domain name, such as myhost.cisco.com. The device uses DNS to periodically resolve the FQDN to its IP address.
- **Host** – This object can contain a single host IPv4 or IPv6 address, such as 10.100.10.10 or 2001:DB8::0DB8:800:200C:417A.
- **Attribute** – This object can contain one or more policy based VM attribute agents, which allow a user to define network objects to filter traffic according to attributes associated with one or more Virtual Machines (VMs) in an VMware ESXi environment managed by VMware vCenter. Each VM attribute agent communicates with a single vCenter server.
- **Address Range** – This object can contain a single range of IPv4 or IPv6 addresses; the start and end addresses must be different, with the start being lower than the end.
- **Network** – This object can contain a single IPv4 network address and subnet mask, such as 10.100.10.0/24, or a single IPv6 prefix and prefix length, such as 2001:DB8::/32.

Networks/Hosts group objects make it easier to manage scalable policies. By using the associative capabilities of Networks/Hosts objects, you can expand your policies along with your network. For example, when you make changes to the list of addresses contained in a Networks/Hosts object, the changes propagate to all other Networks/Hosts objects, and to policies that refer to that Networks/Hosts object.

The host, network, and address range objects have special uses when used in policies for an ASA 8.3+ device. On these devices, you can configure object NAT rules in the policy object itself. If you use the object on other types of device, this NAT configuration is ignored.

The following topics describe how to work with Networks/Hosts objects:

- [Contiguous and Discontiguous Network Masks for IPv4 Addresses](#) , on page 309
- [Creating Networks/Hosts Objects](#) , on page 311
- [Using Unspecified Networks/Hosts Objects](#) , on page 315
- [Specifying IP Addresses During Policy Definition](#) , on page 316
- [VM Attribute Policies](#), on page 318

## Contiguous and Discontiguous Network Masks for IPv4 Addresses

A network mask determines which portion of an IPv4 address identifies the network and which portion identifies the host. Like the IP address, the mask is represented by four octets. (An octet is an 8-bit binary

number equivalent to a decimal number in the range 0-255.) If a given bit of the mask is 1, the corresponding bit of the IP address is in the network portion of the address, and if a given bit of the mask is 0, the corresponding bit of the IP address is in the host portion.

Standard, or contiguous, network masks start with zero or more 1s followed by zero or more 0s. This kind of network mask is considered contiguous because it represents a network that consists of a contiguous IP address range. For example, the network 192.168.1.0/255.255.255.0 contains all the IP addresses ranging from 192.168.1.0 to 192.168.1.255.

The following table shows different methods of representing commonly used standard network masks:

**Table 68: Standard Network Masks**

<b>Dotted Decimal Notation</b>	<b>Classless Inter-Domain Routing (CIDR) Notation</b>
255.0.0.0	/8
255.255.0.0	/16
255.255.255.0	/24
255.255.255.255	/32

For example, 255.255.255.0 indicates that the first three octets of the IP address (24 bits or /24 in CIDR notation) are made up of ones and identify the network; the last octet is made up of zeros and identifies the host.

### **Discontiguous Network Masks**

Nonstandard, or discontiguous, network masks are masks that do not conform to the contiguous format. For example, 10.0.1.1/255.0.255.255 indicates that you want to match an address that matches octets 1, 3, and 4 exactly, but any value in octet 2 is accepted.

Although discontiguous network masks are not typically used for network configurations, they are sometimes used for certain commands, such as filtering commands when defining access control lists (ACLs). Security Manager supports the use of nonstandard network masks in the policies whose CLI commands support them. An error is displayed if you try to define a discontiguous network mask in a policy that does not support them.

### **Network Masks and Discovery**

During discovery, Security Manager attempts to match network/host objects with existing equivalent objects defined in the Policy Object Manager:

- For contiguous network masks—Two network/host objects containing only standard networks are considered equivalent if they consist of the same set of IP addresses.
- For discontiguous network masks—Two network/host objects are considered equivalent only if the standard networks consist of the same set of IP addresses and the nonstandard networks are syntactically equivalent.

### **How Network Masks are Displayed**

Although you can enter both contiguous and discontiguous network masks using dotted decimal notation, all contiguous network masks are converted to CIDR notation. This makes it easier to distinguish them from discontiguous network masks, which are displayed in dotted decimal notation only.

### Related Topics

- [Specifying IP Addresses During Policy Definition](#) , on page 316
- [Using Unspecified Networks/Hosts Objects](#) , on page 315
- [Understanding Networks/Hosts Objects](#) , on page 308

## Creating Networks/Hosts Objects

You can create Networks/Hosts objects to represent networks, individual hosts, or groups of both. When you create a Networks/Hosts object, you must choose the type of object (group, host, FQDN, network, attribute, address range). Once created, you cannot change the object type.

---

**Tip** You can create Networks/Hosts objects “on the fly” when defining policies or objects that use this object type. For more information, see [Selecting Objects for Policies](#) , on page 228.

---

You can specify NAT object only if you have the Modify privilege mapped to your role.

### Related Topics

- [Understanding Networks/Hosts Objects](#) , on page 308
- [Creating Policy Objects](#) , on page 235
- [Contiguous and Discontiguous Network Masks for IPv4 Addresses](#) , on page 309
- [Specifying IP Addresses During Policy Definition](#) , on page 316
- [VM Attribute Policies](#), on page 318
- [Using Unspecified Networks/Hosts Objects](#) , on page 315
- [How Network/Host, Port List, and Service Objects are Named When Provisioned As Object Groups](#) , on page 336

---

**Step 1** Choose **Policy Objects** from the **Manage** menu, or click the Policy Object Manager button in the button bar, to open the Policy Object Manager pane in the lower section of the Configuration Manager window; see [Policy Object Manager](#) , on page 230 for more information.

**Step 2** Select **Networks/Hosts** in the Object Type selector.

**Step 3** Click the New Object button at the bottom of the window and choose one of the following types of Networks/Hosts object to open the [Add or Edit Network/Host Dialog Box](#) , on page 312. You also can right-click in the work area, choose **New Object**, and then choose one of the following options to open the dialog box.

- **Group** – To create an object that has one or more entry. You can include any combination of networks, hosts, address ranges, or other network/host objects (including FQDN objects).
- **FQDN** – (ASA 8.4(2+) only) To create an object with a single host’s fully qualified domain name, such as myhost.cisco.com.
- **Host** – To create an object with a single host address, such as 10.100.10.10 or 2001:DB8::12ab:5689.

- **Attribute** – (ASA 9.7.1+ only) To create a network object to filter traffic according to attributes associated with one or more virtual machines (VMs) in a VMware ESXi environment managed by VMware vCenter.
- **Address Range** – To create an object with a single range of addresses, such as 10.100.10.1-10.100.10.255.
- **Network** – To create an object with a single network address, such as 10.100.10.0/24 or 2001:DB8::/32.

**Tip** Host, network, and address range objects also let you configure object NAT rules for ASA 8.3+ devices. Any NAT configuration is ignored for other devices.

**Step 4** Provide the appropriate information in the [Add or Edit Network/Host Dialog Box](#), on page 312.

## Add or Edit Network/Host Dialog Box

Use the Add or Edit Network/Host dialog box to view, create, or edit network/host objects. The title, content and appearance of the dialog box differ slightly based on the type of network/host object you are creating: Group, FQDN, Host, Attribute, Address Range, or Network. FQDN objects require ASA 8.4.2 or later devices. Attribute objects require ASA 9.7.1 or later devices. The Group type lets you enter multiple definitions, so you can have a collection of networks, hosts, and other network/host objects, whereas the other types allow a single definition only.

The Host, Network, and Address Range versions of the dialog box provide two tabbed panels of options: General and NAT. Options on the General panel and the non-tabbed versions of the dialog box are described in the following table; the NAT options are described in [Add or Edit Network/Host Dialog Box: NAT Tab](#), on page 1060.

**Note** As of Security Manager 4.4, there are no longer separate IPv4 and IPv6 Networks/Hosts objects—there is now a single, unified Networks/Hosts object, which may accept IPv4 addresses, IPv6 addresses, or both (in the case of group objects only). However, group objects containing a mixture of IPv4 and IPv6 addresses can be assigned only to policies on ASA 9.0.1 and later devices.

When you create IPv4-based Host, Network, or Address Range objects for use on ASA 8.3+ devices, or unified Host, Network, or Address Range objects for use on ASA 9.0.1+ devices, you can also configure object NAT rules on the NAT tab of the dialog box. In both cases, you must select **Allow Value Override per Device** to allow object NAT. For reference information on the NAT tab, see [Add or Edit Network/Host Dialog Box: NAT Tab](#), on page 1060.

In addition, you can create an object with no addresses. For this type of object, you must also select **Allow Value Override per Device** and create overrides for every device that uses the object. For more information about using unspecified addresses, see [Using Unspecified Networks/Hosts Objects](#), on page 315.

### Navigation Path

Choose **Policy Objects** from the **Manage** menu, or click the Policy Object Manager button in the button bar, to open the Policy Object Manager pane in the lower section of the Configuration Manager window. Select **Networks/Hosts** from the Object Type Selector. Right-click inside the work area and select **New Object** (and select an object type), or right-click a row and select **Edit Object**; you also can use the related buttons at the bottom of the pane to open either dialog box.

## Field Reference

**Table 69: Network/Host Dialog Box (General Tab)**

Element	Description
Name	The object name (up to 64 characters). Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects</a> , on page 235.
Description	An optional description of the object.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.
Allow Value Override per Device Overrides Edit button	<p>Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.</p> <p><b>Tip</b> If you configure NAT for host, address range, or network objects, you must select this option. The NAT configuration is created as a device override and is not kept in the object.</p> <p>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p>
Group object options	

Element	Description
Available Networks/Hosts Members In Group Type in comma separated IP addresses	<p>The Members In Group list shows the networks, hosts, and other network/host objects that are included in this object. To populate the list, do any combination of the following:</p> <ul style="list-style-type: none"> <li>• Select one or more Address, Attribute, FQDN, Group, Host, Network objects in the Existing Networks/Hosts list and then click the &gt;&gt; button between the lists.</li> <li>• Type one or more IP addresses in the “Type in comma separated IP addresses” field and then click the &gt;&gt; button between the lists. Separate multiple addresses with commas; they are added as separate lines in the Members list.</li> </ul> <p>For IPv4 addresses, you can include host addresses, network addresses (with subnet masks entered after a / character, such as 10.100.10.0/24), or a range of addresses (separate the starting and ending address with a hyphen, and optionally include a subnet mask).</p> <p>For IPv6 addresses, you can include host addresses, network addresses (with prefixes entered after a / character, such as 2001:DB8::/32), or a range of addresses (such as 2001:DB8::1-2001:DB8::100).</p> <p>See <a href="#">Specifying IP Addresses During Policy Definition</a>, on page 316 for more information.</p> <ul style="list-style-type: none"> <li>• To remove an item from the Members In Group list, select it and click the appropriate &lt;&lt; button to return the item to its source location. You can select and remove multiple items at one time.</li> </ul> <p><b>Note</b> Group objects containing a mixture of IPv4 and IPv6 addresses can be assigned only to policies on ASA 9.0.1 and later devices.</p>
FQDN object options	
FQDN FQDN Type	<p>The fully qualified domain name of a single host; for example, somehost.cisco.com.</p> <p>The FQDN Type specifies the type of IP address mapped to the provided domain: IPv4 Only, IPv6 Only, or <b>Default</b>, which applies a device-specific default; for all non-ASA and pre-9.0.1 ASA devices, the default is IPv4.</p>
Host object options	
IP Address	The IPv4 or IPv6 address of the single host to include in the object.
Attribute object options	
Agent Name Type Value	<p>The VM Attribute Agent name. Select from a list of VM attribute agents or add a new VM Attribute Agent.</p> <p>The VM Attribute Agent Type should not exceed 128 characters.</p> <p>The VM Attribute Agent Value should not exceed 128 characters.</p> <p><b>Note</b> A user can assign custom attribute types and values to a set of VMs in order to apply a common set of policies to a set of VMs with a common user-defined characteristic</p>

Element	Description
Address Range object options	
Start IP Address End IP Address	The first and last IP address that define a range of addresses. The start and end addresses must be different, with the start being lower than the end.
Network object options	
IP Address Net Mask/Prefix	The IPv4 or IPv6 address that represents the network; for example, 10.100.10.0 or 2001:DB8::/32.  If you entered an IPv4 address, enter its subnet mask in the Net Mask/Prefix field. You can type a mask in either CIDR format, for example, 24 (without the forward slash), or in dotted decimal format, for example, 255.255.255.0.  If you entered an IPv6 address, enter its prefix length in the Net Mask/Prefix field.

## Using Unspecified Networks/Hosts Objects

When you define a Networks/Hosts object, you can leave the address fields blank, thereby creating a Networks/Hosts object with an unspecified value. Networks/Hosts objects with unspecified values require that you create overrides for every device that uses them.

The advantage of using a Networks/Hosts object with an unspecified value is that Security Manager displays an error if you submit your changes without creating a device-level override on every device using the object. By contrast, when you define the global object with a placeholder value (such as, 10.10.10.10), that global value could be deployed by mistake if you fail to define an override.

The following procedure describes how to create and implement Networks/Hosts objects with unspecified values.

### Related Topics

- [Understanding Policy Object Overrides for Individual Devices](#) , on page 244
- [Creating Networks/Hosts Objects](#) , on page 311
- [Contiguous and Discontiguous Network Masks for IPv4 Addresses](#) , on page 309
- [Specifying IP Addresses During Policy Definition](#) , on page 316
- [Understanding Networks/Hosts Objects](#) , on page 308

**Step 1** Create a Networks/Hosts object, making sure to:

- Leave the address fields blank (for example, the Members in Group, IP Address and Net Mask/Prefix, FQDN, or Start and End IP Address).
- Select the **Allow Value Override per Device** check box.

For more information, see [Creating Networks/Hosts Objects](#) , on page 311.

**Step 2** Create overrides for each device that will use the object:

- a) Click the green checkmark in the Overrides column for the object in the Networks/Hosts table to open the [Policy Object Overrides Window](#) , on page 247.
- b) Click the **Create Override** button and select the devices on which you want to create overrides, then define a value in the address field. At this point, this override value applies to all the selected devices. For more information, see [Creating or Editing Object Overrides for Multiple Devices At A Time](#) , on page 246.
- c) Double-click each device in the Policy Object Overrides dialog box, then modify the address field for the value required by that device.

**Step 3** Define a policy that requires this object. You can use one of two methods:

- Define the policy on a single device in Device view, share the policy, then assign the policy to the other devices. See [Sharing a Local Policy](#) , on page 205 and [Modifying Shared Policy Assignments in Device View or the Site-to-Site VPN Manager](#) , on page 214.
- Create a shared policy in Policy view, then assign the policy to the other devices using the Assignments tab. See [Modifying Policy Assignments in Policy View](#) , on page 219.

**Note** You can create a Networks/Hosts group object that refers to a Networks/Hosts object with an unspecified value. You do not have to create the device-level overrides before you assign the policy containing the object to devices.

## Specifying IP Addresses During Policy Definition

Many policies and policy objects require that you enter an IP address for a host or network. For some policies or objects, you must enter just a host, or just a network. For other policies or objects, you can enter some combination of hosts and networks. You are prevented from entering or selecting addresses that are not appropriate for the circumstances.

The following is a description of all acceptable formats that you can use, both for IPv4 and IPv6 addresses, although a particular policy or object might not allow specific formats (for example, interface roles are allowed as address designations in only a very limited number of policies). If the policy or object allows it, you can enter multiple addresses by separating them with commas.

- Networks/Hosts object. Enter the name of the object or click **Select** to select it from a list. You can also create new Networks/Hosts objects from the selection list.

**Note** The only way to specify a fully qualified domain name (FQDN) is to use an FQDN Networks/Hosts object, or a group object that includes an FQDN object. You cannot directly type in an FQDN.

- Host IP address, in v4 or v6 format.
  - Complete IPv4 address; for example, 10.10.10.100
  - Complete IPv6 address, showing all eight components. For example, 2001:DB8:0:0:0DB8:800:200C:417A. It is not necessary to include the leading zeros in an individual field. Security Manager converts the address to compressed format if possible.
  - Compressed IPv6 address, where a group of fields is replaced by two colons (::). It is common for IPv6 addresses to contain successive hexadecimal fields of zeros. To make IPv6 addresses less cumbersome, you can use two colons (::) to compress successive hexadecimal fields of zeros at the

beginning, middle, or end of an IPv6 address (the colons represent successive hexadecimal fields of zeros). You can use `::` at most once in an IPv6 address. For example, `2001:DB8::0DB8:800:200C:417A`. The unspecified address, `0:0:0:0:0:0:0:0`, can be represented as `::`. The loopback address is `::1`.

- IPv6 representation of an IPv4 address. When dealing in mixed IPv4/IPv6 environments, you can represent the IPv4 addresses in an alternate IPv6 format: `x:x:x:x:x:d.d.d.d`, where the Xs are the hexadecimal values of the first 6 fields, and the Ds are the IPv4 address with the octets separated by periods. The first 6 fields are either all zeros, `::FFFF`, or `2001:DB8::`. For example, `0:0:0:0:0:0:10.1.68.3`, which in compressed format is `::10.1.68.3`, or `0:0:0:0:0:FFFF:10.1.68.3`, or `2001:DB8::10.1.68.3`.
- Network address, in either IPv4 or IPv6 format:
  - IPv4 address, including subnet mask, in either CIDR format (`10.10.10.0/24`), or dotted decimal format (`10.10.10.0/255.255.255.0`).
  - IPv6 address, including the prefix length in decimal format in a manner similar to CIDR notation for IPv4, for example, `/64`. The number specifies the number of the left-most contiguous bit of the address that comprise the prefix. For example, `2001:DB8:0:CD30::/60`.

**Note** You could also enter `2001:DB8:0:CD30::/60` as `2001::CD30:0:0:0/60`. However, compressing the trailing zeros is the preferred method, and Security Manager will translate the address to `2001:DB8:0:CD30::/60`.

For more detailed information on IPv6 addressing, see the IETF RFC 4291, IP Version 6 Addressing Architecture, at <http://www.ietf.org/rfc/rfc4291.txt>.

- A range of IP addresses. Separate the beginning and ending addresses with a hyphen. The range does not need to be within a single subnet unless the policy requires it.

You can also include a prefix or subnet mask in CIDR format; for example, `2001:db8::1 - 2001:db8::2/64`, or `10.10.10.100-10.10.10.200/24`.

- An IPv4 address pattern in the format `10.10.0.10/255.255.0.255`, where the mask is a discontinuous bit mask (see [Contiguous and Discontiguous Network Masks for IPv4 Addresses](#), on page 309).
- Interface role object (in rare cases). Enter the name of the object or click **Select** to select it from a list (you must select Interface Role as the object type). When you use an interface role, the rule behaves as if you supplied the IP address of the selected interface. This is useful for interfaces that get their address through DHCP, because you do not know what IP address will be assigned to the device. For more information, see [Understanding Interface Role Objects](#), on page 301.

When you create a network/host object or define IP addresses as part of a policy, Security Manager verifies that the syntax of the address is correct and that a mask or prefix was entered when required. For example, when you define a policy that requires a host, you do not need to enter a mask/prefix. However, when you define a policy that requires a subnet, you must enter the address with the mask/prefix, or select a network/host object that has a mask/prefix defined.

## VM Attribute Policies

You can define network objects to filter traffic based on attributes associated with one or more virtual machines (VMs) in a VMware ESXi environment. This environment is managed by VMware vCenter. Users can assign attributes to VMs within the ESXi environment and configure an attribute agent; the attribute agent connects to vCenter or to a single ESXi host using HTTPS and requests and retrieves one or more bindings that associate the specific attribute to the primary IP address of the an ESXi VM.

A single ASA can have multiple attribute agents defined; each communicating with a different vCenter, or one or more communicating with the same vCenter.

This enables a user to define access control lists (ACLs) to assign policies to traffic from a group of VMs that share one or more attributes. This feature is referred to as Policy Based on VM Attributes

The VM attributes feature is supported on all hardware platforms, and on all ASA v platforms running on ESXi, KVM, or HyperV hypervisors. VM attributes can only be retrieved from VMs running on an ESXi hypervisor.

---

**Note** The ASA uses the term attribute or attribute type to refer to the characteristic to be monitored. VMWare uses the term property for the same characteristic. The terms may be used interchangeably.

---

## Communication between the VM attribute agent and vCenter

There are two types of messages exchanged between the VM attribute agent and the vCenter - Property Request and Binding Update.:

- **Property Request** - This is a HTTPS message sent from the ASA to the IP address of the vCenter Server, indicating the complete list of attribute types currently configured for network objects associated with this attribute agent. attributes that have been configured. This message contains the SSL credentials necessary to authenticate the connection to vCenter. The vCenter responds with a corresponding HTTPS response.
- **Binding Update** - This is an asynchronous HTTPS message sent from the vCenter to the ASA, whenever an attribute changes for one or more VMs. Each binding update is identified by the IP address of the VM reporting the attribute change. If multiple attributes are being monitored by a single agent, a single binding update contains the current value of all monitored attributes for each VM. If a specific attribute being monitored by the agent is not configured on a VM, the binding will contain an empty attribute value for that VM. If a VM has not been configured with any monitored attributes, vCenter does not send a binding update to the ASA.

When an attribute agent issues a property request containing a new attribute type, vCenter responds with a binding update for each VM where the attribute type is configured. After that point, vCenter only issues a new binding when an attribute value is added or changed on a VM.

## Attribute Agent States

There are two kinds of attribute agent states - Connection State and Agent State.

- Connection State - This indicates whether or not the attribute agent is currently in contact with vCenter.

Connection State	Explanation
No Host Credentials	The user has not entered vCenter host credentials using the host subcommand, or the agent has been deleted using the no attribute source-group command while there are network objects still using the agent.
Disconnected	The agent has host credentials defined, but is currently not in contact with vCenter. The connection is established when the ASA receives a HTTP 200 response to a keepalive packet.
Connected	The agent has received a response from vCenter to the latest keepalive packet.
Invalid Host Credentials	The agent has attempted to contact vCenter to issue a property request, but the request was rejected because the user name and/or password was incorrect. The agent stays in this state until new credentials are entered, at which point it will move to Disconnected state until a keepalive response is received from vCenter.

- Agent State - This indicates whether or not any network objects are configured to monitor attribute types through this agent.

**Table 70: Agent State Table**

Agent State	Explanation
Inactive	The agent currently has no attributes configured.
Active	The agent has one or more attributes configured. An agent can be Active even if there is no connection to vCenter.

## Guidelines for Configuring vCenter Virtual Machines

To leverage the VM attributes feature, those attributes must be made available to the vCenter server by the managed virtual machines. As an example, some attributes are:

- `summary.config.name` - The user-defined name associated with the virtual machine - for example, VM-build-machine-1
- `summary.config.guestFullName` - The full name of the guest OS running on the virtual machine - for example, Red Hat Enterprise Linux 7 (64-bit)
- `summary.config.annotation` - The text description field for the virtual machine.

For string attribute values such as `summary.config.annotation`, the value in the network object attribute definition must be an exact match to the value reported to vCenter by the VM. For example, a network object attribute value, 'This is a Build Machine' does not match the VM `summary.config.annotation` value, 'this is

a build machine' on the VM. A binding update containing the latter string will not be added to the host-map for the former.

VMs being monitored by the VM attributes feature must have VMware Tools installed. VMware Tools is the software component that reports the IPv4 or IPv6 address of the VM to the vCenter server. Since the function of VM attribute is to bind an IP address to an attribute type/value pair, vCenter will not report any binding information for VMs that are not running VMware Tools.

Within the ESXi environment, VMs are defined by a primary IP address, which roughly corresponds to the management IP address of an ASA. There can only be one primary address per VM, which can be either an IPv4 or IPv6 address. Bindings are always provided between the primary IP address and the attribute type/value pair. If a VM is configured with multiple IP addresses (such as IPv6 link local addresses), vCenter will only send binding updates for the primary address (usually the first address configured).

---

**Note** A user can assign custom attribute types and values to a set of VMs in order to apply a common set of policies to a set of VMs with a common user-defined characteristic.

---

For a comprehensive list of the attributes and related guidelines, refer to the VMware vCenter 5.5/6.0 documentation.

## Configuring VM Attribute Policies

There are three steps to configuring a policy based on VM attributes:

### Step 1

Configure the Network Object Attribute.

- a) Choose **Policy Objects** from the **Manage** menu, or click the Policy Object Manager button in the button bar, to open the Policy Object Manager pane in the lower section of the Configuration Manager window. Select **Networks/Hosts** from the Object Type Selector. Right-click inside the work area and select **New Object** > Attribute; you also can use the + button at the bottom of the pane to add a new network object attribute.

**Note** A Network Attribute Object can be used only if object-group-search is enabled.

- b) Select a VM Attribute Agent, specify a VM Attribute Type and add a value for VM Attribute Value.

### Step 2

Add a VM Attribute Agent.

- a) Specify a Name for the VM Attribute Agent and add a Description for the VM attribute Agent.
- b) By default, the Agent Type is esxi.
- c) Enter the primary IP address of the vCenter server in the DNS Host Name/IP Address field.
- d) Specify a Username and Password to authenticate to the vCenter Server.
- e) Specify a duration of time that the connection is kept active while the agent is contacting the vCenter server. The default value of the Retry Interval is 30 seconds.
- f) Specify the number of times that the agent will attempt to contact the vCenter server before declaring it inactive in the Retry Count field. The default value is 3.
- g) Click OK.

### Step 3

Configure an access-list using a VM Attribute. For more information see [Creating Access Control List Objects](#), on page 281.

**Note** VM Attribute only supports an access-list object.

---

# Understanding Pool Objects

Pool objects have the following uses:

- Specifying pools for use in Layer 3 load balancing for ASA clusters
- Specifying pools for use in Layer 3 EIGRP and OSPFv3 on ASA clusters

The following topics describe how to work with pool objects:

- [Add or Edit IPv4 Pool Dialog Box](#) , on page 321
- [Add or Edit IPv6 Pool Dialog Box](#) , on page 322
- [Add or Edit MAC Address Pool Dialog Box](#) , on page 323
- [Add or Edit NET Pool Object Dialog Box](#), on page 324
- [Add or Edit DHCPv6 Pool Dialog Box](#), on page 325

## Add or Edit IPv4 Pool Dialog Box

Use the Add or Edit IPv4 Pool dialog box to view, create, or edit IPv4 pool objects.

### Navigation Path

Choose **Policy Objects** from the **Manage** menu, or click the Policy Object Manager button in the button bar, to open the Policy Object Manager pane in the lower section of the Configuration Manager window. Select **Pool Objects > IPv4 Pool Object** from the Object Type Selector. Right-click inside the work area and select **New Object** (and select an object type), or right-click a row and select **Edit Object**; you also can use the related buttons at the bottom of the pane to open either dialog box.

### Related Topics

### Field Reference

*Table 71: Add IPv4 Pool Object Dialog Box*

Element	Description
Name	The object name (up to 64 characters). Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects</a> , on page 235.
Description	An optional description of the object.
Type	Select whether the pool object is a single IP address or a range of IP addresses.
Address	The IPv4 address of the single host to include in the object.

Element	Description
Start Address End Address	The first and last IP address that define a range of addresses. The start and end addresses must be different, with the start being lower than the end.
Mask	The subnet mask for the IP address or address range.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.
Allow Value Override per Device Overrides Edit button	<p>Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.</p> <p><b>Note</b> IPv4 Pool objects are always overridable. Clearing this option results in an error.</p> <p>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p>

## Add or Edit IPv6 Pool Dialog Box

Use the Add or Edit IPv6 Pool dialog box to view, create, or edit IPv6 pool objects.

### Navigation Path

Choose **Policy Objects** from the **Manage** menu, or click the Policy Object Manager button in the button bar, to open the Policy Object Manager pane in the lower section of the Configuration Manager window. Select **Pool Objects > IPv6 Pool Object** from the Object Type Selector. Right-click inside the work area and select **New Object** (and select an object type), or right-click a row and select **Edit Object**; you also can use the related buttons at the bottom of the pane to open either dialog box.

Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.  If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.

## Add or Edit DHCPv6 Pool Dialog Box

This dialog box is used to add or edit the DHCPv6 Server Pool. For clients that use StateLess Address Auto Configuration (SLAAC) in conjunction with the Prefix Delegation feature, you can configure the ASA to provide information such as the DNS server or domain name when they send Information Request (IR) packets to the ASA. The ASA only accepts IR packets, and does not assign addresses to the clients.

### Navigation Path

- Choose **Policy Objects** from the **Manage** menu, or click the Policy Object Manager button in the button bar, to open the Policy Object Manager pane in the lower section of the Configuration Manager window. Select **Pool Objects > DHCPv6 Pool Object** from the Object Type Selector. Right-click inside the work area and select **New Object** (and select an object type), or right-click a row and select **Edit Object**; you also can use the related buttons at the bottom of the pane to open either dialog box.

OR

- You can access the Add DHCPv6 Pool dialog box from DHCPv6 Pool Selector dialog box: click the Add Row or Edit Row buttons beneath the Available DHCPv6 Pool table. The DHCPv6 Pool Selector dialog box can be accessed from the Server Pool radio button in the Interface IPv6 DHCP section of the IPv6 panel of the Add Interface and Edit Interface dialog box.

**Table 75: Add DHCPv6 Pool Dialog Box**

Element	Description
Name	The DHCPv6 Pool name should not exceed 200 characters. Object names are not case-sensitive.  For more information, see <a href="#">Creating Policy Objects</a> , on page 235.
	<ul style="list-style-type: none"> <li>• Configure parameters on one or more tabs, to provide responses to IR messages to clients.</li> <li>• For each of these tabs, specify the following as appropriate: <ul style="list-style-type: none"> <li>• DNS/SIP/ NIS/ NISP/ SNTP Server: Enter a server name. Make sure that the IPv6 addresses are in the correct format. For more information on IPv6 address format, see <a href="http://www.ietf.org/rfc/rfc2373.txt">http://www.ietf.org/rfc/rfc2373.txt</a> .</li> <li>• DNS/ SIP/NIS/NISP Domain Name: Enter a domain name. Domain names must begin and end with a digit/letter, only letters, digits and hyphen are allowed as internal characters, labels are separated by a dot. Each label must be up to 63 characters and the entire host name has a maximum of 255 characters. For more information on domain names format, see <a href="http://www.ietf.org/rfc/rfc1123.txt">http://www.ietf.org/rfc/rfc1123.txt</a> .</li> </ul> </li> </ul>
<b>Note</b>	The import command uses one or more parameters that the ASA obtained from the DHCPv6 server on the Prefix Delegation client interface. You can mix and match manually-configured parameters with imported parameters; however, you cannot configure the same parameter manually and in the import command.
Server tab	(Optional) Specify DNS Server Name and Domain Name.
SIP tab	(Optional) Specify SIP Server Name and SIP Domain Name.
NIS tab	(Optional) Specify NIS Server Name and NIS Domain Name.
NISP tab	(Optional) Specify NISP Server Name and NISP Domain Name.
SNTP tab	(Optional) Specify SNTP Server Name.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.  If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.

# Configuring SAML Identity Provider

Beginning with version 4.10, Security Manager enables you to configure Security Assertion Markup Language (SAML) 2.0 based Single-Sign on and Single-Logout for ASA VPN. Single Sign-on Server configuration is no longer supported from ASA version 9.5(2). This has been replaced by SAML Identity Provider.

Security Assertion Markup Language is an XML-based, open-standard data format for exchanging authentication and authorization data between parties, in particular, between an identity provider and a service provider. Identity Provider is a service that can assert a user's identity to another resource. An Identity Provider is responsible for authenticating users in an identity management system. Service Provider is a service that the user wants to access (such as a public or a private web application).

## Navigation Path

Select **Manage > Policy Objects and** then select **SAML Identity Provider** from the Object Type Selector.

## Adding or Editing SAML Identity Provider

Use the Add or Edit SAML Identity Provider dialog box to add a new SAML Identity Provider or edit an existing row.

## Navigation Path

Select **Manage > Policy Objects and** then select **SAML Identity Provider** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

## Field Reference

*Table 76: Add or Edit SAML Identity Provider*

Element	Description
Name	Enter a name for the SAML Identity Provider, between 4 and 256 characters.
Description	(Optional) Enter a description for the SAML Identity Provider.
Sign In URL	This URL is used for signing into the Identity Provider. It must begin with http:// or https:// (not case sensitive) and the length of the Sign In URL must be less than or equal to 500 characters. The Sign In URL field allows only the following special characters: : , / , * , [ , ] , .
Sign Out URL	(Optional) This URL is used for redirecting to when signing out of the Identity Provider. It must begin with http:// or https:// (not case sensitive) and the length of the Sign Out URL must be less than or equal to 500 characters. The Sign Out URL field allows only the following special characters: : , / , * , [ , ] , .

Element	Description
Base URL	<p>(Optional) This is the clientless VPN's base URL. This URL is used in SAML metadata that is provided to third-party identity providers so that they can redirect end users back to the ASA device. If the Base URL is not configured it is retrieved from the ASA device's hostname and domain name. For example, if the host name is ssl-vpn and domain name is xyz, the Base URL used is https://ssl-vpn.xyz.com. The Base URL must begin with http:// or https:// (not case sensitive) and the length of the Base URL must be less than or equal to 500 characters. The Base URL field allows only the following special characters:</p> <p>;, /, *, [, ],.</p> <p><b>Note</b> Either Base URL or Domain Name must be configured in the ASA device to configure SAML.</p>
Identity Provider	Select the Identity Provider from the CA Servers Selector Dialog box. Identity Provider is the service that can assert a user's identity to another resource. An Identity Provider is responsible for authenticating users in an identity management system.
Service Provider	(Optional) Select the Service Provider from the CA Servers Selector Dialog box. Service Provider is the service that the user wants to access (such as a public or private web application).
Request Timeout	(Optional) Enter a value between 1 and 7200. By default there is no SAML timeout.
Enable Signature	<p>(Optional) Enable or disable signature in SAML request. If this is enabled, you must configure the Service Provider.</p> <p>Select the cipher suite for the signature in the Authentication Request drop-down. When you enable the signature, the SHA-256 cipher suite is selected by default. You can change the cipher suite in the Authentication Request drop-down. By default, the Signature is disabled and the Authentication Request drop down is hidden.</p> <p><b>Note</b> You can specify an Authentication Request for a SAML signature, only for ASA 9.8.1 and above.</p>
Enable Internal	<p>(Optional) Enable or disable the Internal flag for SAML Identity Provider. When enabled, the Internal flag identifies the Identity Provider in a private network and the SAML Identity Provider can only be accessed through a WebVPN connection. This also implies that the ASA works as a gateway.</p> <p>By default, the Internal flag is disabled and the Identity Provider can be directly accessed.</p>
Enable Force Re-Authentication	<p>(Optional) Enable or disable Force Re-authentication for SAML Identity Provider. When enabled, the identity provider must authenticate the presenter directly rather than rely on a previous security context.</p> <p>By default, the Force Re-authentication flag is enabled.</p>
Category	(Optional) Select a category between CAT-A to CAT-J.
Allow Value Override per Device	(Optional) If the Allow Value Override per device is selected, edit the Overrides.

# Understanding and Specifying Services and Service and Port List Objects

Many policies in Security Manager require that you identify a service to which the policy applies. A service is a protocol and port definition that identifies a particular type of traffic. In many cases, you can specify the service directly in the policy. You can also select service policy objects that define the required services, or use a combination of service objects and policy-specific service designations.

Service objects are convenient because you can create objects to represent the composition of a particular application, or you can model them after the logical organizations that exist on your network, such as a development team or corporate department. There are two types of service policy object:

- Service group—Can contain one or more service, including other service objects. This is the type of service object that was available in all Security Manager 3.x releases.
- Service object—Can contain a single service.

When configuring a policy that requires that you identify a service, you can select or create service objects by clicking the **Select** button next to the Services field. To create a new service from the selection dialog box, click the **Add** button beneath the service list and select a type: group or object. You can also create services from the **Policy Object Manager** by selecting **Services > Services** from the table of contents and clicking the **Add Object** button and selecting group or object. For information on the specific fields available when creating a service object, see [Configuring Service Objects](#), on page 332.

Security Manager includes a comprehensive collection of predefined service group objects, including ICMP messages and objects for commonly used services such as HTTP, Syslog, POP3, Telnet, and SNMP. Before using a predefined service group object, you should review the object definition to verify that it conforms to your network implementation. If the predefined object does not meet your needs (for example, if you require different destination ports), you can create a new service object from scratch or based on a copy of an existing object. For more information, see [Cloning \(Duplicating\) Objects](#), on page 240.

Whether you are creating a service object or specifying services directly in a policy, you can specify services using the following formats. As you type, Security Manager might prompt you with text-completion options related to your entry. You can select a value from the list and press Enter or Tab. You can enter more than one service by separating services with commas.

- *protocol*, where the protocol is 1-255 or a well known protocol name such as tcp, udp, gre, icmp, and so forth. If you enter a number, Security Manager might convert it to the associated name.
- **icmp**/*message\_type*/*message\_code*, where the message type is 1 to 255 or a well-known ICMP message type name such as echo, and the message code is 0 to 255 (for example, **icmp/unreachable/1** or **icmp/echo-reply**).
- **icmp6**/*message\_type*/*message\_code*, where the message type is 1 to 255 or a well-known ICMP message type name such as echo, and the message code is 0 to 255 (for example, **icmp6/unreachable/1** or **icmp6/echo-reply**).
- **{tcp | udp | tcp&udp}**/*{destination\_port\_number | port\_list\_object}* where the destination port number is 1-65535 or the name of a port list object. You can enter a range of ports using a hyphen, for example, 10-20. The source port number is the Default Range port list object. The Default Range object includes either all ports (1-65535) or all secure ports (1024-65535), depending on the setting you select in the [Policy Objects Page](#), on page 577 (select **Tools > Security Manager Administration > Policy Objects**).

For example, defining a service as tcp/10 means that 10 is the destination port and no source port is defined.

When you specify ports, you can also use the following special keywords: **lt** (less than), **gt** (greater than), **eq** (equal to), and **neq** (not equal to), followed by a number. For example, **lt 440** specifies all ports less than 440.

**Tip** To create port list objects, select **Services > Port Lists** in the **Policy Object Manager** and click the **Add Object** button. For more information, see [Configuring Port List Objects](#), on page 331.

- **{tcp | udp | tcp&udp}**/{*source\_port\_number* | *port\_list\_object* }/ {*destination\_port\_number* | *port\_list\_object* }, where the source and destination port numbers are 1-65535 or the name of a port list object. You can enter a range of ports using a hyphen, for example, 10-20.

For example, defining a service as tcp/10/20 means that 10 is the source port and 20 is the destination port. If you do not want to specify a destination port, use the Default Range port list object, for example, tcp/10/Default Range.

- (Service groups only) *service\_object\_name*, which is the name of another existing service object. Specifying other objects lets you nest object definitions. Click **Select** to select a service object or to create a new object.

The following ICMP message types which are applicable only on IOS devices are automatically replaced with ASA/PIX/FWSM device supported ICMP message types.

- ICMP-Mobile-Redirect
- ICMP-Host-Unreachable
- ICMP-Network-Redirect
- ICMP-Port-Unreachable
- ICMP-Protocol-Unreachable
- ICMP-Reassembly-Timeout
- ICMP-Redirect
- ICMP-protocol-redirect

## Configuring Port List Objects

Use the Port List dialog box to create, edit, or copy a port list object. Each port list object can contain one or more ports or port ranges (for example, 1-1000 and 2000-2500). Additionally, a port list object can include other port list objects.

You typically use port list objects when defining services, but you can also use them in various policies to identify a port rather than typing in the port number. For more information about using port lists in service definitions, see [Understanding and Specifying Services and Service and Port List Objects](#) , on page 329.

---

**Tip** The predefined Default Range port list object includes either all ports (1-65535) or all secure ports (1024-65535), depending on the setting you select in the Security Manager Administration window (select **Tools > Security Manager Administration > Policy Objects** and see [Policy Objects Page](#) , on page 577).

---

### Navigation Path

Select **Manage > Policy Objects**, then select **Services > Port Lists** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

### Related Topics

- [Understanding and Specifying Services and Service and Port List Objects](#) , on page 329
- [Configuring Service Objects](#) , on page 332

### Field Reference

*Table 77: Port List Dialog Box*

Element	Description
Name	The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects</a> , on page 235.
Description	An optional description of the object.

Element	Description
Ports	<p>The ports or ranges included in the port list object, for example, 443, or 1-1000. You can define a single port, a range of ports, multiple port ranges, or any combination of single ports and ranges. Separate multiple entries with commas. Port values range from 1 to 65535.</p> <p>You can use the following operators to identify ranges:</p> <ul style="list-style-type: none"> <li>• <b>gt</b>—Greater than. For example, gt 1000.</li> <li>• <b>lt</b>—Less than. For example, lt 1000.</li> <li>• <b>eq</b>—Equals. For example, eq 1000. However, <b>eq 1000</b> has the same meaning as simply entering <b>1000</b>.</li> <li>• <b>neq</b>—Does not equal. For example, neq 1000.</li> </ul> <p>If you use this operator, you can include only the neq value in the Ports field. However, you can include port ranges in the object. Thus, if you want to create an object that specifies all ports from 1000-1200 except for 1150, create a port list object for the 1000-1200 range, and another object that specifies neq 1150 and that includes the other port list object.</p>
Port Lists	The other port list objects included in the object, if any. Enter the name of the port lists or click <b>Select</b> to select them from a list or to create new objects. Separate multiple entries with commas.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.
Allow Value Override per Device Overrides Edit button	<p>Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a>, on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a>, on page 244.</p> <p>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p>

## Configuring Service Objects

Use the Add and Edit Service dialog boxes to create or edit service objects. You can create a service object to describe a type of traffic carried by the devices in your network. When creating a service object, you must specify the protocol used by the service.

When you create a service object, you must choose the object type:

- Service Group—Can contain one or more services, including other service objects. This is the type of service object available in all Security Manager 3.x releases.
- Service object—Can contain a single service.

Security Manager provides many predefined service group objects. Before creating an object, scan the list in the Policy Object Manager to see if an existing object fits your needs. Note that although you can duplicate a predefined object, you cannot edit it.

Cisco Security Manager supports the service objects whose definitions are available in the show running configuration. For the predefined objects, the definition would not be available in the show running configuration. Therefore, any policies configured with these predefined objects in ASA device would not be discovered in Cisco Security Manager.

In order to align with device behavior, in Cisco Security Manager version 4.17, support to these predefined objects was introduced. The ASA predefined objects will be discovered, provided, the device is updated with the object whenever a new predefined service object is added in the ASA. This feature is supported for ASA supporting images across all versions.

**Note** For referring the predefined service in a user-defined service group, you must use the predefined service with type set as service object and not as service group. If the predefined service does not belong to service object type then create a user-defined service object with the same value and refer it in the user-defined service group.

**Note** The PPTP predefined object is not supported.

However, Cisco Security Manager does not support activity validation with respect to ASA versions. Also, the ICMP and ICMPv6 predefined objects of Cisco Security Manager are converted to device predefined objects. Hence, any usage of Cisco Security Manager's predefined objects causes negation and re-creation of that policy.

### Navigation Path

Select **Manage > Policy Objects**, then select **Services > Services** from the Object Type Selector. Right-click inside the work area and select **New Object** (and select an object type) or right-click a row and select **Edit Object**.

*Table 78: Add and Edit Service Dialog Boxes*

Element	Description
Name	The object name. If you are using the object for ASA or PIX devices running software version 8.x, limit the length of the name to 64 characters. For other devices the name can be up to 128 characters.  Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects</a> , on page 235.
Description	An optional description of the object.

Element	Description
Services (for groups) Service (for objects)	<p>The services to include in this policy object. When creating a Service Group, you can enter more than one service by separating services with commas. When creating a Service Object, you can enter one service only.</p> <p>You can specify services using the following formats. As you type, Security Manager may prompt you with text-completion options related to your entry. If you enter a service that translates directly to a predefined service object, the entry is converted to the predefined object name; for example, TCP/80 is converted to HTTP.</p> <ul style="list-style-type: none"> <li>• <i>protocol</i> , where the protocol is 1 to 255 or a well known protocol name such as tcp, udp, gre, icmp, and so forth. If you enter a number, Security Manager might convert it to the associated name.</li> <li>• <b>icmp/message_type /message_code</b> , where the message type is 1 to 255 or a well-known ICMP message type name such as echo, and the message code is 0 to 255 (for example, <b>icmp/unreachable/1</b> or <b>icmp/echo-reply</b>).</li> <li>• <b>icmp6/message_type /message_code</b> , where the message type is 1 to 255 or a well-known ICMP message type name such as echo, and the message code is 0 to 255 (for example, <b>icmp6/unreachable/1</b> or <b>icmp6/echo-reply</b>).</li> </ul>
	<ul style="list-style-type: none"> <li>• <b>{tcp   udp   tcp&amp;udp}/{destination_port_number   port_list_object }</b> where the destination port number can be 1 to 65535, or the name of a port list object. You can enter a range of ports using a hyphen, for example, 10-20. In this instance, the source port number is the Default Range port list object, which specifies the range 1-65535. (See <a href="#">Configuring Port List Objects</a> , on page 331 for information about creating and editing port list objects.)</li> </ul> <p>Whenever you specify ports, you can also use the following special keywords: <b>lt</b> (less than), <b>gt</b> (greater than), <b>eq</b> (equal to), and <b>neq</b> (not equal to), followed by a number. For example, <b>lt 440</b> specifies all ports less than 440.</p> <ul style="list-style-type: none"> <li>• <b>{tcp   udp   tcp&amp;udp}/{source_port_number   port_list_object }/ {destination_port_number   port_list_object }</b>, where the source and destination port numbers can be 1 to 65535, or the name of a port list object. You can enter a range of ports using a hyphen, for example, 10-20.</li> <li>• (Service groups only) <i>service_object_name</i> , which is the name of another existing service object. Specifying other objects lets you nest object definitions. Click <b>Select</b> to select a service object or to create a new object.</li> </ul>
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.
Allow Value Override per Device	Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.
Overrides Edit button	If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.

The following ICMP message types which are applicable only on IOS devices are automatically replaced with ASA/PIX/FWSM device supported ICMP message types.

- ICMP-Mobile-Redirect
- ICMP-Host-Unreachable
- ICMP-Network-Redirect
- ICMP-Port-Unreachable
- ICMP-Protocol-Unreachable
- ICMP-Reassembly-Timeout
- ICMP-Redirect
- ICMP-protocol-redirect

## How Policy Objects are Provisioned as Object Groups

Object groups are a feature of ASA, PIX, FWSM, and IOS 12.4(20)T+ devices that enable you reduce the size of access rules by grouping objects such as IP hosts, networks, protocols, ports, and ICMP message types. Although the functionality of object groups is similar to the functionality of policy objects in Security Manager, there are several important differences in implementation.

As a result, when deploying policies to a device, it is not always possible to create object groups that are an exact copy of the policy objects that you configured in Security Manager. To take one example, policy object names are unique per object type in Security Manager (that is, you can define a network/host object and a service object with the same name), whereas object groups of all types defined on the device share a single naming scheme. Therefore, if you deploy a network/host object whose name matches an existing service object group on the device, a suffix is added to the name of the network/host object to distinguish it from the service object group.

---

**Note** For information about the options available when deploying object groups, see [Deployment Page](#) , on page 522.

---

Similarly, when discovering policies on a device, it is not always possible to create policy objects that are an exact copy of the object groups that are configured on the device. However, Security Manager preserves as much of the original configuration as possible.

---

**Note** For IOS devices, any policy objects that are used by access control list objects are subsequently replaced during deployment by the contents of the object. Object groups used with ACL objects are not preserved, although they are discovered as Security Manager policy objects.

---

The following sections describe the changes that are made when provisioning policy objects to object groups on the device, or when creating the policy objects when discovering policies on these devices:

- [How Network/Host, Port List, and Service Objects are Named When Provisioned As Object Groups](#) , on page 336

- [How Service Objects are Provisioned as Object Groups](#) , on page 337

## How Network/Host, Port List, and Service Objects are Named When Provisioned As Object Groups

In most cases, network/host, port list, and service objects can be provisioned as object groups without changing the object name. The below table describes how object names are changed when the names cannot be converted directly to object groups on supported devices.

**Note** The predefined network/host object **any** is not provisioned as an object group.

**Table 79: How Network/Host, Port List, and Service Objects are Named as Object Groups**

Condition	New Name	Examples
Object name includes a space.	Space is replaced with an underscore.	An object named <b>my object</b> is provisioned as an object group named <b>my_object</b> .
Object name is longer than 64 characters (the maximum supported by object groups).	Name is truncated so that any suffixes required by the object group (such as <b>_TCP</b> or <b>_UDP</b> , or unique numbers, such as <b>_1</b> ) can be added while remaining within the 64-character limit.	
Device already has an object group (Protocol/ICMP/Service) with the same name.	A numeric suffix is added to the name, starting from 1.	If you have a network/host object named <b>West</b> and the device already has a TCP service object group named <b>West</b> , the name of the object group is changed to <b>West_1</b> when deployed.
You have already created a network/host object group with the same name.	A numeric suffix is added to the name, starting from 1.	If you have a network/host object and a port list or service object that are both named <b>West</b> , the network/host object is deployed as <b>West</b> and the port list is deployed as <b>West_1</b> .

**Note** For ASA software versions 8.2 and earlier, if you create an object of the type Network Object on Security Manager, upon discovering the ASA device with an object of the same object name but of type Network-Object Group, Security Manager does not create a new object. Instead, it reuses the existing objects. However, for ASA software versions 8.3 and later, if you create an object of type Network Object on Security Manager, upon discovering the ASA device with an object of the same object name but of type Network-Object Group, Security Manager creates new objects, say, **name\_1**, **name\_2**, and so on. This implies that for Security Manager managing ASA devices that are running the software version 8.2 or earlier, it creates new objects upon upgrading the ASA to version 8.3 or later.

## How Service Objects are Provisioned as Object Groups

The following table describes how Security Manager creates object groups when deploying service objects to supported devices.

**Tip** For ASA 8.3+ devices, service objects are provisioned using the **object service** command instead of the **object-group** command.

*Table 80: How Service Objects are Provisioned as Object Groups*

Condition	Generated Object Group	Examples
Service object contains the ICMP protocol and ICMP message types.	Generates an ICMP-type object group with the same name as the service object.	Service object service1: <b>icmp/icmp-echo, 23</b> Object group: <pre>object-group icmp-type service1   icmp-object icmp-echo   icmp-object 23</pre>
Service object contains only protocols.	Generates a protocol object group with the same name as the service object.	Service object service1: <b>tcp, gre, 34</b> Object group: <pre>object-group protocol service1   protocol-object tcp   protocol-object gre   protocol-object 34</pre>
Service object uses port list objects for both source and destination ports.	Generates service object groups that match the port list objects.	
Service object contains multiple ports or port ranges, but does not use a port list object for the source ports.	Generates service object group with the name <ObjectName>.src for the source ports.	Service object serv1: <b>tcp/400,600/23-80</b> Object group: <pre>object-group service serv1.src tcp   port-object eq 400   port-object eq 600</pre>

Condition	Generated Object Group	Examples
Service object contains multiple ports or port ranges, but does not use a port list object for the destination ports.	Generates service object group for the destination ports with the same name as the service object.	Service object serv1: <b>tcp/400,600/23-80, 566</b>  Object group:  <pre>object-group service serv1 tcp   port-object range 23 80   port-object eq 566 object-group service serv1.src tcp   port-object eq 400   port-object eq 600</pre>
Service object contains the TCP&UDP protocol and includes defined ports.		Service object serv1: <b>tcp&amp;udp/400,600/23-80, 566</b>  Object group:  <pre>object-group service serv1 tcp   port-object range 23 80   port-object eq 566 object-group service serv1.src tcp   port-object eq 400   port-object eq 600 object-group protocol tcp-udp   protocol-object tcp   protocol-object udp</pre>

## CHAPTER 7

# Managing Flexconfigs

FlexConfig policies allow you to configure device commands that are not otherwise supported by Security Manager. By using Flexconfigs, you can extend Security Manager's control over a device configuration and take advantage of new device features before upgrading the product.

FlexConfig policies are made up of FlexConfig objects. These objects are essentially subroutines that can include scripting language commands, device commands, and variables. You can configure an object to be processed prior to applying the Security Manager configuration to a device, or you can have it processed after the configuration. Security Manager processes your objects in the order you specify so that you can create objects whose processing depends on the processing of another object. A FlexConfig policy object's contents can range from a single simple command string to elaborate CLI command structures that incorporate scripting and variables.

---

**Note** You can configure Cisco Security Manager either to deploy FlexConfigs only once after creation or modification of a FlexConfig, or to deploy FlexConfigs with each deployment. By default, Cisco Security Manager deploys FlexConfigs one time. If you have FlexConfigs that need to be deployed with each deployment, disable the "Deploy only new or modified Flexconfigs" setting on the **Tools > Security Manager Administration > Deployment** page. After changing this setting, you have to manage one-time FlexConfigs by deleting them after they have been deployed. For more information, see [Deployment Page](#), on page 522.

---

Understanding policies and objects is central to understanding and using FlexConfig policy objects. For more information on how Security Manager defines and uses policies, see [Managing Policies](#), on page 165 and for information on how Security Manager defines and uses objects, see [Managing Policy Objects](#), on page 227.

---

**Note** With "Deploy only new or modified Flexconfigs" setting on **Tools > Security Manager Administration > Deployment page** enabled, if you have an activity open, with changes, and when you attempt to deploy FlexConfigs, Cisco Security Manager considers the FlexConfig changes specific to that activity alone and not those of other activities. On the other hand, if all activities are submitted and no activity is open, then Security Manager considers the FlexConfig changes specific to the lastly submitted activity that was submitted with changes. Therefore, if you need FlexConfig changes for an activity to reflect during deployment, then ensure the changes are done in a single activity, submitted, and deployed.

---

The following topics describe FlexConfig policies and policy objects and how to use them:

- [Understanding FlexConfig Policies and Policy Objects](#), on page 340
- [Configuring FlexConfig Policies and Policy Objects](#), on page 363

- [FlexConfig Policy Page](#) , on page 374
- [Troubleshooting FlexConfigs](#) , on page 376

## Understanding FlexConfig Policies and Policy Objects

FlexConfig policy objects are used in FlexConfig policies. They allow you to configure device features that are not otherwise supported by Security Manager, or to otherwise fine-tune your device configurations. These policy objects include device configuration commands, variables, and optionally, scripting language instructions to control processing. FlexConfig objects are essentially programming routines to add content to the device configurations that Security Manager generates.

You can create FlexConfig policy objects from scratch or you can duplicate one of the objects that are included with Security Manager.

FlexConfig policies are simply an ordered list of FlexConfig policy objects. Your objects are processed in the order that you specify.

The following topics help you understand FlexConfig policy objects and by extension, FlexConfig policies. For more information about policy objects in general, see [Managing Policy Objects](#), on page 227.

- [Using CLI Commands in FlexConfig Policy Objects](#) , on page 340
- [Using Scripting Language Instructions](#) , on page 341
- [Understanding FlexConfig Object Variables](#) , on page 343
- [Predefined FlexConfig Policy Objects](#) , on page 358

## Using CLI Commands in FlexConfig Policy Objects

The configuration commands that you enter into the FlexConfig Editor are actual CLI commands used to configure devices, such as PIX Firewalls and Cisco IOS Routers. You can include CLI commands that are not supported in Security Manager. You are responsible for knowing and implementing the command according to the proper syntax for the device type. See the command reference for the particular operating system for more information.

When you create a Flexconfig policy object, you determine whether the commands and instructions should be added to the beginning or end of the configuration that is generated from regular Security Manager policies:

- **Prepended objects**—FlexConfig objects that are processed at the beginning of the configurations. If Security Manager policies configure any of the same commands included in the object, the prepended commands are replaced when configuration files are deployed.
- **Appended objects**—FlexConfig objects that are processed at the end of the configurations, after all other commands in the configuration file and before the **write mem** command.

If the appended commands are already configured on the device, the device generates an error when you try to add them again. To resolve this, two workarounds are available:

- Enter the command that removes the configuration in question as an appended command. For example, if the command is **xyz**, enter the following two lines:

```
no xyz
xyz
```

- Change the setting that controls the action that the device will take to “warn.” This is set under **Tools > Security Administration > Deployment**.

The setting change will affect the behavior of devices for all commands being deployed, not just those designated as appended commands.

---

**Note** If you are deploying to a device, you should remove most appended commands after the initial deployment. This is especially true for object groups, where any unbound object group is replaced in the Ending Command section during command generation, then re-sent each time the configuration is deployed to a device. The device displays an error because the firewall device shows that the object group already exists. If you are deploying to a file or AUS, the appended commands should remain.

---

## Using Scripting Language Instructions

You can use scripting language instructions in a FlexConfig policy object to control how the commands in the object are processed. Scripting language instructions are a subset of commands supported in the Velocity Template Engine, a Java-based scripting language that supports looping, if/else statements, and variables.

Security Manager supports all Velocity Template Engine commands except the **include** and **parse** commands. For information about additional supported commands supported, see the Velocity Template Engine documentation.

The following topics provide examples of the most commonly used functions:

- [Scripting Language Example 1: Looping](#) , on page 341
- [Scripting Language Example 2: Looping with Two-Dimensional Arrays](#) , on page 342
- [Example 3: Looping with If/Else Statements](#) , on page 342

### Scripting Language Example 1: Looping

A plain old telephone service (POTS) dial peer enables incoming calls to be received by a telephony device by associating a telephone number to a voice port. The following example enables caller ID for a set of POTS dial peers.

#### Object Body

```
#foreach ($peer_id in ["2", "3", "4"])
    dial-peer voice $peer_id pots
    caller-id
#end
```

#### CLI Output

```
dial-peer voice 2 pots
caller-id
dial-peer voice 3 pots
caller-id
dial-peer voice 4 pots
caller-id
```

## Scripting Language Example 2: Looping with Two-Dimensional Arrays

In this example, a set of phone numbers is associated to voice ports so that incoming calls can be received at a router.

### Object Body

```
#foreach ($phone in [ [ "2000", "15105552000", "1/0/0" ], [ "2100",
"15105552100", "1/0/1" ], [ "2200", "15105552200", "1/0/2" ] ] )
    dial-peer voice $phone.get(0) pots
    destination-pattern $phone.get(1)
    port $phone.get(2)
#end
```

### CLI Output

```
dial-peer voice 2000 pots
destination-pattern 15105552000
port 1/0/0
dial-peer voice 2100 pots
destination-pattern 15105552100
port 1/0/1
dial-peer voice 2200 pots
destination-pattern 15105552200
port 1/0/2
```

## Example 3: Looping with If/Else Statements

In this example, a set of phone numbers is associated to voice ports so that incoming calls can be received at a router. In addition, another set of phone numbers is associated to IP addresses to enable Voice Over IP outgoing calls from the router.

### Object Body

```
#foreach ( $phone in [ [ "2000", "15105552000", "1/0/0", "" ],
[ "2100", "15105552100", "1/0/1", "" ],
[ "2200", "15105552200", "", "ipv4:150.50.55.55" ]
[ "2300", "15105552300", "", "ipv4:150.50.55.55" ] ] )
    dial-peer voice $phone.get(0) pots
    destination-pattern $phone.get(1)
    #if ( $phone.get(2) == "" )
        session target $phone.get(3)
    #else
        port $phone.get(2)
    #end
#end
```

### CLI Output

```
dial-peer voice 2000 pots
    destination-pattern 15105552000
    port 1/0/0

dial-peer voice 2100 pots
    destination-pattern 15105552100
```

```
port 1/0/1

dial-peer voice 2200 pots
  destination-pattern 15105552000
  session target ipv4:150.50.55.55

dial-peer voice 2300 pots
  destination-pattern 15105552300
  session target ipv4:150.50.55.55
```

## Understanding FlexConfig Object Variables

Variables in FlexConfig policy objects start with the \$ character. For example, in the following line, \$inside is a variable:

```
interface $inside
```

There are three types of variables you can use in a FlexConfig policy object:

- Policy object variables—Static variables that reference a specific property. For example, Text objects are a type of policy object variable. They are a name and value pair, and the value can be a single string, a list of strings, or a table of strings. Their flexibility allows you to enter any type of textual data to be referenced and acted upon by any policy object.

There are three ways to add policy object variables to a FlexConfig policy object. First, move the cursor to the desired location, and then:

- Right-click and select **Create Text Object**. This command opens a dialog box where you can create a simple single-value text object and assign it a value. When you click OK, the variable is added to the object, and it is added to the list of defined Text objects in the Policy Object Manager window so that you can use it in other objects or edit its definition. For an example of creating simple text variables, see [Example of FlexConfig Policy Object Variables](#), on page 344.
- Right-click and select a policy object type from the **Insert Policy Object** sub-menu. These commands open a selector dialog box where you can select the specific policy object that contains the variable that you want to insert. After selecting the policy object, you are presented with the Property Selector dialog box, where you choose the specific property of the object that you want to use and optionally change the name of the variable associated with the property.

By using this technique, you can add a property from an existing policy object when you know that the property has the value that you want to use. For example, if you want to insert a variable that specifies the RADIUS protocol from the AAA Server Group policy object named RADIUS, you would right-click, select **Insert Policy Object > AAA Server Group**, select RADIUS in the AAA Server Group Selector dialog box, click OK, and then select Protocol in the Object Property field on the AAA Server Group Property Selector dialog box and click OK. The \$protocol variable is inserted at the cursor, and the value for the property as defined in the selected object is added to the variables list.

- Type in a variable name. If you type in a variable, you cannot assign it a value until you click OK on the Add or Edit FlexConfig dialog box. You will be prompted that a variable is undefined, and given the opportunity to define its value. In the FlexConfig Undefined Variable dialog box, you can select the object type of the policy object that contains the desired value, which will prompt you to select the specific policy object and variable. This is essentially identical to the process for inserting policy object variables described above. The technique you use is a matter of personal preference; the end result is the same.

- **System variables**—Dynamic variables that reference a value during deployment when the configuration is generated. The values are obtained from either the target device or policies configured for the target device. You can declare system variables to be optional in FlexConfig policy objects, which means that the variables do not need to be assigned a value for it to be deployed to the device.

To insert a system variable into a FlexConfig policy object, move the cursor to the desired location, right-click, and select the variable from the **Insert System Variable** sub-menus. For a description of the available system variables, see [FlexConfig System Variables](#), on page 345.

- **Local Variables**—Variables that are local in the looping and assignment derivatives (the **for each** and **set** statements). Local variables get their values directly from the Velocity Template Engine. There is no need to supply values for the local variables.

To insert a local variable, simply type it in. When you click OK on the Add or Edit FlexConfig dialog box, you will be asked if you want to define the undefined variable. You can click No, or if you click Yes to define other variables, you can leave the object type of the local variable as Undefined.

## Example of FlexConfig Policy Object Variables

Using CLI commands and variables, you can create a FlexConfig policy object to name the inside interface and crypto map on a Cisco router:

```
interface $inside
crypto map $mapname
```

The following example shows how to create a FlexConfig policy object that adds these commands and configures the value of \$inside as **serial0** and \$mapname as **my\_crypto**.

When you add the FlexConfig policy object to a device, and the configuration is generated, the following output is created:

```
interface serial0
crypto map my_crypto
```

- 
- Step 1** Select **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager](#), on page 230).
- Step 2** Select **FlexConfigs** from the table of contents. The table in the right pane lists the existing FlexConfig objects.
- Step 3** Right-click in the table and select **New Object**. The Add FlexConfig dialog box appears (see [Add or Edit FlexConfig Dialog Box](#), on page 367).
- Step 4** Enter a name and optionally a description for the object.
- Tip** You can also enter a group name. Groups help you find FlexConfig objects if you create a lot of them. Either type in a group name, or select an existing one from the drop-down list.
- Step 5** Keep **Appended** for Type so that the commands are added at the end of the device configuration.
- Step 6** Create the content of the object:
- Click in the FlexConfig edit box (the large white box) and type in **interface** followed by a space.
  - Right-click and select **Create Text Object**.
  - In the Create Text Object dialog box, enter **inside** as the name and **serial0** as the value. Click **OK** to add the variable.
  - Press Enter to move to the next line and type **crypto map** followed by a space.
  - Right-click and select **Create Text Object**.

- f) In the Create Text Object dialog box, enter **mapname** as the name and **my\_crypto** as the value. Click **OK** to add the variable.

**Step 7** Click the **Validate FlexConfig** icon button above the edit box to check the integrity and deployability of the object. If any errors are identified, fix them.

**Step 8** Click **OK** to save the policy object. You can now add the object to a device's local or shared FlexConfig policy.

## FlexConfig System Variables

System variables reference values during deployment when commands are generated. Security Manager provides a set of defined system variables for you to use in defining FlexConfig policy objects. The values come from the policies you create for the target devices. The values for these variables are required unless otherwise noted. For information about these variables, see the following tables:

- Device system variables—[Table 81: Device System Variables \(Applying to All Device Types\)](#), on page 345. For more information about discovering or configuring devices to obtain values for these variables, see [Managing the Device Inventory](#), on page 69.
- Firewall system variables—[Table 82: Firewall System Variables](#), on page 347. For more information about firewall policies, see [Managing Firewall Devices](#), on page 1803 and [Introduction to Firewall Services](#), on page 595.
- Router platform system variables—[Table 83: Router Platform System Variables](#), on page 351. For more information about router policies, see [Managing Routers](#), on page 2323.
- VPN system variables—[Table 84: VPN System Variables](#), on page 352. For more information about VPN policies, see [Managing Site-to-Site VPNs: The Basics](#), on page 1071.
- Remote access system variables—[Table 85: Remote Access System Variables](#), on page 357. For more information about remote access policies, see [Managing Remote Access VPNs: The Basics](#), on page 1287.

**Table 81: Device System Variables (Applying to All Device Types)**

Name	Dimension	Description
SYS_DEVICE_IDENTITY	0	Unique device identity for devices managed by a Configuration Engine or Auto Update Server (AUS) as defined on the Tools > Device Properties > General tab. There must be a device identity for devices managed by these servers.
SYS_DOMAIN_NAME	0	DNS domain name as defined on the Tools > Device Properties > General tab. This is not necessarily the same value that is defined in the Platform > Device Admin > Hostname policy.
SYS_FW_OS_MODE	0	Operating system mode of the FWSM or ASA device as defined on the Tools > Device Properties > General tab. Possible values are ROUTER (routed mode), TRANSPARENT, or NOT_APPLICABLE.
SYS_FW_OS_MULTI	0	Whether the FWSM or ASA is running in single- or multiple-context mode as defined on the Tools > Device Properties > General tab. Possible values are SINGLE, MULTI, or NOT_APPLICABLE.

Name	Dimension	Description
SYS_HOSTNAME	0	Device hostname as defined on the Tools > Device Properties > General tab. This is not necessarily the same value that is defined in the Platform > Device Admin > Hostname policy.
SYS_IMAGE_NAME	0	Device image name as defined on the Tools > Device Properties > General tab.
SYS_INTERFACE_IP_LIST	1	<p>IP addresses and masks of the interfaces configured in the Interfaces policy.</p> <p>The IP address and mask are in the x.x.x.x/nn format (for example, 10.20.1.2/24). If there are no interfaces defined on the device, no list is returned.</p> <p>Each element in SYS_INTERFACE_NAME_LIST and SYS_INTERFACE_IP_LIST share the same index for the interface. For example, if element 3 in SYS_INTERFACE_NAME_LIST is for Ethernet1, element 3 in SYS_INTERFACE_IP_LIST is the IP address for Ethernet1. If Ethernet1 has no IP address, element 3 in the SYS_INTERFACE_IP_LIST is empty.</p> <p>This variable is optional.</p>
SYS_INTERFACE_NAME_LIST	1	<p>Names of the interfaces on the device configured in the Interfaces policy. If no interfaces are defined on the device, no list is returned. See the explanation above for SYS_INTERFACE_IP_LIST for additional information.</p> <p>This variable is optional.</p>
SYS_MANAGEMENT_IP	0	Management IP address of the device as defined on the Tools > Device Properties > General tab.
SYS_MDF_TYPE	0	Cisco MDF (MetaData Framework) device type, which indicates the device model. This value is displayed on the Tools > Device Properties > General tab, and is determined when you add the device to Security Manager.
SYS_OS_RUNNING_VERSION	0	Software version of the operating system running on the device as displayed on the Tools > Device Properties > General tab. For example, 12.1, 12.2S, and so on, on an IOS platform. This value is determined when you discover policies from the device.
SYS_OS_TARGET_VERSION	0	Operating system version to be used when generating the device configuration as defined on the Tools > Device Properties > General tab.
SYS_OS_TYPE	0	Operating system for the device as defined on the Tools > Device Properties > General tab. Possible values are IOS, PIX, ASA, FWSM, IPS. You configure this value when you add the device to Security Manager.

Name	Dimension	Description
SYS_SYS_OID	0	System object ID (SysObjId) of the device, which is determined when you add the device to Security Manager.

Table 82: Firewall System Variables

Name	Dimension	Description
SYS_FPM_INPUT_SP	1	FPM policy map names applied on the interface corresponding to the entry in the SYS_FPM_INTERFACE list in the “in” direction.  This data is not configured in Security Manager. It is obtained from a router’s running configuration and is used by the IOS_FPM FlexConfig.
SYS_FPM_INTERFACE	1	Interface names.  This data is not configured in Security Manager. It is obtained from a router’s running configuration and is used by the IOS_FPM FlexConfig.
SYS_FPM_OUTPUT_SP	1	FPM policy map names applied on the interface corresponding to the entry in the SYS_FPM_INTERFACE list in the “out” direction.  This data is not configured in Security Manager. It is obtained from a router’s running configuration and is used by the IOS_FPM FlexConfig.
SYS_FW_ACL_IN_NAME	1	Names of ACLs applied to interfaces for traffic filtering in the inbound direction. Each element has a one-to-one correspondence with the SYS_INTERFACE_NAME_LIST variable for Cisco IOS routers, PIX Firewalls, Firewall Service Modules, and ASA devices.  Configure firewall access rules to generate values for this variable.
SYS_FW_ACL_OUT_NAME	1	Names of ACLs applied to interfaces for traffic filtering in the outbound direction. Each element of this array has a one-to-one correspondence with SYS_INTERFACE_NAME_LIST variable for Cisco IOS routers, PIX Firewalls, Firewall Service Modules, and ASA devices.  Configure Access Rules policies to generate values for this variable.

Name	Dimension	Description
SYS_FW_BRIDGE_INTERFACE_NAMES	1	<p>Names of bridge interfaces.</p> <p>This variable applies only to IOS transparent firewalls.</p> <p>Configure the Firewall &gt; Transparent Rules policies to generate values for this variable.</p>
SYS_FW_ETHERTYPERULE_ACL_NAMES	1	<p>Names of ethertype access-lists applied to interfaces for traffic filtering coming in or going out. Each element of this array has a one-to-one correspondence with the elements in the</p> <p>SYS_FW_ETHERTYPERULE_INTERFACE_NAMES and</p> <p>SYS_FW_ETHERTYPERULE_DIRECTION_NAMES variables.</p> <p>Configure Firewall &gt; Transparent Rules policies to generate values for this variable.</p>
SYS_FW_ETHERTYPERULE_DIRECTION_NAMES	1	<p>Direction that ethertype access-lists are applied. The value is either “in” or “out.” Each element has a one-to-one correspondence with the elements in the</p> <p>SYS_FW_ETHERTYPERULE_ACL_NAMES and</p> <p>SYS_FW_ETHERTYPERULE_INTERFACE_NAMES variables.</p> <p>Configure Firewall &gt; Transparent Rules policies to generate values for this variable.</p>
SYS_FW_ETHERTYPERULE_INTERFACE_NAMES	1	<p>Interface names to which ethertype access-lists are applied. Each element has a one-to-one correspondence with the</p> <p>SYS_FW_ETHERTYPERULE_ACL_NAMES and</p> <p>SYS_FW_ETHERTYPERULE_DIRECTION_NAMES variables.</p> <p>Configure Firewall &gt; Transparent Rules policies to generate values for this variable.</p>
SYS_FW_INSPECT_IN_NAME	1	<p>Names of Inspect Rules applied to Cisco IOS router interfaces in the inbound direction. Each element of this array has a one-to-one correspondence with the</p> <p>SYS_INTERFACE_NAME_LIST variable for Cisco IOS routers.</p> <p>Configure Inspection Rules policies to generate values for this variable.</p> <p>This variable is optional.</p>

Name	Dimension	Description
SYS_FW_INSPECT_OUT_NAME	1	Names of Inspect rules applied to Cisco IOS router interfaces in the outbound direction. Each element of this array has a one-to-one correspondence with the SYS_INTERFACE_NAME_LIST variable for Cisco IOS routers.  Configure Inspection Rules policies as values for this variable.  This variable is optional.
SYS_FW_INTERFACE_HARDWARE_ID_LIST	1	Hardware IDs for the device.  Configure Interface policies on the device to generate values for this variable.  This variable is optional.
SYS_FW_INTERFACE_NETWORK_LIST	1	Interface networks on the device.  Configure Interface policies on the device to generate values for this variable.
SYS_FW_INTERFACE_SECURITY_LEVEL_LIST	1	Interface security levels on the device.  Configure Interface policies on the device to generate values for this variable.
SYS_FW_INTERFACE_STATE_LIST	1	Interface states on the device.  Configure Interface policies on the device to generate values for this variable.
SYS_FW_INTERFACE_VLAN_ID_LIST	0	VLAN IDs on the device.  Configure Interface policies on the device to generate values for this variable.
SYS_FW_IPV6_ACL_IN_NAME	1	A list of all IPv6 ACLs in the In direction on the device.  Configure IPv6 Access Rules policies in the In direction on the device to generate values for this variable.
SYS_FW_IPV6_ACL_OUT_NAME	1	A list of all IPv6 ACLs in the Out direction on the device.  Configure IPv6 Access Rules policies in the Out direction on the device to generate values for this variable.

Name	Dimension	Description
SYS_FW_MPCRULE_TRAFFICFLOW_TUNNELGROUPNAME	1	Names of tunnel groups specified in Traffic Flow objects. Traffic Flow objects configure <b>class-map</b> commands on PIX/ASA devices, and the names of the tunnel groups listed in Traffic Flow objects populate this variable. This variable is used by the <code>ASA_define_traffic_flow_tunnel_group</code> FlexConfig object to create tunnel groups on PIX/ASA devices. This variable is optional.
SYS_FW_MULTICAST_PIM_ACCEPT_REG_ROUTEMAP	0	Route-map name used in the <b>pim accept-register route-map</b> command. Enter a name for the route-map (Platform > Multicast > PIM > Request Filter), then configure its features using FlexConfig to generate values for this variable. This variable is optional.
SYS_FW_NAT0_ACL_NAMES	1	Names of ACLs used in the <b>nat interface_name 0 access-list acl_name</b> command. This variable is optional.
SYS_FW_OSPF_PROCESS_ID_LIST	1	IDs for OSPF routing processes globally configured on PIX Firewalls, Firewall Service Modules, and ASA devices. Configure Platform > Routing > OSPF policies to generate values for this variable.
SYS_FW_OSPF_REDISTRIBUTION_ROUTE_MAP_LIST	1	Names for the route maps to apply to the OSPF redistribute commands configured on PIX Firewalls, Firewall Service Modules, and ASA devices. Configure Platform > Routing > OSPF policies to generate values for this variable.
SYS_FW_POLICY_NAT_ACL_NAMES	1	Names of ACLs used in the <b>policy nat</b> commands (nat commands with non-0 pool id). Configure NAT (NAT > Translation Rules > Policy NAT) to generate values for this variable. This variable applies to only PIX 6.3(3) and later, PIX/ASA 7.x, 8.0(x), 8.1(x), and 8.2(x), and FWSM devices. This variable does not apply to Cisco IOS routers. This variable is optional.

Name	Dimension	Description
SYS_FW_POLICY_STATIC_ACL_NAMES	1	<p>Names of ACLs used in the <b>policy static</b> commands that include access lists.</p> <p>Configure NAT 0 (NAT &gt; Translation Rules &gt; Policy NAT) to generate values for this variable. The variable contains the access-list names used by the <b>nat-0</b>, <b>policy nat</b>, and <b>policy static</b> commands.</p> <p>This variable applies to only PIX 6.3(3) and later, PIX/ASA 7.x, 8.0(x), 8.1(x), and 8.2(x), and FWSM devices. This variable does not apply to Cisco IOS routers.</p> <p>This variable is optional.</p>

Table 83: Router Platform System Variables

Name	Dimension	Description
SYS_ROUTER_BGP_AS_NUMBERS_LIST	1	<p>Autonomous system (AS) number of the border gateway protocol (BGP) and exterior gateway protocol (EGP) on the device.</p> <p>Configure Router Platform &gt; Routing &gt; BGP policies to generate values for this variable.</p> <p>This variable is optional.</p>
SYS_ROUTER_EIGRP_AS_NUMBERS_LIST	1	<p>Autonomous system (AS) numbers of the different enhanced Internet gateway routing protocols (EIGRP) and interior gateway protocols (IGP) on the device.</p> <p>Configure Router Platform &gt; Routing &gt; EIGRP policies to generate values for this variable.</p> <p>This variable is optional.</p>
SYS_ROUTER_OSPF_PROCESS_IDS_LIST	1	<p>Open shortest path first (OSPF) interior gateway protocol (IGP) process numbers on the device.</p> <p>Configure Router Platform &gt; Routing &gt; OSPF Process policies to generate values for this variable.</p> <p>This variable is optional.</p>
SYS_ROUTER_QOS_CLASS_MAP_LIST	1	<p>Names of QoS class maps on the device.</p> <p>Configure Quality of Service policies to generate values for this variable.</p> <p>This variable is optional.</p>

Name	Dimension	Description
SYS_ROUTER_QOS_POLICY_MAP_LIST	1	Names of the QoS policy-maps on the device.  Configure Quality of Service policies to generate values for this variable.  This variable is optional.

Table 84: VPN System Variables

Name	Dimension	Description
<b>Topology</b>		
Variables related to the VPN in which a device participates. Configure VPNs to generate values for these variables.		
SYS_VPN_TOPOLOGY	1	Virtual private network (VPN) topology type. Possible values are HUB_AND_SPOKE, POINT_TO_POINT, and FULL_MESH.
SYS_VPN_TOPOLOGY_NAME	1	Name of the VPN topology in which the device participates.
SYS_VPN_TOPOLOGY_ROLE	1	Details about the role of the device in the VPN. Possible values are PEER, HUB, and SPOKE.
<b>Devices</b>		
Variables related to devices in the VPN in which a device participates. Configure VPNs to generate values for these variables.		
SYS_VPN_HOST_NAME	1	Device hostname.
SYS_VPN_LOCAL_PREFIXES	2	Interface and network IP addresses of protected networks.
SYS_VPN_PRIVATE_INTERFACES	2	Private interface names.
SYS_VPN_PRIVATE_TUNNEL_ENDPT_IP	1	Interface tunnel IP address.
SYS_VPN_PUBLIC_INTERFACES	2	Public interface names.
SYS_VPN_TUNNEL_ENDPT_INTERFACE_IP	1	IP address of the VPN endpoint. In IPSec, the endpoint is the VPN interface; in GRE, it is the tunnel source.
SYS_VPN_TUNNEL_ENDPT_INTERFACE_NAME	1	Name of the VPN endpoint. In IPSec, the endpoint is the VPN interface; in GRE, it is the tunnel source.
SYS_VPN_VPNISM_PUBLIC_IFC	2	Export port names for Catalyst 6000 series switches.

Name	Dimension	Description
<b>Remote Peers</b>		
Variables related to remote peers in which a device participates. Configure VPNs to generate values for these variables.		
SYS_VPN_REM_PEER_BAK_LOGICAL_PRIVATE_IP	3	Interface tunnel IP addresses of remote peers of failover hubs. This value is used in DMVPN for next hop resolution protocol (NHRP).
SYS_VPN_REM_PEER_BAK_PREFIX	3	Protected networks (interface and network IP addresses) of remote peers of failover hubs.
SYS_VPN_REM_PEER_BAK_PUBLIC_IP	3	Public interface names of remote peers of failover hubs.
SYS_VPN_REM_PEER_BAK_TUNNEL_SRC	3	IP address of the VPN endpoint of remote peers. In IPSec, the endpoint is the VPN interface; in GRE, it is the tunnel source.
SYS_VPN_REM_PEER_DEVICE_NAME	2	Device hostnames of remote peers.
SYS_VPN_REM_PEER_LOGICAL_PRIVATE_IP	2	Interface tunnel IP addresses of remote peers. This value is used in DMVPN for next hop resolution protocol (NHRP).
SYS_VPN_REM_PEER_PREFIX	3	Protected networks (interface and network IP addresses) of remote peers.
SYS_VPN_REM_PEER_PRIVATE_IP	2	Private interface names of remote peers.
SYS_VPN_REM_PEER_PUBLIC_IP	2	Public interface names of remote peers.
SYS_VPN_REM_PEER_TUNNEL_SRC	2	Tunnel sources (if included in the interface tunnel of remote peers).
<b>IPSec Proposal</b>		
Variables related to IPSec Proposal policies. For more information, see <a href="#">Configuring IPsec Proposals in Site-to-Site VPNs</a> , on page 1170 and <a href="#">Configuring High Availability in Your VPN Topology</a> , on page 1128. Configure the IPSec Proposal policy to generate values for these variables.		
SYS_VPN_CRYPTOMAP_TYPE	1	Crypto map type. Possible values are STATIC and DYNAMIC.
SYS_VPN_DYNAMIC_CRYPTOMAP_NAME	1	Dynamic crypto map name.
SYS_VPN_DYNAMIC_CRYPTOMAP_NUM	1	Dynamic crypto map number.
SYS_VPN_STATIC_CRYPTOMAP_NAME	1	Static crypto map name.
SYS_VPN_STATIC_CRYPTOMAP_NAME_BAK	1	Static crypto map name of failover hubs.

Name	Dimension	Description
SYS_VPN_STATIC_CRYPTO_NUM	2	Static crypto map number.
SYS_VPN_STATIC_CRYPTO_NUM_BAK	2	Static crypto map number of failover hubs.
<b>Preshared Keys</b>		
Variables related to Preshared Key and IKE Proposal policies. For more information, see <a href="#">Configuring IKEv1 Preshared Key Policies</a> , on page 1197.		
SYS_VPN_IKE_AUTHENTICATION_MODE	1	Authentication method of the IKE policy. Possible values are pre-share, rsa-sig, rsa-encr, dsa-sig.  Configure an IKE Proposal policy to generate values for this variable.
SYS_VPN_IKE_PRIORITY	1	Priority number of the IKE policy  Configure an IKE Proposal policy to generate values for this variable.
SYS_VPN_NEGOTIATION_MODE	1	Negotiation method. Possible values are MAIN_ADDRESS, MAIN_HOST, and AGGRESSIVE.  Configure a Preshared Key policy to generate values for this variable.
<b>GRE Modes</b>		
Variables related to GRE Modes policies. For more information, see <a href="#">Understanding the GRE Modes Page</a> , on page 1225.		
SYS_VPN_BAK_TUNNEL_IFC	2	Interface tunnel number of remote peers of failover hubs, for example, tunnel0.  Configure VPNs to generate values for this variable.
SYS_VPN_SIGP_PROCESS_NUMBER	1	Process number of the interior gateway protocol (IGP).  Configure GRE Modes policies to generate values for this variable.
SYS_VPN_SIGP_ROUTING_PROTOCOL	1	Type of secured interior gateway protocol (IGP) used. Possible values are STATIC, OSPF, EIGRP, RIPV2, BGP, and ODR.  Configure GRE Modes policies to generate values for this variable.

Name	Dimension	Description
SYS_VPN_SPOKE_TO_SPOKE_CONN	1	Whether DMVPN is configured for spoke-to-spoke connectivity. Possible values are true or false.  Configure GRE Modes policies to generate values for this variable.
SYS_VPN_TUNNEL_IFC	2	Interface tunnel number of remote peers, for example, tunnel0.  Configure VPNs to generate values for this variable.
<p><b>VRF</b></p> <p>Variables related to virtual routing and forwarding (VRF). For more information, see <a href="#">Configuring VRF Aware IPsec Settings</a>, on page 1122.</p> <p>Configure VPN VRF settings to generate values for these variables.</p>		
SYS_VPN_VRF_AREA_ID	1	Area ID numbers if the OSPF process number was chosen.
SYS_VPN_VRF_MPLS_INTERFACE_IP	1	Multiprotocol label switching (MPLS) interface IP addresses.
SYS_VPN_VRF_MPLS_INTERFACE_NAME	1	Multiprotocol label switching (MPLS) interface names.
SYS_VPN_VRF_NAME	1	VRF names.
SYS_VPN_VRF_PROCESS_NUMBER	1	Interior gateway protocol (IGP) process numbers.
SYS_VPN_VRF_RD	1	RD values.
SYS_VPN_VRF_ROUTING_PROTOCOL	1	Interior gateway protocol (IGP) values. IGP is used for routing the IPsec aggregator toward the Provider Edge (PE)/Multiprotocol Label Switching (MPLS) network.  Possible values are STATIC, OSPF, EIGRP, RIPV2, and BGP.
SYS_VPN_VRF_SOLUTION	1	Virtual routing and forwarding (VRF) solution. Possible values are 1BOX and 2BOX.
<p><b>CA</b></p> <p>Variables related to certificate authority policies. For more information, see <a href="#">Configuring IKEv1 Public Key Infrastructure Policies in Site-to-Site VPNs</a>, on page 1203.</p>		

Name	Dimension	Description
SYS_VPN_CA_NAME	2	Certificate authority (CA) names. Configure PKI policies to generate values for this variable.
<b>EZVPN</b> Variables related to EZVPN. For more information, see <a href="#">Understanding Easy VPN</a> , on page 1245.		
SYS_VPN_EZVPN_GROUP_NAME	2	User group names. Configure User Group policies to generate values for this variable.
<b>Dial Backup</b> Variables related to dial backup configurations. For more information, see <a href="#">Configuring Dial Backup</a> , on page 1113.		
SYS_VPN_RTR_WATCH	1	The rtr/watch number. Configure dial backup to generate values for this variable.
<b>GETVPN</b> Variables related to Group Encrypted Transport (GET) VPN. For more information, see <a href="#">Understanding Group Encrypted Transport (GET) VPNs</a> , on page 1261.		
SYS_GDOI_GROUP_NAME	1	Name of the Group Domain of Interpretation (GDOI) group. Configure the Group Encryption policy to generate values for this variable (Manage > Site-to-Site VPNs > Group Encryption Policy > Group Settings).
SYS_GM_GET_ENABLED_INTF_NAME	1	VPN-enabled outside interface to the provider edge (PE). Traffic originating or terminating on this interface is evaluated for encryption or decryption, as appropriate. Configure group members to generate values for this variable (Manage > Site-to-Site VPNs > Group Members).

Name	Dimension	Description
SYS_IPSEC_PROFILE_NAME	1	Name of the profile that defines the parameters to be used for IPsec encryption between two group members.  Configure the Group Encryption policy to generate values for this variable (Manage > Site-to-Site VPNs > Group Encryption Policy > Security Associations).
SYS_KS_REG_INTERFACE	0	Interface on the key server assigned to handle group domain of interpretation (GDOI) registrations. If no registration interface is specified, GDOI registrations can occur on any interface.  Configure key servers to generate values for this variable (Manage > Site-to-Site VPNs > Key Servers).

Table 85: Remote Access System Variables

Name	Dimension	Description
SYS_ASA_RA_TUNNEL_GROUP_NAME	2	Tunnel group name for ASA devices.
SYS_ASA_RA_USER_GROUP_NAME	2	Name of the ASA user group.
SYS_EZVPN_RA_DYNAMIC_CRYPTOMAP_NAME	1	Dynamic Crypto map name for EZVPN.
SYS_EZVPN_RA_DYNAMIC_CRYPTOMAP_SEQ_NUM	1	Dynamic Crypto map number for EZVPN.
SYS_EZVPN_RA_PUBLIC_INTERFACE_PIX	2	External interface names for EZVPN for PIX firewall and ASA devices only.
SYS_EZVPN_RA_STATIC_CRYPTOMAP_NAME	1	Static crypto map names for EZVPN.
SYS_EZVPN_RA_STATIC_CRYPTOMAP_SEQ_NUM	1	Static crypto map numbers for EZVPN.
SYS_IOS_RA_CA_NAME	1	Certificate authority (CA) names for Cisco IOS devices.
SYS_IOS_RA_PUBLIC_INTERFACE	1	External interface names for Cisco IOS devices.
SYS_IOS_RA_USER_GROUP	1	User group names for Cisco IOS devices.
SYS_IOS_RA_VRF_NAME	1	Virtual routing and forwarding (VRF) names for Cisco IOS devices.

## Predefined FlexConfig Policy Objects

Security Manager provides predefined FlexConfig policy objects for you to use. These policy objects have predefined commands and scripting.

Predefined FlexConfig policy objects are read-only objects. To edit these predefined FlexConfig policy objects, duplicate the desired object, make changes to the copy, and save it with a new name. This way, the original predefined FlexConfigs remain unchanged. For lists of these predefined policy objects and further information on each, see the following tables:

- Predefined ASA FlexConfig Policy Objects—[Table 88: Predefined Cisco IOS FlexConfig Policy Objects](#), on page 360
- Predefined Catalyst FlexConfig Policy Objects—[Table 87: Predefined Catalyst 6500/7600 FlexConfig Policy Objects](#), on page 360
- Predefined Cisco IOS FlexConfig Policy Objects—[Table 88: Predefined Cisco IOS FlexConfig Policy Objects](#), on page 360
- Predefined PIX Firewall FlexConfig Policy Objects—[Table 89: Predefined PIX 6.3 Firewall FlexConfig Policy Objects](#), on page 362
- Predefined Router FlexConfig Policy Objects—[Table 90: Predefined Router FlexConfig Policy Objects](#), on page 362

**Table 86: Predefined ASA FlexConfig Policy Objects**

Name	Description
ASA_add_ACEs	Adds an access control entry (ACE) to all access control lists on the device.
ASA_add_EtherType_ACL_remark	Loops through a list of ethertype access-list names and adds ACEs or remarks to them. The ethertype access list is the same as Transparent Rules for Firewalls in Security Manager. The remarks set by the CLI in this FlexConfig will be shown in the description field of a transparent rule.
ASA_add_IPv6_ACEs	Loops through a list of IPv6 access lists and adds a <b>deny ip any any log</b> entry to the end of the ACL.
ASA_command_alias	Creates a command alias named “save” for the <b>copy running-config</b> and <b>copy startup-config</b> commands.
ASA_copy_image	Copies an image package from a TFTP server to flash.
ASA_csd_image	Provides an ASA Cisco Secure Desktop image. It copies the CSD image from <code>/CSCOpX/tftpboot/device-hostname</code> on the Cisco Security Manager server to the device, then configures the CSD image path. Make sure you fill out the device’s hostname in Device Properties. If the image name is different than the default, you can override it in Device Properties > Policy Object Overrides > Text Objects > AsaCsdImageName. Unassign this FlexConfig from the device after the image has been copied and configured.

Name	Description
ASA_define_traffic_flow_tunnel_group	Defines site-to-site VPN tunnel groups listed in the SYS_FW_MPCRULE_TRAFFICFLOW_TUNNELGROUPNAME system variable. This variable is populated with tunnel group names defined in Traffic Flow objects.
ASA_established	<p>Permits return access for outbound connections through the security appliance. This command works with an original connection that is outbound from a network and protected by the security appliance and a return connection that is inbound between the same two devices on an external host.</p> <p>Uses the <b>established</b> command to specify the destination port that is used for connection lookups, which gives you more control over the command and supports protocols where the destination port is known, but the source port is unknown. The <b>permitto</b> and <b>permitfrom</b> keywords define the return inbound connection.</p>
ASA_FTP_mode_passive	Sets the FTP mode to passive.
ASA_generate_route_map	Generates a route map to be used by the <b>pim accept-register route-map</b> command configured under Platform > Multicast > PIM > Request Filter. Security Manager exports the route-map name used in the <b>pim</b> command so that you can configure it as desired.
ASA_IP_audit	<p>Uses the <b>ip-audit</b> command to provide the following:</p> <ul style="list-style-type: none"> <li>• Sets the default actions (alarm, drop, reset) for packets that match an attack signature.</li> <li>• Sets the default actions (alarm, drop, reset) for packets that match an informational signature.</li> <li>• Creates a named audit policy that identifies the actions to take (alarm, drop, reset) when a packet matches a defined attack signature or an informational signature.</li> <li>• Disables a signature for an audit policy.</li> <li>• Assigns an audit policy to an interface.</li> </ul>
ASA_MGCP	Identifies a specific map for defining the parameters for Media Gateway Control Protocol (MGCP) inspection.
ASA_no_router_Id	Removes the router ID for each OSPF process.
ASA_no_shut_Intf	Loops through and enables all interfaces on a device.
ASA_privilege	Sets the privilege levels for the <b>configuration</b> , <b>show</b> and <b>clear</b> commands.
ASA_route_map	Defines a route map for each OSPF process redistribution route map name.

Name	Description
ASA_RSA_KeyPair_generation	Resets and generates RSA key pairs for certificates.
ASA_svc_image	Provides an ASA SSL VPN Client image. It copies the SVC image from /CSCOpX/tftpboot/device-hostname on the Cisco Security Manager server to the device, then configures the SVC image path. Make sure you fill out the device's hostname in Device Properties. If the image name is different than the default, you can override it in Device Properties > Policy Object Overrides > Text Objects > AsaSvcImageName. Unassign this FlexConfig from the device after the image has been copied and configured.
ASA_sysopt	Uses the <b>sysopt</b> command to provide the following examples: <ul style="list-style-type: none"> <li>• Ensures that the maximum TCP segment size does not exceed the value you set or that the minimum is not less than a specified size.</li> <li>• Forces each TCP connection to remain in a shortened TIME_WAIT state of at least 15 seconds after the final normal TCP close-down sequence.</li> <li>• Disables DNS inspection that alters the DNS A record address.</li> <li>• Ignores the authentication key in RADIUS accounting responses.</li> <li>• Enables the web browser to supply a username and password from its cache when it reauthenticates with the virtual HTTP server on the security appliance.</li> </ul>
ASA_virtual	Configures virtual HTTP and Telnet servers.

Table 87: Predefined Catalyst 6500/7600 FlexConfig Policy Objects

Name	Description
Cat6K_ECLB_algorithm	Sets the Ether Channel load balance algorithm for modules.
Cat6K_ECLB_port_mode	Applies an Ether Channel to the Catalyst trunk ports where IPS sensors are plugged in. Make sure the ports are configured in trunk mode.
Cat6K_ECLB_portchannel	Sets the port channel to trunk mode and add trunk-allowed VLANs.
Cat6K_firewall_multiple_vlan_interfaces	Sets multiple VLAN interfaces mode if multiple SVIs need to be provisioned.

Table 88: Predefined Cisco IOS FlexConfig Policy Objects

Name	Description
IOS_add_bridge_interface_desc	Loops through a list of bridge interfaces and adds the description "this is a bridge interface."

Name	Description
IOS_CA_server	Configures a certificate authority server.
IOS_compress_config	Compresses large Cisco IOS configurations.
IOS_config_root_wireless_station	Creates and configures the root radio station for a wireless LAN on Cisco IOS routers such as the 851 and 871.
IOS_console_AAA_bypass	<p>Provides examples of the following scenarios:</p> <ul style="list-style-type: none"> <li>• Enables the authentication, authorization, and accounting (AAA) access-control model.</li> <li>• Sets AAA at login.</li> <li>• Enables AAA authentication for logins.</li> </ul>
IOS_Copy_Image	Copies the an SVC image from the Security Manager server to the device, then configures the SVC image path. Unassign this FlexConfig from the device after the image has been copied and configured.
IOS_enable_SSL	Enables SSL.
IOS_FPM	Copies traffic class definition files to a router and applies policy-maps.
IOS_IPS_PUBLIC_KEY	Defines public keys on an IOS IPS device. Public keys are required for Security Manager to perform signature updates.
IOS_IPS_SIGNATURE_CATEGORY	Retires all signatures except those in the ios_ips basic category.
IOS_PKI_with_AAA	Configures a PKI AAA authorization using the entire subject name.
IOS_set_clock	Sets the clock to the current time on the Security Manager server.
IOS_VOIP_advance	Loops through and associates a POTS port number to a telephone number and port or IP address number.
IOS_VOIP_simple	Associates a POTS port number to a telephone number and port number.
IOS_VPN_config_gre_tunnel	Uses VPN variables to configure the GRE tunnel for each VPN in which the device participates.
IOS_VPN_set_interface_desc	Using VPN variables, updates the description of the public interface for each VPN in which the device participates.
IOS_VPN_shutdown_inside_interface	Using VPN variables, shuts down all inside interfaces for each VPN in which the device participates.
IOS_VRF_on_vFW	Configures virtual routing and forwarding (VRF) on virtual firewall interfaces.

Table 89: Predefined PIX 6.3 Firewall FlexConfig Policy Objects

Name	Description
PIX6.3_nat0_acl_compiled	Generates a compiled access list for NAT 0 access-control lists.
PIX6.3_policy_nat_acl_compiled	Generates a compiled access list for Policy NAT ACLs
PIX6.3_policy_static_acl_compiled	Generates a compiled access list for Policy Static ACLs.
PIX_VPDN	Configures a virtual private dialup network (VPDN).

Table 90: Predefined Router FlexConfig Policy Objects

Name	Description
ROUTER_add_inspect_rules	Loops through and appends inspect rules.
ROUTER_BGP_no_auto_summary	Disables the auto route summary for each BGP process by using the <b>no auto-summary</b> sub-command.  This FlexConfig policy object uses the list of border gateway protocol (BGP) numbers from the SYS_ROUTER_BGP_AS_NUMBERS_LIST system variable.
ROUTER_BGP_untrusted_info	Uses the <b>distance bgp 255 255 255</b> sub-command to make the border gateway protocol (BGP) routing information untrusted for each BGP.  This FlexConfig policy object uses the list of BGP numbers from the SYS_ROUTER_BGP_AS_NUMBERS_LIST system variable.
ROUTER_EIGRP_min_cost_routes	Configures traffic to use minimum cost routes when multiple routes have different cost routes to the same destination network. This is done using multi-interface load splitting on different interfaces with equal cost paths.  This FlexConfig policy object uses the list of router enhanced interior gateway routing protocol (EIGRP) numbers from the SYS_ROUTER_EIGRP_AS_NUMBERS_LIST system variable.
Router_EIGRP_no_auto_summary	Disables the auto route summary for each router enhanced interior gateway routing protocol (EIGRP) processes by using the <b>no auto-summary</b> sub-command. This FlexConfig policy object uses the list of EIGRP numbers from the SYS_ROUTER_EIGRP_AS_NUMBERS_LIST system variable.
ROUTER_interface_prevent_dos_attacks	Prevents denial-of-service (DOS) attacks on all device interfaces.  This FlexConfig policy object uses the list of interface names from the SYS_INTERFACE_NAME_LIST system variable.
ROUTER_OSPF_no_router_Id	Removes the router OSPF ID for each OSPF process.  This FlexConfig policy uses the list of OSPF IDs from the SYS_ROUTER_OSPF_PROCESS_IDS_LIST system variable.

Name	Description
ROUTER_QoS_Class_Map_description	Sets QoS class map descriptions. This FlexConfig policy object uses the list of router QoS class names from the SYS_ROUTER_QOS_CLASS_MAP_LIST system variable.
ROUTER_QoS_Policy_Map_description	Sets QoS policy descriptions. This FlexConfig policy object uses the list of router QoS policy names from the SYS_ROUTER_QOS_POLICY_MAP_LIST system variable.

## Configuring FlexConfig Policies and Policy Objects

You create and manage FlexConfig policy objects in the same way that you create other policy objects. The following topics describe how to create FlexConfig policies and policy objects. For information on other tasks you can perform with FlexConfig policy objects (such as deleting them), see [Working with Policy Objects—Basic Procedures](#), on page 235.

- [A FlexConfig Creation Scenario](#), on page 363
- [Creating FlexConfig Policy Objects](#), on page 366
- [Editing FlexConfig Policies](#), on page 373

### A FlexConfig Creation Scenario

This scenario takes you through the steps to set up Media Gateway Control Protocol (MGCP) for an ASA device using one of the predefined FlexConfig policy objects that are shipped with Security Manager. MGCP is used by the call agent application to control media gateways (devices that convert telephone circuit audio to data packets). Security Manager does not support MGCP configuration, but you can use a FlexConfig policy object to provide a configuration. This illustrates how FlexConfigs enable you to customize, for your network, what is not otherwise supported in Security Manager.

In this scenario, you do the following:

1. Create a policy object by duplicating an existing policy object.
2. Assign the policy object to a device.
3. Preview the configuration to verify that it is correct.
4. Share the policy object with another device.
5. Deploy the configuration to the devices.

You can use this scenario as an example to implement other features by creating copies of and modifying predefined FlexConfig policy objects or by creating your own objects.

#### Before You Begin

Add two ASA devices to Security Manager for this scenario.

**Step 1** Duplicate the FlexConfig policy object by doing the following:

- a) Select **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager](#) , on page 230).
- b) Select **FlexConfigs** from the table of contents. The table in the right pane lists the existing FlexConfig objects.
- c) Right-click ASA\_MGCP FlexConfig and select **Clone Object**. The Add FlexConfig dialog box appears (see [Add or Edit FlexConfig Dialog Box](#) , on page 367).
- d) Enter a name for the new FlexConfig object, for this example, MyASA\_MGCP.
- e) Enter a new group name and a description of the object.

**Tip** The group name and description are optional. We recommend you establish descriptions and groups for objects you create.

- f) Click **OK**. The new FlexConfig object appears in the list.

**Step 2** Duplicate and edit the \$callAgentList text object.

The original ASA\_MGCP FlexConfig object uses the variable \$callAgentList, which is a text object. The text object is read-only and cannot be edited. Duplicating the text object enables you to edit the duplicate object to apply to your network settings.

- a) Select **Text Objects** from the table of contents.
- b) Right-click **callAgentList** and select **Clone Object**. The Add Text Object dialog box appears.
- c) Edit the name of the text object. For this example change it to mycallAgentList.
- d) Double-click the first value in column A and enter the IP address for a call agent in your network. For this example, change the value to 10.10.10.10.
- e) Double-click the first value in column B and enter the port number for a call agent in your network. For this example, change the value to 105.
- f) Change the IP address and port number values for another call agent. For this example, change the IP address to 20.20.20.20 and the port number to 106. Or, if you have only one call agent in your network, you could remove the second row in the table by decreasing the number in the Number of Rows field. Similarly, if you have *more* than two call agents, you can add rows by increasing the number in this field.

This concept is similar for increasing and decreasing the number of columns by increasing or decreasing the Number of Columns field.

- g) Click **OK**. The new text object appears in the list of text objects.

**Step 3** Edit the new FlexConfig policy object to use the new variable by doing the following:

- a) Select **FlexConfigs** from the table of contents.
- b) Double-click MyASA\_MGCP. The Edit FlexConfig dialog box appears.
- c) Edit \$callAgentList to read \$mycallAgentList.
- d) Click **OK**.

A warning appears that reads: “The following variables are undefined: mycallAgentList Define them now?”

- e) Click **Yes** to the warning.

The FlexConfig Undefined Variables dialog box appears with mycallAgentList listed in the Variable Name column.

- f) From the Object Type list, select **Text Objects**. The Text Objects window appears.
- g) Select **mycallAgentList** from the Available Text Objects list and click **OK**.
- h) In the FlexConfig Undefined Variables window, click **OK**.

The mycallAgentList variable appears in the Variables list of the Edit FlexConfig dialog box.

- i) In the Edit FlexConfig dialog box, click **OK**.
- j) Close the Policy Object Manager window.

**Step 4** Assign the new FlexConfig policy object to a device by doing the following:

- a) From the Device view, select the device for which you want to set up MGCP.
- b) Select **FlexConfigs** from the Policy selector. The FlexConfigs Policy page appears.
- c) Click the **Add** button. The FlexConfigs Selector dialog box appears.
- d) Select the new MyASA\_MGCP FlexConfig policy object and click >> to add the policy object to the Selected FlexConfigs column.

You can select multiple policy objects at one time by holding either the Ctrl (for multiple selections) or Shift (for multiple continuous selections) keys while selecting.

- e) Click **OK**.

The MyASA\_MGCP policy object is added to the Appended FlexConfigs table, because the object is set to be appended to the configuration. You configure FlexConfig policy objects that you want added to the beginning of the configuration as prepended policy objects.

- f) Click **Save**.

**Step 5** Preview the commands before they are generated and sent to the device by doing the following:

- a) From the FlexConfigs Policy page, select the MyASA\_MGCP policy object.
- b) Click **Preview**.

The commands that are generated with this FlexConfig policy object and the values assigned to the selected device appear. Note the changed values:

**Example:**

```
class-map sj_mgcp_class
  match access-list mgcp_list
  exit
mgcp-map inbound_mgcp
  call-agent 10.10.10.10 105
  call-agent 20.20.20.20 106
  gateway 10.10.10.115 101
  gateway 10.10.10.116 102
  command-queue 150
  exit
policy-map inbound_policy
  class sj_mgcp_class
    inspect mgcp inbound_mgcp
  exit
exit
service-policy inbound_policy interface outside
```

**Step 6** If you have additional ASA devices that require MGCP, you can share this policy with them by doing the following:

- a) Right-click **FlexConfigs** in the Policy selector and select **Share Policy**.

The Share Policy dialog box appears.

- b) Enter a name for the policy and click **OK**. For this example, enter MyShared\_ASA\_MGCP.

The banner above the FlexConfigs policy now shows that the device is using a shared policy and displays the name of the policy.

- c) In the FlexConfigs banner, click the link in the Assigned To field. In this example, the link should be labeled **1 Device**, which indicates that this shared policy is assigned to one device (the device you are viewing).

Clicking the link opens the Shared Policy Assignments dialog box. Using this dialog box, you can select the other devices that should use this policy in the Available Devices list, and click >> to add them to the list of devices that are assigned the policy.

- d) Click **OK**. The Shared Policy Assignments dialog box closes, and the additional devices you selected are configured to use the shared policy. The link in the banner changes to indicate the number of devices that now use this policy (in this example, **2 Devices**).

**Tip** You can also share policies from Policy view. Select **View > Policy View**, select FlexConfigs in the policy type selector, select the MyShared\_ASA\_MGCP policy, click the Assignments tab, select the devices to which you want to assign the policy, click>>, and then **Save**.

**Step 7** Submit your changes and deploy the configurations to the devices. For information about deploying configurations, see [Working with Deployment and the Configuration Archive](#) , on page 403.

## Creating FlexConfig Policy Objects

You can create FlexConfig policy objects to configure features on devices that are not supported by Security Manager. For more information about FlexConfig objects, see [Understanding FlexConfig Policies and Policy Objects](#) , on page 340.

**Tip** You can also create FlexConfig policy objects when defining policies or objects that use this object type. For more information, see [Selecting Objects for Policies](#) , on page 228.

### Before You Begin

Ensure that your commands do not conflict in any way with the VPN or firewall configuration on the devices.

Keep the following in mind:

- Security Manager does not manipulate or validate your commands; it simply deploys them to the devices.
- If there is more than one set of commands for an interface, only the last set of commands is deployed. Therefore, we recommend you not use beginning and ending commands to configure interfaces.
- When editing FlexConfig objects that involve route-maps (for example, OSPF or multicast route-maps), you must define the corresponding access control lists (ACLs) before the route-maps. This is a device requirement. If you do not define ACLs before route-maps, you will get a deployment error.

- 
- Step 1** Select **Manage > Policy Objects** to open the Policy Object Manager window (see [Policy Object Manager](#) , on page 230).
- Step 2** Select **FlexConfigs** from the Policy Object Type selector.
- Step 3** Right-click inside the work area and select **New Object**.  
The Add FlexConfig Object dialog box appears (see [Add or Edit FlexConfig Dialog Box](#) , on page 367).
- Step 4** Enter a name for the object and optionally a description. Other optional informational fields include:
- Group—Select an existing group name or type in a new one. These names can help you identify the use of an object.
  - Negate For—If this FlexConfig object is designed to negate another, enter the name of the FlexConfig object whose commands are undone by this object.
- Step 5** In the Type field, select whether commands in the object are to be prepended (put at the beginning) or appended (put at the end) of the configurations generated from Security Manager policies.
- Step 6** In the object body area, enter the commands and instructions to produce the desired configuration file output. You can type in the following types of data:
- Scripting commands to control processing. For more information, see [Using Scripting Language Instructions](#) , on page 341.
  - CLI commands that are supported by the operating system running on the devices to which you will deploy the FlexConfig policy object. For more information, see [Using CLI Commands in FlexConfig Policy Objects](#) , on page 340.
  - Variables. You can insert variables using the right-click menu, which allows you to create simple single-value text variables (**Create Text Object**), select variables from existing policy objects (**Insert Policy Object**), or select system variables (**Insert System Variable**). For more information, see [Understanding FlexConfig Object Variables](#) , on page 343.
- Tip** If you want to remove a variable, select it in the object body and click the Cut button or press the Backspace or Delete key. When you click **OK** to save your changes, the variable is removed from the list of variables.
- Step 7** Click the **Validate FlexConfig** icon button above the object body to check the integrity and deployability of the object.
- Step 8** Click **OK** to save the object.
- 

## Add or Edit FlexConfig Dialog Box

Use the Add or Edit FlexConfig dialog box to create or edit FlexConfig policy objects. FlexConfig objects are small programs that allow you to add configuration commands before or after the configurations generated from Security Manager policies, so that you can extend the abilities of the product to configure your devices. You use these policy objects in FlexConfig device or shared policies.

Before creating FlexConfig policy objects, read the sections in [Understanding FlexConfig Policies and Policy Objects](#) , on page 340.

### Navigation Path

Select **Manage > Policy Objects**, then select **FlexConfigs** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

## Related Topics

- [Creating FlexConfig Policy Objects](#) , on page 366
- [Editing FlexConfig Policies](#) , on page 373

## Field Reference

**Table 91: FlexConfigs Editor Dialog Box**

Element	Description
Name	The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects</a> , on page 235.
Description	An optional description of the object.
Group	The name of the group of FlexConfig objects to which this object belongs, if any. You can type in a name, or select an existing name from the list. This field is for informational purposes only, and can help you find a FlexConfig object in the FlexConfig Objects page in the Policy Object Manager.
Type	Whether the commands in the object are prepended (put at the beginning) or appended (put at the end) of configurations.
Negate For	The name of the FlexConfig object whose commands are undone in this FlexConfig object. This field is for informational purposes only and does not affect the processing of the object.  For example, if FlexConfig A has the command <b>banner login</b> , and FlexConfig B has the command <b>no banner login</b> , FlexConfig B negates the configuration for FlexConfig A.
FlexConfig Object Body	
Object Body edit box	The commands and instructions to produce the desired configuration file output. You can type in the following types of data: <ul style="list-style-type: none"> <li>• Scripting commands to control processing. For more information, see <a href="#">Using Scripting Language Instructions</a> , on page 341.</li> <li>• CLI commands that are supported by the operating system running on the devices to which you will deploy the FlexConfig policy object. For more information, see <a href="#">Using CLI Commands in FlexConfig Policy Objects</a> , on page 340.</li> <li>• Variables. You can insert variables using the right-click menu, which allows you to create simple single-value text variables (<b>Create Text Object</b>), select variables from existing policy objects (<b>Insert Policy Object</b>), or select system variables (<b>Insert System Variable</b>). For more information, see <a href="#">Understanding FlexConfig Object Variables</a> , on page 343.</li> </ul>
Undo button	Deletes the previous action.
Redo button	Performs the previously undone action.

Element	Description
Cut button	Deletes the highlighted text and copies it to the clipboard.
Copy button	Copies the highlighted text to the clipboard.
Paste button	Pastes previously cut or copied text.
Find button	Locates the specified text string in the object body.
Validate FlexConfig button	Checks the integrity and deployability of the FlexConfig object.
<b>FlexConfig Object Variables</b>	
This table lists the variables that are used in the FlexConfig object.	
Name	The name of the variable. Click the cell to edit the name, which also changes the name in the FlexConfig object body.
Default Value	The value to use when one is not provided. Click the cell to edit the value for user-defined variables. You cannot edit system-defined variables.  <b>Note</b> Except for optional variables, if a default value is not provided, you must provide a value for the variable.
Object Property	The property of the object. The object property name is in the following format: <i>type.name .data.property</i> where <ul style="list-style-type: none"> <li>• <i>Type</i> —The type of object, for example Text, Network, AAA Server, and so on.</li> <li>• <i>Name</i> —The name of the object.</li> <li>• <i>Data</i>—Indicates that the property of the object is data.</li> <li>• <i>Property</i> —The property of the data.</li> </ul>
Dimension	The structure of the data in the variable. Possible values are: <ul style="list-style-type: none"> <li>• 0—scaler (a single string)</li> <li>• 1—one-dimensional array (a list of strings)</li> <li>• 2—two-dimensional table (a table of strings)</li> </ul>
Optional	Whether the variable is required to have a value.
Description	A description of the contents of the object. Click the cell to edit the description.

## Create Text Object Dialog Box

Use the Create Text Object dialog box as a shortcut to create text objects of dimension 0, which are single-value variables, for use in FlexConfig policy objects. Enter the name of the variable and the value to assign to it.

When you click **OK**, the variable is added to the FlexConfig object at the cursor location and it is added to the list of variables for the object.

### Navigation Path

In the [Add or Edit FlexConfig Dialog Box](#), on page 367, right-click in the object body field and select **Create Text Object**.

**Tip** If you want to create a multiple-value text object, right-click and select **Insert Policy Object > Text Objects**, and click the **Add** button under the available objects list. For more information, see [Add or Edit Text Object Dialog Box](#), on page 370.

## Add or Edit Text Object Dialog Box

Use the Add or Edit Text Object dialog box to create, edit, duplicate, and view text objects. Create a text object if you need textual data to be referenced and acted upon by another policy object that accepts text objects.

Text objects are a type of policy object variable. They are a name and value pair, where the value can be a single string, a list of strings, or a table of strings. You can enter any type of textual data to be referenced and acted upon by FlexConfig policies. For more information about FlexConfigs, see [Understanding FlexConfig Policies and Policy Objects](#), on page 340.

Create the variable by first selecting the dimension: a simple single-value variable (dimension 0), a list of variables (dimension 1) or a table or variables (dimension 2). After you create the desired grid by selecting the dimension and if applicable, the number of rows and columns, enter the data into each cell by first clicking in the cell.

### Navigation Path

Select **Manage > Policy Objects**, then select **Text Objects** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

### Field Reference

*Table 92: Text Object Dialog Box*

Element	Description
Name	The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects</a> , on page 235.
Description	An optional description of the object (up to 1024 characters).
Dimension	The structure of the data in the variable: <ul style="list-style-type: none"> <li>• 0—scalar (a single string)</li> <li>• 1—one-dimensional array (a list of strings)</li> <li>• 2—two-dimensional table (a table of strings)</li> </ul>

Element	Description
Number of Rows	The number of data rows in the variable if the dimension is 1 or 2.
Number of Columns	The number of data columns in the variable if the dimension is 2.
[text field]	The content of the text object. Click the cell and enter the data.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.  If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.

## FlexConfig Undefined Variables Dialog Box

Use the FlexConfig Undefined Variables dialog box to define variables used in the FlexConfig object that have not yet been defined. You can choose from a list of policy object types or add a new policy object to use.

Each row in the table represents a single undefined variable.

**Tip** You do not need to define local variables, those used by the scripting language for processing control. For more information about variables, see [Understanding FlexConfig Object Variables](#) , on page 343.

### Navigation Path

In the [Add or Edit FlexConfig Dialog Box](#) , on page 367, if you enter a variable name but do not define its values, when you click **OK**, Security Manager displays a warning and asks if you want to define the variables. If you click **Yes**, this dialog box is opened.

### Field Reference

*Table 93: FlexConfig Undefined Variables Dialog Box*

Element	Description
Variable Name	The name of the undefined variable that you used in the FlexConfig object.

Element	Description
Object Type	<p>The type of policy object that contains the value you want to assign to the variable. For local variables, use the Undefined object type.</p> <p>For variables you want to define, you must select the specific policy object and value within that object to assign to the selected variable.</p> <p>You start by selecting the type of policy object from this list. You are then prompted to select the specific policy object. When you click <b>OK</b>, you are prompted to select the specific property within that object that contains the desired value (see <a href="#">Property Selector Dialog Box , on page 372</a>). When you select the value on the Property Selector dialog box and click <b>OK</b>, the value is assigned to the variable.</p>
Object Property	The property of the object. For a detailed explanation, see <a href="#">Add or Edit FlexConfig Dialog Box , on page 367</a> .
Optional	Whether the variable is required to have a value.

## Property Selector Dialog Box

Use the Property Selector dialog box to select the specific property within a selected policy object that you want to assign to a variable within a FlexConfig policy object. The title of the dialog box indicates the type of policy object that you selected (for example, AAA Server Groups Property Selector).

For more information on variables, see [Understanding FlexConfig Object Variables , on page 343](#).

### Navigation Path

- In the [Add or Edit FlexConfig Dialog Box , on page 367](#), right-click and select a specific policy object group type from the **Insert Policy Object** menu, select a specific policy object when prompted, and click **OK**.
- In the [FlexConfig Undefined Variables Dialog Box , on page 371](#), select a policy object type from the Object Type field, select a specific policy object when prompted, and click **OK**.

### Field Reference

*Table 94: Property Selector Dialog Box*

Element	Description
Object Property	The property of the object that contains the value you want to assign to the variable. For specific information on the properties, see topics related to the configuration of those objects.
Name	The name of variable. This field is not available when you are defining undefined variables.
Description	An optional description of the variable. This field is not available when you are defining undefined variables.

## Editing FlexConfig Policies

You can assign FlexConfig policies to devices using either Device view or Policy view (for shared policies) by selecting **FlexConfigs** from the policy selector. You can deploy configurations containing these policies as you would deploy any configuration generated by Security Manager. For a scenario that takes you through setting up a FlexConfig policy object and creating a shared FlexConfig policy, see [A FlexConfig Creation Scenario](#), on page 363.

---

**Note** With "Deploy only new or modified Flexconfigs" setting on **Tools > Security Manager Administration > Deployment page** enabled, if you have an activity open, with changes, and when you attempt to deploy FlexConfigs, Cisco Security Manager considers the FlexConfig changes specific to that activity alone and not those of other activities. On the other hand, if all activities are submitted and no activity is open, then Security Manager considers the FlexConfig changes specific to the lastly submitted activity that was submitted with changes. Therefore, if you need FlexConfig changes for an activity to reflect during deployment, then ensure the changes are done in a single activity, submitted, and deployed.

---

When you edit a FlexConfig policy, you can perform the following actions:

- **Add FlexConfig objects**—To add a FlexConfig object to a policy, click the Add icon button and select the desired object. You can also create new objects from the object selector dialog box. The objects are added to the prepended or appended list depending on how the objects themselves are defined.
- **Remove FlexConfig objects**—If you no longer want to include an object in the policy, select it and click the Remove icon button. This action removes the object from the policy, but it does not delete the object from Security Manager. For information on deleting objects, see [Deleting Objects](#), on page 243.
- **Change the order of the objects**—Objects are processed in the order you specify. If an object depends on the processing of another object, it is important that you order them correctly. Select the object whose order you want to change and click the Up or Down arrow buttons until the object is in the desired location.

When changing the order of FlexConfig objects that involve route-maps (for example, OSPF or multicast route-maps), make sure that the corresponding access control lists (ACLs) are defined before the route-maps. This is a device requirement. If you do not define ACLs before route-maps, you will get a deployment error.

- **Change the values assigned to the variables used in a policy object**—If you want to configure a variable with a different value for a particular device, creating a device-level override for the object, select the object and click **Values**. In the Values Assignment dialog box, click in the Values cell to change the value. For more information, see [Values Assignment Dialog Box](#), on page 375.
- **Preview the CLI that will be generated for a policy object**—In Device view, you can view the CLI that will be generated for a policy object by selecting the object and clicking **Preview**. This is especially useful for checking that the CLI commands generated are what you intend to implement on the device.

---

**Note** During deployment, when the FlexConfig policy objects are compiled on the Security Manager server, the correct system variable values and settings are used to generate commands. However, because the Preview function does not have access to these values the way it normally would during deployment, it might not display some CLI commands. In addition, because the Preview function generates CLI commands on the client, some macros used in FlexConfig policy objects reflect client settings instead of server settings.

- [Managing Deployment](#), on page 379

# FlexConfig Policy Page

Use the FlexConfig Policy page to create FlexConfig policies. FlexConfig policies contain ordered lists of FlexConfig policy objects, which are subroutines that allow you to extend the ability of Security Manager to configure your devices. For more information on FlexConfig policy objects, see [Understanding FlexConfig Policies and Policy Objects](#) , on page 340.

**Navigation Path**

- (Device view) Select **FlexConfigs** from the Policy selector.
- (Policy view) Select **FlexConfigs** from the Policy Type selector and select an existing policy or click the Create a Policy button to create a new one.

**Related Topics**

- [Creating FlexConfig Policy Objects](#) , on page 366

**Field Reference***Table 95: FlexConfigs Policy Page*

Element	Description
Prepended FlexConfigs	The FlexConfig policy objects that are added to the beginning of the configuration. The objects are processed in the order shown.
Appended FlexConfigs	The FlexConfig policy objects that are added to the end of the configuration. The objects are processed in the order shown.
Values button	Click this button to view, modify, or validate the values assigned to the variables used in the selected FlexConfig policy object using the <a href="#">Values Assignment Dialog Box</a> , on page 375.
Preview button (Device view only.)	Click this button to view the CLI commands that will be generated for the selected FlexConfig policy object.  In Policy view, you can preview CLI by first clicking <b>Values</b> , selecting a device in the Values Assignment dialog box, and clicking <b>Preview</b> .

Element	Description
Up/Down arrow buttons	Click these buttons to move the selected object up or down in the list. The objects are processed in the displayed order, so it is important that an object whose processing depends on the processing of another object comes after the object it depends on.
Add button	Click this button to add a FlexConfig policy object to the policy. The object itself defines whether it will be added to the prepended or appended list. You can create new FlexConfig objects or select existing ones.
Edit button	Click this button to edit the selected FlexConfig policy object. Your changes affect all devices that use the edited object; your changes are not local policy object overrides for the device.  <b>Note</b> If you selected a predefined FlexConfig policy object packaged with Security Manager, or an object for which you do not have edit permission, you are allowed only to view the object definition.
Remove button	Click this button to remove the selected object from the policy. The object is not deleted from Security Manager; it is simply removed from the FlexConfig policy.

## Values Assignment Dialog Box

Use the Values Assignment dialog box to view the variables used in a FlexConfig policy object, validate the object, or preview the CLI generated from the object. For more information, see [Understanding FlexConfig Object Variables](#), on page 343 [FlexConfig Policy Page](#), on page 374.

### Navigation Path

Select an object and click **Values** from the [Add or Edit FlexConfig Dialog Box](#), on page 367

### Field Reference

**Table 96: Values Assignment Dialog Box**

Element	Description
Assigned Devices (Policy view only)	The devices to which the shared FlexConfig policy has been assigned. Select the device for which you want to display variable values.
Name	The name of the variable.
Value	The value to use for the variable. To change the value, double-click the cell. When you change this value, Security Manager creates a device-level override for the policy object. If the policy object is configured so that its values cannot be overridden, you cannot edit the value.  If there is no default value for the variable, you must provide a value unless it is an optional variable.

Element	Description
Default Value	The value assigned to the variable in the policy object. Double-click this cell to view the definition of the policy object that defines the variable's value.
Override	Whether you can override the value of the variable. You can edit the value of only those variables that have a checkmark in this column.
Object Property	The property of the object. For a detailed explanation, see <a href="#">Add or Edit FlexConfig Dialog Box</a> , on page 367.
Dimension	The structure of the data in the variable: <ul style="list-style-type: none"> <li>• 0—scalar (a single string)</li> <li>• 1—one-dimensional array (a list of strings)</li> <li>• 2—two-dimensional table (a table of strings)</li> </ul>
Optional	Whether the variable value can be empty.
Description	A description of the variable.
Validate button	Click this button to validate the Velocity Template Language syntax and make sure that all required variables have values, that variables do not start with SYS_, and that referenced policy objects exist.
Preview button	Click this button to display the generated CLI commands for the selected FlexConfig policy object.

## FlexConfig Preview Dialog Box

Use the FlexConfig Preview dialog box to view the generated CLI commands based on the variables of the selected object defined in the FlexConfig policy.

### Navigation Path

To open the FlexConfig Policy Preview dialog box, do one of the following:

- In the [Values Assignment Dialog Box](#) , on page 375, click **Preview**. In Policy view, you must first select a device(Device view) Select a device and click **FlexConfig** (see [FlexConfig Policy Page](#) , on page 374). Select an object in the FlexConfig policy and click **Preview**.

## Troubleshooting FlexConfigs

**Problem:** When adding a FlexConfig using the Cisco Security Manager client, you might receive the following error message:

```
Syntax Error: Failed to setup Velocity Engine to validate syntax.
```

This problem is due to administrator privilege rights on Microsoft Windows. In Microsoft Windows Vista and Microsoft Windows 7, Security Manager requires administrator privileges in order to use the FlexConfig feature.

**Solution:** To resolve this issue, launch the Security Manager client with administrator privileges in either of the following ways:

- To launch the Security Manager client with administrator privileges, right-click the **Configuration Manager** shortcut and select **Run as administrator**.
- To permanently enable administrator privileges for the Security Manager client, right-click the **Configuration Manager** shortcut and select **Properties**. On the Compatibility tab, select **Run this program as an administrator**, and then select **OK**.

**Problem:** When using FlexConfigs to deploy to an ASA firewall the following two commands in one job: **reload in x noconfirm, reload cancel**, you will receive the following error message:

```
An error response from the device prevented successful completion of this
operation. The device provided the following description: reload cancel No
reload is scheduled
```

Unfortunately, deployment always fails due to fact that both commands are pushed too fast, such that the **reload cancel** is sent before the reload schedule is activated on the device.

**Solution:** To work around this problem, the commands must be sent in two separate deployments created manually.

**Problem:** When a FlexConfig is assigned and deployed to a device, the FlexConfig is sometimes shown in subsequent Full configuration previews even after the FlexConfig is deleted from a device.

**Solution:** No workaround is needed. The FlexConfig will not be included in the deployment because only the delta configuration is pushed to the device during deployment.

## CHAPTER 8

# Managing Deployment

---

The settings and policies you define in Security Manager must be deployed to your devices so that you can implement them in your network. The steps you take to deploy configurations to devices depend on whether you are using Workflow mode or non-Workflow mode. Although non-Workflow mode is the default mode of operation for Security Manager, you can use Workflow mode if your company requires it. For more information, see [Workflow and Activities Overview](#) , on page 20.

The following topics provide information about deploying configurations to devices, in each workflow mode:

- [Understanding Deployment](#) , on page 379
- [Overview of the Deployment Manager and Configuration Archive](#) , on page 392
- [Working with Deployment and the Configuration Archive](#) , on page 403
- [Rolling Back Configurations](#) , on page 443

## Understanding Deployment

A deployment job defines how configuration changes are sent to devices. In a deployment job, you can define several parameters, such as the devices to which you want to deploy configurations and the method used to deploy configurations to devices. You can also create deployment schedules to automatically spawn deployment jobs at regular intervals.

The following topics will help you better understand and use deployment jobs:

- [Overview of the Deployment Process](#) , on page 379
- [Deployment in Non-Workflow Mode](#) , on page 382
- [Deployment Task Flow in Workflow Mode](#) , on page 383
- [Including Devices in Deployment Jobs or Schedules](#) , on page 386
- [Understanding Deployment Methods](#) , on page 387
- [Handling Device OS Version Mismatches](#) , on page 391

## Overview of the Deployment Process

Broadly speaking, deployment is a three-step process, as described in the following table.

Table 97: Overview of the Deployment Process

Steps	Deployment Steps
<b>Step 1</b>	<p>Security Manager obtains the current configuration for the device and compares it to the latest saved policies for the device in Security Manager. What Security Manager considers to be the current configuration depends on the type of device, the deployment method, and the settings for deployment preferences. These are the possible sources and the conditions under which they are used:</p> <ul style="list-style-type: none"> <li>• Obtain the running configuration from the device.</li> </ul> <p>The running configuration is used when deploying to the device <i>unless</i> the deployment method is AUS, TMS, or CNS. You can force Security Manager to use Configuration Archive by selecting <b>When Deploying to Device Get Reference Config from: Config Archive</b> as the deployment preference (select <b>Tools &gt; Security Manager Administration</b>, then select <b>Deployment</b>).</p> <ul style="list-style-type: none"> <li>• Obtain the last full configuration from the Security Manager Configuration Archive. The Configuration Archive is used when: <ul style="list-style-type: none"> <li>• Deploying to file, unless you select <b>When Deploying to File Get Reference Config from: Device</b> as the deployment preference.</li> <li>• The deployment method is TMS or CNS.</li> <li>• The device is not managed by Security Manager.</li> <li>• Deploying to a device if uploading the configuration from the device failed. Configuration Archive is used as a backup to obtaining the configuration from the live device.</li> <li>• You preview configurations.</li> </ul> </li> <li>• Use the factory default configuration.</li> </ul> <p>The factory default configuration is used with PIX or ASA devices if you use the AUS deployment method. It is used for deployment and for configuration preview.</p>
<b>Step 2</b>	<p>Security Manager builds a delta configuration that contains the commands needed to update the device configuration to make it consistent with the assigned policies. It also builds a full device configuration.</p>

Steps	Deployment Steps
<b>Step 3</b>	<p>If you are deploying to the device, Security Manager deploys either the delta configuration or the full configuration, depending on which deployment method you use. If you are deploying to file, Security Manager creates two files: <i>device_name_delta.cfg</i> for the delta configuration, and <i>device_name_full.cfg</i> for the full configuration. In both cases, the configurations are also added to Configuration Archive. These are the actions based on deployment method:</p> <ul style="list-style-type: none"> <li>• SSL (HTTPS), SSH, or Telnet—Security Manager contacts the device directly and sends the delta configuration to it.</li> <li>• Auto Update Server (standalone or running on Configuration Engine) for PIX and ASA devices—Security Manager sends the full configuration to Auto Update Server, where the device retrieves it. The delta configuration is not sent.</li> <li>• Configuration Engine for IOS devices—Security Manager sends the delta configuration to Configuration Engine, where the device retrieves it.</li> <li>• TMS—Security Manager sends the delta configuration to the TMS server, from which it can be downloaded to an eToken to be loaded onto the device.</li> </ul>

During deployment, if Security Manager determines that the configuration on the device differs from the last-deployed configuration, Security Manager overwrites the changes by default. You can control this behavior using the deployment preferences; select **Tools > Security Manager Administration**, then select **Deployment**, and look for the **When Out of Band Changes Detected** setting. You can also control this for a specific deployment job by editing the deployment method for the job.

If you make changes to the device configuration outside of Security Manager, you have two choices for bringing those changes into Security Manager:

1. You can rediscover policies on the device, in which case all policies for the device become local policies, and any assignments of shared policies to the device are removed.
2. You can make the required changes in Security Manager and redeploy them to the device. During deployment, do not select the option to force an error if out-of-band changes are found on the device. This is the recommended approach.

For more information on how out-of-band changes affect deployment, see [Understanding How Out-of-Band Changes are Handled](#), on page 390.

After configurations are deployed, you should make changes only through Security Manager for configurations that Security Manager controls. This varies based on operating system. For IPS devices, Security Manager controls the entire configuration. For IOS, ASA, PIX, and FWSM devices, you have more control over which aspects of the device configuration Security Manager controls. If you do not create policies for a feature in Security Manager, such as routing policies, Security Manager does not control those features on the device. If you do create policies for these features, Security Manager overwrites the settings on the device with the settings you defined in Security Manager. Through administration settings, you can control the types of policies that will be available for these devices, thereby preventing Security Manager from displaying or changing policies for these features. To see the available features and control whether they are available for management in Security Manager, select **Tools > Security Manager Administration**, then select **Policy Management**. Security Manager does manage VPN-related policies.

**Related Topics**

- [Deployment in Non-Workflow Mode](#) , on page 382
- [Deployment Task Flow in Workflow Mode](#) , on page 383
- [Deployment Page](#) , on page 522
- [Policy Management Page](#) , on page 575

## Deployment in Non-Workflow Mode

These topics help you understand deployment in non-Workflow mode:

- [Deployment in Non-Workflow Mode](#) , on page 382
- [Job States in Non-Workflow Mode](#) , on page 383

## Deployment Task Flow in Non-Workflow Mode

The deployment task flow in non-Workflow mode consists of three simple steps:

1. **Create the job:** A deployment job is created for you when you do one of the following:
  - Click the **Submit and Deploy Changes** button on the main toolbar, or select **File > Submit and Deploy**.

---

**Note** These options are not available when Ticket Management is enabled.

---

- Select **File > Deploy**.
- Select **Manage > Deployments** and click **Deploy**.

1. **Define the job:** You specify parameters, such as the devices to which you want to deploy the configurations and whether you want to deploy directly to the devices or to a file.

During this step, you can also preview configurations and compare them to the previously deployed configurations or the configuration currently running on the device.

---

**Note** Devices selected for one job cannot be included in any other job. This measure ensures that the order in which policies are deployed is correct. However, you can include devices that are specified in deployment schedules.

---

2. **Deploy the job:** Deploying the job sends the generated CLI to devices, either directly or through an intermediary transport server (such as AUS, CNS, or TMS) or to output files. You select the destination (device or file) when defining a job. The transport server is specified in the device properties. For more details about defining deployment methods and transport servers, see [Understanding Deployment Methods](#) , on page 387.

## Job States in Non-Workflow Mode

In non-Workflow mode, the Status column on the Deployment Manager window lists the state of each job. The following table lists and describes all possible job states in non-Workflow mode. For more details, see [Deployment Manager Window](#) , on page 393.

**Table 98: Job States in Non-Workflow Mode**

State	Description
Deployed	Configurations for all the devices in the job were successfully deployed to the devices or to configuration files. Devices in the job can now be included in another job.
Deploying	Configurations generated for the job are being deployed to the devices or to a directory on the Security Manager server. You can monitor the job progress in the Deployment Manager window if the Deployment Status window is not already open.
Aborted	The job was manually halted. Devices in the job can now be included in another job.
Failed	The deployment to one or more devices in the job failed. Devices in the job can now be included in another job.
Rolling Back	Security Manager is in the process of reverting to and deploying previous configurations for the devices within the deployment job. You can abort a job that is in the Rolling Back state.
Rolled Back	Security Manager has successfully reverted to and deployed previous configurations for the devices within the deployment job.

## Deployment in Workflow Mode

These topics help you understand deployment in Workflow mode:

- [Deployment Task Flow in Workflow Mode](#) , on page 383
- [Job States in Non-Workflow Mode](#) , on page 383
- [Deployment Job Approval](#) , on page 386
- [Deployment Jobs and Multiple Users](#) , on page 386

## Deployment Task Flow in Workflow Mode

The following is a typical task flow in Workflow mode (see [Figure 15: Deployment Task Flow in the Workflow Mode](#), on page 384):

1. **Create the job:** Before you deploy configurations to your devices, you must create a deployment job.
2. **Define the job:** When you create a job, you specify parameters, such as the devices to which you want to deploy the configurations, whether you want to deploy directly to the devices or to a file, and when you want the job to take place.
3. **Submit the job:** In some organizations, before jobs can be deployed, they must be approved by a separate user with the appropriate permissions. In this case, Workflow mode is enabled *with* a deployment job

approver, and you must submit the job to this user for review. The user reviews the job and either approves or rejects it.

4. **Approve or reject the job:** If you are working in Workflow mode with a deployment job approver, the approver reviews it, and can then either approve or reject the job. If the job is approved, the submitter can then deploy the job. If the job is rejected, the submitter can discard the job and start over or modify the job and resubmit it.

If you are working in workflow mode without an approver, you can approve the job yourself.

- **Deploy the job:** Deploying the job sends the generated CLI to either devices, intermediary transport servers (such as AUS, CNS, or TMS), or files. You select the destination (device or file) when defining the job. The transport server is specified in the device properties. For more details about defining deployment methods and transport servers, see [Understanding Deployment Methods](#), on page 387.

For descriptions of job states (shown in red in [Figure 15: Deployment Task Flow in the Workflow Mode](#), on page 384), see [Job States in Workflow Mode](#), on page 385.

**Figure 15: Deployment Task Flow in the Workflow Mode**

## Job States in Workflow Mode

In Workflow mode, the Status column in the Deployment Manager window lists the state of each job. The following table lists and describes all possible job states. For more details about the Deployment Manager window, see [Deployment Manager Window](#), on page 393.

**Table 99: Job States in Workflow Mode**

State	Description
Edit	The job was created, but it is not currently being edited. The job can be opened, approved (in auto-approval mode), or discarded while it is in the Edit state.
Edit-In Use	The job is open for editing. The job can be closed, approved, discarded, or submitted while it is in the Edit Open state.
Submitted	The job was submitted for review. It can be viewed but not edited while it is in the Submitted state. The job can be opened for viewing, discarded, rejected, or approved while it is in the Submitted state. This state occurs only when Workflow mode is enabled with deployment job approval required.
Approved	The job was approved and is ready to be deployed. The job can be deployed while it is in the Approved state.
Rejected	The job was rejected. You can open the job for editing or discard the job while it is in the Rejected state. This state occurs only when Workflow mode is enabled with deployment job approval required.
Discarded	The job was discarded. No further changes to the job are not allowed. The job remains in the Deployment table showing a Discarded state until it is purged from the system. Devices in the job can be included in another job.
Deployed	Configurations for all the devices in the job were successfully deployed to the devices or to configuration files. Devices in the job can now be included in another job.
Deploying	Configurations generated for the job are being deployed to the devices or to a directory on the Security Manager server. You can monitor the job progress in the Deployment Manager window.
Aborted	The job was manually halted. Devices in the job can now be included in another job.
Failed	The deployment to one or more devices in the job failed. Devices in the job can now be included in another job.
Scheduled to run at [date]	The job is scheduled to be deployed at the date and time specified.
Rolling Back	Security Manager is in the process of reverting to and deploying previous configurations for the devices within the deployment job. You can abort a job that is in the Rolling Back state.
Rolled Back	Security Manager has successfully reverted to and deployed previous configurations for the devices within the deployment job.

## Deployment Job Approval

By default, Security Manager operates in non-Workflow mode; deployment jobs are handled behind the scenes and the user does not need to be aware of jobs or their approval. When using Workflow mode, you can choose to operate with or without a deployment job approver.

If you choose to operate without an approver, you have the permissions to define and approve jobs.

If your organization requires a different person with higher permissions to approve deployment of new or changed configurations to devices, use Workflow mode with a deployment job approver. When using Workflow mode with a deployment job approver, the job must be reviewed by a person with the appropriate permissions to approve or reject the job. This approval process helps to ensure that no inappropriate configurations reach the network devices and that deployment jobs are scheduled effectively.

---

**Note** You enable and disable deployment job approval under Tools > Security Manager Administration > Workflow. For more information, see [Workflow Page](#), on page 588.

---

## Deployment Jobs and Multiple Users

Only one user can define or change parameters or devices within an individual deployment job at one time. However, multiple users can work on the same deployment job in sequence: if a deployment job is closed, another user can open it and make changes to it. Multiple users can work in parallel on different deployment jobs.

## Including Devices in Deployment Jobs or Schedules

When you create a deployment job or schedule, you select the devices to include in it. The inclusion of a device influences how the device can be used in other jobs or schedules. When you select a device for a specific job, it cannot be selected for any other job until the original job is deployed, rejected (in Workflow mode), discarded, or aborted. This mechanism prevents two or more people from deploying changes to the same device at the same time and ensures that policies are deployed to devices in the correct order.

However, a device can be part of a deployment schedule and still be selected for specific deployment jobs. While a deployment job is running, the device is locked. The device cannot be included in other jobs while the deployment job is running.

When you create a deployment job, Security Manager displays the devices on which policy changes were made but were not yet deployed. You can deploy to these devices, and you can select additional devices for the job. Although you can add as many devices to a deployment job as you desire (there is no limitation), as a practical matter, you should limit the number of devices per job. The deployment job might fail if you select a large number of devices or several devices that have large configuration files. If you encounter deployment failures, resubmit the job with fewer devices selected.

For VPNs, Security Manager must generate commands for devices that are affected by the policies defined for the devices you select for the job. So, if you select a device that is part of a VPN, Security Manager adds the other relevant devices to the job. For example, if you define a tunnel policy on a spoke, and you select the spoke for the job, Security Manager adds the spoke's assigned hub to the job. During job generation, Security Manager generates commands for both peers so that the VPN configuration is complete and the tunnel can be established. If you deselect one of the devices associated with the VPN, Security Manager warns that removing the device might result in the VPN not functioning properly.

## Understanding Deployment Methods

Security Manager lets you deploy configurations to devices using three main methods: deploying directly to the device, deploying to a configuration file (which you must then manually apply to the device), and deploying to an intermediate server (which is treated like deploying directly to the device). The system default deployment method is to deploy directly to the device.

When you add devices to Security Manager, you select the deployment method to be used by that device. This determines the method used for deploying to the device (instead of a file). When you create a deployment job, an additional deployment method default applies to the job as a whole, which determines whether deployment creates configuration files or whether it sends the configuration to the device using the method selected for the device. You control this default in the administration settings (select **Tools > Security Manager Administration**, then select **Deployment**; see [Deployment Page](#), on page 522). When you create a deployment job, you can also change whether the deployment is to a file or to the device for each device by clicking **Edit Deployment Method** in the Create Job window. If you are using non-Workflow mode, see [Deploying Configurations in Non-Workflow Mode](#), on page 406. If you are using Workflow mode, see [Creating and Editing Deployment Jobs](#), on page 413.

The method you choose to use depends on the processes and procedures of your organization and the transport protocols supported by a particular type of device. If you are using Configuration Engine (CNS) or Auto Update Server (AUS), use those deployment methods. You must use one of these for devices that use dynamic IP addresses. Otherwise, for devices with static IP addresses, use SSL (HTTPS) for IOS, PIX, ASA, IPS, and standalone FWSM devices, and SSH for FWSM through the Catalyst chassis. If you are using a Token Management Server (TMS) for some devices, you can also use that method with Security Manager.

The following topics describe the deployment methods in more detail:

- [Deploying Directly to a Device](#), on page 387
- [Deploying to a Device through an Intermediate Server](#), on page 388
- [Deploying to a File](#), on page 389
- [Understanding How Out-of-Band Changes are Handled](#), on page 390

### Deploying Directly to a Device

If you choose to deploy directly to a device, Security Manager uses the transport protocol defined in the device properties for the device (right click the device, select **Device Properties**, and click **General**). The protocol is typically the default protocol defined in the Device Communication page in the Security Manager Administration settings (see [Device Communication Page](#), on page 530). [Table 100: Default Deployment Transport Protocols](#), on page 388 lists some of the default transport protocol settings.

When you select Device as the deployment method, deployment is affected if you configure a transport server for the device, such as an AUS or Configuration Engine. When using an intermediate transport server, configuration deployment goes through the server. For more information on using an intermediate server, see [Deploying to a Device through an Intermediate Server](#), on page 388.

Deployment can also be affected if you made out-of-band changes to the device since the last deployment. For more information, see [Understanding How Out-of-Band Changes are Handled](#), on page 390.

During deployment, Security Manager sends only the changes made since the last deployment to the device.

**Caution** You must configure at least one policy on a device before deploying to that device. If you deploy to a device without assigning at least one policy, the device's current configuration is overwritten with a blank configuration.

**Table 100: Default Deployment Transport Protocols**

Device Type	Transport Protocol	Description
ASA, IOS 12.3 and later routers, FWSM, PIX Firewall, IPS sensors	SSL (HTTPS) (Default)	Security Manager deploys the configuration to the device using the Secure Socket Layer (SSL) protocol, otherwise known as HTTPS. With this protocol, Security Manager encrypts the configuration file and sends it to the device.
Catalyst 6500/7600 and other Catalyst switches	SSH	Security Manager deploys the configuration to the device using a Secure Shell (SSH). This provides strong authentication and secure communications over insecure channels. Security Manager supports both SSHv1.5 and SSHv2. Once connected to the device, Security Manager determines which version to use and downloads using that version.
IOS 12.2 and 12.1 routers	Telnet	Security Manager deploys the configuration to the device using the Telnet protocol.

## Deploying to a Device through an Intermediate Server

Deploying configurations through an intermediate server, such as an Auto Update Server (AUS), Cisco Networking Services (CNS) Configuration Engine, or Token Management Server (TMS), is a version of deploying directly to device. When selecting the deployment method, select Device. Security Manager sends the configuration updates to the intermediate server, where the device retrieves it (for AUS and CNS), or where you can download it to an eToken (for TMS).

You must use an intermediate server if you are using dynamic IP addresses for your device interfaces (that is, the IP addresses are provided by a DHCP server). You can also use them with static IP addresses. However, you cannot use Configuration Engine to manage IOS devices with dynamic IP addresses if you configure features that use interactive CLI commands. The following features are affected:

- Certificate Enrollment:
  - `crypto pki trustpoint`
  - `crypto isakmp client configuration group`
  - `crypto key generate rsa`

- IPS signature configuration (**ip ips signature-category**)
- IP Authproxy Banner (**ip auth-proxy-banner**)
- Catalyst device interface switchport (**interface switchport**)

Security Manager uses an intermediate server if you have configured the device to use one. The following topics describe the required configuration steps when using an intermediate server:

- [Deploying Configurations Using an Auto Update Server or CNS Configuration Engine](#) , on page 420
- [Deploying Configurations to a Token Management Server](#) , on page 421

Deployment can be affected if you made out-of-band changes to the device since the last deployment. For more information, see [Understanding How Out-of-Band Changes are Handled](#) , on page 390.

During deployment, Security Manager sends configuration changes based on the type of server:

- Auto Update Server (standalone or running on Configuration Engine) for PIX and ASA devices—Security Manager sends the full configuration to Auto Update Server, where the device retrieves it. The delta configuration is not sent.
- Configuration Engine for IOS devices—Security Manager sends the delta configuration to Configuration Engine, where the device retrieves it.
- TMS—Security Manager sends the delta configuration to the TMS server, from which it can be downloaded to an eToken to be loaded onto the device.

- [Managing Device Communication Settings and Certificates](#) , on page 458
- [Device Communication Page](#) , on page 530

## Deploying to a File

If you choose to deploy configurations to configuration files, Security Manager creates two files: *device\_name\_delta.cfg* for the delta configuration, and *device\_name\_full.cfg* for the full configuration. If the files are created by a job that was generated from a deployment schedule, the name includes a time stamp. Configuration files are in TFTP format so that you can upload them to your devices using TFTP.

---

**Tip** You cannot deploy configurations to file for IPS devices.

---

If you deploy to file, you are responsible for transferring the configurations to your devices. Security Manager assumes that you have done this, so the next time you deploy to the same devices, the generated incremental commands are based on the configurations from the previous deployment. If for some reason the last change was not applied to the device, the new delta configuration will not bring the device configuration up to the one reflected in Security Manager.

**Caution**

Although Security Manager in one sense assumes that you applied the delta configuration, in another sense, it assumes that it cannot know if the delta was deployed. Thus, Security Manager maintains an internal view of the configuration based on the last deployment made directly to the device. So, when you apply the delta, those delta changes will be considered out-of-band changes. On next deployment to the device, your out-of-band change setting might cancel the deployment. If you mix deployments to file with deployments to device, you should rediscover policies after applying file deployments to the device. For more information, see [Understanding How Out-of-Band Changes are Handled](#), on page 390.

To set a default directory for file deployments, select **Tools > Security Manager Administration**, then select **Deployment** (see [Deployment Page](#), on page 522). If you select File for the default deployment method, you also select the default directory. When you create a deployment job, you can change this directory for that job.

Deploying configurations to a file is useful when the devices are not yet in place in your network (known as green field deployment), if you have your own mechanisms in place to transfer configurations to your devices, or if you want to delay deployment. When deploying to a file, the deployment job might fail if you select a large number of devices or several devices that have large configuration files. If you encounter deployment failures, resubmit the job with fewer devices selected.

**Tip**

Do not use commands that require interaction with the device during deployment when deploying to file. We recommend previewing your configuration before deployment to make sure there are no such commands in the file. For more information, see [Previewing Configurations](#), on page 422.

## Understanding How Out-of-Band Changes are Handled

Security Manager considers an out-of-band change to be any change made to a device manually or outside of Security Manager control, for example, by logging into the device directly and entering configuration commands through the CLI. Paradoxically, this includes the application of delta changes that Security Manager creates when you deploy configurations to file rather than to the device.

If you are deploying to the device (rather than to file), and the deploy to device method is configured to compare the new configuration to the current configuration on the device, you can specify how to handle out-of-band changes when they are detected using the **Out of Band Change Behavior** setting. The setting does not apply when deploying to file.

This setting is ignored if you are comparing the new device configuration with the latest version stored in the Security Manager Configuration Archive. The default way to handle out-of-band changes, is set in **Tools > Security Manager Administration > Deployment**; for more information see [Deployment Page](#), on page 522. Look for the **Deploy to Device Reference Configuration** and **When Out of Band Changes Detected** settings.

Your options for handling out-of-band changes are:

- **Overwrite changes and show warning**—When configurations are deployed, Security Manager uploads the device's current configuration and compares it against the configuration it has in its database. If changes were made to the device manually, Security Manager continues with the deployment and displays a warning notifying you of this action. Out-of-band changes are removed from the device.
- **Cancel deployment**—When configurations are deployed, Security Manager uploads the device's current configuration and compares it against the configuration it has in its database. If changes were made to the device manually, Security Manager cancels the deployment and displays a warning notifying you of

this action. You must either manually remove the out-of-band changes, or configure the same settings in Security Manager, before you can deploy configuration changes to the device.

- **Do not check for changes**—Security Manager does not check for changes and deploys the changes to the device. No warnings are issued, and any out-of-band changes are removed from the device configuration.

Before you deploy configurations, you might want to detect whether there are out of band changes on a device and analyze whether you want to recreate those changes in Security Manager policies, or allow Security Manager to overwrite the changes. For more information, see [Detecting and Analyzing Out of Band Changes](#), on page 424.

## Handling Device OS Version Mismatches

Before deploying a changed configuration file directly to a device, Security Manager normally uploads the current running configuration file from the device and checks the OS version running on the device with the OS version stored in the Security Manager database (you can configure it so that the archived configuration is used instead of the configuration from the device). Security Manager takes action depending on whether the OS versions match or differ from each other.

In some cases, Security Manager deploys the configuration and issues a warning, but in other cases, Security Manager cannot deploy the configuration. Security Manager deploys the configuration when:

- The device has a newer minor version, for example, ASA 8.1(2) instead of the 8.1(1), indicated in Security Manager.
- The device has a down-level minor version, for example, ASA 8.1(1) instead of 8.1(2).

Security Manager does not deploy the configuration when the device is running a new major version of the OS (for example, ASA 8.0 instead of the 7.2 indicated in Security Manager) or if the device is running a down-level major version (7.2 instead of 8.0).

The following table lists the possible actions Security Manager takes depending on the whether the OS versions match or differ from each other. The table uses the ASA device as an example; however, the actions apply to all supported device types.

**Table 101: Deployment Action Based on OS Version Match or Mismatch**

Scenario	OS Version in Security Manager Database	OS Version On Device	OS Version Used In Deployment	Action
Versions match	ASA 8.2(1)	ASA 8.2(1)	ASA 8.2(1)	Deployment proceeds with no warnings.

Scenario	OS Version in Security Manager Database	OS Version On Device	OS Version Used In Deployment	Action
Device has newer minor OS version.	ASA 8.1(1)	ASA 8.1(2)	ASA 8.1(2)	Security Manager warns that it has detected a different OS version on the device than the one in the Security Manager database.  Security Manager generates the CLI based on the OS version running on the device.
Device has newer minor OS version, one that is not directly supported by Security Manager.	ASA 8.0(2)	ASA 8.0(4)	ASA 8.0(3)	Security Manager warns that it has detected a different OS version on the device than the one in the Security Manager database.  Security Manager generates the CLI based on the OS version that it supports to which the running OS version is downward-compatible.
Device has a new major OS version.	ASA 7.2(4)	ASA 8.2(1)	None. Deployment fails.	Security Manager reports an error indicating that it has detected a different OS version on the device than the one in the Security Manager database.  Security Manager cannot proceed until you correct this mismatch. Remove the device from the inventory, add it again, and discover the device policies.
Device has an older minor OS version.	ASA 8.1(2)	ASA 8.1(1)	ASA 8.1(1)	Security Manager warns that it has detected a different OS version on the device than the one in the Security Manager database.  Security Manager generates the CLI based on the OS version running on the device.
Device has an older major OS version	ASA 8.2(1)	ASA 7.2(4)	None. Deployment fails.	Security Manager reports an error indicating that it has detected a different OS version on the device than the one in the Security Manager database.  Security Manager cannot proceed until you correct this mismatch. Remove the device from the inventory, add it again, and discover the device policies.

## Overview of the Deployment Manager and Configuration Archive

The Deployment Manager and Configuration Archive are the main tools that you can use to manage deployment and device configurations. The following topics provide an overview of these tools:

- [Understanding What You Can Do with the Deployment Manager](#) , on page 393
- [Deployment Manager Window](#) , on page 393
- [Deployment Schedules Tab, Deployment Manager](#) , on page 398
- [Configuration Archive Window](#) , on page 401

## Understanding What You Can Do with the Deployment Manager

The Deployment Manager, where you create and manage deployment jobs and schedules, provides the following benefits:

- **Previewing and comparing configurations**—Before you deploy a configuration file to a device, you can preview the proposed configuration file. You can also compare the proposed configuration file to what was last imported from the device or what is currently running on the device.

After successful deployment to a device, you can view a transcript of the configuration commands downloaded and the device's responses. For more information, see [Previewing Configurations](#) , on page 422.

- **Aborting deployment jobs**—You can stop a deployment job even if it is currently running. However, aborting a job that is in process does not roll back the configuration on devices that have already been reconfigured, or on devices that are in the process of being reconfigured. Only devices for which deployment has not started are prevented from being reconfigured. For more information, see [Aborting Deployment Jobs](#) , on page 434.
- **Rolling back to a previous configuration**—If you deploy configurations to devices, and then determine that there is something wrong with the new configurations, you can revert to and deploy the previous configurations for those devices. For more information, see [Rolling Back Configurations to Devices Using the Deployment Manager](#) , on page 450.
- **Viewing deployment job status**—You can display information about the deployment to specific devices, including information about errors, the proposed configuration, and the transcript of the download. For more information, see [Viewing Deployment Status and History for Jobs and Schedules](#) , on page 403.
- **Scheduling deployment jobs**—You can create deployment schedules to spawn deployment jobs at regular intervals. In Workflow mode, you can also schedule a deployment job to start at a future time when you deploy the job. Scheduling jobs lets you plan deployments for times when traffic on devices is low. For more information, see these topics:
  - [Creating or Editing Deployment Schedules](#) , on page 434
  - [Deploying a Deployment Job in Workflow Mode](#) , on page 418
- **Logging deployment job history (Workflow mode only)**—You can view the history of transactions for a job. The transactions show the changes in job status initiated by various users, such as job approval, and the comments related to those status changes. For more information, see [Viewing Deployment Status and History for Jobs and Schedules](#) , on page 403.

## Deployment Manager Window

Use the Deployment Manager window to manage deployment jobs and schedules. You can display a list of deployment jobs, view job details, deploy and redeploy configurations to devices, abort deployment jobs, roll

back to previous configurations on selected devices, and create schedules to automatically generate deployment jobs. You can also track changes made to deployment jobs and schedules.

**Note** The buttons available in the Deployment Manager depend on the Workflow mode you are using.

### Navigation Path

Click the **Deployment Manager** button on the Main toolbar or select **Manage > Deployments**.

### Field Reference

**Table 102: Deployment Manager Window (Workflow Mode)**

Element	Description
<b>Deployment Jobs Tab</b>	
This tab shows individual deployment jobs. Select a job in the upper pane to view its details in the tabs in the lower pane.	
Filter Options	
Beginning with 4.14, Cisco Security Manager provides filter options to search deployment jobs based on Name (deployment job name), Status, Changed By, and Device Name. After specifying the filter criteria, click Apply. The grid displays the search result. Select a job in the table to view its details in the tabs in the lower pane.	
Name	The name of the job.
Last Action	The date and time that the job or status was changed based on the time zone of the server, not the time zone of the client.
Status	The state of each job. The possible states differ based on workflow mode. For a description of the states, see the following topics: <ul style="list-style-type: none"> <li>• <a href="#">Job States in Non-Workflow Mode</a> , on page 383</li> <li>• <a href="#">Job States in Workflow Mode</a> , on page 385</li> </ul>

Element	Description
Changed By	The name of the user who modified the job.
Description	The description of the job. Double-click the icon to see the description in a separate dialog box.
Job Type	The type of job with respect to scheduling. A <b>one time</b> job was not created from a regularly recurring job, whereas a <b>recurring</b> job was.
Create button (Workflow mode only.)	In Workflow mode, click this button to create a new job. The Create a Job dialog box opens. See <a href="#">Creating and Editing Deployment Jobs</a> , on page 413.
Open button (Workflow mode only.)	In Workflow mode, click this button to open the selected job. The Edit a Job dialog box opens. See <a href="#">Creating and Editing Deployment Jobs</a> , on page 413.
Close button (Workflow mode only.)	In Workflow mode, click this button to close and save all changes made while the selected job was open. You can close a job when it is in the Edit Open or the Submit Open state. Normally, you do not need to close a job, because you will typically submit, approve, deploy, or schedule the job for deployment. However, if the Security Manager server is suddenly unavailable or your login session times out, a job might be left in the Edit Open state. If this happens, you can close it manually by selecting it and clicking Close.
Submit button (Workflow mode only.)	In Workflow mode, click this button to submit the selected job for approval. You can submit a job when it is in the Edit or the Edit Open state. The Submit Deployment Job dialog box opens. See <a href="#">Submitting Deployment Jobs</a> , on page 416.  This button is active only if you are using Workflow mode with a deployment job approver.
Reject button (Workflow mode only.)	In Workflow mode, click this button to reject the selected job if you are not satisfied with the configurations generated for the devices. You can reject jobs only in workflow mode with a deployment job approver. After a job is rejected, it can be opened for editing or discarded. See <a href="#">Approving and Rejecting Deployment Jobs</a> , on page 417.  You are prompted to enter an optional comment to explain why you are rejecting the job.
Approve button (Workflow mode only.)	In Workflow mode, click this button to approve the selected job. After a job is approved, it can be deployed. See <a href="#">Approving and Rejecting Deployment Jobs</a> , on page 417.  You are prompted to enter an optional comment to explain why you are approving the job.

Element	Description
Discard button (Workflow mode only.)	<p>In Workflow mode, click this button to discard the selected job. You can discard a job when it is in any state except Deployed, Deployment Failed, or Aborted. Once discarded, the job cannot be edited, submitted, approved, or deployed. The job state is shown as discarded until the job is purged from the system either automatically as set on the Workflow settings page or manually (for more information, see <a href="#">Workflow Page</a> , on page 588.</p> <p>You are prompted to enter an optional comment to explain why you are discarding the job. See <a href="#">Discarding Deployment Jobs</a> , on page 419.</p>
Deploy button (All modes.)	<p>Click this button to deploy generated CLI commands devices or files. The behavior of this button differs depending on Workflow mode:</p> <ul style="list-style-type: none"> <li>• (Non-Workflow mode.) Click this button to create a deployment job. If you have unsubmitted changes, you are first prompted to submit them. The Deploy Saved Changes dialog box opens, where you can select which devices to include in the job. Note that this button does not act on the deployment job selected in the table, if any; instead, it creates a new deployment job. See <a href="#">Deploying Configurations in Non-Workflow Mode</a> , on page 406.</li> <li>• (Workflow mode.) Click this button to deploy the selected job. If the job is in the Approved state, the Deploy Job dialog box opens (see <a href="#">Deploying a Deployment Job in Workflow Mode</a> , on page 418).</li> </ul> <p>If the job is in the deployed, failed, or aborted state then the Redeploy Job dialog box opens. See <a href="#">Redeploying Configurations to Devices</a> , on page 432.</p>
Generate Report button (All modes.)	<p>Click this button to create a deployment status report for the selected job. You can generate the report in HTML and PDF formats. Jobs must be in deployed, failed, rolled back, or aborted state.</p> <p>The deployment status report includes a summary of the job plus the full and delta configurations and the job transcript. You can use this report for your own purposes or to aid in troubleshooting a problem with Cisco TAC. For more information, see <a href="#">Generating Deployment or Discovery Status Reports</a>, on page 506.</p>
Refresh button (All modes.)	<p>Click this button to reload job information from the Security Manager server. If the message <i>Auto Refresh is On</i> is displayed beneath the table, the job list is automatically refreshed periodically.</p> <p><b>Note</b> The auto refresh setting is configured in the administration settings for deployment: select <b>Tools &gt; Security Manager Administration &gt; Deployment</b>.</p>
Redeploy button (Non-Workflow mode only.)	<p>In Non-Workflow mode, click this button to redeploy the selected job, which deploys the same generated CLI commands to the same devices or files selected in the original job. The Redeploy Job dialog box opens. See <a href="#">Redeploying Configurations to Devices</a> , on page 432.</p> <p>(In Workflow mode, click the Deploy button to redeploy configurations for the selected job.)</p>

Element	Description
Abort button (All modes.)	Click this button to abort the selected job if it is in the Deploying, Scheduled, or Rolling Back state. A warning asks you to confirm the action. See <a href="#">Aborting Deployment Jobs</a> , on page 434.
Rollback button (All modes.)	Click this button to deploy the previously deployed configuration to the devices in the selected job. The Deployment Rollback dialog box opens (see <a href="#">Rolling Back Configurations to Devices Using the Deployment Manager</a> , on page 450).
Summary tab	Displays summary information about the status of the selected deployment job, such as the status of the job, the name of the deployment job, the number of devices included in the job, the number of devices deployed successfully, and the number of devices deployed with errors.
Details tab	<p>Displays detailed information for the selected job. The table lists each device included in the job, whether deployment succeeded or failed, the tickets containing changes that are part of the job for the device, and a summary of the number of warnings, errors, or failures for the device. Select a device in the table to view the results for that device:</p> <ul style="list-style-type: none"> <li>• Double-click the icon in the Config column to view the configuration (see <a href="#">Previewing Configurations</a> , on page 422). If you deleted the device from the inventory, the configuration and transcript might not be available.</li> <li>• If you were deploying to the device, double-click the icon in the Transcripts column to view a transcript of the commands sent to the device and the device's responses. See <a href="#">Viewing Deployment Transcripts</a> , on page 442.</li> <li>• If Ticket Management is enabled, the Last Ticket(s) column displays the ticket IDs of the tickets containing changes that are part of the deployment for the device. You can click on the Ticket IDs to view additional information about the ticket, such as Creator and Last Modified date. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see <a href="#">Ticket Management Page</a> , on page 584).</li> <li>• When you select a device, the Messages box in the lower left contains a summary of the messages generated for the deployment. Select an item to view its description to the right. You might have to enlarge the window to make the Description box visible. If applicable, there might also be information on the actions you can take to resolve the problems.</li> </ul>
History tab (Workflow mode only.)	Displays a log of the changes that have been made to the selected job. The information includes the state changes, the user who made the change, the date and time of the change (based on the Security Manager server time), and any comments the user entered to document the change.
<p><b>Deployment Schedules Tab</b></p> <p>Use this tab to schedule regular deployment jobs. For detailed information about this tab, see <a href="#">Deployment Schedules Tab, Deployment Manager</a> , on page 398.</p>	

## Deployment Workflow Commentary Dialog Box

When you perform an action in the Deployment Manager while working in Workflow mode, you are prompted to enter a comment to describe the action. The comments are preserved in the history for the job or schedule.

The title of the dialog box indicates the action you are taking. Enter an optional comment and click **OK** to perform the action.

### Navigation Path

In Workflow mode, select a job or schedule in the Deployment Manager and click the appropriate button to perform the desired action.

## Deployment Schedules Tab, Deployment Manager

Use the Deployment Schedules tab on the Deployment Manager window to create regularly recurring deployment jobs. Whenever the scheduled deployment time occurs, Security Manager creates a specific deployment job based on the scheduled job.

### Navigation Path

Click the **Deployment Manager** button on the Main toolbar or select **Manage > Deployments**, and then click the **Deployment Schedules** tab in the upper pane.

### Field Reference

*Table 103: Deployment Schedules Tab, Deployment Manager Window*

Element	Description
<b>Deployment Schedule Table</b> This table shows deployment job schedules. Select a schedule in the table to view its details in the tabs in the lower pane. Filter Options Beginning with 4.14, Cisco Security Manager provides filter options to search deployment schedules based on Name (deployment schedule name), Status, and Device Name. After specifying the filter criteria, click Apply. The grid displays the search result. Select a schedule in the table to view its details in the tabs in the lower pane.	
Name	Name of the job schedule. Jobs created from this schedule use this name plus a time stamp.

Element	Description
Status	<p>The status of the schedule:</p> <ul style="list-style-type: none"> <li>• <b>Edit</b>—In Workflow mode, the schedule is being created. You can open it and change its settings. No jobs are created from schedules that are being edited.</li> <li>• <b>Active</b>—Deployment jobs will be created according to this schedule.</li> <li>• <b>Suspended</b>—The schedule was suspended and no jobs are being created by it. You can restart the schedule by selecting it and clicking <b>Resume</b>.</li> </ul>
Recurrence	How often deployment jobs will be created from this schedule.
Next Run	The date and time a deployment job will next be created from this schedule.
Last Run	The date and time of the most recent deployment job created from this schedule.
Schedule End	The date and time the schedule is no longer active. If the schedule has no end date, Active Indefinitely is indicated.
Description	The description of the job schedule. Double-click the icon to see the description.
Create button	Click this button to create a deployment job schedule. The Schedule dialog box opens where you can create the schedule (see <a href="#">Schedule Dialog Box</a> , on page 436).
Open button	<p>Click this button to open the selected schedule. The Schedule dialog box opens where you can view or modify the schedule (see <a href="#">Schedule Dialog Box</a>, on page 436).</p> <p>In non-Workflow mode, modifying the schedule does not change its status. In Workflow mode, the status changes to Edit, and you must resubmit it for approval.</p>
Close button (Workflow mode only)	Click this button to close and save all changes made while the schedule was open. You can close a schedule when it is in the Edit Open or the Submit Open state. Typically, you will have to close schedules only if the Security Manager server becomes unavailable while you have a schedule open.
Submit button (Workflow mode only)	Click this button to submit the selected schedule for approval if you are operating in Workflow mode with an approver. You can submit a schedule when it is in the Edit or the Edit Open state. You are prompted for an optional comment to explain the submission, and an e-mail is generated to the approver in Workflow mode.
Reject button (Workflow mode only)	Click this button to reject the selected schedule. You are prompted for an optional comment to explain the rejection, and an e-mail is generated to the approver and submitter in Workflow mode.
Approve button (Workflow mode only)	Click this button to approve the selected schedule. You are prompted for an optional comment to explain the approval, and an e-mail is generated to the approver and submitter in Workflow mode.

Element	Description
Discard button	<p>Click this button to discard the selected schedule. You can discard a schedule unless there is an active deployment job that was created from the schedule. (You can wait for the job to finish, or abort the job and then discard the schedule.)</p> <p>You are prompted for an optional comment to explain the discard, and an e-mail is generated to the approver and submitter in Workflow mode.</p>
Refresh button	<p>Click this button to reload schedule information from the Security Manager server. If the message <i>Auto Refresh is On</i> is displayed beneath the table, the schedule list is automatically refreshed periodically.</p> <p><b>Note</b> The auto refresh setting is configured in the administration settings for deployment: select <b>Tools &gt; Security Manager Administration &gt; Deployment</b>.</p>
Suspend button	<p>Click this button to suspend the selected schedule. Suspending the schedule does not delete the schedule, but it prevents the creation of deployment jobs based on it. You are prompted for a comment to explain the suspension, and an e-mail is generated to the approver in Workflow mode.</p>
Resume button	<p>Click this button to reactivate a suspended schedule. You are prompted for a comment to explain the suspension, and an e-mail is generated to the approver in Workflow mode.</p>
Summary tab	<p>Displays summary information about the selected schedule. Besides the fields shown in the table, summary information includes the number of devices included in the schedule and the user ID of the person who last changed the schedule.</p>
Devices tab	<p>Displays the devices that are included in the selected schedule. These are the devices to which configurations are deployed when a deployment job is created from the schedule. To change the device list, click <b>Open</b>, then click <b>Add Devices</b> on the Schedule dialog box.</p>
History tab	<p>Displays a log of the changes that have been made to the selected schedule. The information includes the state changes, the user who made the change, the date and time of the change (based on the Security Manager server time), and any comments the user entered to document the change.</p>
Jobs tab	<p>Displays a list of the deployment jobs that have been created based on the selected schedule. Information includes the name of the job, the date and time the job was created based on server time (not the client time), and the job status. If you select a job, and click the <b>Deployment Job</b> tab, the selected job is highlighted and you can view the job details.</p> <p>For information on job status, see these topics:</p> <ul style="list-style-type: none"> <li>• <a href="#">Job States in Workflow Mode</a> , on page 385</li> <li>• <a href="#">Job States in Non-Workflow Mode</a> , on page 383</li> </ul>

## Configuration Archive Window

The Configuration Archive stores configuration versions for each device managed by Security Manager. If you delete a device from Security Manager, all of the device's configurations are also deleted from the Configuration Archive.

You can use Configuration Archive to:

- View the transcript of a configuration deployment for a selected device.
- View and compare configuration versions.
- View CLI differences between deployed configuration versions.
- Roll back to an earlier configuration version, provided that the configuration originated from the device. You should roll back configurations only under extreme circumstances. For more information, see these topics:
  - [Understanding Configuration Rollback](#) , on page 443
  - [Using Rollback to Deploy Archived Configurations](#) , on page 451
- Add the current running configuration for a device to the archive.

You can sort the list of configuration versions for a device by clicking on the column heading that you want to sort on. Clicking the column heading toggles between sorting the rows in ascending or descending order. You can also control the fields displayed by right-clicking on any column heading and selecting or deselecting the desired column names under the Show Columns command.

### Navigation Path

Select **Manage > Configuration Archive**.

### Related Topics

- [Configuration Archive Page](#) , on page 514

- [Filtering Items in Selectors](#) , on page 47

## Field Reference

**Table 104: Configuration Archive Window**

Element	Description
Device Selector	Lists the devices in the device inventory. Select a device to see the configuration versions for the device that are available in the archive. These are displayed in the right pane.
Version ID	The version number of the configuration version. By default, this column is not displayed. To display it, right click any column heading and select <b>Show Columns &gt; Version ID</b> .
Created On	The date and time that the configuration version was archived.
Created By	The user ID or system ID associated with adding the configuration version to the archive.  If there are two names in the form <i>username1 (username2)</i> , the first name is the user who initiated the request, and the name in parentheses is the system identity user. For more information on the system identity trust user, see the Installation Guide for Cisco Security Manager .
Archival Source	The origin of the archiving event (for example, User Request, Deployment or Provision, Discovery).
Creation Comment	A description about how or why the configuration version was created.
Transcript Icon	When double-clicked, displays a transcript of a configuration version that was deployed to a device.  A transcript is the log file of transactions between Security Manager and a device captured during a deployment or rollback operation. It includes commands sent and received between server and device from the time of the deployment or rollback request, but it does not include communication that occurs during the initial discovery phase of deployment, when Security Manager obtains the current configuration from the device.
View button	Click this button to display the selected configuration in the Config Version Viewer window (see <a href="#">Configuration Version Viewer</a> , on page 440), where you can also compare the configuration to other configuration versions.
Rollback button	Click this button to roll the device configuration back to the selected configuration version, provided that the configuration originated from the device. You should roll back configurations only under extreme circumstances. For more information see these topics: <ul style="list-style-type: none"> <li>• <a href="#">Understanding Configuration Rollback</a> , on page 443</li> <li>• <a href="#">Using Rollback to Deploy Archived Configurations</a> , on page 451</li> </ul>

Element	Description
Add from Device button	<p>Click this button to have Security Manager retrieve the current running configuration from the device and add it as a configuration version to the archive. This is useful for any device whose configuration might have been changed directly in its CLI.</p> <p>For more information on adding configuration versions, see <a href="#">Adding Configuration Versions from a Device to the Configuration Archive</a> , on page 439.</p>

## Working with Deployment and the Configuration Archive

The following topics provide information about managing deployment and using the Configuration Archive:

### Viewing Deployment Status and History for Jobs and Schedules

Using the Deployment Manager, you can view status and history information for deployment jobs and schedules, as well as create and manage them. To open the Deployment Manager window, select **Manage > Deployments**.

Jobs and schedules are displayed on separate tabs. However, as jobs are created based on a deployment schedule, those jobs appear in the regular jobs list. Click the appropriate tab to view the list of jobs or schedules, where you can see this information:

- **Deployment Jobs**—The top pane displays a list of the deployment jobs. If you select a job, more detailed information appears in the lower pane:

- **Summary tab**—The Summary tab shows information such as the job status, number of devices deployed successfully, and number of devices deployed with errors.
- **Details tab**—The Details tab shows the status details for each device in the deployment.
- **History tab (Workflow mode only)**—The History tab displays transactions that occurred to the selected job since it was created. Each row in the table shows the action that occurred, the user who performed the action, the date and time it occurred, and comments, if any, that the user entered.
- **Deployment Schedules**—The top pane displays a list of the deployment schedules. If you select a schedule, more detailed information appears in the lower pane:
  - **Summary tab**—The Summary tab shows information such as the schedule, the time of the next job to be created from the schedule, the time a job was last run based on the schedule, the number of devices included in the schedule and the user ID of the person who last changed the schedule.
  - **Devices tab**—The Devices tab shows the list of devices that are included in the schedule.
  - **History tab**—The History tab shows the state changes and related comments of the schedule. You can track which user performed each action.
  - **Jobs tab**—The Jobs tab shows a list of deployment jobs that were created from the schedule and their statuses. You can also view these jobs on the Deployment Jobs tab.

The status information in the Deployment Manager window refreshes automatically unless you turned off automatic refresh in the Security Manager Administration Deployment page (Tools > Security Manager Administration > Deployment). A message below the job or schedule table indicates whether automatic refresh is on. If it is off, refresh status information by clicking **Refresh**.

## Tips for Successful Deployment Jobs

Successful deployment depends on many things, as explained in [Troubleshooting Deployment](#), on page 464. In addition to factors involving network communications and the proper functioning of the device, you can also improve the results of deployment by keeping the following tips in mind when you select devices for a deployment job or start the job:

- You must configure at least one policy on a device before deploying to that device. If you deploy to a device without assigning at least one policy, the device's current configuration is overwritten with a blank configuration and the device will be non-functional.
- Firewall devices only—If you manually added a firewall device (as described in [Adding Devices by Manual Definition](#), on page 92), we highly recommend that you discover (import) the factory-default policies for that device before deploying to that device. Bringing these policies into Security Manager prevents you from unintentionally removing them the first time you deploy to that device. For more information about factory-default policies for firewall devices, see [Default Firewall Configurations](#), on page 1806. For more information about importing policies, see [Discovering Policies](#), on page 176.
- Deployment might take from a few minutes to an hour or more, depending on the number of devices in the deployment job.
- Modifying a subset of devices that are part of a VPN might make the VPN inoperable. If you select a subset of devices that are part of a VPN when creating a deployment job, you are warned and given the opportunity to select the other devices in the VPN. See [Warning - Partial VPN Deployment Dialog Box](#), on page 409.
- You cannot select devices that were included in other deployment jobs that are in an active state (Edit, Edit Open, and Approved). You can select devices that were included in other deployment jobs that are in the Deployed, Failed, Discarded, or Aborted states.
- Firewall service modules (FWSMs) and Intrusion Detection System service modules (IDSMS) contain virtual devices. Security Manager considers the module and the virtual devices to be separate devices.
- Some changes to the FWSM might require the Catalyst Multiservice function card (MSFC) to be updated as well. If you select an FWSM that has these types of changes, Security Manager notifies you that you must include the MSFC in the deployment job, and it will select the MSFC device for you automatically. However, if the MSFC is already included in another active deployment job, you cannot include the MSFC in the current deployment job. You must remove the MSFC from the other deployment job, discard the other deployment job, or include the FWSM in the other deployment job.
- The status of deployments to Catalyst 6500/7600 devices shows deployment to the device as well as its interface contexts when policy changes contain interface commands that affect the interface contexts (child devices). This can occur when you deploy a policy change that affects a VLAN in which the switch participates or when you update inventory, for example, by adding or deleting interface contexts.

- [Job States in Workflow Mode](#) , on page 385

## Deploying Configurations in Non-Workflow Mode

When you deploy configurations, you can transfer them to devices either directly or to another transport server (such as AUS, CNS, or TMS) in the network or create them as configuration files in a directory on the Security Manager server. See [Understanding Deployment Methods](#) , on page 387 for more information.

**Note** If you have made changes to a Unified ACL entry through Policy Object Manager which is used in a RAVPN policy (DAP, Group Policy, and alike) on a device, the device and the ticket does not get displayed in the Deploy Saved Changes window. You must click Add other devices and add the device manually.

**Tip** Before creating the deployment job, read [Tips for Successful Deployment Jobs](#) , on page 405. That topic includes tips and cautions you should keep in mind when creating deployment jobs.

**Caution** You must configure at least one policy on a device before deploying to that device. If you deploy to a device without assigning at least one policy, the device's current configuration is overwritten with a blank configuration.

**Note** When using virtual sensors: An IPS device and all of the virtual sensors on it must be deployed as a group. If you make changes to a virtual sensor and then deploy it, Security Manager deploys the parent device and all virtual sensors associated with it.

### Before You Begin

- Make sure that devices have been bootstrapped. For more information, see [Preparing Devices for Management](#), on page 55.
- If you are deploying to a transport server, such as AUS, CNS, or TMS, make sure the server, Security Manager settings, and device have been set up properly.

### Related Topics

- [Overview of the Deployment Process](#) , on page 379
- [Including Devices in Deployment Jobs or Schedules](#) , on page 386
- [Understanding Deployment Methods](#) , on page 387
- [Deploying Configurations Using an Auto Update Server or CNS Configuration Engine](#) , on page 420
- [Deploying Configurations to a Token Management Server](#) , on page 421

- [Managing Device Communication Settings and Certificates](#) , on page 458
- [Understanding How Out-of-Band Changes are Handled](#) , on page 390

---

**Step 1** Do one of the following in non-Workflow mode:

- Select **File > Submit and Deploy** or click the **Submit and Deploy Changes** button on the toolbar.

**Note** These options are not available when Ticket Management is enabled.

- Select **File > Deploy**.
- Click the **Deployment Manager** button on the Main toolbar and click the **Deployment Jobs** tab if it is not active. Click **Deploy**.

Security Manager validates all of the policy changes that were made since the last deployment. If the validation results in errors, resolve the errors before attempting to deploy again. If there are only warnings or informational messages, click **OK** to proceed to the Deploy Saved Changes dialog box.

**Step 2** In the Deploy Saved Changes dialog box, do the following:

- Select the devices to which you want to deploy configurations. The device selector lists all devices for which policy changes were made but not yet deployed, and initially all changed devices are selected for deployment.

All device groups that contain changed devices are shown, and you can select or deselect the devices using the device group folder. If you select or deselect a device that appears in more than one group, it is selected or deselected in all groups; however, a device is deployed to only once in the job. Right-click and select **Expand All** to open all of the folders.

The Deploy Saved Changes dialog box shows the date, time, and user associated with the changes that will be included in the deployment for the selected devices. This information changes based on the devices you select for deployment. If you have Ticket Management enabled, the tickets associated with the changes to be deployed are also displayed. You can click a ticket ID to view details of the ticket and to navigate to an external ticket management system if configured (see [Ticket Management Page](#) , on page 584).

If you detect out of band changes, when you close the OOB Changes dialog box, the device names are color-coded based on the results: green indicates out of band change; red indicates an error during the detection process; no color change indicates no out of band changes.

- If you want to add devices that do not have policy changes to the deployment job, click **Add other devices** to open the Add Other Devices dialog box (see [Add Other Devices Dialog Box](#) , on page 437). You might want to add unchanged devices if a device was manually modified and you want to return the device to its previous configuration (the one stored in the Security Manager database).
- (Optional) To change the method used to deploy configurations, click **Edit Deploy Method** to open the Edit Deployment Method dialog box (see [Edit Deploy Method Dialog Box](#) , on page 408). There is a system default deployment method (which your organization chooses), so you might not need to change the method. You can select these methods:
  - Device—Deploys the configuration directly to the device or to the transport mechanism specified for the device. For more information, see [Deploying Directly to a Device](#) , on page 387 or [Deploying to a Device through an Intermediate Server](#) , on page 388.
  - File—Deploys the configuration file to a directory you select on the Security Manager server. For more information, see [Deploying to a File](#) , on page 389.

Before proceeding with the deployment, you can do the following:

- Preview proposed configurations and compare them against last deployed configurations or current running configurations. Right-click the device and select **Preview Config**. For more information, see [Previewing Configurations](#) , on page 422.
- Analyze the devices for out of band changes by clicking the **Detect OOB Changes** button. For more information, see [Detecting and Analyzing Out of Band Changes](#) , on page 424 and [OOB \(Out of Band\) Changes Dialog Box](#) , on page 427.

**Step 3** Click **Deploy** to start the deployment job for the selected devices, which generates the required configuration files and applies them according to your selected deployment method.

The Deployment Status Details dialog box opens so that you can view the status of the deployment. It displays summary information about the job, status about the deployment to each device, and messages indicating why the deployment failed.

In the Deployment Details table, select a row corresponding to a device to display deployment status messages specifically for that device. For more information, see [Deployment Status Details Dialog Box](#) , on page 410.

If deployment to any device failed, you can redeploy configurations to the failed devices. For more information, see [Redeploying Configurations to Devices](#) , on page 432.

---

## Edit Deploy Method Dialog Box

Use the Edit Deploy Method dialog box to specify whether to deploy the generated configurations directly to the devices in the network or to create configuration files in a directory on the Security Manager server.

### Navigation Path

Click **Edit Deploy Method** in the Deployment—Create or Edit a Job dialog box (Workflow mode) or Deploy Saved Changes dialog box (non-Workflow mode). For the procedures, see:

- [Creating and Editing Deployment Jobs](#) , on page 413
- [Deploying Configurations in Non-Workflow Mode](#) , on page 406

### Related Topics

- [Understanding Deployment Methods](#) , on page 387

- [Managing Device Communication Settings and Certificates](#) , on page 458

## Field Reference

**Table 105: Edit Deploy Method Dialog Box**

Element	Description
Device	The name of the device.
Method	<p>The deployment method to use:</p> <ul style="list-style-type: none"> <li>• <b>Device</b>—Deploys the configuration directly to the device or to the transport mechanism specified for the device. For more information, see <a href="#">Deploying Directly to a Device</a>, on page 387 or <a href="#">Deploying to a Device through an Intermediate Server</a>, on page 388.</li> <li>• <b>File</b>—Deploys the configuration file to a directory on the Security Manager server. If you select File, specify the directory to which you want to deploy the configuration file in the Destination column. You cannot use file deployment with IPS devices. For more information, see <a href="#">Deploying to a File</a>, on page 389.</li> </ul> <p><b>Note</b> To set the deployment method for more than one device at a time, select the desired rows, right-click and select <b>Edit Selected Deploy Method</b>. The Edit Selected Deploy Method dialog box opens where you can make your selections.</p>
Destination	If you selected File in the Method field, enter the directory to which you want to deploy the configuration file. Click <b>Browse</b> to select from a list of available directories.
Preview Config button	Click this button to display the proposed configuration changes for the selected device. You can compare it to the last deployed configuration or the current running configuration. For more information, see <a href="#">Previewing Configurations</a> , on page 422.
Out of Band Change Behavior	Click the radio button corresponding to the action you want Security Manager to take regarding changes made directly on the device using the CLI. For a complete explanation of how to handle out-of-band changes, including the meaning of the available options, see <a href="#">Understanding How Out-of-Band Changes are Handled</a> , on page 390.

## Warning - Partial VPN Deployment Dialog Box

Use the Partial VPN Deployment dialog box to select other devices that are part of a VPN to which you are deploying configurations.

When you create a deployment job and the job contains devices in a VPN, you must select all of the devices in the VPN. If you select a subset of devices and try to deploy to only those devices, this dialog box appears so that you can select the other devices that are part of the VPN.

### Navigation Path

- **Non-Workflow mode**—If you select a subset of devices in a VPN in the Deploy Saved Changes dialog box, this dialog box appears when you click **Deploy**.
- **Workflow mode**—If you select a subset of devices in a VPN in the Create or Edit a Job dialog box, this dialog box appears when you click **OK**.

- [Deploying Configurations in Workflow Mode](#) , on page 412

**Field Reference***Table 106: Partial VPN Deployment Warning Dialog Box*

Element	Description
VPN	The name of the VPN.
Missing Devices	All the devices in the VPN that were not selected for deployment.
Is Device in Other Job	Whether the missing device is part of another deployment job.
Deploy to All Devices in VPN button	Click this button to deploy to all devices in the VPN. You can deploy to all devices in the VPN only if the devices are not in other deployment jobs.
Deploy to Selected Devices button	Click this button to deploy only to the devices selected in the Create or Edit a Job or Deploy Saved Changes dialog boxes.

**Deployment Status Details Dialog Box**

The Deployment Status Details dialog box appears while configurations are being deployed to selected devices. It displays summary information about the job, status about the deployment to each device, and messages indicating why the deployment failed.

In the Deployment Details table, select a row corresponding to a device to display deployment status messages for that device.

---

**Note** You can click **Close** to close this dialog box and continue working in Security Manager while deployment continues.

---

**Navigation Path**

From the Deploy Saved Changes dialog box, click **Deploy**.

## Field Reference

**Table 107: Deployment Status Details Dialog Box**

Element	Description
Deployment Status Details	
Progress Status Bar	A visual representation and percentage of devices that were successfully updated.
Status	The status of the deployment. The possible states are Deploying, Aborted, Successful, and Failed. For descriptions of these states, see <a href="#">Job States in Workflow Mode</a> , on page 385.
Deployment Job Name	The name of the deployment job.
Devices To Be Deployed	The total number of devices in the deployment job.
Devices Deployed Successfully	The number of devices that were updated successfully.
Devices Deployed With Errors	The number of devices that failed to be updated.
<b>Deployment Details</b>	
This table lists the devices that are included in the deployment job.	
Device	The name of the device.
Status	The status of the deployment to the device. For descriptions of these states, see <a href="#">Job States in Non-Workflow Mode</a> , on page 383.
Summary	The number of warnings, errors, and failures for the device.
Method	The method of deployment to the device. Possible methods are File and Device.
Config	The device configuration file. Double click the icon to preview the configuration for a device. For more information, see <a href="#">Previewing Configurations</a> , on page 422.
Transcript	The commands Security Manager issued to the device and the responses from the device during deployment if you are deploying to the device (instead of deploying to a file). Double-click the icon to see the transcript for a device.
Last Ticket(s)	The tickets containing changes that are part of the deployment for the device. You can click on the Ticket IDs to view additional information about the ticket, such as Creator and Last Modified date. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see <a href="#">Device Communication Page</a> , on page 530).

Element	Description
Messages	The warning, error, and failure messages, as indicated by the severity icon.  When you select an item, the Description box to the right describes the message in detail. The Action box to the right provides information on how you can correct the problem.
Generate Report button	Click this button to create a deployment status report for this job. You can generate the report in HTML and PDF formats. The report includes a summary of the job plus the full and delta configurations and the job transcript. You can use this report for your own purposes or to aid in troubleshooting a problem with Cisco TAC. For more information, see <a href="#">Generating Deployment or Discovery Status Reports</a> , on page 506.
Refresh button	Click this button to update the status information.
Abort button	Click this button to abort the deployment job. You can abort deployment jobs only while they are in the Deploying, Scheduled, or Rolling Back state. Aborting a job stops deployment of configuration files to pending devices, but has no effect on devices to which deployments are in progress (commands are being written to a device) or to which deployment has already completed successfully.

## Deploying Configurations in Workflow Mode

The task of deploying configurations in Workflow mode is a multiple step process. You must create a deployment job, get it approved, and then deploy the job. This process ensures that organizations that separate task authorizations among personnel can implement their control processes.

When you deploy configurations, you can transfer them to devices either directly or to another transport server (such as AUS, CNS, or TMS) in the network or create them as configuration files in a directory on the Security Manager server. See [Understanding Deployment Methods](#), on page 387 for more information.

**Tip** Before creating the deployment job, read [Tips for Successful Deployment Jobs](#), on page 405. That topic includes tips and cautions you should keep in mind when creating deployment jobs.

### Before You Begin

- Make sure that devices have been bootstrapped. For more information, see [Preparing Devices for Management](#), on page 55.
- If you are deploying to a transport server, such as AUS, CNS, or TMS, make sure the server, Security Manager settings, and device have been set up properly.

### Related Topics

- [Overview of the Deployment Process](#), on page 379
- [Including Devices in Deployment Jobs or Schedules](#), on page 386
- [Understanding Deployment Methods](#), on page 387
- [Deploying Configurations Using an Auto Update Server or CNS Configuration Engine](#), on page 420

- [Deploying Configurations to a Token Management Server](#) , on page 421
- [Managing Device Communication Settings and Certificates](#) , on page 458
- [Understanding How Out-of-Band Changes are Handled](#) , on page 390

- 
- Step 1** Click the **Deployment Manager** button in the Main toolbar.  
The Deployment Manager window appears. Click the **Deployment Jobs** tab if it is not active.
- Step 2** Create the deployment job. Click **Create** and enter the job properties. For the procedure, see [Creating and Editing Deployment Jobs](#) , on page 413.  
When you finish creating a job, you can select whether to submit it. If you are not using a deployment job approver, you can also automatically submit, approve, and deploy the job, in which case you do not need to complete the other steps in this procedure.
- Step 3** (Workflow with approver) Submit the job. If you did not submit the job, select it in the Deployment Manager window and click **Submit**. An e-mail is sent to the approver. For more information, see [Submitting Deployment Jobs](#) , on page 416.
- Step 4** (Workflow with or without an approver) Approve the job. If you did not approve the job when you created it, select it in the Deployment Manager window and click **Approve**. If there is a separate person who approves jobs, that person must perform this step. For more information, see [Approving and Rejecting Deployment Jobs](#) , on page 417.
- Step 5** (Workflow with or without an approver) Deploy the job. If you did not deploy the job when you created it, select it in the Deployment Manager window and click **Deploy**. You can specify a future time to start the job, or start it immediately, and configurations are deployed according to the properties of the job. For more information, see [Deploying a Deployment Job in Workflow Mode](#) , on page 418
- Note** You can discard a deployment job at any time before you deploy it. For more information, see [Discarding Deployment Jobs](#) , on page 419.
- 

## Creating and Editing Deployment Jobs

In Workflow mode, before you deploy policy configurations to your devices, you must create a deployment job. When you create a job, you select the devices to which you want to deploy the configurations, whether you want to deploy directly to the devices or to an output file, and when you want the job to take place.

**Note** If you have made changes to a Unified ACL entry through Policy Object Manager which is used in a RAVPN policy (DAP, Group Policy, and alike) on a device, the device and the ticket does not get displayed in the Deployment- Create a Job window. You must click Add other devices and add the device manually.

**Tip** Before creating the deployment job, read [Tips for Successful Deployment Jobs](#) , on page 405. That topic includes tips and cautions you should keep in mind when creating deployment jobs.

**Caution** You must configure at least one policy on a device before deploying to that device. If you deploy to a device without assigning at least one policy, the device's current configuration is overwritten with a blank configuration.

### Before You Begin

- Make sure that devices have been bootstrapped. For more information, see [Preparing Devices for Management, on page 55](#).
- If you are deploying to a transport server, such as AUS, CNS, or TMS, make sure the server, Security Manager settings, and device have been set up properly.

### Related Topics

- [Overview of the Deployment Process , on page 379](#)
- [Including Devices in Deployment Jobs or Schedules , on page 386](#)
- [Understanding Deployment Methods , on page 387](#)
- [Understanding How Out-of-Band Changes are Handled , on page 390](#)
- [Job States in Workflow Mode , on page 385](#)

**Step 1** Click the **Deployment Manager** button in the Main toolbar.  
The Deployment Manager window appears. Click the **Deployment Jobs** tab if it is not active.

**Step 2** Do one of the following:

- Click **Create** to create a new job.
- Select an editable job and click **Open** to edit the job. You cannot edit a job that has already been deployed.

The Create a Job or Edit a Job dialog box opens.

**Step 3** In the dialog box, do the following to define the contents of the job:

- **Job Name and Description**—Keep the default job name or enter a more meaningful name. Because the job name enables you to distinguish one job from another, you should assign a name that reflects the contents of the job. You cannot change the name after you create the job. Optionally, enter a description of the job.
- Select the devices to which you want to deploy configurations. The device selector lists all devices for which policy changes were made but not yet deployed, and initially all changed devices are selected for deployment.

All device groups that contain changed devices are shown, and you can select or deselect the devices using the device group folder. If you select or deselect a device that appears in more than one group, it is selected or deselected in all groups; however, a device is deployed to only once in the job. Right-click and select **Expand All** to open all of the folders.

If you detect out of band changes, when you close the OOB Changes dialog box, the device names are color-coded based on the results: green indicates out of band change; red indicates an error during the detection process; no color change indicates no out of band changes.

- If you want to add devices that do not have policy changes to the deployment job, click **Add other devices** to open the Add Other Devices dialog box (see [Add Other Devices Dialog Box](#) , on page 437). You might want to add unchanged devices if a device was manually modified and you want to return the device to its previous configuration (the one stored in the Security Manager database).
- (Optional) To change the method used to deploy configurations, click **Edit Deploy Method** to open the Edit Deployment Method dialog box (see [Edit Deploy Method Dialog Box](#) , on page 408). There is a system default deployment method (which your organization chooses), so you might not need to change the method. You can select these methods:
  - **Device**—Deploys the configuration directly to the device or to the transport mechanism specified for the device. For more information, see [Deploying Directly to a Device](#) , on page 387 or [Deploying to a Device through an Intermediate Server](#) , on page 388.
  - **File**—Deploys the configuration file to a directory you select on the Security Manager server. For more information, see [Deploying to a File](#) , on page 389.

Before proceeding with the deployment, you can do the following:

- Preview proposed configurations and compare them against last deployed configurations or current running configurations. Right-click the device and select **Preview Config**. For more information, see [Previewing Configurations](#) , on page 422.
- Analyze the devices for out of band changes by clicking the **Detect OOB Changes** button. For more information, see [Detecting and Analyzing Out of Band Changes](#) , on page 424 and [OOB \(Out of Band\) Changes Dialog Box](#) , on page 427.

#### Step 4

Select how you want the job handled when you close the dialog box. The options available to you depend on whether you are using Workflow mode with a deployment job approver:

- **Without an approver**—If you are not using a separate approver, you have these options:
  - **Close the job**—Close the job and leave it in the edit state. Select this option if you know you want to make additional modifications to the job.
  - **Approve the job**—Close the job and approve it but do not deploy it. Configure the following:
    - **Comments**—(Optional) Comments about the job approval.
    - **Submitter**—The e-mail address of the person submitting the job for approval. Notifications of job state changes are sent to this address, which is initially the e-mail address associated with the user account you used to log into Security Manager. Ensure that the address is the correct one so that you receive the notifications.
    - **Deploy the job**—Close the job, approve it, and deploy it. Configure the following:
      - **Options**—Whether to Deploy Now or Schedule. If you select Schedule, additional fields appear where you can specify the date and time when the job should be run. The time is in 24-hour format and is based on the time zone of the Security Manager server, which is not necessarily the same time zone that you are currently in. The target time must be at least five minutes in the future.
      - **Comments**—(Optional) Comments about the deployment job.
    - **Send Deployment Status Notification**—Whether Security Manager should send e-mail notifications whenever the job status changes.

If you select this option, enter the e-mail addresses of the people who should receive notifications in the Job Completion Recipients field. If you enter multiple addresses, separate them with commas. The field initially contains the default approver and your e-mail addresses.

- **With an approver**—If you are using a separate approver, you can configure the following options:
  - **Submit the job**—Whether to submit the job for approval. By default this check box is selected.
  - **Approver E-mail**—The e-mail address of the approver if you are submitting the job for approval. The default approver e-mail address is entered in the field, but you can change it.
  - **Comments**—(Optional) Comments you want to send to the approver, if any.
  - **Submitter E-mail**—The e-mail address of the submitter. The field initially contains the e-mail address associated with the user account you used to log in, but you can change it to another address.

#### Step 5 Click **OK**.

Depending on your selection for how to handle the job, you might still need to submit, approve, and deploy the job. See these topics for more information:

- [Submitting Deployment Jobs](#) , on page 416
- [Approving and Rejecting Deployment Jobs](#) , on page 417
- [Deploying a Deployment Job in Workflow Mode](#) , on page 418

## Submitting Deployment Jobs

In some organizations, before jobs can be deployed, they must be approved by a separate user with the appropriate permissions. In this case, Workflow mode is enabled *with* a deployment job approver, and you must submit the job to this user for review. The user reviews the job and either approves or rejects it.

If you are using Workflow mode *without* a deployment job approver, you can review and approve the job yourself. You do not submit jobs in this mode. For more information, see [Approving and Rejecting Deployment Jobs](#) , on page 417.

**Note** You enable and disable deployment job approval under Tools > Security Manager Administration > Workflow. For more information, see [Workflow Page](#) , on page 588.

This procedure assumes that you already created the job. You can also submit the job when you create it by selecting the **Submit the job** checkbox in the Create a Job dialog box.

#### Related Topics

- [Deployment Manager Window](#) , on page 393
- [Job States in Workflow Mode](#) , on page 385

#### Step 1 Click the **Deployment Manager** button in the Main toolbar.

The Deployment Status window appears. Click the **Deployment Jobs** tab if it is not active.

**Step 2** Select the job to submit.

**Step 3** Click **Submit**.

The Submit Deployment Job dialog box opens.

**Step 4** Enter the following information:

- **Approver**—The e-mail address of the person to be notified of your submission. The default approver e-mail address is entered in the field, but you can change it.
- **Comment**—(Optional) Comments you want to send to the approver, if any.
- **Submitter**—The e-mail address of the person submitting the deployment job. The field initially contains the e-mail address associated with the username you used to log into Security Manager, but you can change it to another e-mail address.

**Step 5** Click **OK**.

The job status changes to Submitted. The approver must approve the job before you can deploy it.

---

## Approving and Rejecting Deployment Jobs

In some organizations, before jobs can be deployed, they must be approved by a separate user with the appropriate permissions. In Workflow mode *with* a deployment job approver, one user submits a job, and another one previews the job and either approves or rejects it.

In Workflow mode without a deployment job approver, you can create and approve the job at the same time. For more information, see [Creating and Editing Deployment Jobs](#), on page 413.

When you reject a job, the devices in the job immediately become available for inclusion in other jobs. A rejected job cannot be deployed, but it can be opened for viewing and editing.

---

**Note** You enable and disable deployment job approval under **Tools > Security Manager Administration > Workflow**. For more information, see [Workflow Page](#), on page 588.

---

### Related Topics

- [Deployment Manager Window](#), on page 393
- [Job States in Workflow Mode](#), on page 385

---

**Step 1** Click the **Deployment Manager** button in the Main toolbar.

The Deployment Manager window appears. Click the **Deployment Jobs** tab if it is not active.

**Step 2** Select a submitted job and do one of the following:

- Click **Approve**.
- Click **Reject**.

You are prompted for an optional comment for your action. The comments are preserved in the history for the job. After submitting your comment, an e-mail notification is sent (if e-mail notifications are configured) and the job status changes to Approved or Rejected, as appropriate. The job can now be deployed (see [Deploying a Deployment Job in Workflow Mode](#), on page 418).

---

## Deploying a Deployment Job in Workflow Mode

When you work in Workflow mode, to deploy configurations to devices you must create a deployment job and have it approved. If you are working without a separate approver, you can approve and deploy the job yourself. Otherwise, you must submit it to an approver.

Deploying a deployment job in workflow mode simply starts a job. You cannot change the contents of a job during deployment.

---

**Note** Deployment might take from a few minutes to an hour or more, depending on the number of devices in the deployment job.

---

### Before You Begin

- Make sure that devices have been bootstrapped. For more information, see [Preparing Devices for Management](#), on page 55.
- If you are deploying to a transport server, such as AUS, CNS, or TMS, make sure the server, Security Manager settings, and device have been set up properly.
- Create a job. For more information, see [Creating and Editing Deployment Jobs](#), on page 413.
- If using Workflow mode with a deployment job approver, submit the job. For more information, see [Submitting Deployment Jobs](#), on page 416.
- Approve the job. For more information, see [Approving and Rejecting Deployment Jobs](#), on page 417.

### Related Topics

- [Overview of the Deployment Process](#), on page 379
- [Deployment Manager Window](#), on page 393
- [Including Devices in Deployment Jobs or Schedules](#), on page 386
- [Understanding Deployment Methods](#), on page 387
- [Managing Device Communication Settings and Certificates](#), on page 458

- 
- Step 1** Click the **Deployment Manager** button in the Main toolbar.  
The Deployment Manager window appears. Click the **Deployment Jobs** tab if it is not active.
- Step 2** Select the job to deploy.
- Step 3** Click **Deploy**.  
The Deploy Job dialog box opens.

**Step 4** In the Deploy Job dialog box, make these selections:

- **Options**—How you want to run the job. Select **Schedule** to run the job at some point in the future. Select **Deploy Now** to run the job immediately. If you schedule the job for a future time, the changes deployed in the job are based on the changes that existed when the job was created, not when the job is run.

If you select Schedule, date and time fields appear.

- Click the calendar icon to pick the day on which to run the job.
- In the Time field, enter the time to start the job in 24-hour clock format. The time must be in time zone of the Security Manager server, which is not necessarily the same as your time zone. The time must be at least 5 minutes in the future.
- **Comments**—(Optional) An explanation of why you are deploying the job.
- **Require Deployment Status Notifications, Job Completion Recipients**— Whether Security Manager should send an e-mail when the job status changes.

If you elect to send status notifications, enter the recipient's e-mail address. The field initially contains the e-mail address associated with the user account you used to log in. You can enter multiple addresses by separating them with commas.

**Step 5** Click **OK**.

You are returned to the Deployment Manager window. The job status changes to Deploying. When the deployment is complete, the job status changes to Deployed.

---

## Discarding Deployment Jobs

In Workflow mode, you can discard a job when it is in any state except Deployed, Deployment Failed, or Aborted. The job state is shown as discarded until the job is purged from the system, either automatically as set on the Workflow Management page or manually.

### Related Topics

- [Deployment Manager Window](#) , on page 393
- [Job States in Workflow Mode](#) , on page 385

---

**Step 1** Click the **Deployment Manager** button in the Main toolbar.

The Deployment Manager window appears. Click the **Deployment Jobs** tab if it is not active.

**Step 2** Select the job to discard.

**Step 3** Click **Discard**. You are prompted for an optional comment to explain why you are discarding the job.

---

# Deploying Configurations Using an Auto Update Server or CNS Configuration Engine

If your organization uses Auto Update Server (AUS) or Cisco Networking Services (CNS) Configuration Engine to manage the deployment of configurations to your network devices, you can use these intermediate servers with Security Manager. To perform this type of deployment, you need to set up the device, the AUS or Configuration Engine, and Security Manager properly. This procedure explains the tasks that you need to perform.

---

**Tip** You cannot successfully deploy a configuration to AUS that requires Security Manager to download other files to the device. For example, some remote access VPN policies allow you to configure plug-ins, Secure Client, and Cisco Secure Desktop configurations. These files are not sent to AUS. Do not use AUS if you want to configure these types of policy.

---

## Related Topics

- [Overview of the Deployment Process , on page 379](#)
- [Preparing Devices for Management, on page 55](#)
- [Including Devices in Deployment Jobs or Schedules , on page 386](#)
- [Understanding Deployment Methods , on page 387](#)
- [Managing Device Communication Settings and Certificates , on page 458](#)

---

**Step 1** Set up the AUS or Configuration Engine using the documentation for those products.

**Step 2** Configure the devices to use the server. The following topics describe the configuration steps depending on the type of server and the desired setup:

- [Setting Up AUS on PIX Firewall and ASA Devices , on page 64](#)

**Step 3** When you add the device to Security Manager, select the AUS or Configuration Engine for the device if your chosen method allows it. If the AUS or Configuration Engine is not already defined in Security Manager, you can identify it to Security Manager as you add the network device. For detailed procedures, see these topics:

- [Adding Devices from the Network , on page 80](#)
- [Adding Devices from Configuration Files , on page 89](#)
- [Adding Devices by Manual Definition , on page 92](#)
- [Adding Devices from an Inventory File , on page 97](#)
- [Adding, Editing, or Deleting Auto Update Servers or Configuration Engines , on page 103](#)

**Tip** After you add a device to the Security Manager inventory, you can change the assigned server in the device properties. Right-click the device and select **Device Properties**. Configure the server using the device properties if you could not identify it while adding the device.

**Step 4** For devices that are using AUS, configure the AUS policy for the device in Security Manager. Do one of the following:

- Configure the policy for a single device. In Device view, select the device, and then select **Platform > Device Admin > Server Access > AUS** from the Device Policy selector.
- Configure a shared policy that you can assign to many devices that share the same AUS. In Policy view, select **PIX/ASA/FWSM Platform > Device Admin > Server Access > AUS** from the Policy Types selector. Right-click **AUS** and select **New AUS Policy** to create a policy, or select an existing policy from the Policies selector to change the policy. Select the Assignments tab to assign the policy to specific devices.

The server you identify in this policy must also be the server you identify in the device properties. The device properties identify the server to which Security Manager will send the configuration, whereas the AUS policy defines the server the device will contact.

**Tip** If you change AUS servers, keep in mind that the device will continue to use the AUS server defined in its current configuration until it receives a new configuration. Thus, you should change the AUS policy but deploy the configuration using the previous AUS server. After deployment is successful, change the device properties to point to the new server.

**Step 5** In Security Manager, deploy your configurations using the **Deploy to Device** deployment method. Security Manager sends the configuration to the AUS or Configuration Engine, where the network device retrieves it.

Depending on the Workflow mode you are using, follow these procedures:

- [Deploying Configurations in Non-Workflow Mode](#) , on page 406
- [Deploying Configurations in Workflow Mode](#) , on page 412

---

## Deploying Configurations to a Token Management Server

If your organization requires the use of a Token Management Server (TMS) for applying configuration updates to routers, you can use Security Manager in conjunction with your TMS processes. To perform this type of deployment, you need to set up the device, TMS, and Security Manager properly. This procedure explains the tasks that you need to perform.

### Related Topics

- [Overview of the Deployment Process](#) , on page 379
- [Preparing Devices for Management](#), on page 55
- [Including Devices in Deployment Jobs or Schedules](#) , on page 386
- [Understanding Deployment Methods](#) , on page 387
- [Managing Device Communication Settings and Certificates](#) , on page 458

---

**Step 1** Set up the TMS as an FTP server. Security Manager uses FTP to deploy the configuration file to the TMS, from which it can be downloaded and encrypted onto an eToken. The eToken can then be connected to the USB port of a router and the configuration downloaded. See the TMS product documentation for more information.

**Step 2** In Security Manager, select **Tools > Security Manager Administration > Token Management** to identify the TMS server to Security Manager.

By default, Security Manager uses the Security Manager server as the TMS, but you can specify a different server. You must enter the hostname or IP address, a username and password for the TMS, the directory to which configuration files should be copied, and the public key file location in Security Manager. For more information, see [Ticket Management Page](#), on page 584.

**Step 3** Specify TMS as the transport protocol to be used for Cisco IOS routers.

You can set this parameter globally for all Cisco IOS routers or for a specific device:

- Globally—Select **Tools > Security Manager Administration > Device Communication** and select TMS in **Transport Protocol (IOS Routers 12.3 and above)**.
- Device—Right click the device in the Device selector and select **Device Properties**. On the General tab, select TMS as the transport protocol in the Device Communications Group. Because not all routers support TMS, you might not be able to configure TMS for specific devices.

**Step 4** In Security Manager, deploy your configurations using the **Deploy to Device** deployment method. Security Manager sends the delta configuration to the TMS server.

Depending on the Workflow mode you are using, follow these procedures:

- [Deploying Configurations in Non-Workflow Mode](#), on page 406
- [Deploying Configurations in Workflow Mode](#), on page 412

**Step 5** Using the TMS, download the configuration to the eToken. See the TMS product documentation for more information.

**Step 6** Download the configuration from the eToken to the router and save the configuration to the device. Plug the eToken into the router, then enter the following commands to download the configuration to the router, where *usb\_token\_id* is either **usbtoken0** or **usbtoken1**, depending on which USB port you used. The default PIN is 1234567890.

**Example:**

```
router# crypto pki token
usb_token_id
login
PIN

router# config terminal

router(config)# crypto pki token default secondary config CCCD

router(config)# exit

router# write memory
```

**Tip** CCCD is the private sector on the eToken where the configuration file resides. When you enter the **crypto pki token default secondary config CCCD** command, the CLI on the e-token merges with the CLI on the router.

## Previewing Configurations

There are many ways to preview a device configuration. You can select a device from the Device selector and select **Tools > Preview Configuration**, or you can click the **Preview Config** button in several dialog boxes.

---

**Tip** You can also right click a device in Map view and select **Preview Configuration**.

---

When you preview a configuration, the configuration is displayed in the Config Version Viewer dialog box. The proposed configuration is on the left. You can select to view the delta configuration (which shows the changes since the last deployment) or the full configuration. You can also compare the configuration to the last one deployed to the device or the current running configuration in the right pane.

The contents of the proposed configuration can differ depending on where you view it from:

- If you use **Tools > Preview Configuration**, or right click the device in the Device selector and select **Preview Configuration**, the proposed configuration includes changes that you have not yet submitted to the database.
- If you preview the configuration while creating a deployment job, the proposed configuration includes only those changes that you have submitted to the database. These are the changes that will be deployed to the device if you start the deployment job.

The value of previewing configurations is that it lets you see the actual device commands that will be used to configure the device. If you are a CLI expert, this can help you verify that you are getting the configuration you expect. Even if you are not a CLI expert, you can use the information to look for more information in the command reference for the operating system on Cisco.com.

---

**Note** New objects are created when you rediscover ASA 8.2.3 devices through Cisco Security Manager after configuring network objects on the device. Ignore the CLIs for these new objects that are generated in preview configuration.

---

Following are some tips for previewing configurations:

- Many configuration options are specific to one or more interfaces. If you must specify an interface name in a policy, the previewed configuration will include the commands for the policy only if the Interfaces policy defines the interface that you specify. Ensure that you configure the Interfaces policy before previewing configurations.
- If you preview the configuration for a virtual sensor, the preview that you see is for the parent device, not the virtual sensor, because the configuration for a virtual sensor is stored on the parent device.
- If you are just curious about what commands a policy will configure, consider adding a dummy device and configure the policy for that device. This will help prevent unintended configuration changes in your real devices. To add a dummy device, use the procedure described in [Adding Devices by Manual Definition](#), on page 92.
- Policies are validated before you can view the configuration. The validation happens for all devices, not just the device you are previewing. Thus, you might see errors and warnings that apply to different devices. If any errors or warnings occur, the Preview Messages dialog box appears. The dialog box lists all of the messages, including their severity and possible solutions. Click **OK** to continue to the Config Version Viewer dialog box. Click **Details** to see detailed information on the problems.

The following table explains the fields in the Config Version Viewer window used for previewing configurations.

Table 108: Config Version Viewer (Preview Configuration) Dialog Box

Element	Description
Proposed Config Type	The type of configuration you want to view. For example, you can view the full configuration or just the delta (the changes from the last deployed configuration). The proposed configuration is displayed in the left pane.
Compare to Version	Choose a configuration to compare against the proposed configuration. The selected configuration is displayed in the right pane. <ul style="list-style-type: none"> <li>• None—Leaves the reference configuration blank.</li> <li>• Last Deployed—Displays the last configuration that was deployed to the device and compares it with the proposed configuration.</li> <li>• Running Config—Displays the current configuration running on the device and compares it with the proposed configuration. The device must be accessible to obtain the running configuration.</li> </ul>
First Difference button	Moves the cursor to the first difference noted between the proposed and reference configurations.
Previous Difference button	Moves the cursor to the previous difference noted between the proposed and reference configurations.
Current Difference button	Centers the currently selected difference on the page.
Next Difference button	Moves the cursor to the next difference noted between the proposed and reference configurations.
Last Difference button	Moves the cursor to the last difference noted between the proposed and reference configurations.
Print button	Prints the configuration.

## Detecting and Analyzing Out of Band Changes

When you deploy configurations to devices, Security Manager either removes out of band changes or cancels the deployment based on your deployment settings. (For a detailed explanation of out of band changes and how they are handled during deployment, see [Understanding How Out-of-Band Changes are Handled](#), on page 390.)

In the most typical scenario, Security Manager removes any out of band changes during deployment. However, there might have been good reason for those changes to have been made to the device outside of Security Manager. Thus, it is good practice to analyze a device for out of band changes before deploying configurations, so that you have the opportunity to proactively recreate any configuration changes that should be preserved.

---

**Note** When a device is rebooted from console, the Config\_mod value becomes 0. Config\_mod parameter value will be stored soon after a discovery or a deployment is done. Ideally, CSM will poll the device every 5 minutes to check for the config\_mod parameter value changes to detect the OOB.

---

There are many ways to detect whether there have been out of band changes to a device configuration since the last deployment to the device. If there have been changes (by another device management application or by direct CLI updates), you can preview the changes and determine whether to update the device policies before deployment, or to deploy and overwrite those out of band changes. (Out of band changes are sometimes called OOB changes in Security Manager). In some scenarios, the OOB changes are not detected. For information on handling such exceptions, see [Exceptions to Out of Band Change Detection, on page 426](#).

---

**Tip** Out of band change detection is available only for IOS, ASA, PIX, FWSM devices, and security contexts; it is not available for IPS devices. However, the settings for handling out of band changes during deployment also apply to IPS devices; the difference is that you cannot proactively analyze these changes in IPS devices prior to deployment.

---

To determine whether there have been out of band changes on one or more device, do any of the following in Device view:

- Select **Tools > Detect Out of Band Changes**. You are prompted to select the devices to evaluate for out of band changes. Select the devices or device groups, click >> to move them to the selected list, and click **OK**. For more information on selecting devices, see [Using Selectors , on page 46](#).
- Select one or more devices or device groups, right-click and select **Detect Out of Band Changes**. The selected devices are evaluated for changes.
- During deployment, select the devices to include in deployment and click the **Detect OOB Changes** button. (The button is available on the Deploy Saved Changes dialog box and the Deployment—Create or Edit a Job dialog box, depending on the workflow mode you are using.) The selected devices are evaluated for changes.

For information on the deployment procedure, see:

- [Deploying Configurations in Non-Workflow Mode , on page 406](#)
- [Creating and Editing Deployment Jobs , on page 413](#)

When you start the detection process, the [OOB \(Out of Band\) Changes Dialog Box , on page 427](#) is opened so that you can view the results. Each selected device is evaluated by retrieving the current running configuration and comparing it to the most recent configuration stored in Configuration Archive. Security Manager does not consider any unmanaged policy types when evaluating differences between the configurations.

---

**Tip** Note that if you are in the process of deployment, the running configuration is **not** compared to the one you are proposing to deploy, so if you detect out of band changes, you might also want to preview the proposed configuration to see if you already implemented the same change in Security Manager policies. Right-click the device in the deployment dialog box and select **Preview Config**. You can compare the proposed configuration to the current running configuration. For more information, see [Previewing Configurations , on page 422](#).

---

The OOB Changes dialog box shows the results of change detection. If a device has out of band changes, the icon for the device in the device selector changes to green. Select a device in the left pane of the OOB Detail tab to view the changes from the latest configuration in configuration archive. Use the buttons at the bottom of the window to move from change to change. The legend at the bottom explains the color coding used to describe the changes.

When evaluating changes, consider the following:

- If you want to keep the change, update the relevant policy in Security Manager to recreate the policy. Use preview config to ensure that your policy changes produce the desired results. Security Manager might use different naming conventions, so consider whether the policy results in the same thing, rather than being exactly the same text. Keep in mind that out of band change detection looks for syntactic differences, not semantic differences.
- If you use another application to configure certain types of policies, consider unmanaging that policy type in Security Manager. Security Manager ignores any configuration commands related to policies that it is not managing. For more information, see [Policy Management Page](#) , on page 575.

---

**Note** A config\_mod parameter value is stored whenever there is a device discovery or deployment. CSM polls every five minutes to check if the config\_mod parameter value is changed and to detect the OOB changes. When you reload an ASA device from the console, the config\_mod parameter value becomes 0 thus marking the OOB state in the device.

---

---

**Tip** If you are detecting changes during deployment, when you close the OOB Changes dialog box, the device names in the deployment dialog box are color-coded based on the results: green indicates out of band change; red indicates an error during the detection process; no color change indicates no out of band changes.

---

## Exceptions to Out of Band Change Detection

If you have not approved the activity in which the changes have been done, the Cisco Security Manager database will not get updated. This results in a discrepancy between the Cisco Security Manager configuration archive (that the OOB feature uses) and the Cisco Security Manager database. When you do not approve the activity, Cisco Security Manager does not detect Our of Band (OOB) changes that are applied to the device. As a result, Cisco Security Manager does not stop deployment (overwriting OOB changes) even when you have configured it to cancel deployment when OOB changes are detected (see [Understanding How Out-of-Band Changes are Handled](#) , on page 390). This section discusses this exception and how to handle it.

The following tasks are executed in Cisco Security Manager (Workflow mode), when a policy rediscovery is initiated:

- 
- Step 1** After rediscovery ( [Discovering Policies on Devices Already in Security Manager](#) , on page 179), a new device configuration is written to the Cisco Security Manager configuration archive.
- Step 2** If you do not approve the activity in which policy rediscovery is done, the Cisco Security Manager database will not be updated with the new device configuration and will continue to use old configuration data. Thus, there will be a mismatch between the configuration archive and the Cisco Security Manager database. This might result in the OOB changes on the device to be overwritten by Cisco Security Manager. This occurs even when you have configured it to cancel deployment when OOB changes are detected (see [Understanding How Out-of-Band Changes are Handled](#) , on page 390).

**Note** If the policy rediscovery activity is not approved, Out of Band (OOB) changes are not detected between the Cisco Security Manager database and configuration on the device. This is because OOB changes are detected using the Cisco Security Manager configuration archive, which has been updated with discovered configuration from device ([Step 1, on page 426](#) above). On the other hand, Cisco Security Manager database still has the previous configuration of device, since activity has not been approved.

---

### What to do next

In addition, when you are [Previewing Configurations](#), on page 422 for the discovered device before the activity is approved, the preview configuration does not show correct configuration changes. In order to see correct differences, you must approve the activity first or preview configurations from another activity.

## Exceptions to Out of Band Change Detection

To overcome these exceptions, do the following:

- 
- Step 1** Create a new activity for rediscovery.
  - Step 2** On completion of policy rediscovery, Submit and Approve the activity. Verify if the activity has been approved.
  - Step 3** To confirm if configuration changes for the rediscovered device is displayed as expected, perform [Previewing Configurations](#), on page 422 for the device.
  - Step 4** Deploy changes from Cisco Security Manager to the device, if required.
- 

## OOB (Out of Band) Changes Dialog Box

Use the OOB Changes dialog box to view and analyze out of band changes on a device. An out of band change is any difference between the running configuration on a device and the most recent configuration for the device stored in Configuration Archive. Note that Security Manager considers only managed policy types when evaluating whether there is a difference between the configurations.

---

**Tip** Configurations are compared for syntactic differences, not semantic differences. Thus, functionally equivalent configurations might be identified as out of band changes.

---

---

**Tip** As an example, consider a simple case in which configuration lines are swapped in the device configuration without making any changes to the semantics. In this simple example case: 1) if there is an object group in Security Manager at line number 100, and 2) the same object group exists in the ASA configuration at any line number *except* 100, then 3) Security Manager detects and reports the change as OOB. To summarize this simple example case, Security Manager reports an OOB change even though this change in the order of a few configuration lines did not result in any changes to the semantics.

---

There are two tabs on this dialog box:

- **OOB Detail**—This tab shows the detailed results and progress of the detection process. The fields are described below.

- **OOB Summary**—This tab shows a summary of the detection results, and becomes available only after the detection process is completed on all selected devices. The information is by device and includes a time stamp (date, time, time zone) and difference data that indicates the additions, subtractions, and changes with the associated configuration line number. You can select text on this tab, use Ctrl+click to copy it to the clipboard, and paste it in another application (such as NotePad).

For more information on detecting and analyzing out of band changes, see [Detecting and Analyzing Out of Band Changes](#), on page 424. For more information on handling out of band changes during deployment, see [Understanding How Out-of-Band Changes are Handled](#), on page 390.

Beginning with Version 4.7, Security Manager has a tool to help you re-sync out of band changes. For more information on this new tool, see [OOB Re-sync. Tool](#), on page 429

### Navigation Path

There are several ways to start the out of band change detection process. You can use the **Tools > Detect Out of Band Changes** command, or select one or more devices right-click and select **Detect Out of Band Changes**. You can also click the **Detect OOB Changes** button in Deploy Saved Changes dialog box and Deployment—Create or Edit a Job dialog box as explained in the following procedures:

- [Deploying Configurations in Workflow Mode](#), on page 412
- [Creating and Editing Deployment Jobs](#), on page 413

### Related Topics

### Field Reference

*Table 109: OOB Changes Dialog Box*

Element	Description
Selected Devices list (left pane)	<p>This list contains all devices you selected to evaluate for out of band changes, organized in device groups (if any).</p> <p>Select a device to see the results in the right pane.</p> <p>The icons for the devices change color based on the results of the detection process:</p> <ul style="list-style-type: none"> <li>• Green—There are out of band changes.</li> <li>• Red—The out of band detection process failed for some reason.</li> <li>• No color change—No out of band changes.</li> </ul>

Element	Description
Configuration Comparison (right pane)	The right pane shows the results of the change detection process for the selected device. Messages will indicate if OOB detection is still in progress, if there are no changes, or if there was an error that prevented change detection from completing.  If there are changes, the right pane shows both the running configuration retrieved from the device and the latest configuration for the device stored in Configuration Archive. The legend at the bottom of the window describes the color coding used to indicate changes, and you can use the following buttons to move from change to change.
First Difference button	Moves the cursor to the first difference noted between the configurations.
Previous Difference button	Moves the cursor to the previous difference noted between the configurations.
Current Difference button	Centers the currently selected difference on the page.
Next Difference button	Moves the cursor to the next difference noted between the configurations.
Last Difference button	Moves the cursor to the last difference noted between the configurations.

## OOB Re-sync. Tool

The OOB Re-sync Tool, which is new in Security Manager 4.7, helps you re-sync, or reconcile, out of band data. The OOB Re-sync Tool is an extension of the OOB Detection Tool available in Security Manager 4.6 and earlier versions and continued into 4.7.

**Tip** Out of band (OOB) data is the difference between the last archived configuration of Security Manager and the latest configuration running on the device. OOB data comes into existence—with the result that you need to update the device CLI—for reasons such as these: 1) emergency requirements (primarily for ACLs) mean that there is no time to use Security Manager and complete its workflow process because an unknown validation error is blocking deployment; 2) the use of management applications other than Security Manager to manage the same devices; and 3) <100% feature support by Security Manager for ASAs means that some ASA features need to be managed by using the CLI. Any changes made to a device using a third-party tool together with any CLI changes made to a device sum up as OOB data.

The OOB Re-sync Tool aims to automate the process of bringing OOB data on a device into your Security Manager installation while retaining the policy structures that you previously established.

Without the OOB Re-sync Tool, Security Manager (versions 4.6 and earlier) has only the following administrative options when OOB data is detected during deployment:

- Warn and override the OOB changes (Default)—Cisco Security Manager detects for OOB changes during deployment, warns the user of the OOB changes but goes ahead and negates/wipes out the OOB changes.
- Stop deployment—Aborts the deployment when OOB changes are detected.
- Do not check for OOB changes—OOB changes are not even detected during deployment and are overridden on the device.

The following objects are supported by the OOB Re-sync Tool:

- Network Object/Object-Group(s)
- Security Group(s)
- Service Object Group(s)
- User Group(s)
- Time Range Object(s)

---

**Note** The OOB Re-sync Tool does not support OOB changes for routers.

---

The OOB Re-sync Tool does not re-sync all objects/ACLs. It re-syncs access rules and unified access rules; it does not, for example, re-sync IPv6 access rules. Note the details for policies in the following list:

- Access rules (unified) are supported
- IPv4 access rules are supported
- IPv6-only access rules are *not* supported
- Ethertype ACLs are *not* supported
- Standard ACLs are *not* supported

The OOB Re-sync Tool has a straightforward work flow:

1. Detect OOB changes by using one of the following methods to run the existing tool:
  - **Configuration Manager > Tools > Detect Out Of Band Changes...**
  - **Configuration Manager > [tool bar] > Detect OOB Changes** icon
  - **Configuration Manager > Device View > right-click a device > click Detect Out Of Band Changes.**
  - In the Deploy Saved Changes dialog box, click **Detect OOB**.
2. If out of band changes are detected, they appear in the right pane of the OOB (Out of Band) Changes Dialog Box on the OOB Details tab. The OOB Details tab displays a report of the changes and the target rule number, shared policy, sections, affected devices, and CLI.

Also if out of band changes are detected, the Re-Sync Summary tab in the right pane of the OOB (Out of Band) Changes Dialog Box becomes active.

After OOB changes are detected by the existing OOB detection tool, click Evaluate; after you do, Security Manager will further analyze the differences in the configuration running on the device and the configuration available in Security Manager. After this analysis, the Re-Sync Summary Tab becomes active. On this tab, Security Manager displays other details, such as ACE, object(s) that will be added or deleted, and rule location(s).

---

**Note** Security Manager also will annotate the policy rule table, both in Device and Policy View and for objects in the Policy Object Manager.

---

- After the Re-Sync Summary Tab becomes active, you have the option of generating a report and checking to see if there is any CLI that is not supported by OOB functionality. After checking the report, you can opt to accept the changes by clicking **Accept**, and if the operation of persisting ACL or object changes in the device went through fine, you will be prompted with a "success" message.

**Note** If you modify access rules that are part of a shared policy, the OOB Re-sync Tool in this particular case will annotate both the rule that has actually been modified and the rule just above it. This occurs when you 1) modify at least two access rules that are part of a shared policy; 2) run the OOB Re-sync Tool; and 3) accept the changes. In this case, the OOB Re-sync Tool reports an OOB condition for some rules in addition to the ones that you modified. It is important to understand that the rules themselves and the shared policy are not adversely affected.

- On the OOB Detail tab in the left pane, you can request a report in .pdf format. To do this click the **Generate Report** button. Cisco recommends that you always generate this report and save it to help with troubleshooting if needed.

**Tip** The following example is a brief description of a scenario in which you use the OOB Re-sync Tool and find some changes in a device that are not supported by the OOB Re-sync Tool along with access-rule changes that are supported. In this scenario, you have an ASA that uses both IPv4 and IPv6. If you use **Tools > Detect Out Of Band Changes..** and find OOB changes, you will need to manually reconcile the IPv6 changes before you can elect to re-sync. the OOB changes by using the OOB Re-sync Tool.

You should be aware of several caveats when using the OOB Re-sync Tool. These are listed in the following table.

**Table 110: Caveats**

Interface Role	Access rules tied to interface roles and multiple interfaces rules will not be absorbed. However, the rules will be annotated to help the user copy the OOB rules from the OOB re-sync report and run "Import Rules" at the right rule location to absorb the OOB CLIs.
Shared Policies	OOB changes that affect shared policies will not be re-synced since doing so would affect other devices. Rules will be annotated to help the user import rules.
Objects	The OOB re-sync process always creates overrides for objects. However, if object override is selectively disabled for that object, then re-sync will not be allowed until the user enables the device overrides for that object.
Unsupported Access List	IPv6 only access-list that existed before the introduction of unified access-list is not supported for resync  Ether Type Access List re-sync is not supported

OOB Access-Group CLI	OOB changes on access-group CLI cannot be absorbed. To explain this caveat further: <ul style="list-style-type: none"> <li>• Under these circumstances (OOB changes on access-group CLI), you cannot choose evaluation; that is, you cannot elect to re-sync. the OOB changes.</li> <li>• In a case involving both 1) OOB changes that the OOB Re-sync Tool can re-sync and 2) changes in access-group CLIs, you must resolve the changes with respect to the access-group command before you can elect to re-sync the OOB changes.</li> </ul>
Conditional Re-sync of Remarks	ACL remarks added to an access-list CLI created out-of-band will be absorbed during re-sync as part of re-sync of the rule. However, any random OOB change in an ACL remark alone will not be absorbed during re-sync
Rule Split	Rules get split during re-sync of OOB changes done within combined rules. User needs to run "Combine Rules" on the flattened rules thus re-synced to restore to the original rule if possible

## Redeploying Configurations to Devices

You can redeploy a deployment job if you want to. This is especially valuable for jobs in the Failed or Aborted states. You can redeploy to all devices in the job, or you can select specific devices (such as the devices to which deployment failed).

#### Tips on Redeploying a Configuration to a Replacement Device

If you have to replace a device, for example, due to hardware failure, you cannot simply redeploy the last deployment job from the device, because Security Manager does not know that the device is actually a new one. To deploy the old device's configuration to the new device, you have these options:

- If the new device is the exact same model and operating system version as the replaced device, you can select the old device in the device selector, right-click and select **Preview Configuration**, and copy and paste the full configuration to the new device. However, this does not migrate certificates from the old device to the new one. You must re-enroll the device or renew the certificate yourself.
- If the new device is not exactly identical to the old device, follow the procedure described in [Changes That Change the Feature Set in Security Manager](#) , on page 124.

#### Before You Begin

- Make sure that devices have been bootstrapped. For more information, see [Preparing Devices for Management](#), on page 55.
- If you are deploying to a transport server, such as AUS, CNS, or TMS, make sure the server, Security Manager settings, and device have been set up properly.

#### Related Topics

- [Overview of the Deployment Process](#) , on page 379
- [Deploying Configurations in Non-Workflow Mode](#) , on page 406
- [Deploying Configurations in Workflow Mode](#) , on page 412
- [Deploying Configurations Using an Auto Update Server or CNS Configuration Engine](#) , on page 420
- [Deploying Configurations to a Token Management Server](#) , on page 421
- [Managing Device Communication Settings and Certificates](#) , on page 458
- [Understanding Deployment Methods](#) , on page 387
- [Job States in Non-Workflow Mode](#) , on page 383
- [Job States in Workflow Mode](#) , on page 385

---

**Step 1** Click the **Deployment Manager** button in the Main toolbar.

The Deployment Manager window appears. Click the **Deployment Jobs** tab if it is not active.

**Step 2** Select the job that contains the devices to which you want to redeploy configurations, then do one of the following:

- In non-Workflow mode, click **Redeploy**.
- In Workflow mode, click **Deploy**.

The Redeploy a Job dialog box opens. The dialog box lists the devices in the deployment job, showing the device name, the deployment method used, the status of the previous deployment, and the name of the deployment job that updated the device.

**Step 3** In the Redeploy a Job dialog box, do the following:

- **Selection column**—Select the devices to which you want to redeploy configurations by putting checkmarks in the checkboxes in the Selection column. Initially all failed devices are selected.
- **Deployment Method, Destination**—(Optional) You can change the method used to deploy configurations for individual devices. The initially selected method is the one used in the job. You can select these methods:
  - **Device**—Deploys the configuration directly to the device or to the transport mechanism specified for the device. For more information, see [Deploying Directly to a Device](#) , on page 387 or [Deploying to a Device through an Intermediate Server](#) , on page 388.
  - **File**—Deploys the configuration file to a directory on the Security Manager server. If you select File, specify the directory to which you want to deploy the configuration file in the Destination column. Click **Browse** to select from a list of available directories. You cannot use file deployment with IPS devices. For more information, see [Deploying to a File](#) , on page 389.

**Note** To set the deployment method for more than one device at a time, select the devices, right-click and select **Edit Selected Deploy Method**. The Edit Selected Deploy Method dialog box opens where you can make your selections.

- **Out of Band Change Behavior**—(Optional) Select how you want Security Manager to respond if it detects that changes were made on the device by someone other than Security Manager (these are called out of band changes).

For a complete explanation of how to handle out-of-band changes, including the meaning of the available options, see [Understanding How Out-of-Band Changes are Handled](#) , on page 390.

**Note** Before proceeding with the deployment, you can preview proposed configurations and compare them against last deployed configurations or current running configurations. Highlight the row for a device and click **Preview Config**. For more information, see [Previewing Configurations](#) , on page 422.

**Step 4** Click **OK**.

---

## Aborting Deployment Jobs

You can stop a deployment job if you do not want to deploy the configurations or you want to postpone deployment.

You can abort deployment jobs only while they are in the Deploying, Scheduled, or Rolling Back state. Aborting a job stops deployment of configurations to pending devices, but has no effect on devices to which deployments are in progress (commands are being written to a device) or to which deployment has already completed successfully.

To abort a job, do either of the following:

- Click **Abort** on the Deployment Status dialog box while you are viewing the running status of an active job. See [Deployment Status Details Dialog Box](#) , on page 410.
- Select **Manage > Deployments** to open the Deployment Manager window, then select the job on the Deployment Jobs tab and click **Abort**.

The Abort the Job dialog box opens and asks you to confirm that you want to abort the job. Click **OK** to confirm.

After you abort a job, the deployment status of pending devices changes to Aborted.

To resume deployment, redeploy the job. See [Redeploying Configurations to Devices](#) , on page 432 for more information.

- [Job States in Workflow Mode](#) , on page 385

## Creating or Editing Deployment Schedules

You can create deployment schedules to create deployment jobs at regular intervals. Schedules can help you ensure that the selected devices get regular configuration updates.

**Tip** When you include a device in a schedule, the device is included in deployment jobs that are generated from the schedule only if changes have been made to the device configuration and those changes were committed to the database. Thus, you might see changes when previewing the device configuration even though the device was not included in a scheduled deployment, if you have not submitted those changes (or if they have been submitted by not yet approved, when using a separate approver in Workflow mode).

#### Related Topics

- [Overview of the Deployment Process](#) , on page 379
- [Viewing Deployment Status and History for Jobs and Schedules](#) , on page 403
- [Suspending or Resuming Deployment Schedules](#) , on page 438

**Step 1** Click the **Deployment Manager** button in the Main toolbar.

The Deployment Manager window appears. Click the **Deployment Schedules** tab if it is not active (see [Deployment Schedules Tab, Deployment Manager](#) , on page 398).

**Step 2** Do one of the following:

- If you are creating a new schedule, click **Create**.
- If you are editing an existing schedule, select it in the Deployment Schedule table and click **Open**.

The Schedule dialog box opens (see [Schedule Dialog Box](#) , on page 436).

**Step 3** Enter at least this information in the Schedule dialog box:

- The name of the schedule.
- If you are using Workflow mode with an approver, ensure that the approver e-mail address is correct. Also verify your e-mail address (in the Submitter field), and choose whether you want to get notifications whenever the status of the job changes.
- Define the first date and time the schedule should start, and select how often deployment jobs will be generated based on the schedule. Also determine whether the schedule should have an end date, after which no new jobs are created from it.
- Click **Add Devices** and select all the devices that should be included in the deployment job. Including devices does not lock them from being modified by users or included in other deployment jobs or schedules.

If Security Manager is configured to use user-login credentials for accessing devices, your username and password are captured during schedule creation. If you change your password, you will need to recreate the schedule.

**Step 4** Click **OK**. The schedule is added to the Deployment Schedule table.

**Step 5** (Workflow mode only) If you are operating in Workflow mode, you must complete these additional steps:

- If you are using an approver for deployment jobs, select the schedule in the table and click **Submit** to submit the schedule to the approver. You are prompted to verify the approver's e-mail address and to enter comments to help the approver evaluate the schedule. The approver will have to approve the schedule before it becomes active.

- If you are not using an approver, select the schedule in the table and click **Approve** to approve it yourself and to activate the schedule.

## Schedule Dialog Box

Use the Schedule dialog box to create a regularly recurring deployment job.

### Navigation Path

Select **Manage > Deployments** to open the Deployment Manager window, click the Deployment Schedules tab in the upper pane, and do one of the following:

- Click **Create** to create a new schedule.
- Select a schedule and click **Open** to view or modify its properties.

### Field Reference

*Table 111: Schedule Dialog Box*

Element	Description
<b>Schedule Name Group</b>	
This group defines the name of the job and the job's notification requirements.	
Name	The name of the job. When individual deployment jobs are created from this schedule, a time stamp is added to the job name.
Description	The description of the purpose of the job.
Approver Email (Workflow only)	The e-mail address of the person who should approve the schedule.
Comments (Workflow only)	(Optional) Information to help the approver evaluate the schedule when you save this schedule.
Submitter Email (Workflow only)	The e-mail address of the person who is submitting this schedule for approval. This field initially contains the e-mail address associated with the user account you used to log into Security Manager, but you can change it.

Element	Description
Require Deployment Status Notifications (Workflow only)	Whether to send e-mail messages for any change in the job status for the job schedule or any job created from it. Messages are sent to the approver and the submitter.
<b>Recurrence Pattern Group</b>	
The fields in this group define the job schedule.	
Start Date	The first day of the schedule. Click the calendar icon to select the date from a calendar.
Time (Start)	The time of day to run the schedule. The time is in 24-hour format and is based on the server time zone, not the client time zone.
Recurrence	How often to create a deployment job based on this schedule: <ul style="list-style-type: none"> <li>• One time—Run this job once on the day specified as the start date at the specified start time.</li> <li>• Hourly—Run this job on an hourly schedule. Specify the number of hours between deployment jobs.</li> <li>• Daily—Run this job on a daily schedule. Specify the number of days between deployment jobs.</li> <li>• Weekly—Run this job on the specified days of the week.</li> <li>• Monthly—Run this job on a monthly schedule. Select the day of the month to run the job, and the number of months between deployment jobs.</li> </ul>
Run Indefinitely End Date and Time	The expiration date and time for the schedule. Deployment jobs are not created after this time. Select Run Indefinitely if you do not want the schedule to expire.
<b>Devices To Deploy Group</b>	
This table lists the devices that are included in the deployment job. To add devices to the list, or to remove them from it, click <b>Add devices</b> , which opens the Add Other Devices dialog box (see <a href="#">Add Other Devices Dialog Box</a> , on page 437).	
If Security Manager is configured to use user-login credentials for accessing devices, your username and password are captured during schedule creation. If you change your password, you will need to recreate the schedule.	

## Add Other Devices Dialog Box

Use the Add Other Devices dialog box to select devices for the deployment job or schedule. The devices in the list might not have active policy changes. When you are creating a job, you might want to add devices that do not have policy changes if a device was manually modified and you want to return the device to its previous configuration (the configuration stored in the Security Manager database).

- Select the devices to include in the job or schedule in the Available Devices list and click >> to move the devices to the Selected Devices list.
- To remove devices, select them in the Selected Devices list and click <<.

### Navigation Path

To open this dialog box, do one of the following:

- (Non-Workflow mode) From the Deploy Saved Changes dialog box, click **Add other devices**. See [Deploying Configurations in Non-Workflow Mode](#) , on page 406.
- (Workflow mode) From the Deployment—Create or Edit a Job Dialog Box, click **Add other devices**. See [Creating and Editing Deployment Jobs](#) , on page 413.
- (All modes) From the [Schedule Dialog Box](#) , on page 436, click **Add devices**.

### Related Topics

---

**Step 1** Click the **Deployment Manager** button in the Main toolbar.

The Deployment Manager window appears. Click the **Deployment Schedules** tab if it is not active (see [Deployment Schedules Tab, Deployment Manager](#) , on page 398).

**Step 2** Do one of the following:

- To suspend an active schedule, select it and click **Suspend**.
  - To resume a suspended schedule, select it and click **Resume**.
-

## Adding Configuration Versions from a Device to the Configuration Archive

The Configuration Archive is updated with a new configuration version any time a configuration is deployed to the device or a file, including when you roll back a configuration to a device.

You can also retrieve a configuration directly from the device to add to the Configuration Archive. This is useful when changes have been made directly to device configurations, which are called out-of-band changes.

---

**Note** You cannot retrieve configurations from devices that are managed by AUS and that have been configured with dynamic IP addresses.

---

This procedure will help you retrieve a configuration from a device and add it to the archive.

### Related Topics

- [Viewing and Comparing Archived Configuration Versions](#) , on page 439

- 
- Step 1** Select **Manage > Configuration Archive** to open the Configuration Archive (see [Configuration Archive Window](#) , on page 401).
- Step 2** In the Device selector, select the device from which you want to retrieve the configuration. The archived configurations appear in the right pane.
- Step 3** Click **Add from Device**. Security Manager logs into the device, retrieves the running configuration, and adds it to the archive.
- 

## Viewing and Comparing Archived Configuration Versions

Using the Configuration Archive, you can view the previous configurations for a device, compare versions of the configuration, and view the transcripts related to configuration deployment. To open the Configuration Archive window, select **Manage > Configuration Archive**.

To view the configuration versions for a device, select the device in the device selector. All archived versions are listed in the right pane. You can do the following:

- To view a configuration, select it and click **View**, which opens the Config Version Viewer dialog box with the configuration displayed in the left pane (for information about the dialog box, see [Configuration Version Viewer](#) , on page 440).

If there is more than one type of configuration available for the selected version, you can choose which type to view using the **Config Type** field. A Full version is a complete configuration, whereas a Delta version is just the commands that were different between this version and the device's previous full configuration. Delta configurations might include negative commands.

- To compare configurations, select one and click **View**. In the Config Version Viewer window, select the configuration you want to compare in the **Compare with Version** field. The second version appears in the right pane with differences color-coded according to the caption below the display area.
- To view the transcript associated with the deployment of a configuration, do one of the following:

- From the Configuration Archive window, double-click the icon in the Transcript column for the desired configuration.
- When viewing a configuration in the left pane of the Config Version Viewer dialog box, click **Transcript View**.

A transcript is the log file of transactions between Security Manager and a device captured during a deployment or rollback operation. It includes commands sent and received between server and device from the time of the deployment or rollback request, but it does not include communication that occurs during the initial discovery phase of deployment, when Security Manager obtains the current configuration from the device. If rollback is unsuccessful, there might be a partial transcript generated depending on which stage rollback or deployment failed. The transcript is displayed in the Transcript Viewer window (see [Viewing Deployment Transcripts](#) , on page 442).

You can configure the number of configuration versions to archive on the Configuration Archive settings page (see [Configuration Archive Page](#) , on page 514).

### Related Topics

- [Adding Configuration Versions from a Device to the Configuration Archive](#) , on page 439

## Configuration Version Viewer

Use the Config Version Viewer window (when opened from the Configuration Archive) to view previous configurations for a device and to compare them to other archived configurations. You can compare any version to any other version in the archive for a selected device. The selected version appears in the left pane, and you can select another version for comparison from the list on the upper right of this window. For more information on viewing and comparing versions, see [Viewing and Comparing Archived Configuration Versions](#) , on page 439.

### Navigation Path

Select **Manage > Configuration Archive**, select a device whose configuration you want to view, select the configuration, and click **View**.

### Related Topics

## Field Reference

**Table 112: Configuration Version Viewer Window (Configuration Archive)**

Element	Description
Version ID	<p>The configuration version to display in the left pane:</p> <ul style="list-style-type: none"> <li>• Previous—Display the version in the sequence before the one currently selected.</li> <li>• Next—Display the version in the sequence after the one currently selected.</li> <li>• Last—Display the last version in the list.</li> <li>• Specific Date and Time—Display the version created on that date and time.</li> </ul>
Compare with version	<p>The configuration version to compare to the version selected in the left pane, if you want to compare versions. The configuration is displayed in the right pane, with differences summarized and color coded as explained by the caption below the pane.</p>
Config Type	<p>The types of configurations that are available for viewing. The types differ based on the type of device. The types might indicate Full or Delta, which have the following meaning:</p> <ul style="list-style-type: none"> <li>• Full Configuration—The full configuration for the selected device as saved in the Configuration Archive. You can compare full configurations for a device.</li> <li>• Delta Configuration—The file that is generated by Security Manager during deployment and that represents policy changes between the configuration selected in the Version ID field and the most recently deployed version.</li> </ul> <p><b>Note</b> Configuration versions resulting from out-of-band changes (for example, in the CLI) can be added to Configuration Archive using <b>Add from Device</b>, but no delta configuration file is generated.</p>
First Difference button	Moves the cursor to the first difference noted between the configuration versions.
Previous Difference button	Moves the cursor to the previous difference noted between the configuration versions.
Current Difference button	Using the cursor, focuses on the currently selected difference in the window.
Next Difference button	Moves the cursor to the next difference noted between the configuration versions.
Last Difference button	Moves the cursor to the last difference noted between the configuration versions.
Transcript View button	Click this button to open the transcript viewer window, which displays the device communication transcript associated with this configuration.
Print button	Click this button to print the configuration.

## Viewing Deployment Transcripts

Use the Transcript Viewer window to view the record of messages exchanged between Security Manager and a device. A transcript is the log file of transactions between Security Manager and a device captured during a deployment or rollback operation. It includes commands sent and received between server and device from the time of the deployment or rollback request, but it does not include communication that occurs during the initial discovery phase of deployment, when Security Manager obtains the current configuration from the device. For more information, see [Viewing and Comparing Archived Configuration Versions](#), on page 439.

### Navigation Path

- Configuration Archive—Select **Manage > Configuration Archive** to open the Configuration Archive, select the device for which you want to view a transcript and double-click the **Transcript** icon in the row for the desired configuration version.

You can also click the **Transcript View** button from the Configuration Version Viewer window when examining an archived configuration (see [Configuration Version Viewer](#), on page 440).

- Deployment Manager—Select **Manage > Deployments** to open the Deployment Manager, select the deployment job that includes the desired device deployment, select the Details tab in the lower pane, and double-click the **Transcript** icon in the row for the desired device.

### Related Topics

- [Configuration Archive Window](#), on page 401

### Field Reference

*Table 113: Transcript Viewer Window*

Element	Description
Version ID	The configuration version for which you are viewing transcripts: <ul style="list-style-type: none"> <li>• Previous—Display the transcripts for the version in the sequence before the one currently selected.</li> <li>• Next—Display the transcripts for the version in the sequence after the one currently selected.</li> <li>• Last—Display the transcripts for the last version in the list.</li> <li>• Specific Date and Time—Display the transcripts for the version created on that date and time.</li> </ul>
Transcript Type	The type of transcript that you want to view. Some configuration versions have more than one transcript associated with them. Use this field to select which transcript to view.
Transcript Window	Displays the selected transcript. You can select text and copy it to the clipboard (Ctrl+C) for pasting in a text editor.

Element	Description
View button	Click this button to display the related configuration in the Config Version Viewer window (see <a href="#">Configuration Version Viewer</a> , on page 440).
Print button	Click this button to print the transcript.

## Rolling Back Configurations

After you deploy a new configuration to a device, you can roll back the configuration to an older version if you find that the new configuration does not work correctly. However, it is usually a better idea to fix the configuration in Security Manager and deploy the fixed configuration, because rolling back a configuration creates a situation where the configuration defined in Security Manager is not the same one running on the device. Roll back configurations only in extreme circumstances.

The following topics will help you better understand and use configuration rollback:

- [Understanding Configuration Rollback](#) , on page 443
- [Rolling Back Configurations to Devices Using the Deployment Manager](#) , on page 450
- [Using Rollback to Deploy Archived Configurations](#) , on page 451
- [Performing Rollback When Deploying to a File](#) , on page 452

## Understanding Configuration Rollback

If you deploy configurations to devices using the Device method, either to deploy the configuration directly to the device or to an intermediate server, you can roll back the configuration to an older version if you find that the new configuration does not work correctly. You cannot roll back to a configuration that was deployed to a file.

### Caution

The Security Manager will take the device's current configuration after each deployment and save it in the configuration archive. When a device is rolled back, Security Manager pulls the previous configuration from the configuration archive and applies it to the device. The complete device configuration is used in this rollback procedure, making it an unreliable operation. We recommend you to use this operation only during extreme circumstances. It is usually a better idea to fix the configuration in Security Manager and deploy the fixed configuration, because rolling back a configuration creates a situation where the configuration defined in Security Manager is not the same one running on the device. After rollback, you should rediscover policies on the device to make the device configuration and its configuration in Security Manager consistent.

You can roll back configurations using these tools:

- **Deployment Manager**—You can roll back a deployment to the last good configuration if that configuration was deployed to the device rather than to a file. To open the Deployment Manager, select **Manage > Deployments**.
- **Configuration Archive**—You can roll back deployment to any archived configuration that was deployed to the device or that originated from the device. To open the Configuration Archive, select **Manage > Configuration Archive**.

When you roll back a configuration, Security Manager does the following:

- On PIX Firewalls and ASA and FWSM devices, Security Manager uses the **replace config** option on the device's SSL interface to perform the equivalent of a reload (xlates are cleared, IPsec tunnels are torn down, and so on).
- For devices running IOS 12.3(7)T or later, Security Manager uses the **configure replace** command to replace the running configuration with the contents of a configuration file. Support for this command is dependent on the IOS version installed on the device:
  - On devices running IOS 12.3(7)T or later, Security Manager copies the configuration file to the startup configuration before executing the **configure replace** command. If the configure replace operation fails, Security Manager issues the **reload** command to reload the operating system using the contents of the startup configuration. The reload command restarts the system, which might result in a temporary network outage.
  - On routers running a version prior to 12.3(7)T, Security Manager copies the configuration file to the startup configuration and issues the **reload** command, which restarts the system. Security Manager uses the TFTP server and directory specified in the Configuration Archive settings page (see [Configuration Archive Page](#) , on page 514) when using this method.
- The rolled-back configuration becomes another archived version in the Configuration Archive for that device.

---

**Tip** Configuration rollback does not include user account policies. When you roll back a configuration, the existing state of user accounts is not changed. This helps ensure that users can continue to log into the device.

---

Special considerations apply to the rollback of certain device types and configurations. See the following sections for more information:

- [Understanding Rollback for Devices in Multiple Context Mode](#) , on page 444
- [Understanding Rollback for Failover Devices](#) , on page 445
- [Understanding Rollback for Catalyst 6500/7600 Devices](#) , on page 445
- [Understanding Rollback for IPS and IOS IPS](#) , on page 446
- [Commands that Can Cause Conflicts after Rollback](#) , on page 448
- [Commands to Recover from Failover Misconfiguration after Rollback](#) , on page 449

#### Related Topics

- [Rolling Back Configurations to Devices Using the Deployment Manager](#) , on page 450
- [Using Rollback to Deploy Archived Configurations](#) , on page 451

## Understanding Rollback for Devices in Multiple Context Mode

If the configuration of the system execution space to which you are rolling back specifies connectivity options to security contexts (for example, vlan config) and there is a mismatch between the configuration selected for rollback and the current running configurations of the security contexts, Security Manager might not be able

to connect to the security contexts. In such cases, we recommend that you roll back configurations for the security contexts before rolling back a configuration for the system execution space.

If you roll back a configuration for the system execution space of a device in multiple context mode to one that includes a different set of security contexts, after rollback the security contexts on the device might not match the security contexts managed by Security Manager that appear in the Device selector.

#### Related Topics

- [Rolling Back Configurations to Devices Using the Deployment Manager](#) , on page 450
- [Using Rollback to Deploy Archived Configurations](#) , on page 451
- [Commands that Can Cause Conflicts after Rollback](#) , on page 448
- [Commands to Recover from Failover Misconfiguration after Rollback](#) , on page 449

## Understanding Rollback for Failover Devices

If you roll back a configuration for a security context that contains a failover policy, Security Manager initially disables failover in the system execution space and both devices become active. After the rollback is completed, the devices should return to their failover configuration.

If a switchover occurs during rollback or connectivity between the active and standby units is lost, copy the bootstrap configuration to the standby unit after rollback completes. For more information, see [Bootstrap Configuration for LAN Failover Dialog Box](#) , on page 1992.

Security Manager can proceed with rollback action if and only if the following conditions are met:

- Both the Primary unit and Secondary unit must be in Active state.
- If configured on a link, the link must be up.
- If configured on LAN, the interface must be up.

#### Related Topics

- [Rolling Back Configurations to Devices Using the Deployment Manager](#) , on page 450
- [Using Rollback to Deploy Archived Configurations](#) , on page 451
- [Commands that Can Cause Conflicts after Rollback](#) , on page 448
- [Commands to Recover from Failover Misconfiguration after Rollback](#) , on page 449

## Understanding Rollback for Catalyst 6500/7600 Devices

If you roll back a configuration to a Catalyst 6500/7600 device that specifies connectivity options to service modules (for example, vlan config) and there is a mismatch between the configuration selected for rollback and the current running configuration, Security Manager might not be able to connect to the service modules. We recommend that you roll back configurations for the service modules before rolling back a configuration to the Catalyst 6500/7600 chassis.

Thus, the proper order for performing rollback on Catalyst 6500/7600 devices is:

1. Security contexts.

2. Service modules.
3. Chassis.

We recommend performing rediscovery after the rollback operation is complete.

If you are rolling back an FWSM deployment and the system is configured to retrieve security certificates when adding devices, you might need to retrieve the certificate after the rollback operation is complete. This can be done using either of the following methods:

- Retrieving the certificate on a per-device basis from Device Properties.
- Configuring Security Manager to automatically retrieve certificates after rollback. To do this, select **Tools > Security Manager Administration > Device Communication**, then select **Retrieve while adding devices** in the PIX/ASA/FWSM Device Authentication Certificates field (in SSL Certificate Parameters).

- [Commands to Recover from Failover Misconfiguration after Rollback](#) , on page 449

## Understanding Rollback for IPS and IOS IPS

---

**Note** From version 4.17, Cisco Security Manager does not support FWSM, IPS, and PIX devices. In addition, from this release, Cisco Security Manager will not provide any enhancements.

---

Special considerations apply to the rollback of IPS devices and IOS IPS devices. For IPS devices and IOS IPS devices, rollback could possibly include rolling back sensor updates or signature updates. The reason for this is that for IPS devices and IOS IPS devices, Security Manager supports not only the management of configuration but also the support of image management in the form of manual and automatic upgrades and signature updates. Keep in mind that when you do a rollback, you are rolling back the configuration, not the sensor updates or signature updates. These updates are downgraded only if the configuration cannot be rolled back without downgrading the updates.

Rollback is accomplished through Configuration Archive. For IPS devices and IOS IPS devices, only the current configuration is archived. The current configuration for one device version (say, Version X) may not be valid for a different device version (say, Version Y). Security Manager rolls back a configuration of Version X to a sensor with Version Y as long as the configuration for X is valid for Y.

If the configuration for X is valid for Y, rollback proceeds and Security Manager displays a confirmation dialog box to you. If the configuration for X is not valid for Y, Security Manager displays a warning dialog box to you and provides you with the option of downgrading the sensor during rollback if such a downgrade will help accomplish the rollback.

**Caution** Downgrading an IPS device removes certain capabilities of the IPS device. For example, downgrading the engine prevents you from applying the latest signature updates. Operation of an IPS device without the latest signature updates diminishes the effectiveness of the IPS device.

For rollback of a deployment job, the warning dialog box contains one or more of the following types of warnings:

- Security Manager warns you about IPS devices that need to have their sensor version downgraded before a rollback can be performed.
- Security Manager warns you about IOS IPS devices whose signature level has changed. For these devices, only the non-IPS sections of the configuration can be rolled back.
- Security Manager warns you about IPS devices that must be downgraded more than one level, and as a result, Security Manager cannot do it. You must use the Cisco IPS CLI for such downgrades. The warning dialog box displays the version to which the device must be reimaged or downgraded.

**Note** The option of downgrading an IOS IPS device during rollback is not available, because IOS IPS devices do not support downgrade.

If the option of downgrading the sensor during rollback will not help accomplish the rollback, you receive an error message stating that rollback cannot occur and that you need to manually reinstall the image on the device to roll back. Only the update package most recently installed on a device can be downgraded, so downgrade does not help in the following cases:

- Rollback of a deployment (signature update) that involves downloading more than one update package to the device.
- Selection of an old deployment or configuration for rollback subsequent to which several upgrades occurred.
- Rollback of an upgrade that cannot be downgraded. Major, minor, and most service pack upgrades cannot be downgraded, as shown in [Table 114: Downgrade Support for Possible Sensor Upgrade Types](#), on page 447

For rollback of a configuration that requires a downgrade to a version prior to Cisco IPS 5.1(4), Security Manager does not support automatic downgrade. You must manually downgrade the device to the specified version and then proceed with rollback.

**Table 114: Downgrade Support for Possible Sensor Upgrade Types**

Upgrade Type	Downgrade Support
Major Upgrade	Downgrade is not supported.
Minor Upgrade	Downgrade is not supported.
Service Pack Update	Downgrade from Cisco IPS 5.1(4) onward is not supported.
Patch update	Downgrade is supported.

Upgrade Type	Downgrade Support
Signature Update	Downgrade is supported.
Engine Update	Downgrade is supported.
Repackage (applicable to major, minor, and service pack updates).	Repackages for service packs prior to 5.1(4) can be downgraded.

**Caution** Outbreak Prevention updates on a particular device may be lost if that device is downgraded.

During rollback, if Security Manager discovers that there have been out-of-band changes to the device that prevent rollback, you will receive an error message stating that rollback is prevented.

- [Using Rollback to Deploy Archived Configurations](#) , on page 451

## Commands that Can Cause Conflicts after Rollback

The following commands can potentially cause conflicts after rollback is performed:

- **http server enable** *porthttp ip\_address net\_mask interface\_name*

Applicable only to security contexts (not the system execution space).

- **allocate-interface** *{physical\_interface | subinterface } [map\_name] [visible | invisible]*

Applicable only to the system execution space under the context subcommand.

- **config-url** *diskX:/path/filename*

Applicable only to the system execution space under the context subcommand.

- **join -failover-group** *group\_number*

Applicable only for active/active failover and only to the system execution space under the context subcommand. The failover group defaults to group 1 if not specified.

- **failover**

Applicable only to the system execution space. Enabling failover causes configuration synchronization to trigger between peers.

- **failover lan enable**

Applicable only to the system execution space. If this command is omitted, this implies serial cable failover on a PIX platform or warrants an incomplete failover configuration warning on ASA and FWSM.

- **failover lan unit** *{primary | secondary }*

Applicable only to the system execution space. If this command is not specified, both units are secondary by default. If rollback takes place on the wrong unit, both can become primary, which impacts which unit becomes active initially.

- **failover group** *group\_number*

Applicable only to the system execution space. This command enables active/active failover. If this command is omitted, active/standby is enabled.

- **preempt** *delay*

Applicable only to the system execution space and under the failover group subcommand to force which failover group becomes active if both units are booted up at the same time, or the primary does not boot up within the delay specified.

- **monitor-interface** *interface\_name*

Applicable only to security contexts and used to enable health monitoring of critical interfaces. If this interface is 'bounced' or fails, a switchover could occur.

- [Rolling Back Configurations to Devices Using the Deployment Manager](#) , on page 450
- [Using Rollback to Deploy Archived Configurations](#) , on page 451
- [Commands to Recover from Failover Misconfiguration after Rollback](#) , on page 449

## Commands to Recover from Failover Misconfiguration after Rollback

If a switchover happens during rollback and the two units are no longer synchronized, you might need to use the following commands to recover:

- **failover active** *group\_number*
- **failover reset** *group\_number*
- **failover reload-standby**
- **clear configure failover**

For more information on these commands, please refer to the command reference for your security appliance.

#### Related Topics

- [Rolling Back Configurations to Devices Using the Deployment Manager](#) , on page 450
- [Using Rollback to Deploy Archived Configurations](#) , on page 451
- [Commands that Can Cause Conflicts after Rollback](#) , on page 448

## Rolling Back Configurations to Devices Using the Deployment Manager

If you deploy configurations to devices and then determine that there is something wrong with the new configurations, you can revert to and deploy the previous configurations for those devices. You cannot roll back to a previous configuration if there are no previous configurations in the Configuration Archive.

You can roll back configurations only to configurations that were deployed to the device, not to a file. For information on how to roll back a configuration that was deployed to a file, see [Performing Rollback When Deploying to a File](#), on page 452.

You can also use the Configuration Archive tool to roll back to any configuration archived from a device. For more information, see [Using Rollback to Deploy Archived Configurations](#), on page 451.

---

**Caution** Roll back configurations only in extreme circumstances. It is usually a better idea to fix the configuration in Security Manager and deploy the fixed configuration, because rolling back a configuration creates a situation where the configuration defined in Security Manager is not the same one running on the device. After rollback, you should rediscover policies on the device to make the device configuration and its configuration in Security Manager consistent. Roll back configurations only in extreme circumstances. Before proceeding, read the following topics.

---

- [Understanding Configuration Rollback](#), on page 443
- [Understanding Rollback for Devices in Multiple Context Mode](#), on page 444
- [Understanding Rollback for Failover Devices](#), on page 445
- [Understanding Rollback for Catalyst 6500/7600 Devices](#), on page 445
- [Understanding Rollback for IPS and IOS IPS](#), on page 446
- [Commands that Can Cause Conflicts after Rollback](#), on page 448
- [Commands to Recover from Failover Misconfiguration after Rollback](#), on page 449

### Before You Begin

When you roll back a configuration, the action is not done as part of an activity or configuration session, which means the device is not locked. Thus, it is possible that two users might roll back configurations simultaneously on a device, which can generate unexpected problems. Before rolling back a configuration, ensure that there are no active deployment jobs for the device listed in the Deployment Manager window.

### Related Topics

- [Viewing Deployment Status and History for Jobs and Schedules](#), on page 403
- [Job States in Non-Workflow Mode](#), on page 383
- [Job States in Workflow Mode](#), on page 385

- 
- Step 1** Click the **Deployment Manager** button in the Main toolbar. Click the **Deployment Jobs** tab if it is not active.
- Step 2** Select the deployment job (which must be in the Deployed or Failed states) and click **Rollback**.

The Rollback a Job dialog box opens. The dialog box lists all of the devices included in the job, including the name of the device, the deployment method (file or device), the status of the previous deployment, and the name of the deployment job that last updated the device.

**Step 3** Select the devices for which you want to roll back configurations by checking the check box in the Selection column. You can select only devices that used the deploy to device method. By default, all the devices with the status Succeeded are selected.

You can view the configuration that will be deployed to a device by highlighting the row for a device and clicking the **Preview Config** button. You can compare it to the last deployed configuration or the current running configuration. For more information, see [Previewing Configurations](#) , on page 422.

**Step 4** Click **OK**. You are asked to confirm the action.

**Step 5** (Optional) To make the configuration defined in Security Manager consistent with the one running on the device, rediscover the device policies as described in [Discovering Policies on Devices Already in Security Manager](#) , on page 179.

---

## Using Rollback to Deploy Archived Configurations

You can roll back any configuration version from Configuration Archive to the device for which it is archived, provided that the configuration was deployed to the device or originated from the device. The rolled-back configuration then becomes another archived version in the list for that device. For information on how to roll back a configuration that was deployed to a file, see [Performing Rollback When Deploying to a File](#) , on page 452.

### Before You Begin

**Tip** When you roll back a configuration, the action is not done as part of an activity or configuration session, which means the device is not locked. Thus, it is possible that two users might roll back configurations simultaneously on a device, which can generate unexpected problems. Before rolling back a configuration, check the Deployment Manager to ensure that there are no active deployment jobs for the device (select **Manage > Deployments**).

Roll back configurations only in extreme circumstances. Before rolling back configurations, carefully read these topics:

- [Understanding Configuration Rollback](#) , on page 443
- [Understanding Rollback for Devices in Multiple Context Mode](#) , on page 444
- [Understanding Rollback for Failover Devices](#) , on page 445

- 
- Step 1** Select **Manage > Configuration Archive** to open the Configuration Archive (see [Configuration Archive Window](#) , on page 401).
- Step 2** In the Device selector, select the device for which you want to roll back to a different configuration version. The archived configurations appear in the right pane.
- Step 3** Select the configuration version to which you want to roll back. You can roll back only to a configuration that was deployed to the device or that originated from the device. You cannot roll back to a configuration that was deployed to a file.
- Tip** To view the configuration version before rollback, click **View**.
- Step 4** Click **Rollback** to deploy the selected configuration version to the device. A progress box appears, followed by a notification message when the configuration version is successfully deployed.
- Step 5** (Optional) To make the configuration defined in Security Manager consistent with the one running on the device, rediscover the device policies as described in [Discovering Policies on Devices Already in Security Manager](#) , on page 179.
- However, it is usually better to correct the policies for the device and to then redeploy the updated configuration. This preserves your changes and shared-policy configuration for the device, which would otherwise be removed if you rediscover policies.
- 

## Performing Rollback When Deploying to a File

You cannot directly perform rollback when deploying to a file instead of to a device. Use this procedure to revert to a previously stored configuration when deploying to file.

- 
- Step 1** Select **Manage > Configuration Archive** to open the Configuration Archive (see [Configuration Archive Window](#) , on page 401).
- Step 2** In the Device selector, select the device for which you want to roll back to a different configuration version. The archived configurations appear in the right pane.

- Step 3** Select the configuration version to which you want to roll back and click **View**.
- Step 4** In the Configuration Version Viewer window, make sure the Config Type is set to Full.
- Step 5** Click in the left-hand pane, then press Ctrl+A followed by Ctrl+C to copy the selected configuration to the Windows clipboard.
- Step 6** Open a text editor such as NotePad, then press Ctrl+V to paste the contents of the clipboard into the text file.
- Step 7** Save the file. You can use this file to perform manual rollback.
-

## CHAPTER 9

# Troubleshooting Device Communication and Deployment

---

One of the more likely areas where you can run into problems is with actions where Security Manager must log into a device. These types of actions include policy discovery and deployment using live devices, or actions that involve retrieving information from a device.

The key point to remember is that the communication pathway is from the Security Manager server to the device; the workstation on which you are running the Security Manager client is not involved in device communication (unless the server is installed on the same machine, of course). The Security Manager server must have a network pathway to the device as well as the correct credentials and certificates to authenticate with the device for communication to be successful.

The following topics can help you troubleshoot general device communication and policy deployment problems:

- [Testing Device Connectivity](#) , on page 455
- [Managing Device Communication Settings and Certificates](#) , on page 458
- [Resolving Red X Marks in the Device Selector](#) , on page 463
- [Troubleshooting Deployment](#) , on page 464

## Testing Device Connectivity

Security Manager must be able to connect to and log into a device in order to manage it. You can test whether Security Manager can use the credentials and transport method you have defined within Security Manager for this purpose.

You can test connectivity only for devices that have static IP addresses. You also cannot test connectivity for devices that use Token Management Server (TMS) as the transport protocol.

If you add a device from the network or from an inventory file to the inventory, Security Manager tests connectivity automatically.

You can manually test device connectivity for any device in the inventory or for new devices that you are adding manually. The following procedure describes how to test connectivity for devices that are already in the inventory. When adding devices manually, click **Test Connectivity** on the Device Credentials page of the New Device wizard to perform the test described below. For more information on adding devices manually, see [Adding Devices by Manual Definition](#) , on page 92.

### Before You Begin

Security Manager uses the settings on the Device Communication page to determine the connection timeout, how often to retry the connection, the transport protocol, and which credentials to use. To configure these settings, select **Tools > Security Manager Administration** and select **Device Communication** from the table of contents.

#### Related Topics

- [Understanding the Device View](#) , on page 69
- [Viewing or Changing Device Properties](#) , on page 107
- [Device Communication Page](#) , on page 530

---

**Step 1** In Device view, do one of the following in the Device selector to open the Device Properties dialog box:

- Double-click a device.
- Right-click a device and select **Device Properties**.
- Select a device and select **Tools > Device Properties**.

**Step 2** Select **Credentials** from the table of contents.

**Step 3** Click **Test Connectivity**.

The Device Connectivity Test dialog box opens and displays the progress of the test, including the protocol being used (see [Device Connectivity Test Dialog Box](#) , on page 457). You can abort the test while it is running. When the test is finished, click **Details** to see:

- For successful tests, the output of the **show version** command or the **getVersion** command (for IPS Sensors and Cisco IOS IPS Sensors). You can select the text, press Ctrl+C to copy the text to the clipboard, and then paste it into another file for later analysis.
- For unsuccessful tests, the error information. Some common problems are:
  - The username or password is incorrect.
  - The wrong protocol is selected. For example, the device might not be configured to respond to the selected protocol.
  - The device is not configured to accept connections correctly. Ensure that at least one supported protocol is configured.
  - The wrong operating system is specified for the device (for example, you specified PIX for an ASA device).
  - If you are using ACS authentication and the connection to the device is completed, you can get errors when Security Manager tries to obtain version information if you do not have Control authorization.
  - There might be general network configuration problems. Test connectivity to the device from outside of Security Manager. Look for hardware, media, and booting errors, excessive traffic causing queues to overflow, duplicate MAC or IP addresses on the device, physical discrepancies, such as link, duplex, and speed mismatch, or logical discrepancies, such as VLAN and VTP inconsistencies or ATM network misconfiguration.

## Device Connectivity Test Dialog Box

Use the Device Connectivity Test dialog box to view whether Security Manager can contact the device using the configured credentials.

### Navigation Path

To start the device connectivity test, click **Test Connectivity** from the Credentials page in one of these areas:

- New Device wizard when adding a device manually. See [Adding Devices by Manual Definition](#), on page 92.
- Device Properties. To open the page, double-click a device in the Device selector or select **Tools > Device Properties**.

The connectivity test is done automatically when you click **Next** or **Finish** on the Credentials page when adding a device from the network.

### Related Topics

### Field Reference

*Table 115: Device Connectivity Test Dialog Box*

Element	Description
Connectivity Protocol	The transport protocol being used to log into the device. Security Manager uses the protocol specified in the device properties for the device, which is usually the default protocol configured on the Device Communications page (see <a href="#">Device Communication Page</a> , on page 530).
Connectivity Status	Displays the status of the test and the time elapsed since the start of the test.
Details button	Click this button to display detailed information about the result of the test. <ul style="list-style-type: none"> <li>• Passed tests—The details display the output of the <b>show version</b> command for PIX Firewall, Adaptive Security Appliances (ASA), Firewall Service Modules (FWSM), Cisco IOS routers, and VPN Services Modules (VPNSM), or the output of the <b>getVersion</b> command for IPS Sensors and Cisco IOS IPS Sensors. You can copy the command output and paste it into a file for analysis.</li> <li>• Failed tests—The detailed error message.</li> </ul>
Abort button	Stops the connectivity test before it is completed.

# Managing Device Communication Settings and Certificates

If you discover device inventory and policies directly from devices, or deploy configurations to devices rather than to files, you must configure Security Manager to use the transport protocols that your devices use. For some device types, only one transport protocol is supported, so you do not need to make a choice. For other devices, such as Cisco IOS routers, you have options concerning the protocols you use.

Security Manager has default settings for transport protocols that are the most-used protocols for each device type. To change these settings, select **Tools > Security Manager Administration** and select **Device Communication** from the table of contents (see [Device Communication Page](#), on page 530).

For most users, the communication settings that require management are the certificates used for SSL (HTTPS) connections and the public keys used for SSH connections. You might update the certificates and keys on the device, which would leave Security Manager holding an outdated copy.

The following topics provide more information about managing certificates and keys, and how to troubleshooting device communications:

- **SSL certificates**—You can configure Security Manager to automatically replace certificates using the ones obtained from the device on the Device Communication page. If you decide to manually manage the SSL certificate store, see [Manually Adding SSL Certificates for Devices that Use HTTPS Communications](#), on page 459. The following topics provide more information about certificate errors:
  - [Security Certificate Rejected When Discovering Device](#), on page 460
  - [Invalid Certificate Error During Device Discovery](#), on page 461
  - [Managing IPS Certificates](#), on page 1786

---

**Tip** Ensure that all PIX Firewalls and Adaptive Security Appliances that you intend to manage with Security Manager have a 3DES/AES license. See [Understanding Device Communication Requirements](#), on page 55.

---

- **SSH Public Keys**—By default, Security Manager replaces public keys with the new ones obtained during SSH connections. If you have problems with SSH communications, see [Troubleshooting SSH Connection Problems](#), on page 461.
- **General Device Communication Troubleshooting**—For other problems you might encounter, see [Troubleshooting Device Communication Failures](#), on page 462.

## Multiple Certificate Authentication Support

Beginning from version 4.13, the Cisco Security Manager supports ASA 9.7.1 feature of multiple certificate authentication for VPN connectivity. ASA, in its release 9.7.1, has introduced multiple certificate authentication support to its VPN client customers. Thus, the client can authenticate remote VPN users with two client certificates. The two client certificate could be a combination of one user certificate and one machine certificate, or two user certificates. Two machine certificate authentication is not supported for security considerations. The multiple certificate authentication works for both SSL VPN and IPsec VPN.

In Cisco Security Manager 4.13, to enable the multiple certificate authentication support, you are required to appropriately specify the AAA authentication method (see [AAA Tab \(Connection Profiles\)](#), on page 1338)

and configure the DAP policy (see [Add/Edit DAP Entry Dialog Box Multiple Certificate Authentication](#), on page 1460).

## Manually Adding SSL Certificates for Devices that Use HTTPS Communications

**Note** In addition to the techniques described in this topic, for IPS devices you can use the IPS Certificates utility to manage the certificates in Security Manager's certificate data store. For more information, see [Managing IPS Certificates](#), on page 1786.

When you use SSL (HTTPS) as the transport protocol for communicating with IPS, PIX, ASA, or FWSM devices, or Cisco IOS routers, you can configure Security Manager to automatically retrieve the device authentication certificate when adding the device (see [Device Communication Page](#), on page 530).

**Tip** Having an accurate certificate is required for successful HTTPS communications; Security Manager cannot communicate with the device without the correct certificate, which prevents configuration deployment. When using self-signed certificates, the device might create a new certificate if Security Manager attempts to access it using the wrong certificate. Thus, it is best to configure Security Manager to always retrieve the certificate from the device.

Instead of having Security Manager automatically retrieve the certificates, you can manually add them to increase the level of network security. On the Device Communication page, you would configure the device authentication setting for the device type as **Manually add certificates**.

The easiest way to manually update the certificate for a device is to retrieve it from the device. Right-click the device and select **Device Properties**. Click **Credentials** to open the Credentials page, and then click **Retrieve From Device** to the right of the **Authentication Certificate Thumbprint** field. Security Manager retrieves the certificate and prompts you to accept it. You might need to do this if you encounter certificate problems during configuration deployment. (You can also type or paste the certificate into this field.)

You can also manually type in, or copy and paste, the certificate thumbprint without having Security Manager log into the device. Use the following procedure to manually enter the SSL certificate thumbprint for a device if you configured that device type to require manually added certificates.

**Tip** Security Manager allows you to generate a 2048-bit self-signed certificate under **Megamenu > Server Administration > Server > Security > Single Server Management > Certificate Setup**.

**Tip** To reach the Megamenu, double-click the Cisco Security Manager icon on your server desktop and log on. Another way to reach the Megamenu is as follows: Windows > Start > All Programs > Cisco Security Manager > Cisco Security Manager > [log on]. This second navigation path may differ slightly, depending upon how you have personalized your Windows Server installation.

### Before You Begin

Obtain the certificate thumbprint (a hexadecimal string) for the device.

**Tip** If the thumbprint is not readily available, you can copy it from the error message that is displayed when you add the device from the network or from an export file.

- 
- Step 1** Select **Tools > Security Manager Administration** and select **Device Communication** from the table of contents to open the Device Communication page (see [Device Communication Page](#), on page 530).
- Step 2** Click **Add Certificate** to open the Add Certificate dialog box (see [Add Certificate Dialog Box](#), on page 533).
- Step 3** Enter the DNS hostname or IP Address of the device, the certificate thumbprint in hexadecimal format, and click **OK**. The thumbprint is added to the certificate store.

**Tip** To erase an existing thumbprint, leave the Certificate Thumbprint field empty.

---

## Security Certificate Rejected When Discovering Device

If an error occurs when you attempt to discover a device, and the error message states that the security certificate received from the device was rejected, you need to update the certificate. You can do this using one of the following methods:

- For IPS devices only, select **Manage > IPS > IPS Certificates** and synchronize the certificates. You might also need to regenerate the certificate. For more information, see [Managing IPS Certificates](#), on page 1786.
- Manually enter the thumbprint required by the certificate by doing one of the following:
  - Select **Tools > Security Manager Administration > Device Communication**. Click **Add Certificate**, enter the IP address of the device, then copy and paste the thumbprint displayed in the error message into the Certificate Thumbprint field.
  - Right-click the device and select **Device Properties > Credentials**. Copy and paste the thumbprint displayed in the error message into the Authentication Certificate Thumbprint field.

You must manually enter the thumbprint whenever you add a new device using the Add New Device or Add From Configuration File options and when you perform rediscovery. It is not required when you add a new device using the Add New Device From Network or Add Device From File options.

- Configure the SSL certificate settings to automatically retrieve the certificate when adding devices. You can select different settings for IPS, router, and ASA/PIX/FWSM devices. To configure these settings, select **Tools > Security Manager Administration > Device Communication**, and look at the **SSL Certificate Parameters** group.

## Invalid Certificate Error During Device Discovery

If the time settings on the device and Security Manager are not in synchronization, when you try to discover policies on a device (adding it to the inventory or rediscovering policies on a device already in the inventory), an error message might state that the certificate is not yet valid.

When the time set on the Security Manager server is lagging behind the time set on the device, Security Manager cannot validate the device certificate if the start time of the validity period is ahead of the Security Manager time setting. Even if the time zones configured on the device and Security Manager are the same, the invalid certificate error occurs if the daylight saving time (summertime) settings are different. To resolve this problem, make sure that the daylight saving time settings are the same on the device and Security Manager, regardless of whether the time zone is the same. After setting the daylight saving time, synchronize the clock on the device with Security Manager so that both of them display the same time.

To obtain best results, we recommend that you set the same time zone on the device and Security Manager, and modify the time zone after you discover the certificates at a later time, if necessary.

## Troubleshooting SSH Connection Problems

For devices that use SSH as the transport protocol, Security Manager automatically detects the appropriate SSH version (1.5 or 2) to use with each device. During SSH version 2 connections, Security Manager automatically negotiates encryption algorithms or ciphers with the device. Security Manager also automatically overwrites the SSH public key for the device if the key changes. Thus, you typically will not run into SSH connection problems.

If you do have SSH connection problems, consider these fixes:

- If the public key on the device changed, and SSH connections are failing due to a key problem, remove the key for the device from the Program Files/CSCOpX/MDC/be/tmp/.ssh/known\_hosts file on the Security Manager server and retry the operation.
- Security Manager uses 3DES (Data Encryption Standard) as the default encryption algorithm. If this is not the correct algorithm for your devices, either change the configuration of your devices, or update the Program Files/MDC/athena/config/DCS.properties file to indicate the correct algorithm on the DCS.ssh.encipher property. (Contact Cisco TAC if you need more help). You must restart the Security Manager daemon manager if you change this file.

### Related Topics

- [Preparing Devices for Management](#), on page 55

- [Device Communication Page](#) , on page 530
- [Device Credentials Page](#) , on page 112

## Troubleshooting Device Communication Failures

If Security Manager fails to communicate with a device, for example, by failing to log into it, during discovery, deployment, or other actions, look at these areas to identify and resolve the problem:

- Ensure the device is operational.
- Check which transport protocol is selected. You must select a protocol that the device is configured to accept. For most devices, the protocol is selected on the Device Properties General page (select **Tools > Device Properties > General**). For IPS devices, the IPS RDEP mode is selected on the device properties Credentials page.

For IOS devices that do not have a K8 or K9 crypto image, ensure that you select Telnet as the protocol.

Some methods of adding devices also allow you to select a non-default transport protocol. To configure the default transport protocols for classes of devices, select **Tools > Security Manager Administration > Device Communications**.

- On the Device Properties General page, ensure that the hostname, domain name, and IP address are correct. Keep in mind that the Hostname and Accounts and Credentials policies for the device define the actual names and credentials that get configured on the device. However, the policies are not used for device communication. If you make changes to the policies that affect the credentials you are using for device communication, you must also manually update the device properties.
- Make sure DNS names can be resolved from the Security Manager server. You might need to fix the DNS settings on the server.
- Check the credentials for the device in Security Manager and ensure that they are correct and that there is a route between the server and device. Right-click the device, select **Device Properties**, select the Credentials tab, and click the **Test Connectivity** button. If the connection fails, check error messages to determine whether the problem is connectivity or credentials. Update the credentials in the device properties if necessary.

When adding new devices the credentials are defined within the New Device wizard if your method of adding the device requires credentials. Keep the following in mind:

- The primary credentials are used for SSH and Telnet connections.
- The HTTP/HTTPS credentials are used for HTTP and SSL connections unless you select **Use Primary Credentials**, in which case the primary credentials are also used for these connections.
- Beginning with version 4.11, Security Manager does not support the device SSL Certificates using MD5 algorithms. If the device SSL uses MD5 algorithms, Security Manager throws up an error when you try to add the device to Security Manager. This happens because JRE, by default, disables the MD5 algorithms due to security vulnerability. To resolve this, you must use higher encryption algorithm for device SSL certificate.
- Beginning with version 4.19, Cisco Security Manager does not support the device SSL Certificates using DES algorithms. If the device SSL uses DES algorithms, Security Manager throws up an error when you try to add the device to Security Manager. This happens because the JRE, by default, disables the DES

algorithms due to security vulnerability. To resolve this, you must use higher encryption algorithm for device SSL certificate, or follow the steps below:

- Stop Security Manager server services.
- Ensure you take a backup of MDC\vm\jre\lib\security\java.security properties.
- In properties, find "jdk.tls.disabledAlgorithms=SSLv3, DES, MD5withRSA, DH keySize <1024, \ EC keySize < 224, RC4\_40, 3DES\_EDE\_CBC" and remove "DES" from the list.
- Start Security Manager server services again.

#### Related Topics

## Resolving Red X Marks in the Device Selector

If a device is marked with a red X in the device selector in Device view, it means that the Auto Update Server (AUS) or Configuration Engine server assignment for the device was lost during an upgrade from a Security Manager release prior to 3.2.0. AUS and Configuration Engines are not migrated during an upgrade from 3.1.x, and devices managed by them need to be reassigned to them after the upgrade using the following procedure.

---

### Step 1

Do one of the following in Device view:

- From the Device selector, right-click a device with a red X icon, then select **Update Server Info**.
- Click any red X icon in the device selection tree. A warning message is displayed stating that AUS and Configuration Engine information was not migrated after the upgrade process. Click **Yes** to add these servers manually.

The Device Server Assignment dialog box opens.

### Step 2

From the Available Devices list, select all the devices that use the same AUS or Configuration Engine server and click >> to move them to the selected list. The Available Devices list includes all devices that are managed by AUS or Configuration Engine that are marked with a red X.

### Step 3

Select the AUS or Configuration Engine that manages the selected devices from the Server list. If the correct server is not listed, select + **Add Server...** to add it to the inventory using the [Server Properties Dialog Box](#) , on page 104.

For more information on adding AUS or Configuration Engine servers to the inventory, see [Adding, Editing, or Deleting Auto Update Servers or Configuration Engines](#) , on page 103.

### Step 4

Repeat the process until no device is marked with a red X.

---

# Troubleshooting Deployment

The deployment process is one of the most likely areas in which you will encounter problems when using Security Manager. There are many different processes involved in deployment that influence whether the deployment job is successful:

- Security Manager itself.
- The stability and availability of your network, including links to remotely-managed devices.
- Any bugs inherent in the versions of the operating systems that you are using on your network devices that affect the commands Security Manager is trying to deploy (Security Manager is not immune to these bugs).
- The licenses you have enabled on the device, because many security commands require specific device licenses.
- The specific features supported by your devices, which Security Manager cannot always determine ahead of time. For example, some platforms support features only if the device has a certain minimum RAM, and some interface settings are available for specific interface cards only.
- The correct functioning of interim applications such as AUS, Configuration Engine, or your TMS server.

If you encounter deployment failures, examine the messages in the deployment status window carefully. In addition, the following topics address some of the problems you might encounter:

- [Changing How Security Manager Responds to Device Messages](#) , on page 464
- [Memory Violation Deployment Errors for ASA 8.3+ Devices](#) , on page 466
- [Security Manager Unable to Communicate With Device After Deployment](#) , on page 466
- [Updating VPNs That Include Routing Processes](#) , on page 467
- [Mixing Deployment Methods with Router and VPN Policies](#) , on page 468
- [Deployment Failures for Routers](#) , on page 469
- [Deployment Failures for Catalyst Switches and Service Modules](#) , on page 470
- [Deployment Failures to Devices Managed by AUS](#) , on page 472
- [Troubleshooting the Setup of Configuration Engine-Managed Devices](#) , on page 473

## Changing How Security Manager Responds to Device Messages

Security Manager has built-in responses to many of the response messages that can be encountered when configuring a device. You might find that messages Security Manager treats as errors are messages that you want to ignore or treat as informational. Although you can configure your deployment jobs to ignore errors, you might instead want to update Security Manager to treat specific messages differently using a properties file.

It is important to understand that setting the properties file to ignore the error is not always sufficient. Deployment can fail because the **Allow Download on Error** check box (located on the **Tools > Security Manager Administration > Deployment** page) is deselected by default. The following table provides details

about how Security Manager behaves when an error occurs during deployment, the **Allow Download on Error** option is either selected or deselected, and the **Save Changes Permanently on Device** option is selected or deselected.

*Table 116: Deployment Device Error Handling for SSL and SSH on PIX Firewall, ASA, and Cisco IOS Routers*

<b>Allow Download on Error</b>	<b>Error Occurred</b>	<b>Error Ignored Using Warning Expression</b>	<b>Deployment Status</b>	<b>Write Memory Done</b>
Selected	Yes	No	Failed	Based on whether <b>Save Changes Permanently on Device</b> is selected.
Selected	Yes	Yes	Success	Based on whether <b>Save Changes Permanently on Device</b> is selected.
Selected	No	Not applicable	Success	Based on whether <b>Save Changes Permanently on Device</b> is selected.
Deselected	Yes	No	Failed (Deploy not Completed message)	No.
Deselected	Yes	Yes	SSL (ASA, PIX, IOS devices)—Failed SSH (IOS devices)—Success	SSL—No. SSH (IOS devices)—Based on whether <b>Save Changes Permanently on Device</b> is selected.
Deselected	No	Not applicable	Success	Based on whether <b>Save Changes Permanently on Device</b> is selected.

**Note** On Cisco IOS routers using the SSL protocol, deployment on devices stops on command syntax errors. It does not stop when configuration-related errors occur.

To change how Security Manager treats a message, you need to update the DCS.properties file in \CSCOPx\MDC\athena\config folder in the installation directory (usually c:\Program Files). Use a text editor such as NotePad to update the file.

It is easiest to determine the message you want to ignore by looking at the transcript of a deployment job that encountered the error using the following procedure.

#### **Related Topics**

- [Viewing Deployment Status and History for Jobs and Schedules](#) , on page 403

- 
- Step 1** Click the **Deployment Manager** button in the Main toolbar.  
The Deployment Manager window appears. Click the **Deployment Jobs** tab if it is not active.
- Step 2** Select the job with the error message.
- Step 3** Click the **Transcript** button in the Deployment Details tab to open the transcript.

- Step 4** Identify the error text that you want to ignore.
- Step 5** Locate the appropriate warning expressions property in the DCS.properties file. For example, for PIX devices the property is called **dev.pix.warningExpressions**, whereas for IOS devices the property is called **dev.ios.warningExpressions**.
- Tip** Conversely, you can make device responses that are not tagged with the Error prefix to appear as error messages. To do this, add the message to the Error Expressions list (for example, **dev.pix.ErrorExpressions**).
- Step 6** Add the error text to the warning expressions list. The warning message should be a generic regular expression string. Except for the last expression, you must delimit all expressions with “\$”. For example, if the message you want to ignore is “Enter a public key as a hexadecimal number,” enter the following string:
- . \*Enter a public key as a hexadecimal number . \*\$**
- Step 7** Restart the CiscoWorks Daemon Manager.

## Memory Violation Deployment Errors for ASA 8.3+ Devices

ASA Software release 8.3+ requires significantly more device memory than previous versions of the ASA software. If you upgrade an ASA device that does not meet the minimum memory requirements, the upgrade process notifies you of the problem and the device regularly sends syslog messages until the minimum memory requirement is met.

Because an ASA device that does not meet the minimum memory requirements can function poorly, Security Manager does not deploy configurations to these devices, although you are allowed to add the device to the inventory and discover policies from it. However, if you try to deploy policies to the device before you add memory, you get a deployment error stating that the device does not meet the minimum memory requirements and deployment fails.

The best way to resolve the error is to add memory to the device. For information about ASA devices and memory upgrade possibilities, see <http://www.cisco.com/go/asa>.

Alternatively, you can downgrade the ASA software version, in which case you should delete the device from the inventory, then add it back to the inventory and discover policies.

## Error While Attempting to Remove Unreferenced Object

If you enable the Remove Unreferenced Object Groups from Device option on the **Tools > Security Manager Administration > Deployment** page, Security Manager will remove objects during deployment that are not used in any policies managed or discovered by Security Manager. If any policy that is NOT discovered or managed by Security Manager is using such an object, Security Manager will still attempt to delete that object during deployment. In such cases, deployment will fail with a transcript error indicating that it was unable to delete the object as the object is being used. To successfully deploy, disable the Remove Unreferenced Object Groups from Device option.

## Security Manager Unable to Communicate With Device After Deployment

There are a number of policies that you can configure in Security Manager that prevent access to a device. That is the point of security, ensuring that unwanted hosts cannot enter your network or network devices.

However, you can inadvertently lock the Security Manager server out of a device, making it impossible for Security Manager to deploy configurations to it or manage it. If you find that after a deployment, Security

Manager can no longer contact a device, and you have already checked that the device is up and running and otherwise functioning normally, look into the following policies to see if they are causing the lock-out:

- **Firewall > Access Rules, or Firewall > Zone Based Firewall Rules**—If you use these policies, the rules must allow management traffic from the Security Manager server. Consider allowing at least HTTP, HTTPS, SSH, and Telnet. Consider creating a shared policy that defines the required access for Security Manager and applying it to all devices. Keep in mind that if you create any rules in these policies, an implicit rule is added to the end of the policy that denies any traffic that is not explicitly allowed.
- **NAT policies**—Make sure that you are not using a local address on the device as the original address to be translated. Translating this address might result in translating the management traffic sent between Security Manager and the device, causing the interruption.
- **Device Access policies on routers**—Security Manager might lose contact with a device after you unassign a device access policy from the device and redeploy it. Device access policies can be used to define the enable password for accessing the device. If you unassign this policy and redeploy, the password is removed from the device. In such cases, the device typically reverts to the default password. However, in some cases, the device might contain an additional password that is unknown to Security Manager, such as a line console password. If this additional password exists, the device reverts to that password instead of the default password. If that happens, Security Manager cannot configure this device. Therefore, if you use a device access policy to configure the enable password or enable secret password on a device, make sure that you do not unassign the policy without assigning a new policy before the next deployment.
- **Site-to-Site VPNs**—If you lose communication with a spoke in a VPN, the problem can occur when the Security Manager server communicates with an external interface on the spoke from within the hub's protected network. We recommend that when you add the hub device to Security Manager that you define a management IP address that is located outside of the hub's protected network.
- **Platform > Device Admin > Device Access > Allowed Hosts**—For IPS devices, the Allowed Hosts policy identifies the hosts that can connect to the sensor. The Security Manager server must be included in this policy.

## Updating VPNs That Include Routing Processes

**Problem:** When you define and deploy changes to a routing process that is being used by a VPN topology (using either the Site-to-Site VPN Manager or the routing policies), the changes that you make are not reflected in the CLI commands configured on the device.

**Solution:** When you discover a VPN topology that includes routing processes, such as GRE full mesh, Security Manager populates the GRE Modes policy in the Site-to-Site VPN Manager, as well as the relevant routing policies. However, changes made to one of these policies in Security Manager are not automatically reflected in the other policy, which can lead to unexpected results after deployment. Therefore, if you make changes to the secured IGP in the Site-to-Site VPN Manager, be sure to go to Platform > Routing in Device view to

make the necessary changes in the device's routing policies. Likewise, if you make changes directly to the routing policy, be sure to make the necessary changes in the Site-to-Site VPN Manager as well.

- [Managing Firewall Devices, on page 1803](#)

## Mixing Deployment Methods with Router and VPN Policies

You might receive unpredictable results when you deploy router platform and VPN policies to a live device after previously deploying to a configuration file.

This problem can occur when you use a mix of deployment methods (deploy to device and deploy to file) with router platform policies and VPN policies. Because Security Manager does not manage all the available CLI commands for these policy types, it maintains a snapshot of the commands it has configured and leaves all other commands (which includes unsupported commands as well as supported commands in policies that have not been configured in Security Manager) intact on the device.

After each deployment, Security Manager creates a snapshot of the policies that were deployed to each device. This snapshot is used during the next deployment to generate the list of configuration changes that will be deployed to the device. Only one snapshot is maintained at a time per device.

Mixing deployment methods with router platform policies and VPN policies can lead to unpredictable results, as shown in this example:

1. Configure router platform policy A to a live device. When deployment completes, Security Manager creates a snapshot for that device with policy A.
2. Next, configure policy B to replace policy A, but instead of deploying policy B to the device, deploy it to a file instead. When this deployment completes, Security Manager creates a snapshot with policy B that replaces the previous snapshot with policy A. However, because you did not deploy policy B to the device, the CLI commands that are required to negate policy A have not been deployed. Policy A is still deployed on the device.
3. Deploy again to the device without first copying the changes in the configuration file to the device. Security Manager cannot generate the commands that are required to negate policy A from the device because the snapshot with policy A no longer exists.

Because policy A is a router platform policy, any of the following results might occur:

- The policy in the latest deployment overrides policy A.
- Both policies end up defined on the device.
- Deployment fails because the two policies cannot coexist.

Therefore, if you deploy to a file when working on a live device, we strongly recommend that you copy your configuration changes from the file to the device before performing additional deployments to the device.

- [Managing Routers, on page 2323](#)

## Deployment Failures for Routers

Following are some potential problems you might encounter when deploying configurations to Cisco IOS routers.

### Deployment Fails for Interface Settings

**Problem:** Deployment fails for interface settings on a router.

**Solution:** Security Manager cannot validate whether you have the appropriate types of interface cards or shared port adapters (SPAs) installed on the router, or the appropriate licenses configured, to support your interface policies. If you add or remove an interface card without changing your interface policies, you can encounter deployment errors. The best practice is to ensure that you discover inventory from the router whenever you change interface modules or SPAs so that Security Manager can discover the appropriate interface features.

### Deploying Layer 2 Interface Definitions

**Problem:** Deployment fails if the interface policy includes a definition for a Layer 2 interface.

**Solution:** Layer 2 interfaces do not support Layer 3 interface definitions, such as IP addresses. Make sure that you did not define a Layer 3 definition on the Layer 2 interface.

### VPN Traffic Sent Unencrypted

**Problem:** Traffic that should be sent encrypted over a VPN is instead being sent unencrypted.

**Solution:** Ensure that you are not performing NAT on VPN traffic. Performing address translation on VPN traffic prevents the traffic from being encrypted and sent through the VPN tunnel. When defining dynamic NAT rules, make sure that the Do Not Translate VPN Traffic check box is selected, even when you perform NAT into IPSec. (This option does not interfere with the translation of addresses arriving from overlapping networks.)

This option can be used only on site-to-site VPNs. For remote access VPNs, you need to create an ACL object that explicitly denies the flow containing VPN traffic and define this ACL as part of a dynamic rule in the NAT policy. For more information, see [NAT Page: Dynamic Rules](#), on page 1025.

### Unable to Deploy ADSL or PVC Policy

**Problem:** Deployment fails for your ADSL or PVC policy.

**Solution:** Make sure that you have selected the correct ATM interface card type in the policy definition. Security Manager cannot properly validate the policy definition without knowing the correct card type, which can lead to deployment failures.

### DHCP Traffic Not Being Transmitted

**Problem:** DHCP traffic is not being transmitted even after you deploy a DHCP policy to the device.

**Solution:** Check whether an access rule on the device blocks Bootstrap Protocol (BootP) traffic. Having such a rule prevents DHCP traffic from being transmitted.

### NAC Not Implemented on Router

**Problem:** Network admission control is not being implemented on the router, even though a NAC policy was deployed to it.

**Solution:** Ensure that the default ACL on the router permits UDP traffic over the port defined in the NAC policy for EAP over UDP traffic. This is the protocol that NAC uses for communication between the Cisco Trust Agent (CTA), which is the NAC client that provides posture credentials for the endpoint device on which it is installed and the network access device (NAD; in this case, the router) that relays the posture credentials to the AAA server for validation. The default port used for EAP over UDP traffic is 21862, but you can change this port as part of the NAC policy. If the default ACL blocks UDP traffic, EAP over UDP traffic is likewise blocked, which prevents NAC from taking place.

### Deployment Fails with Error Writing to Server or HTTP Response Code 500 Messages

**Problem:** Deployment to a Cisco IOS router fails and an “Error Writing to Server” or “Http Response Code 500” error message occurs.

**Solution:** When you use SSL as the transport protocol for deploying configurations to a Cisco IOS router, the configuration is split into multiple configuration bulks. The size of this configuration bulk varies from platform to platform. If Security Manager tries to deploy a configuration bulk that exceeds the size of the SSL chunk configured on that device, the deployment fails and you get an “Error Writing to Server” or “Http Response Code 500” error message.

To resolve this, do the following:

1. On the Security Manager server, open the DCS.properties file in the \CSCOPx\MDC\athena\config folder in the installation directory (usually C:\Program Files).
2. Locate **DCS.IOS.ssl.maxChunkSize=<value of the configuration bulk >**.
3. Reduce the value of the configuration bulk.
4. Restart the CiscoWorks Daemon Manager.

## Deployment Failures for Catalyst Switches and Service Modules

---

**Note** From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches features/functionality, it does not support any enhancements.

---

Following are some potential problems you might encounter when deploying configurations to Catalyst switches and Catalyst 6500/7600 service modules.

### Deployment Fails for Interface Settings

**Problem:** Deployment fails for interface settings on a Catalyst 6500/7600 device.

**Solution:** Certain interface settings (such as speed, duplex, and MTU settings) are specific to particular card types and are not validated prior to deployment. Make sure to enter the correct values for your specific card type to ensure successful deployment.

### Deployment Failures to FWSM Security Contexts After Changing Interface Policies

**Problem:** You add an FWSM with security contexts and discover its policies. The configuration includes interface aliases (the allocate interface command). After changing the interfaces policy for a context, deployment fails.

**Solution:** Connect directly to the FWSM and remove all mapped interface names from the system execution space configuration and in all other contexts, replace interface references to mapped names with the VLAN ID of the interface. You can then delete the FWSM from the Security Manager inventory and rediscover it.

### Deployment Failures for FWSMs That Have Multiple Contexts

**Problem:** Deployment to an FWSM that has multiple security contexts sometimes fails or results in a temporary performance impact to the FWSM.

**Solution:** The problem is that Security Manager is trying to deploy configurations to more than one security context on a device at the same time. Depending on the configuration changes, this can result in errors on the device that prevent successful deployment. If you use FWSM in multiple-context mode, configure Security Manager to deploy configurations serially to the device so that one context at a time is configured, as described in [Changing How Security Manager Deploys Configurations to Multiple-Context FWSM](#), on page 472.

### Deployment Fails for Internal VLANs

**Problem:** Deployment fails when Security Manager tries to create a VLAN with an ID that is within the range of the device's internal VLAN list.

**Solution:** Security Manager cannot detect internal VLANs. Therefore, you must define a VLAN ID that falls outside of the device's internal VLAN list. Use the **show vlan internal usage** command on the device to view the list of internal VLANs.

### Deployment Fails When Changing the Running Mode of an IDSM Data Port VLAN

**Problem:** Deployment fails when you attempt to change the running mode of the data port VLAN from Trunk (IPS) to Capture (IDS) and the following error message is displayed:

Command Rejected: Remove trunk allowed vlan configuration from data port 2 before configuring capture allowed-vlans

**Solution:** On some software releases such as 12.2(18)SFX4, there is a bug that prevents the change from occurring correctly. Reload the device to overcome the problem.

### Deployment Fails for FWSM Configuration With Large Numbers of ACLs

**Problem:** Deployment to FWSM devices fail when the configuration contains a large number of ACLs.

**Solution:** This could occur because the CPU utilization is high during ACL compilation. To resolve this, reconfigure the CPU utilization threshold limit by doing the following:

1. On the Security Manager server, open the DCS.properties file in the \CSCOpX\MDC\athena\config folder in the installation directory (usually C:\Program Files).
2. Locate the **DCS.FWSM.checkThreshold=False** property.
3. Change the value to true: **DCS.FWSM.checkThreshold=True**.
4. Restart the CiscoWorks Daemon Manager.
5. Deploy the configuration to the device again.

After you set the value to true, discovery and deployment checks the CPU utilization and generates error messages if the CPU utilization is not within the configured value set in the DCS.FWSM.minThresholdLimit property. The default value is 85.

## Changing How Security Manager Deploys Configurations to Multiple-Context FWSM

**Note** From version 4.17, though Cisco Security Manager continues to support FWSM features/functionality, it does not support any enhancements.

If you configure a Firewall Services Module (FWSM) to run in multiple context mode, so that you host more than one security context on the FWSM, you need to configure Security Manager to deploy configurations serially to the FWSM. The FWSM has some limitations that can prevent successful deployments if more than one context is updated at the same time, so you might run into deployment failures if you do not use serial deployment. There can also be an impact on FWSM performance during deployment if you do not use serial deployment.

To change how Security Manager deploys configurations to multiple-context FWSM, you need to update the `DCS.properties` file. You also need to add the FWSM contexts to the inventory using the FWSM admin context, rather than adding the individual security contexts.

The following procedure explains the end-to-end process for ensuring that FWSM deployments are done serially.

- 
- Step 1** Make it a standard practice to add FWSM security contexts using the admin context management IP address. Manage the contexts through the admin context.
- Although it is possible to add security contexts for an FWSM individually, using each context's management IP address, Security Manager cannot recognize these individually-added contexts as being hosted on the same physical device. This prevents Security Manager from doing serial deployments to the contexts.
- If you have any FWSM security contexts that you added using the security context management IP, delete the contexts and FWSM from the inventory, then add them using the admin context (discover all policies). See [Adding Devices to the Device Inventory](#) , on page 75.
- Tip** If you have any undeployed changes to these contexts that you want to keep, first deploy the changes to ensure that the configurations on the device are complete. Do the deployments one context at a time.
- Step 2** Log into Windows on the Security Manager server and edit the `DCS.properties` file in the `\CSCOpX\MDC\athena\config` folder in the installation directory (usually `c:\Program Files`). Use a text editor such as NotePad to update the file.
- Step 3** Locate the `DCS.doSerialAccessForFWSMVCs` property in the `DCS.properties` file and set it to true:
- ```
DCS.doSerialAccessForFWSMVCs=true
```
- Step 4** Restart the CiscoWorks Daemon Manager.
- 

## Deployment Failures to Devices Managed by AUS

Deployment might fail when deploying to multiple AUS-managed devices after starting the AUS if you perform deployment before the Auto Update Server (AUS) is fully operational. The AUS requires time to start up after the following operations:

- New installation or upgrade.
- Manual restart (including after a power outage).

- Manual restart of the Cisco Security Manager Daemon Manager service.

You can verify whether the AUS is fully operational by verifying the status of its Windows services. To do this, select **Start > Control Panel > Administrative Services > Services**, then check the status of the CiscoWorks AUS Database Engine service. If this service has started, try again to deploy.

## Device Communication Deployment

### Deployment fails when debug is enabled in CSM managed device

**Problem:** The deployment fails when the debug command is enabled in the devices which are managed by CSM.

**Solution:** During deployment, ensure that the debug command is not enabled in the devices which are managed by CSM.

## Deployment Fails on Entry of Unrecognized Characters

**Problem:** When unrecognized characters are included in the description of VPN topology, the deployment and preview of configuration might fail.

**Solution:** Avoid using unrecognized characters in the VPN topology description. If you are copying texts from some other application or web page, paste the text to a notepad and then copy the text from notepad to the CSM text box.

## Troubleshooting the Setup of Configuration Engine-Managed Devices

The following questions and answers describe issues that might arise when you set up a device managed by a Cisco Configuration Engine (also known as CNS) and how to solve them:

**Question:** Why does Configuration Engine deployment fail?

**Answer:** Not all versions of Configuration Engine function in a compatible manner. Because Security Manager does not verify the software version running on a Configuration Engine when you add it to the device inventory, you can add unsupported versions to the inventory. Then, when you try to deploy, you can run into unpredictable errors. Ensure that you are running a supported version of Configuration Engine (for version information, see the release notes for this version of Security Manager at [http://www.cisco.com/en/US/products/ps6498/prod\\_release\\_notes\\_list.html](http://www.cisco.com/en/US/products/ps6498/prod_release_notes_list.html)).

**Question:** Why do I receive an InvalidParameterException when I click on an IOS device on the Configuration Engine web page?

**Answer:** This is the expected behavior. For IOS devices, Security Manager uses deployment jobs to deploy configurations to Configuration Engine instead of associating a configuration to the IOS device in Configuration Engine. Therefore, you do not see an associated configuration when you click the device name on the Configuration Engine web page. For ASA/PIX devices, Security Manager associates the configuration to the device in Configuration Engine. Therefore, clicking the device name displays the associated configuration.

**Question:** Why am I getting the following error: com.cisco.netmgmt.ce.websvc.exec.ExecServiceException: [002-01003]]deviceName does not exists?

**Answer:** This error indicates that the device has not been added to Configuration Engine. It appears if you have not performed rollback or deployment in Security Manager (both of which add the device automatically), and have not manually added the device to Configuration Engine.

**Question:** Why am I getting the following error: com.cisco.netmgmt.ce.websvc.config.ConfigServiceException: [002-01003]]Device device id is not connected

**Answer:** The answer depends on the type of setup you are performing:

- Event mode setup—Make sure that the Configuration Engine device ID defined in the Device Properties window in Security Manager matches the device ID configured on the router (using the **cns id string** command).
- Call home mode setup—The device is not connected to Configuration Engine in this mode; therefore, all Security Manager operations that require the retrieval of the device configuration using Configuration Engine are not supported. This includes discovery, preview configuration, display running configuration, and connectivity tests (and rollback, for IOS devices).

**Question:** Why is deployment to my Configuration Engine-managed ASA/PIX device not working?

**Answer:** There are several possibilities:

- The configuration contains invalid commands. You can test this by copying the configuration associated with the ASA/PIX device in Configuration Engine and pasting it directly into the device.
- The **auto-update server** command contains an invalid username and password.
- You did not wait long enough for the configuration to be polled into the ASA/PIX device. Use the **show auto** command to verify when the next polling cycle will occur.
- If you previously used the Configuration Engine server for the same ASA/PIX device and did not delete the device from the Configuration Engine server before you started the current task, it is possible that the device received the previous configuration from the server before you deployed the new configuration to it.
- If none of the suggestions above solves the problem, turn on Configuration Engine debug mode on the ASA/PIX device and check the log for errors after the next polling cycle.

**Question:** Why was I able to deploy successfully to a Configuration Engine-managed ASA/PIX device the first time, but subsequent deployments were unsuccessful?

**Answer:** This can happen if the configuration pushed during the first deployment contains incorrect CLI commands for the auto-update feature. Check the following:

- Make sure the username and password of the Configuration Engine server is defined correctly in the **auto-update** command.
- If you used **name** commands when configuring the auto-update server using the device CLI, make sure that you have defined a FlexConfig that contains the necessary **name** commands. A FlexConfig is necessary because Security Manager does not support this command directly. As a result, even though the command was discovered, it does not appear in the full configuration. If you use Security Manager to configure the AUS policy, **name** commands are not necessary.

**Question:** How do I debug Configuration Engine on an ASA/PIX device?

**Answer:** Enter the following CLI commands:

```
logging monitor debug
terminal monitor
logging on
```

You can also find relevant information in the PIX log on the Configuration Engine server.

**Question:** How do I debug Configuration Engine on an IOS device?

**Answer:** Enter the following CLI commands:

```
debug cns all
debug kron exec-cli
terminal monitor
```

When working in event mode, you can also find relevant information in the event log on the Configuration Engine server. When working in call home mode, check the config server log on the Configuration Engine server.

**Question:** Why did I fail to discover an IOS device and acquire its configuration through Configuration Engine?

**Answer:** If you see the following errors in debug mode:

```
*Feb 23 21:42:15.677: CNS exec decode: Unknown hostname cnsServer-lnx.cisco.com ... 474F6860: 72726F72
2D6D6573 73616765 3E584D4C error-message>XML 474F6870: 5F504152 53455F45 52524F52 3C2F6572
_PARSE_ERROR
```

Verify the following:

- The CNS commands use a fully-qualified host name (host name and domain name).
- The device contains the **ip domain name** command.
- The device contains the **ip host** command with the fully qualified hostname of the Configuration Engine with its IP address.

**Question:** Why does the event mode router not appear on the Configuration Engine Discover Device page or appear in green on the Configuration Engine web page?

**Answer:** Check the following:

- Make sure that the router and the Configuration Engine server can ping each other.
- Make sure that the event gateway on the Configuration Engine server is up and running by using one of the following commands:

Status for plain text mode: **/etc/init.d/EvtGateway**

Status for SSL encrypted mode: **/etc/init.d/EvtGatewayCrypto**

- Clear the **cns event** command, then re-enter it without specifying a port number.

## CHAPTER 10

# Managing Security Manager Server

The following topics describe some system management tasks related to the general operation of the Security Manager product:

- [Overview of Security Manager Server Management and Administration, on page 477](#)
- [Managing a Cluster of Security Manager Servers, on page 478](#)
- [Installing Security Manager License Files , on page 492](#)
- [Certificate Trust Management, on page 493](#)
- [Working with Audit Reports, on page 495](#)
- [Taking Over Another User’s Work, on page 499](#)
- [Changing Passwords for the Admin or Other Users , on page 500](#)
- [Backing up and Restoring the Security Manager Database , on page 500](#)
- [Generating Data for the Cisco Technical Assistance Center , on page 504](#)

## Overview of Security Manager Server Management and Administration

As a software application, Cisco Security Manager runs on the framework provided by the CiscoWorks Common Services application. Many of the fundamental server control functions are provided by Common Services. For example, if you want to create a multiple-server setup for Security Manager, you must create that setup in Common Services. Common Services also provides the tools for creating and managing local user accounts, for backing up and restoring the database, for generating various reports on system functions, and for many other basic functions.

To access the Common Services application, do any of the following:

- If you currently have the Security Manager client open, you can select **Tools > Security Manager Administration** and select **Server Security** from the table of contents. The Server Security page has buttons that link to and open specific pages in Common Services. You can click any button and then navigate to any desired page in Common Services.
- Using your web browser, link to the Security Manager server using the URL `https://servername` , where *servername* is the IP address or DNS name of the server. This URL opens the Security Manager home page. Click **Server Administration**, or the **CiscoWorks** link, to open Common Services.

---

**Note** A special consideration applies if you are using Internet Explorer 10.x in Windows Server 2012 (Standard or Datacenter)—64-bit, support for which is new in Version 4.7 of Cisco Security Manager. You need to be aware of this consideration when using the following navigation path: Windows Start > Cisco Security Manager Client > [log in] > Configuration Manager > Tools > Security Manager Administration... > Server Security. The Server Security page will open normally for you, but on that page you will be unable to use the buttons (e.g., Local User Setup) to cross-launch the Server Security Tools within Common Services. To work around this problem, decrease the security levels of your intranet settings in Internet Explorer 10.x.

---

To learn more about the things you can do with Common Services, browse the Common Services online help.

---

**Note** The **Software Center > Software Update** feature in Common Services is not supported by Cisco Security Manager.

---

## Managing a Cluster of Security Manager Servers

A Security Manager server cluster is two or more Security Manager servers used to manage a network. Typically, you want to maintain some relationship between the servers. Although there is no systematic relationship between the servers in the cluster, there are some techniques that you can use to maintain a cluster-like relationship. The topics in this section explain how you can manage a group of Security Manager servers as a cluster.

This section contains the following topics:

- [Overview of Security Manager Server Cluster Management, on page 478](#)
- [Exporting the Device Inventory, on page 481](#)
- [Exporting Shared Policies, on page 487](#)
- [Importing Policies or Devices, on page 489](#)

## Overview of Security Manager Server Cluster Management

You can manage a large number of devices with a single Security Manager server. There are, however, a variety of reasons for managing your network with more than one Security Manager server. For example:

- If you have a very large network with thousands of devices to manage, you might find performance to be unacceptable when trying to manage all devices from a single server.
- For geographic reasons, you might find it better to have servers that are closer to managed devices. For example, if you have major sites on different sides of the globe, having separate servers at each major site might simplify management and improve performance. For example, when deploying configurations to managed devices, a Security Manager server located in Bangalore should be able to deploy configurations to a device in Bangalore much faster than a Security Manager server located in San Francisco simply due to the much shorter physical network distance.

- You might want to segment device management based on the technology managed. For example, you might want to use one server to manage your site-to-site VPNs, another server to manage ASA firewall and remote access VPN policies, and a third server to manage IPS.
- Separate IT organizations might be managing different parts of your network. Although you can set up ACS to fine-tune access control to the device level, you might instead find it simpler to have distinct Security Manager servers for each IT organization.

If you decide to install more than one Security Manager server, the main challenges are the following:

- Splitting a single server into two or more servers—You might currently have a single Security Manager server, and decide that you need multiple servers. For information on how to split a Security Manager server into two or more servers, see [Splitting a Security Manager Server, on page 479](#).
- Maintaining the same set of shared policies—If you use multiple servers to manage the same device types, you might want to ensure that the shared policies assigned to the devices are identical. For example, you might want to have the same set of mandatory and default access rules inherited by all ASA devices.

There is no automatic process for maintaining the same set of shared policies among a cluster of servers. Instead, you must manually export them from your main server and import them into the remaining servers. For more information, see [Synchronizing Shared Policies Among Security Manager Servers, on page 480](#).

## Splitting a Security Manager Server

If you decide that you need to convert a single Security Manager server into two or more servers, you can split the server by moving subsets of the devices managed by the original server to the new servers. Keep in mind that you should manage a specific network device from a single Security Manager server, so delete the moved devices from the original server.

---

**Tip** Use the same release of Security Manager software on all servers.

---

### Related Topics

- [Overview of Security Manager Server Cluster Management, on page 478](#)
- [Synchronizing Shared Policies Among Security Manager Servers, on page 480](#)
- [Exporting Shared Policies, on page 487](#)

- 
- Step 1** Install the new Security Manager servers as described in the [Installation Guide for Cisco Security Manager](#). Ensure that the server is functioning correctly, and also ensure that you install licenses with a device count that will be sufficient for the devices you will move to the server. Ensure that you use a professional license if you manage device types that require it. For information on installing licenses, see [Installing Security Manager License Files , on page 492](#).
- Step 2** On the original server, verify that the policies of the devices that you will move will allow access from the IP address of the new server. For example, consider access rules on ASAs and routers, and the Allowed Hosts policy on IPS devices.
- Step 3** On the original server, ensure that all configuration changes for the devices you are moving have been submitted and deployed. You will need to ask the staff to submit and deploy their changes, there is no simple way to determine this status within Security Manager.

This step ensures that there are no pending uncommitted changes. For information on deploying configurations, see the following topics based on workflow mode:

- [Deploying Configurations in Non-Workflow Mode](#) , on page 406
- [Deploying Configurations in Workflow Mode](#) , on page 412

**Step 4** Select **File > Export > Devices** to export the devices with their assigned policies and policy objects from the original Security Manager server. Be sure to select **Export Devices, Policies, and Objects** during the device export so that policy information is included. The file type must be **dev**. For more detailed information, see [Exporting the Device Inventory from the Security Manager Client](#), on page 482.

Create separate export files containing unique devices for each new Security Manager server.

**Tip** At this point, do not make policy changes to the exported devices in the original server, and do not deploy configurations to those devices. If you find that you need to make changes to the devices from the original server before you complete the split, create a new export file.

**Step 5** On each of the new Security Manager servers, select **File > Import** to import the exported information to the new servers. For more detailed information, see [Importing Policies or Devices](#), on page 489.

**Tip** Device groups are not preserved during import. All devices are placed in the All group. You need to manually recreate the desired device group structure and add the devices to the appropriate groups.

**Step 6** Verify that each of the new Security Manager servers can manage the newly-imported devices. For example, you could do a deployment, even for unchanged devices, to ensure that the new server can successfully contact all devices and deploy configurations.

**Tip** As explained in [Importing Policies or Devices](#), on page 489, you must submit policies before the changes are available for configuring devices. Submit policies before doing a deployment.

**Step 7** If you were monitoring any of the moved devices using the original server (that is, with Event Viewer and optionally Report Manager), ensure that you update the relevant policies to have syslog messages sent to the new server and to allow contact from the new server. None of the event or report data from the original server is transferred to the new server.

For information on configuring the devices to enable Security Manager monitoring, see the following topics:

- [Configuring ASA and FWSM Devices for Event Management](#) , on page 2730
- [Configuring IPS Devices for Event Management](#) , on page 2732

**Step 8** On the original Security Manager server, select **File > Delete Devices** to delete the moved devices from the original server. For information on deleting devices, see [Deleting Devices from the Security Manager Inventory](#) , on page 128.

## Synchronizing Shared Policies Among Security Manager Servers

When you have more than one Security Manager server, you can manually synchronize the shared policies among those servers. When you synchronize shared policies, the policy objects that are used by those shared policies are also synchronized.

### Tips

- There is no programmatic way to identify a single Security Manager server as the “primary” server, the one that contains the official version of shared policies. You must decide which server to use as the primary and have the discipline to edit shared policies on that server only.

- Use the same release of Security Manager software on all servers.
- You can also synchronize certain types of policy object among servers even if those objects are not used in shared policies. If you have network/host, service, or port list objects that you want to synchronize, you can use the command described in [Importing and Exporting Policy Objects](#), on page 251.
- When importing shared policies and policy objects, the imported information always replaces any existing shared policies or policy objects of the same name. Therefore, if you allow users to create their own shared policies and objects on a server where you will import policies and objects, it is critical that you develop a policy and object naming standard so that user policies and objects are not accidentally overwritten by newly imported policies and objects.

- [Overview of Security Manager Server Cluster Management](#), on page 478
- [Splitting a Security Manager Server](#), on page 479
- [Exporting the Device Inventory from the Security Manager Client](#), on page 482

---

**Step 1** On the original server, ensure that all configuration changes for the shared policies and policy objects have been submitted. You will need to ask the staff to submit their changes and have them approved, there is no simple way to determine this status within Security Manager.

When exporting shared policies, there is no need to ensure that new changes have been deployed to devices assigned to the policies. Device assignments and deployment status are not part of the exported information.

**Step 2** Select **File > Export > Policies** to export the shared policies and any policy objects used by the policies. The export process creates a file with the extension **pol**.

**Tip** You cannot pick and choose which policies to export. You can select policy types only. All shared policies of a selected type are exported.

For more detailed information, see [Exporting Shared Policies](#), on page 487.

**Step 3** On each of the other Security Manager servers, select **File > Import** to import the exported shared policy information to the servers. For more detailed information, see [Importing Policies or Devices](#), on page 489.

**Tip** Any shared policies or objects that have the same name as imported ones are replaced. The import of a policy or object will fail if a user already has a lock on the policy or object. As explained in [Importing Policies or Devices](#), on page 489, you must submit policies before the changes are available for configuring devices.

**Step 4** If you do not want to import all of the shared policies, delete the ones you did not want to import on the other servers. This is a manual process.

---

## Exporting the Device Inventory

Exporting the device inventory allows you to import the inventory into other network management applications, or to manipulate the output for your own reporting purposes. There are two unrelated methods to export the device inventory:

- Use the **File > Export > Devices** command—Using this command, you can create either a simple comma-separated values (CSV) file, or a compressed **.dev** file that contains the devices along with their

complete configuration policies. The CSV file is in a format suitable for importing into the CiscoWorks Common Services Device Credential Repository (DCR), the Cisco Security Monitoring, Analysis and Response System (CS-MARS), Cisco Prime Security Manager (PRSM), or another Security Manager installation; or you can open it and view it in a spreadsheet or text editor program. The .dev file is suitable for importing into another Security Manager server only. For more information, see [Exporting the Device Inventory from the Security Manager Client, on page 482](#).

- Use the CSMgrDeviceExport Perl script—Using this Perl script, you can export the inventory without starting the Security Manager client. You can direct the output to the screen or to a comma-separated values (CSV) file. For more information, see [Exporting the Device Inventory from the Command Line, on page 486](#).

---

**Note** Only the five most recent versions of each device configuration are exported.

---

## Exporting the Device Inventory from the Security Manager Client

You can export the device inventory in a variety of formats. These are the main choices:

- **Export as CSV** (comma-separated values)—You can create a simple CSV file containing inventory information in one of the following formats: CSM (for use with Cisco Security Manager), Device Credential Repository (DCR, for CiscoWorks Common Services), and CS-MARS seed file (for use with Cisco Security Monitoring, Analysis and Response System). You can open a CSV file in a spreadsheet application or text editor, and use the file with any application that supports the format, including other Security Manager servers. However, this format contains no policy information, so if you use it with another Security Manager server, you must discover policies while adding the devices.
  - For more information about the CSV formats, see [Supported CSV Formats for Inventory Import/Export, on page 485](#).
  - For information on how to import devices from a CSV file, see [Adding Devices from an Inventory File, on page 97](#).
- **Export Devices, Policies, and Objects**—Export the device inventory along with all device properties, policies, and policy objects used by the device. Exported information includes the following:

---

**Note** Importing of \*.pol or \*.dev files is only supported on the same version of Cisco Security Manager as used when exporting those files. You cannot export from one version of Cisco Security Manager and import on a server running a different version.

---

- All local and shared policies assigned to the devices, including all policy objects used in the policies and any device-level overrides for the objects. Shared policy assignments are maintained.
- Device properties and inventory.
- Configuration Archive data for the devices.
- History snapshots for the devices.
- Device certificates.

- IPS device license and certificate information. Applied signatures are not exported (when importing the device, you must have the same signature package registered on the server). IPS update settings are not included; you will have to recreate them after import.
- The VPN topologies in which the devices participate. However, a VPN topology is exported only if all devices that participate in the topology are included in the export. Extranet VPNs are always exported.

Thus, the export file includes the complete policy configuration for the selected devices. The file created has the extension .dev and can be read only by another Security Manager server (the file contents are compressed and uninterpretable, which preserves the security of your policy information).

For information on importing a .dev file into another Security Manager server, see [Importing Policies or Devices, on page 489](#).

### Export Size Limitations

If your Security Manager database contains a large number of devices or a large number of policies or policy objects, you should limit the number of devices you export at one time to prevent errors. The following guidelines can be used to help estimate the number of devices you can successfully export at one time:

Example 1: 1000+ devices in the database with approximately 1500+ policies per device and approximately 25,000 objects in the database:

- Maximum number of devices (devices only) to be exported at one time = 250
- Maximum number of devices (along with policies and objects) to be exported at one time = 100 to 150

Example 2: Fewer than 1000 devices in the database with approximately 1500+ policies per device and approximately 10,000-15,000 objects in the database:

- Maximum number of devices (devices only) to be exported at one time = 250 to 300
- Maximum number of devices (along with policies and objects) to be exported at one time = 200

### Tips

- When you select the **Export Devices, Policies, and Objects** option, you can export to the Security Manager server or to the local Security Manager client. When exporting a CSV file, you can only export to the Security Manager server. You can control the ability to export to or import from the local Security Manager client from **Tools > Security Manager Administration > Customize Desktop**. For more information, see [Customize Desktop Page , on page 518](#).
- Exported devices are not deleted from the inventory. If you intend to manage the devices from a different Security Manager server, delete the devices after successfully importing them into the other server.
- If you select a device that uses an AUS or Configuration Engine to manage its configuration, you should also select the server in the list of devices to export. You cannot export AUS or Configuration Engine information in CS-MARS format.
- You can export unmanaged devices.
- When exporting devices with their policies, only policies and policy objects that have been submitted and approved are included in the export file. Make sure that all desired submissions and approvals have occurred before exporting devices with policies and policy objects.
- No type of export file includes event and report data (that is, data that is available through Event Viewer or Report Manager). Thus, if you are exporting devices with the intention of moving them to another

Security Manager server, the event and report data that was already collected for the device will not be available on the new server.

- No type of export file includes device group information. You will have to manually recreate device groups and assign devices to them after importing devices.
- When selecting security contexts or virtual sensors, be sure to select the host device as well. Also, if a device is part of a VPN, ensure that you select all devices in the VPN when exporting devices, policies, and policy objects.
- When selecting IPS or IOS IPS devices, make sure that you have already applied an IPS signature update to the device. Although you can export an IPS or IOS IPS device with the base sensor package (Sig0), you will not be able to import it. The import error will be “missing Sig0 package.”
- When you select the following types of device that are contained in another device, the hosting device is also automatically exported: any module in a Catalyst 6500/7600, an AIM or NME module in a router. You can separately export ASA devices and their IPS modules.
- You cannot export devices with their policies (.dev format) while an activity or configuration session is being approved. All approvals must be complete before you can export devices with policies. In Workflow mode with an approver, contact the approver and ask that the approval be completed in a timely manner. In non-Workflow mode, or Workflow mode without an approver, wait a few minutes before retrying the export, because approvals happen automatically when changes are submitted.
- While you are exporting devices with their policies (.dev format), policy changes cannot be approved. Once the export file has been created, and the command finishes, users can again approve policy changes. In non-Workflow mode, or Workflow mode without an approver, this means that submissions are not allowed during the export process.
- To export devices, policies, and policy objects, you must have Modify Policy and Modify Object privileges to the policy and object types, and Modify Device privileges. These privileges can be assigned for separate policies, objects, and devices when using ACS for authorization control. Having system administrator, network administrator, or security administrator privileges provide the required privileges.

When exporting devices to CSV, you need Modify Devices privileges only.

### Related Topics

- [Filtering Items in Selectors](#) , on page 47
- [Selecting or Specifying a File or Directory in Security Manager](#) , on page 52
- [Customize Desktop Page](#) , on page 518

- 
- Step 1** In Device view, select **File > Export > Devices** to open the Export Inventory dialog box.
- Step 2** Select either **Export as CSV** or **Export Devices, Policies, and Objects**. These options are described above.
- Step 3** Select the devices that you want to include in the export file and click >> to add them to the Selected Devices list. You can select a folder to select all devices in the folder.

The list from which you choose contains only those devices to which you have Modify Device permissions.

**Note** If your Security Manager database contains a large number of devices or a large number of policies or policy objects, you should limit the number of devices you export at one time to prevent errors. For more information, see **Export Size Limitations** above.

**Step 4** Click **Browse** to select the folder in which to create the export file and to enter a name for the file. For File Type, select the type of file that you want to create; this selection is critical when creating a CSV file, whereas there is a single option when creating a .dev file.

Click **Save** to return to the Export Inventory dialog box. The Export Inventory To field is updated with the export file information.

**Step 5** Click **OK** to create the export file.

A message indicates when the export completes and whether there were errors in the export. When you click **OK**, if there are problems during the export, a dialog box opens listing the messages. If there is a Details button in the dialog box, you can select a message and click **Details** to see the message in a more readable format.

---

## Supported CSV Formats for Inventory Import/Export

When you export devices to a CSV (comma-separated values) file (by selecting **File > Export > Devices** and selecting Export as CSV), or import devices from a CSV file (by selecting **File > New Device** and then selecting Add Device from File in the New Device wizard), you can select one of the following CSV file formats:

- **Device Credential Repository (DCR)**—The device management system for CiscoWorks Common Services. For information on this format, see the description of the sample version 3.0 CSV file in the Common Services documentation at this URL:  
[http://www.cisco.com/en/US/docs/net\\_mgmt/ciscoverks\\_common\\_services\\_software/3.3/user/guide/dcr.html#wp1193611](http://www.cisco.com/en/US/docs/net_mgmt/ciscoverks_common_services_software/3.3/user/guide/dcr.html#wp1193611)
- **CS-MARS seed file**—Cisco Security Monitoring, Analysis and Response System. For information on this format, see the CS-MARS documentation at this URL:  
[http://www.cisco.com/en/US/docs/security/security\\_management/cs-mars/6.0/device/configuration/guide/chDvcOver.html#wp162016](http://www.cisco.com/en/US/docs/security/security_management/cs-mars/6.0/device/configuration/guide/chDvcOver.html#wp162016)
- **Cisco Security Manager**—The Security Manager format, which is the DCR version 3.0 format with additional fields. If you are importing the inventory into another Security Manager server, selecting this format will allow you to import the inventory without discovering policies on the devices.

---

**Note** If the file does not specify `os_type` and `os_version` for a device, you must discover policies directly from the device when adding it.

---

The additional fields, which appear at the end of each row, are:

- `os_type`. The operating system type, which can be one of the following: PIX, ASA, IOS, FWSM, IPS. This field is required for all device types.
- `os_version`. The target operating system version, which can be any of the version numbers listed in the New Device wizard when you select Add New Device. The acceptable version numbers differ depending on the device model, so if you are creating a CSV file by hand, look over this list carefully. For more information about adding devices using this method, see [Adding Devices by Manual Definition](#), on page 92. This field is required for all device types.
- `fw_os_mode`. The mode in which a firewall device is running, which can be one of the following: TRANSPARENT, ROUTER, MIXED. This field is required for ASA, PIX, and FWSM devices.

- `fw_os_context`. The context in which a firewall device is running, which can be one of the following: SINGLE, MULTI. This field is required for ASA, PIX, and FWSM devices.
- `anc_os_type`. The ancillary operating system type for Cisco IOS-IPS devices. If present, it is IPS. This field is required for IOS IPS devices.
- `anc_os_version`. The ancillary target operating system version, which is the IPS target operating system version. If present, it can be any of the supported IOS-IPS versions. This field is required for IOS IPS devices.

You can use these CSV files with any program that supports the file format. You can also create a CSV file yourself and use the file to import inventory into Security Manager.

- [Importing Policies or Devices, on page 489](#)
- [Adding Devices from an Inventory File , on page 97](#)

## Exporting the Device Inventory from the Command Line

Security Manager includes a Perl script that you can use to export the device inventory without starting the Security Manager client. You can use this script to automate various offline reporting tasks that your organization might require. You can pipe the output to a comma-separated values (CSV) file or otherwise capture and manipulate the output.

**Tip** This command does not produce a file that you can use for importing devices or for adding devices “from file.” Although it exports inventory information, making it similar to the integrated export features, the usefulness of the command is limited to reporting purposes for organizations that have unique off-line reporting process requirements.

The Perl command is located in `$NMSROOT\bin`, which is typically `C:\Program Files\CSCSp\bin`. The syntax of the command is:

```
perl [path ]CSMgrDeviceExport.pl -u username [-p password ] [-s {Dhdoirtg}] [-h] [> filename.csv ]
```

### Syntax

|                                               |                                                                                                                                                 |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>perl [path ]CSMgrDeviceExport.pl</code> | The Perl script command. Include the path to the <code>CSMgrDeviceExport.pl</code> file if the path is not defined in the system path variable. |
| <code>-u username</code>                      | A Security Manager username. The data exported is limited by the permissions assigned to this user. The user must have View Device permissions. |
| <code>-p password</code>                      | (Optional.) The user’s password. If you do not include the password on the command, you are prompted for it.                                    |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-s {Dhdoirtg}</b>     | (Optional.) The fields you are selecting to include in the output. If you do not specify the -s option, all fields are included. You can specify one or more of the following: <ul style="list-style-type: none"> <li>• D—Display name.</li> <li>• h—Host name.</li> <li>• d—Domain name.</li> <li>• o—Operating system (OS) type.</li> <li>• I—Image name.</li> <li>• r—Running OS version.</li> <li>• t—Target OS version.</li> <li>• g—Device groups.</li> </ul> |
| <b>-h</b>                | (Optional.) Display the command line help. If you include this option, all other options are ignored.                                                                                                                                                                                                                                                                                                                                                               |
| <b>&gt; filename.csv</b> | (Optional.) Pipe the output to the specified file. If you do not specify a file, the output is displayed on the screen.                                                                                                                                                                                                                                                                                                                                             |

### Output Format

The output is in standard comma-separated values (CSV) format, which you can open in spreadsheet programs or process with your own scripts. The first line has column headings. The columns, left to right, are in the order of the fields described for the -s option above.

If there is no value for a particular field, that field is blank in the output.

The device group output field is enclosed in double-quotes and it can contain more than one group name. The group names include the path structure for the group. For example, the following output indicates the device is part of two groups, the East Coast group in the Department folder, and the NewGroup group in the New folder. Groups are separated by a semicolon.

```
"/Department/East Coast; /New/NewGroup"
```

Any error messages generated during the script are written to the output file.

## Exporting Shared Policies

You can export shared policies and the policy objects that they use so that you can import them into another Security Manager server. This can help you maintain the same policies among a group of servers, as explained in [Synchronizing Shared Policies Among Security Manager Servers, on page 480](#).

**Note** Importing of \*.pol or \*.dev files is only supported on the same version of Cisco Security Manager as used when exporting those files. You cannot export from one version of Cisco Security Manager and import on a server running a different version.

## Tips

- You can export to the Security Manager server or to the local Security Manager client. You can control the ability to export to or import from the local Security Manager client from **Tools > Security Manager Administration > Customize Desktop**. For more information, see [Customize Desktop Page](#) , on page 518.
- Only shared policies and policy objects that have been submitted and approved are included in the export file. Make sure that all desired submissions and approvals have occurred before exporting policies.
- All policy objects referenced by shared policies are also exported. However, if a policy object is not referenced, it is not exported. There is a separate command you can use to export network/host, service, and port list objects directly; for information, see [Importing and Exporting Policy Objects](#) , on page 251.
- You cannot export policies while an activity or configuration session is being approved. All approvals must be complete before you can export policies. In Workflow mode with an approver, contact the approver and ask that the approval be completed in a timely manner. In non-Workflow mode, or Workflow mode without an approver, wait a few minutes before retrying the export, because approvals happen automatically when changes are submitted.
- While you are exporting policies, policy changes cannot be approved. Once the export file has been created, and the command finishes, users can again approve policy changes. In non-Workflow mode, or Workflow mode without an approver, this means that submissions are not allowed during the export process.
- To export policies and their policy objects, you must have Modify Policy and Modify Object privileges to the policy and object types. These privileges can be assigned for separate policies, objects, and devices when using ACS for authorization control. Having system administrator, network administrator, or security administrator privileges provide the required privileges.

---

**Note** Beginning with version 4.21, Cisco Security Manager supports only TACACS+ authentication via Cisco Identity Services Engine (ISE), because ACS has reached its end of life.

---

## Related Topics

- [Overview of Security Manager Server Cluster Management](#), on page 478
- [Splitting a Security Manager Server](#), on page 479
- [Synchronizing Shared Policies Among Security Manager Servers](#), on page 480
- [Exporting the Device Inventory from the Security Manager Client](#), on page 482
- [Selecting or Specifying a File or Directory in Security Manager](#) , on page 52
- [Customize Desktop Page](#) , on page 518

---

**Step 1** In Configuration Manager, select **File > Export > Policies** to open the Export Shared Policies dialog box. Before opening the dialog box, Security Manager evaluates and loads any shared policies that are defined.

**Step 2** Select the shared policies that you want to export, using any of the following methods:

**Tip** You can use multiple methods to select policies. For example, you can select all shared policies modified since a certain date and also select all shared policies of a specific type to export those policies in the same file.

- To select all shared policies that have been modified since a certain date, enter that date in the Modified since field and click **Select >>** next to the Modified since field. You can enter the date in *MMM DD YYYY* format or you can click the Calendar to select the desired date.
- To select all shared policies, select the **All** folder and click **Select >>** under Browse All Shared Policies.
- To select all shared policies of a specific type, select the shared policy type and click **Select >>** under Browse All Shared Policies. You can select a folder to move all types within the folder to the selected list.
- To specify specific shared policies to export, select the type of shared policies you want to export from the Browse All Shared Policies list, select the check boxes next to the shared policies of that type that you want to export, and then click **Select >>** to move them to the Selected Policies list. If you do not select any specific shared policies, all policies of the selected type will be added to the Selected Policies list.

**Note** Only those policy types for which shared policies have been defined are listed.

To remove any policies from the Selected Policies list, select them and then click the << **Remove** button. Use the **Select All** checkbox to specify that all entries in the Selected Policies list are to be removed.

**Step 3** Click **Browse** next to the Export Shared Policies To field to select the folder where the export file is to be created, and enter a name for the file. The file type is pre-selected as .pol; you cannot change the file type.

Click **OK** to save the file name and location.

**Step 4** Click **OK** in the Export Shared Policies dialog box to begin the export. When the export is completed, you are told how many shared policies were exported and if there are warnings or errors, a dialog box opens listing the problems.

You can now import the policies into other Security Manager servers as explained in [Importing Policies or Devices, on page 489](#).

---

## Importing Policies or Devices

You can import a shared policy (.pol) or device inventory plus policies (.dev) file that was exported from another Security Manager server.

---

**Note** Importing of \*.pol or \*.dev files is only supported on the same version of Cisco Security Manager as used when exporting those files. You cannot export from one version of Cisco Security Manager and import on a server running a different version.

---

### Tips

- You can import from the Security Manager server or from the local Security Manager client. You can control the ability to export to or import from the local Security Manager client from **Tools > Security Manager Administration > Customize Desktop**. For more information, see [Customize Desktop Page, on page 518](#).

- When importing devices, the server must have a sufficient Security Manager license to support the number and types of devices that you are importing. Ensure that you install a professional license before importing device types that require it. For information on installing licenses, see [Installing Security Manager License Files](#) , on page 492.
- When importing policies, whether during device or shared policy import, only the policy types selected for management on the Security Manager Administration Policy Management page will be visible. However, all policies are imported. If you select a previously deselected policy type for management, those imported policies appear with their imported configurations. For more information about selective policy management, see [Customizing Policy Management for Routers and Firewall Devices](#) , on page 175.
- When importing shared policies and policy objects, if a policy or object on the server has the same name as an imported one, it is replaced by the imported policy or object. If there are locks on the policy or object, the import for that policy or object will fail. The message will indicate that the failure was due to a locking problem. To avoid problems, ensure that all users have submitted and approved any changes to shared policies or policy objects before doing an import.
- When importing devices, any shared policies and policy objects assigned to the device are also imported, and these policies and objects replace existing policies and objects under the same conditions as used when importing shared policies.
- To import policies and their policy objects, you must have Modify Policy and Modify Object privileges to the policy and object types. When importing devices, you must also have Modify Device privileges. These privileges can be assigned for separate policies, objects, and devices when using ACS for authorization control. Having system administrator, network administrator, or security administrator privileges provide the required privileges.
- You can import a file only if it was exported from a server running the same release of Security Manager.
- You cannot import a device if the device is already in the inventory. Thus, you cannot update device policies from an import file. If you want to re-import a device, first delete it from the inventory.
- When importing devices that use AUS or Configuration Engine servers to manage configuration deployment, the servers must either be included in the import file or already defined in the Security Manager server, but not both. You will get duplicate display name errors if the import file includes an AUS or Configuration Engine already defined in the inventory. You will get an “invalid server selection” error if you try to import a device that has an AUS or Configuration Engine server assigned to it, but the server is not included in the import file or defined in the inventory.
- You can import unmanaged devices.
- When importing IPS devices, the server must have the same signature levels as the imported devices. For example, if you import two IPS devices, one running signature level 481 and the other 530, you must have both 481 and 530 installed on the server. You might need to download signature packages before importing IPS devices as described in [Checking for IPS Updates and Downloading Them](#) , on page 1781.
- This procedure explains how to import .pol or .dev files. If you want to import a device inventory from a CSV file, the procedure is explained in [Adding Devices from an Inventory File](#) , on page 97. The procedures are not similar.

### Related Topics

- [Overview of Security Manager Server Cluster Management](#), on page 478
- [Splitting a Security Manager Server](#), on page 479

- [Synchronizing Shared Policies Among Security Manager Servers, on page 480](#)
- [Selecting or Specifying a File or Directory in Security Manager , on page 52](#)
- [Customize Desktop Page , on page 518](#)

- 
- Step 1** In Configuration Manager, select **File > Import** to open the Import dialog box.
- Step 2** Click **Browse** to select the file. Make sure that you select the desired file type (either .pol or .dev) from the Files of Type list on the Select a File dialog box.
- Click **OK** when you have selected the file.
- Step 3** Click **OK** in the Import dialog box.
- You are warned that imported policies or policy objects will replace same-named policies and objects. If you have the required authorization privileges (system administrator or Modify Admin), you have the option to deselect **Display a warning on all shared policies and imported objects**. When selected, the banner for shared policies and imported objects warns users that shared policies might have been created during import, and that specific objects were in fact created during import. This warning provides notice that if the user changes the policy or object, those changes might be overridden by a subsequent policy import. Select whether you want to display a warning and click **Yes**.
- Tip** If you decide later that you want to change whether the warning is displayed, you can modify the **Display a warning on all shared policies and imported objects** option on the **Tools > Security Manager Administration > Policy Management** page.
- The information is imported and you are informed of the results. If errors occur, nothing is imported and a dialog box opens that explains the errors. The most common errors include duplicate device display names when importing devices, or locks on shared policies or policy objects that have the same name as those being imported.
- To resolve the duplicate display name problem, you must delete the device from the inventory or rename it. You cannot selectively import devices, you must import all or none.
- Note** Not all duplicate device names might be listed. When using AUS or Configuration Engine to manage configuration deployment, imported AUS and Configuration names are evaluated before managed device names. Thus, you might see new duplicate display name errors after fixing the first set of errors.
- To resolve the locking problem, you must ensure that users submit their policy changes and have them approved. When importing devices, you might have to delete the imported devices before retrying the import.
- Tip** When importing devices, it might take some time for the devices to appear in the device list in Device view. Also, device groups are not preserved during import. All devices are placed in the All group. You need to manually recreate the desired device group structure and add the devices to the appropriate groups.
- Step 4** Because policy changes are performed under an activity or configuration session, the imported policies and policy objects are not yet committed to the Security Manager database. You must submit and approve the changes. Based on Workflow mode:
- Non-Workflow mode—Select **File > Submit**.
  - Workflow mode without an approver—Select **Activities > Approve Activity**.
  - Workflow mode with an approver—Select **Activities > Submit Activity**. The activity must be approved before the changes are committed.

If you are not happy with the import, you can discard the activity or configuration session. However, when importing devices, the devices are added outside an activity or configuration session. Therefore, if you discard the activity or configuration session, you discard the device policies and VPN topologies, but the devices remain in the inventory. You should also delete the devices as described in [Deleting Devices from the Security Manager Inventory](#) , on page 128.

---

## Installing Security Manager License Files

The terms of your Security Manager software license determine many things, including the features that are available to you and the number of devices that you can manage. For licensing purposes, the device count includes any physical device, security context, virtual sensor, or Catalyst security services module that uses an IP address. Failover pairs count as one device. For PIX Firewalls, FWSM, and ASA devices that are configured in multiple-context mode (so that they host more than one security context), only the security contexts are counted as devices; the hosting device is not counted as a separate device.

Three license types, Standard, Professional, and Upgrade, are available, in addition to a free 90-day evaluation period that is restricted to 50 devices. For complete information on the types of licenses available and the various supported upgrade paths, as well as information about the Cisco Software Application Support service agreement contracts that you can purchase, see the product bulletin for this version of Security Manager at [http://www.cisco.com/en/US/products/ps6498/prod\\_bulletins\\_list.html](http://www.cisco.com/en/US/products/ps6498/prod_bulletins_list.html). Also, see the [Installation Guide for Cisco Security Manager](#) .

License limits are imposed when you exceed the allotted time (in the case of the evaluation license), or the number of devices that your license allows you to manage. The evaluation license provides the same privileges as the Professional Edition license. It is important that you register Security Manager as soon as you can within the first 90 days, and for the number of devices that you need, to ensure uninterrupted use of the product. Each time you start the application you are reminded of how many days remain on your evaluation license, and you are prompted to upgrade during the evaluation period. At the end of the evaluation period, you are prevented from logging in until you upgrade your license.

For non-evaluation licenses, if the database contains more devices than what is allowed by your configured licenses, you cannot log into the application using the Security Manager client. You are prompted to add a license during login, and login cannot complete until you add an appropriate license.

---

**Tip** The number of devices includes all discovered security contexts and virtual sensors, even if you have not submitted the activity that discovered them and they do not currently appear in the device selector. If it appears there are fewer devices in the inventory than your license allows, but you are getting device count error messages, submit all activities to determine the number of discovered devices. Delete those that you do not want to manage.

---

### Before You Begin

- Obtain the base or upgrade license and any additional licenses that you require. You must have a Cisco.com user ID, and you must register your copy of the software on Cisco.com. When registering, you must provide the Product Authorization Key (PAK) that is attached to the Software License Claim Certificate inside the shipped software package.
  - If you are a registered Cisco.com user, go to <http://www.cisco.com/go/license>.
  - If you are not a registered Cisco.com user, go to <http://tools.cisco.com/RPF/register/register.do> .

After registration, the base software license is sent to the e-mail address that you provided during registration. In addition to receiving a PAK and license for Security Manager, you might receive one additional PAK for each incremental device count pack you purchased.

Copy the license files to a folder on the Security Manager server or your local Security Manager client. If you are copying the license files to your Security Manager server, you must store your license files on a disk that is local to your Security Manager server; you cannot use a drive that is mapped to the server. Windows imposes this limitation, which serves to improve Security Manager performance and security.

---

**Note** To install a license file that is located on your local Security Manager client, you must have client-side file browsing enabled (see [Customize Desktop Page](#) , on page 518).

---

---

**Tip** Do not place the license file in the etc/licenses/CSM folder in the product's installation folder on the Security Manager server, or you will encounter an error when you try to add the license. Place the file in a folder outside the product folders.

---

- Common Services does not require a license file.
  - Auto Update Server does not require a license file.
- 

**Step 1** Select **Tools > Security Manager Administration** and select **Licensing** from the table of contents.

**Step 2** Click **CSM** if the tab is not active. For a description of the fields on this tab, see [CSM Tab, Licensing Page](#) , on page 568.

**Step 3** Click **Install a License** to open the Install a License dialog box.

The Install a License dialog box includes links to Cisco.com for obtaining licenses if you have not already done so. Click **Browse** to select a license file, and then click **OK** on the Install a License dialog box to install the license.

Repeat the process until you have installed all of your licenses.

---

## Certificate Trust Management

Cisco Security Manager downloads ASA images and IPS packages from Cisco.com over HTTPS, which uses certificates for establishing trust. Beginning with version 4.4, Security Manager has a certificate trust management feature. This feature helps you with improved handling of Cisco.com certificates for both types of downloads:

- ASA image downloads. For detailed documentation on certificate trust management for ASA image downloads, refer to [Image Manager Page](#) , on page 550 or navigate to **Tools > Security Manager Administration... > Image Manager > Help**.
- IPS package downloads. For detailed documentation on certificate trust management for IPS package downloads, refer to [Edit Update Server Settings Dialog Box](#) , on page 562 or navigate to **Tools > Security Manager Administration... > IPS Updates > [Update Server group] > Edit Settings > Help**.

## Certificate Trust Management Feature

The certificate trust management feature in Security Manager has these characteristics:

- It behaves like a browser. It imparts trust to what you, as the user, consciously trust.
- It allows you to view the certificate and use your discretion in accepting it.
- It proactively validates a certificate to help you judge whether to accept or reject it. For example, it checks to see if a certificate is self-signed (not issued by a trusted Certificate Authority) and to see if it is expired, not yet valid, or revoked.
- After you accept a certificate, it stores that certificate on your Security Manager server.
- It provides transparency and control: You can retrieve and add a certificate, view a certificate, and remove a stored certificate.
- During communication with Cisco.com, it compares the live server certificate with the stored certificate and proceeds only upon a complete match. The complete certificate chain, not just the root certificate, is compared for a match. If there is a mismatch, the current operation is aborted until you view and accept the new certificate.
- It performs daily checks of your Security Manager server for certificate revocation and validity, and it removes any revoked or invalid certificates from your server. It does this by live contact with the CRL distribution points/URL present in the certificate. The default fixed schedule is for this daily check to be performed at 2:00 a.m.

## Download Requirements

To download images from Cisco.com, you must retrieve, view, and accept both the latest image meta-data locator certificate and the latest certificate URL of the download site. The Security Manager interface has messages to assist you in key locations, and detailed documentation is available by referring to [Image Manager Page](#), on page 550 and [Edit Update Server Settings Dialog Box](#), on page 562.

## Troubleshooting

During daily checks for certificate revocation and validity, the CRL revocation list is not stored on your Security Manager server. For that reason, if connectivity is lost, the daily checks fail to detect any possible certificate revocations. This problem will be solved after connectivity is restored.

If failure occurs while downloading ASA images or checking for IPS update packages, the most probable causes are the following:

- Site's certificate is not found on your Security Manager server
- There is a mismatch between the certificate received from the site and the stored certificate
- The site's certificate has expired

In all of these three cases listed above, the operation is aborted, and a message gives the cause of the error and the URL of the failed site. To recover, navigate to the user interface of the certificate feature (Tools > Security Manager Administration... > Image Manager or Tools > Security Manager Administration... > IPS Updates > [Update Server group] > Edit Settings); then retrieve, view, and accept the new certificate from the site and re-try the download.

If failure occurs while performing a check for IPS updates, verify that you have accepted both the certificate of the Cisco.com site used to obtain the meta-data information for IPS packages and the certificate of the

actual download site of the IPS packages. Cisco recommends that you always configure email for notification of the job execution status. Then you can view the recommended actions in the email for recovering from the error. Copy the failed download URL from the email message to retrieve the certificate.

Because certificates are stored, if you upgrade to Security Manager 4.4 from a previous version, all communication with Cisco.com will fail. To resolve this problem, you must retrieve the certificates from the image meta-data locator and the download site URL.

If the stored certificate table in the user interface does not show the addition of a particular certificate, check to see if the daily checks for certificate revocation and validity have removed it because of revocation or expiration. You can do this by looking for the Certificate Revocation Check Task in the tomcat log; that log will enable you to determine the exact reason for the removal of the stored certificate.

## Working with Audit Reports

When state changes occur in Security Manager, an audit entry is created in the audit log, which you can view by selecting **Manage > Audit Report**. The following topics provide more detailed information about audit reports:

- [Understanding Audit Reports, on page 495](#)
- [Generating the Audit Report, on page 496](#)
- [Purging Audit Log Entries, on page 499](#)

## Understanding Audit Reports

When state changes occur in Security Manager, an audit entry is created in the audit log, which you can view by selecting **Manage > Audit Report**.

The state changes that generate an event and create an audit entry are:

- Changes to the runtime environment:
  - System changes, such as login attempts (successful or failed), logout, and scheduled backups.
  - Authorization issues, such as failed attempts and security breaches.
  - Map changes, such as saving, deleting, and changing background map views.
  - Administrative changes, such as changing workflow modes.
- Changes to the state of Security Manager objects:
  - Activity changes, such as creating, editing, submitting, or approving an activity.
  - Deployment changes, such as creating, editing, or submitting a deployment job.
- Changes to the state of managed devices:
  - Object changes, such as changes to policy objects.
  - Inventory changes, such as adding, deleting, or modifying devices in the inventory.
  - Policy changes, such as creating, restoring, modifying, or deleting policies.

- VPN changes, such as creating, modifying, or deleting a VPN.

When viewing the audit report, you can view subsets of entries by specifying search criteria to select only the desired records.

#### Related Topics

- [Understanding Audit Reports, on page 495](#)
- [Purging Audit Log Entries, on page 499](#)

## Generating the Audit Report

You can view the audit log to analyze the events that have occurred in the Security Manager System. This information can help you track changes that users have made to devices or to identify other system events of interest. The Audit Report window provides extensive search criteria to help you view the specific audit log entries that interest you.

**Tip** You can also view the audit logs through CiscoWorks Common Services. From the Common Services Server Administration page, select **Server > Reports**, and select **Audit Log** from the table of contents. Click **Generate Report** and you are presented with a list of logs, one for each day. Click the link for the desired log to open it. These logs are stored in the Program Files/CSCOPx/MDC/Logs/audit/ directory. For information about logging into Common Services, see [Logging In to the Cisco Security Management Suite Server , on page 12](#).

#### Related Topics

- [Understanding Audit Reports, on page 495](#)

**Step 1** Select **Manage > Audit Report** to open the Audit Report window.

**Step 2** To reduce the report to a specific set of records that relate to an area of interest, enter the appropriate search criteria in the left pane and click **Search**. For detailed information about the search fields, see [Using the Audit Report Window, on page 497](#).

The following examples describe sample search criteria:

- To find out when the device router1 was removed from Security Manager management—Select **Devices > Delete** from the **Search by action** selector. In the **Search by all or part of the object name** field, enter the display name of the device (router1).
- To find out if a failed login attempt occurred in the system—Select **System > Authorization > Login > Failed** from the **Search by action** selector.

**Step 3** To view the contents of an entry in the report, double click the entry. This action opens a dialog box where you can read the message related to the entry. You can scroll through the report in this dialog box by using the up and down arrow buttons.

## Using the Audit Report Window

Use the Audit Report window to view records of state changes in Security Manager.

The Audit Report page contains two panes. Use the left pane to define the parameters for generating the audit report. The right pane displays the audit report using one row for each audit entry or message. The content of the audit report depends on the parameters you defined in the left pane. Therefore, all columns listed in the table might not be displayed in the generated audit report.

### Navigation Path

Select **Manage > Audit Report**.

| Object                                                                                                                                                                                                                                                                                                                                                                                                 | The identifier of the object of the action. For example, if the category is device, then the object identifier could be the device name or IP address. If the category is deployment, then the object identifier could be job name, job ID, and so on. There frequently is no specific object name. |
| User Name                                                                                                                                                                                                                                                                                                                                                                                              | The username of the person performing the action.                                                                                                                                                                                                                                                   |
| Activity                                                                                                                                                                                                                                                                                                                                                                                               | The name of the activity in which the action occurred, if any.                                                                                                                                                                                                                                      |
| # of rows per page                                                                                                                                                                                                                                                                                                                                                                                     | The number of rows to display on each page.                                                                                                                                                                                                                                                         |
| < arrow                                                                                                                                                                                                                                                                                                                                                                                                | Click this button to return to the previous page of the audit report.                                                                                                                                                                                                                               |
| > arrow                                                                                                                                                                                                                                                                                                                                                                                                | Click this button to advance to the next page of the audit report.                                                                                                                                                                                                                                  |

## Purging Audit Log Entries

Security Manager automatically prunes the audit logs based on the age of the log entries. You do not need to actively manage the size of the log. However, you can change the defaults to increase or decrease the maximum size of the log and thus manage the overall size of the database.

To change the default settings for audit logs, select **Tools > Security Manager Administration** and select **Logs** from the table of contents (see [Logs Page , on page 573](#)). The size of the log is controlled by the maximum number of days an entry can be, and the overall maximum number of entries that can be in the log. These settings work together, and entries are pruned on a periodic basis to keep the log to the maximum number of entries with none that are older than the maximum number of days. If you reduce the maximum size of the log, click **Purge Now** to delete the excess entries before the regular pruning cycle.

---

**Note** The Purge Now button only removes audit report entries from the database. It does not remove the \*.csv files from the <install\_dir>\CSCOPx\MDC\log\audit folder. These \*.csv files can be deleted directly.

---

You can also control the size of the log by changing the severity level of events that are captured in the log. For example, if you capture only Severe events, the log will probably remain small. However, reducing the level of information might reduce the value of the log.

## Taking Over Another User's Work

A user with administrative privileges can take over the work of another user in non-Workflow mode. Taking over another user's work is useful when a user is working on devices and policies, causing the devices and policies to be locked, and another user needs access to the same devices and policies.

- 
- Step 1** Select **Tools > Security Manager Administration** and select **Take Over User Session** from the table of contents to open the Take Over User Session page (see [Take Over User Session Page , on page 583](#)).
- Step 2** Select the user session you want to take over.
- Step 3** Click **Take over session**. The changes made by the selected user are transferred to you. Any changes that have not already been committed are discarded.

If the selected user is logged in at the time changes are taken over, the user receives a warning message, loses the changes in progress, and then is logged out.

---

## Changing Passwords for the Admin or Other Users

The admin user is a pre-defined user that has access to all Security Manager functions. When you install the product, you configure a password for the admin user. If you forget the password, you can use the following procedure to change it. You can also use this procedure to reset the password for other user accounts.

---

**Step 1** Log into Windows on the Security Manager server and open a Windows command line window.

**Step 2** Stop the daemon manager services by using this command:

```
net stop crmdmgtd
```

**Tip** You can also stop and start the daemon manager using the Services control panel.

**Step 3** Run ResetPasswd.pl specifying admin as the user name. This example assumes you installed the product in the default directory; change the directory path if you used a different directory:

```
C:\Program Files\CSCOPx\bin\perl ResetPasswd.pl admin
```

You are prompted for a new password.

**Tip** If you want to change the password for a different user, replace **admin** with the desired user name.

**Step 4** Start the daemon manager services by using this command:

```
net start crmdmgtd
```

---

## Backing up and Restoring the Security Manager Database

You should regularly back up the Security Manager database in case you need to recover your work.

---

**Tip** The Security Manager database backup does not include the event data store used by the Event Manager service. If you want to back up event management data, see [Archiving or Backing Up and Restoring the Event Data Store](#), on page 2738.

---

The following topics describe how to back up and recover the Security Manager database:

- [Backing Up the Server Database](#), on page 500
- [Restoring the Server Database](#), on page 502

### Backing Up the Server Database

Security Manager uses CiscoWorks Common Services facilities to back up and restore its database. In the Security Manager client, select **Tools > Backup** to open the CiscoWorks Common Services Backup page for creating a backup schedule. You should regularly back up the database so that you can recover it if necessary.

After completing a backup, Security Manager compresses it. If you configure an e-mail address on the CiscoWorks Common Services backup page, you will get notifications of the completion of the backup and

compression processes. If you have problems with file compression, or if you do not want to compress the backups, you can turn off backup compression. Edit the backup.properties file in the %NMSROOT%\conf folder (typically C:\Program Files\CSCOpX\conf) and change the backup compression property to specify NO instead of YES, as follows: VMS\_FILEBACKUP\_COMPRESS=NO.

---

**Tip** The backup includes the configuration and reporting databases, but it does not include the event storage areas. You can exclude the reporting database by changing the SKIP\_RPT\_DB\_BACKUP property value to YES in the backup.properties file. Even if you specify YES, the backup will include reports generated by report schedules. For information on backing up the event data store, see [Archiving or Backing Up and Restoring the Event Data Store](#), on page 2738.

---

While backing up and restoring data, both Common Services and Security Manager processes will be shut down and restarted. Because Security Manager can take several minutes to fully restart, users might be able to start their client before the restart is complete. If this happens, they might see the message “error loading page” in device policy windows.

We strongly recommend you take a backup of your current system before restoring an older backup.

You cannot restore a backup from an earlier version of Security Manager if that backup contains any pending data, which is data that has not been committed to the database. Before upgrading to a new version of Cisco Security Manager, we recommend that you commit or discard all uncommitted changes and then create a backup of your database. You can use the following instructions to help with committing or discarding pending data:

- **In non-Workflow mode:**

- To commit changes, select **File > Submit**.
- To discard uncommitted changes, select **File > Discard**.

If there are multiple users with pending data, the changes for those users must also be committed or discarded. If you need to commit or discard changes for another user, you can take over that user’s session. To take over a session, select **Tools > Security Manager Administration > Take Over User Session**, select the session, and click **Take Over Session**.

- **In Workflow mode:**

- To commit and approve changes, select **Manage > Activities**. From the Activity Manager window, select an activity and click **Approve**. If you are using an activity approver, click **Submit** and have the approver approve the activity.
- To discard uncommitted changes, select **Manage > Activities**. From the Activity Manager window, select an activity and click **Discard**. Only an activity in the Edit or Edit Open state can be discarded.

You can also back up the database from a Windows command prompt using the following command:

```
[path ]perl [path ]backup.pl backup_directory [log_filename [email=email_address [number_of_generations [compress]]]]
```

**Syntax**

|                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>[path ]perl [path ]backup.pl</code> | The Perl script command. Include the path to the perl command and the backup.pl file if the path is not defined in the system path variable. The typical path for both is C:\Progra~1\CSCOpX\bin\.                                                                                                                                                                                                                                                      |
| <code>backup_directory</code>             | The directory where you want to create the backup. For example, C:\Backups.                                                                                                                                                                                                                                                                                                                                                                             |
| <code>log_filename</code>                 | (Optional.) The log file for messages generated during backup. Include the path if you want it created somewhere other than the current directory. For example, C:\BackupLogs.<br><br>If you do not specify a name, the log is %NMSROOT%\log\dbbackup.log.                                                                                                                                                                                              |
| <code>email=email_address</code>          | (Optional.) The email address where you want notifications sent. If you do not want to specify an email address, but you need to specify a subsequent parameter, enter <b>email</b> without the equal sign or address.<br><br>You must configure SMTP settings in CiscoWorks Common Services to enable notifications. For more information, see <a href="#">Configuring an SMTP Server and Default Addresses for E-Mail Notifications</a> , on page 27. |
| <code>number_of_generations</code>        | (Optional.) The maximum number of backup generations to keep in the backup directory. When the maximum is reached, old backups are deleted. The default is 0, which does not limit the number of generations kept.                                                                                                                                                                                                                                      |
| <code>compress</code>                     | (Optional.) Whether you want the backup file to be compressed. If you do not enter this keyword, the backup is not compressed if VMS_FILEBACKUP_COMPRESS=NO is specified in the backup.properties file. Otherwise, the backup is still compressed. We recommend compressing backups.                                                                                                                                                                    |

**Example**

The following command assumes that you are in the directory containing the perl and backup.pl commands. It creates a compressed backup and log file in the backups directory and sends notifications to admin@domain.com. Note that you must specify a backup generation to include the compress parameter; if you specify any parameter after the log file parameter, you must include values for all preceding parameters.

```
perl backup.pl C:\backups C:\backups\backup.log email=admin@domain.com 0 compress
```

**Tip** If you stop a backup that is in progress, you need to delete the backup.LOCK file in the Security Manager installation directory (typically C:\Progra~1\CSCOpX) before you can perform another backup.

## Restoring the Server Database

You can restore your database by running a script from the command line. You have to shut down and restart CiscoWorks while restoring data. This procedure describes how you can restore the backed up database on your server. A single backup and restore facility exists to back up and restore all applications installed on a CiscoWorks server; you cannot back up or restore individual applications.

If you install the applications on multiple servers, ensure that you recover the database backup that contains data appropriate for the installed applications.

**Tip** You can restore backups taken from previous releases of the application if the backup is from a version supported for direct local inline upgrade to this version of the application. For information on which versions are supported for upgrade, see the [Installation Guide for Cisco Security Manager](#) for this release of the product.

**Step 1** Stop all processes by entering the following at the command line:

```
net stop crmdmgt
```

**Step 2** Restore the database by entering:

```
$NMSROOT\bin\perl $NMSROOT\bin\restorebackup.pl [-t temporary_directory ] [-gen generationNumber ] -d backup_directory [-h]
```

where:

- *\$NMSROOT* —The full pathname of the Common Services installation directory (the default is C:\Program Files\CSCOpX).
- *-t temporary\_directory* —(Optional) This is the directory or folder used by the restore program to store its temporary files. By default this directory is *\$NMSROOT\tempBackupData*.
- *-gen generationNumber* —(Optional.) The backup generation number you want to recover. By default, it is the latest generation. If generations 1 through 5 exist, then 5 will be the latest.
- *-d backup\_directory* —The backup directory that contains the backup to restore.
- *-h*—(Optional) Provides help. When used with *-d BackupDirectory*, help shows the correct syntax along with available suites and generations.

For example, to restore the most recent version from the c:\var\backup directory, enter the following command:

```
C:\Progra~1\CSCOpX\bin\perl C:\Progra~1\CSCOpX\bin\restorebackup.pl -d C:\var\backup
```

**Tip** If you are restoring a database that contains RME data, you might be asked if you want to collect inventory data. Collecting this data can take a long time. You might want to respond No and then configure RME to schedule an inventory. In RME, select **Devices > Inventory**.

**Step 3** Examine the log file, *NMSROOT\log\restorebackup.log*, to verify that the database was restored.

**Step 4** Restart the system by entering:

```
net start crmdmgt
```

**Step 5** If you restore a database that was backed up prior to installing a Security Manager service pack, you must reapply the service pack after restoring the database.

# Generating Data for the Cisco Technical Assistance Center

Cisco Technical Assistance Center (TAC) personnel might ask you to submit a variety of data to help them identify and resolve problems you might encounter when using the application. The following topics can help you generate the required information. However, you should perform these tasks only at the direction of the TAC, because the information is not always required to resolve a problem.

- [Creating Diagnostics Files for the Cisco Technical Assistance Center](#) , on page 504
- [Generating Deployment or Discovery Status Reports](#), on page 506

## Creating Diagnostics Files for the Cisco Technical Assistance Center

Cisco Technical Assistance Center (TAC) personnel may ask you to submit system configuration information in the form of a diagnostics file when you submit a problem report. The diagnostics file assists them with diagnosing the problem. You do not need to submit a diagnostics file unless they ask you to.

Before you create the diagnostics file, perform the actions that lead to the problem in your report. If necessary, you can control the level of detail in the diagnostics file by changing the settings on the Debug Options page (**Tools > Security Manager Administration > Debug Options**); see [Debug Options Page](#) , on page 520.

Beginning with Version 4.7, Cisco Security Manager supports diagnostics in a new, light variant; this "Light Diagnostics" variant collects only basic information; as a result, the diagnostics file is smaller, and its generation is faster. The existing "General Diagnostics" variant is the same in 4.7 as it was in 4.6 and earlier versions.

### General Diagnostics File

The general diagnostics file (CSMDiagnostics.zip) contains the following files and information:

- Configuration files
- Apache configuration and log files
- Tomcat configuration and log files
- Installation, audit, and operation log files
- The CiscoWorks Common Services Registry subtree ([HKEY\_LOCAL\_MACHINE][SOFTWARE][Cisco][MDC])
- Windows System Event and Application Event log files
- Host environment information (operating system version and installed service packs, amount of RAM, disk space on all volumes, computer name, and virtual memory size)

To create CSMDiagnostics.zip by using the GUI, follow this procedure:

1. Using the Security Manager client, select **Tools > Security Manager Diagnostics... > General Diagnostics...**. A dialog box is opened.
2. Click **OK** to start the file generation. The dialog box displays the progress.
3. When the file is generated, click **Close**.

To create CSMDiagnostics.zip by using the CLI, follow this procedure:

1. Open a command line window on the Security Manager server.
2. Run the `~MDC\bin\CSMDiagnostics` program.
3. CSMDiagnostics.zip is placed in the `<installation_location> /MDC/etc` folder, where `<installation_location>` is the drive and directory in which you installed CiscoWorks Common Services. The default value for `<installation_location>` is `C:\Program Files (x86)\CSCOpX`.
4. If you want to, you can specify a different folder where CSMDiagnostics.zip is placed. For example, you can specify `CSMDiagnostics C:\Temp`.
5. You should move or rename CSMDiagnostics.zip after you create it, because it will be overwritten the second time you generate it, with only one previous version (appended with "\_old") being saved.

---

**Note** When creating CSMDiagnostics.zip by using the CLI, you must allow the command to complete before closing the window; if you do not, subsequent attempts to run `CSMDiagnostics` will not work properly. If you mistakenly close the window, delete the `C:\Program Files\CSCOpX\MDC\etc\mdcsupporttemp` folder before attempting to use the command again.

---

### Light Diagnostics File

The light diagnostics file (CSMDiagnostics\_light.zip) contains a subset of the general diagnostics file (CSMDiagnostics.zip), so it is smaller and generated faster.

To create CSMDiagnostics\_light.zip by using the GUI, follow this procedure:

1. Using the Security Manager client, select **Tools > Security Manager Diagnostics... > Light Diagnostics...**. A dialog box is opened.
2. Click **OK** to start the file generation. The dialog box displays the progress.
3. When the file is generated, click **Close**.

To create CSMDiagnostics\_light.zip by using the CLI, follow this procedure:

1. Open a command line window on the Security Manager Server.
2. Run the following command: `<installation_location> \MDC\diagnostics\script>rundiag.bat`, where `<installation_location>` is the drive and directory in which you installed CiscoWorks Common Services. The default value for `<installation_location>` is `C:\Program Files (x86)\CSCOpX`.
3. Be certain that you run the command with the following 3 parameters and in the order shown:
  - 3.1. Installation Folder—Folder where Security Manager server is installed. This must not be changed or modified. An error in the path leads to failure in the generation of the diagnostics file. Example: `C:\PROGRA~2\CSCOpX\MDC`
  - 3.2. Destination Folder—Folder where the diagnostics file will be placed after generation. You can specify any path and folder where you want the file to be saved. If you want the file to be saved in the default path, then you must specify the default path explicitly. If you do not specify the path, there will be an error in generation. Example: `C:\PROGRA~2\Light_Diagnostics`

3.3. "LightDiagnostics" string without a space. The string alphabets are not case-sensitive, so you can use capital or lower-case letters, but you must not use a space in this string. If you neglect to specify this string, part of the general diagnostics (i.e., not light diagnostics) logs will automatically be collected in the destination folder.

1. Complete command screen example:

```
C:\Program Files (x86)\CSCOPx\MDC\diagnostics\script>rundiag.bat C:\PROGRA~2\CSCOPx\MDC
C:\PROGRA~2\Light_Diagnostics LightDiagnostics
```

## Generating Deployment or Discovery Status Reports

You can generate status reports for deployment and policy discovery jobs. If you have problems involving deployment or discovery, these reports can help the Cisco Technical Support (TAC) personnel resolve your problem. Although the reports are mainly intended for troubleshooting, you can also generate these reports for your own uses.

The status reports are generated as Adobe Acrobat (PDF) files on your workstation (you are prompted to select the location to save the PDF file). The report includes a summary of the job and summaries for each device in the job. Deployment status reports also include the full and delta configurations and the transcript of communications between Security Manager and the device.

You can generate deployment or discovery reports in the following ways:

### • Deployment Status Reports

- When a deployment job finishes, either successfully or unsuccessfully, by clicking the **Generate Report** button on the Deployment Status dialog box. See [Deployment Status Details Dialog Box](#), on page 410.
- For previously completed jobs, by selecting the job in the Deployment Manager and clicking the **Generate Report** button. See [Deployment Manager Window](#), on page 393.

### • Discovery Status Reports

- During a discovery job, which might occur when adding devices or when rediscovering policies on devices already in the inventory, by clicking the **Generate Report** button on the Discovery Status dialog box. See [Discovery Status Dialog Box](#), on page 187.
- For previously completed jobs, by selecting the job in the Policy Discovery Status dialog box and clicking the **Generate Report** button. See [Policy Discovery Status Page](#), on page 189.

## Generating a Partial Database Backup for the Cisco Technical Assistance Center

### Caution

This topic explains how to create a partial database backup. Partial backups are incomplete and you cannot use them as a replacement for full backups. Partial backups are strictly for use in troubleshooting and you should generate one only if instructed to do so by Cisco Technical Assistance (TAC) personnel.

Partial database backups have the same characteristics as regular backups, but they contain a more limited set of data. When creating a partial backup, you are asked whether you want to include data from the Configuration Archive, and if you say yes, how many archive versions (per device) you want to include (regular backups include the entire Configuration Archive). For a description of regular backups, see [Backing Up the Server Database, on page 500](#).

**Tip** The partial backup will include or exclude the reporting database based on the settings in the backup.properties file as described in [Backing Up the Server Database, on page 500](#).

While backing up and restoring data, both Common Services and Security Manager processes will be shut down and restarted. Because Security Manager can take several minutes to fully restart, users might be able to start their client before the restart is complete. If this happens, they might see the message “error loading page” in device policy windows. Note that if you try to restore a partial backup, the system will point out that it is a partial backup, and you will have to confirm that you want to restore a partial backup.

To generate a partial backup, use the following command at a Windows command prompt on the Security Manager server.

```
[path]perl [path]partial_backup.pl backup_directory [log_filename] [email=email_address
[number_of_generations] [compress]]]
```

### Syntax

|                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>[path]perl [path]partial_backup.pl</code> | The Perl script command. Include the path to the perl command and the partial_backup.pl file if the path is not defined in the system path variable. The typical path for both is C:\Progra~1\CSCOp\bin\.                                                                                                                                                                                                                                                |
| <code>backup_directory</code>                   | The directory where you want to create the backup. For example, C:\Backups.                                                                                                                                                                                                                                                                                                                                                                              |
| <code>log_filename</code>                       | (Optional.) The log file for messages generated during backup. Include the path if you want it created somewhere other than the current directory. For example, C:\BackupLogs.<br><br>If you do not specify a name, the log is %NMSROOT%\log\dbbackup.log.                                                                                                                                                                                               |
| <code>email=email_address</code>                | (Optional.) The email address where you want notifications sent. If you do not want to specify an email address, but you need to specify a subsequent parameter, enter <b>email</b> without the equal sign or address.<br><br>You must configure SMTP settings in CiscoWorks Common Services to enable notifications. For more information, see <a href="#">Configuring an SMTP Server and Default Addresses for E-Mail Notifications , on page 27</a> . |
| <code>number_of_generations</code>              | (Optional.) The maximum number of backup generations to keep in the backup directory. When the maximum is reached, old backups are deleted. The default is 0, which does not limit the number of generations kept.                                                                                                                                                                                                                                       |
| <code>compress</code>                           | (Optional.) Whether you want the backup file to be compressed. If you do not enter this keyword, the backup is not compressed if VMS_FILEBACKUP_COMPRESS=NO is specified in the backup.properties file. Otherwise, the backup is still compressed. We recommend compressing backups.                                                                                                                                                                     |

### Example

The following command assumes that you are in the directory containing the perl and partial\_backup.pl commands. It creates a compressed partial backup and log file in the backups directory and sends notifications to admin@domain.com. Note that you must specify a backup generation to include the compress parameter; if you specify any parameter after the log file parameter, you must include values for all preceding parameters. Also note that you are asked whether you want to include the Configuration Archive, and if yes, how many archive versions to include in the backup. In this example, five archive versions per device are included in the backup.

```
perl partial_backup.pl C:\backups C:\backups\pbackup.log email=admin@domain.com 0 compress
Root: c:\backups
Do you also want to take config-archive backup(Yes/No): Yes
How many previous config-archive you want to restore: 5
```

## CHAPTER 11

# Configuring Security Manager Administrative Settings

---

Security Manager has default settings for many system functions that you can change if they do not fit the needs of your organization. To view and change these settings, select **Tools > Security Manager Administration**. You can then select items from the table of contents on the left of the window to view the default settings related to that item.

On most pages, when you change a setting, you must click **Save** to save your changes. If you make a mistake, you can click **Reset** to return the values to the previously saved values. You can also click **Restore Defaults** to return the settings to the Security Manager defaults.

Besides the pages that contain system defaults, the Security Manager Administration window includes items that relate to system administration activities, such as taking over another user's work or obtaining access to pages in Common Services to perform server security tasks.

The following topics describe the settings and actions available on each of the pages available in the Security Manager Administration window:

- [API Settings Page](#), on page 510
- [AutoLink Settings Page](#), on page 511
- [ACL Hit Count Settings Page](#), on page 511
- [CCO Settings Page](#), on page 512
- [Configuration Archive Page](#), on page 514
- [CS-MARS Page](#), on page 516
- [CSM Mobile Page](#), on page 518
- [Customize Desktop Page](#), on page 518
- [Debug Options Page](#), on page 520
- [Deployment Page](#), on page 522
- [Device Communication Page](#), on page 530
- [Device Groups Page](#), on page 533
- [Discovery Page](#), on page 534
- [Event Management Page](#), on page 536
- [Health and Performance Monitor Page](#), on page 545
- [Report Manager Page](#), on page 547
- [Identity Settings Page](#), on page 548
- [Image Manager Page](#), on page 550
- [IP Intelligence Settings Page](#), on page 551

- [Eventing Notification Settings Page](#), on page 554
- [IPS Updates Page](#) , on page 557
- [ISE Settings Page](#) , on page 567
- [Licensing Page](#) , on page 568
- [Logs Page](#) , on page 573
- [Policy Management Page](#) , on page 575
- [Policy Objects Page](#) , on page 577
- [Process Monitoring Settings Page](#), on page 578
- [Single Sign-on Configuration Page](#), on page 579
- [Rule Expiration Page](#) , on page 581
- [Server Security Page](#) , on page 582
- [Take Over User Session Page](#) , on page 583
- [Ticket Management Page](#) , on page 584
- [Token Management Page](#) , on page 585
- [VPN Policy Defaults Page](#) , on page 586
- [Workflow Page](#) , on page 588
- [Wall Settings Page](#), on page 590

## API Settings Page

The Security Manager API settings page enables you to enable or disable the API service and change its settings.

### Navigation Path

Click **Tools** > **Security Manager Administration** and select **API** from the table of contents.

### Field Reference

*Table 118: API Settings Page*

| Element                 | Description                                     |
|-------------------------|-------------------------------------------------|
| Enable API Service      | Whether to enable or disable the API service.   |
| Result Set Page Size    | Allowed values are 100 through 1000, inclusive. |
| Active client sessions  | Allowed values are 1 through 10, inclusive.     |
| Save button             | Saves and applies changes.                      |
| Reset button            | Resets changes to the last saved values.        |
| Restore Defaults button | Resets values to Security Manager defaults.     |

## AutoL-ink Settings Page

The Security Manager Map view provides a graphical view of your VPN and layer 3 network topology. Using device nodes to represent managed devices and map objects to represent unmanaged objects such as devices, clouds, and networks, you can create topology maps with which to study your network. AutoLink settings enable you to exclude any one of five private or reserved networks from Map view. For example, you might want to exclude any test networks that are not relevant to the management tasks you are using Security Manager to perform.

### Navigation Path

Click **Tools > Security Manager Administration** and select **AutoLink** from the table of contents.

### Related Topics

- [Creating and Managing Layer 3 Links on the Map](#) , on page 1604
- [Displaying Your Network on the Map](#) , on page 1599

### Field Reference

| Element                                                                                                   | Description                                                                                            |
|-----------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| Enable AutoLink for 10.0.0.0/8<br>Enable AutoLink for 172.16.0.0/12<br>Enable AutoLink for 192.168.0.0/16 | Whether to automatically include or omit (deselected) these private networks from the maps you create. |
| Enable AutoLink for 127.0.0.0/8                                                                           | Whether to automatically include or omit (deselected) the loopback network from the maps you create.   |
| Enable AutoLink for 224.0.0.0/4                                                                           | Whether to automatically include or omit (deselected) the multicast networks from the maps you create. |
| Save button                                                                                               | Saves and applies changes.                                                                             |
| Reset button                                                                                              | Resets changes to the last saved values.                                                               |
| Restore Defaults button                                                                                   | Resets values to Security Manager defaults.                                                            |

## ACL Hit Count Settings Page

The Security Manager ACL Hit Count Settings page enables you to configure and change the settings for Hit Count. This feature is available in Security Manager version 4.9 and later for ASA and ASASM devices.

**Navigation Path**

Click **Tools > Security Manager Administration** and select **ACL Hit Count Settings** from the table of contents.

**Field Reference***Table 120: Hit Count Settings*

| Element                                   | Description                                                                                                                                                                                                   |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hit Count History Persist Limit (per ACE) | The Hit Count History Persist Limit is the limit for the Hit Count history details that can be stored for the particular ACE in the database. The default value is 5 and you can enter a maximum value of 10. |
| Purge Scheduler Process Time              | The Purge Scheduler Process Time is used by the Hit Count Scheduler to schedule the Hit Count purge job at the given time on a daily basis. Select a time from the drop-down list. The default is 12 AM.      |

**Note** When you navigate to the ACL policy page after moving across screens, the **HitCount** and **LastHitTime** values display **0** and **Never**, respectively for all the ACL rules. To get the actual **HitCount** and **LastHitTime** values, click the **Refresh Hit Count** button on the ACL policy page. The values are retrieved from the database and displayed on all the ACL rules.

## CCO Settings Page

Use the CCO Settings page to configure the settings used to connect to Cisco.com.

Also, use the CCO Settings page for certificate trust management. (Security Manager downloads ASA images from Cisco.com over HTTPS, which uses certificates for establishing trust.) The certificate trust management feature on the Image Manager page is new in Security Manager 4.4. It will help you with improved handling of Cisco.com certificates for ASA image downloads:

- You can use it to view a certificate and use discretion in accepting it.
- After you accept a certificate, it is stored on your Security Manager server.
- You can see all your certificates in a summary table on the Image Manager page, and you can use that table to view or remove certificates.

**Tip** Please be sure to refer to "Retrieve Certificate" in the table below.

For detailed documentation of the certificate trust management feature, refer to [Certificate Trust Management, on page 493](#).

**Navigation Path**

Select **Tools > Security Manager Administration** and select **CCO Settings** from the table of contents.

## Field Reference

Table 121: CCO Settings Page

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Use IPS Updates Settings | <p>If checked, the other settings on this page are disabled and the default prevails (the Cisco.com credentials from the IPS Updates page apply).</p> <p><b>Caution</b> If checked, be sure that the Cisco.com credentials from the IPS Updates page are configured correctly. On that page, the default value for "Update From:" is "Local Server." You must choose "Cisco.com" to see certificate settings. Improper or incomplete certificate setting will prevent connectivity to Cisco.com, and all Cisco.com-related operations in this area will fail.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Username                 | The username Security Manager should use to log in to Cisco.com.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Password Confirm         | The password for the username. Enter the password in both fields.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Proxy Server Settings    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Enable Proxy             | Enables Image Manager to connect to Cisco.com via a web proxy server. When Enable Proxy is selected, the other proxy fields (including IP or Hostname, Port, Username, and Password) are enabled and used to connect to the web proxy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Test Connection          | Used to test for connectivity and credentials for Cisco.com.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Certificate              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Contact URL              | <ul style="list-style-type: none"> <li>When selected, "Image Meta-data Locator" is used. This is the URL on Cisco.com that is used to obtain meta-data information about images. Meta-data information consists of the images applicable to a particular product, name, size, checksum, and URL to download for each image.</li> <li>When selected, "Other" is used. You can enter any valid HTTPS URL. This URL is intended primarily for the HTTPS URL to download the image as obtained from the meta-data information about the image. This URL may be different from the URL of the image meta-data locator described in the previous paragraph; the certificate may be different, as well.</li> </ul> <p><b>Caution</b> If you choose "Other," you need to explicitly add "https://dl.cisco.com" [without the quotation marks]: Enter it in the text field adjacent to the "Other" button. Failure to do this will prevent connectivity to Cisco.com, and all Cisco.com-related operations in this area will fail.</p> |

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Retrieve Certificate    | <p>Used to connect to and retrieve the certificate from the selected "Contact URL". After retrieving the certificate it opens the Certificate Verification dialog, which along with a brief summary of the certificate, i.e., who the certificate is issued to, by whom, and the validity period of the certificate, gives you the following choices:</p> <ul style="list-style-type: none"> <li>• <b>View Certificate</b>—Opens the Certificate Viewer, where you can see all the details of the certificate: Certificate Authority, version, serial number, thumbprint, and other details. It shows the complete certificate chain information all the way up to the root issuing certificate Authority.</li> <li>• <b>Accept</b>—Accepts the certificate and adds it to the Cisco Security Manager.</li> <li>• <b>Reject</b>—Rejects the certificate and no action is taken.</li> <li>• <b>Cancel</b>—Closes the Certificate Verification dialog with no action taken.</li> </ul> <p>You must view and accept the following recommended certificates:</p> <ul style="list-style-type: none"> <li>• <a href="https://www.cisco.com">https://www.cisco.com</a></li> <li>• <a href="https://www.dl3.cisco.com">https://www.dl3.cisco.com</a></li> <li>• <a href="https://www.cloudsso.cisco.com">https://www.cloudsso.cisco.com</a></li> <li>• <a href="https://www.api.cisco.com">https://www.api.cisco.com</a></li> <li>• <a href="https://www.download-ssc.cisco.com">https://www.download-ssc.cisco.com</a></li> </ul> <p><b>Note</b> You can download maximum of two files at a time from Cisco. If you attempt to download more than two files, you will receive an error message.</p> |
| Certificates            | A table that displays, for each certificate in your Security Manager installation, Subject, Issued By, and Accepted By.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| View                    | Opens the Certificate Viewer for a certificate selected in the Certificate table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Remove                  | Removes a certificate selected in the Certificate table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|-------------------------|---------------------------------------------|
| Reset button            | Resets changes to the last saved values.    |
| Restore Defaults button | Resets values to Security Manager defaults. |

## CS-MARS Page

Use the CS-MARS page to register the Cisco Security Monitoring, Analysis and Response System servers that are monitoring your devices with Security Manager. By registering your CS-MARS servers, you can view messages and events captured in CS-MARS based on a device's firewall access rules or IPS signature rules configured in Security Manager. You must register a CS-MARS server before users can see events collected from it.

**Tip** If you are using CS-MARS global controllers, add them instead of the individual local controllers. By adding global controllers, Security Manager can identify the correct local controller for a device automatically, without you having to add each of the local controllers. This simplifies your CS-MARS configuration in Security Manager.

### Navigation Path

Select **Tools > Security Manager Administration** and select **CS-MARS** from the table of contents.

## New or Edit CS-MARS Device Dialog Box

Use the New or Edit CS-MARS Device dialog box to register a CS-MARS server with Security Manager. Users can obtain messages or event status for a device's firewall or IPS policies from the CS-MARS server that is monitoring the device. For more information, see [Registering CS-MARS Servers in Security Manager](#), on page 2902.

### Navigation Path

From the [CS-MARS Page](#), on page 516, click the Add button to add a new server, or select a server and click the Edit button.

**Table 124: Add or Edit CS-MARS Device Dialog Box**

| Element                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CS-MARS Hostname/IP               | <p>The IP address or fully-qualified DNS host name of the CS-MARS server.</p> <p><b>Tip</b> If you add a CS-MARS global controller, do not add any of the local controllers that the global controller monitors. Security Manager will automatically determine the local controller that is monitoring a specific device. Adding global controllers simplifies your CS-MARS configuration.</p>                                                                                                            |
| Username<br>Password<br>User Type | <p>The username and password for logging into the server to validate that the CS-MARS server is running the appropriate software version and to obtain other basic information. Security Manager also uses this account to determine which CS-MARS server is monitoring a particular device.</p> <p>For CS-MARS local controllers, you can enter either a global or local user account. For global controllers, you must enter a global account. Identify the type of account in the User Type field.</p> |

| Element                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Certificate Thumbprint<br>Retrieve From Device<br>button | The CS-MARS server certificate, a hexadecimal string that is unique to the device. Click <b>Retrieve From Device</b> to have Security Manager retrieve the certificate from the CS-MARS server.<br><br>If the certificate is retrieved successfully, it is displayed. After verifying the certificate, click <b>Accept</b> to save it on the Security Manager server. You must have a correct certificate to use the CS-MARS server from Security Manager. |

## CSM Mobile Page

Use the CSM Mobile page of the Security Manager Administration window to enable or disable the CSM Mobile feature in Cisco Security Manager. If the CSM Mobile feature is enabled, users can access device health and summary information from mobile devices by navigating to the following link, where <SecManServer> is the DNS name or IP address of the Security Manager server:

`https://<SecManServer> /mobile/`

or

`https://<SecManServer> /mobile`

For more information about the types of information provided, see [Dashboard Overview, on page 2861](#).

For more information about CSM Mobile, see [CSM Mobile, on page 2872](#).

### Navigation Path

Click **Tools > Security Manager Administration** and select **CSM Mobile** from the table of contents.

### Field Reference

| Element                   | Description                                                                                                                                              |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable CSM Mobile Feature | Lets you enable or disable the CSM Mobile feature. If you disable this feature, you cannot access device health summary information from mobile devices. |
| Save button               | Saves and applies changes.<br><br>If you change whether the service is enabled, it stops or starts, as appropriate. You are shown a progress indicator.  |
| Reset button              | Resets changes to the last saved values.                                                                                                                 |

## Customize Desktop Page

Use the Customize Desktop page to control whether Security Manager applications close automatically after being idle for a specified time, to reset whether you are prompted to verify your actions in certain circumstances, and to control whether certain file operations can be performed on the Security Manager client.

### Navigation Path

Select **Tools > Security Manager Administration** and select **Customize Desktop** from the table of contents.

| Enable Global Search            | <p>Whether to enable or disable the Global Search feature. This feature is enabled by default.</p> <p><b>Tip</b> You can disable Global Search before performing bulk discovery or rediscovery of devices to improve performance. You can reenable Global Search and then recreate the index after discovery is complete or when users are least likely to be using the system.</p>                                                                                                                                                                                                                                                                                                                                                                                                |
| Recreate Index                  | Click this button to regenerate the search index. The global search feature is not available while the index is being recreated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Save button                     | Saves and applies changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Reset button                    | Resets changes to the last saved values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Restore Defaults button         | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Debug Options Page

Use the Debug Options page to configure the severity level of messages to include in debugging logs and to determine what other debugging information is collected.

You should change debugging levels only if the Cisco Technical Assistance Center (TAC) asks you to change them. This makes it possible for you to include more detailed information in the CSMDiagnostics.zip file.

After you change the message level for the appropriate subcomponent, redo the actions that are resulting in system problems. After the problems occur, create the CSMDiagnostics.zip file (or the CSMDiagnostics\_light.zip file) by selecting **Tools > Security Manager Diagnostics... > General Diagnostics...** (or **Tools > Security Manager Diagnostics... > Light Diagnostics...**). You can then reset the debug options to the default levels so that the Security Manager server does not become bogged down collecting extra debug information. For more information about generating the CSMDiagnostics.zip file, see [Creating Diagnostics Files for the Cisco Technical Assistance Center](#), on page 504.

**Note** Beginning with 4.28, Cisco Security Manager uses Log4j 2.x instead of Log4j 1.x.

By default, logs contain messages of the Error severity or worse. The severity levels in order of severity are:

- Severe—Problems that make the system unusable.
- Error—Problems from which Security Manager cannot recover.
- Warning—Unexpected conditions from which Security Manager can recover.
- Info—Informational messages.
- Debug—Internal status information.

### Navigation Path

Select **Tools > Security Manager Administration**, then select **Debug Options** from the table of contents.

|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Capture Discovery/Deployment Debugging Snapshots to File | <p>Whether Security Manager generates data files about configuration generation, deployment, and discovery as these functions are performed. The temporary data files are stored in the MDC\temp directory in the Security Manager installation folder on the server, and you can use these files for debugging purposes.</p> <p>Enable this setting if you encounter problems with deployment or discovery.</p> <p><b>Note</b> Selecting this check box slows down Security Manager response time. Enable this option only in limited circumstances.</p> <p>If you need to send these files to Cisco TAC for debugging, encrypt the files, because they can contain sensitive data such as passwords.</p> <p><b>Note</b> Do not delete any snapshot files under MDC\temp directory in the Security Manager installation folder while discovery (or) deployment is in progress. You can delete them when Security Manager is idle. In addition, ensure you are not deleting any of the default files.</p> |

| Element                                    | Description                                                                             |
|--------------------------------------------|-----------------------------------------------------------------------------------------|
| Deployment Debug Level                     | The message severity level for deployment-related actions such as device communication. |
| Event Manager Debug Level                  | The message severity level for the Event Manager subsystem.                             |
| Health and Performance Monitor Debug Level | The message severity level for the Health and Performance Monitor subsystem.            |
| Image Manager Debug Level                  | The message severity level for the Image Manager subsystem.                             |
| Firewall Services Debug Level              | The message severity level for firewall-related policies.                               |
| IOS Platform Debug Level                   | The message severity level for Cisco IOS Software platform policies.                    |
| PIX Platform Debug Level                   | The message severity level for PIX, ASA, and FWSM platform policies.                    |
| Report Manager Debug Level                 | The message severity level for the Report Manager subsystem.                            |
| VPN Services Debug Level                   | The message severity level for VPN services policies.                                   |
| API Debug Level                            | The message severity level for the Application Programming Interface subsystem.         |
| Save button                                | Saves your changes.                                                                     |
| Reset button                               | Restores all fields to their previous values.                                           |
| Restore Defaults button                    | Resets values to Security Manager defaults.                                             |

## Deployment Page

Use the Deployment page to define the default methods by which Security Manager deploys configurations to devices. You can override some of these settings when you create deployment jobs.

### Navigation Path

Select **Tools > Security Manager Administration** and select **Deployment** from the table of contents.

| General Parameters |             |

| Element                                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Snapshot Purge Settings<br>Purge Debugging Files Older Than (days) | <p>The maximum number of days the system should keep debugging files. Debug files are automatically deleted. If you decrease the number of days, you can click <b>Purge Now</b> to immediately delete all debugging files older than the number of days specified.</p> <p><b>Note</b> For purging, Security Manager considers only the debugging files that got created after the <b>Capture Discovery/Deployment Debugging Snapshots to File</b> checkbox in the <b>Debug Options</b> page is enabled.</p>                                                                                                                                                                                                                                                                                                                                                        |
| Default Deployment Method<br>Directory                             | <p>The method to use as the default method for deploying configurations to devices:</p> <ul style="list-style-type: none"> <li>• Device—Deploys the configuration directly to the device or to the transport mechanism specified for the device. For more information, see <a href="#">Deploying Directly to a Device</a> , on page 387.</li> <li>• File—Deploys the configuration file to a directory on the Security Manager server. If you select File, specify the directory to which you want to deploy the configuration file in the Destination column. Even if you select file as the default, the setting does not apply to IPS devices; you can use device deployment only for IPS devices. For more information, see <a href="#">Deploying to a File</a> , on page 389.</li> </ul> <p>You can override this method when you create deployment jobs.</p> |

| Element                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| When Out of Band Changes Detected        | <p>How Security Manager should respond when it detects that changes were made directly on the device CLI since a configuration was last deployed to the device. Out of band change detection works correctly only when deploying to device, not to file, and applies only when the deployment method is configured to obtain the reference configuration from the device (see below for a description of the Reference Configuration setting).</p> <p>This setting specifies the default action, which you can override when you create deployment jobs. You can choose one of the following:</p> <ul style="list-style-type: none"> <li>• <b>Overwrite changes and show warning</b> (default)—If changes were made to the device manually, Security Manager continues with the deployment, overwrites the changes, and displays a warning notifying you of this action.</li> <li>• <b>Cancel deployment</b>—If changes were made to the device manually, Security Manager cancels the deployment and displays a warning notifying you of this action.</li> <li>• <b>Do not check for changes</b>—Security Manager does not check for changes and deploys the changes to the device, overwriting any local modifications.</li> </ul> <p>For a more complete discussion of out-of-band change handling, see <a href="#">Understanding How Out-of-Band Changes are Handled</a>, on page 390.</p> <p><b>Note</b> For devices in which failover is not configured, if you select the Cancel Deployment option when Out of Band changes are detected, the bootstrap configuration may cause deployments to fail. For deployments to be successful, you must configure failover before discovering the device in Security Manager.</p> |
| Deploy to File Reference Configuration   | <p>The configuration that Security Manager uses to compare new policies against the previous configuration for the device, if you are deploying the configuration to a file on the Security Manager server.</p> <ul style="list-style-type: none"> <li>• Archive (default)—The most recently archived configuration.</li> <li>• Device—The current running device configuration, which is obtained from the device.</li> </ul> <p>After comparing the configurations, Security Manager generates the correct CLI for deployment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Optimize the Deployment of Access Rules For<br>(IPv4 and IPv6 access rules.) | <p>How firewall rules are deployed. You can choose one of the following:</p> <ul style="list-style-type: none"> <li>• <b>Speed (default)</b>—Increases deployment speed by sending only the delta (difference) between the new and old ACLs. This is the recommended option. By making use of ACL line numbers, this approach selectively adds, updates, or deletes ACEs at specific positions and avoids resending the entire ACL. Because the ACL being edited is still in use, there is a small chance that some traffic might be handled incorrectly between the time an ACE is removed and the time that it is added to a new position. The ACL line number feature is supported by most Cisco IOS, PIX and ASA versions, and became available in FWSM from FWSM 3.1(1).</li> <li>• <b>Traffic</b>—This approach switches ACLs seamlessly and avoids traffic interruption. However, deployment takes longer and uses more device memory before the temporary ACLs are deleted. First, a temporary copy is made of the ACL that is intended for deployment. This temporary ACL binds to the target interface. Then the old ACL is recreated with its original name but with the content of the new ACL. It also binds to the target interface. At this point, the temporary ACL is deleted.</li> </ul> <p><b>Note</b> For FWSM devices, this option affects processing only if you also select the Let FWSM Decide When to Compile Access Lists option.</p> |
| Firewall Access-List Names<br>(IPv4 and IPv6 access rules.)                  | <p>How ACL names are deployed to devices if the access rule does not have a name in Security Manager.</p> <ul style="list-style-type: none"> <li>• <b>Reuse existing names</b>—Reuse the ACL name that is configured in the reference configuration (which is usually from the device).</li> <li>• <b>Reset to CS-Manager generated names</b>—Reset the name to a Security Manager auto-generated ACL name.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|-----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Enable ACL Sharing for Firewall Rules<br/>(IPv4 and IPv6 access rules.)</p>    | <p>Whether Security Manager should share a single access control list (ACL) for an access rule policy with more than one interface. If you do not select this option, Security Manager creates unique ACLs for every interface to which you apply an IPv4 or IPv6 access rule policy. The sharing of ACLs is done only for ACLs created by access rule policies.</p> <p>If you select this option, Security Manager evaluates the access rules policy for each interface and deploys the minimum number required to implement your policy while preserving your ACL naming requirements. For example, if you use an interface role to assign the same rules to four interfaces, you specify <b>Reset to CS-Manager generated names</b> for the Firewall Access-List Names property, and you do not specify ACL names for the interfaces in the access control settings policy, only a single ACL is deployed, and each interface uses that ACL.</p> <p>If you select this option, keep the following in mind:</p> <ul style="list-style-type: none"> <li>• An interface might use an ACL that is named for a different interface.</li> <li>• If you specify a name for the ACL in the access control settings policy, an ACL by that name is created even if it is otherwise identical to one used by another interface. Names specified in this policy have precedence over any other settings.</li> <li>• If you select <b>Reuse existing names</b> for the Firewall Access-List Names property, the existing names are preserved (unless you override them in the access control settings policy). This means that you might end up with duplicate ACLs under different names if duplicate ACLs already exist on the device.</li> <li>• Hit count statistics are based on ACL, not on interface, so a shared ACL provides statistics that are combined from all interfaces that share the ACL.</li> <li>• Sharing ACLs is primarily beneficial for memory-constrained devices such as the FWSM.</li> </ul> |
| <p>Let FWSM Decide When to Compile Access Lists<br/>(IPv4 access rules only.)</p> | <p>Whether to have the Firewall Services Module (FWSM) automatically determine when to compile access lists. Selecting this option might increase deployment speed but traffic might be disrupted and the system might become incapable of reporting ACL compilation error messages. If you select this option, you can use the Optimize the Deployment of Access Rules For Traffic setting to mitigate potential traffic disruptions.</p> <p>When deselected, Security Manager controls ACL compilation to avoid traffic interruption and to minimize peak memory usage on the device.</p> <p><b>Caution</b> You should not select this option unless you are experiencing deployment problems and you are an advanced user.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Remove Unreferenced Object Groups from Device (PIX, ASA, FWSM, IOS 12.4(20)T+)<br>(IPv4 and IPv6 objects.) | <p>Whether Security Manager should remove object groups that are not being used by other CLI commands managed by Security Manager from devices during deployment. Object groups include network/host, service, and identity user groups.</p> <p><b>Note</b> After enabling this option, Security Manager will remove objects during deployment that are not used in any policies managed or discovered by Security Manager. If any policy that is NOT discovered or managed by Security Manager is using such an object, Security Manager will still attempt to delete that object during deployment. In such cases, deployment will fail with a transcript error indicating that it was unable to delete the object.</p> <p><b>Tip</b> Network/host objects that include object NAT configurations on ASA 8.3+ devices are never considered unreferenced.</p>                                                                                                                                                                                                                                                                      |

|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Create Object Groups for Policy Objects (PIX, ASA, FWSM, IOS 12.4(20)T+)</p> <p>Create Object Groups for Multiple Sources, Destinations or Services in a Rule (PIX, ASA, FWSM, IOS 12.4(20)T+)</p> <p>Optimize Network Object Groups During Deployment (PIX, ASA, FWSM, IOS 12.4(20)T+) (IPv4 and IPv6 objects.)</p> | <p>Whether Security Manager should create object groups, such as network objects, service group objects, and identity user group objects, to replace comma-separated values in a rule table cell for the indicated devices. When deselected, Security Manager flattens the object groups to display the IP addresses, sources and destinations, users, ports, and protocols for these devices.</p> <p><b>Tip</b> These options do not apply to host, network, or address range network/host objects, or to service objects (as opposed to service group objects), which are always created as objects. Multiple FQDN network objects can be grouped into a single network object.</p> <p>If you select this option, you can also select these options:</p> <ul style="list-style-type: none"> <li>• Create Object Groups for Multiple Sources, Destinations or Services in a Rule—Whether to automatically create network objects, service objects, and identity user group objects to replace comma-separated values in a rule table cell that resulted when multiple rules were combined. The objects are created during deployment and are in the format of ‘CSM_INLINE...’ for example, ‘CSM_INLINE_src_rule_8589960758’. For more information, see <a href="#">Combining Rules</a> , on page 618.</li> </ul> <p><b>Important</b> If you enable <b>Create Object Groups for Multiple Sources, Destinations or Services in a Rule</b>, then the hit count process will get impacted for those ACLs and fails to populate the data. This is because of CSM generated object-groups and ACL hash mismatch between the device and CSM.</p> <ul style="list-style-type: none"> <li>• Optimize Network Object Groups During Deployment—Whether to optimize network object groups by making them more succinct. For more information on optimizing policy objects, see <a href="#">Optimizing Network Object Groups When Deploying Firewall Rules</a> , on page 632.</li> </ul> |

## Device Communication Page

Use the Device Communication page to define default settings for communicating with devices. These settings mainly affect device inventory and policy discovery and configuration deployment. You can override the transport settings for individual devices in the device properties for the device.

If you change the transport protocol settings, ensure that your devices are appropriately configured to accept those types of connections.

### Navigation Path

Select **Tools > Security Manager Administration** and select **Device Communication** from the table of contents.

| Device Connection Timeout                       | The number of seconds that Security Manager has to establish a connection with a device before timing out.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Retry Count                                     | The number of times that Security Manager should try to establish a connection to a device before concluding that the connection cannot be completed. The default value is 3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Socket Read Timeout                             | For SSH and Telnet sessions, the maximum number of seconds Security Manager can wait for incoming data before concluding that the connection is lost.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Transport Protocol (IPS)                        | The default transport protocol for IPS sensors and routers that include the IPS feature. The default is HTTPS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Transport Protocol (IOS Routers 12.3 and above) | The default transport protocol for routers that run Cisco IOS software release 12.3 and above. The default is HTTPS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Transport Protocol (Catalyst Switch/7600)       | The default transport protocol for Catalyst 6500/7600 devices and all other Catalyst switches, regardless of the Cisco IOS software version running on the devices. The default is SSH.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Transport Protocol (IOS Routers 12.2, 12.1)     | The default transport protocol for routers that run Cisco IOS software releases 12.1 and 12.2. The default is Telnet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Connect to Device Using                         | <p>The type of credentials Security Manager should use when accessing devices. For more information, see <a href="#">Understanding Device Credentials</a>, on page 73.</p> <ul style="list-style-type: none"> <li>• <b>Security Manager User Login Credentials</b>—Security Manager contacts the device using the credentials that you entered while logging in to Security Manager. The same set of credentials are used for all devices regardless of the credentials configured for each device on the Device Credentials page.</li> <li>• <b>Security Manager Device Credentials</b>—Security Manager contacts the device using the credentials specified in the Device Properties Credentials page. This is the default.</li> </ul> <p><b>Caution</b> You must use Security Manager Device Credentials, not Security Manager User Login Credentials, if a connection to an IPS sensor is involved. When Security Manager contacts an IPS sensor, it must use device credentials whether or not someone is logged in to Security Manager.</p> |
| SSL Certificate Parameters                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Element                                                                                                                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Device Authentication Certificates (IPS)<br>Device Authentication Certificates (Router)<br>PIX/ ASA/ FWSM Device Authentication Certificates<br>Add Certificate button | <p>How to handle device authentication certificates for SSL (HTTPS) communications. You can configure different behaviors for different types of devices, but the settings have the same meaning:</p> <ul style="list-style-type: none"> <li>• <b>Retrieve while adding devices</b>—Security Manager automatically obtains certificates from the devices while you add devices from the network or from an export file.</li> <li>• <b>Manually add certificates</b>—Security Manager does not automatically accept certificates from the device. Click <b>Add Certificate</b> to open the Add Certificate dialog box (see <a href="#">Add Certificate Dialog Box</a>, on page 533) where you can manually add the thumbprint before you try to add the device from the network or from an export file. You can also add certificates for devices that you create manually from the Device Properties Credentials page to be successful. For more information, see <a href="#">Manually Adding SSL Certificates for Devices that Use HTTPS Communications</a>, on page 459.</li> <li>• <b>Do not use certificate authentication</b>—Security Manager ignores device authentication certificates. This option leaves your system vulnerable to third-party interference with device validation. We recommend that you do not use this option.</li> </ul> |
| Accept Device SSL Certificate after Rollback                                                                                                                           | <p>For devices that use SSL, whether to obtain the certificate installed on an IPS device, firewall device, FWSM, ASA, or Cisco IOS router from the device when you roll back the configuration on the device.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| HTTPS Port Number                                                                                                                                                      | <p>The default port number that the device uses for secure communication with Security Manager (as well as other management applications that use these protocols). This value overrides the HTTPS port number that you configure in the HTTP policy for a device.</p> <p><b>Note</b> If you configure the local HTTP policy to be a shared policy and assign the HTTP policy to multiple devices, the HTTPS port number setting in the shared policy overrides the port number configured in the Device Properties Credentials page for all devices to which the policy is assigned.</p> <p>In addition to providing access to the device through the Cisco web browser user interface, the HTTPS port number is used by device management applications (such as the Cisco Router and Security Device Manager (SDM)) and monitoring tools to communicate with the device.</p> <p><b>Note</b> The security appliance can support both SSL VPN connections and HTTPS connections for device manager administrative sessions simultaneously on the same interface. Both HTTPS and SSL VPN use port 443 by default. Therefore, to enable both HTTPS and SSL VPN on the same interface, you must specify a different port number for either HTTPS or WebVPN. An alternative is to configure SSL VPN and HTTPS on different interfaces.</p>                 |

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Overwrite SSH Keys      | Whether Security Manager can overwrite the SSH key for a device when it changes on the device. For SSH connections, a correct key is required for successful communication.<br><br>Deselect this check box with caution, and only if you require a greater level of security. Security Manager does not communicate with the device if keys are changed on the device. |
| Save button             | Saves and applies changes.                                                                                                                                                                                                                                                                                                                                             |
| Reset button            | Resets changes to the last saved values.                                                                                                                                                                                                                                                                                                                               |
| Restore Defaults button | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                                                                            |

## Add Certificate Dialog Box

Use the Add Certificate dialog box to add device certificates manually for devices that use the SSL transport protocol (firewall devices, FWSMs, ASAs, IPS devices, and Cisco IOS devices). Adding the device certificates manually gives you the highest level of security because then an intruder is prevented from introducing a fraudulent certificate thumbprint. Device certificates are stored in the database to be used for device authentication.

For more information about manually adding SSL certificates, see [Manually Adding SSL Certificates for Devices that Use HTTPS Communications](#), on page 459.

### Navigation Path

Select **Tools > Security Manager Administration**, select **Device Communication** from the table of content, and click **Add Certificate**.

### Field Reference

*Table 130: Add Certificate Dialog Box*

| Element                 | Description                                                                                       |
|-------------------------|---------------------------------------------------------------------------------------------------|
| Host Name or IP Address | The hostname or IP address of the device for which you are adding the certificate.                |
| Certificate Thumbprint  | The certificate thumbprint, which is a string of hexadecimal digits that is unique to the device. |

## Device Groups Page

Use the Device Groups page to manage the device groups and group types defined in the device inventory.

### Navigation Path

Select **Tools > Security Manager Administration**, then select **Device Groups** from the table of contents.

Table 132: Discovery Page

| Element                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Prepend Device Name when Generating Security Context Names | <p>Whether the name of the device that contains the security context should be added to the front of the security context's name. For example, if a security context is named admin, and it is contained in the device with the display name 10.100.15.16, the name that will appear in the Device selector is 10.100.15.16_admin.</p> <p>If you do not prepend the device name, the security context name appears in the inventory by itself. Because Security Manager does not place security contexts in a folder related to the parent device, the only way to easily see contexts that are related to a device is to prepend the device name.</p> <p>If you do not prepend device names, Security Manager adds a numbered suffix to distinguish identically named devices. For example, if the admin context exists in more than one firewall, you will see admin_01, admin_02, and so on, in the Device selector.</p> |
| Purge Discovery Tasks Older Than                           | The number of days to save discovery and device-import tasks. Tasks older than the number of days you enter are deleted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Maximum Number of Multi context ASA per domain             | <p>The number of contexts you can add for a domain. In multi-context ASA, you can create contexts per domain with the same name. The default value is 20 and you can enter any value above 20 as required.</p> <p><b>Note</b> Context name is case-insensitive. For example, context name created with Test, test, and TEST will be considered as same context name.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Reuse Policy Objects for Inline Values                     | <p>Whether to substitute any named policy objects, such as network/host or identity user group objects already defined in Security Manager, for inline values in the CLI. For more information on policy objects, see <a href="#">Managing Policy Objects, on page 227</a>.</p> <p><b>Tip</b> Although this option generally applies to network/host objects, it does not apply to FQDN network/host objects because you cannot specify a fully-qualified domain name (FQDN) as an inline value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Element                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Allow Device Override for Discovered Policy Objects | <p>For the types of objects for which overrides are possible, whether to allow users to override the parent object values at the device level for policy objects that are discovered. For example, if you select this option, if you run policy discovery on a device that has an ACL with the same name as an ACL policy object in Security Manager, the name of the discovered policy object is reused, but a device-level override is created for the object. If you deselect this option, a new policy object is created with a number appended to the name.</p> <p><b>Tip</b> For objects that have subtypes, such as network/host and service, overrides are limited to within a type. For example, an override can be created for a network/host group when discovering a same-named network/host group, but no override would be created when discovering a same-named network/host address range. Instead, the newly-discovered object will have a number appended to the name.</p> <p>For more information, see <a href="#">Understanding Policy Object Overrides for Individual Devices</a>, on page 244.</p> |
| On Error, Rollback Discovery for Entire Device      | <p>Whether Security Manager should roll back all discovered policies if even one error is encountered for a single policy during policy discovery. When deselected, Security Manager keeps the policies successfully discovered and discards only those policies with errors. For more information on policy discovery, see <a href="#">Discovering Policies</a>, on page 176.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Auto-Expand Object Groups with Prefixes             | <p>Expands object groups, such as network or identity user group, with the listed prefixes during the device import process. Separate the prefixes with a comma. This expansion causes the elements of the object group to display as separate items in the discovered policies. For more information, see <a href="#">Expanding Object Groups During Discovery</a>, on page 635.</p> <p><b>Tip</b> This option does not apply to policy objects created from the <b>object network</b> or <b>object service</b> commands from ASA 8.3+ devices. These commands create host, FQDN, network, or address range network/host objects or service objects.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Save button                                         | Saves your changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Reset button                                        | Resets changes to the previously applied values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Restore Defaults button                             | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Event Management Page

Use the Event Management page to enable event management, which allows you to view ASA, FWSM, and IPS events using the Event Viewer. You can also configure settings required for event collection.

The Event Manager service is also required by the Report Manager application, which allows you to view reports that aggregate information collected by the service.

**Tip** If you get a message that Event Viewer is unavailable when you select **Launch > Event Viewer**, but the **Enable Event Management** option is selected on this page, try restarting the Event Manager Service. First, deselect the Enable option and click Save. Wait for the service to stop. Then, select the Enable option, click Save, and wait for the service to finish restarting. You can then try opening Event Viewer again.

### Navigation Path

Click **Tools > Security Manager Administration** and select **Event Management** from the table of contents.

| Element                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Event Management Options   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Enable Event Management    | <p>Whether to enable the Event Manager service, which allows Security Manager to collect event information. If you disable this feature, you cannot use the Event Viewer or Report Manager applications.</p> <p><b>Tip</b> If you change this setting and click <b>Save</b>, you are prompted to confirm that you want to start or stop the Event Manager Service. If you click <b>Yes</b>, the service is started or stopped immediately, and you are shown a progress indicator and told when the change is completed. Wait until the status change is completed before continuing.</p>                                                                                                                    |
| Event Data Store Location  | <p>The directory to use for collecting event information. This is known as the primary event store. Click <b>Browse</b> to select a directory on the Security Manager server.</p> <p>If the directory does not yet exist, create it in Windows Explorer. You cannot create the directory from within Security Manager.</p> <p><b>Tip</b> If you change the location after you have started using the Event Manager service, you cannot query old events.</p>                                                                                                                                                                                                                                                 |
| Event Data Store Disk Size | <p>The amount of disk space you want to allocate for storing event data, in gigabytes (GB). Events are incrementally deleted (rotated out) from the extended store when it becomes 90% full. Before changing this setting, consider the following:</p> <ul style="list-style-type: none"> <li>• If you reduce the size below the amount of disk space already used by event data, the oldest events are deleted until your new size limit is reached.</li> <li>• You can see a visual representation of the amount of space currently used for event data. Open the Event Viewer (<b>Launch &gt; Event Viewer</b>), then from Event Viewer, select <b>Views &gt; Show Event Store Disk Usage</b>.</li> </ul> |

| Element                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Event Syslog Capture Port          | <p>The port on which you want to enable syslog event capture. The default is 514.</p> <p>You must ensure that the Security Manager server, and intervening firewalls, allow incoming traffic on this port for Security Manager to collect the events. Managed devices must be configured to send syslog information to this port on the Security Manager server.</p> <p><b>Tip</b> If you change this port, you must also change the Syslog Servers policies for all ASA and FWSM devices and security contexts that send events to Security Manager. For more information, see <a href="#">Syslog Servers Page</a> , on page 2065.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Event Data Pagination Size         | <p>The maximum number of events per page each query response can contain. The default is 20000, but you can select a different size from the list of supported values.</p> <p><b>Note</b> In Security Manager 4.10, the maximum number of events per page has been increased to 100000.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Extended Store Management Options  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Auto Copy Events to Extended Store | <p>Whether you want to define an extended storage location for event storage. Events are copied from the regular event storage location to the extended location so that they remain available for use. When you query for historical events in Event Viewer, events in the extended storage location are automatically retrieved if they are needed.</p> <p><b>Tip</b> You are prompted to verify that you want to start the extended service and to make changes to the extended storage location.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Extended Data Store Location       | <p>The location of the extended data store for events. This location can be on directly-attached storage that appears as a drive on the server and that uses DAS protocols. For example, SAN storage attached through fiber channel. CIFS storage is not supported. Click <b>Browse</b> to select the desired drive and directory.</p> <p><b>Tips</b></p> <ul style="list-style-type: none"> <li>• When you select an extended storage location and save your changes, Security Manager checks that it can be accessed and that it has write permissions. The primary storage location is used as a reference, and any data that exists in the primary storage location that does not exist in the extended storage location is copied to the extended storage location. Any data that already exists in the extended storage location is not evaluated and is left untouched, although it can be deleted later to make room for new data.</li> <li>• If you change the extended data store location, you cannot query events that exist only in the previous extended data store location (that is, you cannot query events that have already be removed from the primary location). If you want to preserve these events, copy the data from the old location to the new location.</li> </ul> |

| Element                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Extended Data Store Disk Size                | <p>The amount of space you want to allocate to the extended event storage location, in gigabytes (GB). Events are incrementally deleted (rotated out) from the extended store when it becomes 90% full. The size must be equal to or larger than the primary event data storage location.</p> <p>You can see a visual representation of the amount of space currently used for event data. Open the Event Viewer (<b>Launch &gt; Event Viewer</b>), then from Event Viewer, select <b>Views &gt; Show Event Store Disk Usage</b>.</p>                                                                                                                                                                                                                                                                      |
| Error Notification Email IDs                 | <p>The email addresses that should receive notifications if problems arise with the use of the extended storage location. Separate multiple addresses with commas. For notifications to be sent successfully, you must also configure an SMTP server as described in <a href="#">Configuring an SMTP Server and Default Addresses for E-Mail Notifications</a>, on page 27.</p> <p>The message indicates the problem, cause, and recommended action. For example, you get notifications if the extended storage is chronically unreachable, if data copy fails repeatedly, or if a partition was deleted from the primary storage area before it could be copied to the extended storage area (which might happen if the storage is chronically unreachable or if there are persistent copy problems).</p> |
| Syslogs for Failover Devices                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Process Syslogs from Failover Standby Device | <p>Enables or disables processing of syslog messages from the standby ASA. When enabled, syslog messages generated by the standby or failover ASA will be displayed in the Device Identifier column in the Event Monitoring window.</p> <p><b>Note</b> By default, the processing of syslog messages from the standby ASA is disabled.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Syslog Relay Service                         | <p><b>Note</b> Starting with version 4.13, Cisco Security Manager supports syslogs over IPv6 in Event Viewer but the Syslog Relay Service will not be supported for syslogs over IPv6.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Enable Syslog Relay Service                  | Enables or disables the Syslog Relay Service. Select the Enable Syslog Relay Service check box to enable the fields required for configuring the Syslog Relay Service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Syslog Relay Capture Port       | <p>Specifies the UDP port on which the Syslog Relay Service listens for syslogs. The default is 514.</p> <p>If the Syslog Relay Service is enabled, devices must send syslogs to the Syslog Relay Capture Port so that they can be forwarded to the local collector and remote collectors. If the Syslog Relay Service is turned off, devices should send syslogs to the Event Syslog Capture Port.</p> <p><b>Note</b> The Syslog Relay Capture Port and the Event Syslog Capture Port cannot be the same. When enabling the Syslog Relay Service, if devices are currently configured to send syslogs to the Event Syslog Capture Port, you should instead use that port number for the Syslog Relay Capture Port and then change the Event Syslog Capture Port to something else.</p> <p>You must ensure that the Security Manager server, and intervening firewalls, allow incoming traffic on this port for Security Manager to collect the events. Managed devices must be configured to send syslog information to this port on the Security Manager server.</p> <p><b>Tip</b> If you change this port, you must also change the Syslog Servers policies for all ASA and FWSM devices and security contexts that send events to Security Manager. For more information, see <a href="#">Syslog Servers Page</a> , on page 2065.</p> |
| Relay to Local Event Collector  | Enables or disables syslog relay for the local event collector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Relay to Remote Collector 1     | Enables or disables syslog relay for Remote Collector 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Collector 1 IP address          | Specifies the IP address to which syslogs should be sent for Remote Collector 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Collector 1 Syslog Capture Port | Specifies the UDP port on which Remote Collector 1 is listening for relayed syslogs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Relay to Remote Collector 2     | Enables or disables syslog relay for Remote Collector 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Collector 2 IP address          | Specifies the IP address to which syslogs should be sent for Remote Collector 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Collector 2 Syslog Capture Port | Specifies the UDP port on which Remote Collector 2 is listening for relayed syslogs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Device Filter           | <p>You can filter the devices for which syslogs should be relayed for a specific collector. Using this feature, you can configure syslogs for one set of devices to go to one collector and syslogs for a different set of devices to go to another collector:</p> <ol style="list-style-type: none"> <li>1. Select the tab (Local Collector, Remote Collector 1, or Remote Collector 2) for which you want to filter devices.</li> <li>2. To specify the devices for which you want relay syslogs for this collector, select <b>Permit Relay</b>. If instead you want to specify the devices for which you want to disable syslog relay for this collector, clear the <b>Permit Relay</b> check box. If the Permit Relay check box is <b>not</b> selected, then syslogs for the devices you add to the filter will not be relayed; however, syslogs for all other devices will be relayed. <ul style="list-style-type: none"> <li><b>Note</b> For each enabled collector, syslog relays from all devices are enabled by default.</li> <li><b>Note</b> When adding a cluster to the filter list, the IP addresses for the cluster management pool will be included as part of filter configuration.</li> </ul> </li> <li>3. Select the devices or device groups from the Available Devices list that you want to add to the filter and click &gt;&gt; to move them to the Selected Devices list. For more information on selecting devices, see <a href="#">Using Selectors</a> , on page 46.</li> <li>4. To add a device that is not managed in Security Manager, enter the IP address of the device in the Add Special Device field and then click the bottom &gt;&gt; to move the device to the Selected Devices list.</li> </ol> |
| Restart                 | Restarts the Syslog Relay Service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| CPU Throttle Settings   | Opens the CPU Throttling Policy dialog box in which you can control the CPU load used by the syslog relay service. For more information, see <a href="#">CPU Throttling Policy Dialog Box</a> , on page 543.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| View Statistics         | Opens the Syslog Relay Statistics dialog box in which you can see the average CPU and memory usage of the syslog relay service process as well as traffic rates for the different collectors. For more information, see <a href="#">Syslog Relay Statistics Dialog Box</a> , on page 544.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Save button             | <p>Saves and applies changes.</p> <p>Most changes related to the Event Viewer settings require that the Event Manager service briefly stop and then restart. If you change whether the service is enabled, it stops or starts, as appropriate. You are shown a progress indicator.</p> <p>Changes to Syslog Relay Service settings require that the Syslog Relay Service briefly stop and then restart. If you change whether the service is enabled, it stops or starts, as appropriate.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Reset button            | Resets changes to the last saved values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Restore Defaults button | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Troubleshooting Syslog Relay Servers

If the Syslog Relay Service is enabled, devices must send syslogs to the Syslog Relay Capture Port so that they can be forwarded to the local collector and remote collectors. If the Syslog Relay Service is turned off, devices should send syslogs to the Event Syslog Capture Port.

Syslog Relay Servers act as an intermediate connection between device events and Security Manager Event Manager application. It receives device event packets and forwards them to the Local Collectors and Remote Collectors.

### Device Management via IP

To manage devices in Security Manager via IP (using IPv4 or IPv6), the Device Management interface must have the appropriate IP information.

For example, see the following sample configuration.

```
!
interface Management1/1
management-only
nameif management
security-level 100
ip address 10.197.87.95 255.255.255.0
ipv6 address 2016::b2aa:77ff:fe7c:a068/64
ipv6 enable
```

In this configuration, the Device Management IP address has both IPv4 and IPv6 management addresses. So you can manage a device via IPv4 or IPv6.

#### **Problem:**

If a device is managed via IPv6 Management Address in Security Manager, the communication between Security Manager and the device would occur only via IPv6 address and not IPv4 address.

However, Event Syslog server still sends the Event Syslog packets only to IPv4 address, therefore in this scenario Security Manager cannot map the equivalent device for the received IPv4 Event Syslog packets.

When you add a filter device in Local Collector or Remote Collector for Syslog Relay Services in **Tools > Security Manager Administration > Event Management - Syslog Relay Service**, Security Manager tries to extract the device Management IPv4 address instead of the IPv6 management address.

However, there is no IPv4 Management Interface configured in the device. Therefore, Security Manager displays the following error:

**Device selection – Ipv4 address not found for device(s)**

#### **Solution:**

Go to **Device View > Policies > Interfaces**, to configure the device Management Interface with IPv4 address.

## CPU Throttling Policy Dialog Box

Use the CPU Throttling Policy dialog box to specify settings for controlling the CPU load used by the syslog relay service.

After CPU throttling is enabled, if the syslog relay service's average CPU usage over the time period selected in the Average Max CPU Usage Time field is greater than the Maximum CPU Usage threshold, then CPU throttling will take place for the collectors specified in the Stop Forwarding To field for the time specified in the Stop Forwarding For field.

**Note** You can use the Syslog Relay Statistics dialog box to see the number of syslog packets dropped per collector due to the throttle policy (see [Syslog Relay Statistics Dialog Box](#), on page 544).

### Navigation Path

Click **Tools > Security Manager Administration**, select **Event Management** from the table of contents, and then click **CPU Throttle Settings**.

### Field Reference

*Table 134: CPU Throttling Policy Dialog Box*

| Element                              | Description                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable CPU Throttling                | Whether to enable throttling for the syslog relay service. CPU throttling for the syslog relay service is disabled by default.                                                                                                                                                                                                             |
| Maximum CPU Usage                    | Specify the maximum CPU usage for the syslog relay service as a percentage of total CPU capacity. This is threshold at which CPU throttling will be initiated.                                                                                                                                                                             |
| Average Max CPU Usage Time (Minutes) | Specifies the time in minutes for which CPU usage by the syslog relay service is calculated. Options are 1 minute, 5 minutes, and 15 minutes. This average is compared to the Maximum CPU Usage value to determine whether throttling should take place.                                                                                   |
| Stop Forwarding To                   | Specify the collectors for which you want to stop forwarding syslogs when throttling is engaged.                                                                                                                                                                                                                                           |
| Stop Forwarding For                  | Specify how long, in minutes, throttling should be enabled when the threshold is hit. After the specified interval of time has elapsed, if the CPU usage is still above the Maximum CPU Usage threshold, throttling will remain in effect.                                                                                                 |
| Enable Email Notifications           | Whether to send email notifications when the syslog relay service enters or exits throttle mode. Email notifications are disabled by default.<br><br>For the e-mails to be sent, you must configure an SMTP server as described in <a href="#">Configuring an SMTP Server and Default Addresses for E-Mail Notifications</a> , on page 27. |
| Notification Email IDs               | Enter one or more valid addresses in the Notification Email IDs field; separate multiple addresses with commas.                                                                                                                                                                                                                            |

| Element    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Send Email | <p>Specify how often to send notification emails:</p> <ul style="list-style-type: none"> <li>• <b>Every time</b>—Select this option to have a notification sent every time the syslog relay service enters or exits throttle mode. If the CPU usage is still above the Maximum CPU Usage threshold after the Stop Forwarding For timer has elapsed, throttling will remain in effect and an additional notification will be sent.</li> <li>• <b>Every</b>—Select this option to have at most one notification sent when the syslog relay service enters or exits throttle mode during a specific period of time. If you select this option, specify the time period by entering the number of minutes or hours and then selecting the corresponding option (Min/Hour) from the drop-down list.</li> </ul> |

## Syslog Relay Statistics Dialog Box

Use the Syslog Relay Statistics dialog box to view the average CPU and memory usage of the syslog relay service process as well as traffic rates for the different collectors.

### Navigation Path

Click **Tools > Security Manager Administration**, select **Event Management** from the table of contents, and then click **View Statistics**.

*Table 135: Syslog Relay Statistics Dialog Box*

| Element                                        | Description                                                                                                                                                                                                                                                                                                             |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Log Relay Service                              |                                                                                                                                                                                                                                                                                                                         |
| Memory Usage Average (last 1 min.)             | Shows the amount of memory used by the syslog relay service on average over the last minute.                                                                                                                                                                                                                            |
| CPU Usage Average (last 1 min.)                | <p>Shows the percentage of CPU capacity used by the syslog relay service on average over the last minute.</p> <p><b>Tip</b>      If the average CPU usage is too high, you might consider enabling CPU throttling for the syslog relay service (see <a href="#">CPU Throttling Policy Dialog Box</a>, on page 543).</p> |
| Total syslog packets received                  | Shows the total number of syslog packets that have been received by the syslog relay service since the service was started.                                                                                                                                                                                             |
| Average syslog received per second since start | Shows the average number of syslog packets that have been received by the syslog relay service per second since the service was started.                                                                                                                                                                                |

| Element                                               | Description                                                                                                                                                                                 |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Average syslog received per second for last 1 minute  | Shows the average number of syslog packets that have been received by the syslog relay service per second over the last minute.                                                             |
| Average syslog received per second for last 5 minute  | Shows the average number of syslog packets that have been received by the syslog relay service per second over the last five minutes.                                                       |
| Average syslog received per second for last 15 minute | Shows the average number of syslog packets that have been received by the syslog relay service per second over the last fifteen minutes.                                                    |
| Period (in mins.) for which throttle policy is active | Shows how long, in minutes, the CPU throttle policy for the syslog relay service has been active. For more information, see <a href="#">CPU Throttling Policy Dialog Box</a> , on page 543. |
| Local Collector/Remote Collector 1/Remote Collector 2 |                                                                                                                                                                                             |
| Total syslog packets sent successfully                | Shows the total number of syslog packets that have been sent by the syslog relay service since the service was started.                                                                     |
| Total syslog packets dropped (filter policy)          | Shows the total number of syslog packets that have been dropped by the syslog relay service in accordance with the defined filter policy since the service was started.                     |
| Total syslog packets dropped (throttle policy)        | Shows the total number of syslog packets that have been dropped by the syslog relay service in accordance with the throttle policy since the service was started.                           |
| Total syslog packets failed during transmit           | Shows the total number of syslog packets that were not able to be forwarded by the syslog relay service since the service was started.                                                      |
| Average syslog sent per second since start            | Shows the average number of syslog packets that have been sent by the syslog relay service per second since the service was started.                                                        |
| Average syslog sent per second for last 1 minute      | Shows the average number of syslog packets that have been sent by the syslog relay service per second over the last minute.                                                                 |
| Average syslog sent per second for last 5 minute      | Shows the average number of syslog packets that have been sent by the syslog relay service per second over the last five minutes.                                                           |
| Average syslog sent per second for last 15 minute     | Shows the average number of syslog packets that have been sent by the syslog relay service per second over the last fifteen minutes.                                                        |
| Refresh                                               | Refreshes the statistics displayed on the Syslog Relay Statistics dialog box.                                                                                                               |

## Health and Performance Monitor Page

Use the Health and Performance Monitor page of the Security Manager Administration window to enable network-wide health and performance monitoring. The Health and Performance Monitor (HPM) is a stand-alone application that lets you monitor key health and performance data for ASA devices, IPS devices, and VPN services by providing network-level visibility into device status and traffic information.

**Tip** If you get a message that the application is unavailable when you attempt to launch the Health and Performance Monitor, but the **Enable Health and Performance Monitor** option is selected on this page, try restarting Health and Performance Monitoring. First, deselect the Enable option and click Save. Wait for the service to stop. Then, select the Enable option, click Save, and wait for the service to finish restarting. You can then try opening the HPM application again.

### Navigation Path

Click **Tools > Security Manager Administration** and select **Health and Performance Monitor** from the table of contents.

### Field Reference

*Table 136: Health and Performance Monitor Page*

| Element                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Health and Performance Monitor | <p>Lets you enable or disable the Health and Performance Monitoring service, which allows Security Manager to collect event information. If you disable this feature, you cannot use the HPM application.</p> <p><b>Tip</b> If you change this setting and click <b>Save</b>, you are prompted to confirm that you want to start or stop the Health and Performance Monitoring service. If you click Yes, the service is started or stopped immediately, and you are shown a progress indicator and told when the change is completed. Wait until the status change is completed before continuing.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| OOB Notification Settings             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Note</b>                           | <p>To receive email notifications make sure that an SMTP server has been configured on the Security Manager Server. For more information, see <a href="#">Configuring an SMTP Server and Default Addresses for E-Mail Notifications</a>, on page 27.</p> <p>Cisco Security Manager considers an out-of-band (OOB) change to be any change made to a device manually or outside of Security Manager control, for example, by logging into the (monitored) device directly and entering configuration commands through the CLI. For devices monitored by the HPM application, Cisco Security Manager monitors the OOB changes, detected by the HPM periodically. If any out-of-band changes are detected, HPM generates an alert displayed on the Device Status View page and sends an email, to the configured recipients.</p> <p><b>Note</b> If a Cisco Security Manager restart occurs during the update time, after an OOB change is detected and an email notification has already been sent, the same email maybe sent again after Cisco Security Manager starts up.</p> |

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable OOB Email Notification | <p>Lets you enable or disable email notifications for Out of Band changes.</p> <p><b>Note</b> When the email notification is disabled, only an alert is displayed on the Device Status View page.</p> <p><b>Note</b> When HPM detects the OOB change and syncs with the Configuration Manager, a separate email alert notification is sent for each device being monitored. To prevent duplication, emails sent for each OOB change are tracked and stored in a file, once in 5 minutes.</p> <p><b>Tip</b> The default tracking time is set as 5 minutes in the Cisco Security Manager properties file. You can update this as needed.</p> |
| Recipient E-mail(s)           | Specify the recipients who must be notified of the OOB change.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Save button                   | <p>Saves and applies changes.</p> <p>Most changes require that the Health and Performance Monitoring service briefly stop and then restart. If you change whether the service is enabled, it stops or starts, as appropriate. You are shown a progress indicator.</p>                                                                                                                                                                                                                                                                                                                                                                      |

## Report Manager Page

Use the Report Manager page of the Security Manager Administration window to enable or disable the Report Manager feature in Cisco Security Manager. Report Manager is a stand-alone application that lets you view security and usage reports for devices and remote access IPsec and SSL VPNs.

### Navigation Path

Click **Tools > Security Manager Administration** and select **Report Manager** from the table of contents.

# Identity Settings Page

Use the Identity Settings page to configure the Active Directory (AD) server group to use for a NetBIOS domain for use with identity-aware firewall policies on ASA devices. These settings enable you to use the Find feature when selecting users or user groups for identity-aware policies or identity user group policy objects.

**Tip** You can also add entries by configuring the Identity Options policy on an ASA. When you save the policy, you are asked if you want to update the identity settings administrative page. Keep in mind that you can have a single domain-to-AD server match on the settings page, whereas you can configure different ASAs to use different server groups for a domain. Username lookup always selects the AD servers defined in the identity settings administrative page, regardless of what server group is configured for the individual ASA that you are configuring.

## Navigation Path

Select **Tools > Security Manager Administration** and select **Identity Settings** from the table of contents.

| Restore Defaults button         | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Image Manager Page

Use the Image Manager page to control the administrative settings for Image Manager within Security Manager.

### Navigation Path

Select **Tools > Security Manager Administration** and select **Image Manager** from the table of contents.

### Field Reference

*Table 139: Image Manager Page*

| Element               | Description                                                                                                                                                                                       |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Edit CCO Settings     | Use the Edit CCO Settings link to quickly navigate to the CCO Settings page. For information on the CCO Settings page, see <a href="#">CCO Settings Page</a> , on page 512.                       |
| Purge Jobs Older Than | Enter the length of time in days to hold Image Manager jobs before purging them. The default is 365 days. Select <b>Purge Now</b> to immediately clear previous Image Manager job specifications. |
| Include Repository    | If checked, the image repository is part of Security Manager backup. The default is to exclude images.                                                                                            |
| Save button           | Saves your changes.                                                                                                                                                                               |

| Element                 | Description                                 |
|-------------------------|---------------------------------------------|
| Reset button            | Resets changes to the last saved values.    |
| Restore Defaults button | Resets values to Security Manager defaults. |

## IP Intelligence Settings Page

Use the IP Intelligence Settings page to control the administrative settings for the IP Intelligence features within Security Manager.

### Navigation Path

Select **Tools > Security Manager Administration** and select **IP Intelligence Settings** from the table of contents.

### Field Reference

*Table 140: IP Intelligence Settings Page*

| Element                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Edit CCO Settings                        | Credentials for connecting to Cisco.com are required for automatic updates of the GeoIP database. You can use the <b>Edit CCO Settings</b> link to quickly navigate to the CCO Settings page where these credentials are configured. You can also configure settings for a proxy server on the CCO Settings page. For information on the CCO Settings page, see <a href="#">CCO Settings Page</a> , on page 512. |
| Reverse DNS (FQDN)                       |                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Enable Reverse DNS (FQDN) Lookup Service | Whether to enable or disable the Reverse DNS (FQDN) lookup service. Enable this service if you want to be able to determine the fully qualified domain name (FQDN) for an IPv4 address using the IP Intelligence tool.                                                                                                                                                                                           |
| Use CSM Server's DNS Server              | Select this option to use the DNS server defined on the Cisco Security Manager server for reverse DNS lookup requests.                                                                                                                                                                                                                                                                                           |
| Use custom DNS servers                   | Select this option to manually specify the DNS servers to use for reverse DNS lookup requests. You can enter up to three DNS server addresses in the fields provided.<br><br><b>Note</b> Security Manager does not support the use of external DNS servers configured inside of a virtual machine.                                                                                                               |
| Enable Load Balancing                    | Whether to distribute reverse DNS lookup requests amongst the DNS servers when multiple DNS servers are available.                                                                                                                                                                                                                                                                                               |
| Default Blocking Ranges                  | Lists the IP address ranges that are excluded from Reverse DNS lookup by default:<br><br>0.0.0.0, 255.255.255.255, 127.0.0.1, 169.254.0.0-169.254.255.255, 224.0.0.0-239.255.255.255                                                                                                                                                                                                                             |

| Element                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Enable GeoIP Lookup Service                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>Whether to enable or disable the GeoIP lookup service. Enable this service if you want to be able to retrieve geographic location information for an IPv4 address using the IP Intelligence tool.</p> <p><b>Note</b> You will need to download the geographic location database from Cisco.com before GeoIP information will be included in the IP intelligence data. You will also need to download the geographic location database from Cisco.com after restoring the Security Manager database from a backup. Beginning with version 4.9, Security Manager mandates you to read and accept the End User License Agreement (EULA) before you can proceed to downloading updates from cisco.com.</p> <p>In earlier versions of Security Manager, the End-User License Agreement (EULA) and K9 prompts had to be accepted for all image downloads. However, beginning with version 4.23, EULA and K9 prompts does not appear every time you are attempting to download an image.</p> |
| <p><b>GeoIP Manual Upload</b></p> <p>Use the GeoIP Manual Upload fields to update the geographic location database in Security Manager using a MaxMind GeoLite City update package downloaded from Cisco.com.</p> <p><b>Note</b> New update packages are made available on Cisco.com on a monthly basis.</p>                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| GeoIP Database Artifact Location                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>Click <b>Browse</b> and then navigate to and select the MaxMind GeoLite City update package that you downloaded from Cisco.com. | Run immediate database update | Click <b>Update Now</b> to update the geographic location database in Security Manager using the latest update package from Cisco.com.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Enable scheduled update       | <p>Whether to enable or disable automatic updates of the geographic location database on a regular schedule. After enabling scheduled updates, click <b>Edit Settings</b> to specify the schedule for when the update should take place.</p> <p>Using the Weekly option, you can specify the days of the week on which the automatic update should take place. Using the Monthly option, you can specify the day of the month on which the automatic update should take place. For either option, you can specify the time of day that the update should take place.</p> <p><b>Tip</b> The geographic location database is updated by MaxMind on the first Tuesday of every month. New update packages are typically available on Cisco.com approximately one week after they are issued by MaxMind. We recommend configuring your update schedule to occur monthly on day 15 or later. However, you can schedule the updates to take place more frequently if you want to ensure that the updated database is made available in Security Manager as close to the time it is available on Cisco.com as possible.</p> <p><b>Note</b> Beginning with version 4.9, Security Manager mandates you to read and accept the End User License Agreement (EULA) before you can proceed to downloading updates from cisco.com.</p> <p>In earlier versions of Security Manager, the End-User License Agreement (EULA) and K9 prompts had to be accepted for all image downloads. However, beginning with version 4.23, EULA and K9 prompts does not appear every time you are attempting to download an image.</p> |
| Default Blocking Ranges       | <p>Lists the IP address ranges that are excluded from GeoIP lookup by default:</p> <p>0.0.0.0, 255.255.255.255, 127.0.0.1, 10.0.0.0-10.255.255.255, 169.254.0.0-169.254.255.255, 172.16.0.0-172.31.255.255, 192.168.0.0-192.168.255.255, 224.0.0.0-239.255.255.255</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| User-defined Blocking Ranges  | <p>Specifies additional IP addresses or address ranges that should be excluded from GeoIP lookup requests. Click the Edit (pencil) button to open the Edit IPv4 Blocking Range Addresses dialog box in which you can specify the IPv4 addresses or address ranges to be excluded. Separate multiple entries using a comma ",".</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Whois                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Enable Whois Lookup Service   | <p>Whether to enable or disable the Whois lookup service. Enable this service if you want to be able to retrieve WHOIS information for an IPv4 address using the IP Intelligence tool.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| User-defined Blocking Ranges | <p>Specifies additional IP addresses or address ranges that should be excluded from Whois lookup requests. Click the Edit (pencil) button to open the Edit IPv4 Blocking Range Addresses dialog box in which you can specify the IPv4 addresses or address ranges to be excluded. Separate multiple entries using a comma ",".</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| View Statistics              | <p>Opens the IP Intelligence Statistics dialog box which shows statistics for the IP Intelligence feature. Information provided in the IP Intelligence Statistics dialog box includes:</p> <ul style="list-style-type: none"> <li>• Average number of IP Intelligence lookup requests during the last 5 minutes and last 15 minutes</li> <li>• Average lookup time for all IP Intelligence service requests</li> <li>• Average lookup times for each individual service that is currently enabled</li> <li>• Counts of the number of lookups, both successful and failed, for each individual service that is currently enabled</li> <li>• Cache hit ratios for each individual service that is currently enabled</li> <li>• Upload information for GeoIP updates: last update time, status, and version information for the update</li> </ul> <p>Click <b>Refresh</b> to update the data in the IP Intelligence Statistics dialog box.</p> |
| Save button                  | Saves your changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Reset button                 | Resets changes to the last saved values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Restore Defaults button      | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Eventing Notification Settings Page

Use the Eventing Notification Settings page to receive email notifications for IPS events and critical ASA events. You can configure the time interval at which you want to receive the email notifications.

The events are sent in the form of .CSV files in a .zip file format. By default, email notification is disabled. When you enable email notification, only the notification for IPS events is enabled. To receive email notification for critical events you must enable the additional settings for critical events.

**Note** For notifications to be sent successfully by Security Manager, you must configure an SMTP server, as described in [Configuring an SMTP Server and Default Addresses for E-Mail Notifications](#), on page 27.

**Tip** You can also use the Security Manager Event Viewer application or the Dashboard to view and monitor all events.

### Navigation Path

Select **Tools > Security Manager Administration** and select **Eventing Notification Settings** from the table of contents.

### Field Reference

**Table 141: Eventing Notification Settings Page**

| Element                                 | Description                                                                                                                                                                                                                                                                                   |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Eventing Email Notification      | Select to enable notification of IPS events through email.                                                                                                                                                                                                                                    |
| Notification Interval (15 - 60 minutes) | Enter the interval at which you want Security Manager to send email notifications for IPS events or critical events.<br><b>Note</b> If Security Manager receives more than 50000 events during the configured time interval, only the first 50000 events are selected and sent through email. |
| Notification Settings (IPS)             |                                                                                                                                                                                                                                                                                               |
| Email IDs (for IPS Events)              | Enter one or more email addresses (comma separated).                                                                                                                                                                                                                                          |
| Select Severity of Events               | The severity level that the IPS signature reports: High, Medium, Low, or Informational. By default, High and Medium severity are selected.                                                                                                                                                    |
| Notification Content                    | Whether to send summarized or detailed notifications through email. If you select Detailed Notifications, select the fields that you want information for, in the email notification. Some fields are selected by default.                                                                    |
| Fields                                  |                                                                                                                                                                                                                                                                                               |
| Event ID                                | A unique sequential number for each event, assigned internally.                                                                                                                                                                                                                               |
| Severity                                | The Firewall or IPS severity values.                                                                                                                                                                                                                                                          |

| Element           | Description                                                                                                                                                                                                                                         |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Device            | The source of the event; usually the device ID.<br>A device identified as Not Available has been deleted from the Security Manager inventory.                                                                                                       |
| Application Name  | The name of the application originating the event.                                                                                                                                                                                                  |
| Receive Time      | The time the event was received by Security Manager.                                                                                                                                                                                                |
| Event Time        | The time the event was generated by the device.                                                                                                                                                                                                     |
| Sensor Local Time | The local time of the sensor where the event originated.                                                                                                                                                                                            |
| Sig ID            | The Sig ID value is used by the alert originator to identify the activity. It identifies the pre-defined signature defined for this activity.                                                                                                       |
| Sub Sig. ID       | Identifies the unique numerical value assigned to the sub signature. The Sub Sig. Id identifies a more granular version of a broad signature.                                                                                                       |
| Sig. Name         | The name assigned to the signature.                                                                                                                                                                                                                 |
| Sig. Details      | The details of the reported signature that was triggered and resulted in the generation of the alert.                                                                                                                                               |
| Sig. Version      | The version of the signature definition used to generate an alert.                                                                                                                                                                                  |
| Attacker IP       | The IP address of the host that sent the offending packet.                                                                                                                                                                                          |
| Attacker Port     | The port used by the attacker host. This is the port from which the offending packet originated.                                                                                                                                                    |
| Attacker Locality | Identifies whether the attacker address is located inside or outside of a given network, as specified by the intrusion detection device's configuration.                                                                                            |
| Victim IP         | The IP address of the host being attacked.                                                                                                                                                                                                          |
| Victim Port       | The port of the host being attacked (the recipient of the offending packet). This is the port to which the offending packet was sent.                                                                                                               |
| Victim OS         | The OS of the host being attacked.                                                                                                                                                                                                                  |
| Victim Locality   | Identifies whether the target address is located inside or outside of a given network, as specified by the intrusion detection device's configuration.                                                                                              |
| Summary Count     | Specifies that this is a summary alert, representing one or more alerts with common characteristics. The numeric value indicates the number of times the signature fired since the last summary alert with a matching initialAlert attribute value. |
| Initial Alert     | This field applies to a summary alert, representing one or more alerts with common characteristics. The value of InitialAlert provides the event ID of the last nonsummary evIdsAlert with the same characteristic (sigid/ subsigid).               |
| Summary Type      | Defines the common characteristics of all alerts in a summary alert.                                                                                                                                                                                |

| Element                                      | Description                                                                                                                                                                                         |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Is Final                                     | Applies to a summary alert, representing one or more alerts with common characteristics. It indicates whether this is the last event alert containing the same value in the initialAlert attribute. |
| Interface                                    | Name of the IPS interface.                                                                                                                                                                          |
| VLAN                                         | The VLAN number associated with packets involved in the activity that triggered the alert.                                                                                                          |
| Virtual Sensor                               | The name of the virtual sensor associated with the event.                                                                                                                                           |
| Action Taken                                 | The action performed on the flow. For example: Terminated or denied.                                                                                                                                |
| Alert Details                                | The details regarding the alerts.                                                                                                                                                                   |
| Risk Rating                                  | A value that represents the calculated risk associated with the event.                                                                                                                              |
| Threat Rating                                | The threat rating of the event, if any.                                                                                                                                                             |
| Reputation                                   | The attacker's reputation score in the range -10.0 to +10.0. A lower (more negative) score indicates a greater likelihood that the host is malicious.                                               |
| Reputation Details                           | Deny Attacker: Whether a deny-attacker action occurred (or would have occurred) because an internal override was exceeded due to the calculated risk rating: true or false.                         |
| Protocol                                     | The Level-3 or Level-4 protocol.                                                                                                                                                                    |
| Notification Settings (Critical Events only) |                                                                                                                                                                                                     |
| Enable                                       | Whether to send email notification for critical events. If you select this option, also enter one or more email addresses (comma separated).                                                        |
| Email IDs                                    |                                                                                                                                                                                                     |
| Save button                                  | Saves your changes.                                                                                                                                                                                 |
| Reset button                                 | Resets changes to the previously applied values.                                                                                                                                                    |
| Restore Defaults button                      | Resets values to Security Manager defaults.                                                                                                                                                         |

## IPS Updates Page

**Note** From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements.

Use the IPS Updates page to perform administrative tasks associated with keeping your sensors up to date with regard to signatures, minor version updates, and service packs. You can use the IPS Updates page to:

- Monitor update status.

- Check the availability of updates and download them.
- Configure an IPS update server.
- Configure automatic update settings.

---

**Note** Beginning with Security Manager version 4.9, only the latest sensor and signature packages for IPS will be available for download from CCO. The older packages will not be available for download from CCO.

---

### Tips

- To apply IPS updates manually, select **Tools > Apply IPS Update**. For more information, see [Manually Applying IPS Updates](#) , on page 1783.
- If you later decide that you did not want to apply a signature update, you can revert to the previous update level by selecting the Signatures policy on the device, clicking the **View Update Level** button, and clicking **Revert**.

Beginning with version 4.4, Security Manager has a certificate trust management feature. This feature helps you with improved handling of Cisco.com certificates. For detailed documentation of this feature, refer to [Certificate Trust Management](#), on page 493.

### Navigation Path

Select **Tools > Security Manager Administration** and select **IPS Updates** from the table of contents.

## Field Reference

Table 142: IPS Updates Page

| Element                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Update Status group<br>Refresh button                      | <p>Displays the following items. Click <b>Refresh</b> to update the information.</p> <ul style="list-style-type: none"> <li>• Latest Available—The most recent signature and sensor update available on Cisco.com or the local HTTP server when you last checked for updates.</li> <li>• Latest Downloaded—The most recent signature and sensor update downloaded to Security Manager.</li> <li>• Latest Applied—The most recent signature and sensor update applied to any device in Security Manager.</li> <li>• Latest Deployed—The most recent signature and sensor update deployed to any device in Security Manager.</li> <li>• Last Check On—The time that the last check of Cisco.com was performed.</li> <li>• Last Download On—The time that the last update was downloaded to Security Manager.</li> <li>• Last Deployed On—The time that the last update was deployed to any of the devices.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check for Updates button<br>Download Latest Updates button | <p>These buttons check for updates, or download signature and sensor updates that have not already been downloaded to the Security Manager server, from the IPS Update server. You must configure an IPS Update server before checking for updates or downloading them (click <b>Edit Settings</b> in the Update Server group).</p> <p>When you click one of these buttons, a dialog box opens to display the results of the operation. Security Manager logs into the IPS Update server, checks for updates, and downloads them if you clicked the Download button. If a Cisco.com download fails, ensure that the account you are using has applied for eligibility to download strong encryption software. For details, see the description of User Name in <a href="#">Edit Update Server Settings Dialog Box</a>, on page 562.</p> <p><b>Tip</b> If you configure a server, and then try to check for updates, and you are told you did not configure a server, click <b>Save</b> at the bottom of the page and try again.</p> <p><b>Note</b> Beginning with version 4.9, Security Manager mandates you to read and accept the End User License Agreement (EULA) before you can proceed to downloading updates from cisco.com.</p> <p>In earlier versions of Security Manager, the End-User License Agreement (EULA) and K9 prompts had to be accepted for all image downloads. However, beginning with version 4.23, EULA and K9 prompts does not appear every time you are attempting to download an image.</p> |

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Update Server group             | <p>Displays the settings used to access Cisco.com or the local server that contains the IPS update packages. The fields indicate whether the update server is Cisco.com or a locally-configured HTTP server, the name of the local server if you are using one, the user account for logging into the server, and the name of the proxy server, if any. To configure or change the IPS Update server, click <b>Edit Settings</b> to open the Edit Update Server Settings dialog box (see <a href="#">Edit Update Server Settings Dialog Box</a> , on page 562).</p> <p>For more information, see <a href="#">Configuring the IPS Update Server</a> , on page 1780.</p> <p>Beginning with version 4.4, Security Manager has a certificate trust management feature. This feature helps you with improved handling of Cisco.com certificates. For detailed documentation of this feature, refer to <a href="#">Certificate Trust Management</a>, on page 493.</p>                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Signature Filter Settings group | <p>Enables you to download IPS signature updates selectively. Click <b>Edit Settings</b> to open the Edit Signature Download Filter Settings dialog box (see <a href="#">Edit Signature Download Filter Settings Dialog Box</a>, on page 565).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Auto Update Settings group      | <p>Contains the settings specific to automatic updates. For more information, see <a href="#">Automating IPS Updates</a> , on page 1782.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Auto Update Mode                | <p>Establishes whether, and to what extent, automatic updates are performed. Contains the following options:</p> <ul style="list-style-type: none"> <li>• Download, Apply, and Deploy Updates</li> <li>• Disable Auto Update</li> <li>• Check for Updates</li> <li>• Download Updates</li> <li>• Download and Apply Updates</li> </ul> <p>By default, auto update is disabled. The other options are a combination of one or more of the following options:</p> <ul style="list-style-type: none"> <li>• Check for Updates—Security Manager contacts the IPS Update server to check if an update is available and sends e-mail if e-mail notification is configured. No files are downloaded.</li> <li>• Download Updates—Security Manager downloads the latest updates from the IPS Update server, and sends e-mail notification if e-mail notification is configured.</li> <li>• Apply Updates—Security Manager modifies the configuration of the devices selected in the Apply Update To list based on the downloaded update packages. You have to separately deploy these updates unless you also select Deploy Updates.</li> <li>• Deploy Updates—Security Manager starts a deployment job to send the applicable update packages to the devices selected in the Apply Update To list. The device must have the required license for a signature update to be successful.</li> </ul> |

| Element                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Update Schedule<br>Edit Update<br>Schedule button | <p>The schedule for the actions selected in the Auto Update Mode field. To change the schedule, click <b>Edit Update Schedule</b> and define the schedule in the Edit IPS Updates Schedule dialog box. You can specify that Security Manager perform the updates based on hourly, daily, weekly, or monthly schedules, or specify a one-time event. When entering the start time, use the 24-hour clock and the <i>hh:mm</i> format.</p> <p><b>Note</b> If you schedule an update to occur in less than 10 minutes from your Security Manager server time, the "Next Update" field will show tomorrow's date and the job will run accordingly. This is a safety feature designed to guarantee the first occurrence to run.</p> <p><b>Tip</b> Cisco recommends scheduling automatic downloads during off hours so that they do not conflict with other user operations, such as device discovery.</p> <p><b>Tip</b> Cisco recommends using an account other than the admin account for routine user operations.</p> |
| Notify Email                                      | <p>The e-mail address to which notifications of automatic updates are sent. If you enter more than one address, separate the addresses with commas. A notification is sent when an update:</p> <ul style="list-style-type: none"> <li>• Is available for download.</li> <li>• Has been downloaded.</li> <li>• Has been downloaded and applied.</li> <li>• Has been downloaded, applied, and deployed.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Apply Update To Type<br>Edit Row button<br>Devices to be Auto Updated | <p>The selector includes the IPS devices that have local signature policies and the shared signature policies that are defined in Security Manager. The columns in the selector indicate whether a local device policy or a shared policy is selected for these types of updates:</p> <ul style="list-style-type: none"> <li>• Signature—For auto updating the signature update level.</li> <li>• Minor—For minor updates and service packs.</li> <li>• S.P.—For service pack updates.</li> </ul> <p>For shared policies, a partial grey checked box indicates that some, but not all, of the devices that use the policy are selected. If you change the devices assigned to the shared policy between automatic update events, the shared policy is grayed out, and only the old assignments are shown on this page. After the update runs, the assignment list will be synchronized with the shared policy device assignments. To update the device list proactively prior to the next auto update run, select the policy and edit it (to select auto update settings), and the device assignment list will be corrected.</p> <p><b>Note</b> Also for shared policies: You can select only the shared policy assigned to the default virtual sensor (vs0). If you attempt to select the shared policy for a different virtual sensor, your changes will not be applied, and you will not receive an error message.</p> <p>Use the Type field to toggle between viewing local and shared policies. Changing the view does not change your auto update selections.</p> <p>To select a local or shared policy for auto update, select it in the selector and click the <b>Edit Row</b> button below the selector. This opens the Edit Auto Update Settings dialog box, where you can select the types of updates for the policy. When you select any type of auto update for a policy, the affected devices are listed in the <b>Devices to be Auto Updated</b> list to the right of the selector.</p> |
| Save button                                                           | Saves your changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Reset button                                                          | Resets changes to the last saved values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Restore Defaults button                                               | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Edit Update Server Settings Dialog Box

Use the Edit Update Server Settings dialog box to configure the server to use for obtaining IPS updates. If necessary, you can configure a proxy server for communicating with the update server.

Also, use the Edit Update Server Settings dialog box for certificate trust management. (Security Manager downloads IPS packages from Cisco.com over HTTPS, which uses certificates for establishing trust.) The certificate trust management feature on the Image Manager page is new in Security Manager 4.4. It will help you with improved handling of Cisco.com certificates for IPS package downloads:

- You can use it to view a certificate and use discretion in accepting it.
- After you accept a certificate, it is stored on your Security Manager server.

- You can see all your certificates in a summary table on the Image Manager page, and you can use that table to view or remove certificates.

**Tip** Please be sure to refer to "Retrieve Certificate" in the table below.

### Navigation Path

Select **Tools > Security Manager Administration > IPS Updates** and click **Edit Settings** in the Update Server group.

### Field Reference

| Update From                                   | Whether to get IPS updates from Cisco.com or from a local HTTP/HTTPS server. Your selection changes the fields on the dialog box.<br><br>If you select local, you must configure an HTTP or HTTPS server to use as the IPS update server.<br><br><b>Caution</b> The default value for "Update From:" is "Local Server." You must choose "Cisco.com" to see certificate settings. Improper or incomplete certificate setting will prevent connectivity to Cisco.com, and all Cisco.com-related operations in this area will fail.                                                                                                                                                                                                                                                                                                       |
| IP Address/ Host Name<br>(Local server only.) | The hostname or IP address of the local IPS update web server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Web Server Port<br>(Local server only.)       | The port number that your local server listens to for connection requests. The default is 80.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| User Name                                     | The username to log into the IPS update server. If you are configuring a local server that does not require a user login, leave this field blank.<br><br>If you are specifying a Cisco.com username, the user account on Cisco.com must be eligible for downloading strong encryption software. If you are not certain that the account has the required permissions, use the account to log into Cisco.com and try to download an IPS update file ( <a href="http://www.cisco.com/cgi-bin/tablebuild.pl/ips5-system">http://www.cisco.com/cgi-bin/tablebuild.pl/ips5-system</a> ). If the account does not have the appropriate permissions, you are prompted to read and accept the required conditions. If you meet the eligibility requirements, you can accept them. Otherwise, talk to your Cisco sales representative for help. |
| Password<br>Confirm                           | The password for the specified username, entered in both fields. If you are configuring a local server that does not require a password, leave these fields blank.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Element                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Path to Update Files<br>(Local server only.) | The path to the IPS update files location on your local server. For example, if update files can be accessed at http://local-server-ip:port/update_files_path/, then enter update_files_path in this field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Connect Using HTTPS<br>(Local server only.)  | Whether to use SSL when connecting to the local IPS Update server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Certificate Thumbprint                       | Displays the certificate thumbprint after it is calculated from the certificate on the local server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Retrieve From Server                         | Used to connect to the local server specified in this dialog box, retrieve the certificate from the local server given, and calculate the certificate thumbprint, which is displayed in the Certificate Thumbprint field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Contact URL                                  | <ul style="list-style-type: none"> <li>When selected, "Image Meta-data Locator" is used. This is the URL on Cisco.com that is used to obtain meta-data information about images. Meta-data information consists of the images applicable to a particular product, name, size, checksum, and URL to download for each image.</li> <li>When selected, "Other" is used. You can enter any valid HTTPS URL. This URL is intended primarily for the HTTPS URL to download the image as obtained from the meta-data information about the image. This URL may be different from the URL of the image meta-data locator described in the previous paragraph; the certificate may be different, as well.</li> </ul> <p><b>Caution</b> If you choose "Other," you need to explicitly add "https://dl.cisco.com" [without the quotation marks]: Enter it in the text field adjacent to the "Other" button. Failure to do this will prevent connectivity to Cisco.com, and all Cisco.com-related operations in this area will fail.</p> |
| Retrieve Certificate                         | Used to connect to and retrieve the certificate from the selected "Contact URL." After retrieving the certificate it opens the Certificate Verification dialog, which along with a brief summary of the certificate, i.e., who the certificate is issued to, by whom, and the validity period of the certificate, gives you the following choices: <ul style="list-style-type: none"> <li><b>View Certificate</b>—Opens the Certificate Viewer, where you can see all the details of the certificate: Certificate Authority, version, serial number, thumbprint, and other details. It shows the complete certificate chain information all the way up to the root issuing certificate Authority.</li> <li><b>Accept</b>—Accepts the certificate and adds it to the Cisco Security Manager.</li> <li><b>Reject</b>—Rejects the certificate and no action is taken.</li> <li><b>Cancel</b>—Closes the Certificate Verification dialog with no action taken.</li> </ul>                                                        |
| Certificate                                  | A table that displays, for each certificate in your Security Manager installation, Subject, Issued By, and Accepted By.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| View                                         | Opens the Certificate Viewer for a certificate selected in the Certificate table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Remove                                       | Removes a certificate selected in the Certificate table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Element               | Description                                                                                                                                                                                         |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Proxy Server Group    |                                                                                                                                                                                                     |
| Enable Proxy Server   | Whether a proxy server is needed to connect to Cisco.com or to your local server.                                                                                                                   |
| IP Address/ Host Name | The hostname or IP address of the proxy server.<br>You can configure the proxy server to use basic, digest, NT LAN Manager (NTLM) V1, or NTLM V2 authentication. NTLM V2 is the most secure scheme. |
| Port                  | The port number that the proxy server listens to for connection requests. The default is 80.                                                                                                        |
| User Name             | The username to log into the proxy server. If the proxy server does not require a user login, leave this field blank.                                                                               |
| Password<br>Confirm   | The password for the specified username, entered in both fields. If the proxy server does not require a password, leave these fields blank.                                                         |

## Edit Auto Update Settings Dialog Box

Use the Edit Auto Update Settings dialog box to configure the automatic update options for the device or policy selected in the Apply Update To table on the IPS Updates page. For information on configuring automatic updates, see [Automating IPS Updates](#), on page 1782.

### Navigation Path

Select a device or policy on in the Apply Update To table on the IPS Updates page (see [IPS Updates Page](#), on page 557) and click the Edit Row button.

### Field Reference

*Table 144: Edit Auto Update Settings Dialog Box*

| Element                                               | Description                                                                                                                                                                                                      |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Auto Update<br>(IPS sensors and shared policies only) | The type of sensor updates to apply to the selected devices or shared policies. You can apply both minor updates and service packs, service packs only, or select None to apply no sensor updates automatically. |
| Auto Update Signature Update Level                    | Whether to select the device or policy for automatic signature updates.                                                                                                                                          |

## Edit Signature Download Filter Settings Dialog Box

The Edit Signature Download Filter Settings dialog box enables you to download IPS signature updates selectively. It applies both to the manual download and to the automated download.

**Note** Filtering does not apply to IPS sensor packages or to IPS engine packages; it applies to IPS signature packages only. All the available sensor packages on Cisco.com or on the local server will be downloaded as part of a signature download.

The benefits of selective download are reduced download time, reduced disk storage space, and faster troubleshooting because you can download only what you need.

There are four types of signature download available to you with the Edit Signature Download Filter Settings dialog box:

- No filter
- Download all signatures for engine versions starting with [choose E4, E3, E2, or E1]
- Download all signature versions starting with [enter a signature version such as 1000]
- Download a single signature version number [enter a signature number such as 1000]

The default signature configuration is to download all signatures for engine versions starting with E4.

**Tip** This default value is the same for a new installation of Security Manager 4.3 and for upgrades from previous versions.

### Navigation Path

Select **Tools > Security Manager Administration** and then select **IPS Updates** from the table of contents; then click **Edit Settings** in the Signature Filter Settings group.

| Element                                                                | Description                                                                                 |
|------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| Filter Type: No filter                                                 | All available signatures for all available engines are downloaded.                          |
| Filter Type: Download all signatures for engine versions starting with | All available signatures for the engine that you select (E4, E3, E2, or E1) are downloaded. |
| Filter Type: Download all signature versions starting with             | All available signatures starting with the ID that you enter are downloaded.                |

| Element                                               | Description                                                      |
|-------------------------------------------------------|------------------------------------------------------------------|
| Filter Type: Download single signature version number | The single signature having the ID that you enter is downloaded. |

## ISE Settings Page

Use the ISE Settings page to configure communication between Cisco Security Manager and the Cisco Identity Services Engine (ISE) for use with TrustSec firewall policies.

**Note** Security Manager supports communications with only one ISE appliance/server for fetching and resolving security group names and tags.

To be PCI compliant, in Cisco Security Manager 4.15 and 4.16, TLS 1.0 and TLS 1.1 were disabled respectively. Hence from 4.16, Cisco Security Manager was using only TLS 1.2 version.

However, the ISE 1.3 server and its lower versions does not support TLS 1.2. This impacts the legacy ISE settings with Cisco Security Manager from release 4.15. This incompatibility prevents integration of ISE server with Cisco Security Manager.

If you are required to use ISE server (versions 1.3 and lower) in the Cisco Security Manager 4.15, 4.16, or 4.17 versions, to integrate ISE 1.3 and lower versions with Cisco Security Manager successfully, refer Cisco Security Manager User Guide for release 4.17.

### Navigation Path

Select **Tools > Security Manager Administration** and select **ISE Settings** from the table of contents.

|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CSM tab | The license settings for the Security Manager application. For a description of the fields on this tab, see <a href="#">CSM Tab, Licensing Page</a> , on page 568.        |
| IPS tab | The license settings for IPS devices managed by Security Manager. For a description of the fields on this tab, see <a href="#">IPS Tab, Licensing Page</a> , on page 569. |

## CSM Tab, Licensing Page

Use the CSM tab on the Licensing page to view the list of installed Security Manager licenses and to install new licenses. For more information, see [Installing Security Manager License Files](#), on page 492.

### Navigation Path

Select **Tools > Security Manager Administration**, select **Licensing** from the table of contents, and click **CSM**.

## Field Reference

Table 148: CSM Tab, Licensing Page

| Element                  | Description                                                                                                                                                                                                                                                                           |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| License Information      | Displays information about the license registered with the product: the edition, license type, expiration date, the number of licensed devices, the number of devices in use, and the percentage of the device count used.                                                            |
| Install License          | The list of installed licenses with their installation dates.                                                                                                                                                                                                                         |
| Install a License button | Click this button to install a license file. The dialog box that is opened includes links to Cisco.com, where you can obtain licenses if you have not already obtained them. You must copy license files to a local drive on the Security Manager server before you can install them. |

## IPS Tab, Licensing Page

**Note** From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements.

Use the IPS tab on the Licensing page to view the list of installed IPS device licenses, to install new or updated licenses, or to redeploy licenses. The license list shows current licenses, unlicensed devices, devices with expired licenses, and devices with invalid licenses. You can also use the settings on this page to send a report of all those IPS devices whose license would expire within a specified number of days.

### Navigation Path

Select **Tools > Security Manager Administration**, select **Licensing** from the table of contents, and click **IPS**.

## Field Reference

Table 149: IPS Tab, Licensing Page

| Element                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IPS License Table                 | <p>Displays all the IPS devices in the device inventory and their license status as of the last time you refreshed the information. Click the <b>Refresh</b> button to obtain the latest information from the devices.</p> <p>Information includes the serial number for the device, which is used to register for licenses, the license status, and the expiration date of the license. The list shows not only current licenses, but also unlicensed devices, devices with expired licenses, and devices with invalid licenses.</p> <p><b>Tip</b> The list does not include Cisco IOS IPS devices. You cannot use Security Manager to manage licenses for routers running IPS.</p>                                                                                                                                                                                       |
| Update Selected via CCO button    | <p>Click this button to update the license file for the selected devices by connecting to Cisco.com and retrieving a new license. When you click this button, a dialog box opens listing devices that can be updated from Cisco.com, which might not be all the devices you selected. Click <b>OK</b> to perform the update. For successful updates, the updated file is automatically applied to the device.</p> <p>To successfully update the license using this method, you must have a Cisco.com support contract that includes the serial numbers of the selected devices.</p> <p><b>Tip</b> The Cisco software license server (SWIFT) that contains the licenses might block requests from the same server for more than 9 licenses within a three minute period. Thus, you should select fewer than 9 devices at a time when performing manual license updates.</p> |
| Redeploy Selected Licenses button | <p>Click this button to redeploy licenses to the selected devices. Redeploying licenses might be necessary when you have obtained an updated license file and it was not applied to the device successfully during an automatic update.</p> <p>When you click this button, a dialog box opens listing devices whose licenses you are redeploying. Click <b>OK</b> to perform the update. For successful updates, the updated file is automatically applied to the device.</p>                                                                                                                                                                                                                                                                                                                                                                                              |
| Update from License File button   | <p>Click this button to update licenses by selecting a license file from the Security Manager server. When you click this button, a dialog box opens where you can specify the license files. Click <b>Browse</b> to select the files, which must be on a local drive on the Security Manager server. When you click <b>OK</b>, the updated files are automatically applied to the devices.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Export As button                  | <p>Select one or more IPS devices from the list and then click the <b>Export As</b> button to export their licenses to a Portable Document Format (PDF) or comma-separated values (CSV) file. You are prompted to select the folder on the Security Manager server and to specify a file name. If you do not select any device from the list, the licenses of all available devices are exported.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Element                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Refresh License button                                          | Click this button to refresh the data in the IPS license table for the selected devices. The updated information is retrieved from the device. If you do not select any devices, all devices are refreshed; this can take a long time depending on the number of devices listed.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Download and apply licenses<br>Days before the expiration date. | Whether to automatically download IPS licenses from Cisco.com and apply them to the devices. To successfully configure automatic updates, you must have a Cisco.com support contract that includes the serial numbers of your IPS devices.<br><br>If you select this option, also specify the number of days before the license expiration date for downloading and applying licenses. Security Manager evaluates only those devices that do not have licenses, have expired licenses, or have valid licenses within this number of days of expiration. Licenses are applied only if they are valid and either have an expiration date farther out than the current one, or that have different license information. |
| Discover devices daily at                                       | If you select automatic license updates, the time of day when Security Manager should contact devices for current licenses status and evaluate whether there are devices that have licenses that will expire within the specified number of days. Cisco.com is contacted only if one or more device meets the expiration requirements.                                                                                                                                                                                                                                                                                                                                                                               |
| Email License Update Results<br>Email Notification              | Whether to send email notifications of expiration alerts and license update job results. If you select this option, also enter one or more email addresses (comma separated).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Email License Expiration Status<br>Email Notification           | Whether to send a PDF report of those IPS devices whose license would expire within a specified number of days. If you select this option: <ul style="list-style-type: none"> <li>• Enter the number of days (not more than 100) before the device license expiry date, by which you want Security Manager to send the PDF report.</li> <li>• Select the time and day for Security Manager to check the license expiry.</li> <li>• Enter one or more email addresses (comma separated) to which you want the License Expiration Status PDF report to be sent.</li> </ul>                                                                                                                                             |
| Save button                                                     | Saves your changes to the automatic license update and e-mail notification settings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Verifying IPS Devices for License Update or Redeployment

**Note** From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements.

When you select a device on the **Licensing > IPS** tab (see [IPS Tab, Licensing Page , on page 569](#)) and try to update the license from Cisco.com (CCO) or redeploy the license, you are first shown a list of devices that will be updated. The name of the dialog box is based on the action you are taking:

- **Updating Licenses via CCO dialog box**—Review the IPS devices you selected to update from Cisco.com. The device list displays the IPS devices for which you can update the license from Cisco.com, which might not be all of the devices you selected.

To successfully update the license using this method, you must have a Cisco.com support contract that includes the serial numbers of the selected devices.

**Tip** The Cisco software license server (SWIFT) that contains the licenses might block requests from the same server for more than 9 licenses within a three minute period. Thus, you should select fewer than 9 devices at a time when performing manual license updates.

- **Redeploying Licenses dialog box**—Review the IPS devices you selected for redeploying licenses. Before you can redeploy a license to a device, you must have already deployed the license. Security Manager uses the file already associated with the IPS device to redeploy the license.

When you click **OK**, the License Update Status Details dialog box opens so that you can view the status of the license redeployment task. See [License Update Status Details Dialog Box](#), on page 573.

### Navigation Path

To open these dialog boxes, select one or more device on the **Tools > Security Manager Administration > Licensing > IPS** tab and click **Update Selected via CCO** or **Redeploy Selected Licenses**.

## Selecting IPS License Files

**Note** From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements.

If you select one or more devices on the **Tools > Security Manager Administration > Licensing > IPS** tab and click **Update from License File**, you are prompted to select the license file you want to use with the Updating Licenses from File dialog box.

You can store the license file on a local drive on the Security Manager server, and, beginning with Version 4.5 of Security Manager, you can store it on a local drive on a client.

Click **Browse** to select the license file. You can select multiple license files using Ctrl+click or a range of files using Shift+click.

**Note** If you installed the Security Manager client on a different machine than the one on which Security Manager server is installed, you can choose to select the license file from either the client machine or the server machine. If both the client and the server are installed on the same machine, Security Manager allows you to select the license file only from the server.

When you have selected the license files you want to use, click **OK** to apply them to the IPS devices.

**Note** If you want to store the license file on a client machine, you must select "Enable Client side file browser" on the Customize Desktop page at Tools > Security Manager Administration > Customize Desktop.

## License Update Status Details Dialog Box

Use the License Update Status Details dialog box to view the status of an IPS license update task. This dialog box opens whenever you start an update task from the IPS tab of the Licensing page. For more information, see [IPS Tab, Licensing Page](#), on page 569.

*Table 150: License Update Status Details Dialog Box*

| Element                      | Description                                                                                                                                                                                                                                                    |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Progress bar                 | Indicates what percentage of the license update task on the current device has been completed.                                                                                                                                                                 |
| Status                       | The current state of the update task.                                                                                                                                                                                                                          |
| Devices to be updated        | The total number of devices being updated during this task.                                                                                                                                                                                                    |
| Devices updated successfully | The number of devices updated without errors.                                                                                                                                                                                                                  |
| Devices updated with errors  | The number of devices that generated errors during the update.                                                                                                                                                                                                 |
| Device list                  | The devices that are being updated, including the device name, the status of the update, and summary information about the update. Select a device to see the messages generated during the update for that device in the message list below the summary list. |
| Messages list                | The messages generated during the license update for the selected device. Select a message to see detailed information in the fields to the right of the list.                                                                                                 |
| Description                  | Additional information about the message selected in the message list.                                                                                                                                                                                         |
| Action                       | The steps you should take to resolve the described problem.                                                                                                                                                                                                    |
| Abort button                 | Aborts the license update task.                                                                                                                                                                                                                                |

## Logs Page

Use the Logs page to configure the default settings for the audit and operations logs. The audit log keeps a record of all state changes that occur in Security Manager.

### Navigation Path

Select **Tools > Security Manager Administration** and select **Logs** from the table of contents.

| <b>Manual Purging</b>                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Keep Audit Log in DB For (days)         | The maximum number of days of Audit Log entries that has to be stored in the database before deleting it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Keep Audit Log in DB For Last (entries) | The maximum number of audit log entries to be stored in the database. If an entry becomes older than the number of days specified in the Keep Audit Log For field, it is deleted even if the log has fewer than the maximum number of entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Purge Now                               | <p>To delete the old entries from the database, click <b>Purge Now</b>. Based on the values entered in the Keep audit log in DB for Last (days) and Keep audit log in DB for Last (entries) fields, the audit log entries that is maximum gets deleted.</p> <p>For example, if the value for Keep audit log in DB for Last (days) is 5 and Keep audit log in DB for Last (entries) is 5000, and last 5 days log entries is more than 5000, then Cisco Security Manager keeps the last 5000 entries and deletes the older entries even if they belong to the last 5 days.</p> <p><b>Note</b> The Purge Now button only removes audit report entries from the database. It does not remove the *.csv files from the &lt;install_dir&gt;\CSCOPx\MDC\log\audit folder. These *.csv files can be deleted directly.</p> |
| Keep Audit Log File For (days)          | Number of days an audit log file should be retained in the system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Purge Now                               | <p>Click this button to immediately delete the specified older audit log files.</p> <p><b>Note</b> The Purge Now button deletes the CSDL Audit log files from &lt;install_dir&gt;\MDC\log\CSDL Audit Log folder along with Audit log files from &lt;install_dir&gt;\MDC\log\audit folder.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Keep Operation Log Files For (days)     | The number of days that Security Manager keeps operation logs before deleting them. These logs are used for debugging purposes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Purge Now button                        | Click this button to immediately delete the specified older operation log files.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Element                                                 | Description                                                                                                                                                                                                                                     |
|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Scheduled Purging</b>                                |                                                                                                                                                                                                                                                 |
| Enable Scheduled Purging for Audit Log Database Entries | Click this check box to scheduled the purging of older log entries. The schedule options are enabled on clicking this check box.                                                                                                                |
| Keep Audit Log in DB For (days)                         | The maximum number of days of Audit Log entries that has to be stored in the database before deleting it.                                                                                                                                       |
| Keep Audit Log in DB For Last (entries)                 | The maximum number of audit log entries to be stored in the database. If an entry becomes older than the number of days specified in the Keep Audit Log For field, it is deleted even if the log has fewer than the maximum number of entries.  |
| Enable Scheduled Purging for Audit Log Files            | Click this check box to schedule purging of audit logs from the system.                                                                                                                                                                         |
| Keep Audit Log File For (days)                          | Number of days an audit log file should be retained in the system.                                                                                                                                                                              |
| Enable Scheduled Purging for Operation Log Files        | Click this check box to schedule purging of operation logs from the system.                                                                                                                                                                     |
| Keep Operation Log Files For (days)                     | The number of days that Security Manager keeps operation logs before deleting them. These logs are used for debugging purposes.                                                                                                                 |
| Log Level                                               | The level of information, according to severity, that you would like collected in the operation logs. Each level collects different amounts of data. For example, the Info level yields the most data, and the Severe level collects the least. |
| Save button                                             | Saves your changes.                                                                                                                                                                                                                             |
| Reset button                                            | Resets changes to the previously applied values.                                                                                                                                                                                                |
| Restore Defaults button                                 | Resets values to Security Manager defaults.                                                                                                                                                                                                     |

## Policy Management Page

Use the Policy Management page to select the types of router and firewall policies you will manage in Security Manager. These selections apply to routers and firewall devices, but do not apply to IPS devices. By default, all policies are selected for management.

Unmanaged policies are removed from both Device view and Policy view. Any unmanaged policies, local or shared, are removed from the Security Manager database. The only exception is interface policies, which continue to appear in Security Manager but are marked as read-only policies. For firewall devices, interface and failover settings are considered a unit and are managed or unmanaged together.

For detailed information on managing and unmanaging policy types, including what you should do before and after changing these settings, see [Customizing Policy Management for Routers and Firewall Devices](#), on page 175.

**Caution** If you use AUS or CNS to deploy configurations to ASA or PIX devices, be aware that the device downloads a full configuration from AUS or CNS. Thus, reducing the policies managed by Security Manager actually removes the configurations from the device. If you intend to deselect some ASA/PIX policies for management to use other applications along with Security Manager to configure devices, do not use AUS or CNS.

### Navigation Path

Select **Tools > Security Manager Administration** and select **Policy Management** from the table of contents.

### Field Reference

*Table 152: Policy Management Page*

| Element                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Policies to Manage                                            | <p>The policy types are organized in folders, with router and firewall (which includes all ASA, PIX, and FWSM devices) handled separately, and then by category (NAT, Interfaces, and Platform). Select or deselect policy types as desired and click <b>Save</b>. Deselecting the check box for a group of policies deselects all policies in that group. By default, all policies are selected.</p> <p><b>Note</b> Beginning with version 4.18, Cisco Security Manager provides support for ASA 9.10(1) devices that are configured on the Umbrella server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Display a warning on all shared policies and imported objects | <p>Whether to add a message to all shared policies and to objects that were imported using the <b>File &gt; Import</b> command. If you select this option, messages appear on the following:</p> <ul style="list-style-type: none"> <li>• All shared policies, whether they were imported or locally created.</li> <li>• Policy objects that were created by importing devices or shared policies using the <b>File &gt; Import</b> command, but not imported policy objects created by the PolicyObjectImportExport.pl command (described in <a href="#">Importing and Exporting Policy Objects</a>, on page 251).</li> </ul> <p>If you regularly import shared policies, the imported policies and objects replace any same-named policies and objects, so any changes made locally are removed. This message can notify users that policies might be imported and help users identify policy objects that they might not want to edit.</p> <p><b>Tip</b> When importing policies or devices, you are prompted to select a setting for this option. Thus, users who import policies or devices can change this setting without accessing this page provided they have the required authorization. The change is effective only after the importer submits (and if necessary, approves) the changes. For more information, see <a href="#">Importing Policies or Devices</a>, on page 489.</p> |

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Save button             | Saves your changes.<br><br>If you are unmanaging a policy, you are shown a list of devices that have the policy assigned to them. Security Manager must be able to obtain the required locks to unassign the policy from all devices, or you must manually unassign the policies (or remove the locks) before unmanaging the policy.<br><br>If you are managing a previously unmanaged policy, be sure to rediscover all affected devices to bring the existing configurations into Security Manager. |
| Reset button            | Resets changes to the previously applied values.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Restore Defaults button | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Policy Objects Page

Use the Policy Objects page to define system defaults related to policy object creation.

### Navigation Path

Select **Tools > Security Manager Administration** and select **Policy Objects** from the table of contents.

| When Redundant Objects Detected | The action you want Security Manager to take when you try to create a policy object that has the same definition as an existing object: <ul style="list-style-type: none"> <li>• Ignore—You can freely create objects with identical definitions. Any conflicts are ignored by Security Manager.</li> <li>• Warn—Security Manager displays a warning if you attempt to create an object that is identical to an existing object. You may proceed to create the object, if you wish.</li> <li>• Enforce—Security Manager prevents you from creating an object that is identical to an existing object. An error message is displayed.</li> </ul> |

| Element                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Default Source Ports             | <p>The port range value that is used as the default source port range for service objects. You can choose one of the following:</p> <ul style="list-style-type: none"> <li>• Use all ports—Includes all ports from 1 to 65535.</li> <li>• Use secure ports—Includes all ports from 1024 to 65535.</li> </ul> <p>If you change the default source ports, you must manually redeploy any previously deployed devices that might be affected. These changes might not be reflected in any open activities until you refresh the data.</p> <p>For more information on port list objects, see <a href="#">Configuring Port List Objects</a>, on page 331.</p> |
| Enable AutoComplete Dropdown Box | Whether to have Security Manager list matching service and port list names as you type them when you create a service. You can then easily select from names you have already defined. If you deselect AutoComplete, you have to remember the complete service and port list names and type them in yourself.                                                                                                                                                                                                                                                                                                                                            |
| Save button                      | Saves your changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Reset button                     | Resets changes to the previously applied values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Restore Defaults button          | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Process Monitoring Settings Page

Use the Process Monitoring Settings page to enable process monitoring. Here, you can enable or disable monitoring for specific processes and configure notification settings such as monitoring interval and email addresses. This will send an email notification to specified recipients, when a process stops.

### Before You Begin

Configure SMTP Server and sender mail in the CS web console, to get email alerts.

### Navigation Path

Select **Tools > Security Manager Administration** and select **Process Monitoring Settings** from the table of contents.

**Table 154: Process Monitoring Settings Page**

| Element                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Process Monitoring              | <p>When selected, Security Manager will allow you to specify the processes that you want to monitor. You must proceed to configure other process monitoring settings.</p> <p>By default, the Process Monitoring feature is disabled on the Cisco Security Manager Server.</p> <p><b>Note</b> Enabling or disabling the process monitor modifies the Windows registry and may generate a system alert.</p>                                                                                                |
| Monitoring Interval (in minutes)       | <p>Specify the interval, at which, the process will be monitored. Valid values are between 1-60 minutes. The default monitoring interval is 5 minutes.</p> <p><b>Note</b> If the monitoring interval is changed, the monitoring task in progress stops and the new monitoring task starts with the updated interval.</p>                                                                                                                                                                                 |
| Notification Recipient(s)<br>E-mail(s) | <p>Enter email IDs for the notification recipients. You can enter multiple email IDs, separated by a comma. These are the recipients that will be notified, when a process being monitored, stops.</p>                                                                                                                                                                                                                                                                                                   |
| Maximum Mail Alerts                    | <p>Enter the maximum number of emails that will be sent to the recipients during the course of Security Manager runtime. The default value here, is 10.</p>                                                                                                                                                                                                                                                                                                                                              |
| Process List                           | <p>Select one or more processes that you want to monitor. Whenever any of these selected processes stop, a notification email will be sent to the specified recipients.</p> <p><b>Note</b> When Event Management, Health and Performance Monitor and Report Manager are disabled from Tools &gt; Security Manager Administration, email notifications will not be sent, even if, the VmsEventServer, CsmHPMServer and CsmReportServer processes are enabled in the process monitoring settings page.</p> |
| Save button                            | Saves your changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Reset button                           | Resets changes to the previously applied values.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Restore Defaults button                | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Single Sign-on Configuration Page

Use the Single Sign-on Configuration page of the Security Manager Administration window to enable and configure a “single sign-on” (SSO) shared key to use for cross-launching Cisco Prime Security Manager or FireSIGHT Management Center.

---

**Note** Single sign-on allows users to cross-launch Prime Security Manager or FireSIGHT Management Center from Security Manager without logging into Prime Security Manager or FireSIGHT Management Center separately. However, SSO is not required to cross-launch Prime Security Manager or FireSIGHT Management Center.

---

---

**Tip** Cisco Prime Security Manager is used to manage ASA CX modules. FireSIGHT Management Center is used to manager ASA FirePOWER modules.

---

### Navigation Path

1. Click **Tools > Security Manager Administration** and select **Single Sign-on Configuration** from the table of contents.
2. Select **Enable for Prime Security Manager** [checkbox] or **Enable for FireSIGHT Management Center** [checkbox].

### Field Reference

*Table 155: Single Sign-on Configuration Page*

| Element                                | Description                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Enable for Prime Security Manager      | [checkbox] Lets you enable or disable the SSO feature for Prime Security Manager. When disabled, the shared key is retained.      |
| Enable for FireSIGHT Management Center | [checkbox] Lets you enable or disable the SSO feature for FireSIGHT Management Center. When disabled, the shared key is retained. |

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Shared Key for Single Sign-on | <p>Use the features in this section to generate and view an encryption key for cross-launching Prime Security Manager or FireSIGHT Management Center.</p> <p>Click the <b>Generate</b> button to randomly generate a 128-bit AES key, which is then displayed as a 32 hexadecimal string in the SSO Shared Key field.</p> <p><b>Note</b> This key must be provided when configuring single sign-on cross-launching in Prime Security Manager or FireSIGHT Management Center. Also, each allowed Security Manager user must be configured in the Prime Security Manager database or the FireSIGHT Management Center user database with the same username as that in the Security Manager user database (the password can be different).</p> <p><b>Tip</b> Refer to “Configuring Single Sign-On for Cisco Security Manager” in the <i>User Guide for ASA CX and Cisco Prime Security Manager</i> ( <a href="#">Cisco ASA CX Context-Aware Security End-User Guides</a> ) for information about configuring SSO in PRSM.</p> |

## Rule Expiration Page

Use the Rule Expiration page to define the default values for policy rule expiration. When you create policies for some types of policy rules (such as access rules), you can set an expiration date for the rule, and Security Manager can notify you by e-mail of the approaching expiration date.

You must configure an SMTP server to enable e-mail notifications. For more information, see [Configuring an SMTP Server and Default Addresses for E-Mail Notifications](#) , on page 27.

### Navigation Path

Select **Tools > Security Manager Administration** and select **Rule Expiration** from the table of contents.

### Field Reference

*Table 156: Rule Expiration Page*

| Element                  | Description                                                                                                                                                             |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Notify Email             | The default e-mail address that should receive notifications of rule expiration. Users can override this address when configuring individual rules.                     |
| Notify Before Expiration | The default number of days before a rule expires that Security Manager should send the e-mail message. Users can override this value when configuring individual rules. |
| Sender                   | The e-mail address that Security Manager will use for sending e-mail notifications.                                                                                     |

| Element                 | Description                                                                                                                                                                                                                                                                                                                   |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Email Format            | The format of the e-mail message: <ul style="list-style-type: none"> <li>• Text—The e-mail is sent in HTML and plain text formats.</li> <li>• XML—The e-mail is sent using an XML markup. This option might be appropriate if you decide to write a program to automatically process and respond to notifications.</li> </ul> |
| Save button             | Saves your changes.                                                                                                                                                                                                                                                                                                           |
| Reset button            | Restores all fields to their previous values.                                                                                                                                                                                                                                                                                 |
| Restore Defaults button | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                                   |

## Server Security Page

Use the Server Security page to open specific pages in the CiscoWorks Common Services application, where you can configure various security features on the Security Manager server. CiscoWorks Common Services controls the basic functions of the Security Manager server, including user access control and system security.

When you log in to Security Manager, your username and password are compared with the account information stored in the CiscoWorks or Cisco Secure Access Control Server (ACS) database, depending on which system you established at installation as your AAA provider. After the authentication of your credentials, you have access according to the role you have been assigned.

For more information on Security Manager roles and privileges, including descriptions of how Common Services roles translate to user functions in Security Manager, see the [Installation Guide for Cisco Security Manager](#).

### Navigation Path

Select **Tools > Security Manager Administration** and select **Server Security** from the table of contents.

### Field Reference

**Table 157: Server Security Page**

| Element                  | Description                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AAA Setup button         | Opens Common Services and displays the AAA Mode Setup page. From this page, you can set AAA as your fallback sign-on method. For more information about AAA, click <b>Help</b> from the AAA Mode Setup page.                                                                                                                                          |
| Certificate Setup button | Opens Common Services and displays the Self-Signed Certificate Setup page. CiscoWorks enables you to create self-signed security certificates, which you can use to enable SSL connections between your client browser and management server. For more information about self-signed certificates, click <b>Help</b> from the Certificate Setup page. |

| Element                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Single Sign On button                                         | Opens Common Services and displays the Single Sign-On Setup page. With Single Sign On (SSO), you can use your browser session to transparently navigate to multiple CiscoWorks servers without having to authenticate to each of them. Communication between multiple CiscoWorks servers is enabled by a trust mode addressed by certificates and shared secrets. For more information about setting up SSO, click <b>Help</b> from the Single Sign-On page. |
| Local User Setup                                              | Opens Common Services and displays the Local User Setup page, from which you can add and delete users, edit user settings, and assign roles or permissions. For more information, click <b>Help</b> from the Local User Setup page and see the <a href="#">Installation Guide for Cisco Security Manager</a> .                                                                                                                                               |
| System Identity Setup                                         | Opens Common Services and displays the System Identity Setup page. Communication between multiple CiscoWorks servers is enabled by a trust mode addressed by certificates and shared secrets. System Identity setup helps you to create a trust user on servers that are part of a multi- server setup. For more information about system identity setup, click <b>Help</b> from the System Identity Setup page.                                             |
| Native RBAC Parameters                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Allow logon for user ids not available in Local User Database | For Security Manager installations integrated with an external authentication server like Active Directory, TACACS+, or RADIUS, specifies whether users can log in even when their user name is not defined in the Security Manager user list. When enabled, users are allowed to log in using the default role specified in Role Management Setup. If a default role is not configured, the user is not allowed to log in.                                  |

## Take Over User Session Page

Use the Take Over User Session page to take over another user's configuration session. A user with administrative privileges can take over the work of another user in non-Workflow mode. Taking over a session is useful when a user is working on devices and policies, causing the devices and policies to be locked, and another user needs access to the same devices and policies. However, when you take over another user's session, your current session is discarded, so make sure that you submit your changes before taking over a session.

The table shows all current configuration sessions, listing the user name and the state of the session, whether the user is currently logged in or logged out. Select the configuration session you want to take over and click **Take over session**. The session is transferred to you in its current state, including any saved changes the user made during the session.

If the selected user is logged in at the time you take over the session, the user receives a warning message, loses any unsaved changes in progress, and then is logged out.

For more information, see [Taking Over Another User's Work, on page 499](#)

### Navigation Path

Select **Tools > Security Manager Administration** and select **Take Over User Session** from the table of contents.

## Ticket Management Page

Use the Ticket Management page to enable Ticket Management, to configure a ticketing system URL for integration with an external change management system, and to configure purge settings for ticket information.

When Ticket Management is enabled, every Image Management installation job must have an assigned ticket or it will not be performed.

### Navigation Path

Select **Tools > Security Manager Administration** and select **Ticket Management** from the table of contents.

| Restore Defaults button                                                                                                                                                                             | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                                                                                                                 |

## Token Management Page

Use the Token Management page to identify the Token Management System (TMS) server to use for deploying configurations to Cisco IOS routers that use TMS as the communication protocol. Security Manager uses the settings on this page to contact the TMS server.

Security Manager uses FTP to deploy the delta configuration file to the TMS server, from which the configuration file can be downloaded and encrypted onto an eToken.

To use TMS with Cisco IOS routers, you must specify TMS as the transport protocol. You can do this for all routers on the Device Communication page (see [Device Communication Page](#) , on page 530), or for a specific router in its device properties (see [Device Properties: General Page](#) , on page 108). You must also configure the TMS server as an FTP server, otherwise deployment will fail.

### Navigation Path

Select **Tools > Security Manager Administration** and select **Token Management** from the table of contents.

| Element                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Server Name or IP Address                    | The DNS hostname or IP address of the TMS server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Username                                     | The username Security Manager should use to log on to the TMS server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Password                                     | The password for the username. Enter the password in both fields.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Confirm Password                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Directory in the TMS Server for Config Files | The directory on the TMS server where deployed configuration files will be downloaded. The root FTP directory (“.”) is the default FTP location on the TMS server.                                                                                                                                                                                                                                                                                                                                                                                                |
| Public Key File Location                     | <p>The location of the public and private key files on the Security Manager server, as copied from the TMS server. Security Manager uses the public key to encrypt data sent to the TMS server. Then the server uses its private key to decrypt the data. Security Manager comes with a default public key that matches the default private key on the server.</p> <p><b>Note</b> If needed, you can generate a new pair of public and private keys using the TMS server. If you do this, you need to copy the new public key to the Security Manager server.</p> |
| Save button                                  | Saves your changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Reset button                                 | Resets changes to the last saved values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Restore Defaults button                      | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## VPN Policy Defaults Page

Use the VPN Policy Defaults page to view or assign the default VPN policies that Security Manager uses for each IPsec technology. Before you can select a policy as a default, you must create the policy as a shared policy, submit it to the database and have it approved. You cannot create policies from this page. For detailed information on how to configure these defaults, see [Understanding and Configuring VPN Default Policies](#) , on page 1084.

For each tab that relates to a VPN topology, the drop-down lists for each policy type list the existing shared policies that you can select. You can select a policy and click the **View Content** button to see the definition of that policy. In some cases, you are allowed to make changes, but you cannot save them.

Security Manager uses VPN policy defaults to simplify VPN configuration while ensuring that policy consistency is maintained. Security Manager provides factory default policies for mandatory policies, which provide values for settings that must be configured on the devices in your VPN topology for the VPN to work. Mandatory policies differ depending on the assigned IPsec technology. Factory default policies with their default configurations enable you to deploy to your devices immediately after creating the VPN topology.

Default settings are not provided for optional policies. You might want to create shared policies to provide different default settings instead of using the factory default settings.

### Navigation Path

Select **Tools > Security Manager Administration** and select **VPN Policy Defaults** from the table of contents.

**Table 160: VPN Policy Defaults Page**

| Element               | Description                                                                                                                 |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------|
| DMVPN tab             | Lists the policy types for which you can configure default policies for the Dynamic Multipoint VPN technology.              |
| Large Scale DMVPN tab | Lists the policy types for which you can configure default policies for the Large Scale Dynamic Multipoint VPN technology.  |
| Easy VPN tab          | Lists the policy types for which you can configure default policies for the Easy VPN technology.                            |
| IPsec/GRE tab         | Lists the policy types for which you can configure default policies for the IPsec/GRE VPN technology.                       |
| GRE Dynamic IP tab    | Lists the policy types for which you can configure default policies for the GRE Dynamic IP VPN technology.                  |
| Regular IPsec tab     | Lists the policy types for which you can configure default policies for regular IPsec VPN technology.                       |
| Regular IPsec VTI tab | Lists the policy types for which you can configure default policies for regular, tunnel-based IPSEC VPN technology.         |
| GET VPN               | Lists the policy types for which you can configure default policies for the Group Encrypted Transport (GET) VPN technology. |
| Remote Access VPN     | Lists the policy types for which you can configure default policies for IPsec remote access VPNs.                           |
| S2S Endpoints tab     | The interface roles that define the default endpoints for internal and external interfaces in site-to-site VPNs.            |

# Workflow Page

Use the Workflow page to select the workflow mode that Security Manager enforces and to define the default settings for activity and deployment job notifications and logging.

Before changing the workflow mode, read the following topics to understand how the modes differ and the effects of changing the modes:

- [Working in Workflow Mode](#) , on page 21
- [Working in Non-Workflow Mode](#) , on page 22
- [Comparing Workflow Modes](#) , on page 22
- [Changing Workflow Modes](#) , on page 28

## Navigation Path

Click **Tools > Security Manager Administration** and select **Workflow** from the table of contents.

## Related Topics

*Table 161: Workflow Page*

| Element                                     | Description                                                                                                                                                                                                                                                         |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Workflow Control                            |                                                                                                                                                                                                                                                                     |
| Enable Workflow                             | Whether to enable Workflow mode. When Workflow mode is enabled, you can select whether or not to have an approver for activities and deployment jobs.                                                                                                               |
| Require Activity Approval                   | Whether to require that activities be approved explicitly by an assigned approver. For more information about the differences between working with and without an approver, see <a href="#">Activity Approval</a> , on page 141.                                    |
| Submitter can Approve Activity              | Activities can be approved by submitter.                                                                                                                                                                                                                            |
| Require Deployment & Install Image Approval | Whether to require that deployment jobs and install image jobs be approved explicitly by an assigned approver. For more information about the differences between working with and without an approver, see <a href="#">Understanding Deployment</a> , on page 379. |
| Submitter can Approve Deployment Jobs       | Deployment jobs can be approved by submitter.                                                                                                                                                                                                                       |

| Element                                                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| System Generated Default Activity Name                                                        | By default, this check box is checked. Clear the check box, if you do not want the activity name to be appended with the system generated default name. The activity name field in the activity creation dialog is left blank.                                                                                                                                                                                                                                                                                                                                     |
| Email Notifications                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Sender                                                                                        | The e-mail address that Security Manager will use for sending e-mail notifications.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Activity Approver                                                                             | The default e-mail address for the person responsible for approving activities. Users can override this address when submitting an activity for approval. For more information, see <a href="#">Submitting an Activity for Approval (Workflow Mode with Activity Approver)</a> , on page 159.                                                                                                                                                                                                                                                                      |
| Job/Schedule Approver                                                                         | The default e-mail address of the person responsible for approving deployment jobs or schedules. Users can override this address when submitting a job or schedule for approval. For more information, see <a href="#">Submitting Deployment Jobs</a> , on page 416.                                                                                                                                                                                                                                                                                               |
| Require Deployment Status Notification<br>Include Job Deployer<br>Job Completion Notification | Whether to have e-mail notifications sent whenever the status of a deployment job changes. If you select this option, enter the e-mail addresses that should receive notification in the Job Completion Notification field. Separate multiple addresses with commas.<br><br>You can also select Include Job Deployer to include the e-mail address of the person who deployed the job on the notification e-mail message.                                                                                                                                          |
| Workflow History                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Keep Activity for                                                                             | The number of days that activity information should be kept in the Activity table. The default is 30. You can specify from 1 to 180 days.<br><br>Click <b>Purge Now</b> to delete all activities older than the number of days specified.<br><br><b>Note</b> If ticketing is enabled in non-Workflow mode, purge settings are controlled via the settings for Tickets (see <a href="#">Ticket Management Page</a> , on page 584).                                                                                                                                  |
| Keep Job for                                                                                  | The number of days that deployment job information should be kept in the Deployment Job table. The default is 30. You can specify from 1 to 180 days.<br><br>Click <b>Purge Now</b> to delete all jobs older than the number of days specified.<br><br><b>Note</b> From Cisco Security Manager version 4.22, choosing this option deletes the deployment transcript files older than the number of days specified, from the <b>C:\Program Files (x86)\CSCOpx\MDC\tomcat\vm\athena\transcript</b> folder also. This helps eradicate stale entries getting piled up. |

| Element                   | Description                                                                                                                                                                                                                                                                                                                                |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Keep job per schedule for | The number of days that deployment job information should be kept in the Deployment Job table for each job schedule. This setting applies only to jobs that were initiated by a schedule. The default is 30. You can specify from 1 to 180 days.<br><br>Click <b>Purge Now</b> to delete all jobs older than the number of days specified. |
| Save button               | Saves your changes.                                                                                                                                                                                                                                                                                                                        |
| Reset button              | Resets changes to the previously applied values.                                                                                                                                                                                                                                                                                           |
| Restore Defaults button   | Resets values to Security Manager defaults.                                                                                                                                                                                                                                                                                                |

## Wall Settings Page

The Security Manager Wall Settings page is where you can enable or disable the Wall feature.

The "Wall" feature is also called the "ShoutBox" feature. You can use it to send messages to all users who are logged in on the same Security Manager server. First, however, it must be enabled on the Wall Settings page.

---

**Note** Only admin users have permission to enable or disable the Wall feature, but all users have permission to send messages.

---

You would want to use the Wall feature, for example, to interact with other users while making some changes in your Security Manager installation, perhaps about the changes being made or certain immediate actions to be performed on the changes. The message being sent is broadcast to all users who are logged in. The Wall feature allows users to enter basic profile information that can be viewed by others when logged in. A significant use of the Wall feature is that it can be used to view a list of all users who are currently logged in. (A user is removed from the Wall window after idle timeout or logging out through the Security Manager client.)

You cannot use the Wall feature to send \*.pdf, \*.xls, or other file attachments.

### Navigation Path

Click **Tools > Security Manager Administration** and select **Wall Settings** from the table of contents.

### Field Reference

*Table 162: Wall Settings Page*

| Element                                 | Description                                    |
|-----------------------------------------|------------------------------------------------|
| Enable users to send messages to others | Whether to enable or disable the Wall feature. |
| Save button                             | Saves and applies changes.                     |
| Reset button                            | Resets changes to the last saved values.       |

| Element                 | Description                                 |
|-------------------------|---------------------------------------------|
| Restore Defaults button | Resets values to Security Manager defaults. |

When the Wall feature is enabled, you can open the Wall window by clicking **Tools > Wall...** or by clicking the Wall icon in Configuration Manager.

You can also open the Wall window by clicking the Wall icon in Health and Performance Monitor or Image Manager. You cannot open the Wall window in Event Viewer or Report Manager.

Detailed Wall feature help is available on the Wall window by clicking the help icon.

The Wall window contains the following elements:

- Left-hand pane, which shows the users who are logged in on the same Security Manager server and an expand/collapse button.
- Right-hand pane, which occupies most of the page and contains the text of the messages that users have sent. The right-hand pane also has a button to enable or disable wall alerts and the help icon, which you can click to see detailed help.

| Summary of the Wall Window |                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Message Display            | <p>Messages are displayed in the right-hand pane of the Wall window. The latest messages are always displayed at the top. Selective copy of text is allowed from the messages.</p> <p>You are allowed to type a maximum of 280 characters in the message panel, and after completing this number of characters you are alerted by a beep sound.</p>                                                                               |
| Message Log                | <p>You can see a log of previous messages. The message log keeps 100 messages. The messages become visible to you when you launch the Wall window.</p>                                                                                                                                                                                                                                                                            |
| Profile Picture            | <p>You can upload a picture for your profile. Valid image types such as JPG, PNG, BMP, and GIF types are supported.</p> <p>To upload a picture, use the <b>upload</b> link in the user profile window. To open the user profile window, click on the username or user picture in the Wall window.</p> <p>The user profile window also has an icon that toggles between Edit profile information and Save profile information.</p> |
| User Profile Window        | <p>To open the user profile window, click on the username or user picture in the Wall window. ## CHAPTER 12

# Introduction to Firewall Services

The Firewall policy folder (in either Device or Policy view) includes firewall-related policies that you can deploy to the Adaptive Security Appliance (ASA), PIX Firewall (PIX), Catalyst Firewall Services Module (FWSM), and security routers running Cisco IOS Software. These policies allow you to control network access through a device.

This chapter contains the following topics:

- [Overview of Firewall Services](#) , on page 595
- [Managing Your Rules Tables](#) , on page 602

## Overview of Firewall Services

The Firewall policy folder (in either Device or Policy view) includes firewall-related policies that you can deploy to the Adaptive Security Appliance (ASA), PIX Firewall (PIX), and Catalyst Firewall Services Module (FWSM).

---

**Note** From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software

---

These policies are focused on controlling access through the device, rather than access to the device (that is, logging into the device so that you can change its configuration or use **show** commands). Following is a general overview of the available firewall policies with pointers to topics that provide more detailed information:

- **AAA rules**—These are AAA firewall or authentication proxy rules that can require a user to authenticate (with a username and password) and optionally be authorized before the device allows the user to make network connections through it. You can also create accounting rules to collect billing, security, or resource allocation information. For more information, see [Understanding AAA Rules](#) , on page 683.
- **Access rules**—These are traditional interface-based extended access control rules. They permit or deny a packet based on source address, destination address, source interface, and service, and you can apply them in both the in and out directions. For more information, see [Understanding Access Rules](#) , on page 715.
- **Inspection rules**—These are traditional Context-Based Access Control (CBAC) inspection rules that filter out bad TCP/UDP packets based on application-layer protocol session information and that enable

return traffic for the selected services. For more information, see [Understanding Inspection Rules](#) , on page 765.

- Web filter rules—These are a type of inspection rule that filters web traffic based on the requested URL, allowing you to prevent connections to undesirable web sites. For more information, see [Understanding Web Filter Rules](#) , on page 883.
- Zone-based firewall rules—These rules replace access rules, inspection rules, and web filter rules on IOS devices if you want to configure your rules based on zones instead of interfaces. A zone is a defined group of interfaces that perform the same security role (such as Inside or Outside). By using zone rules, you can create more compact device configurations than you can by using the other types of rules. For more information, see [Understanding the Zone-based Firewall Rules](#) , on page 931.
- Botnet Traffic Filter Rules—These rules help you to spot botnet traffic when it is sent to known bad addresses. Botnets install malware on unsuspecting computers and use those computers as proxies to perform malicious actions. For more information, see [Managing Firewall Botnet Traffic Filter Rules](#), on page 905.
- Transparent rules—These are Ethertype access control rules that apply to non-IP layer-2 traffic on transparent or bridged interfaces. For more information, see [Configuring Transparent Firewall Rules](#) , on page 1007.

Most firewall rules policies are configured in rules tables. These tables allow in-line editing for most cells, rule organization using sections, and the ability to change the order of rules. If you create shared rules policies, you can apply them to a number of devices, even to devices running different operating systems, and Security Manager automatically creates the appropriate device commands to configure the policies based on the characteristics of each individual device, filtering out settings that do not apply to a device. For more information on using rule tables, see [Managing Your Rules Tables](#) , on page 602.

Another powerful feature used by most firewall rules policies is the idea of inheritance. When you create shared policies, one of your options is to have a device inherit the policy rather than be assigned the policy. This allows you to have a set of shared rules that apply to all devices, while having unique rules that apply to only those devices that require them. For more information about inheritance, see the following topics:

- [Understanding Rule Inheritance](#) , on page 168
- [Working with Shared Policies in Device View or the Site-to-Site VPN Manager](#) , on page 201

The following topics provide additional overview information about firewall services policies:

- [Understanding the Processing Order of Firewall Rules](#) , on page 596
- [Understanding How NAT Affects Firewall Rules](#) , on page 597
- [ACL Names Preserved by Security Manager](#) , on page 598

## Understanding the Processing Order of Firewall Rules

When you configure firewall rules policies, you should keep in mind the logical order in which the rules are processed. For example, if you plan to drop all traffic of a certain type in an access rule, there is no reason to create rules in other firewall policies that apply to that type of traffic, because they will never be triggered. Conversely, if you want to apply certain types of inspection or web filtering on traffic, you must ensure that your access rules first allow that traffic to enter the device.

Following is the general logical processing order of firewall rules:

- AAA rules—If you require authentication, with or without authorization, the user must successfully pass the test or the traffic is dropped.
- Access rules (In direction)—The traffic must then get through your access rules. If you used AAA rules, you might have allowed temporary per-user access rules to be configured for the user's session. These per-user rules are configured in your AAA server, not in Security Manager.  
On ASA 8.3+ devices, global access rules are then processed after any interface-specific access rules. For more information, see [Understanding Global Access Rules](#) , on page 717.
- Inspection rules (In direction), web filter rules (In direction), botnet rules, service policy rules (IPS, QoS, Connection)—All of these are applied to the traffic. For devices that do not allow you to configure the direction, all rules are considered to be in the In direction.
- Zone-based firewall rules—If you configured zone-based rules for an IOS device, these rules replace inspection and web filter rules (botnet rules do not apply to IOS devices).
- Routing protocols are then applied to the traffic. The traffic is dropped if it cannot be routed. (Routing policies are in the Platform folders for the various device types and are not considered firewall policies.)
- ScanSafe Web Security policies, Inspection rules (Out direction), web filter rules (Out direction)—For IOS devices only, if you created ScanSafe policies, or inspection or web filter rules in the Out direction, they are now applied.
- Access rules (Out direction)—Finally, the traffic must pass through any Out direction access rules.

Transparent rules do not fit into this picture. Because transparent rules apply to non-IP layer-2 traffic only, if a transparent rule applies to a packet, no other firewall rule applies to it; and conversely, if other rules apply, the transparent rule never applies.

## Understanding How NAT Affects Firewall Rules

Devices that support firewall rules also allow you to configure network address translation (NAT). NAT substitutes the real address in a packet with a mapped address that is routable on the destination network.

If you configure NAT to occur on an interface, the firewall rules that are also configured on that interface should assess traffic based on the translated address rather than on the original (pre-NAT) address, with the exception of ASA 8.3+ devices.

Devices running ASA software release 8.3 and later use the original, or real, IP address when evaluating traffic with the exception of IPSec VPN traffic policies. Thus, when you configure firewall rules, ACL policy objects, or the IOS, QoS, and connection rules platform service policy, ensure that you use the original addresses.

For more information about NAT, see the following topics:

- ASA, PIX, FWSM devices— [Understanding Network Address Translation](#) , on page 1015.
- IOS devices— [NAT Policies on Cisco IOS Routers](#) , on page 1020.

## ACL Names Preserved by Security Manager

Security Manager tries to preserve user-defined access control list (ACL) names as they appear in device configurations. Security Manager can preserve the ACL names configured on a device in the following circumstances:

- If the ACL name is specified in Security Manager.

For access rules policies, you can specify ACL names in **Firewall > Settings > Access Control** or **Firewall > Settings > IPv6 Access Control**. You can specify a given name for a single interface and direction, but the name is used for any other interfaces and directions that use the same ACL. Keep in mind that you cannot use the same name as an ACL policy object that you assign to other policies on the device, and you cannot use the same name for IPv4 and IPv6 ACLs.

---

**Note** Prior to the release of Security Manager 4.4 and versions 9.0 and later of the ASA, separate pages, policies and policy objects were provided for configuring IPv4 and IPv6 firewall rules and policies. With Security Manager 4.4 and ASA 9.0+, these policies and policy objects were combined or unified. However, for the earlier ASA versions, a separate page for IPv6 access rules is still provided in Device view, while in Policy view, IPv4 and unified versions of the AAA-, access- and inspection-rule policy types are provided.

---

- If a policy uses an ACL policy object, the name of the policy object is used for the ACL name. ACL policy objects created during discovery use the name of the ACL defined on the device whenever possible. Behavior depends on an administrative setting:
  - If you select **Allow Device Override for Policy Objects** in **Tools > Security Manager Administration > Discovery**, if a policy object with the same name exists in Security Manager, but it has different content, the name is reused and a device-level override is created.
  - If you do not select that option, a new policy object is created with the same name but with a number appended to it, for example, ACLobject\_1. This is the default behavior.
- If you select **Reuse Existing Names** for the **Firewall Access List Names** setting in **Tools > Security Manager Administration > Deployment**, names defined on the device are reused for firewall rules that generate ACLs.
- If the ACL is unshared, even if you change the content of the ACL in Security Manager.
- If the ACL is shared, but the policies that share the ACL are defined identically in Security Manager. If you change the content of the ACL, one ACL retains the name and the others are assigned generated names.

**Note** On ASA devices and on PIX devices not running version 6.3(x), Security Manager does not reuse the ACL name if it is used by a NAT policy static rule and contains an object-group. The ACL is deployed with the contents of the object-group defined as the source. This is because the device requires that all ACEs in the ACL have the same source.

### Tips

- If you use an ACL policy object that uses a name also used by an ACL already defined on the device, and the existing ACL is for a command that Security Manager does not support, you will get a deployment error asking you to choose a different name. If this happens, rename the policy object.
- ACLs named <number>\_<number> are not valid on IOS devices. Security Manager strips off the suffix prior to deployment. This also means that you cannot assign an IOS device more than one ACL object with the same numbered prefix. However, named ACLs that have a numbered suffix are allowed, for example, ACLname\_1.
- Numbered ACLs must use the correct number ranges for IOS devices. Standard ACLs must be in the range 1-99 or 1300-1999. Extended ACLs must be in the range 100-199 or 2000-2699.
- ACL names for IOS devices cannot begin with an underscore (\_).
- Policies that do not preserve user-defined names include SSL VPN policies, transparent firewall rules, and AAA rules (for IOS devices).

The following topics provide additional information about ACL naming:

- [ACL Naming Conventions](#) , on page 599
- [Resolving User Defined ACL Policy Naming Conflicts](#), on page 601
- [Resolving ACL Name Conflicts Between Policies](#) , on page 601

## ACL Naming Conventions

When the name for the ACL is generated by Security Manager, the name is derived from the type of rule or platform being defined and certain configuration settings that make it unique. All newly created ACLs are given a name based on the naming conventions shown in the following table.

**Tip** During deployment, sometimes a suffix *.n* (where *n* is an integer) might get added to an ACL name if the existing ACL cannot be edited in place. For example, if an ACL named `acl_mdc_outside_10` already exists on the device, a new ACL with the name `acl_mdc_outside_10.1` is created if you do not remove the old ACL before you deploy the new ACL.

**Table 163: ACL Naming Conventions**

| Policy Type | Naming Convention                                                                                                                       |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Access ACLs | <ul style="list-style-type: none"> <li>• Inbound: CSM_FW_ACL_InterfaceName</li> <li>• Outbound: CSM_FW_ACL_OUT_InterfaceName</li> </ul> |

| Policy Type                              | Naming Convention                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Resolving User Defined ACL Policy Naming Conflicts

Cisco Security Manager generates ACL names that begin with “CSM\_”. You should not use the same naming pattern while defining a ACL in the device. If you declare ACL names with the “CSM\_” prefix on device, during discovering the device configuration in Cisco Security Manager, those ACL names are replaced with Security Manager generated names and respective configuration delta would be applied to a device on the next deployment.

For example, Cisco Security Manager has CSM\_FW\_ACL\_InterfaceName as the ACL naming pattern for inbound firewall interface. Here, if you use the CSM pattern for ACL name declaration in device like, CSM\_xyz, Security Manager renames it as “CSM\_FW\_ACL\_InterfaceName”.

---

**Note** This rule is valid for firewall access list and delta would be generated and applied to a device even when the Reuse existing names setting is configured in Tools > Security Manager Administration > Deployment.

---

## Resolving ACL Name Conflicts Between Policies

If an ACL is shared, but the policies that share the ACL are not defined identically in Security Manager, one policy uses the original name of the ACL and the other policies use a new name generated by Security Manager. The order of preference for determining which policy uses the original name is as follows:

- Access list ACLs
- AAA ACLs
- Static ACLs
- NAT0 ACLs
- NAT ACLs

For example, if an access ACL and a NAT0 ACL try to reuse the same ACL, the access ACL uses the original name as configured on the device and the NAT0 ACL is renamed by Security Manager.

# Managing Your Rules Tables

The following sections explain some of the basics of using rules tables, which appear in many of the firewall rules, NAT, and select other policies:

- [Using Rules Tables](#) , on page 602
- [Adding and Removing Rules](#) , on page 604
- [Editing Rules](#) , on page 605
- [Finding and Replacing Items in Rules Tables](#) , on page 612
- [Moving Rules and the Importance of Rule Order](#) , on page 615
- [Enabling and Disabling Rules](#) , on page 616
- [Using Sections to Organize Rules Tables](#) , on page 616
- [Combining Rules](#) , on page 618
- [Generating Policy Query Reports](#) , on page 625
- [Optimizing Network Object Groups When Deploying Firewall Rules](#) , on page 632
- [Expanding Object Groups During Discovery](#) , on page 635

## Using Rules Tables

Rules tables in Security Manager display sets of rules (for example, access rules) that make up a policy. These types of tables are used in only a select group of policies, but many of the firewall services rules policies use them. Rules tables are used when the order of the rules within the policy matter.

The below figure details the features in rules tables.

Figure 17: Rules Table Example

The screenshot displays the 'Access Rules (Unified)' configuration page for device 'PMR-ASA912.cisco.com'. The policy is assigned to '1 Device' and inherits from 'GlobalAccessPolicy'. The table shows several rule sections, including 'GlobalAccessPolicy - Mandatory (1 Rule)', 'GroupA\_AccessPolicy - Mandatory (4 Rules)', 'DHCP Access (2-4) Permit access to DHCP', and 'GlobalAccessPolicy - Default (1 Rule)'. The table columns are: No., Permit, Sources (Network, Security Group, User), Destinations (Network, Security Group, Service). The 'DHCP Access' section is expanded, showing four rules for DHCP-Relay, DHCPv6-Client, and DHCPv6-Server. The bottom of the interface features buttons for 'Enable conflict detection', 'Generate Report', 'Refresh Hit Count', 'Query', and 'Save'.

Following is an explanation of the numbered call-outs of the rules table features:

- **Device and policy identification banner (1)**—The banner provides information about policy sharing and inheritance and includes the ability to perform some actions. For detailed information, see [Using the Policy Banner](#), on page 203.
- **Table filter (2)**—You can filter the rules displayed to help you find rules in a large table. For more information, see [Filtering Tables](#), on page 50.
- **Table column headings (3)**—You can sort by column and move, show, and hide columns. For more information, see [Table Columns and Column Heading Features](#), on page 51.
- **Rules, Workarea (4)**—The body of the table shows the rules that are included in the policy.
- **User-defined sections (5)**—You can group rules into sections for your convenience. For more information, see [Using Sections to Organize Rules Tables](#), on page 616.
- **Table buttons (6)**—Use the buttons below the table to do the following:
  - Enable automatic conflict detection (Access Rules only). For more information, see [Using Automatic Conflict Detection](#), on page 742.

If conflict detection is enabled, you can click the **Generate Report** button to create an HTML report of the conflicts that can be printed or exported to another tool.

When you first open the Access Rules page, the Generate Report button is replaced with a progress bar. After conflict analysis has completed, the Generate Report button becomes available along with the other conflict detection features.

- Update the hit count information displayed in the table. For more information, see [Viewing Hit Count Details](#) , on page 751 and [Hit Count Selection Summary Dialog Box](#) , on page 735.
- Run a policy query, which can help you evaluate your rules and identify ineffective rules. See [Generating Policy Query Reports](#) , on page 625.
- Find and replace items within rules (button with the binoculars icon)—For more information, see [Finding and Replacing Items in Rules Tables](#) , on page 612.
- Move and rearrange rules (up and down arrows)—For more information, see [Moving Rules and the Importance of Rule Order](#) , on page 615.
- Add rules to the table (+ icon)—For more information, see [Adding and Removing Rules](#) , on page 604.
- Edit the selected rule (pencil icon)—For more information, see [Editing Rules](#) , on page 605.
- Delete the selected rule (trash can icon)—For more information, see [Adding and Removing Rules](#) , on page 604.
- **Conflict Navigation Bar (7)**—Use the Conflict navigation bar to navigate to conflicting rules in the rules table. For more information, see [Using Automatic Conflict Detection](#) , on page 742.

## Adding and Removing Rules

When you work with policies that use rules tables, like many of the firewall rules policies, you can add rules to the policy using several methods:

- **Add Row** button (+ icon)—Clicking the Add Row button beneath the table is the standard method to add a new rule. Clicking this button opens the dialog box for adding rules that is specific to that type of policy. If you select a row or section heading, the new rule is added after the selected row. Otherwise, it is added at the end of the appropriate scope (typically, the local scope).
- Right-click a row and select **Add Row**—This is equivalent to selecting a row and clicking the Add Row button.
- Copy and paste—If you want to create a new rule that is similar to an existing rule, you can select the rule, right-click and select **Copy**, then select the row after which you want to place the rule, right-click and select **Paste**. This creates a duplicate rule, which you can select and edit (see [Editing Rules](#) , on page 605).
- Cut and paste—Cut and paste is similar to copy and paste, except you are deleting the existing rule when you select the **Cut** command. Instead of cut and paste, consider moving the rule (see [Moving Rules and the Importance of Rule Order](#) , on page 615).

When you no longer need a rule, you can remove it by selecting the rule and clicking the **Delete Row** button (trash can icon).

---

**Tip** Rather than deleting a rule, consider first disabling the rule. By disabling a rule, you remove it from the device (when you redeploy the configuration) without removing it from Security Manager. Then, if you discover that you really needed that rule after all, you can simply enable it and redeploy the configuration. If you delete the rule, you would have to recreate it (there is no undo function). Thus, you might want to develop a policy of deleting rules only after they have been disabled for a certain amount of time. For more information, see [Enabling and Disabling Rules](#) , on page 616.

---

## Editing Rules

To edit an existing rule in any of the rules policies that use rules tables, select the rule and click the **Edit Row** button, or right-click and select **Edit Row**. This allows you to edit all aspects of the selected rule.

---

**Tip** You cannot edit any aspect of an inherited rule from a local device rule policy. Edit inherited rules in Policy view.

---

For most rule tables, you can also edit specific attributes, or table cells, instead of editing the entire rule, using commands in the right-click menu.

The ability to edit a cell is limited by whether it makes sense to edit the content. For example, Inspection Rules have many limitations based on how the rule is configured:

- If you applied the rule to All Interfaces, you cannot edit source or destination addresses, the interface, or the direction of the rule.
- If you selected Default Inspection Traffic for the traffic match criteria (without selecting the option to limit inspection between source and destination), or Custom Destination Ports, you cannot edit source or destination addresses.
- If you selected Destination Address and Port (IOS), you cannot edit source addresses.

The following cell-level commands are available, although the ability to edit multiple rows is not supported in all policies that use rule tables:

- **Add <Attribute Type>**—When you select multiple rows and right-click a Source, User, Destination, Services, or Interface cell, you can select the Add command to append entries to the data currently in the selected cells. The Add command's full name includes the name of the attribute, for example, Add Source.
- **Edit <Attribute Type>**—Most attributes allow you to edit the content. Editing replaces the content of the cell. You can edit a single cell, or select multiple rows and edit the contents of the same type of cell in all rows at once. The Edit command's full name includes the name of the attribute, for example, Edit Interfaces.

- **Edit <Entry>**—In some cases, when you edit Source, User, Destination, Services, or Interfaces, you can select an entry in the cell and edit just that entry. For example, if the Sources cell contains three network/host objects and an IP address, you can select any of them and edit the entry. The edit command includes the name of the entry, for example, Edit HostObject.
- **Remove <Entry>**—In some cases, when you edit Source, User, Destination, Services, or Interfaces, you can select an entry in the cell and remove the entry. You cannot remove the last entry in the cell, because the rule would become invalid. The remove command includes the name of the entry, for example, Remove IP.
- **Create <Object Type> Object from Cell Contents**—In the Sources, User, Destinations, and Services cells, you can select the Create command to create a policy object of the appropriate type. You can also select an entry in the cell and create a policy object from just the selected item. The create command includes the policy object type you can create, and the name of the item that is the source for the object, either cell contents for everything in the cell, or the name of an entry if you selected one. When creating network/host objects, you are always creating network/host group objects.
- **Show <Attribute Type> Contents; Show <Entry> Contents**—The show commands let you view the actual data defined in the cell. The results depend on the view you are in:
  - **Device View, Map View, or Import Rules**—You are shown the actual IP addresses, fully-qualified domain names (FQDNs), services, or interfaces to which the rule will apply for the specific device. For example, if the rule uses network/host objects, you will see the specific IP addresses or FQDNs defined by the objects. If the rule uses interface objects, you will see the specific interfaces defined on the device that the object identifies, if any.

The IP addresses for network/host objects are sorted in ascending order on the IP address, and then descending order on the subnet mask.

Service objects are sorted on protocol, source port, and destination port.

Interface objects are listed in alphabetical order. If the interface is selected because it matches a pattern in an interface object, the pattern is listed first, and the matching interface is shown in parentheses. For example, “\*(Ethernet1)” indicates that the Ethernet1 interface on the device is selected because it matches the \* pattern (which matches all interfaces).

- **Policy View**—You are shown the patterns defined in the policy objects and entries defined for the policy. Entries are sorted alphabetically, with numbers and special characters coming first.

## Adding or Editing Address Cells in Rules Tables

Use the Add or Edit Sources or Destinations dialog boxes, or Address dialog boxes for NAT tables, to edit the source or destination entry in a rules table that includes sources or destinations. For detailed information on editing firewall rules cells, see [Editing Rules](#) , on page 605.

You can enter any combination of the following address types to define the source or destination of the traffic. The type of policy determines whether an IPv4 or IPv6 address is required; you cannot mix address types. You can enter more than one value by separating the items with commas. For more information, see [Specifying IP Addresses During Policy Definition](#) , on page 316.

- Network/host object. Enter the name of the object or click **Select** to select it from a list. You can also create new objects from the selection list.

**Note** The only way to specify a fully-qualified domain name (FQDN) is to use an FQDN network/host object or a group object that includes an FQDN object. You cannot directly type in an FQDN. Not all policy types allow FQDN; you are prevented from specifying an object that contains an FQDN object if the policy does not allow it.

- Host IP address, for example, 10.10.10.100 (IPv4) or 2001:DB8::200C:417A (IPv6).
- IPv4 network address, including subnet mask, in either the format 10.10.10.0/24 or 10.10.10.0/255.255.255.0.
- IPv6 network address and prefix length in the format 2001:DB8::/32.
- A range of IP addresses, for example, 10.10.10.100-10.10.10.200 (IPv4) or 2001:DB8::1-2001:DB8::100 (IPv6).
- (IPv4 only.) An IP address pattern in the format 10.10.0.10/255.255.0.255, where the mask is a discontinuous bit mask (see [Contiguous and Discontiguous Network Masks for IPv4 Addresses](#) , on page 309).
- Interface roles object. Enter the name of the object or click **Select** to select it from a list (you must select Interface Role as the object type). When you use an interface role, the rule behaves as if you supplied the IPv4 or IPv6 address of the selected interface. This is useful for interfaces that get their address through DHCP, because you do not know what IP address will be assigned to the device. For more information, see [Understanding Interface Role Objects](#) , on page 301.

If you select an interface role as a source, the dialog box displays tabs to differentiate between hosts or networks and interface roles.

### Navigation Path

Do any of the following in a rules policy that includes sources, destinations, or other address cells:

- Right-click an address cell in a rules table and select **Edit Sources** or **Edit Destinations** or a similar command. The data replaces the content of the selected cells.
- Select an entry in an address cell and select **Edit <Entry>**. The data replaces the selected entry.
- Select multiple rules, right-click a Sources or Destination cell, and select **Add Sources** or **Add Destinations**. The data is appended to the data already in the cell.

## Adding or Editing User Cells in Rules Tables

**Tip** The user cell applies to ASA 8.4(2+) only. Anything configured in the cell is ignored for other device types or OS versions.

Use the Add or Edit Users dialog boxes to edit the user entry in a rules table that includes user identity groups. For detailed information on editing firewall rules cells, see [Editing Rules](#) , on page 605.

You can enter any combination of the following to identify traffic based on Active Directory (AD) user or user group names. If you configure identity user groups, they apply to source traffic only. For traffic to match the rule, both the source addresses and identity user groups must match. That is, the rule applies to traffic sent from users on the specific networks or hosts defined in the source field when directed at the destination. For more information, see [Configuring Identity-Based Firewall Rules](#) , on page 657.

To make the rule apply to a user without regard for the source address, specify **any** in the source cell.

You can enter more than one value by separating the items with commas. Following are the supported formats:

- Identity user group objects.
- Individual users: NETBIOS\_DOMAIN\user
- User groups (note the double \): NETBIOS\_DOMAIN\user\_group

Click **Select** to select objects, users, or user groups from a list or to create new objects. For more information, see [Selecting Identity Users in Policies](#) , on page 656 and [Creating Identity User Group Objects](#) , on page 654.

### Navigation Path

Do any of the following in a rules policy that includes user cells:

- Right-click a user cell in a rules table and select **Edit Users**. The data replaces the content of the selected cells.
- Select an entry in a user cell and select **Edit <Entry>**. The data replaces the selected entry.
- Select multiple rules, right-click a user cell, and select **Add Users**. The data is appended to the data already in the cell.

## Adding or Editing Services Cells in Rules Tables

Use the Edit Services dialog box to edit the services that define the type of traffic to act on. You can enter more than one value by separating the items with commas.

You can enter any combination of service objects and service types (which are typically a protocol and port combination). If you type in a service, you are prompted as you type with valid values. You can select a value from the list and press Enter or Tab. You can also click **Select** to select the service from a list, or to create a new service.

For complete information on how to specify services, see [Understanding and Specifying Services and Service and Port List Objects](#) , on page 329.

For detailed information on editing firewall rules cells, see [Editing Rules](#) , on page 605.

### Navigation Path

Do any of the following in a rules policy that includes services:

- Right-click a Services cell in a rules table and select **Edit Services**. The data replaces the content of the selected cells.
- Select an entry in a Services cell and select **Edit <Entry>**. The data replaces the selected entry.
- Select multiple rules, right-click a Services cell, and select **Add Services**. The data is appended to the data already in the cell.

---

**Tip** For inspection rules, services appear in the Traffic Match column and only for rules where the traffic matches source, destination, and port.

---

## Adding or Editing Interfaces or Zones Cells in Rules Tables

Use the Add or Edit Interfaces (or Zones) dialog box to edit the interfaces or zones for which the rule is defined. For detailed information on editing firewall rules cells, see [Editing Rules , on page 605](#).

- When editing interfaces, you can enter any combination of specific interface names or interface roles. You can enter more than one value by separating the items with commas. Enter the names or click **Select** to select the interfaces and roles from a list, or to create new roles. An interface must already be defined to appear on the list.

When you deploy the policy to the device, interface roles are replaced by actual interface names, and only to interfaces that are actually configured on the device. To see which interfaces will actually be selected by a rule, right-click the Interfaces cell and select **Show Interfaces**.

- When editing zones, you can select only one interface role, and you cannot select individual interfaces. The interface roles are used to create zones for zone based firewall rules. To see the interfaces that will belong to the zone, right-click the Zones cell and select **Show Zone Contents**.

For more information about interface roles and selecting interfaces, see the following topics:

- [Understanding Interface Role Objects , on page 301](#)
- [Specifying IP Addresses During Policy Definition , on page 316](#)

### Navigation Path

Do any of the following in a rules policy that includes interfaces or zones:

- Right-click an Interfaces or Zones cell in a rules table and select **Edit Interfaces**, **Edit Zones**, or similar command. The data replaces the content of the selected cells.
- Select an entry in an Interfaces cell and select **Edit <Entry>**. The data replaces the selected entry. You cannot edit an entry in a zone.
- Select multiple rules, right-click an Interfaces cell, and select **Add Interfaces**. The data is appended to the data already in the cell. You cannot add entries to a zone.

## Editing Category Cells in Rules Tables

Use the Edit Category dialog box to change the category assigned to a rule. Categories help you organize and identify rules and objects. See [Using Category Objects , on page 239](#). For detailed information on editing firewall rules cells, see [Editing Rules , on page 605](#).

### Navigation Path

Right-click a Category cell in a rules policy that includes categories and select **Edit Category**.

## Editing Description Cells in Rules Tables

Use the Edit Description dialog box to edit the description of the rule. The description helps you identify the purpose of a rule and can be up to 1024 characters. For detailed information on editing rules cells, see [Editing Rules , on page 605](#).

### Navigation Path

Right-click a Description cell in a rules policy that includes descriptions and select **Edit Description**.

## Showing the Contents of Cells in Rules Tables

Use the Show Contents dialog boxes to display the actual, translated data defined in a source, user, destination, services, interfaces, zones, or other cell in a rules table that includes addresses, identity user groups, interfaces, services, or policy objects that define those things. The title of the dialog box indicates which cell or entry you are examining. Use this information to determine to which addresses, services, or interfaces the rule will actually apply when deployed to the device. For detailed information about editing or viewing cell contents, see [Editing Rules , on page 605](#).

What you see in the dialog box depends on the view you are in:

- **Device View, Map View**—You are shown the actual IP addresses, users, services, or interfaces to which the rule will apply for the specific device. For example, if the rule uses network/host objects, you will see the specific IP addresses or fully-qualified domain names (FQDN) defined by the objects. If the rule uses interface objects, you will see the specific interfaces defined on the device that the object identifies, if any.
  - The IP addresses for network/host objects are sorted in ascending order on the IP address, and then descending order on the subnet mask.
  - Service objects are sorted on protocol, source port, and destination port.
  - Interface objects are listed in alphabetical order. If the interface is selected because it matches a pattern in an interface object, the pattern is listed first, and the matching interface is shown in parentheses. For example, “\*(Ethernet1)” indicates that the Ethernet1 interface on the device is selected because it matches the \* pattern (which matches all interfaces).
- **Policy View**—You are shown the patterns defined in the policy objects and entries defined for the policy. Entries are sorted alphabetically, with numbers and special characters coming first.

### Filtering Contents

A List Filter field is provided above the results in the Show Contents dialog box. You can use the List Filter field to quickly locate any entries that contain a specified text string.

Figure 18: List Filter Field

To search for a specific text string in the Show Contents list:

- Click in the List Filter field to place the text cursor, and then begin typing.

These are “live filter” fields. That is, as you type each character, entries that do not include your current text string are removed from the list or table.

To clear a List Filter field:

- Click the clear button at the right side of the field.

This button appears when you begin typing in the field. (You also can highlight the characters and press the Delete or Backspace key on your keyboard.)

When you clear the List Filter field, all entries in the list are again displayed.

You can tune the filter results by selecting case sensitivity or insensitivity, by allowing wildcards or regular expressions, and by specifying where in a returned string your characters must be located.

To change the List Filter criteria:

1. Click the filter-parameters button (magnifying glass) at the left side of the List Filter field to open the parameters menu.
2. Choose an option.

The menu consists of three sections:

- **Case sensitive** and **Case insensitive** – Choose one or the other. If you choose **Case sensitive**, found text must match not only the characters you enter, but also their as-typed case.
- **Use wildcards** and **Use regular expression** – Choose one or the other. The following wildcards are recognized:
  - \* (asterisk) – Match zero or more characters at that location in the string.
  - + (plus sign)– Match one or more characters at that location in the string.
  - ? (question mark) – Match one character at that location in the string.
- **Match from start**, **Match exactly**, and **Match anywhere** – Choose one. **Match from start** means that the string you enter must be found at the beginning of an entry, although it can be part of a larger set of characters. **Match exactly** requires that the string you enter exactly match the entire column entry. **Match anywhere** means the string can be found anywhere within an entry, and it can be part of a larger set of characters.
- Repeat Steps 1 and 2 to change another parameter.

### Navigation Path

Do any of the following in a rules policy that includes sources, user, destinations, services, interfaces, zones, or other fields that specify networks, identity user groups, interfaces, or services. You can also show contents when using tools that work with rules, such as importing rules.

- Right-click one of those cells and select **Show <Attribute Type> Contents**, where the attribute type is the name of the cell. The data includes all entries defined in the cell.
- Right-click an entry in one of those cells and select **Show <Entry> Contents**, where the name of the selected entry is included in the command name. The data displayed is only for the selected entry.

---

**Tip** For inspection rules, services appear in the Traffic Match column and only for rules where the traffic matches source, destination, and port.

---

## Finding and Replacing Items in Rules Tables

In policies that use rules tables, you can search for items in some cells and selectively replace them. The cells that you can search depend on the policy. You can use wildcard characters to find items based on pattern matching, for example, so that you can replace several related networks with a new network/host policy object defined for them.

To use find and replace, click the **Find and Replace** (binoculars icon) button at the bottom of any policy that uses rules tables to open the [Find and Replace Dialog Box](#), on page 613. In the Firewall folder, this includes AAA rules, access rules, IPv6 access rules, inspection rules, zone based firewall rules, and web filter rules (for ASA/PIX/FWSM devices only). For ASA/PIX/FWSM devices, it also includes the NAT translation rules policy (but not for every combination of context and operational mode) and the IOS, QoS, and connection rules platform service policy.

When searching for items, you select the type of item, the columns you want to search, and enter the string that you want to find and optionally, the string you want to use to replace it. You can find and replace the following types of items:

- Network—A network/host object name, or the IP address of a host or network.
- User—An Active Directory (AD) username (NetBIOS\_DOMAIN\user), user group name (NetBIOS\_DOMAIN\user\_group), or identity user group object name.
- Service—A service object name or protocol and port, for example TCP/80. The search is syntactic, not semantic, that is, if you are searching for TCP/80 and a rule uses HTTP, the search results will not find it.
- Interface Role—An interface name or interface role object name.

---

**Note** In access rules, you can search for global rules by using the Global interface name. However, there is no way to convert between global and interface-specific rules. Although you can find global rules using the Global interface name, if you try to replace an interface name with the name “Global,” you are actually creating an interface-specific access rule that uses a policy object named Global.

---

- Text—A text string in a Description field.

The following are some examples of what you might do with find and replace:

- If you create a new network/host object named network10.100 for all networks in the 10.100.0.0/16 range, you can search and replace all subordinate network specifications. For example, you can search for ^10.100\* to find all addresses like 10.100.10.0/24. Select the **Find Whole Words Only** and **Allow Wildcard** options, and enter network10.100 as the replacement string. Because you selected Find Whole Words Only, the string that is replaced is the entire 10.100.10.0/24 string, not just the 10.100 portion.
- If you want to find all rules that use IP addresses (instead of network/host objects), you can search for \*.\*.\*.\* to find all host or network IP addresses. You can then selectively edit the cell while the Find and Replace dialog box is open.
- If you want to replace all interface role objects that include “side” in the name (such as inside and outside) with the interface role object named External, search for \*side with the **Find Whole Words Only** and **Allow Wildcard** options selected, and enter External in the Replace field.

## Find and Replace Dialog Box

Use the Find and Replace dialog box to locate and optionally replace items in rule table cells. The types of items you can search for differ based on the policy you are viewing.

#### Navigation Path

Click the **Find and Replace** (binoculars icon) button at the bottom of any policy that uses rules tables. In the Firewall folder, this includes AAA rules, access rules, IPv6 access rules, inspection rules, zone based firewall rules, and web filter rules (for ASA/PIX/FWSM devices only). For ASA/PIX/FWSM devices, it also includes the NAT translation rules policy (but not for every combination of context and operational mode) and the IOS, QoS, and connection rules platform service policy.

| Find       | The string you are trying to locate. If you are searching for a policy object, click <b>Select</b> to choose the object from a list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Replace    | <p>(Optional) The string you want to use to replace the search string. What gets replaced is controlled by the search options. If you want to replace the search string with the name of a policy object, click <b>Select</b> to choose the object from a list.</p> <p>You can replace search strings with multiple items. Separate the items with commas. For example, you can search for the TCP service and replace it with TCP, UDP.</p> <p>You can remove items by not entering anything in the Replace field and clicking the <b>Replace</b> button.</p> <p>This field is greyed out if the table does not allow editing.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Direction  | The direction in which you want to search relative to the currently selected row or cell, either up or down. When the end of the table is reached, the search continues to the top of the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Match Case | For text searches, whether you want to match the capitalization you used in the Find field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Find Whole Words Only | <p>Whether the search should find and select only whole words, which are strings delimited by spaces or punctuation. For example, a whole word search for SanJose will find SanJose but not SanJose1.</p> <p>If you use this option with the Allow Wildcard option, you can search for partial strings but if you replace the located string, you replace the whole word and not the partial string. For example, you can search for ^10.100* to find all addresses like 10.100.10.0/24, and replace with them with the network10.100 policy object. By selecting Whole Words, the network/host object replaces the entire address, not just the portion you searched for.</p> <p>For text searches, this option and the Allow Wildcards option are mutually exclusive.</p> |
| Allow Wildcards       | <p>Whether the search or replacement strings use wildcard characters. If you do not select this option, all characters are treated literally.</p> <p>You can use the Java regular expression syntax to create your expression with the following exceptions:</p> <ul style="list-style-type: none"> <li>• Period (.)—The period is a literal period and it is implicitly escaped.</li> <li>• Question mark (?)—The question mark indicates a single character.</li> <li>• Asterisk (*)—The asterisk matches one or more characters. It does not match zero characters.</li> <li>• Plus sign (+)—The plus sign means the same as the asterisk; it matches one or more characters.</li> </ul>                                                                                 |
| Find Next button      | Click this button to find the next occurrence of the search string.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Replace button        | Click this button to replace the found string with the replacement string.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Replace All button    | Click this button to automatically find the search string and replace it throughout the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Moving Rules and the Importance of Rule Order

Rules policies that use rules tables are ordered lists. That is, the top to bottom order of the rules matters and has an effect on the policy.

When the device analyzes a packet against a rules policy, the device searches the rules in order from top to bottom. The first rule that matches the packet is the rule that is applied to the packet, and all subsequent rules are ignored. Thus, if you place a general rule pertaining to IP traffic before a more specific rule pertaining to HTML traffic for a given source or destination, the more specific rule might never be applied.

For access control rules, you can use the automatic conflict detection tool to help identify when rule order will prevent a rule from ever being applied to traffic (for more information, see [Using Automatic Conflict Detection](#), on page 742). For other rules policies, carefully inspect the table to spot problems with rule order.

When you find that you need to rearrange the order of a rule, select the rule that needs to be moved and click the **Up Row** (up arrow) or **Down Row** (down arrow) buttons as appropriate. If these buttons do not appear beneath the rules table, rule order does not matter and you cannot rearrange them.

If you use sections to organize your rules, you can move rules only within the section. When you move rules that are outside the sections, you can move them above or below the section. For more information about working with sections, see [Using Sections to Organize Rules Tables](#) , on page 616.

---

**Tip** Special rules apply to moving access rules when you mix interface-specific and global rules in a policy. For more information, see [Understanding Global Access Rules](#) , on page 717.

---

## Enabling and Disabling Rules

You can enable and disable individual rules in a policy that uses rules tables, such as most firewall services rules policies. Your change takes effect when you redeploy the configuration to the device.

If a rule is disabled, it appears in the table overlain with hash marks. When you deploy the configuration, disabled rules are removed from the device.

Disabled rules are kept in the rules policy in Security Manager as a convenience so that you can easily enable needed rules without recreating them. Thus, it is often wise to disable a rule that you believe you no longer need instead of immediately deleting it.

To change whether a rule is enabled or disabled, select the rule, right-click and select **Enable** or **Disable**, as appropriate.

## Using Sections to Organize Rules Tables

You can organize policies that use rules tables into sections. There are two types of sections:

- Scopes, which define inheritance relationships between a policy and an inherited policy. These sections are automatically created when you inherit policies. For more information, see [Understanding Rule Inheritance](#) , on page 168.

- User-defined sections, which are convenient groupings that help you organize rules so that you can evaluate and edit the policy more easily. These types of sections are most useful for policies that contain a large number of rules.

All rules within a section must be sequential; you cannot group rules randomly. If you want to identify non-contiguous rules as being related, you can assign the same category to the rules.

User-defined sections are set off visually from the other rules in the table by an indented section heading. The heading contains, left to right, a +/- icon for opening and closing the section, a band of color identifying the category you assigned the section (if any), the section name, the first and last rule number contained in the section (for example, 4-8), and the description, if any, you gave the section.

---

**Note** You might need to resize the rule number column to see the numbering of rules in sections.

---

Whether you create user-defined sections is completely up to you. If you decide creating these types of sections is worthwhile, the following information explains how to create and use them:

- To create a new section, right-click a row that you want to place the section and select **Include in New Section**. (You can also use Shift+click to select a block of rules.) You are prompted for a name, description, and category for the section (the name is the only required element).
- To move existing rules into a section, select one or more contiguous rules, right-click and select **Include in Section <name of section>**. This command appears only if the selected rows are next to an existing section. If the rows you want to add to a section are not currently next to the section, you can do one of two things: move the rules until they are next to the section; cut the rules and paste them into the section.
- You cannot move a section. Instead, you need to move the rules that are outside of the section around it. When you move a rule that is next to, but not within, a section, the rule jumps over the section.
- You cannot move a rule outside of or through a section. A section defines the borders within which you can move rules. If you want to move rules out of a section and back into the Local scope section, select one or more contiguous rules, right-click and select **Remove from Section <name of section>**. The rules must be at the beginning or end of the section to use this command. If they are not, you can either move the rules until they are, or use cut and paste to move them out of the section.
- To add a new rule to a section, select the rule after which you want to create the rule before clicking the Add Row button. To place it at the beginning of the section, select the section heading.

If you want to create a rule after, but outside of, a section, you can either create it as the last rule in the section and then remove it from the section, or create it just above the section and click the down arrow button.

- You can change the name, description, or category of a section by right-clicking the section heading and selecting **Edit Section**.
- When you delete a section, all rules contained in the section are retained and moved back into the Local scope section. No rules are deleted. To delete a section, right-click the section heading and select **Delete Section**.
- If you use the Combine Rules tool, the resulting combined rules respect your sections. Rules that are in a section can be combined only with other rules in that section.

## Add and Edit Rule Section Dialog Boxes

Use the Add and Edit Rule Section dialog boxes to add or edit a user-defined section heading in a rules table. For detailed information about how to use sections to organize a rules table, see [Using Sections to Organize Rules Tables](#) , on page 616.

### Navigation Path

Do one of the following:

- Select one or more rules in a rules table, right-click and select **Include in New Section**.
- Right-click a section heading and select **Edit Section**.

### Field Reference

*Table 165: Add and Edit Rule Section Dialog Boxes*

| Element     | Description                                                                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name        | The name of the section.                                                                                                                                     |
| Description | A description for the section, up to 1024 characters.                                                                                                        |
| Category    | The category assigned to the section. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239. |

## Combining Rules

Access rules and AAA rules policies can grow over time to include a large number of rules. The size of these policies can make it difficult to manage them. To alleviate this problem, you can use the rule combiner tool to reduce the number of rules in a policy without changing how the policy handles traffic.

**Tip** Combining rules can dramatically compress the number of access rules required to implement a particular security policy. For example, a policy that required 3,300 access rules might only require 40 rules after hosts and services are efficiently grouped. However, you cannot use the rule combiner with IPv6 access rules or with rules that specify users or user groups, either directly or with identity user group objects. You can use the tool with rules that use FQDN network/host objects.

You might have several rules that allow a specific range of services to various trusted hosts (as sources) to various public servers (as destinations). If you have 10 rules applying to this situation, it is possible that those 10 rules can be combined into a single rule. You could then create new policy objects for the collection of services (for example, AllowedServices), hosts (for example, TrustedHosts), and servers (for example, PublicServers). To create the new objects during rule combination, you can right-click the newly-combined cells and select **Create Network (or Service) Object from Cell Contents**.

For example, you might have two rules for interface FastEthernet0:

- Permit TCP for source 10.100.10.1 to destination 10.100.12.1
- Permit TCP for source 10.100.10.1 to destination 10.100.13.1

These can be combined into a single rule: permit TCP for source 10.100.10.1 to destination 10.100.12.1, 10.100.13.1.

Multidimensional sorting is used to combine rules. For example, for access rules:

1. Rules are sorted by their sources, so rules with the same source are placed together.
2. Same-source rules are sorted by destination, so rules with the same source and destination are placed together.
3. Same-source and same-destination rules are combined into a single rule, and the services are concatenated.
4. Adjacent rules are checked to see if they have the same source and service. If so, they are combined into a single rule, and the destinations are concatenated.
5. Adjacent rules are checked to see if they have the same destination and service. If so, they are combined into a single rule, and the sources are concatenated.

Sorting is repeated based on destination and service in place of source.

---

**Tip** Rules from different sections are never combined. Any sections you create to organize rules limit the scope of the possible combinations. Also, interface-specific and global access rules are never combined. For more information about global rules, see [Understanding Global Access Rules](#), on page 717.

---

#### Related Topics

- [Managing Firewall AAA Rules, on page 683](#)
- [Managing Firewall Access Rules, on page 715](#)

---

**Step 1** Select the policy whose rules you want to combine from the **Firewall** folder. You can combine rules for the following types of policy:

- AAA rules
- Access rules

**Step 2** If you want the tool to limit possible combinations to a specific group of rules, select them. You can select rules using Shift+click and Ctrl+click, select all rules in a section by selecting the section heading, or all rules within a scope by selecting the scope heading (for example, Local). To not limit the tool, do not select anything in the table. Keep the following in mind:

- In Device view, you can save combinations only for local rules. The tool will allow you to run it on shared and inherited rules, but you cannot save the results. If you do not select any rules, the default is to consider all local scope rules.
- To combine rules in shared policies, you must run the tool in Policy view. If you do not select any rules, the default is to consider all mandatory rules.

You are warned if you try to run the tool when you cannot save the results.

**Step 3** Right-click anywhere in the rules table and choose **Combine Rules** to open the [Combine Rules Selection Summary Dialog Box](#), on page 620. If you have selected specific rules for which to limit combining, make sure you right-click on one of the selected rules or the rules will be deselected.

**Step 4** Select the columns you want the rule to consider combining. If you do not select certain columns, the combined rules must have the identical settings in those columns to be combined.

You can also elect to consider combining the rules you selected or all rules within the policy.

**Tip** If a column type is not listed, then combined rules must have the identical content in those cells except for the Description cell. Rules that have different content for the cells are not combined.

**Step 5** Click **OK** to generate the combination and display the results in the Rule Combiner Results Dialog Box.

Analyze the results and evaluate whether you want to save the combinations. You must save all or none, you cannot pick and choose which combinations to save.

For more information on evaluating the results, see [Interpreting Rule Combiner Results](#), on page 621. For an example, see [Example Rule Combiner Results](#), on page 623.

**Step 6** Click **OK** to replace the original rules in the rules tables with the combined rules.

## Combine Rules Selection Summary Dialog Box

Use the Combine Rules Selection Summary dialog box to define the parameters used for combining rules in firewall rules policies. When you click **OK**, the combination results are displayed in the Rule Combiner Results Dialog Box, where you can choose to save or discard the results as explained in [Interpreting Rule Combiner Results](#), on page 621.

### Navigation Path

You can combine rules from the [AAA Rules Page](#), on page 691 and the [Access Rules Page](#), on page 724. Click **Tools** located at the bottom of the tables and select **Combine Rules**.

### Field Reference

*Table 166: Combine Rules Selection Summary Dialog Box*

| Element         | Description                                                                                                                                                                                     |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Policy Selected | Shows the policy selected and the scope. Local indicates the local device rules. Otherwise, the field indicates the name of the shared policy and the scope selected within the policy, if any. |

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rules to be combined            | <p>The rules you want the tool to consider combining:</p> <ul style="list-style-type: none"> <li>• All Rules—Consider combining all rules within the selected policy.</li> <li>• Selected Rules—Consider combining only those rules you selected in the policy before starting the tool.</li> </ul> <p>For detailed information on selecting rules before running the tool, see <a href="#">Combining Rules</a> , on page 618.</p>                                                                                                                                                                                  |
| Choose which columns to combine | <p>The columns in the rules table that can be combined. Any columns that you do not select must have the identical content for two rules to be combined (even those not listed as combinable, except for the Description column). The columns you can combine are:</p> <ul style="list-style-type: none"> <li>• Source</li> <li>• User</li> <li>• Destination</li> <li>• Service</li> <li>• Interface</li> <li>• Security Sources</li> <li>• Security Destinations</li> <li>• For AAA rules, these additional columns: <ul style="list-style-type: none"> <li>• Action</li> <li>• Auth Proxy</li> </ul> </li> </ul> |

## Interpreting Rule Combiner Results

Use the Rule Combiner Results dialog box to evaluate the results of a rule combination (see [Combining Rules](#) , on page 618). The dialog box includes a summary of the results, and shows the new rules that will be created if you click **OK**.

Changed rule cells are outlined in red. Select a combined rule in the upper table to see the rules in the lower table that were combined to create the rule.

You can refine some elements of the results in this window:

- You can right-click on the Source, Destination, and Service cells with multiple elements and select **Create Network (or Service) Object from Cell Contents** to create a new policy object that contains the contents of the combined cell. The new object replaces the contents of the cell.

You can also automatically create network object groups in the deployed configuration to replace the comma-separated values in a rule table cell. The network objects are created during deployment, and they do not affect the content of your rules policy. To enable this option, select **Tools > Security Manager**

**Administration > Deployment** to open the [Deployment Page](#), on page 522 and select **Create Object Groups for Multiple Sources, Destinations, or Services in a Rule**.

- You can right-click on Description and select **Edit Description** to change the description. The descriptions of combined rules are a concatenation of the descriptions of the old rules separated by new lines.

For an example, see [Example Rule Combiner Results](#), on page 623.

### Tips

- The combined results are not applied to the policy until you click **OK**. If you do not like the results of the combination, click **Cancel** and consider selecting smaller groups of rules to limit the scope of the Combine Rules tool.

If you click **OK** but then decide you do not want to accept the changes, you have two options. First, make sure you do not click **Save** on the policy page, select a different policy, and click **No** when prompted to save your changes to the policy. If you already clicked **Save**, you can still back out the changes by discarding your activity or configuration session (for example, **File > Discard** in non-Workflow mode), but this also discards any other changes you have made to other policies. Once you submit your changes or your activity is approved, you cannot undo your changes.

- You are allowed to run the Combine Rules tool even if you are combining rules for a policy that you are not allowed to save. For example, you cannot save combined rules for a shared or inherited policy in Device view. You are warned before running the tool if you will not be allowed to save the results.
- Rules from different sections are never combined. Any sections you create to organize rules limit the scope of the possible combinations. Also, interface-specific and global access rules are never combined. For more information about global rules, see [Understanding Global Access Rules](#), on page 717.

### Navigation Path

You can combine rules from the [AAA Rules Page](#), on page 691 and the [Access Rules Page](#), on page 724. Click **Tools** located at the bottom of the tables and select **Combine Rules**, fill in the [Combine Rules Selection Summary Dialog Box](#), on page 620 and click **OK**.

*Table 167: Combined Rules Results Summary*

| Element        | Description                                                                                                                                                                                                                             |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Result Summary | Provides a summary of the results of the combination and indicates the number of original rules, the number of rules remaining after the combination, and the number of changed and unchanged rules, if any combinations could be made. |

| Element                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Resulting Rules table              | <p>The rules that will replace the rules currently in the policy. If you click <b>OK</b>, these rules become part of your policy. The columns are the same as those in the associated policy (see <a href="#">AAA Rules Page , on page 691</a> or <a href="#">Access Rules Page , on page 724</a>), with the addition of the Rule State column.</p> <p>The Rule State column shows the status of the rule:</p> <ul style="list-style-type: none"> <li>• Modified, Combined—The new rule is the result of combining one or more rules or modifying an existing rule. A red box around a cell indicates cells that have combined contents.</li> <li>• Unchanged—The rule remains unchanged, as it could not be combined with any other rule.</li> <li>• Not Selected—You did not select the rule for possible combination.</li> </ul> <p>If there are a large number of rules, you can use the buttons beneath the table to scroll through the rules that have changes. Unchanged and unselected rules are skipped.</p> |
| Original rules table (lower table) | The table in the lower half of the dialog box shows the original rules that were combined to create the rule you select in the upper table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Detail Report button               | <p>Click this button to create an HTML report of the results. The report summarizes the results and also provides the details about the resulting rules and the rules that were combined to create the new rule.</p> <p>For combined rules that have a lot of entries in cells, this report makes it easier to read the results. You can also print or save the report for later use.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Example Rule Combiner Results

When you run the Combine Rules tool as described in [Combining Rules , on page 618](#), the results of the combination are displayed in the Rule Combiner Results Dialog Box (see [Interpreting Rule Combiner Results , on page 621](#)).

The below figure shows an example of a rule combination.

The new rules are shown in the upper table. Any new rules are indicated as modified or combined rules, and the changed cells are outlined in red. When you select a new rule in the upper table, the lower table shows the old rules that were combined to create the new rule. In this example, the two old rules had the same destination, service, and interface, and the two distinct sources were concatenated to form the new rule.

The top of the report summarizes the results. In this example, 5700 rules were reduced to 96 rules.

Figure 19: Example of Rule Combiner Results

Result Summary: The 5700 rules in Local Policy were combined into 96 rules (80 combined rules, 16 unchanged original rules).

Resulting Rules (Scope: Local)

| No. | Rule State | Permit | Source                                        | Destination                | Service                   | Interface  | Dir. | Options | Category |
|-----|------------|--------|-----------------------------------------------|----------------------------|---------------------------|------------|------|---------|----------|
| 4   | Combined   | ✓      | 10.10.10.3<br>10.10.10.131                    | 192.0.3.10                 | SSH                       | DMZ-slot:2 | in   |         | None     |
| 5   | Combined   | ✓      | 10.10.10.131<br>10.10.10.134<br>10.10.10.2/31 | 192.0.3.100<br>192.0.3.101 | SSH<br>NTP-TCP<br>NTP-UDP | DMZ-slot:2 | in   |         | None     |
| 6   | Combined   | ✓      | 10.10.10.131<br>10.10.10.134<br>10.10.10.2/31 | 192.0.3.8/31               | tcp/7970-7974             | DMZ-slot:2 | in   |         | None     |
| 7   | Combined   | ✓      | 10.10.10.131<br>10.10.10.134<br>10.10.10.2/31 | 192.0.2.50<br>192.0.2.54   | NTP-TCP<br>NTP-UDP        | DMZ-slot:2 | in   |         | None     |
|     | Combined   | ✓      | 10.10.10.2<br>10.10.10.134                    | 192.0.3.11<br>192.0.3.12   | tcp/6000-6010             | DMZ-slot:2 | in   |         | None     |

The selected resulting rule was created by combining the following 2 original rules.

| Original No. | Permit | Source       | Destination | Service | Interface  | Dir. | Options | Category | De |
|--------------|--------|--------------|-------------|---------|------------|------|---------|----------|----|
| 4            | ✓      | 10.10.10.3   | 192.0.3.10  | SSH     | DMZ-slot:2 | in   |         | None     |    |
| 7            | ✓      | 10.10.10.131 | 192.0.3.10  | SSH     | DMZ-slot:2 | in   |         | None     |    |

181983

|   |                     |   |                |
|---|---------------------|---|----------------|
| 1 | Combined cell       | 3 | Original rules |
| 2 | Newly combined rule |   |                |

## Converting IPv4 Rules to Unified Rules

Prior to the release of Security Manager 4.4 and versions 9.0 and later of the ASA, separate pages, policies and policy objects were provided for configuring IPv4 and IPv6 firewall rules and policies. With Security Manager 4.4 and ASA 9.0+, these policies and policy objects were combined or unified. However, for the earlier ASA versions, a separate page for IPv6 access rules is still provided in Device view, while in Policy view, IPv4 and unified versions of the AAA-, access- and inspection-rule policy types are provided.

A utility to convert separate IPv4 and IPv6 firewall rules to “unified” rules is provided with Security Manager 4.4 for use when you upgrade an ASA from an earlier version to 9.0 or later.

### Navigation Path

To access the firewall-rule unification utility:

- (Policy view) Select the firewall IPv4 rule type from the Policy Type selector and then right-click the desired policy in the Policies pane; choose **Convert to <rule-type> Rules (Unified)**.

#### Related Topics

- [AAA Rules Page](#) , on page 691
- [Access Rules Page](#) , on page 724
- [Inspection Rules Page](#) , on page 772

---

Open the utility as described above; in the Convert Policy dialog box, provide a name for the new unified policy and click OK.

Following processing, the new unified rules policy is displayed. You can now assign this policy to ASA 9.0+ devices.

---

## Generating Policy Query Reports

For most of the firewall rules policies, you can generate policy query reports that can help you evaluate your rules. With policy query reports, you can determine what rules already exist for a particular source, user, destination, interface, service, or zone before creating new rules to apply to those items.

To a limited degree, you can also determine if there are some blocking rules that prevent a rule from being used, or redundant rules that you can delete. If you are evaluating access rules, however, it is better to use the more powerful rule analysis tool to determine these problems.

When you create a policy query, you describe the traffic that interests you, much the same way you describe traffic when creating a rule. Creating a query is essentially the same as creating a rule, but you might want to describe the rule more broadly to capture a wider set of traffic so you can see a set of related rules rather than a single rule or a limited number of rules. The query you create depends on the information you are trying to discover.

The possible extent of a query depends on the view you are in:

- Device or Map view—The query is limited to the selected device. However, you can query across all supported rule types. This allows you to compare different types of rules that apply to the same traffic.
- Policy view—The query is limited to the selected policy. You see only rules that are defined in that policy, and you cannot query other types of policies. If you want to query a shared policy while examining other policies, select a device that is assigned to the shared policy, and query the policy from the device in Device view.

#### Related Topics

- [AAA Rules Page](#) , on page 691

- [Inspection Rules Page](#) , on page 772
- [Inspection Rules Page](#) , on page 772

- [Zone-based Firewall Rules Page](#) , on page 987

- 
- Step 1** Select the policy that you want to query from the **Firewall** folder. You can query any of the following types of policy:
- AAA Rules
  - Access Rules
  - Inspection Rules
  - Web Filter Rules (PIX/ASA/FWSM)
  - Zone Based Rules
- Step 2** Click the **Query** button located below the table to open the Querying Device or Policy dialog box.
- Step 3** Enter the parameters that define the rules you want to query. When setting up your query, you must select at least one rule type; enabled, disabled or both; permitted, denied, or both; and mandatory, default, or both. For detailed information about the query parameters, see [Querying Device or Policy Dialog Box](#) , on page 626.
- In Policy view, you cannot change the type of rule you are querying. In Device view, you can query any combination of rule types.
- Step 4** Click **OK** to view the rules that match the criteria in the Policy Query Results dialog box. For information on reading the report, see [Interpreting Policy Query Results](#) , on page 629.
- For an example of a policy query report, see [Example Policy Query Result](#) , on page 631.
- 

## Querying Device or Policy Dialog Box

Use the Querying Device or Querying Policy dialog box to set up the parameters for a query. The query results show the rules that match your parameters. The title of the dialog box indicates what you are querying:

- In Device or Map view, you are querying rules defined for the selected device.
- In Policy view, you are querying rules within the selected policy only.

You can query rules from these types of policies: AAA rules, access rules, inspection rules, web filter rules for ASA/PIX/FWSM, and zone based firewall rules.

When setting up your query, you must select at least one rule type; enabled, disabled or both; permitted, denied, or both; and mandatory, default, or both.

---

**Note** For inspection rules, if you enter Global as the interface value, the match status results will be shown as a partial match even if the match is complete.

---

Results are displayed in the Policy Query Results dialog box (see [Interpreting Policy Query Results](#) , on page 629).

### Navigation Path

To generate Policy Query reports, do one of the following:

- (Device view) Select a device, then select one of the supported firewall rules policies from the Firewall folder, and then click the **Query** button located below the table.
- (Policy view) Select any of the supported firewall rules policies from the Firewall folder, then select a specific policy from the Shared Policy selector, and then click the **Query** button located below the table.
- (Map view) Right-click a device and select a supported firewall rules policy from the Edit Firewall Policies menu. Click the **Query** button.

| Sources<br>Destinations | <p>The source or destination of the traffic. You can enter more than one value by separating the items with commas.</p> <p><b>Note</b> If you leave a field blank, the query matches any address for that field.</p> <p>You can enter any combination of the following address types to define the source or destination of the traffic. For more information, see <a href="#">Specifying IP Addresses During Policy Definition</a> , on page 316.</p> <ul style="list-style-type: none"> <li>• Network/host object. Enter the name of the object or click <b>Select</b> to select it from a list. You can also create new network/host objects from the selection list.</li> <li>• Host IP address, for example, 10.10.10.100.</li> <li>• Network address, including subnet mask, in either the format 10.10.10.0/24 or 10.10.10.0/255.255.255.0.</li> <li>• A range of IP addresses, for example, 10.10.10.100-10.10.10.200.</li> <li>• An IP address pattern in the format 10.10.0.10/255.255.0.255, where the mask is a discontinuous bit mask (see <a href="#">Contiguous and Discontiguous Network Masks for IPv4 Addresses</a> , on page 309).</li> </ul> <p><b>Tip</b> You can create an object with a list of the IP addresses to facilitate future policy query requests.</p> |
