The Embedded Event Manager table lists the currently defined event manager applets. Use the Add Row, Edit Row and Delete Row buttons below the table to manage these entries. The Add Row and Edit Row buttons open the [Add and Edit Applet Dialog Boxes](#), on page 2041.

### Navigation Path

- (Device view) Select **Platform > Logging > Embedded Event Manager** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Embedded Event Manager** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Add and Edit Applet Dialog Boxes

Use the Add Applet and Edit Applet dialog boxes to define and edit event manager applets. Except for the title, the two dialog boxes are identical; the following information applies to both.

### Navigation Path

You can open the Add and Edit Applet dialog boxes from the [Embedded Event Manager](#), on page 2039.

### Field Reference

**Table 667: Add and Edit Applet Dialog Boxes**

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name              | Enter a unique name for the event manager applet. The name cannot contain spaces and must be less than 32 characters.                                                                                                                                                                                                                                                               |
| Description       | Enter a description for the event manager applet. The description may be up to 256 characters long.                                                                                                                                                                                                                                                                                 |
| Configuration Tab |                                                                                                                                                                                                                                                                                                                                                                                     |
| Crashinfo         | When selected, the event manager applet is triggered when the ASA crashes. Regardless of the value of the Output field, the action commands are directed to the crashinfo file. The output is generated before the show tech command.<br><br><b>Note</b> The state of the ASA is generally unknown when it crashes. Some CLI commands may not be safe to run during this condition. |
| None              | When selected, you can trigger the event manager applet manually.<br><br><b>Note</b> Manual triggering of the EEM applet is not supported in Cisco Security Manager. To manually trigger an applet, you must use a FlexConfig. See <a href="#">Managing Flexconfigs</a> , on page 339 for more information.                                                                         |

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Syslog table | The Syslog table lists the currently defined syslog message IDs for the selected applet. Use the Add Row, Edit Row and Delete Row buttons below the table to manage these entries. The Add Row and Edit Row buttons open the <a href="#">Add and Edit Syslog Configuration Dialog Boxes</a> , on page 2043.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Absolute     | Configure an absolute (once-a-day) timer event. Absolute timers cause an event to occur once a day at a specified time, and restart automatically.<br><br>Use the fields provided to enter the time of day in hours, minutes, and seconds. The time range is from 00:00:00 (midnight) to 23:59:59.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Countdown    | Configures a countdown (one-shot) timer event. Countdown timers trigger an event manager applet once after the specified time period and do not restart unless they are removed, then re-added.<br><br>Enter the time period in seconds. The number of seconds may range from 1- 604800.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Watchdog     | Configures a watchdog (periodic) timer event. Watchdog timers trigger an event manager applet after the specified time period following the completion of the applet's actions and restart automatically.<br><br>Enter the time period in seconds. The number of seconds may range from 1- 604800.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Output       | To configure specific destinations for sending output from an action, choose one of the available output destination options: <ul style="list-style-type: none"> <li>• none—(default) discards the output.</li> <li>• console—sends the output to the ASA console.</li> <li>• file—sends the output to a file. Select the file option in the Action list.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Action       | The following four file options are available: <ul style="list-style-type: none"> <li>• new—creates a new, uniquely named file each time that an event manager applet is invoked. The filename has the format of eem-applet-timestamp.log, in which applet is the name of the event manager applet and timestamp is a dated timestamp in the format of YYYYMMDD-hhmmss.</li> <li>• overwrite—overwrites a specified file each time that an event manager applet is invoked. Specify the file details using the File Location and File Name fields.</li> <li>• append—appends to a specified file each time that an event manager applet is invoked. If the file does not yet exist, it is created. Specify the file details using the File Location and File Name fields.</li> <li>• rotate—creates a set of uniquely named files that are rotated each time that an event manager applet is invoked. Specify the number of files to be rotated in the File Count field (valid values range from 2 - 100).</li> </ul> <p>When a new file is to be written, the oldest file is deleted, and all subsequent files are renumbered before the first file is written. The newest file is indicated by 0, and the oldest file is indicated by the highest number. The filename format is eem-applet-x.log, in which applet is the name of the applet, and x is the file number.</p> |

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| File Location | Specifies the location of the output file. The location may also use FTP, TFTP, and SMB targeted files.                                                                                                                                                                                                                                                                                                                                                                                       |
| File Name     | Specifies the filename of the output file.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| File Count    | Specify the number of files to be rotated when "rotate" is the selected Action.<br><br>When a new file is to be written, the oldest file is deleted, and all subsequent files are renumbered before the first file is written. The newest file is indicated by 0, and the oldest file is indicated by the highest number. Valid values for the rotate value range from 2 - 100. The filename format is eem-applet-x.log, in which applet is the name of the applet, and x is the file number. |
| Action Tab    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Action table  | The Action table lists the currently defined actions for the selected applet. Use the Add Row, Edit Row and Delete Row buttons below the table to manage these entries. The Add Row and Edit Row buttons open the <a href="#">Add and Edit Action Configuration Dialog Boxes</a> , on page 2044.                                                                                                                                                                                              |

## Add and Edit Syslog Configuration Dialog Boxes

Use the Add Syslog Configuration and Edit Syslog Configuration dialog boxes to configure the syslog message IDs for an event manager applet. Except for the title, the two dialog boxes are identical; the following information applies to both.

### Navigation Path

You can open the Add and Edit Syslog Configuration dialog boxes from the [Add and Edit Applet Dialog Boxes](#) , on page 2041.

### Field Reference

**Table 668: Add and Edit Syslog Configuration Dialog Boxes**

| Element | Description                                                                                                                                                                                                                                                                                                                     |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID      | Enter a single syslog message or a range of syslog messages. If a syslog message occurs that matches the specified individual syslog message or range of syslog messages, an event manager applet is triggered.<br><br><b>Note</b> Syslog message IDs may not be entered twice or overlap within a single event manager applet. |
| Occurs  | (Optional) In the occurrences field, enter the number of times that the syslog message must occur for an event manager applet to be invoked. The default is 1 occurrence every 0 seconds. Valid values are from 1 - 4294967295.                                                                                                 |
| Period  | (Optional) In the period field, enter the number of seconds within which the syslog messages must occur to invoke the action. This value limits how frequently an event manager applet is invoked to at most once in the configured period. Valid values are from 0 - 604800. A value of 0 means that no period is defined.     |

## Add and Edit Action Configuration Dialog Boxes

Use the Add Action Configuration and Edit Action Configuration dialog boxes to configure the actions for an event manager applet. Except for the title, the two dialog boxes are identical; the following information applies to both.

### Navigation Path

You can open the Add and Edit Action Configuration dialog boxes from the [Add and Edit Applet Dialog Boxes](#), on page 2041.

### Field Reference

*Table 669: Add and Edit Action Configuration Dialog Boxes*

| Element    | Description                                                                                                                                                                                                                   |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ordinal ID | Enter the unique sequence number in the Ordinal ID field. Valid sequence numbers range from 0 - 4294967295. When adding an action configuration, the Ordinal ID will default to one greater than the highest Ordinal ID used. |
| CLI        | Enter the CLI command in the CLI field. The command runs in global configuration mode as a user with privilege level 15 (the highest). The command may not accept any input, because it is disabled.                          |

## E-Mail Setup Page

The E-Mail Setup page (PIX 7.0/ASA Only) lets you set up a source e-mail address, as well as a list of recipients for specified syslog messages to be sent as e-mails. You can filter the syslog messages sent to a destination e-mail address by severity. The table shows which entries have been set up.

The syslog severity filter used for the destination e-mail address will be the higher of the severity selected in this section and the global filter set for all e-mail recipients in the Logging Filters page.

### Navigation Path

- (Device view) Select **Platform > Logging > Syslog > E-Mail Setup** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > E-Mail Setup** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Field Reference

*Table 670: E-Mail Setup Page*

| Element              | Description                                                                               |
|----------------------|-------------------------------------------------------------------------------------------|
| Source Email Address | Enter the email address to be used as the source address when syslogs are sent as emails. |

| Element                   | Description                                                                                                                                                                                                                                                             |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Destination Address table | Lists the currently defined email recipients of syslog messages.<br>Use the Add Row, Edit Row and Delete Row buttons below the table to manage this list; the Add Row and Edit Row buttons open the <a href="#">Add/Edit Email Recipient Dialog Box</a> , on page 2045. |

## Add/Edit Email Recipient Dialog Box

The Add/Edit Email Recipient dialog box lets you configure a destination address to be sent emails containing syslog messages; you can limit the messages sent according to severity.

The syslog severity filter used for the destination email address will be the higher of the severity selected in this section and the global filter set for all email recipients on the [Logging Filters Page](#) , on page 2049.

### Navigation Path

You can access the Add/Edit Email Recipient dialog box from the [E-Mail Setup Page](#) , on page 2044.

### Field Reference

*Table 671: Add/Edit Email Recipient Dialog Box*

| Element                   | Description                                                                                                                                                                                                      |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Destination Email Address | Enter the recipient email address for the chosen type of syslog messages.                                                                                                                                        |
| Syslog Severity list      | Choose the severity of the syslogs to be emailed to this recipient; messages of the chosen severity and higher are sent. Message severity levels are described in <a href="#">Logging Levels</a> , on page 2062. |

## Event Lists Page

The Event Lists page (PIX 7.0+/ASA only) lets you define a set of syslog message filters for logging. After you enable logging and set up global logging parameters on the Logging Setup page, use this page to configure event lists used to filter syslog messages sent to different logging destinations. (The [Logging Filters Page](#) , on page 2049 lets you specify logging destinations for event lists.)

Use the Add Row, Edit Row and Delete Row buttons below the Event Lists table to manage the entries. Add Row and Edit Row open the [Add/Edit Event List Dialog Box](#) , on page 2047.

### Navigation Path

- (Device view) Select **Platform > Logging > Syslog > Event Lists** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > Event Lists** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Add/Edit Event List Dialog Box

The Add/Edit Event List dialog box lets you create or edit an event list, and specify which syslog messages to include in the event list filter.

You can use the following criteria to define an event list:

- Class and Severity
- Message ID

Class represents specific types of related syslog messages. For example, the class auth represents all syslog messages related to user authentication.

Severity classifies syslogs based on the relative importance of the event in the normal functioning of the network. The highest severity is Emergency, which means the resource is no longer available. The lowest severity is Debugging, which provides detailed information about every network event.

The message ID is a numeric value that uniquely identifies each individual message. You can specify a single message ID, or a range of IDs, in an event list.

### Navigation Path

You can access the Add/Edit Event List dialog box from the [Event Lists Page](#) , on page 2045.

### Field Reference

## Add/Edit Syslog Class Dialog Box

The Add/Edit Syslog Class dialog box lets you specify an event class and a related severity level as an event list filter.

Class represents specific types of related syslog messages, so you do not have to select the syslogs individually. For example, the class auth represents all syslog messages related to user authentication.

Severity classifies syslogs based on the relative importance of the event in the normal functioning of the network. The highest severity is Emergency, which means the resource is no longer available. The lowest severity is Debugging, which provides detailed information about every network event.

### Navigation Path

You access the Add/Edit Syslog Class dialog box from the [Add/Edit Event List Dialog Box](#) , on page 2047.

### Field Reference

**Message IDs** – Enter a syslog message ID, or a range of IDs. Use a hyphen to specify a range; for example, 101001-101010 . Message IDs must be between 100000 and 999999.

Message IDs and their corresponding messages are listed in the System Log Message guides for the appropriate product. You can access these guides from [cisco.com](http://cisco.com):

PIX Firewall

- [http://www.cisco.com/en/US/products/sw/secursw/ps2120/products\\_system\\_message\\_guides\\_list.html](http://www.cisco.com/en/US/products/sw/secursw/ps2120/products_system_message_guides_list.html)

#### ASA

- [http://www.cisco.com/en/US/products/ps6120/products\\_system\\_message\\_guides\\_list.html](http://www.cisco.com/en/US/products/ps6120/products_system_message_guides_list.html)

#### FWSM

- [http://www.cisco.com/en/US/products/hw/modules/ps2706/ps4452/tsd\\_products\\_support\\_model\\_home.html](http://www.cisco.com/en/US/products/hw/modules/ps2706/ps4452/tsd_products_support_model_home.html)

## Logging Filters Page

The Logging Filters page lets you configure a logging destination for event lists (syslog filters) that have been configured using the Event Lists page, or for only the syslog messages that you specify using the Edit Logging Filters page. Syslog messages from specific or all event classes can be selected using the Edit Logging Filters page.

### Navigation Path

- (Device view) Select **Platform > Logging > Syslog > Logging Filters** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > Logging Filters** from the Policy Type selector. Right-click **Logging Filters** to create a policy, or select an existing policy from the Shared Policy selector.

| Syslogs From Specific Event Classes | <p>Lists event class and severity set up as the filter. Event classes are described in <a href="#">Message Classes and Associated Message ID Numbers</a> , on page 2046. Severity levels are described in <a href="#">Logging Levels</a> , on page 2062.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Edit Logging Filters Dialog Box

The Edit Logging Filters dialog box lets you edit filters for a logging destination. Syslogs can be configured from all or specific event classes, or disabled for a specific logging destination.

### Navigation Path

You can access the Edit Logging Filters dialog box from the Logging Filters page. For more information about the Logging Filters page, see [Logging Filters Page](#) , on page 2049.

| Filter on severity option                   | Filters on the severity of the logging messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Filter on severity list                     | Specifies the level of logging messages on which to filter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Use event list option                       | Specifies to use an event list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Use event list                              | Specifies the event list to use. Event lists are defined on the <a href="#">Event Lists Page</a> , on page 2045.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Disable logging option                      | Disables all logging to the selected destination.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Syslog from Specific Event Classes (PIX7.0) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Event Class                                 | Specifies the event class and severity. Event classes include one or all available items. Event classes are described in <a href="#">Message Classes and Associated Message ID Numbers</a> , on page 2046.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Severity                                    | Specifies the level of logging messages. Severity levels are described in <a href="#">Logging Levels</a> , on page 2062.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

# Configuring Logging Setup

The Logging Setup page lets you enable system logging on the security appliance and configure other logging options. These options include enabling logging on the security appliance and failover unit, specifying the base log format and detail, and logging to longer-term storage devices, FTP server or Flash, before purging the internal buffer.

## Related Topics

- [Logging Setup Page](#) , on page 2052

- 
- Step 1** Select **Platform > Logging > Syslog > Logging Setup** to display the Logging Setup page.
- Step 2** Check **Enable Logging**.
- This option enables logging on the security appliance.
- Step 3** To enable logging on the failover unit paired with this security appliance, select the **Enable logging on the standby failover unit** check box.
- Step 4** To enable EMBLEM format, or to send debug messages as part of the syslog messages, select the corresponding check boxes.
- If you enable EMBLEM, you must use the UDP protocol to publish syslog messages. It is not compatible with TCP.
- Step 5** To write the internal buffer data to an FTP server for future processing prior to clearing the buffer, do the following:
- Check **FTP Server Buffer wrap**.
  - Enter the IP address of the FTP server in the **IP Address** field.
  - Enter the user name of the account used to log into the FTP server in the **User Name** field.
  - Enter the path in the **Path** field, relative to the FTP root, where the file should be stored.
  - Enter and confirm the password used to authenticate the user name.
- Step 6** To write the internal buffer data to Flash for future processing prior to clearing the buffer, do the following:
- Check **Flash**.
  - Specify the maximum amount of memory to allocate to the storage of internal buffer data.
  - Specify the minimum memory that should remain free on the Flash drive. If this minimum value cannot be retained while writing out the data from the internal buffer, the messages will be pruned to meet the space requirements.
- Step 7** To specify the maximum queue size maintained on the appliance for viewing by an ASDM client, enter that value in the **Message Queue Size (Messages)** field.
- 

## Logging Setup Page

The Logging Setup page lets you enable system logging on the security appliance and configure other logging options.

### Navigation Path

- (Device view) Select **Platform > Logging > Syslog > Logging Setup** from the Device Policy selector.

- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > Logging Setup** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

| Element                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Logging                                           | Turns on logging for the main security appliance.                                                                                                                                                                                                                                                                                                                                                              |
| Enable Logging on the Failover Standby Unit              | Turns on logging for the standby security appliance, if available.                                                                                                                                                                                                                                                                                                                                             |
| Send syslogs in EMBLEM format (PIX7.x+, ASA, FWSM 3.x+)  | Enables EMBLEM format logging for every logging destination. If you enable EMBLEM, you must use the UDP protocol to publish syslog messages; EMBLEM is not compatible with TCP.<br><br><b>Note</b> This setting is not compatible with CS-MARS.                                                                                                                                                                |
| Send debug messages as syslogs (PIX7.x+, ASA, FWSM 3.x+) | Redirects all the debug trace output to the syslog. The syslog message does not appear in the console if this option is enabled. Therefore, to see debug messages, you must enable logging at the console and configure it as the destination for the debug syslog message number and logging level. The syslog message number used is <i>711011</i> . Default logging level for this syslog is <i>debug</i> . |
| Memory Size of Internal Buffer (bytes)                   | Specify the size of the internal buffer to which syslogs is saved if the logging buffer is enabled. When the buffer fills up, it is overwritten. The default is 4096 bytes. The range is 4096 to 1048576.                                                                                                                                                                                                      |
| Specify FTP Server Information (PIX7.x+, ASA, FWSM 3.x+) |                                                                                                                                                                                                                                                                                                                                                                                                                |
| FTP Server Buffer Wrap                                   | To save the buffer contents to the FTP server before it is overwritten, check this box and enter the necessary destination information in the following fields. To remove the FTP configuration, deselect this option.                                                                                                                                                                                         |
| IP Address                                               | Enter the IP address of the FTP server.                                                                                                                                                                                                                                                                                                                                                                        |
| User Name                                                | Enter the user name to use when connecting to the FTP server.                                                                                                                                                                                                                                                                                                                                                  |
| Path                                                     | Enter the path, relative to the FTP root, where the buffer contents should be saved.                                                                                                                                                                                                                                                                                                                           |
| Password/Confirm                                         | Enter and confirm the password used to authenticate the user name to the FTP server.                                                                                                                                                                                                                                                                                                                           |
| Specify flash size                                       |                                                                                                                                                                                                                                                                                                                                                                                                                |
| Flash                                                    | To save the buffer contents to the flash memory before it is overwritten, check this box. This option is only available in routed or transparent single mode.                                                                                                                                                                                                                                                  |

| Element                                  | Description                                                                                                                                       |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum flash to be used by logging (KB) | Specify the maximum space to be used in the flash memory for logging (in KB). This option is available only in routed or transparent single mode. |
| Minimum free space to be preserved (KB)  | Specifies the minimum free space to be preserved in flash memory (in KB). This option is available only in routed or transparent single mode.     |
| ASDM Logging (PIX7.x+, ASA, FWSM 3.x+)   |                                                                                                                                                   |
| Message Queue Size                       | Specify the queue size for syslogs intended for viewing in ASDM.                                                                                  |

## Configuring Rate Limit Levels

The Rate Limit page lets you specify the maximum number of log messages of specific types (e.g., “alert” or “critical”), and messages with specific Syslog IDs, that can be generated within given periods of time. You can specify individual limits for each logging level, and each Syslog message ID. If the settings conflict, the Syslog message ID limits take precedence.

The [Add/Edit Rate Limited Syslog Message Dialog Box](#), on page 2056 is used to specify the maximum number of messages that can be generated for a particular Syslog message ID within a given period of time.

The [Add/Edit Rate Limit for Syslog Logging Levels Dialog Box](#), on page 2056 is used to specify the maximum number of messages that can be generated for a particular Syslog logging level within a given period of time.

### Related Topics

- [Rate Limit Page](#), on page 2055

Follow these steps to manage rate limits for message logging:

- 
- Step 1** Access the Rate Limit page by doing one of the following:
- (Device view) Select **Platform > Logging > Syslog > Rate Limit** from the Device Policy selector.
  - (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > Rate Limit** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new policy.
- Step 2** Add, edit and delete rate limits for Syslog logging levels:
- To specify the maximum number of messages that can be generated within a given period of time for particular logging level, click the **Add Row** button under the Rate Limits for Syslog Logging Levels table to open the [Add/Edit Rate Limit for Syslog Logging Levels Dialog Box](#), on page 2056. Choose a logging level and define a rate limit.
  - To edit the rate limit for a particular logging level, select the appropriate entry in the Rate Limits for Syslog Logging Levels table, and then click the **Edit Row** button under the table to open the [Add/Edit Rate Limit for Syslog Logging Levels Dialog Box](#), on page 2056. Alter the rate limit as necessary.
  - To delete a rate limit entry from the Rate Limits for Syslog Logging Levels table, select it and then click the **Delete Row** button under the table. A confirmation dialog box may be displayed; click OK to delete the entry.
- Step 3** Add, edit and delete limits for log messages according to message IDs:

- To specify the maximum number of messages that can be generated within a given period of time for particular message ID, click the **Add Row** button under the Individually Rate Limited Syslog Messages table to open the [Add/Edit Rate Limited Syslog Message Dialog Box](#) , on page 2056. Choose a Syslog message ID and define a rate limit.
- To edit the rate limit for a particular Syslog message ID, select the appropriate entry in the Individually Rate Limited Syslog Messages table, and then click the **Edit Row** button under the table to open the [Add/Edit Rate Limited Syslog Message Dialog Box](#) , on page 2056. Alter the rate limit as necessary.
- To delete a message limit entry from the Individually Rate Limited Syslog Messages table, select it and then click the **Delete Row** button under the table. A confirmation dialog box may be displayed; click OK to delete the entry.

## Rate Limit Page

The Rate Limit page allows you to specify the maximum number of log messages of a particular type (for example, alert or critical) that should be generated within a given period of time. You can specify a limit for each logging level and Syslog message ID. If the settings differ, Syslog message ID limits take precedence.

### Navigation Path

- (Device view) Select **Platform > Logging > Syslog > Rate Limit** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > Rate Limit** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new policy.

|--------------------|----------------------------------------------------------------------------------------|
| Syslog ID          | Identification number of the Syslog message for which you are specifying a rate limit. |
| No. of Messages    | Maximum number of messages with the specified ID allowed in the specified time period. |
| Interval (seconds) | Number of seconds before the rate limit counter resets.                                |

## Add/Edit Rate Limit for Syslog Logging Levels Dialog Box

Using the Add/Edit Rate Limit for Syslog Logging Levels dialog box, you can specify the maximum number of log messages for particular log level that should be generated within a given period of time. You can specify a limit for each logging level or syslog message ID (see [Add/Edit Rate Limited Syslog Message Dialog Box , on page 2056](#)). If the settings differ, the rate limited syslog message-level settings override rate limit logging level settings.

### Navigation Path

You can access the Add/Edit Rate Limit for Syslog Logging Levels dialog box from the Rate Limit page. For more information, see [Rate Limit Page , on page 2055](#).

| Element            | Description                                                                            |
|--------------------|----------------------------------------------------------------------------------------|
| Syslog ID          | Identification number of the syslog message for which you are specifying a rate limit. |
| Number of Messages | Maximum number of messages with the specified ID allowed in the specified time period. |
| Interval (Seconds) | Number of seconds before the rate limit counter resets.                                |

## Configuring Syslog Server Setup

You can configure general syslog server settings to set the facility code to be included in syslog messages that are sent to syslog servers, specify whether a timestamp is included in each message, specify the device ID to include in messages, view and modify the severity levels for messages, and disable the generation of specific messages.

**Related Topics**

- [Defining Syslog Servers](#) , on page 2063

**Step 1**

Do one of the following:

- (Device view) Select **Platform > Logging > Syslog > Server Setup** to open the [Server Setup Page](#) , on page 2059.
- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > Server Setup** from the Policy Type selector. Select an existing policy or create a new one.

**Step 2**

Change the basic message configuration as required:

- If your syslog server expects a different facility than the default, select the required facility in the **Facility** list.
- If you want to include the date and time a message was generated in the message, select **Enable Timestamp on Each Syslog Message**.
  - If you want to configure logging timestamp in the rfc5424 format, select **Enable Timestamp Format(rfc5424)**. This option is applicable for ASA 9.12.1 devices and later. Example output of the timestamp:

**Example:**

```
2003-08-24T05:14:15.000003-07:00
```

- If you want to add a device identifier to syslog messages (which is placed at the beginning of the message), select **Enable Syslog Device ID** and then select the type of ID:

**Note** For an ASA cluster, each unit in the cluster generates its own syslog messages. You can configure logging so that each unit uses either the same or a different device ID in the syslog message header field. For example, the hostname configuration is replicated and shared by all units in the cluster. If you configure logging to use the hostname as the device ID, syslog messages generated by all units look as if they come from a single unit. If you configure logging to use the local-unit name that is assigned in the cluster bootstrap configuration as the device ID (Cluster ID option), syslog messages look as if they come from different units. You can also specify whether or not the interface IP address of the Control unit should be used for all cluster devices.

- **Interface**—To use the IP address of the specified interface, regardless of the interface through which the appliance sends the message. Click **Select** to select the interface or the interface role that identifies the interface. Interface roles must map to a single interface.

For ASA clusters, to specify that the interface IP address of the Control unit should be used for all cluster devices, select the corresponding option under the Interface Name field.

- **User Defined ID**—To use a text string (up to 16 characters) of your choosing.
- **Host Name**—To use the hostname of the device.
- **Cluster ID**—To use the unique name in the boot configuration of an individual ASA unit in the cluster as the device ID.

**Step 3**

Use the Syslog Message table to alter the default settings for specific syslog messages. You need to configure rules in this table only if you want to change the default settings. You can change the severity assigned to a message, or you can suppress (disable) the generation of a message.

- To add a rule, click the **Add Row** button and fill in the [Add/Edit Syslog Message Dialog Box](#), on page 2062.

You select the message number whose configuration you want to change, and then select the new severity level, or select **Suppressed** to disable the generation of the message. Typically, you would not change the severity level and disable the message, but you can make changes to both fields if desired. Click **OK** to add the rule to the table.

For a description of message severity levels, see [Logging Levels](#), on page 2062.

- To edit a rule, select it and click the **Edit Row** button, make the desired changes, and click **OK**.
- To delete a rule, select it and click the **Delete Row** button.
- If you are using NetFlow, you can easily disable the generation of syslog messages that have NetFlow equivalents by clicking the **Disable NetFlow Equivalent Syslogs** button. This adds the messages to the table as suppressed messages. Note that if any of these syslog equivalents are already in the table, your existing rules are not overwritten.

## Syslog Relay Configuration

In addition to events being received by the Cisco Security Manager server, they can be forwarded to a maximum of two external/remote controllers (syslog hosts). Syslog relay will forward the received messages to another syslog host using the UDP syslog protocol.

If you want the syslog messages that are forwarded from the Cisco Security Manager server to have the Cisco Security Manager server's IP address as the source IP address of the syslog message, you must enable it through CLI command:

1. Navigate to CSCOpX\MDC\logrelay and open the logrelay.properties file.
2. Set the values of ext1 and ext2 to false like this:

```
## Source Preservation
#logrelay.dp.txring.ext0.preserve.source=true logrelay.dp.txring.ext1.preserve.source=false
logrelay.dp.txring.ext2.preserve.source=false
```

---

**Note** By default the value is true for all collectors, by setting ext1 and ext2 as false, Cisco Security Manager will send the sylog messages with Cisco Security Manager IP. This modification can be done only for remote collectors and not for the local collector (ext0).

---

## Server Setup Page

The Server Setup page allows you to set the facility code to be included in syslog messages that are sent to syslog servers, specify whether a timestamp is included in each message, specify the device ID to include in messages, view and modify the severity levels for messages, and disable the generation of specific messages.

### Navigation Path

- (Device view) Select **Platform > Logging > Syslog > Server Setup** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > Server Setup** from the Policy Type selector. Select an existing policy or create a new one.

*Table 681: Server Setup Page*

| Element                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Facility                                | <p>The syslog facility code that the appliance includes in messages destined for syslog servers. The default is LOCAL4(20), which is what most UNIX systems expect. You can select a facility between LOCAL0(16) and LOCAL7(23).</p> <p>Syslog facility is useful when you have a central syslog monitoring system that needs to distinguish among the various network devices that generate syslog data streams. Because your network devices share the eight available facilities, you might need to change this value.</p> |
| Enable Timestamp on Each Syslog Message | <p>Whether to include the date and time a message was generated in syslog messages. The default is to not include time stamps.</p>                                                                                                                                                                                                                                                                                                                                                                                            |

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Syslog Device ID | <p>Whether to configure a device ID in non-EMBLEM-format syslog messages. If you select this option, select one of the following to use as the device ID, which is placed at the start of all syslog messages:</p> <p><b>Note</b> For an ASA cluster, each unit in the cluster generates its own syslog messages. You can configure logging so that each unit uses either the same or a different device ID in the syslog message header field. For example, the hostname configuration is replicated and shared by all units in the cluster. If you configure logging to use the hostname as the device ID, syslog messages generated by all units look as if they come from a single unit. If you configure logging to use the local-unit name that is assigned in the cluster bootstrap configuration as the device ID (Cluster ID option), syslog messages look as if they come from different units. You can also specify whether or not the interface IP address of the Control unit should be used for all cluster devices.</p> <ul style="list-style-type: none"> <li>• <b>Interface</b>—The IP address of the selected interface. Enter the name of the interface or click <b>Select</b> to select it from a list (or to select an interface role that specifies the interface). Messages include the IP address of the interface specified, regardless of which interface the adaptive security appliance uses to send the log data to the external server.</li> </ul> <p>If you select an interface role, that role must map to a single interface on the device.</p> <p>For ASA clusters, to specify that the interface IP address of the Control unit should be used for all cluster devices, select the corresponding option under the Interface Name field.</p> <ul style="list-style-type: none"> <li>• <b>User Defined ID</b>—A text string you define as the device ID. This string can be up to 16 characters, but cannot contain any of the following special characters:<br/>&amp; ' " &lt; &gt; ?</li> <li>• <b>Host Name</b>—The hostname of the security appliance.</li> <li>• <b>Cluster ID</b>—Use the unique name in the boot configuration of an individual ASA unit in the cluster as the device ID.</li> </ul> |
| Syslog Message table    | <p>Use this table to enable or disable the generation of specific syslog messages, or to change the severity level of a message. If you do not want to constrict which message types are generated, or change any message severity levels, you do not need to configure anything in this table. The table shows the messages you have configured with the message level and whether generation is suppressed (“true” in the table).</p> <ul style="list-style-type: none"> <li>• To add a rule, click the <b>Add Row</b> button and fill in the <a href="#">Add/Edit Syslog Message Dialog Box</a>, on page 2062.</li> <li>• To edit a rule, select it and click the <b>Edit Row</b> button.</li> <li>• To delete a rule, select it and click the <b>Delete Row</b> button.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Disable/Enable NetFlow Equivalent Syslogs | <p>If you are using NetFlow logging, you might want to disable the generation of syslog messages that duplicate NetFlow messages. If you click the Disable button, these duplicate syslog messages are added to the Syslog Message table as suppressed messages, and the button is renamed Enable NetFlow Equivalent Syslogs.</p> <p>Clicking the Enable button removes the duplicate syslog messages from the table, meaning that they will no longer be suppressed, and the device will start sending them again. However, if you manually edited any message that was added to the list by the Disable button, the Enable button does not remove them.</p> |

## Logging Levels

The following table describes logging levels.

**Table 682: Logging Levels**

| Logging Level | Type          | Description                                                                                                                                                                                                                                                                     |
|---------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0             | Emergency     | System unusable. Generates messages that identify system instabilities.                                                                                                                                                                                                         |
| 1             | Alerts        | Immediate action needed. Generates messages that identify system integrity issues that require immediate administrative action.                                                                                                                                                 |
| 2             | Critical      | Critical condition. Generates messages that identify critical system issues.                                                                                                                                                                                                    |
| 3             | Errors        | Error condition. Generates messages that identify system errors during operation.                                                                                                                                                                                               |
| 4             | Warnings      | Warning condition. Generates messages that identify system warnings. For example, device might be configured incorrectly.                                                                                                                                                       |
| 5             | Notifications | Normal but significant condition. Generates messages that identify normal operations that are typically considered significant events.                                                                                                                                          |
| 6             | Information   | Informational only. Generates messages that identify system information that is typical of day-to-day activity, such as network session records.                                                                                                                                |
| 7             | Debugging     | Generates syslog messages that assist you in debugging. Also generates logs that identify the commands issued during FTP sessions and the URLs requested during HTTP sessions. Includes all emergency, alert, critical, error, warning, notification, and information messages. |
| -             | Disabled      | No logging.                                                                                                                                                                                                                                                                     |

## Add/Edit Syslog Message Dialog Box

The Add/Edit Syslog Message dialog box lets you modify the logging level or suppression setting for a syslog message.

### Navigation Path

You can access the Add/Edit Syslog Message dialog box from the [Server Setup Page](#) , on page 2059.

### Field Reference

*Table 683: Add/Edit Syslog Message Dialog Box*

| Element                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syslog ID list             | <p>The message log ID of the message whose severity level or suppression setting you want to alter. These values and their corresponding messages are identified in the System Log Message guides for the appropriate product:</p> <p><b>PIX Firewall</b></p> <p><a href="http://www.cisco.com/en/US/products/sw/secursw/ps2120/products_system_message_guides_list.html">http://www.cisco.com/en/US/products/sw/secursw/ps2120/products_system_message_guides_list.html</a></p> <p><b>ASA</b></p> <p><a href="http://www.cisco.com/en/US/products/ps6120/products_system_message_guides_list.html">http://www.cisco.com/en/US/products/ps6120/products_system_message_guides_list.html</a></p> <p><b>FWSM</b></p> <p><a href="http://www.cisco.com/en/US/products/hw/modules/ps2706/ps4452/tsd_products_support_model_home.html">http://www.cisco.com/en/US/products/hw/modules/ps2706/ps4452/tsd_products_support_model_home.html</a></p> <p><b>Note</b> Starting from Cisco Security Manager 4.10, you can enter a syslog message in the Syslog ID field. Make sure that you enter a valid syslog ID corresponding to the device; else the deployment may fail.</p> |
| Logging Level list         | <p>The logging level that you want to assign to the message. For logging levels and descriptions, see <a href="#">Logging Levels</a> , on page 2062.</p> <p>Select (default) to use the default level assigned to the message.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Suppressed                 | <p>Whether to suppress the generation of the syslog message. Suppressing a message disables its generation, so you will not see it in syslogs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Disable Syslogs on Standby | <p>Whether to block specific syslog messages from being generated on standby ASA devices. This feature is available from ASA version 9.4(1) and Security Manager supports this feature starting from version 4.9.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Defining Syslog Servers

The Syslog Servers page lets you specify the syslog servers to which the security appliance will send syslog messages. To make use of the syslog servers you define, you must enable logging using the Logging Setup page and set up the appropriate filters for destinations using the Logging Filters page.

---

**Tip** If you want to view events from an ASA device using Security Manager Event Viewer, ensure that you define the Security Manager server as a syslog server. Also, if you use CS-MARS or other applications to manage syslog events, include those servers in this policy.

---

By directing syslog records generated by a security appliance to a syslog server, you can process and study the records.

### Before You Begin

Enable logging. See [Configuring Logging Setup](#), on page 2052.

### Related Topics

- [Syslog Servers Page](#), on page 2065
- [Add/Edit Syslog Server Dialog Box](#), on page 2066

---

**Step 1** Select **Platform > Logging > Syslog > Syslog Servers** to display the Syslog Servers page.

**Step 2** Do one of the following:

- To add a new syslog target, click the **Add Row** button.
- To edit an existing syslog target, select the check box for the row, then click the **Edit Row** button.

**Step 3** Enter or select the interface name in the **Interface** field.

The list displays all interfaces defined at the current scope.

**Step 4** Enter or select the IP address of the syslog server in the **IP Address** field.

**Step 5** Determine whether to use UDP or TCP, then click the appropriate radio button under Protocol.

**Step 6** Enter the port from which the security appliance sends either UDP or TCP syslog messages. The port must be the same port on which the syslog server listens.

- TCP—1470 (Default). TCP ports work only with a security appliance syslog server.
- UDP—514 (Default).

**Step 7** To generate syslog messages using the EMBLEM format, select the **Log messages in Cisco EMBLEM format** check box.

To enable this option, you must select UDP protocol to publish messages to this syslog server.

**Step 8** Click **OK**.

The definition appears in the Syslog Servers table.

---

## Syslog Servers Page

The Syslog Servers page lets you specify the syslog servers to which the security appliance sends syslog messages. To make use of the syslog servers you define, you must enable logging using the Logging Setup page and set up the appropriate filters for destinations using the Logging Filters page.

**Tip** If you want to view events from an ASA device using Security Manager Event Viewer, ensure that you define the Security Manager server as a syslog server. Also, if you use CS-MARS or other applications to manage syslog events, include those servers in this policy.

### Navigation Path

- (Device view) Select **Platform > Logging > Syslog > Syslog Servers** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > Syslog Servers** from the Policy Type selector. Select an existing policy or create a new one.

Minimum is 1 message. Default is 512. Specify 0 to allow an unlimited number of messages to be queued (subject to available block memory).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Allow user traffic to pass when TCP syslog server is down | <p>Whether to restrict all traffic if any syslog server that is using the TCP protocol is down.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Add/Edit Syslog Server Dialog Box

The Add/Edit Syslog Servers dialog box lets you add or edit the syslog servers to which the security appliance will send syslog messages. To make use of the syslog servers you define, you must enable logging using the Logging Setup page and set up the appropriate filters for destinations using the Logging Filters page.

---

**Note** There is a limit of four syslog servers that can be set up per context.

---

### Navigation Path

You can access the Add Syslog Servers dialog box from the Syslog Servers page. For more information about the Syslog Servers page, see [Syslog Servers Page](#), on page 2065.

*Table 685: Add/Edit Syslog Server Dialog Box*

| Element    | Description                                                                                                                                                                                                                                                                                               |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface  | The interface used to communicate with the syslog server. Enter the name of the interface or interface role object, or click <b>Select</b> to select it from a list or to create a new object.                                                                                                            |
| IP Address | The IP address of syslog server. Enter the IP address or the name of the network/host policy object that defines the address, or click <b>Select</b> to select the network/host object.<br><br><b>Note</b> Starting with Cisco Security Manager 4.13, IPv6 addresses are supported for the syslog server. |
| Protocol   | The protocol used by syslog server, either TCP or UDP. UDP is the default. TCP ports work only with a security appliance syslog server.<br><br><b>Note</b> You must select UDP if you intend to use the EMBLEM format.                                                                                    |

| Element                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port                                           | <p>The TCP or UDP port from which the security appliance sends syslog messages and on which the syslog server receives them. The default ports for each protocol are:</p> <ul style="list-style-type: none"> <li>• TCP—1470.</li> <li>• UDP—514.</li> </ul> <p><b>Tip</b> If you are defining the Security Manager server as a syslog server, you can find the port number on the Security Manager Administration <a href="#">Event Management Page</a> , on page 536.</p> <p><b>Note</b> During the installation or upgrade of Security Manager, the Common Services syslog service port is changed from 514 to 49514. Later, if Security Manager is uninstalled, the port is not reverted to 514.</p> |
| Log messages in Cisco EMBLEM format (UDP only) | <p>Whether to log messages in Cisco EMBLEM format. The syslog server must use UDP.</p> <p><b>Note</b> If the syslog server is a Cisco Security MARS appliance, do not select this option. Cisco Security MARS does not process the EMBLEM format.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Reference Identity                             | <p>Beginning with version 4.12, Security Manager enables you to select Reference Identity policy object name from the Policy Objects Selector.</p> <p>Reference Identity is enabled only if the Port is TCP and is disabled if the Port is UDP.</p> <p>For more information, see <a href="#">Reference Identities</a> , on page 1947.</p>                                                                                                                                                                                                                                                                                                                                                               |

## CHAPTER 55

# Configuring Multicast Policies on Firewall Devices

---

The Multicast section contains pages for defining IP multicast routing on security devices. Multicast routing is supported in single-context, routed mode only.

Enabling multicast routing enables IGMP and PIM on all interfaces by default. Internet Group Management Protocol (IGMP) is used to learn whether members of a group are present on directly attached subnets. Hosts join multicast groups by sending IGMP report messages. Protocol Independent Multicast (PIM) is used to maintain forwarding tables for multicast datagrams.

---

**Note** Only the UDP transport layer is supported for multicast routing.

---

This chapter contains the following topics:

- [Enabling PIM and IGMP](#) , on page 2069
- [Configuring IGMP](#) , on page 2070
- [Configuring Multicast Routes](#) , on page 2076
- [Configuring Multicast Boundary Filters](#) , on page 2078
- [Configuring PIM](#) , on page 2079

## Enabling PIM and IGMP

The **Enable PIM and IGMP** page lets you enable or disable Internet Group Management Protocol (IGMP) and Protocol Independent Multicast (PIM) on all interfaces on the security appliance. IGMP is used to learn whether members of a group are present on directly attached subnets. Hosts join multicast groups by sending IGMP report messages. PIM is used to maintain forwarding tables to forward multicast datagrams.

When **Enable PIM and IGMP** is checked on this page, PIM and IGMP are enabled on all interfaces on the security appliance. Deselect the option to disable PIM and IGMP on all interfaces.

---

**Note** You can disable PIM and IGMP on a per-interface basis; see [IGMP Page - Protocol Tab](#) , on page 2071 and [PIM Page - Protocol Tab](#) , on page 2080 for more information.

---

### Navigation Path

- (Device view) Select **Platform > Multicast > Enable PIM and IGMP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Multicast > Enable PIM and IGMP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Configuring IGMP

Internet Protocol hosts use IGMP to report their group memberships to directly connected multicast routers. Internet Group Management Protocol (IGMP) uses group-address (Class D) IP addresses.

Host group addresses can be in the range 224.0.0.0 to 239.255.255.255. The address 224.0.0.0 is never assigned to any group. The address 224.0.0.1 is assigned to all systems on a subnet. The address 224.0.0.2 is assigned to all routers on a subnet.

The IGMP page provides four tabbed panels, used to configure and manage IGMP in Security Manager:

- [IGMP Page - Protocol Tab](#) , on page 2071 – This panel displays interface-specific IGMP parameters; you can disable IGMP and change IGMP parameters.
- [IGMP Page - Access Group Tab](#) , on page 2073 – Lets you manage access groups that restrict the multicast sources allowed on an interface.
- [IGMP Page - Static Group Tab](#) , on page 2074 – Sometimes, hosts on a network may have a configuration that prevents them from answering IGMP queries; however, you still want multicast traffic to be forwarded to that network segment. There are two methods to pull multicast traffic down to a network segment:
  - Use the Join Group tab to configure the interface as a member of the multicast group. With this method, the security appliance accepts the multicast packets in addition to forwarding them to the specified interface.
  - Use the Static Group tab to configure the security appliance to be a statically connected member of a group. With this method, the security appliance does not accept the packets itself, but only forwards them. Therefore, this method allows fast switching. The outgoing interface appears in the IGMP cache, but itself is not a member of the multicast group.

Use this tab to statically assign a multicast group to an interface, or change existing static group assignments.

- [IGMP Page - Join Group Tab](#) , on page 2075 – Use this tab to manage the multicast groups to which the security appliance belongs.

**Note** If you simply want to forward multicast packets for a specific group to an interface without the security appliance accepting those packets as part of the group, see [IGMP Page - Static Group Tab](#) , on page 2074.

### Navigation Path

- (Device view) Select **Platform > Multicast > IGMP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Multicast > IGMP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## IGMP Page - Protocol Tab

Use the Protocol tab to configure IGMP parameters for an interface on the security appliance.

### Navigation Path

You can access the Protocol tab from the IGMP page. For more information about the IGMP page, see [Configuring IGMP](#) , on page 2070.

| Element        | Description                                                                                                                                                                                                                      |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol Table |                                                                                                                                                                                                                                  |
| Interface      | The name of the interface to which the IGMP settings apply.                                                                                                                                                                      |
| Enabled        | Indicates whether IGMP is enabled on the interface.                                                                                                                                                                              |
| Version        | The version of IGMP enabled on the interface.                                                                                                                                                                                    |
| Query Interval | The interval, in seconds, at which the designated router sends IGMP host-query messages. Valid values range from 1 to 3600 seconds. The default value is 125 seconds.                                                            |
| Query Timeout  | The period of time, in seconds, before the security appliance takes over querying the interface, after the previous appliance has stopped doing so. Valid values range from 60 to 300 seconds. The default value is 255 seconds. |

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Response Time            | The maximum response time, in seconds, advertised in IGMP queries. If the security appliance does not receive any host reports within the designated response time, the IGMP group is pruned. Decreasing this value lets the security appliance prune groups faster. Valid values range from 1 to 12 seconds. The default value is 10 seconds. Changing this value is only valid only for IGMP Version 2. |
| Group Limit              | The maximum number of hosts that can join on an interface. Valid values range from 1 to 500. The default value is 500.                                                                                                                                                                                                                                                                                    |
| Maximum Groups (PIX 6.3) | The maximum number of groups enabled for multicast. Valid values range from 0 to 2000.                                                                                                                                                                                                                                                                                                                    |
| Forward Interface        | The name of the interface to which the selected interface forwards IGMP host reports if IGMP forwarding is enabled.                                                                                                                                                                                                                                                                                       |

## Configure IGMP Parameters Dialog Box

Use the Configure IGMP Parameters dialog box to configure IGMP parameters for an interface on the security appliance.

### Navigation Path

You can access the Configure IGMP Parameters dialog box from the IGMP Page - Protocol tab. For more information, see [IGMP Page - Protocol Tab , on page 2071](#).

### Related Topics

- [IGMP Page - Protocol Tab , on page 2071](#)

### Field Reference

*Table 687: Configure IGMP Parameters Dialog Box*

| Element           | Description                                                                                                                                                                                                     |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface         | The name of the interface to which the IGMP settings apply.                                                                                                                                                     |
| Forward Interface | The name of the interface to which IGMP host reports are forwarded if IGMP forwarding is enabled.                                                                                                               |
| Version           | The version of IGMP to enable on the interface. Choose 1 to enable IGMP Version 1, or 2 to enable IGMP Version 2. Some features require IGMP Version 2. By default, the security appliance uses IGMP Version 2. |
| Query Interval    | The interval, in seconds, at which the designated router sends IGMP host-query messages. Valid values range from 1 to 3600 seconds. The default value is 125 seconds.                                           |

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Response Time            | The maximum response time, in seconds, advertised in IGMP queries. If the security appliance does not receive any host reports within the designated response time, the IGMP group is pruned. Decreasing this value lets the security appliance prune groups faster. Valid values range from 1 to 12 seconds. The default value is 10 seconds. Changing this value is valid only for IGMP Version 2. |
| Maximum Groups (PIX 6.3) | The maximum number of groups enabled for multicast. Valid values range from 0 to 2000.                                                                                                                                                                                                                                                                                                               |
| PIX 7.x and ASA Only     |                                                                                                                                                                                                                                                                                                                                                                                                      |
| Enable IGMP              | When selected, IGMP is enabled on the specified interface.                                                                                                                                                                                                                                                                                                                                           |
| Group Limit              | The maximum number of hosts that can join on an interface. Valid values range from 1 to 500. The default value is 500.                                                                                                                                                                                                                                                                               |
| Query Timeout            | The period of time, in seconds, before the security appliance takes over querying the interface, after the previous appliance has stopped doing so. Valid values range from 60 to 300 seconds. The default value is 255 seconds.                                                                                                                                                                     |

## IGMP Page - Access Group Tab

Use the Access Group tab to control the multicast groups that are allowed on an interface.

The table on this page lists all currently defined multicast access groups, showing for each, the name of the interface or interface role for which the group is defined, the group network(s), and whether this group is permitted or denied. For a detailed explanation of these fields, see [Configure IGMP Access Group Parameters Dialog Box](#), on page 2073.

- To add a multicast access group to the table, click the Add Row button.
- To edit the settings for a group, select it and click the Edit Row button.
- To delete a group, select it and click the Delete Row button.

### Navigation Path

You can access the Access Group tab from the [Configuring IGMP](#), on page 2070.

## Field Reference

*Table 692: Configure IGMP Join Group Parameters Dialog Box*

| Element    | Description                                                                                                          |
|------------|----------------------------------------------------------------------------------------------------------------------|
| Interface  | The name of the interface for which you are configuring multicast group membership.                                  |
| Join Group | The multicast group address to which this rule applies. The group address must be from 224.0.0.0 to 239.255.255.255. |

## Configuring Multicast Routes

Static multicast routes let you separate multicast traffic from unicast traffic. For example, when a path between a source and destination does not support multicast routing, the solution is to configure two multicast devices with a GRE tunnel between them, sending the multicast packets over the tunnel.

Static multicast routes are local to the security appliance and are not advertised or redistributed.

Use the Multicast Routes page to manage static multicast routes—currently defined routes are listed, and you can add, edit and delete static multicast routes.

See [Add/Edit MRoute Configuration Dialog Box](#), on page 2077 for more information about the fields displayed in the table on this page.

**Navigation Path**

- (Device view) Select **Platform > Multicast > Multicast Routes** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Multicast > Multicast Routes** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Add/Edit MRoute Configuration Dialog Box

Use the Add/Edit MRoute Configuration dialog box to add a static multicast route to the security appliance, or to change an existing route.

**Navigation Path**

You can access the Add/Edit MRoute Configuration dialog box from the Multicast Routing page. See [Configuring Multicast Routes , on page 2076](#) for more information.

**Field Reference**

*Table 693: Add/Edit MRoute Configuration Dialog Box*

| Element                          | Description                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source Interface                 | Enter or Select the incoming interface for the multicast route.                                                                                                                                                                                                                                                                                      |
| Source Network                   | Enter the IP address and mask of the multicast source, or select a Networks/Hosts object.                                                                                                                                                                                                                                                            |
| Output Interface/Dense           | (Optional) Enter or Select the outgoing interface for the multicast route. If you specify the destination interface, the route is forwarded through the selected interface. If you do not specify a destination interface, then RPF is used to forward the route. You can specify the interface, or the RPF neighbor, but not both at the same time. |
| Multicast Network (PIX 6.3)      | Enter or Select the group that is to receive the multicast packets. This must be a multicast IP address in the range of 224.0.1.0 to 239.255.255.255.                                                                                                                                                                                                |
| Distance (PIX 7.x, ASA and FWSM) | Enter an administrative distance for the static multicast route. If the static multicast route has the same administrative distance as the unicast route, the static multicast route takes precedence.                                                                                                                                               |

# Configuring Multicast Boundary Filters

On an ASA running version 7.2(1) or later, you can use the Multicast Boundary Filter page to configure the appliance to act as a boundary between multicast domains. The ASA compares multicast group addresses to an access list, blocking all multicast traffic except that specifically permitted by the list.

The Multicast Boundary Filter page lists all currently defined per-interface boundary filter lists; you can add, edit and delete filter lists from this page.

Refer to [Add/Edit MBoundary Configuration Dialog Box](#) , on page 2078 for a description of the fields on this page.

## Navigation Path

- (Device view) Select **Platform > Multicast > Multicast Boundary Filter** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Multicast > Multicast Boundary Filter** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action          | Choose <b>permit</b> or <b>deny</b> to specify the action taken for this multicast group.                                                                                                                                                                                                                                                                                         |
| Multicast Group | Enter a single multicast address, or a multicast group address, to which this action applies. The address must be 0.0.0.0, or from 224.0.0.0 to 239.255.255.255. A group address range can be entered using either a standard subnet mask (e.g., 239.0.0.0 255.0.0.0), or using CIDR prefix notation (e.g., 239.0.0.0/8).<br><br>You also can Select a named network/host object. |

## Configuring PIM

Protocol independent multicast (PIM) provides a scalable method for determining the best paths in a network for distributing a specific multicast transmission to each host that has registered using IGMP to receive the transmission. Routers and security devices use PIM to maintain tables for forwarding multicast datagrams.

With PIM sparse mode (PIM SM), which is the default for Cisco routers, when the source of a multicast transmission begins broadcasting, the traffic is forwarded from one multicast router to the next until the packets reach every registered host. If a more direct path to the traffic source exists, the last-hop router sends a join message to the source that causes the traffic to be rerouted along the better path.

**Note** PIM is not supported with PAT—the PIM protocol does not use ports and PAT only works with protocols that use ports.

When you enable multicast routing on a security appliance, PIM and IGMP are enabled on all interfaces by default. You can disable PIM on a per-interface basis.

The PIM page provides up to six tabbed panels:

- [PIM Page - Protocol Tab , on page 2080](#)– Lets you manage interface-specific PIM properties.
- [PIM Page - Neighbor Filter Tab , on page 2081](#) – Lets you manage neighbor filters for individual interfaces; available only on ASA 7.2(1)+ devices.
- [PIM Page - Bidirectional Neighbor Filter Tab , on page 2082](#) – Lets you manage bidirectional neighbor filters for individual interfaces; available only on ASA 7.2(1)+ devices.
- [PIM Page - Rendezvous Points Tab , on page 2084](#) – When you configure PIM, you must choose one or more devices to operate as the rendezvous point (RP). An RP is a single, common root of a shared distribution tree and is statically configured on each device. First-hop routers use the RP to send registration packets on behalf of the source multicast hosts.
- [PIM Page - Route Tree Tab , on page 2086](#) – By default, PIM leaf routers join the shortest-path tree immediately after the first packet arrives from a new source. This reduces delay, but requires more memory than shared tree. You can configure whether the security appliance should join shortest-path tree, or use a shared tree, either for all multicast groups or only for specific multicast addresses.
- [PIM Page - Request Filter Tab , on page 2087](#) – When the security appliance is acting as an RP, you can restrict specific multicast sources from registering. This prevents unauthorized sources from registering with the RP. The Request Filter panel lets you define the multicast sources from which the security appliance will accept PIM registration messages.

## PIM Page - Protocol Tab

Use the Protocol tab to configure PIM properties for the interfaces on a security appliance (not available on PIX 6.3 devices). All currently configured interfaces are listed; you can add, edit and delete entries on this panel.

Refer to [Add/Edit PIM Protocol Dialog Box , on page 2080](#) for a description of the fields on this panel.

### Navigation Path

You access the Protocol tab from the PIM page. For more information, see [Configuring PIM , on page 2079](#).

### Related Topics

## Add/Edit PIM Protocol Dialog Box

Use the Add/Edit PIM Protocol dialog box to configure PIM properties for an interface on a security appliance running PIX 7.x or later.

### About the Designated Router

The DR is responsible for sending PIM register, join, and prune messages to the Rendezvous Point (RP). When there is more than one multicast routing device on a network segment, there is an election process to select the Designated Router based on DR priority. If multiple devices have the same DR priority, then the device with the highest IP address becomes the DR. By default, security appliances have a DR priority of 1.

### Navigation Path

You can access the Add/Edit PIM Protocol dialog box from the [PIM Page - Protocol Tab](#), on page 2080.

### Field Reference

*Table 696: Add/Edit PIM Protocol Dialog Box*

| Element                       | Description                                                                                                                                                                                                                                                                                                                |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                     | Enter or Select the interface on which you are configuring PIM.                                                                                                                                                                                                                                                            |
| Enable PIM                    | When checked, PIM is enabled on the selected interface. You can deselect this option to disable PIM on the interface without deleting this PIM Protocol entry from the table.                                                                                                                                              |
| DR Priority                   | The designated router (DR) priority for this interface. The router with the highest DR priority on subnet becomes the designated router. Valid values range from 0 to 4294967294. The default DR priority is 1. Setting this value to zero makes the security appliance interface ineligible to become the default router. |
| Hello Interval (seconds)      | The frequency, in seconds, at which the interface sends PIM hello messages. Valid values range from 1 to 3600 seconds; the default value is 30 seconds.                                                                                                                                                                    |
| Join-Prune Interval (seconds) | The frequency, in seconds, at which the interface sends PIM join and prune advertisements. Valid values range from 10 to 600 seconds; the default value is 60 seconds.                                                                                                                                                     |

## PIM Page - Neighbor Filter Tab

A PIM neighbor filter is an access control list (ACL) that defines the neighbor devices that can participate in PIM. If a neighbor filter is not configured for an interface, then there are no restrictions. If a PIM neighbor filter is configured, only those neighbors permitted by the filter list can participate in PIM with the security appliance.

On an ASA running version 7.2(1) or later, you can use the Neighbor Filter tab to control the devices that can become PIM neighbors. This panel is used to define and manage the per-interface neighbor filter list. Refer to [Add/Edit PIM Neighbor Filter Dialog Box](#), on page 2082 for a description of the fields on this panel.

### Navigation Path

You access the Protocol tab from the PIM page. For more information, see [Configuring PIM](#), on page 2079.

*Table 697: Add/Edit PIM Neighbor Filter Dialog Box*

| Element               | Description                                                                                                                                                                                                                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface             | Enter or Select the interface to which this PIM Neighbor filter entry will be applied.                                                                                                                                                                                                                               |
| Neighbor Filter Group | Enter a single multicast address, or a multicast group address, to which the chosen Action applies. A group address range can be entered using either a standard subnet mask (e.g., 239.0.0.0 255.0.0.0), or using CIDR prefix notation (e.g., 239.0.0.0/8).<br><br>You also can Select a named network/host object. |
| Action                | Choose <b>permit</b> to allow the specified neighbors to participate in PIM, or <b>deny</b> to prevent the specified neighbors from participating in PIM.                                                                                                                                                            |

## PIM Page - Bidirectional Neighbor Filter Tab

A PIM bidirectional neighbor filter is an access control list (ACL) that defines the neighbor devices that can participate in the bidirectional trees and designated forwarder (DF) election. If a PIM bidirectional neighbor filter is not configured for an interface, then there are no restrictions. If a PIM bidirectional neighbor filter is configured, only those neighbors permitted by the ACL can participate in DF election process.

The PIM bidirectional neighbor filters enable the transition from a sparse-mode-only network to a “bidir” network by letting you specify the devices that should participate in DF election, while still allowing all devices to participate in the sparse-mode domain. The bidir-enabled devices can elect a DF from among themselves, even when there are non-bidir devices on the segment. Multicast boundaries on the non-bidir devices prevent PIM messages and data from the bidir groups from leaking in or out of the bidir subset cloud.

Bidirectional PIM allows multicast devices to maintain reduced state information. All of the multicast devices in a segment must be bidirectionally enabled for bidir to elect a DF.

When a PIM bidirectional neighbor filter is enabled, the routers and other devices that are permitted by the ACL are considered to be bidir-capable. Therefore:

- If a permitted neighbor does not support bidir, the DF election does not occur.
- If a denied neighbor supports bidir, then DF election does not occur.
- If a denied neighbor does not support bidir, the DF election can occur.

### Managing the Bidirectional Neighbor Filter List

On an ASA running version 7.2(1) or later, you can use this panel to define and manage the per-interface bidirectional neighbor filter list, permitting or denying multicast source addresses for specific interfaces. Refer to [Add/Edit PIM Bidirectional Neighbor Filter Dialog Box , on page 2083](#) for a description of the fields on this panel.

### Navigation Path

You access the Bidirectional Neighbor Filter tab from the PIM page. For more information, see [Configuring PIM , on page 2079](#).

| Action  | Choose <b>permit</b> to allow the specified neighbors to participate in the DF election process, or <b>deny</b> to prevent the specified neighbors from participating in the process. |

## PIM Page - Rendezvous Points Tab

When you configure PIM, you must choose one or more routers or routing devices to operate as the RP. An RP is a single, common root of a shared distribution tree and is statically configured on each device. First hop routers use the RP to send register packets on behalf of the source multicast hosts.

You can configure a single RP to serve more than one group. If a specific group is not specified, the RP for the group is applied to the entire IP multicast group range (224.0.0.0/4).

Use the Rendezvous Points panel to define rendezvous points. You can configure more than one RP, but you cannot have more than one entry with the same RP.

### Navigation Path

You access the Rendezvous Points tab from the PIM page. For more information, see [Configuring PIM](#), on page 2079.

### Related Topics

**Table 700: Add/Edit Rendezvous Point Dialog Box**

| Element                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rendezvous Point IP Address                             | Enter the IP address of the rendezvous point. This is a unicast address. You also can click Select to select a Networks/Hosts object.<br><br>When editing a rendezvous point entry, you cannot change this value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Use bi-directional forwarding                           | Check this box if you want the specified Multicast Groups to operate in bidirectional mode. In bidirectional mode, if the security appliance receives a multicast packet and has no directly connected members or PIM neighbors present, it sends a Prune message back to the source. Deselect this option if you want the specified Multicast Groups to operate in Sparse Mode.<br><br><b>Note</b> The security appliance always advertises bidirectional capability in PIM hello messages regardless of the actual bidir configuration.                                                                                                                                                                       |
| Use this RP for All Multicast Groups                    | Select this option to use the specified Rendezvous Point for all multicast groups on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Use this RP for the Multicast Groups as specified below | Select this option to define the multicast groups that are to use the specified Rendezvous Point; the Multicast Groups table is activated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Multicast Groups table                                  | The multicast groups currently associated with the specified Rendezvous Point are listed.<br><br>Table entries are processed from the top down. For example, you can create an entry that includes a range of multicast groups, and then exclude specific groups within that range by placing deny rules for those specific groups at the top of the table. That is, the permit rule for the range of multicast groups follows the individual deny statements.<br><br>Use the buttons at the bottom of the table to open the <a href="#">Add/Edit Multicast Group Rules Dialog Box</a> , on <a href="#">page 2085</a> to add or edit an entry; to delete an entry; and to move entries up or down in the table. |

### Add/Edit Multicast Group Rules Dialog Box

Use the Add/Edit Multicast Group Rules dialog box to create a multicast group rule, or modify a multicast group rule, for the Multicast Groups table in the Add/Edit Rendezvous Point dialog box. This dialog box is also used to specify individual multicast groups that use Shared Tree route filtering on the Route Tree tab

### Navigation Path

When defining Rendezvous Points, you access the Add/Edit Multicast Group Rules dialog box from the [Add/Edit Rendezvous Point Dialog Box](#) , on page 2084. See [PIM Page - Rendezvous Points Tab](#) , on page 2084 for more information.

When specifying how PIM register messages are filtered, you open this dialog box by clicking Add Row or Edit row buttons below the Multicast Groups table on the [PIM Page - Route Tree Tab](#) , on page 2086.

### Field Reference

**Table 701: Add/Edit Multicast Group Rules Dialog Box**

| Element                 | Description                                                                                                                                                                         |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action                  | Choose <b>permit</b> to create a group rule that allows the specified multicast addresses; choose <b>deny</b> to create a group rule that denies the specified multicast addresses. |
| Multicast Group Network | Enter the multicast address and network mask associated with the group, or Select the desired Networks/Hosts object.                                                                |

## PIM Page - Route Tree Tab

If the security appliance is acting as a Rendezvous Point, use the Route Tree tab to specify how the PIM register messages from various sources are filtered: shortest-path tree or shared tree, either for all multicast groups or only for specific multicast addresses.

### Navigation Path

You can access the Route Tree tab from the PIM page. For more information, see [Configuring PIM](#) , on page 2079.

## PIM Page - Request Filter Tab

When the security appliance acts as a rendezvous point, you can restrict specific multicast sources from registering with it. This prevents unauthorized sources from registering with the rendezvous point. You can use the Request Filter tab to define the multicast sources from which the security appliance accepts and denies PIM register messages.

### Navigation Path

You can access the Request Filter tab from the PIM page. For more information, see [Configuring PIM](#), on page 2079.

## Add/Edit Multicast Group Rules Dialog Box

Use the Add/Edit Multicast Group Rules dialog box to define the multicast sources that are denied or permitted to register with the security appliance when the appliance acts as a rendezvous point. You create the filter rules based on the source IP address and the destination multicast address.

### Navigation Path

You can access the Add/Edit Multicast Group Rules dialog box from the [PIM Page - Request Filter Tab](#), on page 2087.

## Field Reference

*Table 704: Add/Edit Multicast Group Rules Dialog Box*

| Element             | Description                                                                                                                                                                                                                                                                        |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action              | Choose <b>permit</b> to create a rule that allows the specified Source of the specified Destination multicast traffic to register with the security appliance; choose <b>deny</b> to create a rule that denies registration to the specified Source/Destination multicast traffic. |
| Source Network      | Enter the IP address and network mask for the source of the register message, or Select the appropriate Networks/Hosts object.                                                                                                                                                     |
| Destination Network | Enter the IP address and network mask for the multicast destination, or Select the appropriate Networks/Hosts object.                                                                                                                                                              |

## PIM Page - Bootstrap Router Tab

PIM Bootstrap Router (BSR) is a dynamic Rendezvous Point (RP) selection model that uses candidate routers for Rendezvous Point function and for relaying the Rendezvous Point information for a group. The Rendezvous Point function includes RP discovery and provides a default route to the RP. It does this by configuring a set of devices as candidate BSRs (C-BSR) which participate in a BSR election process to choose a BSR amongst themselves. Once the BSR is chosen, devices that are configured as candidate Rendezvous Points (C-RP) will start sending their group mapping to the elected BSR. The BSR then distributes the group-to-RP mapping information to all the other devices down the multicast tree, through BSR messages that travel from PIM router to PIM router on a per-hop basis.

You can use the Bootstrap Router tab to configure a device as a PIM Bootstrap Router.

### Navigation Path

You can access the Bootstrap Router tab from the PIM page. For more information, see [Configuring PIM](#), on page 2079.

| Element   | Description                                                                             |
|-----------|-----------------------------------------------------------------------------------------|
| Interface | Select the interface from which the BSR address is derived, to make it a candidate BSR. |

| Element          | Description                                                                                                                                                                                                                                                                                                                                         |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hash Mask Length | Enter the length of a mask that is to be ANDed with the group address before the hash function is called. All groups with the same seed hash (correspond) to the same Rendezvous Point (RP).<br><br>For example, if this value is 24, only the first 24 bits of the group addresses matter. This fact allows you to get one RP for multiple groups. |
| Priority         | Enter the priority of the candidate BSR. The BSR with the larger priority is preferred. If the priority values are the same, the router with the larger IP address is the BSR.                                                                                                                                                                      |

## Add/Edit Bootstrap Router Dialog Box

Use the Add/Edit Bootstrap Router dialog box to configure a Bootstrap Router as a Border BSR. BSR messages should not be exchanged between different domains, because routers in one domain may elect rendezvous points (RPs) in the other domain, resulting in protocol malfunction or loss of isolation between the domains.

A border interface in a PIM sparse mode (PIM-SM) domain is configured to avoid exchange of certain traffic with a neighboring domain reachable through that interface, especially if that domain is also running PIM-SM. Thus to prevent BSR messages from being sent or received through such an interface configure the interface as a border BSR.

### Navigation Path

You can access the Add/Edit Bootstrap Router dialog box from the [PIM Page - Bootstrap Router Tab](#), on [page 2089](#)

### Field Reference

**Table 706: Add/Edit Bootstrap Router Dialog Box**

| Element                         | Description                                                                                                                                       |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| (Optional) BSR Border table Add | Add an interface and configure it as a border BSR. No PIM BSR messages will be sent or received, when an interface is configured as a Border BSR. |

## CHAPTER 56

# Configuring Routing Policies on Firewall Devices

The Routing section in Security Manager contains pages for defining and managing routing settings for security appliances.

This chapter contains the following topics:

- [Configuring No Proxy ARP](#) , on page 2091
- [Configuring BGP](#) , on page 2092
- [Configuring EIGRP](#) , on page 2124
- [Configuring EIGRPv6](#) , on page 2141
- [Configuring ISIS](#) , on page 2153
- [Configuring BFD Routing](#) , on page 2175
- [Configuring OSPF](#) , on page 2183
- [Configuring Key Chain](#) , on page 2211
- [Configuring OSPFv3](#) , on page 2215
- [Configuring RIP](#) , on page 2234
- [Configuring Static Routes](#) , on page 2244
- [Configuring Policy Objects for ASA Routing Policies](#) , on page 2247

## Configuring No Proxy ARP

When a host sends IP traffic to another device on the same Ethernet network, the host needs to know the MAC address of the device. Address Resolution Protocol (ARP) is a Layer 2 protocol that resolves an IP address to a MAC address: a host sends an ARP request asking “Who is this IP address?” The device owning the IP address replies, “I own that IP address; here is my MAC address.”

With Proxy ARP, a device responds to an ARP request with its own MAC address, even though the device does not own the IP address. Serving as an ARP Proxy for another host effectively directs network traffic to the proxy, in this case your security appliance. Traffic that passes through the appliance is then routed to the appropriate destination.

For example, the security appliance uses proxy ARP when you configure NAT and specify a global address that is on the same network as the appliance interface. The only way traffic can reach the destination hosts is if the appliance claims and subsequently routes traffic to the destination global addresses.

By default, proxy ARP is enabled for all interfaces. Use the No Proxy ARP page to disable proxy ARP for global addresses:

- To disable proxy ARP for one or more interfaces, enter their names in the Interfaces field. Separate multiple interfaces with commas. You can click Select to choose the interfaces from a list of interfaces defined on the device, and interface roles defined in Security Manager.

---

**Note** On ASA 8.4.2 and later devices operating in routed mode, you can disable Proxy ARP on the egress interface for a Manual NAT rule. See *Do not proxy ARP on Destination Interface* in Table 24-15 for more information.

---

### Navigation Path

- (Device view) Select **Platform > Routing > No Proxy ARP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > No Proxy ARP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Configuring BGP

Border Gateway Protocol (BGP) is an inter autonomous system routing protocol. An autonomous system is a network or group of networks under a common administration and with common routing policies. BGP is used to exchange routing information for the Internet and is the protocol used between Internet service providers (ISP).

---

**Note** BGP configuration is supported on ASA 9.2(1)+ only. Also, beginning with ASA 9.3(1), BGP is supported in L2 (EtherChannel Type) and L3 (Individual Interface Type) clustering modes.

---

### Navigation Path

- (Device view) Select **Platform > Routing > BGP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > BGP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

The BGP page provides two tabbed panels for configuring BGP routing on a firewall device. This is the basic procedure for configuring the BGP process:

1. Enable the BGP routing process by checking the Enable BGP check box on the BGP page.
2. In the AS Number field, enter the autonomous system (AS) number for the BGP process. The AS number internally includes multiple autonomous numbers. The AS number can be from 1 to 4294967295 or from 1.0 to 65535.65535.

3. On the [General Tab](#) , on page 2095:
  - (Optional) Check the Limit the number of AS numbers in AS\_PATH attribute of received routes check box to restrict the number of AS numbers in AS\_PATH attribute to a specific number. Valid values are from 1 to 254.
  - (Optional) Check the Log Neighbor Changes check box to enable logging of BGP neighbor changes (up or down) and resets. This helps in troubleshooting network connectivity problems and measuring network stability.
  - (Optional) Check the Use TCP path MTU Discovery check box to use the Path MTU Discovery technique to determine the maximum transmission unit (MTU) size on the network path between two IP hosts. This avoids IP fragmentation.
  - (Optional) Check the Enable fast external failover check box to reset the external BGP session immediately upon link failure.
  - (Optional) Check the Enforce that the first AS is peer's AS for EBGP routes check box to discard incoming updates received from external BGP peers that do not list their AS number as the first segment in the AS\_PATH attribute. This prevents a mis-configured or unauthorized peer from misdirecting traffic by advertising a route as if it was sourced from another autonomous system.
  - (Optional) Check the Use dot notation for AS numbers check box to split the full binary 4-byte AS number into two words of 16 bits each, separated by a dot. AS numbers from 0-65535 are represented as decimal numbers and AS numbers larger than 65535 are represented using the dot notation.
  - Define the configuration related to the best path selection process for BGP routing (see [General Tab](#) , on page 2095).
  - Specify the timer information in the Neighbor timers area (see [General Tab](#) , on page 2095).
  - (Optional) Configure Graceful Restart (see [General Tab](#) , on page 2095).
4. On the IPv4 Family tab, select the Enable IPv4 Family check box and then use the tabs provided to configure IPv4 Address Family settings. For more information, see [IPv4 Family Tab](#) , on page 2097.
5. On the IPv6 Family tab, select the Enable IPv6 Family check box and then use the tabs provided to configure IPv6 Address Family settings. For more information, see [IPv6 Family Tab](#) , on page 2111.

- [About BGP](#) , on page 2093

## About BGP

BGP is an inter autonomous system routing protocol. An autonomous system is a network or group of networks under a common administration and with common routing policies. BGP is used to exchange routing information for the Internet and is the protocol used between Internet service providers (ISP).

### When to Use BGP

Customer networks, such as universities and corporations, usually employ an Interior Gateway Protocol (IGP) such as OSPF for the exchange of routing information within their networks. Customers connect to ISPs, and ISPs use BGP to exchange customer and ISP routes. When BGP is used between autonomous systems (AS),

the protocol is referred to as External BGP (EBGP). If a service provider is using BGP to exchange routes within an AS, then the protocol is referred to as Interior BGP (IBGP).

### Routing Table Changes

BGP neighbors exchange full routing information when the TCP connection between neighbors is first established. When changes to the routing table are detected, the BGP routers send to their neighbors only those routes that have changed. BGP routers do not send periodic routing updates, and BGP routing updates advertise only the optimal path to a destination network.

Routes learned via BGP have properties that are used to determine the best route to a destination, when multiple paths exist to a particular destination. These properties are referred to as BGP attributes and are used in the route selection process:

- **Weight** -- This is a Cisco-defined attribute that is local to a router. The weight attribute is not advertised to neighboring routers. If the router learns about more than one route to the same destination, the route with the highest weight is preferred.
- **Local preference** -- The local preference attribute is used to select an exit point from the local AS. Unlike the weight attribute, the local preference attribute is propagated throughout the local AS. If there are multiple exit points from the AS, the exit point with the highest local preference attribute is used as an exit point for a specific route.
- **Multi-exit discriminator** -- The multi-exit discriminator (MED) or metric attribute is used as a suggestion to an external AS regarding the preferred route into the AS that is advertising the metric. It is referred to as a suggestion because the external AS that is receiving the MEDs may also be using other BGP attributes for route selection. The route with the lower MED metric is preferred.
- **Origin** -- The origin attribute indicates how BGP learned about a particular route. The origin attribute can have one of three possible values and is used in route selection.
  - **IGP**- The route is interior to the originating AS. This value is set when the network router configuration command is used to inject the route into BGP.
  - **EGP**-The route is learned via the Exterior Border Gateway Protocol (EBGP).
  - **Incomplete**- The origin of the route is unknown or learned in some other way. An origin of incomplete occurs when a route is redistributed into BGP.
- **AS\_path** -- When a route advertisement passes through an autonomous system, the AS number is added to an ordered list of AS numbers that the route advertisement has traversed. Only the route with the shortest AS\_path list is installed in the IP routing table.
- **Next hop** -- The EBGP next-hop attribute is the IP address that is used to reach the advertising router. For EBGP peers, the next-hop address is the IP address of the connection between the peers. For IBGP, the EBGP next-hop address is carried into the local AS.
- **Community** -- The community attribute provides a way of grouping destinations, called communities, to which routing decisions (such as acceptance, preference, and redistribution) can be applied. Route maps are used to set the community attribute. The predefined community attributes are as follows:
  - **no-export**- Do not advertise this route to EBGP peers.
  - **no-advertise**- Do not advertise this route to any peer.
  - **internet**- Advertise this route to the Internet community; all routers in the network belong to it.

### BGP Path Selection

BGP may receive multiple advertisements for the same route from different sources. BGP selects only one path as the best path. When this path is selected, BGP puts the selected path in the IP routing table and propagates the path to its neighbors. BGP uses the following criteria, in the order presented, to select a path for a destination:

- If the path specifies a next hop that is inaccessible, drop the update.
- Prefer the path with the largest weight.
- If the weights are the same, prefer the path with the largest local preference.
- If the local preferences are the same, prefer the path that was originated by BGP running on this router.
- If no route was originated, prefer the route that has the shortest AS\_path.
- If all paths have the same AS\_path length, prefer the path with the lowest origin type (where IGP is lower than EGP, and EGP is lower than incomplete).
- If the origin codes are the same, prefer the path with the lowest MED attribute.
- If the paths have the same MED, prefer the external path over the internal path.
- If the paths are still the same, prefer the path through the closest IGP neighbor.
- If both paths are external, prefer the path that was received first (the oldest one).
- Prefer the path with the lowest IP address, as specified by the BGP router ID.
- If the originator or router ID is the same for multiple paths, prefer the path with the minimum cluster list length.
- Prefer the path that comes from the lowest neighbor address.

## General Tab

Use the General tab to configure BGP settings such as Best Path Selection, Neighbor Timers, and Graceful Restart.

### Navigation Path

You can access the Neighbors tab from the BGP page (see [Configuring BGP](#) , on page 2092).

## Field Reference

**Table 707: General Tab**

| Element                                                                | Description                                                                                                                                                                                                                                                                                          |
|------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Limit the number of AS numbers in AS_PATH attribute of received routes | Restricts the number of AS numbers in AS_PATH attribute to a specific number. Valid values are from 1 to 254.                                                                                                                                                                                        |
| Log Neighbor Changes                                                   | Enables logging of BGP neighbor changes (up or down) and resets. This helps in troubleshooting network connectivity problems and measuring network stability.                                                                                                                                        |
| Use TCP path MTU Discovery                                             | Enables the use of the Path MTU Discovery technique to determine the maximum transmission unit (MTU) size on the network path between two IP hosts. This avoids IP fragmentation.                                                                                                                    |
| Enable fast external failover                                          | Resets the external BGP session immediately upon link failure.                                                                                                                                                                                                                                       |
| Enforce that the first AS is peer's AS for EBGp routes                 | Discards incoming updates received from external BGP peers that do not list their AS number as the first segment in the AS_PATH attribute. This prevents a mis-configured or unauthorized peer from misdirecting traffic by advertising a route as if it was sourced from another autonomous system. |
| Use dot notation for AS numbers                                        | Splits the full binary 4-byte AS number into two words of 16 bits each, separated by a dot. AS numbers from 0-65533 are represented as decimal numbers and AS numbers larger than 65535 are represented using the dot notation.                                                                      |
| Best Path Selection                                                    |                                                                                                                                                                                                                                                                                                      |
| Default local preference                                               | Specify a value between 0 and 4294967295. The default value is 100. Higher values indicate higher preference. This preference is sent to all routers and access servers in the local autonomous system.                                                                                              |
| Allow comparing MED from different neighbors                           | Allows the comparison of Multi Exit Discriminator (MED) for paths from neighbors in different autonomous systems.                                                                                                                                                                                    |
| Compare Router-id for identical EBGp paths                             | Compares similar paths received from external BGP peers during the best path selection process and switches the best path to the route with the lowest router ID.                                                                                                                                    |
| Pick the best MED path among paths advertised from the neighboring AS  | Enables MED comparison among paths learned from confederation peers. The comparison between MEDs is made only if no external autonomous systems are there in the path.                                                                                                                               |
| Treat missing MED as the least preferred one                           | Considers the missing MED attribute as having a value of infinity, making the path the least desirable; therefore, a path with a missing MED is least preferred.                                                                                                                                     |
| Neighbor Timers                                                        |                                                                                                                                                                                                                                                                                                      |

| Element                                                                                | Description                                                                                                                                                                                                                              |
|----------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Keepalive Interval                                                                     | Enter the time interval for which the BGP neighbor remains active after not sending a keepalive message. At the end of this keepalive interval, the BGP peer is declared dead, if no messages are sent. The default value is 60 seconds. |
| Hold Time                                                                              | Enter the time interval for which the BGP neighbor remains active while a BGP connection is being initiated and configured. The default values is 180 seconds.                                                                           |
| Min Hold Time                                                                          | (Optional) Enter the minimum time interval for which the BGP neighbor remains active while a BGP connection is being initiated and configured. Specify a value from 0 to 65535.                                                          |
| <b>Graceful Restart</b> (Use in failover or spanned cluster mode)<br>(ASA 9.3.1+ only) |                                                                                                                                                                                                                                          |
| Enable Graceful Restart                                                                | Enables ASA peers to avoid a routing flap following a switchover.                                                                                                                                                                        |
| Restart Time                                                                           | Specify the time duration that ASA peers will wait to delete stale routes before a BGP open message is received. The default value is 120 seconds. Valid values are between 1 and 3600 seconds.                                          |
| Stalepath Time                                                                         | Enter the time duration that the ASA will wait before deleting stale routes after an end of record (EOR) message is received from the restarting ASA. The default value is 360 seconds. Valid values are between 1 and 3600 seconds.     |

## IPv4 Family Tab

Use the IPv4 Family tab on the BGP page to enable and configure IPv4 settings for BGP.

### Navigation Path

You can access the IPv4 Family tab from the BGP page. For more information about the BGP page, see [Configuring BGP](#), on page 2092.

*Table 708: IPv4 Family - Aggregate Address Tab*

| Element            | Description                                                                        |
|--------------------|------------------------------------------------------------------------------------|
| Enable IPv4 Family | Enables configuration of routing sessions that use standard IPv4 address prefixes. |

| Element           | Description                                                                                                                                                                                                                                                                                                                                                        |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| General           | Use this panel to configure general IPv4 settings such as Best Path Selection, Neighbor Timers, and Graceful Restart. See <a href="#">IPv4 Family - General Tab</a> , on page 2098 for more about these definitions.                                                                                                                                               |
| Aggregate Address | Use this panel to define the aggregation of specific routes into one route.<br><br>Specify a value for the aggregate timer (in seconds) in the Aggregate Timer field. Valid values are 0 or any value between 6 and 60. The default value is 30.<br><br>See <a href="#">Add/Edit Aggregate Address Dialog Box</a> , on page 2113 for more about these definitions. |
| Filtering         | Use this panel to filter routes or networks received in incoming BGP updates. See <a href="#">Add/Edit Filter Dialog Box</a> , on page 2101 for more about these definitions.                                                                                                                                                                                      |
| Neighbor          | Use this panel to define BGP neighbors and neighbor settings. See <a href="#">Add/Edit Neighbor Dialog Box</a> , on page 2102 for more about these definitions.                                                                                                                                                                                                    |
| Networks          | Use this panel to define the networks to be advertised by the BGP routing process. See <a href="#">Add/Edit Network Dialog Box</a> , on page 2108 for more about these definitions.                                                                                                                                                                                |
| Redistribution    | Use this panel to define the conditions for redistributing routes from another routing domain into BGP. See <a href="#">Add/Edit Redistribution Dialog Box</a> , on page 2109 for more about these definitions.                                                                                                                                                    |
| Route Injection   | Use this panel to define the routes to be conditionally injected into the BGP routing table. See <a href="#">Add/Edit Route Injection Dialog Box</a> , on page 2110 for more about these definitions.                                                                                                                                                              |

## IPv4 Family - General Tab

Use the IPv4 Family - General tab to configure the general IPv4 settings.

### Navigation Path

You can access the General tab from the IPv4 Family Tab on the BGP page. For more information about the IPv4 Family tab, see [IPv4 Family Tab](#) , on page 2097.

Table 709: IPv4 Family - General Tab

| Element                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Router ID                                                              | <p>On a single device, choose <b>Automatic</b> or <b>IP Address</b>. (An address field appears when you choose IP Address.)</p> <p>If you choose Automatic, the highest-level IP address on the security appliance is used as the router ID. To use a fixed router ID, choose IP Address and enter an IPv4 address in the Router ID field.</p> <p>On a device cluster, choose <b>Automatic</b> or <b>Cluster Pool</b>. (An IPv4 Pool object ID field appears when you choose Cluster Pool.)</p> <p>If you choose Cluster Pool, enter or Select the name of the IPv4 Pool object that is to supply the Router ID address. For more information, see <a href="#">Add or Edit IPv4 Pool Dialog Box</a> , on page 321.</p>                                             |
| Learned Route Map                                                      | <p>Enter or Select the name of a route map object.</p> <p><b>Tip</b> Click <b>Select</b> to open the Route Map Object Selector from which you can select a route map object. You can also create new route map objects from the Route Map Object Selector. For more information, see <a href="#">Understanding Route Map Objects</a> , on page 2248.</p>                                                                                                                                                                                                                                                                                                                                                                                                           |
| Scanning Interval                                                      | Enter a scanning interval (in seconds) for BGP routers for next-hop validation. Valid values are from 5 to 60 seconds. The default value is 60.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Routes and Synchronization                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Generate Default Route                                                 | (Optional) Configures a BGP routing process to distribute a default route (network 0.0.0.0).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Summarize subnet routes into network-level routes                      | (Optional) Configures automatic summarization of subnet routes into network-level routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Advertise inactive routes                                              | (Optional) Advertises routes that are not installed in the routing information base (RIB).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Synchronize between BGP and the Interior Gateway Protocol (IGP) system | <p>Enables synchronization between BGP and your Interior Gateway Protocol (IGP) system. To enable the Cisco IOS software to advertise a network route without waiting for the IGP, deselect this option.</p> <p>Usually, a BGP speaker does not advertise a route to an external neighbor unless that route is local or exists in the IGP. By default, synchronization between BGP and the IGP is turned off to allow the Cisco IOS software to advertise a network route without waiting for route validation from the IGP. This feature allows routers and access servers within an autonomous system to have the route before BGP makes it available to other autonomous systems. Use synchronization if routers in the autonomous system do not speak BGP.</p> |
| Redistribute iBGP into an IGP                                          | (Optional) Configures iBGP redistribution into an interior gateway protocol (IGP), such as IS-IS or OSPF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Element                             | Description                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Administrative Route Distances      |                                                                                                                                                                                                                                                                                                                                          |
| External                            | Specifies the administrative distance for external BGP routes. Routes are external when learned from an external autonomous system. The range of values for this argument are from 1 to 255. The default value is 20.                                                                                                                    |
| Internal                            | Specifies administrative distance for internal BGP routes. Routes are internal when learned from peer in the local autonomous system. The range of values for this argument are from 1 to 255. The default value is 200.                                                                                                                 |
| Local                               | Specifies administrative distance for local BGP routes. Local routes are those networks listed with a network router configuration command, often as back doors, for the router or for the networks that is being redistributed from another process. The range of values for this argument are from 1 to 255. The default value is 200. |
| Next Hop                            |                                                                                                                                                                                                                                                                                                                                          |
| Enable address tracking             | (Optional) Enables BGP next hop address tracking.                                                                                                                                                                                                                                                                                        |
| Delay Interval                      | Specify the delay interval between checks on updated next-hop routes installed in the routing table.                                                                                                                                                                                                                                     |
| Forward packets over Multiple Paths |                                                                                                                                                                                                                                                                                                                                          |
| Number of Paths                     | (Optional) Specify the maximum number of external BGP routes that can be installed to the routing table.                                                                                                                                                                                                                                 |
| IBGP Number of Paths                | (Optional) Specify the maximum number of internal BGP routes that can be installed to the routing table.                                                                                                                                                                                                                                 |

## Add/Edit Aggregate Address Dialog Box

Use the Add/Edit Aggregate Address dialog box to define the aggregation of specific routes into one route.

### Navigation Path

You can access the Add/Edit Aggregate Address dialog box from the [IPv4 Family Tab](#) , on page 2097.

## Field Reference

**Table 710: Add/Edit Aggregate Address Dialog Box**

| Element                                      | Description                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Network                                      | Enter an IP address, or enter or Select the desired Network/Hosts objects.                                                                                                                                                                                                                                                                                                                                |
| Attribute Map                                | (Optional) Enter or Select the route map used to set the attribute of the aggregate route.<br><br><b>Tip</b> Click <b>Select</b> to open the Route Map Object Selector from which you can select a route map object. You can also create new route map objects from the Route Map Object Selector. For more information, see <a href="#">Understanding Route Map Objects</a> , on page 2248.              |
| Advertise Map                                | (Optional) Enter or Select the route map used to select the routes to create AS_SET origin communities.<br><br><b>Tip</b> Click <b>Select</b> to open the Route Map Object Selector from which you can select a route map object. You can also create new route map objects from the Route Map Object Selector. For more information, see <a href="#">Understanding Route Map Objects</a> , on page 2248. |
| Suppress Map                                 | (Optional) Enter or Select the route map used to select the routes to be suppressed.<br><br><b>Tip</b> Click <b>Select</b> to open the Route Map Object Selector from which you can select a route map object. You can also create new route map objects from the Route Map Object Selector. For more information, see <a href="#">Understanding Route Map Objects</a> , on page 2248.                    |
| Generate AS Set Path Information             | Enables generation of autonomous system set path information.                                                                                                                                                                                                                                                                                                                                             |
| Filter all more-specific routes from updates | Filters all more-specific routes from updates.                                                                                                                                                                                                                                                                                                                                                            |

## Add/Edit Filter Dialog Box

Use the Add/Edit Filter dialog box to filter routes or networks received in incoming BGP updates.

### Navigation Path

You can access the Add/Edit Filter dialog box from the [IPv4 Family Tab](#) , on page 2097.

## Field Reference

**Table 711: Add/Edit Filter Dialog Box**

| Element    | Description                                                                                                                                                  |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACL        | Select an Access Control List that defines which networks are to be received and which are to be suppressed in routing updates.                              |
| Direction  | Choose a direction from the Direction drop-down list. The direction will specify if the filter should be applied to inbound updates or outbound updates.     |
| Protocol   | Select the routing process for which you want to filter: None, BGP, Connected, EIGRP, OSPF, RIP, or Static.                                                  |
| AS Number  | Shows the autonomous system number of the BGP routing process. This value is specified on the BGP page (see <a href="#">Configuring BGP</a> , on page 2092). |
| Process ID | Enter the identifier for the routing process. Applies to EIGRP and OSPF routing protocols.                                                                   |

## Add/Edit Neighbor Dialog Box

Use the Add/Edit Neighbor dialog box to define BGP neighbors and neighbor settings.

### Navigation Path

You can access the Add/Edit Neighbor dialog box from the [IPv4 Family Tab](#) , on page 2097.

| Element                                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| General                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| IP Address                                                                      | Enter the BGP neighbor IP address. This IP address is added to the BGP neighbor table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Remote AS                                                                       | Enter the autonomous system to which the BGP neighbor belongs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Update Source<br>(ASA 9.19.1+ only)                                             | <p>(Optional) Select the appropriate interfaces to update the source interface for BGP neighborship.</p> <p><b>Tip</b> Click <b>Select</b> to open the Interface Selector from which you can select an interface. For more information about interfaces, see <a href="#">Available Interface Types</a>, on page 2328.</p> <p><b>Note</b> If you update the loopback interface as source for BGP neighborship, IP address of the loopback interface is advertised across the network. The loopback interface acts as eBGP peer and participate in routing. As the loopback interface is stable when enabled and remains available until administratively shut-down, the ASA is always reachable on the loopback interface IP address.</p> |
| Enable Address Family                                                           | (Optional) Enables communication with the BGP neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Shutdown neighbor administratively                                              | (Optional) Disable a neighbor or peer group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Configure Graceful Restart per neighbor<br>(ASA 9.3.1+ only)                    | (Optional) Enables configuration of the Border Gateway Protocol (BGP) graceful restart capability for this neighbor. After selecting this option, you must use the Graceful Restart (Use in failover or spanned cluster mode) option to specify whether graceful restart should be enabled or disabled for this neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                |
| Graceful Restart (Use in failover or spanned cluster mode)<br>(ASA 9.3.1+ only) | (Optional) Enables the Border Gateway Protocol (BGP) graceful restart capability for this neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Filter routes using AS Path filter                     | <p>(Optional) Enter or Select the appropriate incoming or outgoing AS path filter to distribute BGP neighbor information.</p> <p><b>Tip</b> Click <b>Select</b> to open the AS Path Object Selector from which you can select an AS path object. You can also create new AS path objects from the AS Path Object Selector. For more information, see <a href="#">Add or Edit As Path Object Dialog Boxes</a> , on page 2267.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Limit the number of prefixes allowed from the neighbor | <p>(Optional) Select to control the number of prefixes that can be received from a neighbor.</p> <ul style="list-style-type: none"> <li>• Enter the maximum number of prefixes allowed from a specific neighbor in the <b>Maximum Prefixes</b> field.</li> <li>• Enter the percentage (of maximum) at which the router starts to generate a warning message in the <b>Threshold Level</b> field. Valid values are integers between 1 and 100. The default value is 75.</li> <li>• (Optional) Check the <b>Control prefixes received from the peer</b> check box to specify additional controls for the prefixes received from a peer. Do one of the following: <ul style="list-style-type: none"> <li>• Select <b>Terminate peering when prefix limit is exceeded</b> to stop the BGP neighbor when the prefix limit is reached. Specify the interval after which the BGP neighbor will restart in the Restart interval field.</li> <li>• Select <b>Give only warning message when prefix limit is exceeded</b> to generate a log message when the maximum prefix limit is exceeded. Here, the BGP neighbor will not be terminated.</li> </ul> </li> </ul> |
| Routes                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Advertisement Interval                                 | Enter the minimum interval (in seconds) between the sending of BGP routing updates. Valid values are between 1 and 600.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Element                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Enable Authentication                                          | <p>(Optional) Select to enable MD5 authentication on a TCP connection between two BGP peers.</p> <ul style="list-style-type: none"> <li>• Choose an encryption type from the Enable Encryption drop-down list.</li> <li>• Enter a password in the Password field. Reenter the password in the Confirm field.</li> </ul> <p>The password is case-sensitive and can be up to 25 characters long when the service password-encryption command is enabled and up to 81 characters long when the service password-encryption command is not enabled. The first character cannot be a number. The string can contain any alphanumeric characters, including spaces.</p> <p><b>Note</b> You cannot specify a password in the format number-space-anything. The space after the number can cause authentication to fail.</p>                                                                                                                                     |
| Send Community attribute to this neighbor                      | (Optional) Specifies that communities attributes should be sent to the BGP neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Use ASA as next hop for neighbor                               | (Optional) Select to configure the router as the next-hop for a BGP speaking neighbor or peer group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Disable connection verification                                | <p>(Optional) Select to disable the connection verification process for eBGP peering sessions that are reachable by a single hop but are configured on a loopback interface or otherwise configured with a non-directly connected IP address.</p> <p>This command is required only when the neighbor ebgp-multihop command is configured with a TTL value of 1. The address of the single-hop eBGP peer must be reachable. The neighbor update-source command must be configured to allow the BGP routing process to use the loopback interface for the peering session.</p> <p>When deselected (default), a BGP routing process will verify the connection of single-hop eBGP peering session (TTL=254) to determine if the eBGP peer is directly connected to the same network segment by default. If the peer is not directly connected to same network segment, connection verification will prevent the peering session from being established.</p> |
| Allow connections with neighbor that is not directly connected | <p>Select to accept and attempt BGP connections to external peers residing on networks that are not directly connected.</p> <p>(Optional) Enter the time-to-live in the TTL hops field. Valid values are between 1 and 255.</p> <p><b>Note</b> This feature should be used only under the guidance of Cisco technical support staff. To prevent the creation of loops through oscillating routes, the multihop will not be established if the only route to the multihop peer is the default route (0.0.0.0).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Element                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Limit number of TTL hops to neighbor | <p>Select this option to secure a BGP peering session. Enter the maximum number of hops that separate eBGP peers in the TTL hops field. Valid values are between 1 and 254.</p> <p>This feature provides a lightweight security mechanism to protect BGP peering sessions from CPU utilization-based attacks. These types of attacks are typically brute force Denial of Service (DoS) attacks that attempt to disable the network by flooding the network with IP packets that contain forged source and destination IP addresses in the packet headers.</p> <p>This feature leverages designed behavior of IP packets by accepting only IP packets with a TTL count that is equal to or greater than the locally configured value. Accurately forging the TTL count in an IP packet is generally considered to be impossible. Accurately forging a packet to match the TTL count from a trusted peer is not possible without internal access to the source or destination network.</p> <p>This feature should be configured on each participating router. It secures the BGP session in the incoming direction only and has no effect on outgoing IP packets or the remote router. When this feature is enabled, BGP will establish or maintain a session only if the TTL value in the IP packet header is equal to or greater than the TTL value configured for the peering session. This feature has no effect on the BGP peering session, and the peering session can still expire if keepalive packets are not received. If the TTL value in a received packet is less than the locally configured value, the packet is silently discarded and no Internet Control Message Protocol (ICMP) message is generated. This is designed behavior; a response to a forged packet is not necessary.</p> <p>To maximize the effectiveness of this feature, the hop-count value should be strictly configured to match the number of hops between the local and external network. However, you should also take path variation into account when configuring this feature for a multihop peering session.</p> <p>The following restrictions apply to the configuration of this command:</p> <ul style="list-style-type: none"> <li>• This feature is not supported for internal BGP (iBGP) peers.</li> <li>• The effectiveness of this feature is reduced in large-diameter multihop peerings. In the event of a CPU utilization-based attack against a BGP router that is configured for large-diameter peering, you may still need to shut down the affected peering sessions to handle the attack.</li> <li>• This feature is not effective against attacks from a peer that has been compromised inside of your network. This restriction also includes peers that are on the network segment between the source and destination network.</li> </ul> |
| Use TCP Path MTU Discovery           | (Optional) Select to enable a TCP transport session for a BGP session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| TCP transport mode                   | Choose the TCP connection mode from the drop-down list. Options are Default, Active, or Passive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Weight                               | (Optional) Enter a weight for the BGP neighbor connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Element                                                                          | Description                                                                                                                                                                                                                                                                  |
|----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BGP Version                                                                      | Choose the BGP version that the ASA will accept from the drop-down list. The version can be set to 4-Only to force the software to use only Version 4 with the specified neighbor. The default is to use Version 4 and dynamically negotiate down to Version 2 if requested. |
| <b>Migration</b>                                                                 |                                                                                                                                                                                                                                                                              |
| <b>Note</b>                                                                      | This customization should only be used for AS migration, and should be removed after the transition has been completed. The procedure should be attempted only by an experienced network operator. Routing loops can be created through improper configuration.              |
| Customize the AS number for routes received from the neighbor                    | (Optional) Select to customize the AS_PATH attribute for routes received from an eBGP neighbor.                                                                                                                                                                              |
| Local AS Number                                                                  | Enter the local autonomous system number. Valid values are any valid autonomous system number from 1 to 4294967295 or 1.0 to 65535.65535.                                                                                                                                    |
| Do not prepend local AS number to routes received from neighbor                  | (Optional) Select to prevent the local AS number from being prepended to any routes received from eBGP peer.                                                                                                                                                                 |
| Replace real AS number with local AS number in routes received from neighbor     | (Optional) Select to replace the real autonomous system number with the local autonomous system number in the eBGP updates. The autonomous system number from the local BGP routing process is not prepended.                                                                |
| Accept either real AS number or local AS number in routes received from neighbor | (Optional) Configures the eBGP neighbor to establish a peering session using the real autonomous system number (from the local BGP routing process) or by using the local autonomous system number.                                                                          |

## Add/Edit Network Dialog Box

Use the Add/Edit Network dialog box to define the networks to be advertised by the BGP routing process.

### Navigation Path

You can access the Add/Edit Network dialog box from the [IPv4 Family Tab](#) , on page 2097.

| Network   | Specifies the network to be advertised by the BGP routing processes.                                                                                                                                                                                                                                                                                                                                                                                               |
| Route Map | <p>(Optional) Enter or Select a route map that should be examined to filter the networks to be advertised. If not specified, all networks are redistributed.</p> <p><b>Tip</b> Click <b>Select</b> to open the Route Map Object Selector from which you can select a route map object. You can also create new route map objects from the Route Map Object Selector. For more information, see <a href="#">Understanding Route Map Objects</a> , on page 2248.</p> |

## Add/Edit Redistribution Dialog Box

Use the Add/Edit Redistribution dialog box to define the conditions for redistributing routes from another routing domain into BGP.

### Navigation Path

You can access the Add/Edit Redistribution dialog box from the [IPv4 Family Tab](#) , on page 2097.

## Field Reference

**Table 714: Add/Edit Redistribution Dialog Box**

| Element         | Description                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------|
| Source Protocol | Choose the protocol from which you want to redistribute routes into the BGP domain from the Source Protocol drop-down list. |

| Element    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Process ID | Enter the identifier for the routing process. Applies to EIGRP and OSPF routing protocols.                                                                                                                                                                                                                                                                                                                                                                           |
| Metric     | (Optional) Enter a metric for the redistributed route.                                                                                                                                                                                                                                                                                                                                                                                                               |
| Route Map  | <p>Enter or Select a route map that should be examined to filter the networks to be redistributed. If not specified, all networks are redistributed.</p> <p><b>Tip</b> Click <b>Select</b> to open the Route Map Object Selector from which you can select a route map object. You can also create new route map objects from the Route Map Object Selector. For more information, see <a href="#">Understanding Route Map Objects</a> , on page 2248.</p>           |
| Match      | <p>The conditions used for redistributing routes from one routing protocol to another. The routes must match the selected condition to be redistributed. You can choose one or more of the following match conditions. These options are enabled only when OSPF is chosen as the Source Protocol.</p> <ul style="list-style-type: none"> <li>• Internal</li> <li>• External 1</li> <li>• External 2</li> <li>• NSSA External 1</li> <li>• NSSA External 2</li> </ul> |

## Add/Edit Route Injection Dialog Box

Use the Add/Edit Route Injection dialog box to define the routes to be conditionally injected into the BGP routing table.

### Navigation Path

You can access the Add/Edit Route Injection dialog box from the [IPv4 Family Tab](#) , on page 2097.

| Advertise inactive routes                                                                            | (Optional) Advertises routes that are not installed in the routing information base (RIB).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Synchronize between BGP and the Interior Gateway Protocol (IGP) system                               | <p>Enables synchronization between BGP and your Interior Gateway Protocol (IGP) system. To enable the Cisco IOS software to advertise a network route without waiting for the IGP, deselect this option.</p> <p>Usually, a BGP speaker does not advertise a route to an external neighbor unless that route is local or exists in the IGP. By default, synchronization between BGP and the IGP is turned off to allow the Cisco IOS software to advertise a network route without waiting for route validation from the IGP. This feature allows routers and access servers within an autonomous system to have the route before BGP makes it available to other autonomous systems. Use synchronization if routers in the autonomous system do not speak BGP.</p> |
| Redistribute iBGP into an IGP (use filtering to limit the number of prefixes that are redistributed) | (Optional) Configures iBGP redistribution into an interior gateway protocol (IGP), such as IS-IS or OSPF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Administrative Route Distances                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| External                                                                                             | Specifies the administrative distance for external BGP routes. Routes are external when learned from an external autonomous system. The range of values for this argument are from 1 to 255. The default value is 20.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Internal                                                                                             | Specifies administrative distance for internal BGP routes. Routes are internal when learned from peer in the local autonomous system. The range of values for this argument are from 1 to 255. The default value is 200.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Local                                                                                                | Specifies administrative distance for local BGP routes. Local routes are those networks listed with a network router configuration command, often as back doors, for the router or for the networks that is being redistributed from another process. The range of values for this argument are from 1 to 255. The default value is 200.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Forward packets over Multiple Paths                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Number of Paths                                                                                      | (Optional) Specify the maximum number of Border Gateway Protocol routes that can be installed in a routing table. The range of values are from 1 to 8. The default value is 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| iBGP Number of Paths                                                                                 | (Optional) Specify the maximum number of parallel internal Border Gateway Protocol (iBGP) routes that can be installed in a routing table. The range of values are from 1 to 8. The default value is 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Add/Edit Aggregate Address Dialog Box

Use the Add/Edit Aggregate Address dialog box to define the aggregation of specific routes into one route.

### Navigation Path

You can access the Add/Edit Aggregate Address dialog box from the [IPv6 Family Tab](#) , on page 2111. Click the **Add Row (+)** button, or select a row in the table and click the **Edit Row(pencil)** button.

| Generate AS Set Path Information             | Enables generation of autonomous system set path information.                                                                                                                                                                                                                                                                                                                                             |
| Filter all more-specific routes from updates | Filters all more-specific routes from updates.                                                                                                                                                                                                                                                                                                                                                            |

## Add/Edit Neighbor Dialog Box

Use the Add/Edit Neighbor dialog box to define BGP neighbors and neighbor settings.

### Navigation Path

You can access the Add/Edit Neighbor dialog box from the [IPv6 Family Tab](#), on page 2111. Click the **Add Row (+)** button, or select a row in the table and click the **Edit Row(pencil)** button.

*Table 719: Add/Edit Neighbor Dialog Box*

| Element                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| General                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| IP Address                          | Enter the BGP neighbor IP address. This IP address is added to the BGP neighbor table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Remote AS                           | Enter the autonomous system to which the BGP neighbor belongs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Update Source<br>(ASA 9.19.1+ only) | <p>(Optional) Select the appropriate interfaces to update the source interface for BGP neighborship.</p> <p><b>Tip</b> Click <b>Select</b> to open the Interface Selector from which you can select an interface. For more information about interfaces, see <a href="#">Available Interface Types</a>, on page 2328.</p> <p><b>Note</b> If you update the loopback interface as source for BGP neighborship, IP address of the loopback interface is advertised across the network. The loopback interface acts as eBGP peer and participate in routing. As the loopback interface is stable when enabled and remains available until administratively shut-down, the ASA is always reachable on the loopback interface IP address.</p> |
| Enable Address Family               | (Optional) Enables communication with the BGP neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Element                                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Shutdown neighbor administratively                                              | (Optional) Disable a neighbor or peer group.                                                                                                                                                                                                                                                                                                                                                                                       |
| Configure Graceful Restart per neighbor<br>(ASA 9.3.1+ only)                    | (Optional) Enables configuration of the Border Gateway Protocol (BGP) graceful restart capability for this neighbor. After selecting this option, you must use the Graceful Restart (Use in failover or spanned cluster mode) option to specify whether graceful restart should be enabled or disabled for this neighbor.                                                                                                          |
| Graceful Restart (Use in failover or spanned cluster mode)<br>(ASA 9.3.1+ only) | (Optional) Enables the Border Gateway Protocol (BGP) graceful restart capability for this neighbor.                                                                                                                                                                                                                                                                                                                                |
| Description                                                                     | (Optional) Enter a description for the BGP neighbor.                                                                                                                                                                                                                                                                                                                                                                               |
| fall-over BFD                                                                   | (Optional) Enables BFD support for fall-over for the BGP neighbor.                                                                                                                                                                                                                                                                                                                                                                 |
| BFD-Hop                                                                         | (Optional) Specify if there is a single IP hop or multiple IP hops between a BFD source and destination.                                                                                                                                                                                                                                                                                                                           |
| Filtering                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Filter routes using an access list                                              | (Optional) Enter or Select the appropriate incoming or outgoing access control list to distribute BGP neighbor information.                                                                                                                                                                                                                                                                                                        |
| Filter routes using route map                                                   | (Optional) Enter or Select the appropriate incoming or outgoing route maps to apply a route map to incoming or outgoing routes.<br><br><b>Tip</b> Click <b>Select</b> to open the Route Map Object Selector from which you can select a route map object. You can also create new route map objects from the Route Map Object Selector. For more information, see <a href="#">Understanding Route Map Objects</a> , on page 2248.  |
| Filter routes using a Prefix list                                               | (Optional) Enter or Select the appropriate incoming or outgoing prefix list to distribute BGP neighbor information.<br><br><b>Tip</b> Click <b>Select</b> to open the Prefix List Object Selector from which you can select a prefix list object. You can also create new objects from the object Prefix List Object selector. For more information, see <a href="#">Add or Edit Prefix List Object Dialog Box</a> , on page 2262. |
| Filter routes using AS Path filter                                              | (Optional) Enter or Select the appropriate incoming or outgoing AS path filter to distribute BGP neighbor information.<br><br><b>Tip</b> Click <b>Select</b> to open the AS Path Object Selector from which you can select an AS path object. You can also create new AS path objects from the AS Path Object Selector. For more information, see <a href="#">Add or Edit As Path Object Dialog Boxes</a> , on page 2267.          |

| Element                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Limit the number of prefixes allowed from the neighbor  | <p>(Optional) Select to control the number of prefixes that can be received from a neighbor.</p> <ul style="list-style-type: none"> <li>• Enter the maximum number of prefixes allowed from a specific neighbor in the <b>Maximum Prefixes</b> field.</li> <li>• Enter the percentage (of maximum) at which the router starts to generate a warning message in the <b>Threshold Level</b> field. Valid values are integers between 1 and 100. The default value is 75.</li> <li>• (Optional) Check the <b>Control prefixes received from the peer</b> check box to specify additional controls for the prefixes received from a peer. Do one of the following: <ul style="list-style-type: none"> <li>• Select <b>Terminate peering when prefix limit is exceeded</b> to stop the BGP neighbor when the prefix limit is reached. Specify the interval after which the BGP neighbor will restart in the Restart interval field.</li> <li>• Select <b>Give only warning message when prefix limit is exceeded</b> to generate a log message when the maximum prefix limit is exceeded. Here, the BGP neighbor will not be terminated.</li> </ul> </li> </ul> |
| Routes                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Advertisement Interval                                  | Enter the minimum interval (in seconds) between the sending of BGP routing updates. Valid values are between 1 and 600.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Remove private AS numbers from outbound routing updates | (Optional) Excludes the private AS numbers from being advertised on outbound routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Generate Default route                                  | <p>(Optional) Select to allow the local router to send the default route 0.0.0.0 to a neighbor to use as a default route. Enter or Select the route map that allows the route 0.0.0.0 to be injected conditionally in the Route map field.</p> <p><b>Tip</b> Click <b>Select</b> to open the Route Map Object Selector from which you can select a route map object. You can also create new route map objects from the Route Map Object Selector. For more information, see <a href="#">Understanding Route Map Objects</a> , on page 2248.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Set timers for the BGP peer     | (Optional) Select to set the keepalive frequency, hold time and minimum hold time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Keepalive Interval              | Enter the frequency (in seconds) with which the ASA sends keepalive messages to the neighbor. Valid values are between 0 and 65535. The default value is 60 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Hold Time                       | Enter the interval (in seconds) after not receiving a keepalive message that the ASA declares a peer dead. Valid values are between 0 and 65535. The default value is 180 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Min Hold Time                   | (Optional) Enter the minimum interval (in seconds) after not receiving a keepalive message that the ASA declares a peer dead. Valid values are between 0 and 65535. The default value is 0 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Advanced                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Element                                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Authentication                                          | <p>(Optional) Select to enable MD5 authentication on a TCP connection between two BGP peers.</p> <ul style="list-style-type: none"> <li>• Choose an encryption type from the Enable Encryption drop-down list.</li> <li>• Enter a password in the Password field. Reenter the password in the Confirm field.</li> </ul> <p>The password is case-sensitive and can be up to 25 characters long when the service password-encryption command is enabled and up to 81 characters long when the service password-encryption command is not enabled. The first character cannot be a number. The string can contain any alphanumeric characters, including spaces.</p> <p><b>Note</b> You cannot specify a password in the format number-space-anything. The space after the number can cause authentication to fail.</p>                                                                                                                                     |
| Send Community attribute to this neighbor                      | <p>(Optional) Specifies that communities attributes should be sent to the BGP neighbor.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Use ASA as next hop for neighbor                               | <p>(Optional) Select to configure the router as the next-hop for a BGP speaking neighbor or peer group.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Disable connection verification                                | <p>(Optional) Select to disable the connection verification process for eBGP peering sessions that are reachable by a single hop but are configured on a loopback interface or otherwise configured with a non-directly connected IP address.</p> <p>This command is required only when the neighbor ebgp-multihop command is configured with a TTL value of 1. The address of the single-hop eBGP peer must be reachable. The neighbor update-source command must be configured to allow the BGP routing process to use the loopback interface for the peering session.</p> <p>When deselected (default), a BGP routing process will verify the connection of single-hop eBGP peering session (TTL=254) to determine if the eBGP peer is directly connected to the same network segment by default. If the peer is not directly connected to same network segment, connection verification will prevent the peering session from being established.</p> |
| Allow connections with neighbor that is not directly connected | <p>Select to accept and attempt BGP connections to external peers residing on networks that are not directly connected.</p> <p>(Optional) Enter the time-to-live in the TTL hops field. Valid values are between 1 and 255.</p> <p><b>Note</b> This feature should be used only under the guidance of Cisco technical support staff. To prevent the creation of loops through oscillating routes, the multihop will not be established if the only route to the multihop peer is the default route (0.0.0.0).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Limit number of TTL hops to neighbor | <p>Select this option to secure a BGP peering session. Enter the maximum number of hops that separate eBGP peers in the TTL hops field. Valid values are between 1 and 254.</p> <p>This feature provides a lightweight security mechanism to protect BGP peering sessions from CPU utilization-based attacks. These types of attacks are typically brute force Denial of Service (DoS) attacks that attempt to disable the network by flooding the network with IP packets that contain forged source and destination IP addresses in the packet headers.</p> <p>This feature leverages designed behavior of IP packets by accepting only IP packets with a TTL count that is equal to or greater than the locally configured value. Accurately forging the TTL count in an IP packet is generally considered to be impossible. Accurately forging a packet to match the TTL count from a trusted peer is not possible without internal access to the source or destination network.</p> <p>This feature should be configured on each participating router. It secures the BGP session in the incoming direction only and has no effect on outgoing IP packets or the remote router. When this feature is enabled, BGP will establish or maintain a session only if the TTL value in the IP packet header is equal to or greater than the TTL value configured for the peering session. This feature has no effect on the BGP peering session, and the peering session can still expire if keepalive packets are not received. If the TTL value in a received packet is less than the locally configured value, the packet is silently discarded and no Internet Control Message Protocol (ICMP) message is generated. This is designed behavior; a response to a forged packet is not necessary.</p> <p>To maximize the effectiveness of this feature, the hop-count value should be strictly configured to match the number of hops between the local and external network. However, you should also take path variation into account when configuring this feature for a multihop peering session.</p> <p>The following restrictions apply to the configuration of this command:</p> <ul style="list-style-type: none"> <li>• This feature is not supported for internal BGP (iBGP) peers.</li> <li>• The effectiveness of this feature is reduced in large-diameter multihop peerings. In the event of a CPU utilization-based attack against a BGP router that is configured for large-diameter peering, you may still need to shut down the affected peering sessions to handle the attack.</li> <li>• This feature is not effective against attacks from a peer that has been compromised inside of your network. This restriction also includes peers that are on the network segment between the source and destination network.</li> </ul> |
| Use TCP Path MTU Discovery           | (Optional) Select to enable a TCP transport session for a BGP session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Options are Default, Active, or Passive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Weight                               | (Optional) Enter a weight for the BGP neighbor connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Element                                                                          | Description                                                                                                                                                                                                                                                                  |
|----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BGP Version                                                                      | Choose the BGP version that the ASA will accept from the drop-down list. The version can be set to 4-Only to force the software to use only Version 4 with the specified neighbor. The default is to use Version 4 and dynamically negotiate down to Version 2 if requested. |
| <b>Migration</b>                                                                 |                                                                                                                                                                                                                                                                              |
| <b>Note</b>                                                                      | This customization should only be used for AS migration, and should be removed after the transition has been completed. The procedure should be attempted only by an experienced network operator. Routing loops can be created through improper configuration.              |
| Customize the AS number for routes received from the neighbor                    | (Optional) Select to customize the AS_PATH attribute for routes received from an eBGP neighbor.                                                                                                                                                                              |
| Local AS Number                                                                  | Enter the local autonomous system number. Valid values are any valid autonomous system number from 1 to 4294967295 or 1.0 to 65535.65535.                                                                                                                                    |
| Do not prepend local AS number to routes received from neighbor                  | (Optional) Select to prevent the local AS number from being prepended to any routes received from eBGP peer.                                                                                                                                                                 |
| Replace real AS number with local AS number in routes received from neighbor     | (Optional) Select to replace the real autonomous system number with the local autonomous system number in the eBGP updates. The autonomous system number from the local BGP routing process is not prepended.                                                                |
| Accept either real AS number or local AS number in routes received from neighbor | (Optional) Configures the eBGP neighbor to establish a peering session using the real autonomous system number (from the local BGP routing process) or by using the local autonomous system number.                                                                          |

## Add/Edit Network Dialog Box

Use the Add/Edit Network dialog box to define the networks to be advertised by the BGP routing process.

### Navigation Path

You can access the Add/Edit Network dialog box from the [IPv6 Family Tab](#), on page 2111. Click the **Add Row (+)** button, or select a row in the table and click the **Edit Row (pencil)** button.

| Element             | Description                                                                                                                                                                                                                                         |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable EIGRP        | Check this box to enable the EIGRP routing process.                                                                                                                                                                                                 |
| AS Number           | Enter the autonomous system (AS) number for the EIGRP process. The AS number can be from 1 to 65535.                                                                                                                                                |
| Advanced button     | Opens the <a href="#">EIGRP Advanced Dialog Box</a> , on page 2126, in which you can configure additional EIGRP process settings, such as the router ID, stub routing, and adjacency changes.                                                       |
| Setup tab           | Use the Setup tab to configure the networks used by the EIGRP routing process, passive interfaces, default route information, administrative distances, and default metrics.<br>For more information, see <a href="#">Setup Tab</a> , on page 2128. |
| Filter Rules tab    | Use the Filter Rules tab to define filter rules that let you control which routes are accepted or advertised by the EIGRP routing process.<br>For more information, see <a href="#">Filter Rules Tab</a> , on page 2131.                            |
| Neighbors tab       | Use the Neighbors tab to manually define EIGRP neighbors.<br>For more information, see <a href="#">Neighbors Tab</a> , on page 2132.                                                                                                                |
| Redistribution tab  | Use the Redistribution tab to define the rules for redistributing routes from other routing protocols to the EIGRP routing process.<br>For more information, see <a href="#">Redistribution Tab</a> , on page 2134.                                 |
| Summary Address tab | Use the Summary Address tab to create statically defined EIGRP summary addresses.<br>For more information, see <a href="#">Summary Address Tab</a> , on page 2137.                                                                                  |
| Interfaces tab      | Use the Interfaces tab to configure interfaces for EIGRP.<br>For more information, see <a href="#">Interfaces Tab</a> , on page 2139.                                                                                                               |

## About EIGRP

EIGRP is an enhanced version of IGRP developed by Cisco. Unlike IGRP and RIP, EIGRP does not send out periodic route updates. EIGRP updates are sent out only when the network topology changes. Key capabilities that distinguish EIGRP from other routing protocols include fast convergence, support for variable-length subnet mask, support for partial updates, and support for multiple network layer protocols. From version 4.27, EIGRPv6 is also supported. EIGRPv6 is an enhancement to EIGRP with IPv6 support.

A router running EIGRP stores all the neighbor routing tables so that it can quickly adapt to alternate routes. If no appropriate route exists, EIGRP queries its neighbors to discover an alternate route. These queries propagate until an alternate route is found. Its support for variable-length subnet masks permits routes to be automatically summarized on a network number boundary. In addition, EIGRP can be configured to summarize on any bit boundary at any interface. EIGRP does not make periodic updates. Instead, it sends partial updates

only when the metric for a route changes. Propagation of partial updates is automatically bounded so that only those routers that need the information are updated. As a result of these two capabilities, EIGRP consumes significantly less bandwidth than IGRP.

Neighbor discovery is the process that the ASA uses to dynamically learn of other routers on directly attached networks. EIGRP routers send out multicast hello packets to announce their presence on the network. When the ASA receives a hello packet from a new neighbor, it sends its topology table to the neighbor with an initialization bit set. When the neighbor receives the topology update with the initialization bit set, the neighbor sends its topology table back to the ASA.

The hello packets are sent out as multicast messages. No response is expected to a hello message. The exception to this is for statically defined neighbors. If you manually configure a neighbor, the hello messages sent to that neighbor are sent as unicast messages. Routing updates and acknowledgments are sent out as unicast messages.

Once this neighbor relationship is established, routing updates are not exchanged unless there is a change in the network topology. The neighbor relationship is maintained through the hello packets. Each hello packet received from a neighbor includes a hold time. This is the time in which the ASA can expect to receive a hello packet from that neighbor. If the ASA does not receive a hello packet from that neighbor within the hold time advertised by that neighbor, the ASA considers that neighbor to be unavailable.

The EIGRP protocol uses four key algorithm technologies, four key technologies, including neighbor discovery/recovery, Reliable Transport Protocol (RTP), and DUAL, which is important for route computations. DUAL saves all routes to a destination in the topology table, not just the least-cost route. The least-cost route is inserted into the routing table. The other routes remain in the topology table. If the main route fails, another route is chosen from the feasible successors. A successor is a neighboring router used for packet forwarding that has a least-cost path to a destination. The feasibility calculation guarantees that the path is not part of a routing loop.

If a feasible successor is not found in the topology table, a route recomputation must occur. During route recomputation, DUAL queries the EIGRP neighbors for a route, who in turn query their neighbors. Routers that do not have a feasible successor for the route return an unreachable message.

During route recomputation, DUAL marks the route as active. By default, the ASA waits for three minutes to receive a response from its neighbors. If the ASA does not receive a response from a neighbor, the route is marked as stuck-in-active. All routes in the topology table that point to the unresponsive neighbor as a feasibility successor are removed.

---

**Note** EIGRP neighbor relationships are not supported through the IPsec tunnel without a GRE tunnel.

| Router ID | <p>The router ID is used to identify the originating router for external routes. If an external route is received with the local router ID, the route is discarded. To prevent this, specify a global address for the router ID. A unique value should be configured for each EIGRP router.</p> <p>On a single device, choose <b>Automatic</b> or <b>IP Address</b>. (An address field appears when you choose IP Address.)</p> <p>If you choose Automatic, the highest-level IP address on the security appliance is used as the router ID. To use a fixed router ID, choose IP Address and enter an IPv4 address in the Router ID field.</p> <p>On a device cluster, choose <b>Automatic</b> or <b>Cluster Pool</b>. (An IPv4 Pool object ID field appears when you choose Cluster Pool.)</p> <p>If you choose Cluster Pool, enter or Select the name of the IPv4 Pool object that is to supply the Router ID address. For more information, see .</p> |

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Stub              | <p>You can enable, and configure the ASA as an EIGRP stub router. Stub routing decreases memory and processing <a href="#">Add or Edit IPv4 Pool Dialog Box</a> , on page 321 requirements on the ASA. As a stub router, the ASA does not need to maintain a complete EIGRP routing table because it forwards all nonlocal traffic to a distribution router. Generally, the distribution router need not send anything more than a default route to the stub router.</p> <p>Only specified routes are propagated from the stub router to the distribution router. As a stub router, the ASA responds to all queries for summaries, connected routes, redistributed static routes, external routes, and internal routes with the message “inaccessible.” When the ASA is configured as a stub, it sends a special peer information packet to all neighboring routers to report its status as a stub router. Any neighbor that receives a packet informing it of the stub status will not query the stub router for any routes, and a router that has a stub peer will not query that peer. The stub router depends on the distribution router to send the correct updates to all peers.</p> <p>To enable the ASA as an EIGRP stub routing process, choose one or more of the following EIGRP stub routing processes:</p> <ul style="list-style-type: none"> <li>• Receive only—Configures the EIGRP stub routing process to receive route information from the neighbor routers but does not send route information to the neighbors. If this option is selected, you cannot select any of the other stub routing options.</li> <li>• Connected—Advertises connected routes.</li> <li>• Redistributed—Advertises redistributed routes.</li> <li>• Static—Advertises static routes.</li> <li>• Summary—Advertises summary routes.</li> </ul> |
| Adjacency Changes | <p>These options specify the syslog messages sent when adjacency changes occur.</p> <ul style="list-style-type: none"> <li>• Log Neighbor Changes – enables the logging of EIGRP neighbor adjacency changes. This option is selected by default.</li> <li>• Log Neighbor Warnings – enables the logging of EIGRP neighbor warning messages. This option is selected by default.</li> </ul> <p>(Optional) The time interval (in seconds) between repeated neighbor warning messages. Valid values are from 1 to 65535. Repeated warnings are not logged if they occur during this interval.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Setup Tab

Use the Setup tab on the EIGRP page to configure the networks used by the EIGRP routing process, passive interfaces, default route information, administrative distances, and default metrics.

### Navigation Path

You can access the Setup tab from the EIGRP Page; see [Configuring EIGRP](#) , on page 2124 for more information.

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Auto Summary      | <p>Check this box to enable automatic route summarization. Auto summary is enabled by default for ASA versions earlier than 9.2.1 and is disabled by default for ASA 9.2(1) and later.</p> <p>When enabled, the EIGRP routing process summarizes on network number boundaries. This can cause routing problems if you have noncontiguous networks.</p> <p>For example, if you have a router with the networks 192.168.1.0, 192.168.2.0, and 192.168.3.0 connected to it, and those networks all participate in EIGRP, the EIGRP routing process creates the summary address 192.168.0.0 for those routes. If an additional router is added to the network with the networks 192.168.10.0 and 192.168.11.0, and those networks participate in EIGRP, they will also be summarized as 192.168.0.0. To prevent the possibility of traffic being routed to the wrong location, you should disable automatic route summarization on the routers creating the conflicting summary addresses.</p> |
| Networks          | <p>Enter the IP addresses of the networks to participate in the EIGRP routing process.</p> <p><b>Tip</b> You can click <b>Select</b> to select the networks from a list of network/host objects.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Passive Interface | <p>You can configure one or more interfaces as passive interfaces. In EIGRP, a passive interface does not send or receive routing updates.</p> <p>By default, all interfaces are enabled for active routing (sending and receiving routing updates) when routing is enabled for that interface.</p> <p>To configure passive interfaces, do one of the following:</p> <ul style="list-style-type: none"> <li>• To enable all interfaces for active routing (sending and receiving routing updates) when routing is enabled for that interface, select <b>None</b>.</li> <li>• To configure all interfaces as passive, select <b>All Interfaces</b>.</li> <li>• To configure specific interfaces as passive, select <b>Specified Interfaces</b> and then enter or select the interfaces that you want to make passive.</li> </ul>                                                                                                                                                            |

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Default Route Information | <p>You can control the sending and receiving of default route information in EIGRP updates. By default, default routes are sent and accepted. Configuring the ASA to disallow default information to be received causes the candidate default route bit to be blocked on received routes. Configuring the ASA to disallow default information to be sent disables the setting of the default route bit in advertised routes.</p> <ul style="list-style-type: none"> <li>• Accept Default Route Info—configures EIGRP to accept exterior default routing information. Optionally, you can specify a standard access list that define which networks are allowed and which are not when receiving default route information.</li> <li>• Send Default Route Info—configures EIGRP to advertise external routing information. Optionally, you can specify a standard access list that defines which networks are allowed and which are not when sending default route information.</li> </ul>                                                                                                                                                                                                                                              |
| Administrative Distance   | <p>Because every routing protocol has metrics based on algorithms that are different from the other routing protocols, it is not always possible to determine the “best path” for two routes to the same destination that were generated by different routing protocols. Administrative distance is a route parameter that the ASA uses to select the best path when there are two or more different routes to the same destination from two different routing protocols.</p> <p>If you have more than one routing protocol running on the ASA, you can use the distance eigrp command to adjust the default administrative distances of routes discovered by the EIGRP routing protocol in relation to the other routing protocols.:</p> <p>Internal Distance—Administrative distance for EIGRP internal routes. Internal routes are those that are learned from another entity within the same autonomous system. Valid values are from 1 to 255. The default value is 90.</p> <p>External Distance—Administrative distance for EIGRP external routes. External routes are those for which the best path is learned from a neighbor external to the autonomous system. Valid values are from 1 to 255. The default value is 170.</p> |
| Default Metrics           | <p>You can define the default metrics for routes redistributed into the EIGRP routing process:</p> <ul style="list-style-type: none"> <li>• Bandwidth—the minimum bandwidth of the route in kilobits per second. Valid values range from 1 to 4294967295.</li> <li>• Delay Time—the route delay in tens of microseconds. Valid values range from 0 to 4294967295.</li> <li>• Reliability—the likelihood of successful packet transmission expressed as a number 0 through 255. The value 255 indicates 100 percent reliability; 0 means no reliability.</li> <li>• Loading—the effective bandwidth of the route. Valid values range from 1 to 255; 255 indicates 100 percent loaded.</li> <li>• MTU—the smallest allowed value for the maximum transmission unit of the path. Valid values range from 1 to 65535.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                           |

## Filter Rules Tab

The Filter Rules tab contains the Filter Rules table which displays the route filtering rules configured for the EIGRP routing process. Filter rules let you control which routes are accepted or advertised by the EIGRP routing process.

### Navigation Path

You can access the Filter Rules tab from the EIGRP Page; see [Configuring EIGRP , on page 2124](#) for more information.

|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EIGRP Filter Direction | Specify the direction for the filter rule: <ul style="list-style-type: none"> <li>• Inbound—The rule filters default route information from incoming EIGRP routing updates.</li> <li>• Outbound—The rule filters default route information from outgoing EIGRP routing updates.</li> </ul>                                                                                                                                                                                                                                                                                                                                                            |
| Type                   | Specify the type of filter rule: <ul style="list-style-type: none"> <li>• (Optional) Interface—Specify the interface on which to apply the routing updates. Specifying an interface causes the access list to be applied only to routing updates for that interface. If no interface is specified, the access list will be applied to all updates.</li> <li>• (Optional) Routing Protocol—For outbound EIGRP routing updates, select the routing protocol for which you want to filter: BGP, Connected, OSPF, RIP, or Static.</li> </ul> Routing Protocol ID—Enter the identifier for the routing process. Applies to BGP and OSPF routing protocols. |
| ACL                    | Select an Access Control List that defines which networks are to be received and which are to be suppressed in routing updates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Neighbors Tab

The Neighbors tab contains the Neighbors table, through which you can define static neighbors. When you manually define an EIGRP neighbor, hello packets are sent to that neighbor as unicast messages.

### Navigation Path

You can access the Neighbors tab from the EIGRP Page; see [Configuring EIGRP](#) , on page 2124 for more information.

**Field Reference***Table 728: EIGRP - Neighbors Tab*

| Element   | Description                                            |
|-----------|--------------------------------------------------------|
| Interface | The interface through which the neighbor is available. |
| Neighbor  | The IP address of the static neighbor.                 |

**Add/Edit EIGRP Neighbor Dialog Box**

EIGRP hello packets are sent as multicast packets. If an EIGRP neighbor is located across a non broadcast network, such as a tunnel, you must manually define that neighbor. When you manually define an EIGRP neighbor, hello packets are sent to that neighbor as unicast messages.

---

**Note** Configuring the passive-interface command for an interface suppresses all incoming and outgoing routing updates and hello messages on that interface. EIGRP neighbor adjacencies cannot be established or maintained over an interface that is configured as passive.

---

Use the Add/Edit EIGRP Neighbor dialog box to define a static neighbor or change information for an existing static neighbor.

**Navigation Path**

You can access the Add/Edit EIGRP Neighbor dialog box from the [Neighbors Tab](#) , on page 2132.

**Table 730: EIGRP - Redistribution Tab**

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol    | The source protocol from which the routes are being redistributed: <ul style="list-style-type: none"> <li>• BGP—Redistribute routes discovered by the BGP routing process to EIGRP.</li> <li>• RIP—Redistributes routes discovered by the RIP routing process to EIGRP.</li> <li>• Static—Redistributes static routes to the EIGRP routing process. Static routes that fall within the scope of a network statement are automatically redistributed into EIGRP; you do not need to define a redistribution rule for them.</li> <li>• Connected—Redistributes connected routes (routes established automatically by virtue of having IP address enabled on the interface) to the EIGRP routing process. Connected routes that fall within the scope of a network statement are automatically redistributed into EIGRP; you do not need to define a redistribution rule for them.</li> <li>• OSPF—Redistributes routes discovered by the OSPF routing process to EIGRP. If you choose this protocol, the Match options on this dialog box become visible. These options are not available when redistributing static, connected, RIP, or BGP routes.</li> </ul> |
| ID          | The autonomous system (AS) number for the BGP or OSPF routing process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Bandwidth   | The minimum bandwidth of the route in kilobits per second. Valid values range from 1 to 4294967295.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Delay Time  | The route delay in tens of microseconds. Valid values range from 0 to 4294967295.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Reliability | The likelihood of successful packet transmission expressed as a number 0 through 255. The value 255 indicates 100 percent reliability; 0 means no reliability.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Loading     | The effective bandwidth of the route. Valid values range from 1 to 255; 255 indicates 100 percent loaded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| MTU         | The smallest allowed value for the maximum transmission unit of the path. Valid values range from 1 to 65535.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Route Map   | The name of the route map object to apply to the redistribution entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Add/Edit EIGRP Redistribution Dialog Box

Use the Add/Edit Redistribution dialog box to add a redistribution rule or to edit an existing redistribution rule in the Redistribution table.

### Navigation Path

You can access the Add/Edit EIGRP Redistribution dialog box from the [Redistribution Tab](#) , on page 2134.

**Field Reference****Table 731: Add/Edit EIGRP Redistribution Dialog Box**

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol           | <p>Select the source protocol from which the routes are being redistributed. You can choose one of the following options:</p> <ul style="list-style-type: none"> <li>• BGP—Redistribute routes discovered by the BGP routing process to EIGRP.</li> <li>• RIP—Redistributes routes discovered by the RIP routing process to EIGRP.</li> <li>• Static—Redistributes static routes to the EIGRP routing process. Static routes that fall within the scope of a network statement are automatically redistributed into EIGRP; you do not need to define a redistribution rule for them.</li> <li>• Connected—Redistributes connected routes (routes established automatically by virtue of having IP address enabled on the interface) to the EIGRP routing process. Connected routes that fall within the scope of a network statement are automatically redistributed into EIGRP; you do not need to define a redistribution rule for them.</li> <li>• OSPF—Redistributes routes discovered by the OSPF routing process to EIGRP. If you choose this protocol, the Match options on this dialog box become visible. These options are not available when redistributing static, connected, RIP, or BGP routes.</li> </ul> |
| Routing Process ID | The autonomous system (AS) number for the BGP or OSPF routing process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Optional Metrics   | <p>You can define the following metrics for routes redistributed into the EIGRP routing process:</p> <ul style="list-style-type: none"> <li>• Bandwidth—the minimum bandwidth of the route in kilobits per second. Valid values range from 1 to 4294967295.</li> <li>• Delay Time—the route delay in tens of microseconds. Valid values range from 0 to 4294967295.</li> <li>• Reliability—the likelihood of successful packet transmission expressed as a number 0 through 255. The value 255 indicates 100 percent reliability; 0 means no reliability.</li> <li>• Loading—the effective bandwidth of the route. Valid values range from 1 to 255; 255 indicates 100 percent loaded.</li> <li>• MTU—the smallest allowed value for the maximum transmission unit of the path. Valid values range from 1 to 65535.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                           |

| Element                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Route Map                    | <p>Enter or Select a route map object to define which routes are redistributed into the EIGRP routing process.</p> <p><b>Tip</b> Click <b>Select</b> to open the Route Map Object Selector from which you can select a route map object. You can also create new route map objects from the Route Map Object Selector. For more information, see <a href="#">Understanding Route Map Objects</a> , on page 2248.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Optional OSPF Redistribution | <p>If you have chosen OSPF as the Route Type, choose the conditions used for redistributing routes from one routing protocol to another. The routes must match the selected condition to be redistributed. You can choose one or more of the following match conditions:</p> <ul style="list-style-type: none"> <li>• Internal—The route is internal to a specific AS.</li> <li>• External 1—Routes that are external to the autonomous system, but are imported into OSPF as Type 1 external routes.</li> <li>• External 2—Routes that are external to the autonomous system, but are imported into OSPF as Type 2 external routes.</li> <li>• NSSA External 1—Routes that are external to the autonomous system, but are imported into OSPF as Type 2 NSSA routes.</li> <li>• NSSA External 2—Routes that are external to the autonomous system, but are imported into OSPF as Type 2 NSSA routes.</li> </ul> |

## Summary Address Tab

Use the Summary Address tab to configure a summary for EIGRP on a specific interface. You can configure summary addresses on a per-interface basis. You need to manually define summary addresses if you want to create summary addresses that do not occur at a network number boundary or if you want to use summary addresses on an ASA with automatic route summarization disabled. If any more specific routes are in the routing table, EIGRP will advertise the summary address out the interface with a metric equal to the minimum of all more specific routes.

### Navigation Path

You can access the Summary Address tab from the EIGRP Page; see [Configuring EIGRP](#) , on page 2124 for more information.

*Table 732: EIGRP - Summary Address Tab*

| Element                 | Description                                                 |
|-------------------------|-------------------------------------------------------------|
| Interface               | The interface from which the summary address is advertised. |
| Network                 | The IP address and network mask of the summary address.     |
| Administrative Distance | The administrative distance of the summary route.           |

## Add/Edit EIGRP Summary Address Dialog Box

Use the Add/Edit EIGRP Summary Address dialog box to add new entries or to modify existing entries in the Summary Address table. You can configure summary addresses on a per-interface basis. You need to manually define summary addresses if you want to create summary addresses that do not occur at a network number boundary or if you want to use summary addresses on an ASA with automatic route summarization disabled. If any more specific routes are in the routing table, EIGRP will advertise the summary address out the interface with a metric equal to the minimum of all more specific routes.

### Navigation Path

You can access the Add/Edit EIGRP Summary Address dialog box from the [Summary Address Tab](#) , on page 2137.

| Element   | Description                                                                                                                                                         |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface | The interface from which the summary address is advertised.<br><br><b>Tip</b> You can click <b>Select</b> to select the interface from a list of interface objects. |
| Networks  | The IP address and network mask of the summary address.<br><br><b>Tip</b> You can click <b>Select</b> to select the network from a list of network objects.         |

| Element                 | Description                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------------------|
| Administrative Distance | (Optional) The administrative distance of the summary route. Valid values are from 1 to 255. The default value is 5. |

## Interfaces Tab

Use the Interfaces tab to configure interface-specific EIGRP routing properties.

### Navigation Path

You can access the Interfaces tab from the EIGRP Page; see [Configuring EIGRP](#), on page 2124 for more information.

*Table 734: EIGRP - Interfaces Tab*

| Element        | Description                                                                                                                                             |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface      | The name of the interface to which the configuration applies.                                                                                           |
| Hello Interval | The interval, in seconds, between EIGRP hello packets sent on an interface. Valid values range from 1 to 65535 seconds. The default value is 5 seconds. |
| Hold Time      | The hold time advertised by the ASA in EIGRP hello packets. Valid values range from 1 to 65535 seconds. The default value is 15 seconds.                |
| Split Horizon  | Whether EIGRP split-horizon is enabled (true) or disabled (false) on an interface.                                                                      |
| Delay          | The delay time in tens of microseconds. Valid values are from 1 to 16777215. This option is not supported for devices in multi-context mode.            |
| Key ID         | The ID of the key used to authenticate EIGRP updates.                                                                                                   |

## Add/Edit EIGRP Interface Dialog Box

Use the Add/Edit EIGRP Interface dialog box to configure interface-specific EIGRP routing parameters.

### Navigation Path

You can access the Add/Edit EIGRP Interface dialog box from the [Interfaces Tab](#) , on page 2139.

### Related Topics

- [Configuring EIGRP](#) , on page 2124
- [About EIGRP](#) , on page 2125
- [Interfaces Tab](#) , on page 2139

### Field Reference

| Element                   | Description                                                                                                                                                                                                                                                                           |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                 | The name of the interface to which the configuration applies.                                                                                                                                                                                                                         |
| Hello Interval            | The interval, in seconds, between EIGRP hello packets sent on an interface. Valid values range from 1 to 65535 seconds. The default value is 5 seconds.                                                                                                                               |
| Hold Time                 | The hold time advertised by the ASA in EIGRP hello packets. Valid values range from 1 to 65535 seconds. The default value is 15 seconds.                                                                                                                                              |
| Split Horizon             | Enable/disable EIGRP split-horizon on an interface.                                                                                                                                                                                                                                   |
| Delay Time                | The delay time in tens of microseconds. Valid values are from 1 to 16777215. This option is not supported for devices in multi-context mode and will be disabled.                                                                                                                     |
| Enable MD5 Authentication | Enables MD5 authentication of EIGRP packets.                                                                                                                                                                                                                                          |
| Key Type                  | Select Clear Text to indicate that the key you will be entering is in clear text. Select Encrypted to indicate that the key you will be entering is already encrypted.                                                                                                                |
| Key ID and Key            | Specify the key to authenticate EIGRP updates: <ul style="list-style-type: none"> <li>• Key ID—Enter a numerical key identifier. Valid values range from 0 to 255.</li> <li>• Key—An alphanumeric character string of up to 16 bytes.</li> <li>• Confirm—Re-enter the key.</li> </ul> |

# Configuring EIGRPv6

The EIGRPv6 page provides six tabbed panels for configuring Enhanced Interior Gateway Routing Protocol (EIGRPv6) routing on a firewall device. The following topics provide detailed information about enabling and configuring EIGRPv6:

- [IPv6 EIGRP Advanced Dialog Box](#) , on page 2142
- [Setup Tab](#) , on page 2143
- [Filter Rules Tab](#) , on page 2145
- [Neighbors Tab](#) , on page 2146
- [Redistribution Tab](#) , on page 2147
- [Summary Address Tab](#) , on page 2150
- [Interfaces Tab](#) , on page 2152

## Navigation Path

- (Device view) Select **Platform > Routing > EIGRP** from the Device Policy selector. Click **IPv6 Family** tab.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > EIGRP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one. Click **IPv6 Family** tab.

## Field Reference

*Table 736: EIGRPv6 Page*

| Element           | Description                                                                                                                                                                                                                                           |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable IPv6 EIGRP | Check this box to enable the EIGRPv6 routing process.                                                                                                                                                                                                 |
| AS Number         | Enter the autonomous system (AS) number for the EIGRPv6 process. The AS number can be from 1 to 65535.                                                                                                                                                |
| Advanced button   | Opens the <a href="#">IPv6 EIGRP Advanced Dialog Box</a> , on page 2142, in which you can configure additional EIGRPv6 process settings, such as the router ID, stub routing, and adjacency changes.                                                  |
| Setup tab         | Use the Setup tab to configure the networks used by the EIGRPv6 routing process, passive interfaces, default route information, administrative distances, and default metrics.<br>For more information, see <a href="#">Setup Tab</a> , on page 2143. |
| Filter Rules tab  | Use the Filter Rules tab to define filter rules that let you control which routes are accepted or advertised by the EIGRPv6 routing process.<br>For more information, see <a href="#">Filter Rules Tab</a> , on page 2145.                            |

| Element             | Description                                                                                                                                                                                                           |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Neighbors tab       | Use the Neighbors tab to manually define EIGRPv6 neighbors.<br>For more information, see <a href="#">Neighbors Tab</a> , on page 2146.                                                                                |
| Redistribution tab  | Use the Redistribution tab to define the rules for redistributing routes from other routing protocols to the EIGRPv6 routing process.<br>For more information, see <a href="#">Redistribution Tab</a> , on page 2147. |
| Summary Address tab | Use the Summary Address tab to create statically defined EIGRPv6 summary addresses.<br>For more information, see <a href="#">Summary Address Tab</a> , on page 2150.                                                  |
| Interfaces tab      | Use the Interfaces tab to configure interfaces for EIGRP.<br>For more information, see <a href="#">Interfaces Tab</a> , on page 2152.                                                                                 |

## IPv6 EIGRP Advanced Dialog Box

Use the EIGRPv6 Advanced dialog box to configure settings such as the router ID, stub routing, and adjacency changes.

### Navigation Path

You can access the IPv6 EIGRP Advanced dialog box from the EIGRPv6 page (see [Configuring EIGRPv6](#) , on page 2141).

### Field Reference

*Table 737: IPv6 EIGRP Advanced Dialog Box*

| Element   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Router ID | <p>The router ID is used to identify the originating router for external routes. If an external route is received with the local router ID, the route is discarded. To prevent this, specify a global address for the router ID. A unique value should be configured for each EIGRPv6 router.</p> <p>On a single device, choose <b>Automatic</b> or <b>IP Address</b>. (An address field appears when you choose IP Address.)</p> <p>If you choose Automatic, the highest-level IP address on the security appliance is used as the router ID. To use a fixed router ID, choose IP Address and enter an IPv6 address in the Router ID field.</p> <p>On a device cluster, choose <b>Automatic</b> or <b>Cluster Pool</b>. (An IPv6 Pool object ID field appears when you choose Cluster Pool.)</p> <p>If you choose Cluster Pool, enter or Select the name of the IPv6 Pool object that is to supply the Router ID address. For more information, see .</p> |

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Stub              | <p>You can enable, and configure the ASA as an EIGRPv6 stub router. Stub routing decreases memory and processing <a href="#">Add or Edit IPv6 Pool Dialog Box</a> , on page 322 requirements on the ASA. As a stub router, the ASA does not need to maintain a complete EIGRPv6 routing table because it forwards all nonlocal traffic to a distribution router. Generally, the distribution router need not send anything more than a default route to the stub router.</p> <p>Only specified routes are propagated from the stub router to the distribution router. As a stub router, the ASA responds to all queries for summaries, connected routes, redistributed static routes, external routes, and internal routes with the message “inaccessible.” When the ASA is configured as a stub, it sends a special peer information packet to all neighboring routers to report its status as a stub router. Any neighbor that receives a packet informing it of the stub status will not query the stub router for any routes, and a router that has a stub peer will not query that peer. The stub router depends on the distribution router to send the correct updates to all peers.</p> <p>To enable the ASA as an EIGRPv6 stub routing process, choose one or more of the following EIGRPv6 stub routing processes:</p> <ul style="list-style-type: none"> <li>• Receive only—Configures the EIGRPv6 stub routing process to receive route information from the neighbor routers but does not send route information to the neighbors. If this option is selected, you cannot select any of the other stub routing options.</li> <li>• Connected—Advertises connected routes.</li> <li>• Redistributed—Advertises redistributed routes.</li> <li>• Static—Advertises static routes.</li> <li>• Summary—Advertises summary routes.</li> </ul> |
| Adjacency Changes | <p>These options specify the syslog messages sent when adjacency changes occur.</p> <ul style="list-style-type: none"> <li>• Log Neighbor Changes – enables the logging of EIGRPv6 neighbor adjacency changes. This option is selected by default.</li> <li>• Log Neighbor Warnings – enables the logging of EIGRPv6 neighbor warning messages. This option is selected by default.</li> </ul> <p>(Optional) The time interval (in seconds) between repeated neighbor warning messages. Valid values are from 1 to 65535. Repeated warnings are not logged if they occur during this interval.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Setup Tab

Use the Setup tab on the EIGRPv6 page to configure the networks used by the IPv6 EIGRP routing process, passive interfaces, default route information, administrative distances, and default metrics.

### Navigation Path

You can access the Setup tab from the EIGRPv6 Page; see [Configuring EIGRPv6](#) , on page 2141 for more information.

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Passive Interface | <p>You can configure one or more interfaces as passive interfaces. In EIGRPv6, a passive interface does not send or receive routing updates.</p> <p>By default, all interfaces are enabled for active routing (sending and receiving routing updates) when routing is enabled for that interface.</p> <p>To configure passive interfaces, do one of the following:</p> <ul style="list-style-type: none"> <li>• To enable all interfaces for active routing (sending and receiving routing updates) when routing is enabled for that interface, select <b>None</b>.</li> <li>• To configure an interface as passive by default, select <b>Default</b>.</li> <li>• To configure specific interfaces as passive, select <b>Specified Interfaces</b> and then enter or select the interfaces that you want to make passive.</li> </ul>                               |
| Default Metrics   | <p>You can define the default metrics for routes redistributed into the EIGRPv6 routing process:</p> <ul style="list-style-type: none"> <li>• <b>Bandwidth</b>—the minimum bandwidth of the route in kilobits per second. Valid values range from 1 to 4294967295.</li> <li>• <b>Delay Time</b>—the route delay in tens of microseconds. Valid values range from 0 to 4294967295.</li> <li>• <b>Reliability</b>—the likelihood of successful packet transmission expressed as a number 0 through 255. The value 255 indicates 100 percent reliability; 0 means no reliability.</li> <li>• <b>Loading</b>—the effective bandwidth of the route. Valid values range from 1 to 255; 255 indicates 100 percent loaded.</li> <li>• <b>MTU</b>—the smallest allowed value for the maximum transmission unit of the path. Valid values range from 1 to 65535.</li> </ul> |

## Filter Rules Tab

The Filter Rules tab contains the Filter Rules table which displays the route filtering rules configured for the EIGRPv6 routing process. Filter rules let you control which routes are accepted or advertised by the EIGRPv6 routing process.

### Navigation Path

You can access the Filter Rules tab from the EIGRPv6 Page; see [Configuring EIGRPv6 , on page 2141](#) for more information.

|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EIGRP Filter Direction | Specify the direction for the filter rule: <ul style="list-style-type: none"> <li>• Inbound—The rule filters default route information from incoming EIGRPv6 routing updates.</li> <li>• Outbound—The rule filters default route information from outgoing EIGRPv6 routing updates.</li> </ul> |
| Interface              | Select the Interface from the Interface Selector tab.                                                                                                                                                                                                                                          |
| IPv6 Prefix List       | The IPv6 prefix list name. The list defines which networks are to be received and which are to be suppressed in routing updates.                                                                                                                                                               |

## Neighbors Tab

The Neighbors tab contains the Neighbors table, through which you can define neighbors for EIGRPv6. When you manually define an EIGRPv6 neighbor, hello packets are sent to that neighbor as unicast messages.

**Navigation Path**

You can access the Neighbors tab from the EIGRPv6 Page; see [Configuring EIGRPv6](#) , on page 2141 for more information.

## Field Reference

*Table 741: IPv6 EIGRP - Neighbors Tab*

| Element   | Description                                            |
|-----------|--------------------------------------------------------|
| Interface | The interface through which the neighbor is available. |
| Network   | The IPv6 address of the added neighbor.                |

## Add/Edit IPv6 EIGRP Neighbor Dialog Box

EIGRPv6 hello packets are sent as multicast packets. If an EIGRPv6 neighbor is located across a non broadcast network, such as a tunnel, you must manually define that neighbor. When you manually define an EIGRPv6 neighbor, hello packets are sent to that neighbor as unicast messages.

Use the Add/Edit IPv6 EIGRP Neighbor Page dialog box to define a neighbor or change information for an existing neighbor.

### Navigation Path

You can access the Add/Edit IPv6 EIGRP Neighbor Page dialog box from the [Neighbors Tab](#) , on page 2146.

| Element   | Description                                                                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface | The interface through which the neighbor is available.<br><br><b>Tip</b> You can click <b>Select</b> to select the interface from a list of interface objects. |
| Network   | The IPv6 address of the neighbor.<br><br><b>Tip</b> You can click <b>Select</b> to select the neighbor from a list of host objects.                            |

## Redistribution Tab

Use the Redistribution tab to define the rules for redistributing routes from other routing protocols to the EIGRPv6 routing process.

## Navigation Path

You can access the Redistribution tab from the EIGRPv6 Page; see [Configuring EIGRPv6](#), on page 2141 for more information.

**Table 743: IPv6 EIGRP - Redistribution Tab**

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol    | <p>The source protocol from which the routes are being redistributed:</p> <ul style="list-style-type: none"> <li>• BGP—Redistribute routes discovered by the BGP routing process to EIGRPv6.</li> <li>• Static—Redistributes static routes to the EIGRPv6 routing process. Static routes that fall within the scope of a network statement are automatically redistributed into EIGRPv6; you do not need to define a redistribution rule for them.</li> <li>• Connected—Redistributes connected routes (routes established automatically by virtue of having IP address enabled on the interface) to the EIGRPv6 routing process. Connected routes that fall within the scope of a network statement are automatically redistributed into EIGRPv6; you do not need to define a redistribution rule for them.</li> <li>• OSPF—Redistributes routes discovered by the OSPF routing process to EIGRPv6. If you choose this protocol, the Match options on this dialog box become visible. These options are not available when redistributing static, connected, or BGP routes.</li> <li>• ISIS—Redistribute routes discovered by the ISIS routing protocol to EIGRPv6.</li> </ul> |
| ID          | The autonomous system (AS) number for the BGP or OSPF routing process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Bandwidth   | The minimum bandwidth of the route in kilobits per second. Valid values range from 1 to 4294967295.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Delay Time  | The route delay in tens of microseconds. Valid values range from 0 to 4294967295.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Reliability | The likelihood of successful packet transmission expressed as a number 0 through 255. The value 255 indicates 100 percent reliability; 0 means no reliability.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Element    | Description                                                                                                   |
|------------|---------------------------------------------------------------------------------------------------------------|
| Loading    | The effective bandwidth of the route. Valid values range from 1 to 255; 255 indicates 100 percent loaded.     |
| MTU        | The smallest allowed value for the maximum transmission unit of the path. Valid values range from 1 to 65535. |
| Route Map  | The name of the route map object to apply to the redistribution entry.                                        |
| ISIS Level | Select Level 1 or Level 2 or Level-1-2. The default is Level 2.                                               |

## Add/Edit IPv6 EIGRP Redistribution Dialog Box

Use the Add/Edit IPv6 EIGRP Redistribution dialog box to add a redistribution rule or to edit an existing redistribution rule in the Redistribution table.

### Navigation Path

You can access the Add/Edit IPv6 EIGRP Redistribution dialog box from the [Redistribution Tab](#) , on page 2147.

| Protocol | <p>Select the source protocol from which the routes are being redistributed. You can choose one of the following options:</p> <ul style="list-style-type: none"> <li>• BGP—Redistribute routes discovered by the BGP routing process to EIGRPv6.</li> <li>• Static—Redistributes static routes to the EIGRPv6 routing process. Static routes that fall within the scope of a network statement are automatically redistributed into EIGRPv6; you do not need to define a redistribution rule for them.</li> <li>• Connected—Redistributes connected routes (routes established automatically by virtue of having IP address enabled on the interface) to the EIGRPv6 routing process. Connected routes that fall within the scope of a network statement are automatically redistributed into EIGRPv6; you do not need to define a redistribution rule for them.</li> <li>• OSPF—Redistributes routes discovered by the OSPF routing process to EIGRPv6. If you choose this protocol, the Match options on this dialog box become visible. These options are not available when redistributing static, connected, or BGP routes.</li> <li>• ISIS—Redistribute routes discovered by the ISIS routing protocol to EIGRPv6.</li> </ul> |

| Element                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID                           | The autonomous system (AS) number for the BGP or OSPF routing process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Optional Metrics             | <p>You can define the following metrics for routes redistributed into the EIGRPv6 routing process:</p> <ul style="list-style-type: none"> <li>• Bandwidth—the minimum bandwidth of the route in kilobits per second. Valid values range from 1 to 4294967295.</li> <li>• Delay Time—the route delay in tens of microseconds. Valid values range from 0 to 4294967295.</li> <li>• Reliability—the likelihood of successful packet transmission expressed as a number 0 through 255. The value 255 indicates 100 percent reliability; 0 means no reliability.</li> <li>• Loading—the effective bandwidth of the route. Valid values range from 1 to 255; 255 indicates 100 percent loaded.</li> <li>• MTU—the smallest allowed value for the maximum transmission unit of the path. Valid values range from 1 to 65535.</li> </ul>                                                                                |
| Route Map                    | <p>Enter or Select a route map object to define which routes are redistributed into the EIGRPv6 routing process.</p> <p><b>Tip</b> Click <b>Select</b> to open the Route Map Object Selector from which you can select a route map object. You can also create new route map objects from the Route Map Object Selector. For more information, see <a href="#">Understanding Route Map Objects</a>, on page 2248.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Optional OSPF Redistribution | <p>If you have chosen OSPF as the Route Type, choose the conditions used for redistributing routes from one routing protocol to another. The routes must match the selected condition to be redistributed. You can choose one or more of the following match conditions:</p> <ul style="list-style-type: none"> <li>• Internal—The route is internal to a specific AS.</li> <li>• External 1—Routes that are external to the autonomous system, but are imported into OSPF as Type 1 external routes.</li> <li>• External 2—Routes that are external to the autonomous system, but are imported into OSPF as Type 2 external routes.</li> <li>• NSSA External 1—Routes that are external to the autonomous system, but are imported into OSPF as Type 2 NSSA routes.</li> <li>• NSSA External 2—Routes that are external to the autonomous system, but are imported into OSPF as Type 2 NSSA routes.</li> </ul> |
| ISIS Level                   | Select Level 1 or Level 2 or Level-1-2. The default is Level 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Summary Address Tab

Use the Summary Address tab to configure a summary for EIGRPv6 on a specific interface. You can configure summary addresses on a per-interface basis. You need to manually define summary addresses if you want to

create summary addresses that do not occur at a network number boundary or if you want to use summary addresses on an ASA with automatic route summarization disabled. If any more specific routes are in the routing table, EIGRPv6 will advertise the summary address out the interface with a metric equal to the minimum of all more specific routes.

### Navigation Path

You can access the Summary Address tab from the EIGRPv6 Page; see [Configuring EIGRPv6](#), on page 2141 for more information.

| Element                 | Description                                                 |
|-------------------------|-------------------------------------------------------------|
| Interface               | The interface from which the summary address is advertised. |
| Network                 | The IP address and network mask of the summary address.     |
| Administrative Distance | The administrative distance of the summary route.           |

## Add/Edit IPv6 EIGRP Summary Address Page Dialog Box

Use the Add/Edit IPv6 EIGRP Summary Address Page dialog box to add new entries or to modify existing entries in the Summary Address table. You can configure summary addresses on a per-interface basis. You need to manually define summary addresses if you want to create summary addresses that do not occur at a network number boundary or if you want to use summary addresses on an ASA with automatic route summarization disabled. If any more specific routes are in the routing table, EIGRPv6 will advertise the summary address out the interface with a metric equal to the minimum of all more specific routes.

### Navigation Path

You can access the Add/Edit IPv6 EIGRP Summary Address dialog box from the [Summary Address Tab](#), on page 2150.

| Split Horizon  | Enable/disable EIGRPv6 split-horizon on an interface.                                                                                                     |

## Configuring ISIS

The ISIS page provides nine tabbed panels for configuring ISIS (Intermediate System-to-Intermediate System) routing on a firewall device. ISIS routing protocol is supported from Security Manager version 4.11 for ASA

devices running the software version 9.6(1) or later. The following topics provide detailed information about enabling and configuring ISIS:

### Navigation Path

- (Device view) Select **Platform > Routing > ISIS** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > ISIS** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

Select Enable ISIS to enable Intermediate System-to-Intermediate System routing protocol on the selected ASA device.

## About ISIS

Intermediate System-to-Intermediate System (ISIS) routing protocol is a link-state Interior Gateway Protocol (IGP). Link-state protocols are characterized by the propagation of the information required to build a complete network connectivity map on each participating router. That map is then used to calculate the shortest path to destinations. The IOS ISIS implementation supports CLNP, IPv4, and IPv6.

A routing domain may be divided into one or more sub-domains. Each sub-domain is referred to as an area and is assigned an area address. Routing within an area is referred to as Level-1 routing. Routing between Level-1 areas is referred to as Level-2 routing. A router in OSI terminology is referred to as an Intermediate System (IS). An IS may operate at Level 1, Level 2, or both. ISs that operate at Level 1 exchange routing information with other Level-1 ISs in the same area. ISs that operate at Level 2 exchange routing information with other Level-2 routers regardless of whether they are in the same Level-1 area. The set of Level-2 routers and the links that interconnect them form the Level-2 sub-domain, which must not be partitioned in order for routing to work properly.

## General Tab

Use the General tab to configure BGP settings such as Best Path Selection, Neighbor Timers, and Graceful Restart.

### Navigation Path

You can access the Neighbors tab from the BGP page (see [Configuring BGP](#), on page 2092).

### Related Topics

- [Configuring BGP](#), on page 2092

## Field Reference

**Table 749: General Tab**

| Element                                                                | Description                                                                                                                                                                                                                                                                                          |
|------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Limit the number of AS numbers in AS_PATH attribute of received routes | Restricts the number of AS numbers in AS_PATH attribute to a specific number. Valid values are from 1 to 254.                                                                                                                                                                                        |
| Log Neighbor Changes                                                   | Enables logging of BGP neighbor changes (up or down) and resets. This helps in troubleshooting network connectivity problems and measuring network stability.                                                                                                                                        |
| Use TCP path MTU Discovery                                             | Enables the use of the Path MTU Discovery technique to determine the maximum transmission unit (MTU) size on the network path between two IP hosts. This avoids IP fragmentation.                                                                                                                    |
| Enable fast external failover                                          | Resets the external BGP session immediately upon link failure.                                                                                                                                                                                                                                       |
| Enforce that the first AS is peer's AS for EBGP routes                 | Discards incoming updates received from external BGP peers that do not list their AS number as the first segment in the AS_PATH attribute. This prevents a mis-configured or unauthorized peer from misdirecting traffic by advertising a route as if it was sourced from another autonomous system. |
| Use dot notation for AS numbers                                        | Splits the full binary 4-byte AS number into two words of 16 bits each, separated by a dot. AS numbers from 0-65535 are represented as decimal numbers and AS numbers larger than 65535 are represented using the dot notation.                                                                      |
| Best Path Selection                                                    |                                                                                                                                                                                                                                                                                                      |
| Default local preference                                               | Specify a value between 0 and 4294967295. The default value is 100. Higher values indicate higher preference. This preference is sent to all routers and access servers in the local autonomous system.                                                                                              |
| Allow comparing MED from different neighbors                           | Allows the comparison of Multi Exit Discriminator (MED) for paths from neighbors in different autonomous systems.                                                                                                                                                                                    |
| Compare Router-id for identical EBGP paths                             | Compares similar paths received from external BGP peers during the best path selection process and switches the best path to the route with the lowest router ID.                                                                                                                                    |
| Pick the best MED path among paths advertised from the neighboring AS  | Enables MED comparison among paths learned from confederation peers. The comparison between MEDs is made only if no external autonomous systems are there in the path.                                                                                                                               |
| Treat missing MED as the least preferred one                           | Considers the missing MED attribute as having a value of infinity, making the path the least desirable; therefore, a path with a missing MED is least preferred.                                                                                                                                     |
| Neighbor Timers                                                        |                                                                                                                                                                                                                                                                                                      |

| Element                                                                                | Description                                                                                                                                                                                                                              |
|----------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Keepalive Interval                                                                     | Enter the time interval for which the BGP neighbor remains active after not sending a keepalive message. At the end of this keepalive interval, the BGP peer is declared dead, if no messages are sent. The default value is 60 seconds. |
| Hold Time                                                                              | Enter the time interval for which the BGP neighbor remains active while a BGP connection is being initiated and configured. The default values is 180 seconds.                                                                           |
| Min Hold Time                                                                          | (Optional) Enter the minimum time interval for which the BGP neighbor remains active while a BGP connection is being initiated and configured. Specify a value from 0 to 65535.                                                          |
| <b>Graceful Restart</b> (Use in failover or spanned cluster mode)<br>(ASA 9.3.1+ only) |                                                                                                                                                                                                                                          |
| Enable Graceful Restart                                                                | Enables ASA peers to avoid a routing flap following a switchover.                                                                                                                                                                        |
| Restart Time                                                                           | Specify the time duration that ASA peers will wait to delete stale routes before a BGP open message is received. The default value is 120 seconds. Valid values are between 1 and 3600 seconds.                                          |
| Stalepath Time                                                                         | Enter the time duration that the ASA will wait before deleting stale routes after an end of record (EOR) message is received from the restarting ASA. The default value is 360 seconds. Valid values are between 1 and 3600 seconds.     |

## IPv4 Family Tab

Use the IPv4 Family tab on the BGP page to enable and configure IPv4 settings for BGP.

### Navigation Path

You can access the IPv4 Family tab from the BGP page. For more information about the BGP page, see [Configuring BGP](#), on page 2092.

### Related Topics

### Field Reference

*Table 750: IPv4 Family - Aggregate Address Tab*

| Element            | Description                                                                        |
|--------------------|------------------------------------------------------------------------------------|
| Enable IPv4 Family | Enables configuration of routing sessions that use standard IPv4 address prefixes. |

| Element           | Description                                                                                                                                                                                                                                                                                                                                                        |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| General           | Use this panel to configure general IPv4 settings such as Best Path Selection, Neighbor Timers, and Graceful Restart. See <a href="#">IPv4 Family - General Tab</a> , on page 2098 for more about these definitions.                                                                                                                                               |
| Aggregate Address | Use this panel to define the aggregation of specific routes into one route.<br><br>Specify a value for the aggregate timer (in seconds) in the Aggregate Timer field. Valid values are 0 or any value between 6 and 60. The default value is 30.<br><br>See <a href="#">Add/Edit Aggregate Address Dialog Box</a> , on page 2113 for more about these definitions. |
| Filtering         | Use this panel to filter routes or networks received in incoming BGP updates. See <a href="#">Add/Edit Filter Dialog Box</a> , on page 2101 for more about these definitions.                                                                                                                                                                                      |
| Neighbor          | Use this panel to define BGP neighbors and neighbor settings. See <a href="#">Add/Edit Neighbor Dialog Box</a> , on page 2102 for more about these definitions.                                                                                                                                                                                                    |
| Networks          | Use this panel to define the networks to be advertised by the BGP routing process. See <a href="#">Add/Edit Network Dialog Box</a> , on page 2108 for more about these definitions.                                                                                                                                                                                |
| Redistribution    | Use this panel to define the conditions for redistributing routes from another routing domain into BGP. See <a href="#">Add/Edit Redistribution Dialog Box</a> , on page 2109 for more about these definitions.                                                                                                                                                    |
| Route Injection   | Use this panel to define the routes to be conditionally injected into the BGP routing table. See <a href="#">Add/Edit Route Injection Dialog Box</a> , on page 2110 for more about these definitions.                                                                                                                                                              |

## IPv4 Family Tab—General Tab

### Field Reference

*Table 751: ISIS IPv4 Family Tab—General Tab*

| Element                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Perform Adjacency Check      | Check the ‘Perform adjacency check’ check box for the router to check on nearby IS routers.                                                                                                                                                                                                                                                                                                                                                    |
| Distance                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Administrative Distance      | In the Administrative Distance field, enter a distance assigned to routes discovered by IS-IS protocol. Administrative distance is a parameter used to compare routes among different routing protocols. In general, the higher the value, the lower the trust rating. And administrative distance of 255 means that the routing information source cannot be trusted at all and should be ignored. The range is 1 to 255. The default is 115. |
| Maximum No. of Forward Paths | Enter the maximum number of IS routes that can be installed in a routing table. The range is 1 to 8, the default is 4.                                                                                                                                                                                                                                                                                                                         |

| Element                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Distribute Default Route                     | Check the Distribute default route check box to configure an IS routing process to distribute a default route, and then choose the default route from the Route Map Object selector.                                                                                                                                                                                                                                                                                       |
| ISIS Metrics                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Global ISIS Metric Level 1                   | <p>Enter a number specifying the metric.</p> <p>The range depends on the TLV Style that you select. The default is 10.</p> <ul style="list-style-type: none"> <li>• If you select Use old style of TLVs with narrow metric, the range is 1 to 63.</li> <li>• If you select Use new style of TLVs to carry wider metric, the range is 1 to 16777214.</li> <li>• If you select Send and accept both styles of TLVs during transition, the range is 1 to 16777214.</li> </ul> |
| Global ISIS Metric Level 2                   | <p>Enter a number specifying the metric.</p> <p>The range depends on the TLV Style that you select. The default is 10.</p> <ul style="list-style-type: none"> <li>• If you select Use old style of TLVs with narrow metric, the range is 1 to 63.</li> <li>• If you select Use new style of TLVs to carry wider metric, the range is 1 to 16777214.</li> <li>• If you select Send and accept both styles of TLVs during transition, the range is 1 to 16777214.</li> </ul> |
| TLV Style                                    | <p>Select one of the following Type, Length, and Values:</p> <ul style="list-style-type: none"> <li>• Use old style of TLVs with narrow metric</li> <li>• Use new style of TLVs to carry wider metric</li> <li>• Send and accept both styles of TLVs during transition</li> </ul>                                                                                                                                                                                          |
| Accept both styles of TLVs during transition | If you selected one of the first two options in TLV Style, you can select this option,                                                                                                                                                                                                                                                                                                                                                                                     |
| Apply metric style to                        | <p>Select one of the following:</p> <ul style="list-style-type: none"> <li>• Level 1</li> <li>• Level 2</li> <li>• Both</li> </ul> <p>The default is Level 1.</p>                                                                                                                                                                                                                                                                                                          |

## IPv4 Family Tab—SPF Tab

### Field Reference

*Table 752: ISIS IPv4 FamilyTab—SPF Tab*

| Element                                                                                      | Description                                                                                                                                                                                                                                                                                                         |
|----------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Shortest Path First                                                                          |                                                                                                                                                                                                                                                                                                                     |
| Honour external metrics during SPF calculations                                              | Check this check box to have the SPF calculations include external metrics.                                                                                                                                                                                                                                         |
| Signal other routers to not use this router as an intermediate hop in their SPF calculations | Check this check box if you want to exclude this device, and configure the following:                                                                                                                                                                                                                               |
| Specify on-startup behavior                                                                  | If you select this element you must choose one of the following options: <ul style="list-style-type: none"> <li>• Advertise overself as overloaded until BGP has converged</li> <li>• Specify time to advertise overself as overloaded after reboot—Specify the time in the range of 5 to 86400 seconds.</li> </ul> |
| Don't advertise IP prefixes learned from other protocols when overload bit is set            | Check this check box to exclude IP prefixes.                                                                                                                                                                                                                                                                        |
| Don't advertise IP prefixes learned from another ISIS level when overload bit is set         | Check this check box to exclude IP prefixes.                                                                                                                                                                                                                                                                        |
| Minimum interval between partial route calculations                                          |                                                                                                                                                                                                                                                                                                                     |
| PRC Interval                                                                                 | Enter an amount of time for the router to wait between partial route calculations (PRCs). The range is 1 to 120 seconds. The default is 5 seconds.                                                                                                                                                                  |
| Initial wait for PRC                                                                         | Enter the initial PRC calculation delay (in milliseconds) after a topology change. The range is 1 to 120.000 milliseconds. The default is 2000 milliseconds.                                                                                                                                                        |
| Minimum wait between first and second PRC                                                    | Enter the amount of time in milliseconds that you want the router to wait between PRCs. The range is 1 to 120,000 milliseconds. The default is 5000 milliseconds.                                                                                                                                                   |
| Minimum interval between SPF calculations                                                    |                                                                                                                                                                                                                                                                                                                     |
| Configure parameters for level 1                                                             |                                                                                                                                                                                                                                                                                                                     |
| SPF calculation interval                                                                     | Enter an amount of time for the router to wait between SPF calculations. The range is 1 to 120 seconds. The default is 10 seconds.                                                                                                                                                                                  |

| Element                                               | Description                                                                                                                                                                   |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Initial wait for SPF calculation                      | Enter the amount of time for the router to wait for an SPF calculation. The range is 1 to 120,000 milliseconds. The default is 5500 milliseconds.                             |
| Minimum wait between first and second SPF calculation | Enter the amount of time in milliseconds that you want the router to wait between SPF calculations. The range is 1 to 120,000 milliseconds. The default is 5500 milliseconds. |
| Configure parameters for level 2                      |                                                                                                                                                                               |
| SPF calculation interval                              | Enter an amount of time for the router to wait between SPF calculations. The range is 1 to 120 seconds. The default is 10 seconds.                                            |
| Initial wait for SPF calculation                      | Enter the amount of time for the router to wait for an SPF calculation. The range is 1 to 120,000 milliseconds. The default is 5500 milliseconds.                             |
| Minimum wait between first and second SPF calculation | Enter the amount of time in milliseconds that you want the router to wait between SPF calculations. The range is 1 to 120,000 milliseconds. The default is 5500 milliseconds. |

## IPv4 Family Tab—Redistribution Tab

Use the Add/Edit button to add a new Redistribution route or edit an existing row.

### Field Reference

*Table 753: ISIS IPv4 Family Tab—Redistribution Tab*

| Element                      | Description                                                                                                                                                                 |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source Protocol              | From the Source Protocol drop-down list, choose the protocol (BGP, Connected, EIGRP, OSPF, RIP, or Static) from which you want to redistribute routes into the ISIS domain. |
| Process ID                   | Enter the Process ID for the source protocol.                                                                                                                               |
| Route Level                  | From the Route Level drop-down list, choose Level-1, Level-2, or Level 1-2.                                                                                                 |
| Metric                       | In the Metric field, enter a metric for the redistributed route. The range is 1 to 4294967295.                                                                              |
| Metric Type                  | For the Metric Type, click the internal or external radio button.                                                                                                           |
| ISIS Inter Area Route Levels |                                                                                                                                                                             |
| Source ISIS Level            | Select Level 1 or Level 2. The default is Level 1.                                                                                                                          |
| Destination ISIS Level       | Select Level 1 or Level 2. The default is Level 1.                                                                                                                          |
| Distribution List            | Select from the available Access Control List or add new.                                                                                                                   |

| Element   | Description                                                                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Route Map | Choose a route map from the Route Map Object selector that should be examined to filter the networks to be redistributed, or click Add to add a new route map or edit an existing route map. |
| Match     | Check one or more of the Match check boxes -Internal, External 1, External 2, NSSA External 1, and NSSA External 2 check boxes to redistribute routes from an OSPF network.                  |

## IPv6 Family Tab

Use the IPv6 Family tab on the BGP page to enable and configure IPv6 settings for BGP.

### Navigation Path

You can access the IPv6 Family tab from the BGP page. For more information about the BGP page, see [Configuring BGP](#), on page 2092.

### Related Topics

- [About BGP](#), on page 2093
- [General Tab](#), on page 2095

### Field Reference

**Table 754: IPv6 Family - Aggregate Address Tab**

| Element            | Description                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable IPv6 Family | Enables configuration of routing sessions that use standard IPv6 address prefixes.                                                                                                                                                                                                                                                                                 |
| General            | Use this panel to configure general IPv6 settings. See <a href="#">IPv6 Family - General Tab</a> , on page 2112 for more about these definitions.                                                                                                                                                                                                                  |
| Aggregate Address  | Use this panel to define the aggregation of specific routes into one route.<br><br>Specify a value for the aggregate timer (in seconds) in the Aggregate Timer field. Valid values are 0 or any value between 6 and 60. The default value is 30.<br><br>See <a href="#">Add/Edit Aggregate Address Dialog Box</a> , on page 2113 for more about these definitions. |
| Neighbor           | Use this panel to define BGP neighbors and neighbor settings. See <a href="#">Add/Edit Neighbor Dialog Box</a> , on page 2115 for more about these definitions.                                                                                                                                                                                                    |
| Networks           | Use this panel to define the networks to be advertised by the BGP routing process. See <a href="#">Add/Edit Network Dialog Box</a> , on page 2121 for more about these definitions.                                                                                                                                                                                |
| Redistribution     | Use this panel to define the conditions for redistributing routes from another routing domain into BGP. See <a href="#">Add/Edit Redistribution Dialog Box</a> , on page 2122 for more about these definitions.                                                                                                                                                    |

| Element         | Description                                                                                                                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Route Injection | Use this panel to define the routes to be conditionally injected into the BGP routing table. See <a href="#">Add/Edit Route Injection Dialog Box</a> , on page 2123 for more about these definitions. |

### Field Reference

*Table 755: ISIS IPv6 Family Tab—General Tab*

| Element                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Perform Adjacency Check      | Check the ‘Perform adjacency check’ check box for the router to check on nearby IS routers.                                                                                                                                                                                                                                                                                                                                                   |
| Distance                     |                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Administrative Distance      | In the Administrative Distance field, enter a distance assigned to routes discovered by ISIS protocol. Administrative distance is a parameter used to compare routes among different routing protocols. In general, the higher the value, the lower the trust rating. And administrative distance of 255 means that the routing information source cannot be trusted at all and should be ignored. The range is 1 to 255. The default is 115. |
| Maximum No. of Forward Paths | Enter the maximum number of IS routes that can be installed in a routing table. The range is 1 to 8. The default is 4.                                                                                                                                                                                                                                                                                                                        |
| Distribute Default Route     | Check the Distribute default route check box to configure an IS routing process to distribute a default route, and then choose the default route from the Route Map Object selector.                                                                                                                                                                                                                                                          |

## IPv6 Family Tab—SPF Tab

### Field Reference

*Table 756: ISIS IPv6 FamilyTab—SPF Tab*

| Element                                                                                      | Description                                                                           |
|----------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| Shortest Path First                                                                          |                                                                                       |
| Signal other routers to not use this router as an intermediate hop in their SPF calculations | Check this check box if you want to exclude this device, and configure the following: |

| Element                                                                              | Description                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Specify on-startup behavior                                                          | If you select this element you must choose one of the following options: <ul style="list-style-type: none"> <li>• Advertise overself as overloaded until BGP has converged</li> <li>• Specify time to advertise overself as overloaded after reboot—Specify the time in the range of 5 to 86400 seconds.</li> </ul> |
| Don't advertise IP prefixes learned from other protocols when overload bit is set    | Check this check box to exclude IP prefixes.                                                                                                                                                                                                                                                                        |
| Don't advertise IP prefixes learned from another ISIS level when overload bit is set | Check this check box to exclude IP prefixes.                                                                                                                                                                                                                                                                        |
| Minimum interval between partial route calculations                                  |                                                                                                                                                                                                                                                                                                                     |
| PRC Interval                                                                         | Enter an amount of time for the router to wait between partial route calculations (PRCs). The range is 1 to 120 seconds. The default is 5 seconds.                                                                                                                                                                  |
| Initial wait for PRC                                                                 | Enter the initial PRC calculation delay (in milliseconds) after a topology change. The range is 1 to 120,000 milliseconds. The default is 2000 milliseconds.                                                                                                                                                        |
| Minimum wait between first and second PRC                                            | Enter the amount of time in milliseconds that you want the router to wait between PRCs. The range is 1 to 120,000 milliseconds. The default is 5000 milliseconds.                                                                                                                                                   |
| Minimum interval between SPF calculations                                            |                                                                                                                                                                                                                                                                                                                     |
| Configure parameters for level 1                                                     |                                                                                                                                                                                                                                                                                                                     |
| SPF calculation interval                                                             | Enter an amount of time for the router to wait between SPF calculations. The range is 1 to 120 seconds. The default is 10 seconds.                                                                                                                                                                                  |
| Initial wait for SPF calculation                                                     | Enter the amount of time for the router to wait for an SPF calculation. The range is 1 to 120,000 milliseconds. The default is 5500 milliseconds.                                                                                                                                                                   |
| Minimum wait between first and second SPF calculation                                | Enter the amount of time in milliseconds that you want the router to wait between SPF calculations. The range is 1 to 120,000 milliseconds. The default is 5500 milliseconds.                                                                                                                                       |
| Configure parameters for level 2                                                     |                                                                                                                                                                                                                                                                                                                     |
| SPF calculation interval                                                             | Enter an amount of time for the router to wait between SPF calculations. The range is 1 to 120 seconds. The default is 10 seconds.                                                                                                                                                                                  |

| Element                                               | Description                                                                                                                                                                   |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Initial wait for SPF calculation                      | Enter the amount of time for the router to wait for an SPF calculation. The range is 1 to 120,000 milliseconds. The default is 5500 milliseconds.                             |
| Minimum wait between first and second SPF calculation | Enter the amount of time in milliseconds that you want the router to wait between SPF calculations. The range is 1 to 120,000 milliseconds. The default is 5500 milliseconds. |

## IPv6 Family Tab—Redistribution Tab

Use the Add/Edit button to add or edit Redistribution routes.

### Field Reference

*Table 757: ISIS IPv6 Family Tab—Redistribution Tab*

| Element                      | Description                                                                                                                                                                                  |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source Protocol              | From the Source Protocol drop-down list, choose the protocol (BGP, Connected, EIGRP, OSPF, RIP, or Static) from which you want to redistribute routes into the ISIS domain.                  |
| Process ID                   | Enter the Process ID for the source protocol.                                                                                                                                                |
| Route Level                  | From the Route Level drop-down list, choose Level-1, Level- 2, or Level 1-2.                                                                                                                 |
| Metric                       | In the Metric field, enter a metric for the redistributed route. The range is 1 to 4294967295.                                                                                               |
| Metric Type                  | For the Metric Type, click the internal or external radio button.                                                                                                                            |
| ISIS Inter Area Route Levels |                                                                                                                                                                                              |
| Source ISIS Level            | Select Level 1 or Level 2. The default is Level 1.                                                                                                                                           |
| Destination ISIS Level       | Select Level 1 or Level 2. The default is Level 1.                                                                                                                                           |
| Distribution List            | Select from the available Access Control List or add new.                                                                                                                                    |
| Route Map                    | Choose a route map from the Route Map Object selector that should be examined to filter the networks to be redistributed, or click Add to add a new route map or edit an existing route map. |
| Match                        | Check one or more of the Match check boxes -Internal, External 1, External 2, NSSA External 1, and NSSA External 2 check boxes to redistribute routes from an OSPF network.                  |

## IPv6 Family Tab—Summary Prefix

You must configure at least one Network Entity Title entry to proceed.

See [Network Entity Title Tab](#) , on page 2168 for more information.

Use the Add/Edit button to add or edit Summary Prefix.

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IPv6 Summary Prefix       | IPv6 prefix in the form X.X.X.X::X/0-128                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Apply Summary Prefix into | <p>Select Level 1, Level 2, or Both.</p> <p>Level 1: Only routes redistributed into Level 1 are summarized with the configured address and mask value.</p> <p>Level 2: Routes learned by Level 1 routing are summarized into the Level 2 backbone with the configured address and mask value. Redistributed routes into Level 2 ISIS are also summarized.</p> <p>Both: Summary routes are applied when redistributing routes into Level 1 and Level2 ISIS and when Level 2 ISIS advertises Level 1 routes as reachable in it area.</p> |

## Authentication Tab

### Field Reference

**Table 759: ISIS Authentication Tab**

| Element                                        | Description                                                                                       |
|------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Configure authentication parameter for level 1 |                                                                                                   |
| Type                                           | Select a Type from the drop-down list.                                                            |
| Key                                            | Enter the key to authenticate ISIS updates. The key can include up to 16 characters.              |
| Confirm                                        | Confirm the key.                                                                                  |
| Send only                                      | Click Enable or Disable depending on whether you want Send Only enabled.                          |
| Mode                                           | Choose the authentication mode by clicking either the Disabled, MD5, or Clear Text radio buttons. |
| Area password                                  | Enter the Area password and confirm the same in the next textbox.                                 |
| Configure authentication parameter for level 2 |                                                                                                   |
| Type                                           | Select a Type from the drop-down list.                                                            |
| Key                                            | Enter the key to authenticate ISIS updates. The key can include up to 16 characters.              |

| Element         | Description                                                                                       |
|-----------------|---------------------------------------------------------------------------------------------------|
| Confirm         | Confirm the key.                                                                                  |
| Send only       | Click Enable or Disable depending on whether you want Send Only enabled.                          |
| Mode            | Choose the authentication mode by clicking either the Disabled, MD5, or Clear Text radio buttons. |
| Domain password | Enter the Domain password and confirm the same.                                                   |

## Link State Packet Tab

### Field Reference

**Table 760: ISIS Link State Packet Tab**

| Element                                                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ignore LSP Errors                                                                         | Check the Ignore LSP Errors check box to allow the ASA to ignore LSP packets that are received with internal checksum errors rather than purging the LSPs.                                                                                                                                                                                                                                                                                                                                                   |
| Flood LSPs before running SPF                                                             | Check this box to fast-flood and fill LSPs before running SPF. If you select this option, enter the number of LSPs to be flooded in the range of 1 to 15.<br><br>This parameter sends a specified number of LSPs from the ASA. If no LSP number is specified, the default of 5 is used. The LSPs invoke SPF before running SPF. Cisco recommends that you enable fast flooding, because then you speed up the LSP flooding process, which improves overall network convergence time. The default value is 5. |
| Suppress IP prefixes                                                                      | To suppress IP prefixes, check the Suppress IP prefixes check box, and then check one of the following.<br><br>In networks where there is no limit placed on the number of redistributed routes into IS-IS, it is possible that the LSP can become full and routes will be dropped. Use these options to control which routes are suppressed when the PDU becomes full.                                                                                                                                      |
| Don't advertise IP prefixes learned from another ISIS level when ran out of LSP fragments | Suppresses any routes coming from another level. For example, if the Level-2 LSP becomes full, routes from Level 1 are suppressed.                                                                                                                                                                                                                                                                                                                                                                           |
| Don't advertise IP prefixes learned from other protocols when ran out of LSP fragments    | Suppresses any redistributed routes on the ASA.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| LSP General Interval                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| LSP Interval Parameters for level 1                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Element                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LSP Calculation Interval               | <p>Enter the interval of time in seconds between transmission of each LSP. The range is 1-120 seconds. The default is 5.</p> <p>The number should be greater than the expected round-trip delay between any two ASAs on the attached network. The number should be conservative or needless transmission results. Retransmissions occur only when LSPs are dropped. So setting the number to a higher value has little effect on reconvergence. The more neighbors the ASAs have, and the more paths over which LSPs can be flooded, the higher you can make this value.</p>                                                                                                                                                                                                                          |
| Initial wait for LSP calculation       | Enter the time in milliseconds specifying the initial wait time before the first LSP is generated. The range is 1 to 120,000. The default is 50.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Minimum wait between first and second  | Enter the time in milliseconds between the first and second LSP generation. The range is 1 to 120,000. The default is 5000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| LSP Interval Parameters for level 2    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Use level 1 parameter also for level 2 | If you want the values you configured for Level 1 to also apply to Level 2, check the Use level 1 parameters also for level 2 check box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| LSP Calculation Interval               | <p>Enter the interval of time in seconds between transmission of each LSP. The range is 1-120 seconds. The default is 5.</p> <p>The number should be greater than the expected round-trip delay between any two ASAs on the attached network. The number should be conservative or needless transmission results. Retransmissions occur only when LSPs are dropped. So setting the number to a higher value has little effect on reconvergence. The more neighbors the ASAs have, and the more paths over which LSPs can be flooded, the higher you can make this value.</p>                                                                                                                                                                                                                          |
| Initial wait for LSP calculation       | Enter the time in milliseconds specifying the initial wait time before the first LSP is generated. The range is 1 to 120,000. The default is 50.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Minimum wait between first and second  | Enter the time in milliseconds between the first and second LSP generation. The range is 1 to 120,000. The default is 5000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Maximum LSP size                       | In the Maximum LSP size field, enter the number of seconds. The range is 128 to 4352. The default is 1492.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| LSP refresh interval                   | <p>In the LSP refresh interval field, enter the number of seconds at which LSPs are refreshed. The range is 1 to 65535. The default is 900.</p> <p>The refresh interval determines the rate at which the software periodically transmits in LSPs the route topology information that it originates. This is done to keep the database information from becoming too old.</p> <p>Reducing the refresh interval reduces the amount of time that undetected link state database corruption can persist at the cost of increased link utilization. (This is an extremely unlikely event, however, because there are other safeguards against corruption.) Increasing the interval reduces the link utilization caused by the flooding of refreshed packets (although this utilization is very small).</p> |

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum LSP lifetime | <p>In the Maximum LSP lifetime field, enter the maximum number of seconds that LSPs can remain in a router's database without being refreshed. The range is 1 to 65535. The default is 1200 (20 minutes).</p> <p>You might need to adjust this parameter if you change the LSP refresh interval. LSPs must be periodically refreshed before their lifetimes expire. The value set for LSP refresh interval should be less than the value set for the maximum LSP lifetime; otherwise LSPs will time out before they are refreshed. If you make the LSP lifetime too low compared to the LSP refresh interval, the LSP refresh interval is automatically reduced to prevent the LSPs from timing out.</p> |

## Summary Address Tab

Use the Add/Edit button to add or edit Summary Addresses.

### Field Reference

*Table 761: ISIS Summary Address Tab*

| Element      | Description                                                                                                                                  |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| IP address   | Enter the IP address of the summary route.                                                                                                   |
| Net Mask     | Choose or enter the network mask to apply to the IP address.                                                                                 |
| Select level | Select the Level 1, Level 2, or Level 1 and 2 radio button depending on which levels you want to receive summary addresses.                  |
| Tag          | In the Tag field, enter a number for the tag. The range is from 1 to 4294967295.                                                             |
| Metric       | In the Metric field, enter the metric that will be applied to the summary route. The range is from 1 to 4294967295. The default value is 10. |

## Network Entity Title Tab

Use the Add/Edit button to add to edit Network Entity Title.

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface      | The name of the interface to which the configuration applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Authentication | <p>The type of OSPF authentication enabled on the interface. The authentication type can be one of the following values:</p> <ul style="list-style-type: none"> <li>• None—OSPF authentication is disabled.</li> <li>• Password—Clear text password authentication is enabled.</li> <li>• MD5—MD5 authentication is enabled.</li> <li>• Area—The authentication type specified for the area is enabled on the interface. Area authentication is the default value for interfaces. However, area authentication is disabled by default. So, unless you previously specified an area authentication type, interfaces showing Area authentication have authentication disabled.</li> <li>• Key Chain—Key chain authentication is enabled.</li> </ul> |
| Point-to-Point | Displays “true” if the interface is set to non-broadcast (point-to-point). Displays “false” if the interface is set to broadcast.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Element                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cost                                   | The cost of sending a packet through the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Priority                               | The OSPF priority assigned to the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| MTU Ignore                             | Displays “false” if MTU mismatch detection is enabled. Displays “true” if the MTU mismatch detection is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Database Filter                        | Displays “true” if outgoing LSAs are filtered during synchronization and flooding. Displays “false” if filtering is not enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Hello Interval                         | The interval, in seconds, between hello packets sent on an interface. The smaller the hello interval, the faster topological changes are detected but the more traffic is sent on the interface. This value must be the same for all routers and access servers on a specific interface. Valid values range from 1 to 65535 seconds. The default value is 10 seconds.                                                                                                                                                                                                          |
| Transmit Delay                         | The estimated time, in seconds, required to send an LSA packet on the interface. LSAs in the update packet have their ages increased by the amount specified by this field before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links. Valid values range from 1 to 65535 seconds. The default value is 1 second. |
| Retransmit Interval                    | The time, in seconds, between LSA retransmissions for adjacencies belonging to the interface. When a router sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgment message. If the router receives no acknowledgment, it resends the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links. Valid values range from 1 to 65535 seconds. The default value is 5 seconds.                                                                              |
| Dead Interval                          | The interval, in seconds, in which no hello packets are received, causing neighbors to declare a router down. Valid values range from 1 to 65535. The default value of this setting is four times the interval set by the Hello Interval field.                                                                                                                                                                                                                                                                                                                                |
| Hello Multiplier<br>(ASA 9.2(1)+ only) | The number of hello packets to be sent per second. Valid values are between 3 and 20.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Interface Tab—General Tab

### Field Reference

*Table 764: ISIS Interfaces Tab—General Tab*

| Element   | Description                                     |
|-----------|-------------------------------------------------|
| Interface | Select the interface from available interfaces. |

| Element                            | Description                                                                                                                                                                                                                                                                                                             |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Shutdown ISIS on this interface    | Shutdown ISIS on this interface—Lets you disable the IS-IS protocol for this interface without removing the configuration parameters. The IS-IS protocol will not form any adjacencies on this interface and the IP address of this interface will be put into the LSP that is generated by the ASA.                    |
| Enable ISIS on this interface      | Enables IS-IS protocol on the selected interface.                                                                                                                                                                                                                                                                       |
| Enable IPv6 ISIS on this interface | Enables IPv6 IS-IS routing on the selected interface.                                                                                                                                                                                                                                                                   |
| Priority for level 1               | Lets you set a priority for Level 1. The priority is used to determine which router on a LAN will be the designated router or Designated Intermediate System (DIS). The priorities are advertised in the hello packets. The router with the highest priority becomes the DIS. The range is 0 to 127. The default is 64. |
| Priority for level 2               | Lets you set a priority for Level 2. The priority is used to determine which router on a LAN will be the designated router or Designated Intermediate System (DIS). The priorities are advertised in the hello packets. The router with the highest priority becomes the DIS. The range is 0 to 127. The default is 64. |
| Tag                                | Sets a tag on the IP address configured for an interface when this IP prefix is put into an ISIS LSP.                                                                                                                                                                                                                   |
| CSNP Interval for level 1          | Sets the Complete Sequence Number PDUs (CSNPs) interval in seconds between transmission of CSNPs on multiaccess networks for Level 1. This interval only applies for the designated router. The range is from 0 to 65535. The default is 10 seconds.                                                                    |
| CSNP Interval for level 2          | Sets the Complete Sequence Number PDUs (CSNPs) interval in seconds between transmission of CSNPs on multiaccess networks for Level 2. This interval only applies for the designated router. The range is from 0 to 65535. The default is 10 seconds.                                                                    |
| Adjacency filter                   | Filters the establishment of IS-IS adjacencies.                                                                                                                                                                                                                                                                         |
| Match all area addresses           | All NSAP addresses must match the filter to accept the adjacency.<br><br>If not specified (the default), only one address must match the filter for the adjacency to be accepted.                                                                                                                                       |

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Key Type           | Select Clear Text or Encrypted.                                                                                                                                                                                                                                                                                                                                                           |
| Key                | Enter the key to authenticate IS-IS updates. The range is 0 to 8 characters.<br>If no password is configured with the Key option, no key authentication is performed.<br><b>Note</b> If you selected Key Type as Clear Text, you can enter a maximum of 17 characters in the Key field. If you selected Key Type as Encrypted, you can enter a maximum of 50 characters in the Key field. |
| Send only          | For Send only click the Enable or Disable radio button.<br>Choosing Send only causes the system only to insert the password into the SNPs, but not check the password in SNPs that it receives. Use this keyword during a software upgrade to ease the transition. The default is disabled.                                                                                               |
| Mode               | Choose the authentication mode by checking the Mode check box and then choosing MD5 or Text from the drop-down list.                                                                                                                                                                                                                                                                      |
| Password           | Enter a password.<br><b>Note</b> You can select either Mode or enter a password value.                                                                                                                                                                                                                                                                                                    |
| Level 2 parameters |                                                                                                                                                                                                                                                                                                                                                                                           |
| Key Type           | Select Clear Text or Encrypted.                                                                                                                                                                                                                                                                                                                                                           |
| Key                | Enter the key to authenticate IS-IS updates. The range is 0 to 8 characters.<br>If no password is configured with the Key option, no key authentication is performed.<br><b>Note</b> If you selected Key Type as Clear Text, you can enter a maximum of 17 characters in the Key field. If you selected Key Type as Encrypted, you can enter a maximum of 50 characters in the Key field. |
| Send only          | For Send only click the Enable or Disable radio button.<br>Choosing Send only causes the system only to insert the password into the SNPs, but not check the password in SNPs that it receives. Use this keyword during a software upgrade to ease the transition. The default is disabled.                                                                                               |
| Mode               | Choose the authentication mode by checking the Mode check box and then choosing MD5 or Text from the drop-down list.                                                                                                                                                                                                                                                                      |
| Password           | Enter a password.<br><b>Note</b> You can select either Mode or enter a password value.                                                                                                                                                                                                                                                                                                    |

| Element                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hello Padding                         | Enables Hello Padding.<br><br>IS-IS hellos are padded to the full maximum transmission unit (MTU) size. Padding IS-IS hellos to the full MTU allows for early detection of errors that result from transmission problems with large frames or errors that result from mismatched MTUs on adjacent interfaces.                                                                                                                                                                                                                                                                                               |
| Minimal holdtime 1 second for level 1 | Enables the holdtime (in seconds) that the LSP remains valid for Level 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Hello interval for level 1            | Specifies the length of time in seconds between hello packets for Level 1. The range is 1 to 65535. The default is 10.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Minimal holdtime 1 second for level 2 | Enables the holdtime (in seconds) that the LSP remains valid for Level 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Hello interval for level 2            | Specifies the length of time in seconds between hello packets for Level 2. The range is 1 to 65535. The default is 10.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Hello multiplier for level 1          | Specifies the number of IS-IS hello packets a neighbor must miss before the ASA declares the adjacency is down for Level 1.<br><br>The advertised hold time in IS-IS hello packets will be set to the hello multiplier times the hello interval. Neighbors will declare an adjacency to this router down after not having received any IS-IS hello packets during the advertised hold time. The hold time (and thus the hello multiplier and the hello interval) can be set on a per-interface basis, and can be different between different routers in one area. The range is 3 to 1000. The default is 3. |
| Hello multiplier for level 2          | Specifies the number of IS-IS hello packets a neighbor must miss before the ASA declares the adjacency is down for Level 2.<br><br>The advertised hold time in IS-IS hello packets will be set to the hello multiplier times the hello interval. Neighbors will declare an adjacency to this router down after not having received any IS-IS hello packets during the advertised hold time. The hold time (and thus the hello multiplier and the hello interval) can be set on a per-interface basis, and can be different between different routers in one area. The range is 3 to 1000. The default is 3. |
| Configure Circuit Type                | Specifies whether the interface is configured for local routing (level 1), area routing (Level 2), or both local and area routing (Level 1-2).                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Interface Tab—LSP Settings Tab

### Field Reference

*Table 767: ISIS Interfaces Tab—LSP Settings Tab*

| Element                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Advertise ISIS Prefix        | <p>Allows the advertising of IP prefixes of connected networks in the LSP advertisements per IS-IS interface.</p> <p>Disabling this option is an IS-IS mechanism to exclude IP prefixed of connected network from LSP advertisements thereby reducing IS-IS convergence time.</p>                                                                                                                                                      |
| Retransmit Interval          | <p>Specifies the amount of time in seconds between retransmission of each IS-IS LSP on a point-to-point link.</p> <p>The number should be greater than the expected round-trip delay between any two routers on the attached network. The range is 0 to 65535. The default is 5.</p>                                                                                                                                                   |
| Retransmit Throttle Interval | <p>Specifies the amount of time in milliseconds between retransmissions on each IS-IS LSP on a point-to-point interface.</p> <p>This option may be useful in very large networks with many LSPs and many interfaces as a way of controlling LSP retransmission traffic. This option controls the rate at which LSPs can be re-sent on the interface. The range is 0 to 65535. The default is 33.</p>                                   |
| LSP Interval                 | <p>Specifies the time delay in millisecond between successive IS-IS LSP transmissions.</p> <p>In topologies with a large number of IS-IS neighbors and interfaces, a router may have difficulty with the CPU load imposed by LSP transmission and reception. This option allows the LSP transmission rate (and by implication the reception rate of other systems) to be reduced. The range is 1 to 4294967295. The default is 33.</p> |

## Interface Tab—Metrics Tab

## Configuring BFD Routing

The BFD page provides two tabs for configuring BFD (Bidirectional Forwarding Detection) routing on a firewall device. The following topics provide detailed information on configuring BFD.

### Navigation Path

- (Device view) Select **Platform > Routing > BFD** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > BFD** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Related Topics

- [About BFD, on page 2176](#)
- [Create BFD Template, on page 2179](#)
- [Add/Edit BFD Map Dialog Box, on page 2181](#)
- [Add/ Edit BFD Interface Dialog Box, on page 2182](#)

## About BFD

Bidirectional Forwarding Detection (BFD) is a detection protocol designed to provide fast forwarding path failure detection times for all media types, encapsulations, topologies, and routing protocols. BFD operates in a unicast, point-to-point mode on top of any data protocol being forwarded between two systems. Packets are carried in the payload of the encapsulating protocol appropriate for the media and the network.

BFD provides a consistent failure detection method for network administrators in addition to fast forwarding path failure detection. Because the network administrator can use BFD to detect forwarding path failures at a uniform rate, rather than the variable rates for different routing protocol hello mechanisms, network profiling and planning are easier and reconvergence time is consistent and predictable.

## BFD Asynchronous Mode and Echo Function

BFD can operate in asynchronous mode with or without the echo function enabled.

### Asynchronous Mode

In asynchronous mode, the systems periodically send BFD control packets to one another, and if a number of those packets in a row are not received by the other system, the session is declared to be down. Pure asynchronous mode (without the Echo function) is useful because it requires half as many packets to achieve a particular detection time as the Echo function requires.

### BFD Echo Function

The BFD echo function sends echo packets from the forwarding engine to the directly-connected single-hop BFD neighbor. The echo packets are sent by the forwarding engine and forwarded back along the same path to perform detection. The BFD session at the other end does not participate in the actual forwarding of the echo packets. Because the echo function and the forwarding engine are responsible for the detection process, the number of BFD control packets that are sent out between BFD neighbors is reduced. And also because the forwarding engine is testing the forwarding path on the remote neighbor system without involving the remote system, the inter-packet delay variance is improved. This results in quicker failure detection times.

When the echo function is enabled, BFD can use the slow timer to slow down the asynchronous session and reduce the number of BFD control packets that are sent between BFD neighbors, which reduces processing overhead while at the same time delivering faster failure detection.

---

**Note** The echo function is not supported for IPv4 multi-hop or IPv6 single-hop BFD neighbors.

---

You can enable BFD at the interface and routing protocol levels. You must configure BFD on both systems (BFD peers). After you enable BFD on the interfaces and at the router level for the appropriate routing protocols, a BFD session is created, BFD timers are negotiated, and the BFD peers begin to send BFD control packets to each other at the negotiated level.

## BFD Session Establishment

The following example shows the ASA and a neighboring router running Border Gateway Protocol (BGP). At the time when both devices come up, there is no BFD session established between them.

Figure 44: BFD Session Initiated

After BGP identifies its BGP neighbor, it bootstraps the BFD process with the IP address of the neighbor. BFD does not discover its peers dynamically. It relies on the configured routing protocols to tell it which IP addresses to use and which peer relationships to form.

The BFD on the router and the BFD on the ASA form a BFD control packet and start sending the packets to each other at a one-second interval until the BFD session is established. The initial control packets from either system are very similar, for example, the Vers, Diag, H, D, P, and F bits are all set to zero, and the State is set to Down. The My Discriminator field is set to a value that is unique on the transmitting device. The Your Discriminator field is set to zero because the BFD session has not yet been established. The TX and RX timers are set to the values found in the configuration of the device.

After the remote BFD device receives a BFD control packet during the session initiation phase, it copies the value of the My Discriminator field into its own Your Discriminator field and the transition from Down state to Init state and then eventually to Up state occurs. Once both systems see their own Discriminators in each other's control packets, the session is officially established.

The following illustration shows the established BFD connection.

Figure 45: BFD Session Established

## BFD Timer Negotiation

BFD devices must negotiate the BFD timers to control and synchronize the send rate of BFD control packets.

A device needs to ensure the following before it can negotiate a BFD timer:

- That its peer device saw the packet containing the proposed timers of the local device
- That it never sends BFD control packets faster than the peer is configured to receive them
- That the peer never sends BFD control packets faster than the local system is configured to receive them

The setting of the Your Discriminator field and the H bit are sufficient to let the local device that the remote device has seen its packets during the initial timer exchange. After receiving a BFD control packet, each system takes the Required Min RX Interval and compares it to its own Desired Min TX Interval, and then takes the greater (slower) of the two values and uses it as the transmission rate for its BFD packets. The slower of the two systems determines the transmission rate.

When these timers have been negotiated, they can be renegotiated at any time during the session without causing a session reset. The device that changes its timers sets the P bit on all subsequent BFD control packets until it receives a BFD control packet with the F bit set from the remote system. This exchange of bits guards against packets that might otherwise be lost in transit.

**Note** The setting of the F bit by the remote system does not mean that it accepts the newly proposed timers. It indicates that the remote system has seen the packets in which the timers were changed.

## BFD Failure Detection

When the BFD session and timers have been negotiated, the BFD peers send BFD control packets to each other at the negotiated interval. These control packets act as a heartbeat that is very similar to IGP Hello protocol except that the rate is more accelerated.

As long as each BFD peer receives a BFD control packet within the configured detection interval (Required Minimum RX Interval), the BFD session stays up and any routing protocol associated with BFD maintains its adjacencies. If a BFD peer does not receive a control packet within this interval, it informs any clients participating in that BFD session about the failure. The routing protocol determines the appropriate response to that information. The typical response is to terminate the routing protocol peering session and reconverge and thus bypass a failed peer.

Each time a BFD peer successfully receives a BFD control packet in a BFD session, the detection timer for that session is reset to zero. Thus the failure detection is dependent on received packets and NOT when the receiver last transmitted a packet.

## BFD Deployment Scenarios

The following describes how BFD operates in these specific scenarios.

### Failover

In a failover scenario, BFD sessions are established and maintained between the active unit and the neighbor unit. Standby units do not maintain any BFD sessions with the neighbors. When a failover happens, the new active unit must initiate session establishment with the neighbor because session information is not synched between active and standby units.

For a graceful restart/NSF scenario, the client (BGP IPv4/IPv6) is responsible for notifying its neighbor about the event. When the neighbor receives the information, it keeps the RIB table until failover is complete. During failover, the BFD and the BGP sessions go down on the device. When the failover is complete, a new BFD session between the neighbors is established when the BGP session comes up.

### Spanned EtherChannel and L2 Cluster

In a Spanned EtherChannel cluster scenario, the BFD session is established and maintained between the primary unit and its neighbor. Subordinate units do not maintain any BFD sessions with the neighbors. If a BFD packet is routed to the subordinate unit because of load balancing on the switch, the subordinate unit must forward this packet to the primary unit through the cluster link. When a cluster switchover happens, the new primary unit must initiate session establishment with the neighbor because session information is not synched between primary and subordinate units.

### Individual Interface Mode and L3 Cluster

In an individual interface mode cluster scenario, individual units maintain their BFD sessions with their neighbors.

## Create BFD Template

This section describes the steps required to create a BFD template policy object. The BFD template specifies a set of BFD interval values. BFD interval values as configured in the BFD template are not specific to a single interface. You can also configure authentication for single-hop and multi-hop sessions. You can enable Echo on single-hop only.

### Navigation Path

Select **Manage > Policy Objects**, then select **BFD Template** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## Add/Edit BFD Map Dialog Box

The Add/ Edit BFD Map dialog box lets you create a BFD map containing destinations that you can associate with a multi-hop template. You must have a multi-hop BFD template already configured. For more information see, [Create BFD Template](#), on page 2179.

### Navigation Path

You can access the Add/ Edit BFD Map dialog box from the Maps tab on the BFD page. Click the Add Row button to add a new BFD map; select an existing BFD map and click the Edit Row button to edit that map.

|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP version                                   | Select the appropriate address format for the source and destination - IPv4 or IPv6.                                                                                                                                                                                                                |
| IPv4 Destination/Prefix, IPv4 Source/Prefix  | Enter the IPv4 address for the destination and source in the appropriate fields in the x.x.x.x/prefix format.                                                                                                                                                                                       |
| IPv6 Destination/ Prefix, IPv6 Source/prefix | Enter the IPv6 address for the destination and source in the appropriate fields in the x:x:x:x:x:x/prefix format.                                                                                                                                                                                   |
| Slow Timers                                  | This reduces the number of BFD control packets, that are sent between BFD neighbors. This slows down the asynchronous session, reduces the processing overhead and results in faster failure detection.<br><br>The default value for slow timers is 1000 and valid values are between 1000 - 30000. |

## Add/ Edit BFD Interface Dialog Box

The Add/ Edit BFD Interfaces dialog box lets you bind a BFD template to an interface, configure the baseline BFD session parameters per interface, and enable echo mode per interface.

### Navigation Path

You can access the Add/ Edit BFD Interface dialog box from the Interface tab on the BFD page. Click the Add Row button to add a new BFD interface; select an existing BFD interface and click the Edit Row button to edit that map.

| Element                | Description                                                                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface              | Enter an interface name, select an interface or add an interface role.                                                                                                                                                     |
| BFD Configuration      | Select BFD template to select an existing single-hop BFD template or add a single-hop BFD template. Alternately, select BFD interval.<br><br>For more information see, <a href="#">Create BFD Template, on page 2179</a> . |
| BFD Interval           |                                                                                                                                                                                                                            |
| Minimum Transmit Value | Enter the minimum transmit interval capability in milliseconds. Valid values are between 50 and 999 milliseconds                                                                                                           |
| Minimum Receive Value  | Enter the minimum receive interval capability milliseconds. Valid values are between 50 and 999 milliseconds                                                                                                               |

| Element    | Description                                                                                                                                                                       |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Multiplier | Enter the number of consecutive BFD control packets that must be missed before BFD declares that a peer is unavailable. The default value is 3. Valid values are between 3 to 50. |
| Echo       | (Optional) Select to enable echo. When enabled, echo packets are sent by the forwarding engine and forwarded back along the same path in order to perform detection.              |

## Configuring OSPF

The OSPF page provides ten tabbed panels for configuring OSPF (Open Shortest Path First) routing on a firewall device. The following topics provide detailed information about enabling and configuring OSPF:

---

**Note** Depending on the device version that you are configuring, some tabs might not be available.

---

---

**Note** Beginning with ASA version 9.2(1), certain OSPF settings have changed. If you configure a shared policy that uses settings specific to ASA 9.2(1)+, you will receive a validation error if that policy is assigned to a device whose version is earlier than 9.2(1). Likewise, if you configure a shared policy that uses settings that no longer apply to ASA 9.2(1)+, you will receive a validation error if that policy is assigned to an 9.2(1)+ device.

---

### Navigation Path

- (Device view) Select **Platform > Routing > OSPF** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > OSPF** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## About OSPF

Open Shortest Path First (OSPF) is an interior gateway routing protocol that uses link states rather than distance vectors for path selection. OSPF propagates link-state advertisements (LSAs) rather than routing table updates. Because only LSAs are exchanged, rather than entire routing tables, OSPF networks converge more quickly than RIP networks.

OSPF supports MD5 and clear-text neighbor authentication. Authentication should be used with all routing protocols whenever possible, because route redistribution between OSPF and other protocols (like RIP) can potentially be used by attackers to subvert routing information.

If NAT is used when OSPF is operating on public and private areas, and if address filtering is required, you need to run two OSPF processes—one process for the public areas and one for the private areas.

A router that has interfaces in multiple areas is called an Area Border Router (ABR). A router that acts as a gateway to redistribute traffic between routers using OSPF and routers using other routing protocols is called an Autonomous System Boundary Router (ASBR).

An ABR uses LSAs to send information about available routes to other OSPF routers. Using ABR type 3 LSA filtering, you can have separate private and public areas with the security appliance acting as an ABR. Type 3 LSAs (inter-area routes) can be filtered from one area to other. This lets you use NAT and OSPF together without advertising private networks.

---

**Note** Only type 3 LSAs can be filtered. If you configure the security appliance as an ASBR in a private network, it will send type 5 LSAs describing private networks, which will be broadcast to the entire autonomous system (AS) including public areas.

---

If NAT is employed but OSPF is only running in public areas, routes to public networks can be redistributed inside the private network, either as default or type 5 AS External LSAs. However, you need to configure static routes for the private networks protected by the security appliance. Also, you should not mix public and private networks on the same security appliance interface.

- [Configuring OSPF](#) , on page 2183

## General Tab

Use the General panel on the OSPF page to enable up to two OSPF process instances. Each OSPF process has its own associated areas and networks.

**Note** You cannot enable OSPF if you have RIP enabled.

### Navigation Path

You can access the General tab from the OSPF page; see [Configuring OSPF](#), on page 2183 for more information.

| Element                                                                                                                                        | Description                                                                                                                                                                                                                                                    |
|------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The General tab provides two identical sections; each is used to enable one OSPF process. The following options are available in each section. |                                                                                                                                                                                                                                                                |
| Enable this OSPF Process                                                                                                                       | Check this box to enable an OSPF process. You cannot enable an OSPF process if you have RIP enabled on the security appliance. Deselect this option to remove the OSPF process.                                                                                |
| OSPF Process ID                                                                                                                                | Enter a unique numeric identifier for the OSPF process. This process ID is used internally and does not need to match the OSPF process ID on any other OSPF devices. Valid values are from 1 to 65535.                                                         |
| Advanced button                                                                                                                                | Opens the <a href="#">OSPF Advanced Dialog Box</a> , on page 2185, in which you can configure additional process-related parameters, such as Router ID, Adjacency Changes, Administrative Route Distances, Timers, and Default Information Originate settings. |

## OSPF Advanced Dialog Box

Use the OSPF Advanced dialog box to configure settings such as the Router ID, Adjacency Changes, Administrative Route Distances, Timers, and Default Information Originate settings for an OSPF process.

**Note** Beginning with ASA version 9.2(1), certain OSPF settings have changed. If you configure a shared policy that uses settings specific to ASA 9.2(1)+, you will receive a validation error if that policy is assigned to a device whose version is earlier than 9.2(1). Likewise, if you configure a shared policy that uses settings that no longer apply to ASA 9.2(1)+, you will receive a validation error if that policy is assigned to an 9.2(1)+ device.

### Navigation Path

You can access the OSPF Advanced dialog box from the [General Tab](#) , on page 2184.

| OSPF Process        | Displays the ID of the OSPF process you are configuring. You cannot change this value in this dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| General Tab         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Router ID           | To use a fixed router ID, select <b>IP Address</b> and then enter a router ID in IP address format in the Router ID field. To have the router ID automatically generated (the highest-level IP address on the security appliance is used as the router ID), select <b>Automatic</b> .                                                                                                                                                                                                                                           |
| Ignore LSA MOSPF    | Select this option to suppress transmission of syslog messages when the security appliance receives Type 6 (MOSPF) LSA packets.                                                                                                                                                                                                                                                                                                                                                                                                 |
| RFC 1583 Compatible | Select this option to calculate summary route costs per RFC 1583. Deselect this option to calculate summary route costs per RFC 2328. To minimize the chance of routing loops, all OSPF devices in an OSPF routing domain should have RFC compatibility set identically. This option is selected by default.                                                                                                                                                                                                                    |
| Adjacency Changes   | These options specify the syslog messages sent when adjacency changes occur. <ul style="list-style-type: none"> <li>• Log Adjacency Changes – When selected, the security appliance sends a syslog message whenever an OSPF neighbor goes up or down. This option is selected by default.</li> <li>• Log Adjacency Changes Detail – When selected, the security appliance sends a syslog message whenever any state change occurs, not just when a neighbor goes up or down. This option is not selected by default.</li> </ul> |

| <b>Note</b>                                  | Non Stop Forwarding (NSF) is supported on ASA 9.3(1)+ devices in Spanned Cluster mode or Failover mode only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Enable Cisco Non Stop Forwarding Capability  | Enables configuration of Cisco nonstop forwarding (NSF) operations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Enable Cisco Non Stop Forwarding Helper mode | <p>Enables Cisco nonstop forwarding (NSF) helper mode.</p> <p>When an ASA has NSF enabled, it is said to be NSF-capable and will operate in graceful restart mode--the OSPF router process performs nonstop forwarding recovery due to a Route Processor (RP) switchover. By default, the neighboring ASAs of the NSF-capable ASA will be NSF-aware and will operate in NSF helper mode. When the NSF-capable ASA is performing graceful restart, the helper ASAs assist in the nonstop forwarding recovery process.</p> <p>If you do not want the ASA to help the restarting neighbor with nonstop forwarding recovery, clear the Enable Cisco Non Stop Forwarding Helper mode option.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Element                                                                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Cisco Non Stop Forwarding                                                                   | Enables Cisco nonstop forwarding (NSF).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Cancel NSF restart when non-NSF-aware neighboring networking devices are detected (Enforce Global) | <p>If neighbors that are not NSF-aware are detected on a network interface during an NSF graceful restart, restart is aborted on that interface only and graceful restart will continue on other interfaces. To cancel restart for the entire OSPF process when neighbors that are not NSF-aware are detected during restart, select the Cancel NSF restart when non-NSF-aware neighboring networking devices are detected (Enforce Global) option.</p> <p><b>Note</b> The NSF graceful restart will also be canceled for the entire process when a neighbor adjacency reset is detected on any interface or when an OSPF interface goes down.</p>                                        |
| Enable IETF Non Stop Forwarding Capability                                                         | Enables configuration of Internet Engineering Task Force (IETF) NSF operations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Enable IETF Non Stop Forwarding Helper mode                                                        | <p>Enables IETF nonstop forwarding (NSF) helper mode.</p> <p>When an ASA has NSF enabled, it is said to be NSF-capable and will operate in graceful restart mode--the OSPF router process performs nonstop forwarding recovery due to a Route Processor (RP) switchover. By default, the neighboring ASAs of the NSF-capable ASA will be NSF-aware and will operate in NSF helper mode. When the NSF-capable ASA is performing graceful restart, the helper ASAs assist in the nonstop forwarding recovery process.</p> <p>If you do not want the ASA to help the restarting neighbor with nonstop forwarding recovery, clear the Enable IETF Non Stop Forwarding Helper mode option.</p> |
| Enable Strict Link State advertisement checking                                                    | Enables strict link-state advertisement (LSA) checking for IETF NSF helper mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Enable IETF Non Stop Forwarding                                                                    | Enables IETF nonstop forwarding (NSF).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Length of graceful restart interval                                                                | <p>(Optional) Specifies the length of the graceful restart interval, in seconds. The range is from 1 to 1800. The default is 120.</p> <p><b>Note</b> For a restart interval below 30 seconds, graceful restart will be terminated.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Area Tab

Use the Area tab on the OSPF page to configure OSPF areas and networks.

### Navigation Path

You can access the Area tab from the OSPF page. For more information about the OSPF page, see [Configuring OSPF](#) , on page 2183.

**Field Reference****Table 775: Area Tab**

| Element        | Description                                                           |
|----------------|-----------------------------------------------------------------------|
| OSPF Process   | The OSPF process the area applies to.                                 |
| Area ID        | The area ID.                                                          |
| Area Type      | The area type (Normal, Stub, or NSSA).                                |
| Networks       | The area networks.                                                    |
| Options        | The options, if any, set for the area type.                           |
| Authentication | The type of authentication set for the area (None, Password, or MD5). |
| Cost           | The default cost for the area.                                        |

**Add/Edit Area/Area Networks Dialog Box**

Use the Add/Edit Area/Area Networks dialog box to define area parameters, the networks contained by the area, and the OSPF process associated with the area.

**Navigation Path**

You can access the Add/Edit Area/Area Networks dialog box from the [Area Tab](#) , on page 2191.

## Field Reference

**Table 776: Add/Edit Area/Area Networks Dialog Box**

| Element                                                   | Description                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process                                              | When adding a new area, choose the OSPF process ID for the OSPF process for which the area is being added. If there is only one OSPF process enabled on the security appliance, that process is selected by default. When editing an existing area, you cannot change the OSPF process ID.                                                       |
| Area ID                                                   | When adding a new area, enter the area ID. You can specify the area ID as either a decimal number or an IP address. Valid decimal values range from 0 to 4294967295. You cannot change the area ID when editing an existing area.                                                                                                                |
| Area Type                                                 |                                                                                                                                                                                                                                                                                                                                                  |
| Normal                                                    | Choose this option to make the area a standard OSPF area. This option is selected by default when you first create an area.                                                                                                                                                                                                                      |
| Stub                                                      | Choosing this option makes the area a stub area. Stub areas do not have any routers or areas beyond it. Stub areas prevent AS External LSAs (Type 5 LSAs) from being flooded into the stub area. When you create a stub area, you can prevent summary LSAs (Type 3 and 4) from being flooded into the area by deselecting the Summary check box. |
| Summary (allows sending LSAs into the stub area)          | When the area being defined is a stub area, deselecting this check box prevents LSAs from being sent into the stub area. This check box is selected by default for stub areas.                                                                                                                                                                   |
| NSSA                                                      | Choose this option to make the area a not-so-stubby area. NSSAs accept Type 7 LSAs. When you create a NSSA, you can prevent summary LSAs from being flooded into the area by deselecting the Summary check box. You can also disable route redistribution by deselecting the Redistribute check box and enabling Default Information Originate.  |
| Redistribute (imports routes to normal and NSSA areas)    | Deselect this check box to prevent routes from being imported into the NSSA. This check box is selected by default.                                                                                                                                                                                                                              |
| Summary (allows sending LSAs into the NSSA area)          | When the area being defined is a NSSA, deselecting this check box prevents LSAs from being sent into the stub area. This check box is selected by default for NSSAs.                                                                                                                                                                             |
| Default Information Originate (generate a Type 7 default) | Select this check box to generate a Type 7 default into the NSSA. This check box is deselected by default.                                                                                                                                                                                                                                       |
| Metric Value                                              | Specifies the OSPF metric value for the default route. Valid values range from 0 to 16777214. The default value is 1.                                                                                                                                                                                                                            |
| Metric Type                                               | The OSPF metric type for the default route. The choices are 1 (Type 1) or 2 (Type 2). The default value is 2.                                                                                                                                                                                                                                    |

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Network        | <p>The IP address and network mask of the network or host to be added to the area. Use 0.0.0.0 with a netmask of 0.0.0.0 to create the default area. You can only use 0.0.0.0 in one area.</p> <p><b>Tip</b> You can click <b>Select</b> to select the interfaces from a list of interface objects.</p>                                                                                                                        |
| Authentication | <p>Contains the settings for OSPF area authentication.</p> <ul style="list-style-type: none"> <li>• None—Choose this option to disable OSPF area authentication. This is the default setting.</li> <li>• Password—Choose this option to use a clear text password for area authentication. This option is not recommended where security is a concern.</li> <li>• MD5—Choose this option to use MD5 authentication.</li> </ul> |
| Default Cost   | <p>Specify a default cost for the area. Valid values range from 0 to 65535 for ASA devices earlier than 9.2(1) and from 0 to 16777214 for ASA 9.2(1)+. The default value is 1.</p>                                                                                                                                                                                                                                             |

## Range Tab

Use the Range tab to summarize routes between areas.

### Navigation Path

You can access the Range tab from the OSPF page. For more information about the OSPF page, see [Configuring OSPF](#), on page 2183.

**Table 777: Range Tab**

| Element    | Description                                                                                                                                                                         |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Process ID | The ID of the OSPF process associated with the route summary.                                                                                                                       |
| Area ID    | The ID of the area associated with the route summary.                                                                                                                               |
| Network    | The summary IP address and network mask.                                                                                                                                            |
| Advertise  | Displays “true” if the route summaries are advertised when they match the address/mask pair or “false” if the route summaries are suppressed when they match the address/mask pair. |

## Add/Edit Area Range Network Dialog Box

Use the Add/Edit Area Range Network dialog box to add a new entry to the Route Summarization table or to change an existing entry.

### Navigation Path

You can access the Add/Edit Area Range Network dialog box from the [Range Tab](#) , on page 2194.

### Related Topics

- [Configuring OSPF](#) , on page 2183

### Field Reference

*Table 778: Add/Edit Area Range Network Dialog Box*

| Element      | Description                                                                                                                                                                                                   |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process | Select the OSPF process to which the route summary applies. You cannot change this value when editing an existing route summary entry.                                                                        |
| Area         | Select the area ID of the area to which the route summary applies. You cannot change this value when editing an existing route summary entry.                                                                 |
| Network      | The IP address and mask of the network for the routes being summarized.<br><b>Tip</b> You can click <b>Select</b> to select the networks from a list of network objects.                                      |
| Advertise    | Select this check box to set the address range status to “advertise”. This causes Type 3 summary LSAs to be generated. Deselect this check box to suppress the Type 3 summary LSA for the specified networks. |

## Neighbors Tab

Use the Neighbors tab to define static neighbors. You need to define a static neighbor for each point-to-point, non-broadcast interface. You also need to define a static route for each static neighbor in the Neighbors table.

### Navigation Path

You can access the Neighbors tab from the OSPF page. For more information about the OSPF page, see [Configuring OSPF](#) , on page 2183.

### Related Topics

| Element      | Description                                           |
|--------------|-------------------------------------------------------|
| OSPF Process | The OSPF process associated with the static neighbor. |
| Neighbor     | The IP address of the static neighbor.                |
| Interface    | The interface associated with the static neighbor.    |

## Add/Edit Static Neighbor Dialog Box

Use the Add/Edit Static Neighbor dialog box to define a static neighbor or change information for an existing static neighbor. You must define a static neighbor for each point-to-point, non-broadcast interface.

### Navigation Path

You can access the Add/Edit Static Neighbor dialog box from the [Neighbors Tab](#), on page 2195.

| Neighbor     | The IP address of the static neighbor.<br><br><b>Tip</b> You can click <b>Select</b> to select the neighbor from a list of host objects.                   |
| Interface    | The interface associated with the static neighbor.<br><br><b>Tip</b> You can click <b>Select</b> to select the interface from a list of interface objects. |

## Redistribution Tab

Use the Redistribution tab to define the rules for redistributing routes from one routing domain to another.

### Navigation Path

You can access the Redistribution tab from the OSPF Page. For more information about the OSPF page, see [Configuring OSPF](#), on page 2183.

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process | The OSPF process associated with the route redistribution entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Route Type   | The source protocol the routes are being redistributed from. Valid entries are the following: <ul style="list-style-type: none"> <li>• BGP—Redistribute routes from the BGP routing process.</li> <li>• Connected—Redistributes connected routes (routes established automatically by virtue of having IP address enabled on the interface) to the OSPF routing process. Connected routes are redistributed as external to the AS.</li> <li>• EIGRP—Redistributes routes from the EIGRP routing process. Choose the autonomous system number of the EIGRP routing process from the list.</li> <li>• OSPF—Redistributes routes from another OSPF routing process.</li> <li>• RIP—Redistributes routes from the RIP routing process.</li> <li>• Static—Redistributes static routes to the OSPF routing process.</li> </ul> |
| Match        | The conditions used for redistributing routes from one routing protocol to another. These options are not available when redistributing static, connected, RIP, BGP, or EIGRP routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Subnets      | Displays “true” if subnetted routes are redistributed. Does not display anything if only routes that are not subnetted are redistributed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Metric Value | The metric that is used for the route. This column is blank for redistribution entries if the default metric is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Metric Type  | Displays “1” if the metric is a Type 1 external route, “2” if the metric is Type 2 external route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Tag Value    | A 32-bit decimal value attached to each external route. This value is not used by OSPF itself. It may be used to communicate information between ASBRs. Valid values range from 0 to 4294967295.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Route Map    | The name of the route map object to apply to the redistribution entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Redistribution Dialog Box**

Use the Redistribution dialog box to add a redistribution rule or to edit an existing redistribution rule in the Redistribution table.

**Navigation Path**

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process       | Select the OSPF process associated with the route redistribution entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Route Type         | Select the source protocol from which the routes are being redistributed. You can choose one of the following options: <ul style="list-style-type: none"> <li>• BGP—Redistribute routes from the BGP routing process.</li> <li>• Connected—Redistributes connected routes (routes established automatically by virtue of having IP address enabled on the interface) to the OSPF routing process. Connected routes are redistributed as external to the AS.</li> <li>• EIGRP—Redistributes routes from the EIGRP routing process. Choose the autonomous system number of the EIGRP routing process from the list.</li> <li>• OSPF—Redistributes routes from another OSPF routing process. If you choose this protocol, the Match options on this dialog box become visible. These options are not available when redistributing static, connected, RIP, BGP, or EIGRP routes.</li> <li>• RIP—Redistributes routes from the RIP routing process.</li> <li>• Static—Redistributes static routes to the OSPF routing process.</li> </ul> |
| Routing Process ID | The autonomous system (AS) number for the BGP or EIGRP routing process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Match              | If you have chosen OSPF as the Route Type, choose the conditions used for redistributing routes from one routing protocol to another. The routes must match the selected condition to be redistributed. You can choose one or more of the following match conditions: <ul style="list-style-type: none"> <li>• Internal—The route is internal to a specific AS.</li> <li>• External 1—Routes that are external to the autonomous system, but are imported into OSPF as Type 1 external routes.</li> <li>• External 2—Routes that are external to the autonomous system, but are imported into OSPF as Type 2 external routes.</li> <li>• NSSA External 1—Routes that are external to the autonomous system, but are imported into OSPF as Type 2 NSSA routes.</li> <li>• NSSA External 2—Routes that are external to the autonomous system, but are imported into OSPF as Type 2 NSSA routes.</li> </ul>                                                                                                                              |

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Metric Value | The metric value for the routes being redistributed. Valid values range from 1 to 16777214. When redistributing from one OSPF process to another OSPF process on the same device, the metric will be carried through from one process to the other if no metric value is specified. When redistributing other processes to an OSPF process, the default metric is 20 when no metric value is specified. |
| Metric Type  | Select “1” if the metric is a Type 1 external route, “2” if the metric is a Type 2 external route.                                                                                                                                                                                                                                                                                                      |
| Tag Value    | The tag value is a 32-bit decimal value attached to each external route. This is not used by OSPF itself. It may be used to communicate information between ASBRs. Valid values range from 0 to 4294967295.                                                                                                                                                                                             |
| Use Subnets  | When selected, redistribution of subnetted routes is enabled. Deselect this check box to cause only routes that are not subnetted to be redistributed.                                                                                                                                                                                                                                                  |
| Route Map    | Enter or Select a route map object to apply to the redistribution entry.<br><br><b>Tip</b> Click <b>Select</b> to open the Route Map Object Selector from which you can select a route map object. You can also create new route map objects from the Route Map Object Selector. For more information, see <a href="#">Understanding Route Map Objects</a> , on page 2248.                              |

## Virtual Link Tab

Use the Virtual Link tab to create virtual links. If you add an area to an OSPF network, and it is not possible to connect the area directly to the backbone area, you need to create a virtual link. A virtual link connects two OSPF devices that have a common area, called the transit area. One of the OSPF devices must be connected to the backbone area.

### Navigation Path

You can access the Virtual Link tab from the OSPF page. For more information about the OSPF page, see [Configuring OSPF](#) , on page 2183.

### Field Reference

*Table 783: Virtual Link Tab*

| Element      | Description                                        |
|--------------|----------------------------------------------------|
| OSPF Process | The OSPF process associated with the virtual link. |
| Area ID      | The ID of the transit area.                        |
| Peer Router  | The IP address of the virtual link neighbor.       |

| Element        | Description                                                                                                                                                                                                                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authentication | Displays the type of authentication used by the virtual link: <ul style="list-style-type: none"> <li>• None—No authentication is used.</li> <li>• Password—Clear text password authentication is used.</li> <li>• MD5—MD5 authentication is used.</li> <li>• Key Chain—Key chain authentication is enabled.</li> </ul> |

## Add/Edit OSPF Virtual Link Configuration Dialog Box

Use the Add/Edit OSPF Virtual Link Configuration dialog box to define virtual links or change the properties of existing virtual links.

### Navigation Path

You can access the Add/Edit OSPF Virtual Link Configuration dialog box from the [Virtual Link Tab](#), on [page 2199](#).

### Field Reference

**Table 784: Add/Edit OSPF Virtual Link Configuration Dialog Box**

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process   | Select the OSPF process associated with the virtual link.                                                                                                                                                                                                                                                                                                                                                                                            |
| Area ID        | Select the area shared by the neighbor OSPF devices. The selected area cannot be an NSSA or a stub area.                                                                                                                                                                                                                                                                                                                                             |
| Peer Router    | Enter the IP address of the virtual link neighbor.                                                                                                                                                                                                                                                                                                                                                                                                   |
| Hello Interval | The interval, in seconds, between hello packets sent on an interface. The smaller the hello interval, the faster topological changes are detected but the more traffic is sent on the interface. This value must be the same for all routers and access servers on a specific interface. Valid values range from 1 to 65535 seconds for ASA devices earlier than 9.2(1) and from 1 to 8192 seconds for ASA 9.2(1)+. The default value is 10 seconds. |

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Retransmit Interval     | The time, in seconds, between LSA retransmissions for adjacencies belonging to the interface. When a router sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgment message. If the router receives no acknowledgment, it will resend the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links. Valid values range from 1 to 65535 seconds for ASA devices earlier than 9.2(1) and from 1 to 8192 seconds for ASA 9.2(1)+. The default value is 5 seconds.                                                                                                                                                                                                                                                                                                                            |
| Transmit Delay          | The estimated time, in seconds, required to send an LSA packet on the interface. LSAs in the update packet have their ages increased by the amount specified by this field before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links. Valid values range from 1 to 65535 seconds for ASA devices earlier than 9.2(1) and from 1 to 8192 seconds for ASA 9.2(1)+. The default value is 1 second.                                                                                                                                                                                                                                                   |
| Dead Interval           | The interval, in seconds, in which no hello packets are received, causing neighbors to declare a router down. Valid values range from 1 to 65535 seconds for ASA devices earlier than 9.2(1) and from 1 to 8192 seconds for ASA 9.2(1)+. The default value of this field is four times the interval set by the Hello Interval field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Authentication          | <p>Contains the OSPF authentication options.</p> <ul style="list-style-type: none"> <li>• None—Choose this option to disable OSPF authentication.</li> <li>• Area—Choose this option to use the authentication type specified for the area. See <a href="#">Add/Edit Area/Area Networks Dialog Box</a>, on page 2192 for information about configuring area authentication. Area authentication is disabled by default. Therefore, unless you have previously specified an area authentication type, interfaces set to area authentication have authentication disabled until you configure this setting.</li> <li>• Password—Choose this option to use clear text password authentication. This is not recommended where security is a concern.</li> <li>• MD5—Choose this option to use MD5 authentication (recommended).</li> <li>• Key Chain—Choose this option to use key chain authentication.</li> </ul> |
| Key Chain               | <p>This field appears when Key Chain authentication is enabled. Click Select and choose the configured key chain. To know the configuration steps, refer <a href="#">Configuring Key Chain</a>, on page 2211.</p> <p><b>Note</b> Use the same authentication type and key ID for the peers to establish a successful adjacency.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Authentication Password | <p>Contains the settings for entering the password when password authentication is enabled.</p> <ul style="list-style-type: none"> <li>• Password—Enter a text string of up to 8 characters.</li> <li>• Confirm—Re-enter the password.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

- [Configuring OSPF](#) , on page 2183

### Field Reference

*Table 785: Add/Edit OSPF Virtual Link MD5 Configuration Dialog Box*

| Element    | Description                                                   |
|------------|---------------------------------------------------------------|
| MD5 Key ID | A numerical key identifier. Valid values range from 1 to 255. |
| MD5 Key    | An alphanumeric character string of up to 16 bytes.           |
| Confirm    | Re-enter the MD5 key.                                         |

## Filtering Tab

Use the Filtering tab to configure the ABR Type 3 LSA filters for each OSPF process. ABR Type 3 LSA filters allow only specified prefixes to be sent from one area to another area and restricts all other prefixes. This type of area filtering can be applied out of a specific OSPF area, into a specific OSPF area, or into and out of the same OSPF areas at the same time.

**Benefits**

OSPF ABR Type 3 LSA filtering improves your control of route distribution between OSPF areas.

**Restrictions**

Only type-3 LSAs that originate from an ABR are filtered.

**Navigation Path**

You can access the Filtering tab from the OSPF page. For more information about the OSPF page, see [Configuring OSPF](#), on page 2183.

**Related Topics**

**Field Reference**

*Table 786: Filtering Tab*

| Element           | Description                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process      | The OSPF process associated with the filter entry.                                                                                              |
| Area ID           | The ID of the area associated with the filter entry.                                                                                            |
| Prefix List Name  | The name of the prefix list.                                                                                                                    |
| Filtered Network  | The IP address and mask of the network being filtered.                                                                                          |
| Traffic Direction | Displays “Inbound” if the filter entry applies to LSAs coming in to an OSPF area or “Outbound” if it applies to LSAs going out of an OSPF area. |
| Sequence #        | The sequence number for the filter entry. When multiple filters apply to an LSA, the filter with the lowest sequence number is used.            |
| Action            | Displays “Permit” if LSAs matching the filter are allowed or “Deny” if LSAs matching the filter are denied.                                     |
| Lower Range       | The minimum prefix length to be matched.                                                                                                        |
| Upper Range       | The maximum prefix length to be matched.                                                                                                        |

**Add/Edit Filtering Dialog Box**

Use the Add/Edit Filtering dialog box to add new filters to the Filter table or to modify an existing filter.

**Navigation Path**

You can access the Add/Edit Filtering dialog box from the [Filtering Tab](#), on page 2202.

| Element           | Description                                                                                                                                                                                                                                                                                                                                                        |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process      | Select the OSPF process associated with the filter entry.                                                                                                                                                                                                                                                                                                          |
| Area ID           | Select the ID of the area associated with the filter entry.                                                                                                                                                                                                                                                                                                        |
| Prefix List Name  | Enter or Select the appropriate prefix list object.<br><br><b>Tip</b> Click <b>Select</b> to open the Prefix List Object Selector from which you can select a prefix list object. You can also create new objects from the object Prefix List Object selector. For more information, see <a href="#">Add or Edit Prefix List Object Dialog Box</a> , on page 2262. |
| Filtered Network  | Enter the IP address and mask of the network being filtered.                                                                                                                                                                                                                                                                                                       |
| Traffic Direction | Select the traffic direction to filter. Choose “Inbound” to filter LSAs coming into an OSPF area or “Outbound” to filter LSAs going out of an OSPF area.                                                                                                                                                                                                           |
| Sequence Number   | Enter a sequence number for the filter. Valid values range from 1 to 4294967294. When multiple filters apply to an LSA, the filter with the lowest sequence number is used.                                                                                                                                                                                        |
| Action            | Select “Permit” to allow the LSA traffic or “Deny” to block the LSA traffic.                                                                                                                                                                                                                                                                                       |
| Lower Range       | Specify the minimum prefix length to be matched. The value of this setting must be greater than the length of the network mask entered in the Filtered Network field and less than or equal to the value, if present, entered in the Upper Range field.                                                                                                            |
| Upper Range       | Enter the maximum prefix length to be matched. The value of this setting must be greater than or equal to the value, if present, entered in the Lower Range field, or, if the Lower Range field is left blank, greater than the length of the network mask length entered in the Filtered Network field.                                                           |

**Filter Rule Tab**

Use the Filter Rule tab to configure rules to filter networks received or transmitted in Open Shortest Path First (OSPF) updates.

---

**Note** Filter rules are supported on ASA 9.2(1)+ only.

---

**Navigation Path**

You can access the Filter Rule tab from the OSPF page. For more information about the OSPF page, see [Configuring OSPF](#) , on page 2183.

**Table 789: Add/Edit Filter Rule Dialog Box**

| Element            | Description                                                                                                                                                                                                                                                          |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process       | Select the OSPF process associated with the filter rule.                                                                                                                                                                                                             |
| ACL                | Select an Access Control List that defines which networks are to be received and which are to be suppressed in routing updates.                                                                                                                                      |
| Direction          | Specify the direction for the filter rule: <ul style="list-style-type: none"> <li>• in—The rule filters default route information from incoming routing updates.</li> <li>• out—The rule filters default route information from outgoing routing updates.</li> </ul> |
| Interface          | (Optional) Specify the interface on which to apply the routing updates. Specifying an interface causes the access list to be applied only to routing updates received on that interface.                                                                             |
| Routing Process    | Select the routing process for which you want to filter: None, BGP, Connected, EIGRP, OSPF, RIP, or Static.                                                                                                                                                          |
| Routing Process ID | Enter the identifier for the routing process. Applies to BGP, EIGRP, and OSPF routing protocols.                                                                                                                                                                     |

## Summary Address Tab

Use the Summary Address tab to configure summary addresses for each OSPF routing process.

Routes learned from other routing protocols can be summarized. The metric used to advertise the summary is the smallest metric of all the more specific routes. Summary routes help reduce the size of the routing table.

Using summary routes for OSPF causes an OSPF ASBR to advertise one external route as an aggregate for all redistributed routes that are covered by the address. Only routes from other routing protocols that are being redistributed into OSPF can be summarized.

### Navigation Path

You can access the Summary Address tab from the OSPF page. For more information about the OSPF page, see [Configuring OSPF](#), on page 2183.

## Field Reference

*Table 790: Summary Address Tab*

| Element    | Description                                                                                                                                             |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| Process ID | The OSPF process associated with the summary address.                                                                                                   |
| Network    | The IP address and network mask of the summary address.                                                                                                 |
| Tag        | A 32-bit decimal value attached to each external route. This value is not used by OSPF itself. It may be used to communicate information between ASBRs. |
| Advertise  | Displays “true” if the summary routes are advertised. Displays “false” if the summary route is not advertised.                                          |

## Add/Edit Summary Address Dialog Box

Use the Add/Edit Summary Address dialog box to add new entries or to modify existing entries in the Summary Address table.

### Navigation Path

You can access the Add/Edit Summary Address dialog box from the [Summary Address Tab](#) , on page 2206.

*Table 791: Add/Edit Summary Address Dialog Box*

| Element      | Description                                                                                                                                                                                                 |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process | Choose the OSPF process associated with the summary address. You cannot change this information when editing an existing entry.                                                                             |
| Network      | The IP address and network mask of the summary address.                                                                                                                                                     |
| Tag          | The tag value is a 32-bit decimal value attached to each external route. This is not used by OSPF itself. It may be used to communicate information between ASBRs. Valid values range from 0 to 4294967295. |
| Advertise    | When selected, summary routes are advertised. Deselect this check box to suppress routes that fall under the summary address. By default, this check box is selected.                                       |

## Interface Tab

Use the Interface tab to configure interface-specific OSPF authentication routing properties.

### Navigation Path

You can access the Interface tab from the OSPF page. For more information about the OSPF page, see [Configuring OSPF](#), on page 2183.

*Table 792: Interface Tab*

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface       | The name of the interface to which the configuration applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Authentication  | The type of OSPF authentication enabled on the interface. The authentication type can be one of the following values: <ul style="list-style-type: none"> <li>• None—OSPF authentication is disabled.</li> <li>• Password—Clear text password authentication is enabled.</li> <li>• MD5—MD5 authentication is enabled.</li> <li>• Area—The authentication type specified for the area is enabled on the interface. Area authentication is the default value for interfaces. However, area authentication is disabled by default. So, unless you previously specified an area authentication type, interfaces showing Area authentication have authentication disabled.</li> <li>• Key Chain—Key chain authentication is enabled.</li> </ul> |
| Point-to-Point  | Displays “true” if the interface is set to non-broadcast (point-to-point). Displays “false” if the interface is set to broadcast.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Cost            | The cost of sending a packet through the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Priority        | The OSPF priority assigned to the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| MTU Ignore      | Displays “false” if MTU mismatch detection is enabled. Displays “true” if the MTU mismatch detection is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Database Filter | Displays “true” if outgoing LSAs are filtered during synchronization and flooding. Displays “false” if filtering is not enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Hello Interval  | The interval, in seconds, between hello packets sent on an interface. The smaller the hello interval, the faster topological changes are detected but the more traffic is sent on the interface. This value must be the same for all routers and access servers on a specific interface. Valid values range from 1 to 65535 seconds. The default value is 10 seconds.                                                                                                                                                                                                                                                                                                                                                                      |

| Element                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Transmit Delay                         | The estimated time, in seconds, required to send an LSA packet on the interface. LSAs in the update packet have their ages increased by the amount specified by this field before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links. Valid values range from 1 to 65535 seconds. The default value is 1 second. |
| Retransmit Interval                    | The time, in seconds, between LSA retransmissions for adjacencies belonging to the interface. When a router sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgment message. If the router receives no acknowledgment, it resends the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links. Valid values range from 1 to 65535 seconds. The default value is 5 seconds.                                                                              |
| Dead Interval                          | The interval, in seconds, in which no hello packets are received, causing neighbors to declare a router down. Valid values range from 1 to 65535. The default value of this setting is four times the interval set by the Hello Interval field.                                                                                                                                                                                                                                                                                                                                |
| Hello Multiplier<br>(ASA 9.2(1)+ only) | The number of hello packets to be sent per second. Valid values are between 3 and 20.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Add/Edit Interface Dialog Box

Use the Add/Edit Interface dialog box to add OSPF authentication routing properties for an interface or to change an existing entry.

**Note** Beginning with ASA version 9.2(1), the upper limit for acceptable entries for Hello Interval, Transmit Delay, Retransmit Interval, and Dead Interval has been reduced from 65535 seconds to 8192 seconds. If you configure a shared policy that uses a value over 8192, you will receive a validation error if that policy is assigned to an 9.2(1)+ device.

### Navigation Path

You can access the Add/Edit Interface dialog box from the [Interface Tab](#) , on page 2169.

*Table 793: Add/Edit Interface Dialog Box*

| Element   | Description                                                   |
|-----------|---------------------------------------------------------------|
| Interface | The name of the interface to which the configuration applies. |

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authentication          | <p>The type of OSPF authentication enabled on the interface. The authentication type can be one of the following values:</p> <ul style="list-style-type: none"> <li>• No Authentication—OSPF authentication is disabled.</li> <li>• Area Authentication—The authentication type specified for the area is enabled on the interface. Area authentication is the default value for interfaces. However, area authentication is disabled by default. So, unless you previously specified an area authentication type, interfaces showing Area authentication have authentication disabled.</li> <li>• Password Authentication—Clear text password authentication is enabled.</li> <li>• MD5 Authentication—MD5 authentication is enabled.</li> <li>• Key Chain—Key chain authentication is enabled.</li> </ul> |
| Key Chain               | <p>Click Select and choose the configured key chain. To know the configuration steps, refer <a href="#">Configuring Key Chain</a>, on page 2211.</p> <p><b>Note</b> Use the same authentication type and key ID for the peers to establish a successful adjacency.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Authentication Password | <p>Contains the settings for entering the password when password authentication is enabled.</p> <ul style="list-style-type: none"> <li>• Enter Password—Enter a text string of up to 8 characters.</li> <li>• Confirm—Re-enter the password.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| MD5 Key IDs and Keys    | <p>Contains the settings for entering the MD5 keys and parameters when MD5 authentication is enabled. All devices on the interface using OSPF authentication must use the same MD5 key and ID.</p> <ul style="list-style-type: none"> <li>• Key ID—Enter a numerical key identifier. Valid values range from 1 to 255.</li> <li>• Key—An alphanumeric character string of up to 16 bytes.</li> <li>• Confirm—Re-enter the MD5 key.</li> </ul> <p>Enter the above values, then click &gt;&gt; to add the key information to the Keys table. Select a key entry and then click &lt;&lt; to remove it from the Keys table.</p>                                                                                                                                                                                 |
| Cost                    | The cost of sending a packet through the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Priority                | The OSPF priority assigned to the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| MTU Ignore              | When selected, MTU mismatch detection is disabled. Clear this check box to enable MTU mismatch detection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Database Filter All Out | When selected, outgoing LSAs are filtered during synchronization and flooding. Deselect this check box to disable filtering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Element                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hello Interval (sec)                               | <p>The interval, in seconds, between hello packets sent on an interface. The smaller the hello interval, the faster topological changes are detected but the more traffic is sent on the interface. This value must be the same for all routers and access servers on a specific interface.</p> <p>For ASA 9.2(1)+ devices, valid values range from 1 to 8192 seconds. For all other devices, valid values range from 1 to 65535 seconds. The default value is 10 seconds.</p>                                                                                                                                                                                                          |
| Transmit Delay (sec)                               | <p>The estimated time, in seconds, required to send an LSA packet on the interface. LSAs in the update packet have their ages increased by the amount specified by this field before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links.</p> <p>For ASA 9.2(1)+ devices, valid values range from 1 to 8192 seconds. For all other devices, valid values range from 1 to 65535 seconds. The default value is 1 second.</p> |
| Retransmit Interval (sec)                          | <p>The time, in seconds, between LSA retransmissions for adjacencies belonging to the interface. When a router sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgment message. If the router receives no acknowledgment, it will resend the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links.</p> <p>For ASA 9.2(1)+ devices, valid values range from 1 to 8192 seconds. For all other devices, valid values range from 1 to 65535 seconds. The default value is 5 seconds.</p>                                                                          |
| Dead Interval (sec)                                | <p>The interval, in seconds, in which no hello packets are received, causing neighbors to declare a router down.</p> <p>For ASA 9.2(1)+ devices, valid values range from 1 to 8192 seconds. For all other devices, valid values range from 1 to 65535 seconds. The default value of this setting is four times the interval set by the Hello Interval field.</p>                                                                                                                                                                                                                                                                                                                        |
| Hello Multiplier (Hello/Sec)<br>(ASA 9.2(1)+ only) | <p>The number of hello packets to be sent per second. Valid values are between 3 and 20.</p> <p><b>Note</b> If you specify a Hello Multiplier, the Hello Interval and Dead Interval values will be ignored. If you entered a value for Hello Interval or Dead Interval, you will be asked to confirm that you want to use the Hello Multiplier instead of the Hello Interval and Dead Interval settings.</p>                                                                                                                                                                                                                                                                            |
| Point-to-Point                                     | <p>Displays “true” if the interface is set to non-broadcast (point-to-point). Displays “false” if the interface is set to broadcast.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Configuring Key Chain

To enhanced data security and protection on the networking devices, the devices are configured with rotating keys for authenticating IGP peers that have a duration of 180 days or less. The rotating keys prevent any malicious user from guessing the keys used for routing protocol authentication and thereby protecting the network from advertising incorrect routes and redirecting traffic. Changing the keys frequently reduces the

risk of them eventually being guessed. When configuring authentication for routing protocols that provide key chains, configure the keys in a key chain to have overlapping lifetimes. This configuration helps to prevent loss of key-secured communication due to absence of an active key. If the key lifetime expires and no active keys are found, OSPF uses the last valid key to maintain the adjacency with peers.

The two limitations of key chain configuration in Cisco Security Manager are:

- The configured Key ID will be displayed in unencrypted format in the [OOB \(Out of Band\) Changes Dialog Box](#) , on page 427.
- The option to copy provision is not available for key chains.

## Lifetime of a Key

To maintain stable communications, each device stores key chain authentication keys and uses more than one key for a feature at the same time. Based on the send and accept lifetimes of a key, keychain management provides a secured mechanism to handle key rollover. The device uses the lifetimes of keys to determine which keys in a key chain are active.

Each key in a key chain has two lifetimes:

- Accept lifetime—The time interval within which the device accepts the key during key exchange with another device.
- Send lifetime—The time interval within which the device sends the key during key exchange with another device.

During a key send lifetime, the device sends routing update packets with the key. The device does not accept communication from other devices when the key sent is not within the accept lifetime of the key on the device.

If lifetimes are not configured then it is equivalent to configuring MD5 authentication key without timelines.

### Key Selection

- When key chain has more than one valid key, OSPF selects the key that has the maximum life time.
- Key having an infinite lifetime is preferred.
- If keys have the same lifetime, then key with the higher key ID is preferred.

## Add/Edit Key Chain

Use the Add/Edit KeyChain dialog box to add new entries or to modify existing entries in the KeyChain table.

### Navigation Path

- You can access the Key Chain page tab from the Interface tab of OSPF page. For more information about the Interface tab, see [Interface Tab , on page 2169](#).
- You can directly access the Add Key Chain page from **Manage > Policy Objects > Key Chain**.

**Step 1** Create a key chain policy object that includes the key chains for authentication.

- Select **Manage > Policy Objects** to open the Policy Object Manager window (see [Policy Object Manager , on page 230](#)).
- Select **Key Chain** from the table of contents.
- Right-click and choose **New Object**.
- In the Add Key Chain dialog box, enter a name for the object, for example, Chain 1.
- Click the **Add button** to add the key chain entry to the Key Chain list.

**Step 2** Enter the relevant values in the **Add Key Chain Entry dialog box**:

### Field Reference

*Table 794: Add Key Chain Entry page*

| Element                   | Description                                                                                                                                                                                                          |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Algorithm                 | MD5 is the default cryptographic algorithm used for authentication.                                                                                                                                                  |
| Key ID                    | Enter a value between 0 and 255.<br><br><b>Note</b> The Key ID does not get displayed in encrypted format in the <a href="#">OOB (Out of Band) Changes Dialog Box , on page 427</a> .                                |
| Authentication Type       | Select the relevant option: <ul style="list-style-type: none"> <li>• Clear Text—To have the authentication key in text format.</li> <li>• Encryption —To have the authentication key in encrypted format.</li> </ul> |
| Key String                | Enter the key string.                                                                                                                                                                                                |
| Confirm Key String        | Re-enter the same key string.                                                                                                                                                                                        |
| Accept Lifetime Settings— | Provide the interval within which the device accepts the key during key exchange with another device.                                                                                                                |
| Timezone                  | Select either UTC or Local.                                                                                                                                                                                          |
| Start Date/Time           | Provide the start date and the time in hh:mm:ss format.                                                                                                                                                              |

| Element                                                                                                                 | Description                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| End Time Type                                                                                                           | Select the relevant option: <ul style="list-style-type: none"> <li>• Date Time—The absolute time that the lifetime ends.</li> <li>• Duration—The number of seconds after the start time that the lifetime ends.</li> <li>• Infinite—Infinite lifetime (no end-time).</li> </ul> |
| End Date                                                                                                                | Provide the absolute date and the time. This option is not available if you choose Duration or Infinite as the End Time Type.                                                                                                                                                   |
| Duration                                                                                                                | Provide the value in seconds after the start time that the lifetime ends. The permissible range is 1 and 2147483646. This option is not available if you choose Date Time or Infinite as the End Time Type.                                                                     |
| Send Lifetime Settings—The time interval within which the device sends the key during key exchange with another device. |                                                                                                                                                                                                                                                                                 |
| Timezone                                                                                                                | Select either UTC or Local.                                                                                                                                                                                                                                                     |
| Start Date/Time                                                                                                         | Provide the start date and the time in hh:mm:ss format.                                                                                                                                                                                                                         |
| End Time Type                                                                                                           | Select the relevant option: <ul style="list-style-type: none"> <li>• Date Time—The absolute time that the lifetime ends.</li> <li>• Duration—The number of seconds after the start time that the lifetime ends.</li> <li>• Infinite—Infinite lifetime (no end-time).</li> </ul> |
| End Date                                                                                                                | Provide the absolute date and the time. This option is not available if you choose Duration or Infinite as the End Time Type.                                                                                                                                                   |
| Duration                                                                                                                | Provide the value in seconds after the start time that the lifetime ends. The permissible range is 1 and 2147483646. This option is not available if you choose Date Time or Infinite as the End Time Type.                                                                     |

# Configuring OSPFv3

The OSPFv3 page provides two tabbed panels for configuring OSPF (Open Shortest Path First) version 3 routing on a firewall device.

## Navigation Path

- (Device view) Select **Platform > Routing > OSPFv3** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > OSPFv3** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

This is the basic procedure for configuring an OSPFv3 process and assigning it to an interface on the OSPFv3 page:

1. On the [Process Tab](#) , on page 2217:
  - Specify which of the two processes you are configuring by choosing **Process 1** or **Process 2** from the OSPFv3 Process drop-down list.
  - Check **Enable OSPFv3 Process**.
  - Assign a **Process ID**; any positive integer between 1 and 65535.
  - Use the following features as needed to define the process:
    - **Advanced** button, opening the [OSPFv3 Advanced Properties Dialog Box](#) , on page 2218.
    - **Area Tab (OSPFv3)** , on page 2222, for managing area, range, and virtual-link definitions, by means of the [Add/Edit Area Dialog Box \(OSPFv3\)](#) , on page 2222, [Add/Edit Range Dialog Box \(OSPFv3\)](#) , on page 2224, and [Add/Edit Virtual Link Dialog Box \(OSPFv3\)](#) , on page 2225.
    - **Redistribution** panel, for managing route redistribution definitions by means of the [Add/Edit Redistribution Dialog Box \(OSPFv3\)](#) , on page 2226.
    - **Summary Prefix** panel, for managing summary-prefix definitions by means of the [Add/Edit Summary Prefix Dialog Box \(OSPFv3\)](#) , on page 2227.
2. On the [OSPFv3 Interface Tab](#) , on page 2228:
  - a. Use the Interface and Neighbor panels to assign the process to a specific interface, using the [Add/Edit Interface Dialog Box \(OSPFv3\)](#) , on page 2229 and the [Add/Edit Neighbor Dialog Box \(OSPFv3\)](#) , on page 2232.

## About OSPFv3

Open Shortest Path First (OSPF) is an interior gateway routing protocol that uses link states rather than distance vectors for path selection. Version 3 is basically OSPFv2 enhanced for IPv6. It is similar to OSPFv2 (see

[About OSPF , on page 2184](#)), but it is not backward compatible. To use OSPF to route both IPv4 and IPv6 packets, it will be necessary to run both OSPFv2 and OSPFv3 concurrently. They co-exist with each other, but do not interact.

---

**Note** OSPFv3 is supported on ASA 9.0+ devices operating in single-context, routed mode only. That is, multiple contexts and transparent mode are not supported.

---

Think of a link as being an interface on a networking device. A link-state protocol makes its routing decisions based on the states of the links that connect source and destination devices. The state of a link is a description of that interface and its relationship to its neighboring networking devices. This interface information includes the IPv6 prefix/length of the interface, the type of network it is connected to, the devices connected to that network, and so on. This information is propagated in various type of link-state advertisements (LSAs). Because only LSAs are exchanged, rather than entire routing tables, OSPF networks converge more quickly than RIP networks.

The ASA can run two processes of the OSPFv3 protocol simultaneously on different sets of interfaces. You might want to run two processes if you have interfaces that use the same IP addresses (NAT allows these interfaces to co-exist, but OSPFv3 does not allow overlapping addresses). Or you might want to run one process on the inside interface and another on the outside, redistributing a subset of routes between the two processes. Similarly, you might need to segregate private addresses from public addresses.

You can redistribute routes into an OSPFv3 routing process from another OSPFv3 routing process, a RIP routing process, or from static and connected routes configured on OSPFv3-enabled interfaces.

If NAT is employed but OSPFv3 is only running in public areas, routes to public networks can be redistributed inside the private network, either as default or type 5 AS External LSAs. However, you need to configure static routes for the private networks protected by the security appliance. Also, you should not mix public and private networks on the same security appliance interface.

### Differences Between OSPFv2 and OSPFv3

The additional features provided by OSPFv3 over OSPFv2 include the following:

- Use of the IPv6 link-local address for neighbor discovery and other features.
- LSAs expressed as prefix and prefix length.
- Addition of two LSA types.
- Handling of unknown LSA types.
- Protocol processing per link.
- Removal of addressing semantics.
- Addition of flooding scope.
- Support for multiple instances per link.
- Authentication support using the IPsec ESP standard for OSPFv3 routing protocol traffic, as specified by RFC-4552.

### Configuration Restrictions

The following are ASA OSPFv3 configuration restrictions:

- To enable OSPFv3 on a specific interface, IPv6 should be enabled on the interface and it must be named.
- Only one OSPFv3 process, with one area and one instance, can be assigned to an interface.
- The Interface neighbor entries take effect only when the OSPFv3 is enabled, and network type should be point-to-point on the specified interface.
- Interface neighbor address must be a link-local address.
- Range value in area Range table should be unique across the area.
- If the area is set to NSSA or stub, the same area cannot be set for virtual-link.
- OSPFv3 redistribution not applicable on the same OSPFv3 process.
- If used in an ASA cluster, OSPFv3 encryption should be disabled.
- The Layer 3 cluster pool is not shared between OSPFv3 and the interface.

## Process Tab

Use the Process tab on the OSPFv3 page to enable and configure up to two OSPFv3 routing processes. Each OSPF process has its own associated areas and networks. For each, at minimum, create an area for OSPFv3, enable an interface for OSPFv3, then redistribute the route into the targeted OSPFv3 routing processes. Note that only single-context mode is supported.

### Navigation Path

The Process tab is on the OSPFv3 page.

- (Device view) Select **Platform** > **Routing** > **OSPFv3** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform** > **Routing** > **OSPFv3** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

| Element               | Description                                                                                                                                                                                                                                                                                 |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPFv3 Process        | Identify which OSPFv3 process you are configuring: choose <b>Process 1</b> or <b>Process 2</b> . You can enable one or both.                                                                                                                                                                |
| Enable OSPFv3 Process | Check this box to enable the chosen OSPFv3 process. Deselect this option to disable the OSPFv3 process; the process configuration information is retained should you wish to re-enable it later.                                                                                            |
| Process ID            | Enter a unique numeric identifier for this process. The ID can be any positive integer between 1 and 65535.<br><br>This process ID is used internally and does not need to match the OSPFv3 process ID on any other OSPFv3 devices.                                                         |
| Advanced              | Opens the <a href="#">OSPFv3 Advanced Properties Dialog Box</a> , on page 2218, in which you can configure additional process-related parameters, such Router ID, Adjacency Changes, Administrative Route Distances, Timers, Default Information Originate, and Passive Interface settings. |
| Area                  | Use the tabs and tables in this panel to manage area, range and virtual-link definitions. See <a href="#">Area Tab (OSPFv3)</a> , on page 2222 for more about these definitions.                                                                                                            |
| Redistribution        | Use this panel to manage redistribution definitions. See <a href="#">Add/Edit Redistribution Dialog Box (OSPFv3)</a> , on page 2226 for more about these definitions.                                                                                                                       |
| Summary Prefix        | Use this panel to manage summary prefix definitions. See <a href="#">Add/Edit Summary Prefix Dialog Box (OSPFv3)</a> , on page 2227 for more about these definitions.                                                                                                                       |

## OSPFv3 Advanced Properties Dialog Box

Use the OSPF Advanced dialog box to configure settings such as the Router ID, Adjacency Changes, Administrative Route Distances, Timers, and Default Information Originate settings for an OSPF process.

### Navigation Path

You can access the OSPF Advanced dialog box from the [Process Tab](#), on page 2217.

| Timers (in milliseconds) | <p>LSA and SPF throttling provide a dynamic mechanism to slow LSA updates in OSPFv3 during times of network instability, and allow faster OSPFv3 convergence by providing LSA rate limiting. The settings used to configure LSA pacing and SPF calculation timers are:</p> <ul style="list-style-type: none"> <li>• LSA Arrival – The minimum delay between acceptance of the same LSA arriving from neighbors. Valid values range from 0 to 600000 milliseconds. The default is 1000.</li> <li>• LSA Flood Pacing – The amount of time LSAs in the flooding queue are paced in between updates. Valid values range from 5 to 100 milliseconds. The default value is 33.</li> <li>• LSA Group Pacing – The interval at which LSAs are collected into a group and refreshed, check summed, or aged. Valid values range from 10 to 1800; the default value is 240 milliseconds.</li> <li>• LSA Retransmission Pacing – The length of time at which LSAs in the retransmission queue are paced. Valid values range from 5 to 200 milliseconds. The default value is 66.</li> <li>• LSA Throttle – The delay in milliseconds to generate the first occurrence of the LSA. Valid values range from 0 to 600000 milliseconds. When you enter a value in this field, the min and max fields are enabled: <ul style="list-style-type: none"> <li>• min – The minimum delay for originating the same LSA. Valid values range from 1 to 600000 milliseconds.</li> <li>• max – The maximum delay for originating the same LSA. Valid values range from 1 to 600000 milliseconds.</li> </ul> </li> <li>• SPF Throttle – The delay to receive a change to the SPF calculation. Valid values range from 1 to 600000 milliseconds. When you enter a value in this field, the min and max fields are enabled: <ul style="list-style-type: none"> <li>• min – The delay between the first and second SPF calculations. Valid values range from 1 to 600000 milliseconds.</li> <li>• max – The maximum wait time for SPF calculations. Valid values range from 1 to 600000 milliseconds.</li> </ul> </li> </ul> <p><b>Note</b> For LSA throttling, if the minimum or maximum time is less than the first occurrence value, then OSPFv3 automatically corrects to the first occurrence value. Similarly, if the maximum delay specified is less than the minimum delay, then OSPFv3 automatically corrects to the minimum delay value.</p> |

| Default Information Originate                                                                                        | <p>Settings used by an ASBR to generate a default external route into an OSPFv3 routing domain:</p> <ul style="list-style-type: none"> <li>• <b>Enable Default Information Originate</b> – Check this box to enable generation of a default route into the OSPFv3 routing domain; the following options become available: <ul style="list-style-type: none"> <li>• <b>Always advertise the default route</b> – Check this box to always advertise the default route.</li> <li>• <b>Metric Value</b> – The OSPFv3 metric used to generate the default route. Valid values range from 0 to 16777214.</li> <li>• <b>Metric Type</b> – The external link type associated with the default route advertised into the OSPFv3 routing domain. Choose <b>1</b> or <b>2</b>, indicating a Type 1 or a Type 2 external route. The default value is 1.</li> <li>• <b>Route Map</b> – (Optional) Enter or Select the name of a route map object to apply. The routing process generates the default route if the route map is satisfied.</li> </ul> </li> </ul> <p><b>Tip</b> Click <b>Select</b> to open the Route Map Object Selector from which you can select a route map object. You can also create new route map objects from the Route Map Object Selector. For more information, see <a href="#">Understanding Route Map Objects</a>, on page 2248.</p> |
| Passive Interface                                                                                                    | <p>Passive routing helps control the advertisement of OSPFv3 routing information, and disables sending and receiving OSPFv3 routing updates on an interface.</p> <p>Enter or Select one or more interfaces, or interface objects, to enable passive OSPFv3 routing on those interfaces. IPv4 and IPv6 addresses are supported.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <p><b>Non Stop Forwarding Tab</b></p> <p><b>Note</b> Non Stop Forwarding (NSF) is supported on ASA 9.3(1)+ only.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Enable graceful-restart helper                                                                                       | <p>Enables graceful restart helper mode.</p> <p>When an ASA has NSF enabled, it is said to be NSF-capable and will operate in graceful restart mode. By default, the neighboring ASAs of the NSF-capable ASA will be NSF-aware and will operate in NSF helper mode. When the NSF-capable ASA is performing graceful restart, the helper ASAs assist in the nonstop forwarding recovery process.</p> <p>If you do not want the ASA to help the restarting neighbor with nonstop forwarding recovery, clear the Enable graceful-restart helper option.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Enable Link State Advertisement                                                                                      | <p>Enables strict link-state advertisement (LSA) checking.</p> <p><b>Note</b> When enabled, it indicates that the helper router will terminate the process of restarting the router if it detects that there is a change to a LSA that would be flooded to the restarting router, or if there is a changed LSA on the retransmission list of the restarting router when the graceful restart process is initiated.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Element                                                                   | Description                                                                                                                                                                                                                     |
|---------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable graceful-restart (Use when Spanned Cluster or Failover configured) | Enables graceful restart on the ASA.                                                                                                                                                                                            |
| Length of graceful restart interval                                       | (Optional) Specifies the length of the graceful restart interval, in seconds. The range is from 1 to 1800. The default is 120.<br><br><b>Note</b> For a restart interval below 30 seconds, graceful restart will be terminated. |

## Area Tab (OSPFv3)

Use the Area panel on the [Process Tab](#), on page 2217 of the OSPFv3 page to configure OSPFv3 areas, ranges and virtual links. The Area panel consists of three definition tables—Area, Range, and Virtual Link:

- Refer to [Add/Edit Area Dialog Box \(OSPFv3\)](#), on page 2222 for information about adding and editing Area table entries.
- Refer to [Add/Edit Range Dialog Box \(OSPFv3\)](#), on page 2224 for information about adding and editing Range table entries.
- Refer to [Add/Edit Virtual Link Dialog Box \(OSPFv3\)](#), on page 2225 for information about adding and editing Virtual Link table entries.

Refer to [Using Tables](#), on page 50 for basic information about working with Security Manager tables.

### Navigation Path

You can access the Area tab from the [Process Tab](#), on page 2217 of the OSPFv3 page. For more information about the OSPFv3 page, see [Configuring OSPFv3](#), on page 2215.

| Peer Router ID    | Enter the IP address of the virtual link neighbor.<br><b>Tip</b> You can click <b>Select</b> to select from a list of network objects.                                                                                                                                                                                                                                                                                                                                                                       |
| TTL Security      | The time-to-live (TTL) security hop count on a virtual link. The hop count value can range from 1 to 254.                                                                                                                                                                                                                                                                                                                                                                                                    |
| Dead Interval     | The interval, in seconds, if no hello packets are received, neighbors declare the device down. Valid values range from 1 to 8192. The default value of this field is four times the Hello Interval.                                                                                                                                                                                                                                                                                                          |
| Hello Interval    | The interval, in seconds, between hello packets sent on an interface. The smaller the hello interval, the faster topological changes are detected but the more traffic is sent on the interface. This value must be the same for all routers and access servers on a specific interface. Valid values range from 1 to 8192 seconds. The default value is 10 seconds.                                                                                                                                         |
| Transmit Interval | The time, in seconds, between LSA retransmissions for adjacencies belonging to the interface. When a device sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgment message. If the device does not receive an acknowledgment, it will resend the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links. Valid values range from 1 to 8192 seconds. The default value is 5 seconds. |

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Transmit Delay | The estimated time, in seconds, required to send an LSA packet on the interface. LSAs in the update packet have their ages increased by the amount specified by this field before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links. Valid values range from 1 to 8192 seconds. The default value is 1 second. |

## Add/Edit Redistribution Dialog Box (OSPFv3)

Use the Add/Edit Redistribution dialog box to add a redistribution rule to this process, or to edit an existing redistribution rule.

### Navigation Path

You can access the Redistribution dialog box from the Redistribution panel under the [Process Tab](#) , on page 2217.

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source Protocol | Choose the source protocol for route redistribution: <ul style="list-style-type: none"> <li>• Connected – Redistributes connected routes (routes established automatically by virtue of having an IP address enabled on the interface) to the OSPFv3 routing process. Connected routes are redistributed as external to the autonomous system.</li> <li>• OSPF – Redistributes routes from another OSPF routing process. The Routing PID and the Match options are enabled when you choose this option.</li> <li>• Static – Redistributes static routes to the OSPFv3 routing process.</li> </ul> |
| Metric          | The metric value for the routes being redistributed. Valid values range from 1 to 16777214; the default is 20.<br><br>When redistributing from one OSPF process to another OSPF process on the same device, the metric will be carried through from one process to the other if no metric value is specified.                                                                                                                                                                                                                                                                                     |

| Element                                                                                                                                                                                                                                                                                        | Description                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Metric Type                                                                                                                                                                                                                                                                                    | The metric type is the external link type associated with the default route that is advertised into the OSPFv3 routing domain.<br><br>Choose None, 1, or 2, where None indicates there is no default route, 1 indicates the metric is a Type 1 external route, and 2 is a Type 2 external route.                                                                                         |
| Tag (optional)                                                                                                                                                                                                                                                                                 | The tag is a 32-bit decimal value attached to each external route. This is not used by OSPF itself. It may be used to communicate information between other border devices. Valid values range from 0 to 4294967295.                                                                                                                                                                     |
| Route Map                                                                                                                                                                                                                                                                                      | Enter or Select the name of the route map object to apply to the redistribution entry.<br><br><b>Tip</b> Click <b>Select</b> to open the Route Map Object Selector from which you can select a route map object. You can also create new route map objects from the Route Map Object Selector. For more information, see <a href="#">Understanding Route Map Objects</a> , on page 2248. |
| Routing PID                                                                                                                                                                                                                                                                                    | The ID of the process to which redistribution is directed. (The Process ID is defined on the <a href="#">Process Tab</a> , on page 2217.)<br><br>This option is enabled only when OSPF is chosen as the Source Protocol.                                                                                                                                                                 |
| Include Connected                                                                                                                                                                                                                                                                              | Check this box to include connected routes in the redistribution.                                                                                                                                                                                                                                                                                                                        |
| <b>Match</b>                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                          |
| The conditions used for redistributing routes from one routing protocol to another. The routes must match the selected condition to be redistributed. You can choose one or more of the following match conditions. These options are enabled only when OSPF is chosen as the Source Protocol. |                                                                                                                                                                                                                                                                                                                                                                                          |

| NSSA External 2                                                                                                                                                                                                                                                                                | Routes that are external to the autonomous system, but are imported into OSPF as Type 2 NSSA routes.                                                                                                                                                                                                                                                                                     |

## Add/Edit Summary Prefix Dialog Box (OSPFv3)

Use the Add/Edit Summary Prefix dialog box to add new route-summarization entries to the selected process, or to modify existing entries.

**Navigation Path**

You can access the Add/Edit Summary Prefix dialog box from the Summary Prefix panel under the [Process Tab](#) , on page 2217.

**Related Topics**

| Element            | Description                                                                                                                                                                                                                                                           |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Process ID         | This read-only value identifies the process to which this rule applies.                                                                                                                                                                                               |
| IPv6 Prefix/Length | Enter an IPv6 prefix/length for external route summarization.<br><b>Tip</b> You can click <b>Select</b> to select from a list of network objects.                                                                                                                     |
| Advertise          | When selected, summary routes that match the specified prefix and mask pair are advertised. When deselected, routes that match the specified prefix and mask pair are suppressed. By default, this check box is selected.                                             |
| Tag (optional)     | The tag is a 32-bit decimal value attached to each external route. This is not used by OSPF itself. It may be used to communicate information between border devices. Valid values range from 0 to 4294967295.<br><br>This field is enabled when you check Advertise. |

## OSPFv3 Interface Tab

Use the Interface panel to configure interface-and neighbor-specific OSPFv3 routing properties. The Interface panel consists of two definition tables, Interface and Neighbor:

- Refer to [Add/Edit Interface Dialog Box \(OSPFv3\)](#) , on page 2229 for information about adding and editing Interface table entries.
- Refer to [Add/Edit Neighbor Dialog Box \(OSPFv3\)](#) , on page 2232 for information about adding and editing Neighbor table entries.

Refer to [Using Tables](#) , on page 50 for basic information about working with Security Manager tables.

**Navigation Path**

Click the Interface tab on the OSPFv3 page to display this panel. For more information about the OSPFv3 page, see [Configuring OSPFv3](#) , on page 2215.

**Related Topics**

- [About OSPFv3](#) , on page 2215

|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                                 | The name of the interface to which this routing configuration applies.<br><b>Tip</b> You can click <b>Select</b> to select from a list of interface objects.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Enable OSPFv3 on this interface           | Check this box to enable OSPFv3 on the specified interface, and activate the following fields: <ul style="list-style-type: none"> <li>• Process ID – Choose the process to apply to this interface; defined on the <a href="#">OSPFv3 Process Tab , on page 2217</a>.</li> <li>• Area ID – Identify the area to be assigned; areas are also defined on the <a href="#">OSPFv3 Process Tab , on page 2217</a>.</li> <li>• Instance ID – (Optional) Specify an ID for this process instance. Valid values for this setting range from 0 to 255.</li> </ul> <p>This feature lets you have multiple OSPFv3 processes on a single link. Received packets with other instance IDs are then ignored by this process.</p> |
| Properties                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Filter outgoing link-state advertisements | Check this box to filter outgoing LSAs. All outgoing LSAs are flooded to the interface by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Disable MTU mismatch detection            | Check this box to disable the OSPFv3 MTU mismatch detection when database description (DBD) packets are received.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Flood Reduction                           | Check this box to suppress unnecessary flooding of LSAs in stable topologies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Point-to-point Network | <p>Check this box to define this as a link to a point-to-point network; that is, a network between two routing devices. All neighbors on a point-to-point network establish adjacency and there is no designated router.</p> <p>This option is unavailable when the Broadcast option is selected.</p>                                                                                                                                                                                                                                                                                                |
| Broadcast              | <p>Check this box to define this as a link to a network with multiple routing devices. Such networks establish a designated router (DR), as well as a backup designated router (BDR), that controls LSA flooding on the network.</p> <p>This option is unavailable when the Point-to-point Network option is selected.</p>                                                                                                                                                                                                                                                                           |
| Cost                   | <p>The cost of sending a packet through the interface. Link cost is an arbitrary number used in shortest path first calculations. If you do not assign a value, the configured reference bandwidth divided by the interface port speed is used. (The default reference bandwidth is 40 Gb/sec.)</p>                                                                                                                                                                                                                                                                                                  |
| Priority               | <p>Assign an OSPFv3 priority to this interface. Valid values for this setting range from 0 to 255. Entering 0 for this setting makes the device ineligible to become the designated router or backup designated router. This setting does not apply to interfaces that are configured as point-to-point, non-broadcast interfaces.</p> <p>When two routing devices connect to a network, both attempt to become the designated router. The device with the higher priority becomes the designated router. If there is a tie, the router with the higher router ID becomes the designated router.</p> |
| Dead Interval          | <p>If no hello packets are received from a neighbor within this interval, that device is designated as inactive. Valid values range from 1 to 65535. The default value for this setting is four times the hello interval.</p>                                                                                                                                                                                                                                                                                                                                                                        |
| Poll Interval          | <p>If a neighboring device is inactive, it may be necessary to continue sending hello packets to that neighbor. The hello packets are sent at this reduced interval, which should be larger than the hello interval.</p>                                                                                                                                                                                                                                                                                                                                                                             |
| Retransmit Interval    | <p>The time, in seconds, between LSA retransmissions for adjacent neighbors. When a router sends an LSA to a neighbor, it keeps the LSA until it receives an acknowledgment. If an acknowledgment is not received within this interval, it will resend the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links. Valid values range from 1 to 65535 seconds.</p>                                                                                                                                       |
| Transmit Delay         | <p>The estimated time, in seconds, required to send an LSA packet on the interface. LSAs in the update packet have their ages increased by the amount specified by this field before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links. Valid values range from 1 to 65535 seconds.</p>                                               |
| Authentication         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Element                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type                       | <p>The type of authentication enabled on this interface. Choose one of the following:</p> <ul style="list-style-type: none"> <li>• Area – OSPFv3 does not provide “built-in” authentication, instead relying on IPv6/IPSec protocols. Choose this option to use those protocols to authenticate OSPFv3 traffic on all interfaces in the area; this means all routing devices in the area must use this option. This is the default.</li> <li>• Interface – Choose this option to secure this interface and protect OSPFv3 virtual links. The additional parameters in this section are enabled when you choose this option.</li> <li>• None – OSPFv3 authentication is disabled.</li> </ul> |
| Security Parameter Index   | <p>Enter an IPSec identification tag used to distinguish this particular OSPFv3 interface; used in conjunction with the specified authentication and encryption rules. Valid values range from 256 to 4294967295.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Authentication Algorithm   | <p>Choose the type of authentication algorithm to use:</p> <ul style="list-style-type: none"> <li>• md5 – Message Digest 5; produces a 128-bit hash value.</li> <li>• sha1 – Secure Hash Algorithm version 1; produces a 160-bit hash value.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Authentication Key         | <p>Enter an authentication key. The length of the key entered depends on the type of authentication chosen as the Authentication Algorithm, and whether the key is to be encrypted (when you check the Encrypt Authentication Key box):</p> <ul style="list-style-type: none"> <li>• md5 – 32 characters.</li> <li>• md5 (encrypted) – 66 characters.</li> <li>• sha1 – 40 characters.</li> <li>• sha1 (encrypted) – 82 characters.</li> </ul>                                                                                                                                                                                                                                              |

## Add/Edit Neighbor Dialog Box (OSPFv3)

You must define a static neighbor for each point-to-point, non-broadcast interface. This feature lets you broadcast OSPFv3 advertisements across an existing VPN connection without having to encapsulate the advertisements in a GRE tunnel. Note the following restrictions:

- You cannot define the same static neighbor for two different OSPFv3 processes.
- You must define a static route for each static neighbor.

Use the Add/Edit Neighbor dialog box to define a static neighbor for the interface selected in the Interface table, or to change information for an existing static neighbor.

### Navigation Path

You can access the Add/Edit Neighbor dialog box from the Neighbor panel under the [OSPFv3 Interface Tab](#), on page 2228.

| Link-local Address       | Enter the IPv6 address of the static neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Cost and Database Filter | <p>Check this box to enable filtering of the outgoing LSAs on the interface during synchronization and flooding. The following options are enabled:</p> <ul style="list-style-type: none"> <li>• Cost – Use this field to assign an arbitrary cost to this neighbor. If a value is not assigned, the cost of the interface is used (this value is based on the port speed of the interface, and is calculated as reference bandwidth divided by interface speed). Valid values range from 1 to 65535.</li> <li>• Filter outgoing link-state advertisements – Check this box to disable forwarding of outgoing LSAs to this neighbor.</li> </ul> <p><b>Note</b> The Cost and Database Filter options and the Poll-Interval options are mutually exclusive.</p> |

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Poll-Interval | <p>Check this box to enable the following options:</p> <ul style="list-style-type: none"> <li>• Poll Interval – Time interval in seconds between transmission of hello packets to a “dead” neighbor. The default is 120.</li> </ul> <p>If a neighboring device becomes inactive (hello packets have not been received for the dead interval period), it may be necessary to continue sending hello packets to the dead neighbor at a reduced rate. Thus this value should be larger than the interface hello interval.</p> <ul style="list-style-type: none"> <li>• Priority – The router priority value of this neighbor. The default is 0; valid values range from 1 to 255.</li> </ul> <p>The priority value helps determine the designated router for an OSPFv3 link. A value of zero means the device is ineligible to become the designated router, or backup designated router.</p> <p><b>Note</b> The Poll-Interval options and the Cost and Database Filter options are mutually exclusive. Also, these values do not apply to point-to-multipoint interfaces.</p> |

## Configuring RIP

Routing Information Protocol (RIP) is a dynamic routing protocol, or more precisely, an interior gateway protocol that is based on distance vectors. RIP uses hop count as the metric for path selection. When RIP is enabled on an interface, the interface exchanges RIP broadcast packets with neighboring devices to dynamically learn about and advertise routes. These RIP packets contain information about the destination networks that the gateways can reach, and the number of gateways that a packet must travel through to reach those destinations.

Cisco Security Manager supports both RIP version 1 and RIP version 2. Version 1 does not send the subnet mask with the routing update; RIP version 2 sends the subnet mask with the routing update, and supports variable-length subnet masks. Additionally, RIP version 2 supports neighbor authentication when routing updates are exchanged. This authentication ensures that the security appliance receives reliable routing information from a trusted source.

---

**Note** You cannot enable RIP if you have OSPF processes running.

---

### Limitations

RIP has the following limitations:

- Cisco Security Manager cannot pass RIP updates between interfaces.
- RIP Version 1 does not support variable-length subnet masks.
- RIP has a maximum hop count of 15. A route with a hop count greater than 15 is considered unreachable.
- RIP convergence is relatively slow compared to other routing protocols.

### RIP Version 2 Notes

The following information applies to RIP Version 2 only:

- If using neighbor authentication, the authentication key and key ID must be the same on all neighbor devices that provide RIP version 2 updates to the interface.
- With RIP version 2, the security appliance transmits and receives default route updates using the multicast address 224.0.0.9. In passive mode, it receives route updates at that address.
- When RIP version 2 is configured on an interface, the multicast address 224.0.0.9 is registered on that interface. When a RIP version 2 configuration is removed from an interface, that multicast address is unregistered.

### Using Security Manager to Configure RIP on Security Appliances

Use the RIP page to enable the Routing Information Protocol on an interface. The settings and features available when configuring RIP depend on the type of device and OS version that you are configuring:

- To configure RIP on a PIX Firewall or ASA running an OS version earlier than 7.2, or on any FWSM, see [RIP Page for PIX/ASA 6.3–7.1 and FWSM , on page 2235](#).
- To configure RIP on a PIX Firewall or ASA running OS version 7.2 or later, see [RIP Page for PIX/ASA 7.2 and Later , on page 2237](#).

## RIP Page for PIX/ASA 6.3–7.1 and FWSM

---

**Note** From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functionality, it does not support any bug fixes or enhancements.

---

Use this RIP page to enable the Routing Information Protocol (RIP) on an interface in any FWSM, or in a PIX/ASA running a pre-7.2 version operating system.

The RIP table on this page lists all interfaces on which RIP is currently defined. Use the Add RIP Configuration and Edit RIP Configuration dialog boxes to create and maintain these entries. See [RIP Page for PIX/ASA 6.3–7.1 and FWSM , on page 2235](#) for more information.

### Navigation Path

- (Device view) Select **Platform > Routing > RIP** from the Device Policy selector.

- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > RIP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

When creating a shared RIP policy, you must choose a Version in the Create a Policy dialog box, as follows:

- **PIX/ASA 6.3-7.1 and FWSM**
- **PIX/ASA 7.2 and Later**

When assigning a shared RIP policy, be sure to assign the appropriate RIP policy for the device. For example, you cannot assign a PIX/ASA 7.2+ RIP policy to an FWSM.

## Add/Edit RIP Configuration (PIX/ASA 6.3–7.1 and FWSM) Dialog Boxes

**Note** From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functionality, it does not support any bug fixes or enhancements.

Use the Add RIP Configuration and Edit RIP Configuration dialog boxes to add a RIP configuration to the security appliance, or to make changes to an existing RIP configuration. By adding a RIP configuration, you enable RIP on the specified interface. Except for their titles, the two dialog boxes are identical.

### Navigation Path

You can access the Add and Edit RIP Configuration dialog boxes from the [RIP Page for PIX/ASA 6.3–7.1 and FWSM](#) , on page 2235.

| Element   | Description                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------|
| Interface | Enter or Select the interface for the RIP configuration. You cannot configure two different RIP configurations on the same interface. |

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode                     | <p>Select the interface behavior regarding RIP updates:</p> <ul style="list-style-type: none"> <li>• <b>Send default routes</b> – The interface will transmit RIP routing updates only.</li> <li>• <b>Receive routes</b> – The interface will listen for RIP routing broadcasts and use that information to populate its routing table, but it will not send RIP routing updates.</li> <li>• <b>Send default routes and receive routes</b> – The interface will send and receive RIP routing updates.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Version                  | <p>Select the RIP version to enable on the interface:</p> <ul style="list-style-type: none"> <li>• <b>RIP Version 1</b> – Enables RIP Version 1 on the interface.</li> <li>• <b>RIP Version 2</b> – Enables RIP Version 2 on the interface. Configuring RIP Version 2 registers the multicast address 224.0.0.9 on the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Version 2 Authentication | <p>These options let you enable and select the type of authentication used with RIP Version 2.</p> <ul style="list-style-type: none"> <li>• <b>Enable Authentication</b> – This option is available when you select RIP Version 2 above. When this box is checked, RIP neighbor authentication is enabled and the following options become available: <ul style="list-style-type: none"> <li>• <b>Type</b> – Select <b>MD5</b> to use the MD5 hash algorithm for authentication (recommended), or select <b>Clear text</b> to use clear text for authentication.</li> <li>• <b>Key ID</b> – The identification number of the authentication key. This number must be shared with all other devices sending updates to and receiving updates from the security appliance. Valid values range from 1 to 255.</li> <li>• <b>Key</b> – The shared key used for authentication. This key must be shared with all other devices sending updates to and receiving updates from the security appliance. The key can be up to 16 characters.</li> </ul> </li> </ul> |

## RIP Page for PIX/ASA 7.2 and Later

**Note** From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functionality, it does not support any bug fixes or enhancements.

Use this RIP page to enable and configure the Routing Information Protocol (RIP) on PIX and ASA devices running operating system 7.2 or later. The RIP page consists of these tabbed panels:

- [RIP - Setup Tab , on page 2238](#)
- [RIP - Redistribution Tab , on page 2240](#)
- [RIP - Filtering Tab , on page 2241](#)
- [RIP - Interface Tab , on page 2242](#)

### Navigation Path

- (Device view) Select **Platform > Routing > RIP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > RIP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

When creating a shared RIP policy, you must choose a Version in the Create a Policy dialog box, as follows:

- **PIX/ASA 6.3-7.1 and FWSM**
- **PIX/ASA 7.2 and Later**

When assigning a shared RIP policy, be sure to assign the appropriate RIP policy for the device. For example, you cannot assign a PIX/ASA 7.2+ RIP policy to an FWSM.

## RIP - Setup Tab

Use the Setup panel to define RIP on the security appliance, and to configure global RIP protocol parameters. You can only enable a single RIP process on the security appliance.

### Navigation Path

You can access the Setup tab from the [RIP Page for PIX/ASA 7.2 and Later](#) , on page 2237.

## Field Reference

Table 805: Setup Tab

| Element                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Networks                       | <p>Define one or more networks for RIP routing. Enter IP address(es), or enter or Select the desired Network/Hosts objects (see <a href="#">Understanding Networks/Hosts Objects</a>, on page 308); IP addresses must not contain any subnet information. There is no limit to the number of networks you can add to the security appliance configuration.</p> <p>The RIP routing updates will be sent and received only through interfaces on the specified networks. Also, if the network of an interface is not specified, the interface will not be advertised in any RIP updates.</p>                                                                                                                                                                                                                                     |
| Passive Interface              | <p>Use this option to specify passive interfaces on the security appliance, and by extension the active interfaces. The device listens for RIP routing broadcasts on passive interfaces, using that information to populate its routing tables, but does not broadcast routing updates on passive interfaces. Interfaces that are not designated as passive, receive and send updates. Choose one of these options:</p> <ol style="list-style-type: none"> <li><b>None</b> – No interfaces are designated as passive.</li> <li><b>All Interfaces</b> – All interfaces on the device are designated as passive, except those entered the Excluded Interfaces field below.</li> <li><b>Specified Interfaces</b> – Only those interfaces explicitly specified in the Interfaces field below are designated as passive.</li> </ol> |
| Interfaces/Excluded Interfaces | <p>Use this field to specify the interfaces excluded from the passive list, or those explicitly designated as passive, depending on your choice from the Passive Interface list above:</p> <ul style="list-style-type: none"> <li>If you chose All Interfaces, this field is labeled <b>Excluded Interfaces</b>: enter or Select only those interfaces to be excluded (that is, those that are to be active not passive).</li> <li>If you chose Specified Interfaces in the Passive Interface list, enter or Select those interfaces that are to be designated as passive.</li> </ul> <p><b>Note</b> You cannot specify two different RIP configurations for the same interface.</p>                                                                                                                                           |
| RIP Version                    | <p>Choose the RIP versions for sending and receiving RIP updates:</p> <ul style="list-style-type: none"> <li>Receive Version 1 and 2, Send Version 1</li> <li>Send and Receive Version 1</li> <li>Send and Receive Version 2</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Generate Default Route         | <p>When selected, a default route is generated for distribution, based on the Route Map you specify.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Route Map           | Specify the route map to use for generating default routes.<br><br><b>Note</b> This field contains only the Route Map name. The Route Map is created and contained within a FlexConfig; see <a href="#">Understanding FlexConfig Policies and Policy Objects</a> , on page 340 for more information.                                                                                                 |
| Enable Auto-Summary | When Send and Receive Version 2 is the chosen RIP Version, this option is available. When checked, automatic route summarization is enabled. Disable automatic summarization if you must perform routing between disconnected subnets. When automatic summarization is disabled, subnets are advertised.<br><br><b>Note</b> RIP Version 1 always uses automatic summarization—you cannot disable it. |

## RIP - Redistribution Tab

Use the Redistribution panel to manage redistribution routes. These are the routes that are being redistributed from other routing processes into the RIP routing process. See [Add/Edit Redistribution Dialog Box](#) , on page 2122 for more information.

### Navigation Path

You can access the Redistribution tab from the [RIP Page for PIX/ASA 7.2 and Later](#) , on page 2237.

### Related Topics

- [RIP - Setup Tab](#) , on page 2238
- [RIP - Filtering Tab](#) , on page 2241
- [RIP - Interface Tab](#) , on page 2242

## Add/Edit Redistribution Dialog Box

Use the Add Redistribution and Edit Redistribution dialog boxes to add and edit redistribution routes on the [RIP - Redistribution Tab](#) , on page 2240. These are the routes that are being redistributed from other routing processes into the RIP routing process. Except for their titles, these two dialog boxes are identical.

### Navigation Path

You can access the Add and Edit Redistribution dialog boxes from the Redistribution tab on the [RIP Page for PIX/ASA 7.2 and Later](#) , on page 2237.

| Process ID               | Enter the process ID when the OSPF protocol is chosen.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Match                    | <p>If you are redistributing OSPF routes into the RIP routing process, you can select specific types of OSPF routes to redistribute. Ctrl-click to select multiple types:</p> <ul style="list-style-type: none"> <li>• <b>Internal</b> – Routes internal to the autonomous system (AS) are redistributed.</li> <li>• <b>External 1</b> – Type 1 routes external to the AS are redistributed.</li> <li>• <b>External 2</b> – Type 2 routes external to the AS are redistributed.</li> <li>• <b>NSSA External 1</b> – Type 1 routes external to a not-so-stubby area (NSSA) are redistributed.</li> <li>• <b>NSSA External 2</b> – Type 2 routes external to an NSSA are redistributed.</li> </ul> <p>Match criteria are optional. The default is match Internal, External 1, and External 2.</p> |
| Metric                   | <p>The RIP metric type to apply to the redistributed routes. The two choices are:</p> <ul style="list-style-type: none"> <li>• <b>Transparent</b> – Use the current route metric.</li> <li>• <b>Specified Value</b> – Assign a specific metric value.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Route Map                | <p>The name of a route map that must be satisfied before the route can be redistributed into the RIP routing process.</p> <p><b>Note</b> This field contains only the route Map name. The contents of the route map are created and contained within a FlexConfig. See <a href="#">Understanding FlexConfig Policies and Policy Objects</a>, on page 340 for more information.</p>                                                                                                                                                                                                                                                                                                                                                                                                              |

## RIP - Filtering Tab

Use the Filtering panel to manage filters for the RIP policy. Filters are used to limit network information in incoming and outgoing RIP advertisements. See [Add/Edit Filter Dialog Box](#), on page 2242 for more information.

### Navigation Path

You can access the Filtering tab from the [RIP Page for PIX/ASA 7.2 and Later](#), on page 2237.

### Related Topics

- [RIP - Setup Tab , on page 2238](#)
- [RIP - Redistribution Tab , on page 2240](#)
- [RIP - Interface Tab , on page 2242](#)

### Add/Edit Filter Dialog Box

Use the Add Filter and Edit Filter dialog boxes to add and edit RIP filters on the [RIP - Filtering Tab , on page 2241](#). Filters are used to limit network information in incoming and outgoing RIP advertisements. Except for their titles, these two dialog boxes are identical.

### Navigation Path

You can access the Add and Edit Filter dialog boxes from the Filtering tab on the [RIP Page for PIX/ASA 7.2 and Later , on page 2237](#).

### Field Reference

*Table 807: Add/Edit Filter Dialog Box*

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Traffic Direction | Choose the type of traffic to be filtered: <b>Inbound</b> or <b>Outbound</b> .<br><b>Note</b> If Traffic Direction is Inbound, you can define an Interface filter only.                                                                                                                                                                                                                                                                                                                                                                                                           |
| Filter On         | Specify whether the filter is based on an <b>Interface</b> or a <b>Route</b> .<br>If you select Interface, enter or Select the name of the interface on which routing updates are to be filtered.<br>If you select Route, choose the route type: <ul style="list-style-type: none"> <li>• <b>Static</b> – Only static routes are filtered.</li> <li>• <b>Connected</b> – Only connected routes are filtered.</li> <li>• <b>OSPF</b> – Only OSPF routes discovered by the specified OSPF process are filtered. Enter the Process ID of the OSPF process to be filtered.</li> </ul> |
| Filter ACLs       | Enter or Select the name of one or more access control lists (ACLs) that define the networks to be allowed or removed from RIP route advertisements.                                                                                                                                                                                                                                                                                                                                                                                                                              |

### RIP - Interface Tab

Use the Interface panel to manage the interfaces configured to send and receive RIP broadcasts. See [Add/Edit Interface Dialog Box , on page 2243](#) for more information.

### Navigation Path

You can access the Interface tab from the [RIP Page for PIX/ASA 7.2 and Later , on page 2237](#).

### Related Topics

- [RIP - Setup Tab , on page 2238](#)

|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface           | Enter or Select an interface defined on this appliance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Send (Version)      | These options let you override, for this interface, the global Send versions specified on the <a href="#">RIP - Setup Tab , on page 2238</a> . Select the appropriate boxes to specify sending updates using RIP Version 1, Version 2, or both.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Receive (Version)   | These options let you override the global Receive versions. Select the appropriate boxes to specify accepting updates using RIP Version 1 only, Version 2 only, or both.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Authentication Type | <p>Choose the authentication used on this interface for RIP broadcasts:</p> <ul style="list-style-type: none"> <li>• <b>None</b> – No authentication.</li> <li>• <b>MD5</b> – Employ MD5.</li> <li>• <b>Clear Text</b> – Employ clear-text authentication.</li> </ul> <p>If you choose MD5 or Clear Text, you must also provide the following authentication parameters:</p> <ul style="list-style-type: none"> <li>• <b>Key ID</b> – The ID of the authentication key. Valid values are from 0 to 255.</li> <li>• <b>Key</b> – The key used by the chosen authentication method. Can contain up to 16 characters.</li> <li>• <b>Confirm</b> – Enter the authentication key again, to confirm.</li> </ul> |

# Configuring Static Routes

A static route is a specific path to a particular destination network that is manually defined on the current device. Static routes are used in a variety of situations, and can be a quick and effective way to route data from one network to another when there is no dynamic route to the destination, or when use of a dynamic routing protocol is not feasible.

All routes have a value or “metric” that represents its priority of use. (This metric is also referred to as “administrative distance.”) When two or more routes to the same destination are available, devices use administrative distance to decide which route to use.

For static routes, the default metric value is one, which gives them precedence over routes from dynamic routing protocols. If you increase the metric to a value greater than that of a dynamic route, the static route operates as a back-up in the event that dynamic routing fails. For example, Open Shortest Path First (OSPF)-derived routes have a default administrative distance of 100. To configure a back-up static route that is overridden by an OSPF route, specify a metric value for the static route that is greater than 100. This is referred to as a “floating” static route.

There is a special kind of static route known as a default route, or a “zero-zero” route because all zeroes are used for both the destination address and subnet mask. The default static route serves as a catch-all gateway: if there are no matches for a particular destination in the device’s routing table, the default route is used. The default route generally includes a next-hop IP address or local exit interface.

Use the Static Route page to maintain manually defined static routes. The Static Route table on this page lists all currently defined static routes, showing for each, the name of the interface or interface role for which the route is defined, the destination network(s), the next hop gateway, the route metric, whether the route is tunneled, and whether there is service-level agreement tracking for the route. For a detailed explanation of these fields, see [Add/Edit Static Route Dialog Box , on page 2245](#) or [Add/Edit IPv6 Static Route Dialog Box , on page 2246](#).

## Static null0 Route Configuration

Typically ACLs are used for traffic filtering and they enable you to filter packets based on the information contained in their headers. In packet filtering, the ASA firewall examines packet headers to make a filtering decision, thus adding some overhead to the processing of the packets and affecting performance.

Static null 0 routing is a complementary solution to filtering. A static null0 route is used to forward unwanted or undesirable traffic into a black hole. The null interface null0, is used to create the black hole. Static routes are created for destinations that are not desirable, and the static route configuration points to the null interface. Any traffic that has a destination address that has a best match of the black hole static route is automatically dropped. Unlike with ACLs, static null0 routes do not cause any performance degradation.

The static null0 route configuration is used to prevent routing loops. BGP leverages the static null0 configuration for Remotely Triggered Black Hole routing.

## Navigation Path

- (Device view) Select **Platform > Routing > Static Route** or **Platform > Routing > IPv6 Static Route** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > Static Route** or **PIX/ASA/FWSM Platform > Routing > IPv6 Static Route** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Add/Edit Static Route Dialog Box

The Add/Edit Static Route dialog box lets you add or edit a static route.

**Navigation Path**

You can access the Add/Edit Static Route dialog box from the Static Routes page. Click the Add Row button to add a new static route; select an existing static route and click the Edit Row button to edit that route.

*Table 809: Add/Edit Static Route Dialog Box*

| Element   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface | <p>Enter or Select the interface to which this static route applies.</p> <p>Sending traffic to a Null0 interface results in dropping the packets destined to the specified network. This feature is useful in configuring Remotely Triggered Black Hole (RTBH) for BGP. For more information, see <a href="#">Configuring Static Routes</a> , on page 2244.</p> <p><b>Note</b> If Null0 is selected as the interface, the Gateway and Tunneled options are disabled.</p> |
| Network   | <p>Enter or Select the destination network(s). You can provide one or more IP address/netmask entries, one or more Networks/Hosts objects, or a combination of both; separate the entries with commas.</p> <p>Enter “0.0.0.0/0” or “any” to specify a default route.</p>                                                                                                                                                                                                 |
| Gateway   | <p>Enter or Select the gateway router which is the next hop for this route. You can provide an IP address, or a Networks/Hosts object.</p> <p><b>Note</b> If an IP address from one of the security appliance’s interfaces is used as the Gateway IP address, the security appliance will resolve the designated IP address in the packet instead of resolving the Gateway IP address.</p>                                                                               |

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Metric         | <p>The Metric is a measurement of the “expense” of a route, based on the number of hops (hop count) to the network on which a specific host resides. Hop count is the number of networks that a network packet must traverse, including the destination network, before it reaches its final destination. Because the hop count includes the destination network, all directly connected networks have a metric of 1.</p> <p>Enter the number of hops to the destination network. Valid values range from 1 to 255; the default value is 1.</p> <p>The maximum number of equal-cost (equal-metric) routes that can be defined per interface is three. You cannot add a route with the same metric on different interfaces that are on the same network.</p> |
| Tunneled       | Select this option to make this a tunnel route; can be used only for a default route. You can configure only one default tunneled gateway per device. The Tunneled option is not supported in transparent mode. Available only on PIX/ASA 7.0+ devices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Route Tracking | <p>To monitor route availability, enter or Select name of an SLA (service level agreement) object that defines the monitoring policy. Available only on PIX/ASA 7.2+ devices.</p> <p>For more information on route tracking, see <a href="#">Monitoring Service Level Agreements (SLAs) To Maintain Connectivity</a> , on page 2002.</p>                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Add/Edit IPv6 Static Route Dialog Box

The Add/Edit IPv6 Static Route dialog box lets you add or edit an IPv6 static route. IPv6 static routes are only supported on the following devices:

- ASA 7.0 and later (Routed mode)
- ASA 8.2 and later (Transparent mode)
- FWSM 3.1 and later (Routed mode)

### Navigation Path

You can access the Add/Edit IPv6 Static Route dialog box from the IPv6 Static Route page. Click the **Add Row** button to add a new static route; select an existing static route and click the **Edit Row** button to edit that route.

| IPv6 Network | <p>Enter or Select the destination network(s). You can provide one or more IP address entries, one or more Networks/Hosts objects, or a combination of both; separate the entries with commas.</p> <p>Enter two colons (::) to specify a default route.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| IPv6 Gateway | <p>Enter or Select the gateway router which is the next hop for this route. You can provide an IP address, or a Networks/Hosts object.</p> <p><b>Note</b> If an IP address from one of the security appliance's interfaces is used as the Gateway IP address, the security appliance will resolve the designated IP address in the packet instead of resolving the Gateway IP address.</p>                                                                                                                                                                                                                                                                                                                                                                  |
| Metric       | <p>The Metric is a measurement of the "expense" of a route, based on the number of hops (hop count) to the network on which a specific host resides. Hop count is the number of networks that a network packet must traverse, including the destination network, before it reaches its final destination. Because the hop count includes the destination network, all directly connected networks have a metric of 1.</p> <p>Enter the number of hops to the destination network. Valid values range from 1 to 255; the default value is 1.</p> <p>The maximum number of equal-cost (equal-metric) routes that can be defined per interface is three. You cannot add a route with the same metric on different interfaces that are on the same network.</p> |
| Tunneled     | <p>Select this option to specify the route as the default tunnel gateway for VPN traffic. You can configure only one default tunneled gateway per device. Available only on ASA 7.0+ devices in routed mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Configuring Policy Objects for ASA Routing Policies

There are several policy objects that you use with ASA routing policies. This reference explains the configuration of these policy objects.

This section contains the following topics:

- [Understanding Route Map Objects](#) , on page 2248
- [Add or Edit Policy List Object Dialog Box](#) , on page 2259
- [Add or Edit Prefix List Object Dialog Box](#) , on page 2262
- [Add or Edit Prefix List IPv6 Object Dialog Box](#) , on page 2264
- [Add or Edit As Path Object Dialog Boxes](#) , on page 2267
- [Add or Edit Community List Object Dialog Box](#) , on page 2268
- [Create BFD Template](#), on page 2179

## Understanding Route Map Objects

You can use route maps to define the conditions for redistributing routes from one routing protocol into another, or to enable policy routing.

Route maps have many features in common with widely known ACLs. These are some of the traits common to both:

- They are an ordered sequence of individual statements, each has a permit or deny result. Evaluation of ACL or route maps consists of a list scan, in a predetermined order, and an evaluation of the criteria of each statement that matches. A list scan is aborted once the first statement match is found and an action associated with the statement match is performed.
- They are generic mechanisms—Criteria matches and match interpretation are dictated by the way that they are applied. The same route map applied to different tasks might be interpreted differently.

These are some of the differences between route maps and ACLs:

- Route maps frequently use ACLs as matching criteria.

---

**Note** Route maps do not support ACLs that include a user, user group, security group tag, or fully qualified domain name objects.

---

- The main result from the evaluation of an ACL is a yes or no answer—An ACL either permits or denies input data. Applied to redistribution, an ACL determines if a particular route can (route matches ACLs permit statement) or can not (matches deny statement) be redistributed. Typical route maps not only permit (some) redistributed routes but also modify information associated with the route, when it is redistributed into another protocol.
- Route maps are more flexible than ACLs and can verify routes based on criteria which ACLs can not verify. For example, a route map can verify if the type of route is internal.
- Each ACL ends with an implicit deny statement, by design convention; there is no similar convention for route maps. If the end of a route map is reached during matching attempts, the result depends on the specific application of the route map. Fortunately, route maps that are applied to redistribution behave the same way as ACLs: if the route does not match any clause in a route map then the route redistribution is denied, as if the route map contained deny statement at the end.

Route maps are preferred if you intend to either modify route information during redistribution or if you need more powerful matching capability than an ACL can provide. If you simply need to selectively permit some routes based on their prefix or mask, we recommend that you use a route map to map to an ACL (or equivalent prefix list).

---

**Note** You must use a standard ACL as the match criterion for your route map. Using an extended ACL will not work, and your routes will never be redistributed. We recommend that you number clauses in intervals of 10 to reserve numbering space in case you need to insert clauses in the future.

---

### Permit and Deny Clauses

Route maps can have permit and deny clauses. If the match criteria are met for this route map, and the permit keyword is specified, the route is redistributed as controlled by the set actions. If the match criteria are not met, and the permit keyword is specified, the next route map with the same map tag is tested. If a route passes none of the match criteria for the set of route maps sharing the same name, it is not redistributed by that set. If the match criteria are met for the route map and the deny keyword is specified, the route is not redistributed.

The following rules apply:

- If you use an ACL in a route map using a permit clause, routes that are permitted by the ACL are redistributed.
- If you use an ACL in a route map deny clause, routes that are permitted by the ACL are not redistributed.
- If you use an ACL in a route map permit or deny clause, and the ACL denies a route, then the route map clause match is not found and the next route-map clause is evaluated.

### Match and Set Clause Values

Each entry in a route map statement contains a combination of match and set clauses. The match clause defines the criteria for whether appropriate packets meet the particular policy (that is, the conditions to be met). The set clause explains how the packets should be routed once they have met the match criteria.

For each route that is being redistributed, the router first evaluates the match criteria of a clause in the route map. If the match criteria succeed, then the route is redistributed or rejected as dictated by the permit or deny clause, and some of its attributes might be modified as defined by the set clause. If the match criteria fail, then this clause is not applicable to the route, and the software proceeds to evaluate the route against the next clause in the route map. Scanning of the route map continues until a clause is found whose match clause matches the route or until the end of the route map is reached.

A match or set value in each clause can be missed or repeated several times, if one of these conditions exists:

- If several Match Clause values are present in a clause, all must succeed for a given route in order for that route to match the clause (in other words, the logical AND algorithm is applied for multiple match commands).
- If a Match Clause value refers to several objects in one command, any of the objects should match (the logical OR algorithm is applied).
- If a Match Clause value is not present, all routes match the clause.
- If a Set Value is not present in a route map permit clause, then the route is redistributed without modification of its current attributes.

---

**Note** Do not configure a Set Value in a route map deny clause because the deny clause prohibits route redistribution—there is no information to modify.

---

A route map clause without a Match or Set value performs an action. An empty permit clause allows a redistribution of the remaining routes without modification. An empty deny clause does not allow a redistribution of other routes (this is the default action if a route map is completely scanned, but no explicit match is found).

### BGP Match and BGP Set Clauses

In addition to the match and set values described above, BGP provides additional match and set capabilities to route maps.

The following route-map match clauses are supported with BGP:

- match AS path access list
- match community
- match policy list

The following route-map set clauses are supported with BGP:

- set AS path
- set community
- set automatic tag
- set local preference
- set weight
- set origin
- set next hop
- set IP prefix list

### Creating and Using Route Map Objects

When configuring a policy that requires that you identify a route map, you can select or create route map objects by clicking the **Select** button next to the Route Map field. To create a new route map from the Route Map Object Selector dialog box, click the **Create** button beneath the route map list. You can also create route map objects from the [Policy Object Manager](#), on page 230 by selecting **Route Map** from the Object Type Selector and then clicking the **New Object** button. For information on the specific fields available when creating a route map object, see [Add or Edit Route Map Object Dialog Boxes](#), on page 2251.

### Note about the use of Route Map Objects in BGP Policies

Some of the match and set criteria used in route maps are not supported in all BGP subcommands. For example:

The following route map match criteria:

- Match Clause tab > Match first hop interface of route, Match Next Hop (IPv4 and IPv6), Match Route Source (IPv4 and IPv6), Match Metric Route Value, and Match Tag
- BGP Match Clause tab > Match AS path access lists

and the following route map set criteria:

- Set Clause tab > Metric Values (all fields) and Metric Type
- BGP Set Clause tab > Set AS path, Prepend AS path, and Prepend last AS to the AS path

are not supported in the following places:

- BGP policy > IPv4 Address Family:
  - Aggregate Address tab > Attribute Map, Advertise Map, and Suppress Map
  - Neighbor tab > Filtering tab
  - Route Injection tab > Inject Map and Exist Map

Security Manager allows you to use route maps in your BGP configuration even if the route map contains unsupported match or set criteria and you will not receive a warning or error during validation. In such cases, deployment will fail and you will receive an error from the device in the following format: ...%"My-Route-map" used as BGP inbound route-map, nexthop match not supported... .

Please refer to the ASA documentation for guidelines on the match/set criteria supported in route maps used in BGP configuration.

## Add or Edit Route Map Object Dialog Boxes

Use the Add/Edit Route Map Object dialog box to create, copy and edit route map policy objects. You can use route maps to define the conditions for redistributing routes from one routing protocol into another, or to enable policy routing.

### Navigation Path

Select **Manage > Policy Objects**, then select **Route Map** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

You can also create new IPv6 Prefix List objects from the Prefix List Object Selector. For more information, see <a href="#">Add or Edit Prefix List IPv6 Object Dialog Box</a> , on page 2264.</p>                                                                                                                                                                 |
| <b>Policy Based Routing (PBR) Tab</b>                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <p>Click the Policy Based Routing tab to define policy for traffic flows, and lessening reliance on routes derived from routing protocols. PBR gives you more control over routing by extending and complementing the existing mechanisms provided by routing protocols. PBR allows you to set the IP precedence. It also allows you to specify a path for certain traffic, such as priority traffic over a high-cost link.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Set Default Next-Hop IPv4 Address                                                                                                                                                                                                                                                                                                                                                                                               | <p>Check the Set default next-hop IPv4 address check box to indicate where to output packets that pass a match clause of a route map for policy routing. In the IPv4 Address enter the destination address.</p>                                                                                                                                                                                                                                                                                                                                |
| Set Default Next-Hop IPv6 Address                                                                                                                                                                                                                                                                                                                                                                                               | <p>Check the Set default next-hop IPv6 address check box to indicate where to output packets that pass a match clause of a route map for policy routing. | Recursively find and set Next-Hop IPv4 Address                                | Check the Recursively find and set next-hop IP address check box and specify an IP address in the IPv4 Address field. In this case, the next-hop IP address need not be on a directly connected subnet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Set Interfaces                                                                | Check the Set interfaces check box and select a destination interface from the Interfaces Selector dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Set Null0 Interfaces as Default Interface                                     | Check the Set null0 interface as the default interface check box, if there is a need to completely black hole or drop some traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Set do-not-fragment bit to either 0 or 1                                      | Check the Set do-not-fragment bit to either 1 or 0 and then select the appropriate radio button.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Set Differential Service Code point (DSCP) value in QoS bits for IPv4 packets | Check the Set differential service code point (DSCP) value in QoS bits for IPv4 packets check box and either enter a value between 0 and 63 or select a value from the Select Value drop-down list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Set Differential Service Code point (DSCP) value in QoS bits for IPv6 packets | Check the Set differential service code point (DSCP) value in QoS bits for IPv6 packets check box and either enter a value between 0 and 63 or select a value from the Select Value drop-down list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Set Adaptive Interface                                                        | <p>Check the <b>Set adaptive Interface</b> box, select the metrics from the drop-down list, and specify the interface in the Set Adaptive Interface dialog box to determine the best path for routing PBR traffic. Following are the adaptive interface metrics:</p> <ul style="list-style-type: none"> <li>• <b>cost</b>—Traffic is forwarded based on the priority of the interfaces.</li> <li>• <b>jitter</b>—Traffic is forwarded to the interface that has the lowest jitter value.</li> <li>• <b>lost</b>—Traffic is forwarded to the interface that has the the minimal packet loss.</li> <li>• <b>mos</b>—Traffic is forwarded to the interface that has the maximum mean opinion score (MOS)</li> <li>• <b>rtt</b>—Traffic is forwarded to the interface that has the the minimal round trip time (RTT)</li> </ul> |

## Add or Edit Policy List Object Dialog Box

Use the Add/Edit Policy List Object dialog box to create, copy, and edit policy list policy objects. You can create policy list objects to use when you are configuring route maps (see [Understanding Route Map Objects](#), on page 2248).

When a policy list is referenced within a route map, all of the match statements within the policy list are evaluated and processed. Two or more policy lists can be configured with a route map. A policy list can also coexist with any other preexisting match and set statements that are configured within the same route map but outside of the policy list. When multiple policy lists perform matching within a route map entry, all policy lists match on the incoming attribute only.

## Navigation Path

Select **Manage > Policy Objects**, then select **Policy List** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

**Table 813: Add/Edit Policy List Object Dialog Box**

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name            | <p>The name of the object. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects</a> , on page 235.</p> <p><b>Caution</b> Security Manager allows you to rename these objects even though you cannot rename them on the device. When you rename these objects in Security Manager, the name change is accomplished by negating the existing CLI, and then issuing new CLI to create and assign the object using the new name. This initial negation may cause routing/network issues in your environment. Security Manager will not provide a warning message about these consequences when you rename the object.</p> |
| Description     | An optional description of the object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Basic Tab       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Action          | <p>Whether to permit access for matching conditions or not.</p> <p><b>Note</b> The Action for a policy list object cannot be changed after the initial creation of the policy list object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Match Interface | <p>Select to distribute routes that have their next hop out of one of the interfaces specified. Enter or select the interfaces to match. Separate multiple entries with a comma. If you specify more than one interface, then the route can match either interface.</p> <p>Use the ellipsis to open the Interfaces Selector from which you can select one or more interfaces. You can also create new interface roles from the Interfaces Selector. For more information, see <a href="#">Understanding Interface Role Objects</a> , on page 301.</p>                                                                                                               |

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Match Address         | <p>Select to redistribute any routes that have a destination address that is permitted by a standard access list or prefix list. Choose whether to use an Access List or Prefix List for matching from the drop-down list and then enter or select the ACL objects or Prefix list objects you want to use for matching.</p> <p>Use the ellipsis to open the Access Control List Object Selector or Prefix List Object Selector from which you can select one or more objects. You can also create new objects from the object selector. For more information, see <a href="#">Add or Edit Access List Dialog Boxes</a> , on page 288 or <a href="#">Add or Edit Prefix List Object Dialog Box</a> , on page 2262.</p>                      |
| Match Next-Hop        | <p>Select to redistribute any routes that have a next hop router address passed by one of the access lists or prefix lists specified. Choose whether to use an Access List or Prefix List for matching from the drop-down list and then enter or select the ACL objects or Prefix list objects you want to use for matching.</p> <p>Use the ellipsis to open the Access Control List Object Selector or Prefix List Object Selector from which you can select one or more objects. You can also create new objects from the object selector. For more information, see <a href="#">Add or Edit Access List Dialog Boxes</a> , on page 288 or <a href="#">Add or Edit Prefix List Object Dialog Box</a> , on page 2262.</p>                 |
| Match Route Source    | <p>Select to redistribute routes that have been advertised by routers and access servers at the address specified by the access lists or prefix list. Choose whether to use an Access List or Prefix List for matching from the drop-down list and then enter or select the ACL objects or Prefix list objects you want to use for matching.</p> <p>Use the ellipsis to open the Access Control List Object Selector or Prefix List Object Selector from which you can select one or more objects. You can also create new objects from the object selector. For more information, see <a href="#">Add or Edit Access List Dialog Boxes</a> , on page 288 or <a href="#">Add or Edit Prefix List Object Dialog Box</a> , on page 2262.</p> |
| Advanced Tab          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Match AS Path         | <p>Select to match a BGP autonomous system path. If you specify more than one AS path, then the route can match either AS path.</p> <p>Use the ellipsis to open the AS Path Object Selector from which you can select one or more AS path objects. You can also create new AS path objects from the AS Path Object Selector. | Match Community Rules | <p>Select to enable matching the BGP community with the specified community. If you specify more than one community, then the route can match either community.</p> <p>Use the ellipsis to open the Community List Object Selector from which you can select one or more Community List objects. You can also create new Community List objects from the Community List Object Selector. For more information, see <a href="#">Add or Edit Community List Object Dialog Box</a> , on page 2268.</p> <p>To enable matching the BGP community exactly with the specified community, check the <b>exact-match</b> check box.</p>                                                                                                              |

| Element                         | Description                                                                                                                                                                                                                                                                                                           |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Match Metric                    | Enable or disable matching the metric of a route. Type the metric values to use for matching in the Match Metric field. You can enter multiple values separated by commas. This setting allows you to match any routes that have a specified metric. The metric values can range from 0 to 4294967295.                |
| Match Tag                       | Enable or disable matching the security group tag of a route. Type the tag values to use for matching in the Match Tag field. You can enter multiple values separated by commas. This setting allows you to match any routes that have a specified security group tag. The tag values can range from 0 to 4294967295. |
| Category                        | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                           |
| Allow Value Override per Device | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.                                           |
| Overrides Edit button           | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                                                          |

## Add or Edit Prefix List Object Dialog Box

Use the Add/Edit Prefix List Object dialog box to create, copy and edit prefix list policy objects. You can create prefix list objects to use when you are configuring route maps (see [Understanding Route Map Objects](#) , on page 2248), policy maps (see [Add or Edit Policy List Object Dialog Box](#) , on page 2259), OSPF Filtering (see [Add/Edit Filtering Dialog Box](#) , on page 2203), or BGP Neighbor Filtering (see [Add/Edit Neighbor Dialog Box](#) , on page 2102).

Area Border Router (ABR) type 3 link-state advertisement (LSA) filtering extends the capability of an ABR that is running OSPF to filter type 3 LSAs between different OSPF areas. Once a prefix list is configured, only the specified prefixes are sent from one OSPF area to another OSPF area. All other prefixes are restricted to their OSPF area. You can apply this type of area filtering to traffic going into or coming out of an OSPF area, or to both the incoming and outgoing traffic for that area.

When multiple entries of a prefix list match a given prefix, the entry with the lowest sequence number is used. For efficiency, you may want to put the most common matches or denials near the top of the list by manually assigning them a lower sequence number.

### Navigation Path

Select **Manage > Policy Objects**, then select **Prefix List** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p>                                                                                                                                                                                          |

## Add or Edit Prefix List Entry Dialog Box

Use the Add/Edit Prefix List Entry dialog box to create a new prefix list entry or edit an existing one.

### Navigation Path

From the [Add or Edit Prefix List Object Dialog Box](#), on page 2262, click the **Add** button beneath the Prefix List table or select an entry in the table and click the **Edit** button.

### Field Reference

*Table 815: Add/Edit Prefix List Entry Dialog Box*

| Element               | Description                                                                                                                                                                                                                                                                   |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action                | Select the Permit or Deny radio button to indicate the redistribution access.                                                                                                                                                                                                 |
| Sequence No           | (Optional) Unique number that indicates the position a new prefix list entry will have in the list of prefix list entries already configured for this object. If left blank, the sequence number will default to five more than the largest sequence number currently in use. |
| IP Address            | Specify the prefix number in the format of IP address/mask length.                                                                                                                                                                                                            |
| Minimum Prefix Length | (Optional) Enter the minimum prefix length.<br>The value must be greater than the mask length and less than or equal to the Maximum Prefix Length, if specified.                                                                                                              |
| Maximum Prefix Length | (Optional) Enter the maximum prefix length.<br>The value must be greater than or equal to the Minimum Prefix Length, if present, or greater than the mask length if the Minimum Prefix Length is not specified.                                                               |

## Add or Edit Prefix List IPv6 Object Dialog Box

Use the Add/Edit Prefix List IPv6 Object dialog box to create, copy and edit IPv6 prefix list policy objects. You can create IPv6 prefix list objects to use when you are configuring route maps (see [Understanding Route Map Objects](#), on page 2248), policy maps (see [Add or Edit Policy List Object Dialog Box](#), on page 2259), OSPF Filtering (see [Add/Edit Filtering Dialog Box](#), on page 2203), or BGP Neighbor Filtering (see [Add/Edit Neighbor Dialog Box](#), on page 2115).

Area Border Router (ABR) type 3 link-state advertisement (LSA) filtering extends the capability of an ABR that is running OSPF to filter type 3 LSAs between different OSPF areas. Once a prefix list is configured, only the specified prefixes are sent from one OSPF area to another OSPF area. All other prefixes are restricted to their OSPF area. You can apply this type of area filtering to traffic going into or coming out of an OSPF area, or to both the incoming and outgoing traffic for that area.

When multiple entries of a prefix list match a given prefix, the entry with the lowest sequence number is used. For efficiency, you may want to put the most common matches or denials near the top of the list by manually assigning them a lower sequence number.

### Navigation Path

Select **Manage > Policy Objects**, then select **Prefix ListIPv6** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

When you rename these objects in Security Manager, the name change is accomplished by negating the existing CLI, and then issuing new CLI to create and assign the object using the new name. This initial negation may cause routing/network issues in your environment. Security Manager will not provide a warning message about these consequences when you rename the object.</p> |
| Description            | An optional description of the object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## Add or Edit IPv6 Prefix List Entry Dialog Box

Use the Add/Edit IPv6 Prefix List Entry dialog box to create a new IPv6 prefix list entry or edit an existing one.

### Navigation Path

From the [Add or Edit IPv6 Prefix List Entry Dialog Box](#) , on page 2266, click the **Add** button beneath the Prefix List table or select an entry in the table and click the **Edit** button.

### Field Reference

**Table 817: Add/Edit Prefix List Entry Dialog Box**

| Element               | Description                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action                | Select the Permit or Deny radio button to indicate the redistribution access.                                                                                                                                                                                                                                                                                      |
| Sequence No           | (Optional) Unique number that indicates the position a new IPv6 prefix list entry will have in the list of IPv6 prefix list entries already configured for this object. If left blank, the sequence number will default to five more than the largest sequence number currently in use.<br><br><b>Note</b> Sequence Number must be in the range of 1 to 4294967295 |
| IPv6 Address          | Specify the prefix number in the format: IPv6 address/mask length where mask length is less than or equal to 128.                                                                                                                                                                                                                                                  |
| Minimum Prefix Length | (Optional) Enter the minimum prefix length in the range of 1 to 128.<br><br>The value must be greater than the mask length and less than or equal to the Maximum Prefix Length, if specified.                                                                                                                                                                      |
| Maximum Prefix Length | (Optional) Enter the maximum prefix length in the range of 1 to 128.<br><br>The value must be greater than or equal to the Minimum Prefix Length, if present, or greater than the mask length if the Minimum Prefix Length is not specified.                                                                                                                       |

## Add or Edit As Path Object Dialog Boxes

Use the Add/Edit As Path Object dialog box to create, copy and edit autonomous system (AS) path policy objects. You can create AS path objects to use when you are configuring route maps (see [Understanding Route Map Objects](#) , on page 2248), policy maps (see [Add or Edit Policy List Object Dialog Box](#) , on page 2259), or BGP Neighbor Filtering (see [Add/Edit Neighbor Dialog Box](#) , on page 2102).

An AS path filter allows you to filter the routing update message by using access lists and look at the individual prefixes within an update message. If a prefix within the update message matches the filter criteria then that individual prefix is filtered out or accepted depending on what action the filter entry has been configured to carry out.

**Note** AS path object names must be a unique integer from 1-500. If an AS path object is discovered from a device or configuration file that uses the same name as an existing AS path object, the AS path object on Security Manager will be overwritten regardless of the Allow Device Override for Discovered Policy Objects setting on the Security Manager Administration - Discovery page.

### Navigation Path

Select **Manage > Policy Objects**, then select **As Path** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

## Add or Edit As Path Entry Dialog Box

Use the Add/Edit As Path Entry dialog box to create a new autonomous system (AS) path entry or edit an existing one.

### Navigation Path

From the [Add or Edit As Path Object Dialog Boxes](#) , on page 2267, click the **Add Row** button beneath the As Path table or select an entry and click the **Edit Row** button.

### Field Reference

*Table 819: Add/Edit As Path Entry Dialog Box*

| Element | Description                                                                                                                                                                                                                         |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action  | Select the <b>Permit</b> or <b>Deny</b> radio button to indicate the redistribution access.                                                                                                                                         |
| Reg Exp | Specify the regular expression that defines the AS path filter. For information on the metacharacters you can use to build regular expressions, see <a href="#">Metacharacters Used to Build Regular Expressions</a> , on page 878. |

## Add or Edit Community List Object Dialog Box

Use the Add/Edit Community List Object dialog box to create, copy and edit community list policy objects. You can create community list objects to use when you are configuring route maps (see [Understanding Route Map Objects](#) , on page 2248) or policy maps (see [Add or Edit Policy List Object Dialog Box](#) , on page 2259).

A community is a group of destinations that share some common attribute. You can use community lists to create groups of communities to use in a match clause of a route map. Just like an access list, a series of community lists can be created. Statements are checked until a match is found. As soon as one statement is satisfied, the test is concluded.

### Navigation Path

Select **Manage > Policy Objects**, then select **Community List** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

| Name                 | The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects</a> , on page 235.                                                                                                                                                                                                                                                                                                                                                                                              |
| Description          | An optional description of the object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Community List table | The community list entries that are defined in the object. <ul style="list-style-type: none"> <li>• To add a community list entry, click the <b>Add</b> button to open the <a href="#">Add or Edit Community List Entry Dialog Box</a> , on page 2270.</li> <li>• To edit a community list entry, select it and click the <b>Edit</b> button.</li> <li>• To delete a community list entry, select it and click the <b>Delete</b> button.</li> <li>• To rearrange the entries, select an entry and then click the <b>Move Up</b> or <b>Move Down</b> button.</li> </ul> |
| Category             | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                                                                                            |

| Element                                   | Description                                                                                                                                                                                                                                                                 |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Allow Value Override per Device Overrides | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244. |
| Edit button                               | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                |

## Add or Edit Community List Entry Dialog Box

Use the Add/Edit Community List Entry dialog box to create a new community list entry or edit an existing one.

### Navigation Path

From the [Add or Edit Community List Object Dialog Box](#) , on page 2268, click the **Add** button beneath the Community List table or select an entry in the table and click the **Edit** button.

### Field Reference

*Table 821: Add/Edit Community List Entry Dialog Box*

| Element      | Description                                                                                                                                                                                                                                                    |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type         | Select the <b>Standard</b> or <b>Expanded</b> radio button to indicate the community rule type.<br><b>Note</b> You cannot have entries using Standard and entries using Expanded community rule types in the same Community List object.                       |
| Action       | Select the <b>Permit</b> or <b>Deny</b> radio button to indicate the redistribution access.                                                                                                                                                                    |
| Communities  | Specify a community number. Valid values can be from 1 to 4294967295 or from 0:1 to 65534:65535.                                                                                                                                                               |
| internet     | Select to specify the Internet well-known community. Routes with this community are advertised to all peers (internal and external).                                                                                                                           |
| no-advertise | Select to specify the no-advertise well-known community. Routes with this community are not advertised to any peer (internal or external).                                                                                                                     |
| no-export    | Select to specify the no-export well-known community. Routes with this community are advertised to only peers in the same autonomous system or to only other sub-autonomous systems within a confederation. These routes are not advertised to external peers. |
| Expressions  | For an expanded community list, specify the regular expression. For information on the metacharacters you can use to build regular expressions, see <a href="#">Metacharacters Used to Build Regular Expressions</a> , on page 878.                            |

## CHAPTER 57

# Configuring Security Policies on Firewall Devices

---

You can configure general security settings for the device using the General page and the Timeouts page under Platform > Security. You can enable anti-spoofing on interfaces, configure IP fragment settings, and configure a variety of timeout values for the device.

This chapter contains the following topics:

- [General Page](#) , on page 2271
- [Configuring Timeouts](#) , on page 2274

## General Page

Use the General page to configure security settings that help protect against malformed packets, spoofed packets, fragmented packets, and denial of service attacks. See [Configuring Floodguard, Anti-Spoofing and Fragment Settings](#) , on page 2272 for more information about the settings on this page.

### Navigation Path

- (Device view) Select **Platform > Security > General** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Security > General** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Related Topics

- [Add/Edit General Security Configuration Dialog Box](#) , on page 2274
- [Configuring Timeouts](#) , on page 2274

## Field Reference

| Element                                                                                                                                                                                                                                                                                                                                                                                                                              | Description                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Disable Floodguard (PIX 6.3 and FWSM 2.x only)                                                                                                                                                                                                                                                                                                                                                                                       | Check this box to disable Floodguard on the firewall device. This option is available only on PIX 6.3 and FWSM 2.x devices. See <a href="#">Configuring Floodguard, Anti-Spoofing and Fragment Settings</a> , on page 2272 for more information about the Floodguard feature.                                                                |
| <b>Global Fragment Settings</b>                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                              |
| Use these options to configure global fragment settings for the device. You can override these settings for individual interfaces; see <a href="#">Add/Edit General Security Configuration Dialog Box</a> , on page 2274 for more information.                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                              |
| Enable Default Settings                                                                                                                                                                                                                                                                                                                                                                                                              | Check this box to enable the default fragment settings fields.                                                                                                                                                                                                                                                                               |
| Size                                                                                                                                                                                                                                                                                                                                                                                                                                 | Specify the maximum number of fragments that can be in the IP re-assembly database waiting for re-assembly. The default is 200.                                                                                                                                                                                                              |
| Chain                                                                                                                                                                                                                                                                                                                                                                                                                                | Specify the maximum number of fragments into which a full IP packet can be fragmented. The default is 24 packets.                                                                                                                                                                                                                            |
| Timeout                                                                                                                                                                                                                                                                                                                                                                                                                              | Specify the maximum number of seconds to wait for an entire fragmented packet to arrive. The timer starts after the first fragment of a packet arrives. If all fragments of the packet do not arrive by the number of seconds specified, all fragments of the packet that were already received will be discarded. The default is 5 seconds. |
| <b>Interface Configuration Table</b>                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                              |
| This table lists all interfaces on which individual anti-spoofing and fragment settings have been defined. Refer to <a href="#">Configuring Floodguard, Anti-Spoofing and Fragment Settings</a> , on page 2272 for more information about these settings. Refer to <a href="#">Add/Edit General Security Configuration Dialog Box</a> , on page 2274 for more information about configuring these settings on individual interfaces. |                                                                                                                                                                                                                                                                                                                                              |

## Configuring Floodguard, Anti-Spoofing and Fragment Settings

Use the General page under Platform > Security to enable or disable Floodguard (on a PIX 6.3 or FWSM 2.x device), to enable Unicast Reverse Path Forwarding (anti-spoofing) on individual interfaces, and to configure IP fragment settings for the device, and for each interface of the device.

### Floodguard

Floodguard lets you reclaim firewall resources if the user authentication subsystem runs out of resources. If an inbound or outbound uauth connection is being attacked or overused, the firewall will actively reclaim TCP user resources.

If the user authentication subsystem is depleted, TCP user resources in different states are reclaimed in the following order, depending on urgency:

1. Timewait

2. LastAck
3. FinWait
4. Embryonic
5. Idle

Floodguard is enabled by default. This option applies only to PIX 6.3 or FWSM 2.x devices.

### Anti-spoofing

Unicast Reverse Path Forwarding (RPF) guards against IP spoofing—a packet using an incorrect source IP address to obscure its true source—by ensuring that all packets have a source IP address that matches the correct source interface according to the routing table.

Normally, the security appliance looks only at the destination address when determining where to forward the packet. Unicast RPF instructs the security appliance to also look at the source address; this is why it is called Reverse Path Forwarding. For any traffic that you want to allow through the security appliance, the security appliance routing table must include a route back to the source address. See RFC 2267 for more information.

With outside traffic, for example, the security appliance can use the default route to satisfy the Unicast RPF protection. If traffic enters from an outside interface, and the source address is not known to the routing table, the security appliance uses the default route to correctly identify the outside interface as the source interface.

If traffic enters the outside interface from an address that is known to the routing table, but is associated with the inside interface, the security appliance drops the packet. Similarly, if traffic enters the inside interface from an unknown source address, the security appliance drops the packet because the matching route (the default route) indicates the outside interface.

Unicast RPF is implemented as follows:

- ICMP packets have no session, so each packet is checked.
- UDP and TCP have sessions, so the initial packet requires a reverse route look-up. Subsequent packets arriving during the session are checked using an existing state maintained as part of the session. Non-initial packets are checked to ensure they arrived on the same interface used by the initial packet.

### Fragment Settings

Fragment settings provide management of packet fragmentation and improve compatibility with the Network File System (NFS). By default, the security appliance allows up to 24 fragments per IP packet, and up to 200 fragments awaiting reassembly. You might need to allow fragments on your network if you have an application that routinely fragments packets, such as NFS over UDP. However, if you do not have an application that fragments traffic, we recommend that you do not allow fragments through the security appliance, as fragmented packets are often used as DoS attacks.

| Element                            | Description                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                          | Enter or Select the name of the interface for which you want to configure anti-spoofing or fragment settings.                                                                                                                                                                                                                                                           |
| Enable Anti-Spoofing               | Check this box to enable Unicast RPF (anti-spoofing) on the specified interface.                                                                                                                                                                                                                                                                                        |
| Override Default Fragment Settings | To override the default fragment settings on the specified interface, check this box to enable the following fields, and then enter the new values. See the <a href="#">General Page</a> , on page 2271 for the default global fragment settings on the device.                                                                                                         |
| Size                               | Specify the maximum number of fragments that can be in the IP re-assembly database waiting for re-assembly for the specified interface. The default is 200.                                                                                                                                                                                                             |
| Chain                              | Specify the maximum number of fragments into which a full IP packet can be fragmented for the specified interface. The default is 24 packets.                                                                                                                                                                                                                           |
| Timeout                            | Specify the maximum number of seconds to wait for an entire fragmented packet to arrive on the specified interface. The timer starts after the first fragment of a packet arrives. If all fragments of the packet do not arrive by the number of seconds specified, all fragments of the packet that were already received will be discarded. The default is 5 seconds. |

## Configuring Timeouts

The Timeouts page lets you set a variety of timeout values on the security appliance. All times are in the format **hh:mm:ss**.

These values represent idle timeouts for the connection and translation slots for various protocols. If a slot has not been used for the idle time specified, the resource is returned to the free pool. TCP connection slots are freed approximately 60 seconds after a normal connection close sequence.

**Danger** We recommend that you do not change these values unless advised to do so by Customer Support.

### Navigation Path

- (Device view) Select **Platform > Security > Timeouts** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Security > Timeouts** from the Policy Types selector. Select an existing policy from the Policies selector, or create a new one.

### Field Reference

*Table 824: Timeouts Page*

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                 | To change the timeout value for a parameter, click the radio button to the left of the parameter entry to activate it, and then enter the new value in the parameter field. To reset any value to its default, click the related Default button.<br><br>Clicking the Disable button, where provided, disables the timeout by setting its value to 0:00:00. Follow either of the procedures in the previous paragraph to re-enable a disabled value. |
| Translation Slot (xlate)        | Length of time idle until a translation slot is freed. This value must be at least 1 minute; the default is 3 hours. Enter 0:00:00 to disable this timeout.                                                                                                                                                                                                                                                                                         |
| Connection (conn)               | Length of time idle until a connection slot is freed. This value must be at least 5 minutes; the default is 1 hour. Click Disable or enter 0:00:00 to disable this timeout.                                                                                                                                                                                                                                                                         |
| Half-Closed                     | Length of time idle until a half-closed TCP connection is closed. For ASA 9.1.2 and later devices, the minimum is 30 seconds. For all other devices, the minimum is 5 minutes. The default is 10 minutes. Click Disable or enter 0:00:00 to disable this timeout.                                                                                                                                                                                   |
| UDP                             | Length of time idle until a UDP protocol connection is closed. This value must be at least 1 minute; the default is 2 minutes. Click Disable or enter 0:00:00 to disable this timeout.                                                                                                                                                                                                                                                              |
| SCTP                            | Length of time idle until a SCTP protocol connection is closed. This value must be at least 1 minute; the default is 2 minutes. Click Disable or enter 0:00:00 to disable this timeout.                                                                                                                                                                                                                                                             |
| Connection Holddown             | Length of time idle until traffic is forwarded. This is the time for which the ASA waits before forwarding traffic, to avoid route flapping. This value must be at least 1 second; the default is 15 seconds. Click Disable or enter 0:00:00 to disable this timeout.                                                                                                                                                                               |
| ICMP (PIX 7.x+, ASA, FWSM 3.x+) | Length of time idle after which general ICMP states are closed.                                                                                                                                                                                                                                                                                                                                                                                     |

| Element                                              | Description                                                                                                                                                                                                                                                                 |
|------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RPC/Sun RPC                                          | Length of time idle until a SunRPC slot is freed. This value must be at least 1 minute; the default is 10 minutes. Click Disable or enter 0:00:00 to disable this timeout.                                                                                                  |
| H.225                                                | Length of time idle until an H.225 signaling connection is closed. The H.225 default timeout is 1 hour (01:00:00). Setting the value to 00:00:00 means never close the connection. To close a connection immediately after all calls are cleared, enter 1 second (0:00:01). |
| H.323                                                | Length of time idle until an H.323 media connection is closed. The default is 5 minutes. Click Disable or enter 0:00:00 to disable this timeout.                                                                                                                            |
| MGCP                                                 | Length of time idle after which MGCP media ports are closed. The default is 5 minutes (0:05:00). Click Disable or enter 0:00:00 to disable this timeout.                                                                                                                    |
| MGCP PAT (PIX 7.x+, ASA, FWSM 3.x+)                  | Length of time idle after which an MGCP PAT translation is removed. The minimum time is 30 seconds; the default is 5 minutes (0:05:00). Click Disable or enter 0:00:00 to disable this timeout.                                                                             |
| SIP                                                  | Length of time idle until an SIP signaling port connection is closed. This value must be at least 5 minutes; the default is 30 minutes. Click Disable or enter 0:00:00 to disable this timeout.                                                                             |
| SIP Media                                            | Length of time idle until an SIP media port connection is closed. This value must be at least 1 minute; the default is 2 minutes. Click Disable or enter 0:00:00 to disable this timeout.                                                                                   |
| SIP Disconnect (PIX 6.3(5), PIX/ASA 7.2+, FWSM 3.2+) | Length of time idle after which a SIP session is deleted if the 200 OK is not received for a CANCEL or a BYE message. The minimum value is 0:00:01; the maximum value is 0:10:00. The default value is 0:02:00.                                                             |
| SIP Invite (PIX 6.3(5), PIX/ASA 7.2+, FWSM 3.2+)     | Length of time idle after which pinholes for PROVISIONAL responses and media xlates will be closed. The minimum value is 0:01:00; the maximum value is 0:30:00. The default value is 0:03:00.                                                                               |
| SIP Provisional Media (PIX/ASA 7.2(3)+)              | The timeout value for SIP provisional media connections; must be a value between 0:01:00 and 1193:00:00. The default is 2 minutes.                                                                                                                                          |

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Auth. (uath) Absolute   | <p>Length of time until the authentication cache times out and new connections must be re-authenticated. The system waits until a user starts a new connection to prompt for re-authentication. This time must be shorter than the Translation Slot value. Click Disable or enter 0:00:00 to disable caching and require re-re-authentication on every new connection.</p> <p><b>Note</b> Do not set this value to 0:00:00 if passive FTP is used on the connections.</p> <p><b>Note</b> If you set this value to 0:00:00; HTTPS authentication may not work. If a browser initiates multiple TCP connections to load a Web page after HTTPS authentication, the first connection is permitted through, but subsequent connections trigger authentication. As a result, users are continuously presented with an authentication page, even after successful authentication. To work around this, set the authentication absolute timeout to 1 second. However, this workaround opens a one-second window of opportunity that might allow non-authenticated users through the firewall if they are coming from the same source IP address.</p> |
| Auth. (uath) Inactivity | <p>Length of time idle until the authentication cache times out and users have to re-authenticate new connections. This duration must be shorter than the Translation Slot value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| IGP                     | <p>The Cisco ASA supports Non-Stop Forwarding from software Version 9.3.1 and later for dynamic routing protocols— Border Gateway Protocol (BGP) and Open Shortest Path First (OSPF). The length of convergence time of Open Shortest Path First (OSPF) is 70 seconds by default.</p> <p>Using this field, you can change the length of the convergence time. This value must be within the range of 10 seconds to 1 hour and 40 seconds. The default value for IGP is 0:01:10.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## CHAPTER 58

# Configuring Service Policy Rules on Firewall Devices

---

This section describes configuring service policy rules. Service policies provide a consistent and flexible way to configure certain security appliance features, including priority queuing, application inspection, and QoS (quality of service). For example, you can use a service policy to create a timeout configuration that is specific to a particular TCP application, as opposed to one that applies to all TCP applications.

- [About Service Policy Rules, on page 2279](#)
- [About TCP State Bypass , on page 2280](#)
- [Priority Queues Page , on page 2282](#)
- [Service Policy Rules Page , on page 2283](#)
- [Configuring Traffic Flow Objects , on page 2297](#)
- [Configuring TCP Maps , on page 2301](#)

## About Service Policy Rules

Service policy rules encompass these features:

- TCP and general connection settings (including TCP State Bypass; see [About TCP State Bypass , on page 2280](#))
- Content security control (CSC)
- Application inspection
- Intrusion Prevention Services
- QoS queuing and policing
- ASA CX redirection (see [About the ASA CX , on page 2296](#))
- ASA FirePOWER redirection
- User statistics for identity-based firewall policies

The configuration options for these features are presented on two pages in Security Manager—**Priority Queues** and **Rules**—accessed by navigating to Platform > Service Policy.

## Priority Queuing

Priority queuing establishes two queues on an interface, a Low Latency Queuing (LLQ) priority queue and a “best effort” queue. This lets you prioritize latency-sensitive traffic like voice and video, so it is transmitted ahead of other traffic. Packets in the priority queue are always transmitted before packets in the best effort queue.

Because queues are not of infinite size, they can fill and overflow. When a queue is full, additional packets cannot get into the queue and are dropped. This is called “tail drop.” To minimize tail drop, you can increase the queue buffer size. You can also fine-tune the maximum number of packets allowed into the transmit queue. These options let you control the latency and robustness of priority queuing.

Priority queuing is a Quality of Service (QoS) feature. In Security Manager, priority queue size and transmit queue size are managed on the [Priority Queues Page](#), on page 2282, while establishment of priority queuing for a traffic class is an option on the QoS tab of the Service Policy (MPC) Rule Wizard, which is accessed from the [Service Policy Rules Page](#), on page 2283.

## Application Inspection and QoS

Some applications require special handling by the security appliance, and specific application inspection engines are provided for this purpose. Specifically, applications that embed IP addressing information in the user data packet, or open secondary channels on dynamically assigned ports require special inspection.

Application inspection is enabled by default for many protocols, while it is disabled for others. In many cases, you can change the port which the application inspection engine monitors for traffic.

Application inspection engines work with network address translation (NAT) to help identify the location of embedded addressing information. This allows NAT to translate these embedded addresses, and to update any checksum or other fields that are affected by the translation.

Service policy rules define how specific types of application inspection are applied to different types of traffic processed by the security appliance. You can apply rules to specific interfaces, or globally to every interface.

These rules provide a means to configure security appliance features in a manner similar to the Cisco IOS software quality-of-service (QoS) CLI. For example, with service policy rules you can include IP Precedence as one of the criteria to identify traffic for rate-limiting. You can also create a timeout configuration that is specific to a particular TCP application, as opposed to one that applies to all TCP applications.

Traffic match criteria are used to define the types of traffic to which you want to apply application inspection. For example, TCP traffic on port 23 might be classified as the Telnet traffic class. You then might use the traffic class to apply connection limits.

Multiple traffic match criteria can be assigned to a single interface, but a packet will only match the first criteria within a specific service policy rule.

# About TCP State Bypass

By default, all traffic that enters an ASA or FWSM is inspected using the Adaptive Security Algorithm, and is either allowed through or dropped based on the security policy. The device maximizes its firewall performance by checking the state of each packet—to determine whether this a new connection, or an established connection—and assigning it to the session management path (if it is a new connection SYN packet), the fast path (if it is an established connection), or the control-plane path (for advanced inspection).

---

**Note** TCP State Bypass is available on FWSM 3.2+ and ASA 8.2+ devices only.

---

TCP packets that match existing connections in the fast path can pass through the appliance without every aspect of the security policy being rechecked. This feature maximizes performance. However, the method of establishing the session in the fast path using the SYN packet, and the checks that occur in the fast path (such as TCP sequence number), require that both outbound and inbound flows for a connection pass through the same device, which is not the case in asymmetric routing environments.

For example, assume a new connection is assigned to security device 1. The SYN packet goes through the session management path, and an entry for the connection is added to the fast path table. If subsequent packets of this connection go through device 1, then the packets match the entry in the fast path, and are passed through. But if subsequent packets go to device 2, where a SYN packet did not go through the session management path, there is no entry in the fast path for the connection, and the packets are dropped.

Thus, if you have asymmetric routing configured on upstream routers, and traffic alternates between two security devices, enable TCP state bypass for those specific traffic flows. TCP state bypass alters the way sessions are established in the fast path and disables the fast path checks. TCP traffic is then treated much as a UDP connection is treated: when a non-SYN packet matching the specified networks enters the security device, and there is not a fast path entry, then the packet goes through the session management path to establish a connection in the fast path. Once in the fast path, the traffic bypasses the fast path checks.

### Unsupported Features

The following features are not supported when you enable TCP state bypass:

- Application inspection – Application inspection requires both inbound and outbound traffic to go through the same security device, so application inspection is not supported with TCP state bypass.
- AAA authenticated sessions – When a user authenticates with one security device, traffic returning via the other security device will be denied because the user did not authenticate with that device.
- TCP Intercept, Maximum Embryonic Connections limit, TCP sequence number randomization – If TCP state bypass is enabled, the device does not keep track of the state of the connection, so these features are not applicable.
- Cisco CSC SSM (Content Security and Control Security Services Module) – SSM and SSC functionality cannot be used with TCP state bypass.

### Compatibility with NAT

Because the translation session is established separately for each security device, be sure to configure static NAT on both devices for TCP state bypass traffic; if you use dynamic NAT, the address chosen for the session on device 1 will differ from the address chosen for the session on device 2.

# Priority Queues Page

Priority queues let you define how traffic is prioritized in the network. You can define a series of filters based on packet characteristics to cause traffic to be placed in a higher or lower priority queue. The queue with the highest priority is serviced first until it is empty, then the lower queues are serviced in sequence.

In Security Manager, priority queue size and transmit queue size are managed on this page, while establishment of priority queuing for a traffic class is an option on the QoS tab of the Service Policy (MPC) Rule Wizard, which is accessed from the [Service Policy Rules Page](#) , on page 2283.

The Priority Queue Configuration dialog box is used to add and edit these queues. Refer to [Priority Queue Configuration Dialog Box](#) , on page 2282 for descriptions of the fields displayed in the Priority Queues table on this page.

---

**Note** Priority queuing is not available on Catalyst 6500 service modules (the Firewall Services Module and the Adaptive Security Appliance Service Module).

---

## Navigation Path

- (Device view) Select **Platform** > **Service Policy** > **Priority Queues** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform** > **Service Policy** > **Priority Queues** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Table 825: Priority Queue Configuration Dialog Box**

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name          | Specify the interface to which this rule applies; you can enter the interface name, or click Select to choose an available interface.                                                                                                                                                                                                                                                                                                                  |
| Queue Limit             | Enter the maximum number of packets that can be queued in a priority queue before it drops data. This limit must be in the range of 0 through 2048 packets.                                                                                                                                                                                                                                                                                            |
| Transmission Ring Limit | Enter the maximum number of packets allowed into the transmit queue. This fine-tuning of the transmit queue can reduce latency and offer better performance through the transmit driver.<br><br>On PIX devices, this value can range from 3 through 128 packets. On ASAs prior to version 7.2, this limit can be in the range 3 through 256 packets, while on ASAs running version 7.2 and later, the value can be in the range 3 through 512 packets. |

## Service Policy Rules Page

Use the Service Policy Rules page to define new service policy rules, and to edit or delete existing service policy rules.

Configuring Service Policy Rules consists of three tasks:

1. **Configure a service policy.** Create a service policy and determine the interfaces to which the service policy applies. For more information, see [Step 1. Configure a Service Policy](#) , on page 2284.
2. **Configure the traffic class.** Specify the criteria you want to use to identify the traffic to which the service policy applies. For more information, see [Step 2. Configure the traffic class](#) , on page 2285.
3. **Configure the actions.** Specify the actions that should be taken to protect information or resources, or to perform QoS functions for the traffic specified in this service policy. For more information, see [Step 3. Configure the MPC actions](#) , on page 2286.

The three tasks are performed using the [Insert/Edit Service Policy \(MPC\) Rule Wizard](#) , on page 2284. Refer to the individual task topics for descriptions of the fields displayed in the Service Policy Rules table on this page.

### Navigation Path

- (Device view) Select **Platform** > **Service Policy** > **Rules** from the Device Policy selector.

- (Policy view) Select **PIX/ASA/FWSM Platform > Service Policy > Rules** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### ASA CX Auth Proxy Configuration

The CXSC Auth Proxy button below the Service Policy Rules table opens the Add/Edit CXSC Auth Proxy Configuration dialog box, which is described in [ASA CX Auth Proxy Configuration , on page 2296](#).

The CXSC Auth Proxy button is available below the Service Policy Rules table only in Device view; it is not visible in Policy view.

---

**Note** Security Manager uses “CXSC” in some places to refer to an ASA CX Security Services Processor (SSP).

## Insert/Edit Service Policy (MPC) Rule Wizard

Use the Insert/Edit Service Policy (MPC) Rule wizard to add and edit service policy rules on the Service Policy Rules page. The Insert/Edit Service Policy (MPC) Rule wizard presents the following steps:

- [Step 1. Configure a Service Policy , on page 2284](#)
- [Step 2. Configure the traffic class , on page 2285](#)
- [Step 3. Configure the MPC actions , on page 2286](#)

---

**Note** “MPC” refers to what is now called the Modular Policy Framework. Refer to [Using Modular Policy Framework for additional information](#).

---

### Navigation Path

Open the Insert/Edit Service Policy (MPC) Rule wizard by clicking the Add Row or Edit Row button on the [Service Policy Rules Page , on page 2283](#).

## Step 1. Configure a Service Policy

The first step in using the Insert/Edit Service Policy (MPC) Rule Wizard to configure a Service Policy Rule involves enabling the rule and specifying the interface(s) to which it is applied.

### Navigation Path

Open the Insert/Edit Service Policy (MPC) Rule wizard by clicking the Add Row or Edit Row button on the [Service Policy Rules Page](#), on page 2283.

### Related Topics

| Element                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable The Current MPC Rule        | Check this box to enable this service policy rule. You can deselect this option if you want to define the rule now, but not deploy it to the device until later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Category                           | To assign the rule to a category, choose the category from the list. Categories can help you organize and identify rules and objects. For more information, see <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Description                        | Optionally, enter a description for the service policy rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Global - Applies to All Interfaces | Select this option to apply the rule globally to all interfaces. This option is not compatible with matching traffic based on the source or destination IP address using an access list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Interfaces                         | Select this option to apply the rule to a specific interface or group of interfaces (or interface roles), and then enter or Select the name of an interface or interface object.<br><br>This selection is required if you want to match traffic based on the source or destination IP address using an access list.<br><br><b>Note</b> Interface-specific rules take precedence over the global service policy for a given feature. For example, if you have a global policy with FTP inspection, and an interface policy with TCP connection limits, then both FTP inspection and TCP connection limits are applied to the interface. However, if you have a global policy with FTP inspection, and an interface policy with FTP inspection, then only the interface policy FTP inspection is applied to that interface. |

## Step 2. Configure the traffic class

The second step in using the Insert/Edit Service Policy (MPC) Rule Wizard to configure a Service Policy Rule involves specifying the traffic class to which the rule is applied.

Specify the class to use to match traffic for this rule:

- **Use class-default As The Traffic Class**—Select this option to use the traffic class class-default for this service policy. The class-default traffic class matches all traffic.
- **Traffic Class**—Select this option to apply this rule to a specific traffic class. Enter the name of the previously defined traffic class, or click **Select** to select it from the Traffic Flows Selector.

You also can define or edit a traffic flow “on the fly” by clicking the either Create or Edit buttons in the Traffic Flows Selector. (Traffic flows are also created and edited on the Traffic Flows page of the Policy Object Manager.) See [Configuring Traffic Flow Objects](#) , on page 2297 for more information.

| Element                     | Description                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Intrusion Prevention tab    |                                                                                                                                                                                                                                                                                                                                                             |
| Enable IPS for this Traffic | <p>Enables or disables intrusion prevention for this traffic flow. When this box is checked, the other parameters on this panel are available.</p> <p><b>Note</b> These parameters are applicable only on ASA 7.0+ devices that have an IPS module installed. See <a href="#">About IPS Modules on ASA Devices</a> , on page 2294 for more information.</p> |

| Element                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IPS Mode                         | <p>Select the operating mode for intrusion prevention:</p> <ul style="list-style-type: none"> <li>• <b>Inline</b>—This mode places the IPS module directly in the traffic flow. No traffic that you identified for IPS inspection can continue through the ASA without first passing through, and being inspected by, the IPS module. This mode is the most secure because every packet identified for inspection is analyzed before being allowed through. Also, the IPS module can implement a blocking policy on a packet-by-packet basis. However, this mode can affect throughput.</li> <li>• <b>Promiscuous</b>—This mode sends a duplicate stream of traffic to the IPS module. This is less secure than Inline mode, but has little impact on traffic throughput. Unlike Inline mode, in Promiscuous mode the IPS module cannot drop the original packets, it can only block traffic by instructing the ASA to shun the traffic, or by resetting the connection on the appliance.</li> </ul> <p>Also, while the IPS module is analyzing the traffic, a small amount of traffic may pass through the ASA before the IPS module can shun it.</p> |
| On IPS Card Failure              | <p>Specify the action to be taken if the IPS module becomes inoperable. Select either:</p> <ul style="list-style-type: none"> <li>• <b>Open</b>—Permits traffic if the module or card fails.</li> <li>• <b>Close</b>—Blocks traffic if the module or card fails.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Virtual Sensor                   | Text box in which you can view, edit, or remove the virtual sensor in the service policy that you are adding or editing                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>CXSC tab</b>                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Note</b>                      | Security Manager uses “CXSC” in places to refer to an ASA CX Security Services Processor (SSP).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Enable CXSC For This Traffic     | <p>Check this box to enable redirection of this traffic flow to an ASA CX installed in the ASA. When this box is checked, the other parameters on this panel are available.</p> <p><b>Note</b> These parameters are applicable only on ASA 5585-X devices running version 8.4(4)+ and ASA 55xx-X devices running version 9.1(1)+ that have an ASA CX SSP installed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| On Context Security Card Failure | <p>Specify the action to be taken if the ASA CX becomes inoperable. Select either:</p> <ul style="list-style-type: none"> <li>• <b>Open</b> – If the ASA CX fails for any reason, the ASA will continue to pass traffic that would otherwise be redirected to the ASA CX.</li> <li>• <b>Close</b> – If the ASA CX fails, the ASA will drop any traffic that would otherwise be redirected to the ASA CX.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Enable Auth Proxy                           | <p>Check this box to enable the authentication proxy, which is required if you want to use active authentication in the identity policies on the ASA CX. If not checked, no authentication is performed.</p> <p><b>Note</b> You can change the port used for authentication proxy; see <a href="#">ASA CX Auth Proxy Configuration</a> , on page 2296 for more information.</p>                                                                                                           |
| FirePOWER tab                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Enable FirePOWER Card For This Traffic      | <p>Check this box to enable redirection of this traffic flow to an ASA FirePOWER module installed in the ASA. When this box is checked, the other parameters on this panel are available.</p> <p><b>Note</b> These parameters are applicable only on ASA 55xx-X devices running version 9.2(1)+.</p>                                                                                                                                                                                      |
| On FirePOWER Card Failure                   | <p>Specify the action to be taken if the ASA FirePOWER module becomes inoperable. Select either:</p> <ul style="list-style-type: none"> <li>• <b>Open</b> – If the ASA FirePOWER module fails for any reason, the ASA will continue to pass traffic that would otherwise be redirected to the ASA FirePOWER module.</li> <li>• <b>Close</b> – If the ASA FirePOWER module fails, the ASA will drop any traffic that would otherwise be redirected to the ASA FirePOWER module.</li> </ul> |
| Enable Monitor Only                         | <p>Sets the module to monitor-only mode. In monitor-only mode, the module can process traffic for demonstration purposes, but then drops the traffic. You cannot use the traffic-forwarding interface or the device for production purposes.</p>                                                                                                                                                                                                                                          |
| Connection Settings tab                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Enable Connection Settings For This Traffic | <p>Enables or disables connection settings for this traffic flow. When this box is checked, the other parameters on this panel become active. From the Connection Settings tab you can configure maximum connections, embryonic connections, timeouts, and TCP parameters.</p>                                                                                                                                                                                                            |

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum Connections | <p>You can specify the maximum number of TCP and UDP connections, and the maximum number of embryonic connections for this traffic flow:</p> <ul style="list-style-type: none"> <li>• <b>Maximum TCP &amp; UDP Connections</b> – Specify the maximum number of simultaneous TCP and UDP connections for the entire subnet, up to 65,535, for ASA versions earlier than 8.4(5); for ASA 8.4(5) and later, the maximum number is 2,000,000. The default is zero for both protocols, which means the maximum possible connections are allowed.</li> <li>• <b>Maximum TCP &amp; UDP Connections Per Client</b> – For ASA/PIX 7.1+ only; specify the maximum number of simultaneous TCP and UDP connections on a per client basis. For ASA 8.4(5) and later, the maximum number is 2,000,000.</li> <li>• <b>Maximum Embryonic Connections</b> – For ASA/PIX 7.0+ only; specify the maximum number of embryonic connections per host, up to 65,535, for ASA versions earlier than 8.4(5); for ASA 8.4(5) and later, the maximum number is 2,000,000. An embryonic connection is a connection request that has not finished the necessary handshake between source and destination. This limit enables the TCP Intercept feature. The default is zero, which means the maximum embryonic connections. TCP Intercept protects inside systems from a DoS attack perpetrated by flooding an interface with TCP SYN packets. When the embryonic limit has been surpassed, the TCP intercept feature intercepts TCP SYN packets from clients to servers on a higher security level. SYN cookies are used during the validation process and help minimize the amount of valid traffic being dropped. Thus, connection attempts from unreachable hosts will never reach the server. This feature is not applicable if TCP State Bypass is enabled.</li> <li>• <b>Maximum Embryonic Connections Per Client</b> – For ASA/PIX 7.1+ only; specify the maximum number of embryonic connections on a per client basis. For ASA 8.4(5) and later, the maximum number is 2,000,000. This feature is not applicable if TCP State Bypass is enabled.</li> </ul> |

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Connection Timeouts           | <p>You can specify the following connection timeout settings for this traffic flow:</p> <ul style="list-style-type: none"> <li>• <b>Embryonic Connection Timeout</b> – Specify the idle time until an embryonic connection slot is freed. Enter 0:00:00 to disable timeout for the connection. The default is 20 seconds for FWSMs, and 30 seconds for ASA/PIX devices.</li> <li>• <b>Half Closed Connection Timeout</b> – Specify the idle time until a half-closed connection slot is freed. Enter 0:00:00 to disable timeout for the connection.</li> </ul> <p>For FWSMs, the default value is 20 seconds; the maximum value is 255 seconds (four minutes, 15 seconds).</p> <p>For ASA 9.1.2 and later devices, the minimum is 30 seconds. For all other ASA/PIX devices, the minimum is 5 minutes. The default is 10 minutes for all ASA/PIX devices.</p> <ul style="list-style-type: none"> <li>• <b>Idle Connection Timeout</b> – Specify the idle time until a connection slot is freed. Enter 0:00:00 to disable timeout for the connection. This duration must be at least 5 minutes. The default is 1 hour.</li> </ul> |
| Reset Connection Upon Timeout | If selected, connections are reset after a timeout occurs. Available for ASA/PIX 7.0(4)+ only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Detect Dead Connections       | <p>Enables the Dead Connection Detection feature; available for ASA/PIX 7.2+ devices. Selecting this option enables these two fields:</p> <ul style="list-style-type: none"> <li>• <b>Dead Connection Detection Timeout</b> – Specify the period of time between retries when a dead connection is detected. The default is 15 seconds.</li> <li>• <b>Dead Connection Detection Retries</b> – Specify the number of retries to be performed after a dead connection is detected. The default is five.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Traffic Flow Idle Timeout     | Specify the period of time between a traffic flow becoming idle and the flow's disconnection. Applicable to FWSM 3.2+ only. The default is 1 hour.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Enable TCP Normalization      | Enables TCP normalization, and activates the TCP Map selection option. Applies to ASA/PIX 7.0+ only; not applicable if TCP State Bypass is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| TCP map                       | Specify the TCP map to use for TCP normalization: enter or Select the name of a TCP map. For more information, see <a href="#">Configuring TCP Maps</a> , on page 2301.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Randomize TCP Sequence Number | Enables the Randomize Sequence Number feature. Disable this feature only if another inline security appliance is also randomizing sequence numbers and the result is scrambling the data. Each TCP connection has two Initial Sequence Numbers: one generated by the client and one generated by the server. The security appliance randomizes the ISN that is generated by the host/server on the higher security interface. At least one ISN must be randomly generated so that attackers cannot predict the next ISN and potentially hijack the session. Not applicable if TCP State Bypass is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Element                                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable TCP State Bypass                                                      | Enables TCP state bypass for this traffic flow. This allows specific traffic flows in asymmetric routing environments when both the outbound and inbound flow for a connection do not pass through the same device. Applicable to FWSM 3.2+ and ASA 8.2+ only. See <a href="#">About TCP State Bypass</a> , on page 2280 for more information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Enable SCTP State Bypass (ASA 9.5.2 + only)                                  | You can bypass Stream Control Transmission Protocol (SCTP) stateful inspection if you do not want SCTP protocol validation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Enable Decrement TTL                                                         | Select this option to turn on decrementing of the time-to-live (TTL) value in packets passed by the security appliance. Applicable to PIX/ASA 7.2.2+ only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Configure Flow Offload (For Firepower 9000/4000 series ASA 9.6(1) and above) | <p><b>Note</b> You must enable flow offload manually on the ASA and restart the device, before configuring flow offload in the Service Policy Wizard in Cisco Security Manager. Flow offload and flow offload statistics are supported on the ASA only in the single context and system context modes. It is not supported in the admin or user context. ASA supports flow offload starting from version 9.5.2(1); however Cisco Security Manager supports flow offload from ASA 9.6(1).</p> <p>Select this option to offload specific traffic to a super-fast path; traffic is switched and processed in the NIC instead of the ASA. Offloading can help you improve performance for data-intensive applications such as large file transfers.</p> <p><b>Tip</b> You can configure flow offload only when TCP State Bypass and SCTP State bypass are not enabled on your device.</p> |
| QoS tab                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Enable QoS For This Traffic                                                  | Enables Quality of Service (QoS) options for this traffic flow. When selected, the Enable Priority For This Flow and the Traffic Policing options become active. <p><b>Note</b> The options on this tab are applicable to PIX/ASA 7.0+ devices only.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Enable Priority For This Flow                                                | Enables strict scheduling priority for this flow. The priority queues must be defined on the <a href="#">Priority Queues Page</a> , on page 2282.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Traffic Policing                                                             | Enables output and input traffic policing. Traffic policing lets you control the maximum rate of traffic transmitted or received on an interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Element                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Output (Traffic Policing)                        | <p>Enables policing of traffic flowing out of the device. If you enable policing, you can specify the following values:</p> <ul style="list-style-type: none"> <li>• <b>Committed Rate</b> – The rate limit for this traffic flow; this is a value in the range 8,000 to 2,000,000,000, specifying the maximum speed (bits per second) allowed.</li> <li>• <b>Burst Rate</b> – A value in the range 1,000 to 512,000,000 that specifies the maximum number of instantaneous bytes allowed in a sustained burst before throttling to the conforming rate value.</li> <li>• <b>Conform Action</b> – The action to take when the rate is less than the conform-burst value. Choices are Transmit or Drop.</li> <li>• <b>Exceed Action</b> – Take this action when the rate is between the conform-rate value and the conform-burst value. Choices are Transmit or Drop.</li> </ul>                                                 |
| Input (Traffic Policing)                         | <p>Enables policing of traffic flowing into the device; these options apply to ASA/PIX 7.2+ devices only. If you enable policing, you can specify the following values:</p> <ul style="list-style-type: none"> <li>• <b>Committed Rate</b> – The rate limit for this traffic flow; this is a value in the range 8,000 to 2,000,000,000, specifying the maximum speed (bits per second) allowed.</li> <li>• <b>Burst Rate</b> – A value in the range 1,000 to 512,000,000 that specifies the maximum number of instantaneous bytes allowed in a sustained burst before throttling to the conforming rate value.</li> <li>• <b>Conform Action</b> – The action to take when the rate is less than the conform-burst value. Choices are Transmit or Drop.</li> <li>• <b>Exceed Action</b> – Take this action when the rate is between the conform-rate value and the conform-burst value. Choices are Transmit or Drop.</li> </ul> |
| CSC tab                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Enable Content Security Control For This Traffic | <p>Enables or disables the use of the Cisco CSC SSM (Content Security and Control Security Services Module) for this traffic flow. When this box is checked, the On CSC SSM Failure options become available. These options are applicable on ASA 7.1+ devices only; they are not applicable if TCP State Bypass is enabled.</p> <p>The CSC SSM provides protection against viruses, spyware, spam, and other unwanted traffic by scanning the FTP, HTTP, POP3, and SMTP packets.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| On CSC SSM Failure                               | <p>Specifies the action to take if the CSC SSM becomes inoperable:</p> <ul style="list-style-type: none"> <li>• <b>Open</b> – Permits traffic if the CSC SSM fails.</li> <li>• <b>Close</b> – Blocks traffic if the CSC SSM fails.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| User Statistics tab                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Enable SCTP for this traffic (ASA 9.5.2 + only)                | Enables or disables the use of SCTP for this traffic flow. <ul style="list-style-type: none"> <li>• <b>SCTP Policy Map</b>– enables policy map selection</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Enable Diameter Inspection for this traffic (ASA 9.5.2 + only) | Enables or disables the use of Diameter inspection for this traffic flow. <ul style="list-style-type: none"> <li>• <b>Diameter Policy Map</b>– enables policy map selection</li> </ul> <p>When Diameter Inspection is enabled, you can further enable inspection of encrypted traffic by selecting the Enable encrypted traffic inspection check box. You must select the TLS Proxy to be used for this inspection.</p>                                                                                                                                                                                                               |
| Enable LISP for this traffic (ASA 9.5.2 + only)                | Enables or disables the use of LISP Inspection for this traffic flow. <ul style="list-style-type: none"> <li>• <b>LISP Policy Map</b>– enables policy map selection</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Enable Flow LISP mobility for devices (ASA 9.5.2 + only)       | Enables flow mobility in clustering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Enable STUN Inspection support for devices (ASA 9.6.2 + only)  | Enables or disables the use of STUN inspection for this traffic flow. It is supported on ASA 9.6.2 and above in the single and multi-context mode. <p><b>Note</b> When you enable STUN inspection on the default inspection class, TCP/UDP port 3478 is watched for STUN traffic. The inspection supports IPv4 addresses and TCP/UDP only. STUN inspection is supported in failover and cluster modes, as pinholes are replicated. However, as the transaction ID is not replicated among units, when a unit fails after receiving a STUN Request and another unit received the STUN Response, the STUN Response will be dropped.</p> |

Ensure that you remove the duplicate collectors.</p> |

## About IPS Modules on ASA Devices

**Note** From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any bug fixes or enhancements.

You can install a variety of IPS modules, such as the Advanced Inspection and Prevention Security Services Module (AIP-SSM), in some ASA device models. The IPS modules supported by each ASA model differ. The IPS modules run advanced IPS software that provides proactive, full-featured intrusion prevention services to stop malicious traffic, including worms and network viruses, before they can affect your network.

The ASA IPS module runs separately from the adaptive security appliance, and you need to add it to the device inventory as a separate device. It is, however, integrated into the ASA traffic flow.

When you configure the ASA IPS module, you need to configure the service policy rules on the host ASA as well as the IPS policies on the IPS module. The service policy rules determine which traffic is inspected by the IPS module. For an overview of IPS policy configuration, see [Overview of IPS Configuration](#), on page 1617.

When you identify traffic for IPS inspection, the traffic flows through the ASA and the IPS module as follows:

1. Traffic enters the ASA.
2. Firewall policies, such as interface access rules, are applied.

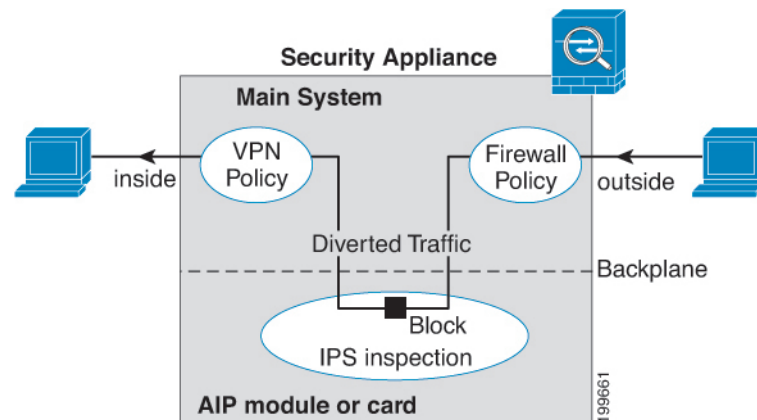

- Traffic is sent to the IPS module over the backplane when you operate in inline mode. If you configure the system to use promiscuous mode, a copy of the traffic is sent to the IPS module.

See **IPS Mode** in the Intrusion Prevention section of the Insert/Edit Service Policy (MPC) Rule wizard ([Step 3. Configure the MPC actions , on page 2286](#)) for more information about Inline and Promiscuous modes.

- The IPS module applies its security policy to the traffic and takes appropriate actions.
- Allowed traffic is sent back to the adaptive security appliance over the backplane. In Inline mode, the IPS module may block some traffic according to its security policy; in other words, that traffic is not passed back.
- VPN policies are applied (if configured).
- Traffic exits the ASA.

The following illustration depicts traffic flow when running the IPS module in Inline mode. In this example, the IPS module automatically blocks traffic that it identifies as an attack. All other traffic is returned to the ASA.

The next illustration depicts traffic flow when the IPS module is running in Promiscuous mode. In this example, the IPS module sends a shun message to the ASA for traffic it has identified as a threat.

**About the ASA CX**

The ASA CX is a Security Services Processor (SSP) that can be installed in the Cisco ASA-5585-X series Adaptive Security Appliance. You configure the parent ASA to redirect traffic to the ASA CX, which then applies its security policies and either drops the traffic, or returns it to the ASA for further processing and routing to the next destination.

There are two basic policies that may need adjustment in the ASA when you add a ASA CX: access rules and inspection rules:

- Access rules, whether global rules or those applied to specific interfaces, are always applied before traffic is redirected to the ASA CX. Thus, the security card sees only the traffic already permitted, and does not process traffic that was dropped at entry to the ASA. Consider adjusting the rules to ensure that all traffic that you want the ASA CX to process is permitted.
- Inspection rules determine which traffic is inspected. The ASA CX does not inspect traffic that has already been inspected by the ASA. Therefore, you must ensure that you do not inspect traffic that you intend the ASA CX to inspect. Specifically, do not inspect HTTP traffic, because HTTP inspection is one of the core functions of the ASA CX. The default inspection rules on the ASA do not include HTTP inspection, so you must alter your inspection rules only if you added HTTP rules.

Determine if you need to create access rules for an interface, or global access rules that apply to all interfaces. Use the ASA access rules to filter traffic before it is redirected to the ASA CX. If you know there are classes of traffic that you never want to pass, it is more efficient to drop them immediately upon entry to the ASA.

If you have already established access rules, there is no requirement to change them. However, you should evaluate whether they need to be relaxed in order to have the ASA CX process certain types of traffic that you are now dropping by means of access rules.

Enabling traffic redirection to an installed ASA CX is described in [Step 3. Configure the MPC actions](#) , on page 2286 of the [Insert/Edit Service Policy \(MPC\) Rule Wizard](#) , on page 2284.

**ASA CX Auth Proxy Configuration**

If you enabled ASA CX authentication proxy—on the **CXSC** tab during Step 3 of the Insert/Edit Service Policy (MPC) Rule Wizard; see [Step 3. Configure the MPC actions](#) , on page 2286—and you want to use a non-default port for active authentication, use the Add/Edit CXSC Auth Proxy Configuration dialog box to change the ASA CX Auth Proxy Port number.

If users must be prompted for authentication credentials, the prompting is done through this port.

---

**Note** Security Manager uses “CXSC” in some places to refer to an ASA CX Security Services Processor (SSP).

---

### Navigation Path

Open the Add/Edit CXSC Auth Proxy Configuration dialog box by clicking the **CXSC Auth Proxy** button below the rules table on the [Service Policy Rules Page](#), on page 2283.

**Note** The CXSC Auth Proxy button is available below the IPS, QoS, and Connection Rules table only in Device view; it is not visible in Policy view.

| Element              | Description                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| CXSC Auth Proxy Port | The default authentication proxy TCP port is 885; however, if you change it, you must enter a port number between 1024 and 65535. |

## Configuring Traffic Flow Objects

Use the Add and Edit Traffic Flow dialog boxes to configure traffic-match definitions. These traffic-flow definitions correspond to class maps (the **class map** command) in the IPS, QoS and Connection Rules service policy for devices running the PIX 7.0+, ASA 7.0+, and FWSM 3.2+ operating systems. For more information on configuring these rules, see [About Service Policy Rules](#), on page 2279.

### Navigation Path

Select **Manage > Policy Objects**, then select **Traffic Flows** from the Object Type selector. Right-click inside the work area and choose New Object, or right-click a row and choose Edit Object.

These dialog boxes also can be opened by clicking the Create or Edit buttons in the Traffic Flows Selector while defining a Service Policy rule. See for [Step 2. Configure the traffic class](#), on page 2285 more information about selecting a Traffic Flow class.

|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                                                                                                                                                                                                                            | The name of the Traffic Flow object. A maximum of 40 characters is allowed. The name space for class maps is local to a security context. Therefore, the same name may be used in multiple security contexts. The maximum number of class maps per security context is 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Description                                                                                                                                                                                                                     | A description of the Traffic Flow (optional). A maximum of 1024 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Traffic Match Type                                                                                                                                                                                                              | <p>The type of traffic to match. The option you choose may change the fields in the dialog box; all possible fields are explained later in this table. The Traffic Match Type options are:</p> <ul style="list-style-type: none"> <li>Any Traffic – Matches all traffic.</li> <li>Source and Destination IP Address (access-list) – Matches the source and destination IP addresses in a packet based on the access control list that you specify.</li> </ul> <p>For ASA 8.4(2+) devices, the ACL can include FQDN objects and user specifications to perform identity-based traffic matching.</p> <ul style="list-style-type: none"> <li>Default Inspection Traffic – Matches default inspection traffic. For a list of default settings, see <a href="#">Default Inspection Traffic</a> , on page 2299.</li> <li>Default Inspection Traffic with access list – Matches default inspection traffic limited by the access control list that you specify.</li> <li>TCP or UDP or SCTP Destination Port – Matches traffic to the TCP or UDP or SCTP destination port or port range that you specify. Valid port numbers here are 0 to 65535.</li> <li>RTP Range – Matches traffic to the range of UDP destination ports that you specify. Valid port numbers here are 2000 to 65535.</li> <li>Tunnel Group – Matches the destination address based on flows in VPN tunnels belonging to a specified tunnel group.</li> <li>IP Precedence Bits – Matches precedence values assigned to the traffic packets. You can select a maximum of four values.</li> <li>IP DiffServe Code Points (DSCP) Values – Matches DSCP values associated with the traffic packets. You can select a maximum of eight values.</li> </ul> |
| <p><b>Variable Fields</b></p> <p>The following fields may appear in the Add and Edit Traffic Flow dialog boxes, depending on your choice in the Traffic Match Type field. This list is the complete set of possible fields.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Element                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Available ACLs                                         | A list of the access control list (ACL) objects that you can select for the map. Select the ACL that defines the target traffic, or click the Create button to add a new object. You can also select an object and click Edit to change its definition. If the list of objects is large, use the Filter field to limit the display (see <a href="#">Filtering Items in Selectors</a> , on page 47).                                                                                                                            |
| TCP or UDP or SCTP<br>TCP/UDP/SCTP Port or Port Range  | Radio buttons used to specify a protocol (either TCP, UDP, or SCTP), and a text field used to specify a destination port number or range of numbers to use when matching traffic based on the specified protocol/ports.<br><br>You can specify a single port value, or a range of port numbers (for example, 0-2000). Valid port numbers are 0 to 65535.                                                                                                                                                                       |
| RTP Port Range                                         | The range of RTP destination ports associated with the traffic flow. You must enter a port range within the valid range of 2000 to 65535.<br><br><b>Note</b> When you close the dialog box, the port range you entered is converted to port-span values by subtracting the start value from the end value. For example, if you enter the range 2001-3000 in the dialog box, “RTP port 2001 range 999” appears in the Match Value column of the Traffic Flows policy object table. Port-span values are expected by the device. |
| Tunnel group name<br>Match Flow IP Destination Address | Lists available VPN tunnel groups. Choose one or enter the name of a group. You can also select Match Flow IP Destination Address to recognize the destination address as the match type.<br><br><b>Tip</b> You can use FlexConfig objects and policies to define a VPN tunnel group on a PIX 7.0+ device. For more information, see <a href="#">Understanding FlexConfig Policies and Policy Objects</a> , on page 340.                                                                                                       |
| Available IP Precedence<br>Match on IP Precedence      | The IP precedence numbers. Select the values you want to match and click >> to add them to the Match table. Ctrl-click to select multiple values. You can select a maximum of four values.<br><br>To remove a value from the Match table, select it and click <<.                                                                                                                                                                                                                                                              |
| Available DSCP Values<br>Match on DSCP                 | The IP DiffServe Code Points (DSCP) numbers. Select the values you want to match and click >> to add them to the Match table. Ctrl-click to select multiple values. You can select a maximum of eight values.<br><br>To remove a value from the Match table, select it and click <<.                                                                                                                                                                                                                                           |
| Category                                               | The category assigned to the traffic-flow object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                                       |

## Default Inspection Traffic

When you create a Traffic Flow policy object, you can choose to match the default inspection traffic. For more information, see [Configuring Traffic Flow Objects](#), on page 2297. The following table lists the types of traffic included in the Default Inspection Traffic category.

Table 830: Default Inspection Traffic

| Value                                 | Port                        | NAT Limitations                                     | Comments                                                                                           |
|---------------------------------------|-----------------------------|-----------------------------------------------------|----------------------------------------------------------------------------------------------------|
| CTIQBE                                | TCP/2748                    |                                                     |                                                                                                    |
| CuSeeMe                               | UDP/7648                    |                                                     |                                                                                                    |
| DNS over UDP                          | UDP/53                      | No NAT support for name resolution through WINS.    | No PTR records are changed.                                                                        |
| FTP                                   | TCP/21                      |                                                     |                                                                                                    |
| GTP                                   | UDP/2123, 3386              |                                                     |                                                                                                    |

|------------------|---------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sun RPC over UDP | UDP/111 | No NAT or PAT.  | The default rule includes UDP port 111; if you want to enable Sun RPC inspection for TCP port 111, you need to create a new rule that matches TCP port 111 and performs Sun RPC inspection. |
| TFTP             | UDP/69  |                 | Payload IP addresses are not translated.                                                                                                                                                    |
| XDMCP            | UDP/177 | No NAT or PAT.  |                                                                                                                                                                                             |

## Configuring TCP Maps

Use the Add and Edit TCP Map dialog boxes to define TCP normalization maps for use with IPS, QoS, and Connection Rules service policies. The TCP normalization feature lets you specify criteria that identify abnormal packets, which the security appliance drops when they are detected. The map is used for TCP traffic that passes through the device or that is going to the device.

These TCP maps can be applied to TCP flows on PIX 7.x+ and ASA devices. For more information on configuring IPS, QoS, and Connection Rules, see [About Service Policy Rules, on page 2279](#).

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > TCP Maps** from the Object Type selector. Right-click inside the work area and choose New Object, or right-click a row and choose Edit Object.

These dialog boxes also can be opened by clicking the Create or Edit buttons in the TCP Maps Selector while defining a Service Policy rule. See the “Connection Settings” section of [Step 3. Configure the MPC actions, on page 2286](#) for more information about enabling TCP normalization and selecting a TCP map.

|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Queue Limit<br>(ASA devices only)                 | <p>The maximum number of out-of-order packets that can be buffered and put in order for a TCP connection; enter a value between 1 and 250. Enter 0 to disable this setting and use the default system queue limit, which depends on the type of traffic:</p> <ul style="list-style-type: none"> <li>• Connections for application inspection, IPS, and TCP check-retransmission have a queue limit of 3 packets. If the security appliance receives a TCP packet with a different window size, then the queue limit is dynamically changed to match the advertised setting.</li> <li>• For other TCP connections, out-of-order packets are passed through untouched.</li> </ul> <p>However, if you set the Queue Limit to 1 or higher, the number of out-of-order packets allowed for all TCP traffic matches the specified value. For application inspection, IPS, and TCP check-retransmission traffic, any advertised settings are ignored. For other TCP traffic, out-of-order packets are now buffered and put in order instead of passed through untouched.</p> |
| Time Out<br>(ASA 7.2(4)+ devices only)            | <p>The maximum amount of time that out-of-order packets can remain in the buffer before they are dropped; enter a value between 1 and 20 seconds. The default is 4 seconds.</p> <p>This setting is ignored if you entered 0 for the Queue Limit.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Verify TCP Checksum                               | If checked, checksum verification is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Drop SYN Packets with Data                        | If checked, TCP SYN packets that include data are dropped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Drop Connection on Window Variation               | If checked, connections that change window size unexpectedly are dropped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Drop Packets that Exceed Maximum Segment Size     | If checked, packets that exceed the maximum segment size (MSS) set by a peer are dropped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Check if Transmitted Data is the Same as Original | If checked, retransmit data checking is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Clear Urgent Flag                                 | If checked, the URG (urgent) flag is cleared through the security appliance. The URG flag is used to indicate that the packet contains information that is of higher priority than other data within the stream. The TCP RFC is vague about the exact interpretation of the URG flag; therefore end systems handle urgent offsets in different ways, which may make the end system vulnerable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Enable TTL Evasion Protection | <p>Enables the TTL evasion protection offered by the security appliance. Do not enable this option if you want to prevent attacks that attempt to evade security policy.</p> <p>For example, an attacker can send a packet that passes policy with a very short TTL. When the TTL goes to zero, a router between the security appliance and the endpoint drops the packet. It is at this point that the attacker can send a malicious packet with a long TTL that appears to the security appliance to be a retransmission and is passed. To the endpoint host, however, it is the first packet that has been received. In this case, an attacker is able to succeed without security preventing the attack.</p> |
| Selective Acknowledgment      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Clear Selective Ack           | When checked, clears window selective acknowledgment mechanism option and allows packet. When unchecked, allows packets with single selective acknowledgment option.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Selective Ack Allow Multiple  | Whether or not packets with multiple selective acknowledgment mechanism (SACK) are allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Note</b>                   | If the selective acknowledgment options are not configured, by default, packets with a single selective acknowledgment option are allowed and packets with multiple selective acknowledgment options are dropped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| MSS Allow Multiple            | Whether or not the packets with multiple MSS options are allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Max. MSS                      | Enter a value for the TCP MSS limit in bytes. Valid values are between 68- 65535.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Note</b>                   | If the MSS options are not configured, by default, packets with a single MSS option are allowed and packets with multiple MSS options are dropped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Allow packets with MD5 option | <p>Whether or not to allow packets with the MD5 option.</p> <p>The Allow, Allow Multiple and Clear checkboxes are available when packets with MD5 option are allowed.</p> <p>Allow: This allows a packet with a single MD5 option.</p> <p>Allow Multiple: This allows a packet with multiple MD5 options.</p> <p>Clear: This clears the MD5 option and allows a packet.</p>                                                                                                                                                                                                                                                                                                                            |
| <b>Note</b>                   | If the MD5 options are not configured, by default, packets with a single MD5 option are allowed and packets with multiple MD5 options are dropped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Reserved Bits                 | <p>Specify how to handle TCP packets with the reserved bits set in the TCP header. The six reserved bits in the TCP header are for future use and usually have a value of 0.</p> <ul style="list-style-type: none"> <li>• Clear and Allow—Clears the reserved bits in the TCP header and allows the packet.</li> <li>• Allow only—Permits packets with the reserved bits set in the TCP header.</li> <li>• Drop—Drops packets with the reserved bits set in the TCP header.</li> </ul>                                                                                                                                                                                                                 |
| TCP Range Options table       | <p>The TCP Range Options table lists TCP options ranges defined for the TCP map, and the action to take for those options. The typical range numbers are 6-7, 9-18 and 20-255; the lower bound must be less than or equal to the upper bound.</p> <ul style="list-style-type: none"> <li>• To add a range, click the Add button to open the Add TCP Option Range dialog box (see <a href="#">Add and Edit TCP Option Range Dialog Boxes</a>, on page 2305).</li> <li>• To edit a range, select it and click the Edit button.</li> <li>• To delete a range, select it and click the Delete button.</li> </ul> <p><b>Note</b> Prior to ASA 9.6(2), the TCP values are in the range of 6-7 and 9-255.</p> |
| Category                      | The category assigned to the map object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Add and Edit TCP Option Range Dialog Boxes

Use the Add and Edit TCP Option Range dialog boxes to define or edit a range of TCP options for use with a TCP normalization map; these are TCP options not explicitly supported on the device. This feature lets you allow or discard packets with the specified TCP options set. The typical range numbers are 6-7, 9-18 and 20-255.

### Navigation Path

In the Add and Edit TCP Map dialog boxes, right-click inside the TCP Range Options table and choose Add Row, or right-click an existing row and choose Edit Row. See [Configuring TCP Maps](#), on page 2301.

### Field Reference

*Table 832: Add and Edit TCP Option Range Dialog Boxes*

| Element     | Description                                                                                                                                                                                                                                                                                                                                               |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Note</b> | Prior to ASA 9.6(2), specify either 6 or 7 or an integer from 9-255 for the lower and upper bounds of the range, respectively. For all devices, the Lower bound must be less than or equal to the Upper bound.                                                                                                                                            |
| Lower       | The lower bound of the range; enter either 6 or 7, or an integer from 9 to 18 or an integer from 20-255.                                                                                                                                                                                                                                                  |
| Upper       | The upper bound of the range; enter either 6 or 7, or an integer from 9 to 18 or an integer from 20-255.                                                                                                                                                                                                                                                  |
| Action      | Choose the action to take for packets with the specified options set: <ul style="list-style-type: none"> <li>• Allow – Allows any packet with a specified option set.</li> <li>• Clear – Clears the specified option from any packet that has it set and allows the packet.</li> <li>• Drop – Discards any packet with a specified option set.</li> </ul> |

## CHAPTER 59

# Configuring Security Contexts on Firewall Devices

---

You can define multiple security “contexts” on a single security appliance. Each context operates as an independent virtual device, with its own security policy, interfaces and administrators. Multiple contexts are similar to having multiple stand-alone devices. Many features are supported in multiple-context mode, including routing tables, firewall features, IPS, and management. Some features are not supported; for example, VPN, multicast, and dynamic routing protocols; security contexts support only static routes; and you cannot enable OSPF or RIP in multiple-context mode. Also, some features are not directly managed by Cisco Security Manager, such as the IPS feature set for ASA and PIX devices.

In multiple-context mode, the security appliance includes a configuration for each context that identifies the security policy, interfaces, and most of the options you can configure on a stand-alone device. The system administrator adds and manages contexts by configuring them in the system configuration, which, like a single-mode configuration, is the start-up configuration. The system configuration identifies basic settings for the security appliance, but it does not include any network interfaces or network settings for itself; rather, when the system needs to access network resources (such as downloading the contexts from the server), it uses the context that is designated as the Admin context. The system configuration is used to add, delete and edit basic context settings, including allocating network interfaces to the various contexts.

The Admin context is just like any other context, except that when a user logs in to the Admin context, that user has system administrator rights and can access the system configuration and all other contexts.

This chapter contains the following topics:

- [Checklist for Configuring Multiple Security Contexts](#) , on page 2308
- [Managing Security Contexts](#) , on page 2310

## Enabling and Disabling Multiple-Context Mode

Cisco Security Manager does not support switching to multiple-context mode on an existing device. To perform this task, you must delete the device from Security Manager, enable multiple-context mode using a device manager or CLI input, and then add the device again to Security Manager. After the device is added in multiple-context mode, you can add, edit and delete security contexts.

**Note** When manually defining a multiple-context device, choose **Multi** from the Contexts list in the Operating System section of the New Device - Device Information dialog box.

Similarly, Cisco Security Manager does not support restoring an existing device to single-context mode. To perform this task, you must delete the device and any of its child contexts from Security Manager, restore single-context operation using a device manager or CLI input, and then add the device again to Security Manager.

**Note** When manually defining a single-context device, choose **Single** from the Contexts list in the Operating System section of the New Device - Device Information dialog box.

## Checklist for Configuring Multiple Security Contexts

Security contexts allow a single physical device to act as multiple independent firewalls. Each security context defines a single virtual firewall, complete with its own configuration—and just as with physical devices, each security context must be correctly configured, or overall security can be compromised. Thus, defining and configuring multiple firewalls on the same physical appliance requires special care.

The following checklist outlines the basic steps necessary to configure a firewall device with multiple security contexts. Each of these steps may involve multiple substeps; all steps should be performed in the order presented. For example, you must define interfaces before configuring the various contexts.

| Step          | Task                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <p><b>Define interfaces and subinterfaces, or VLANs, on the physical appliance.</b></p> <p>In this task, you define the interfaces and subinterfaces, or VLANs on FWSMs, that will be allocated to the various security contexts when you create them later. Provide physical interface parameters, such as connection type (Ethernet, GigabitEthernet, etc.), hardware Port ID, speed, and duplex mode, as well as VLAN ID if defining a subinterface.</p> <p><b>Result:</b> All interfaces and subinterfaces are defined.</p> <p>For more information, see <a href="#">Configuring Firewall Device Interfaces</a> , on page 1807.</p> |

| Step   | Task                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 2 | <p data-bbox="459 289 1263 321"><b>Define an Admin context for administering the base security appliance.</b></p> <p data-bbox="459 338 1523 464">This task is called out separately to ensure you define a context and IP address specifically for administration of the security appliance. The process is the same as defining a security context; however, during the process, be sure to check <b>Admin Context</b> to designate this as the administration context.</p> <p data-bbox="459 485 1523 575">In addition to being used to administer the appliance, the Admin context is used to publish syslog and SNMP messages to monitoring devices, such as the Cisco Security Monitoring, Analysis and Response System (CS-MARS), for further processing.</p> <p data-bbox="459 596 1523 722">Until you associate a specific management IP address with the Admin context, the IP address used to manage the security appliance is the one you specified when defining the device. When you specify a Management IP Address with the Admin context, it takes precedence over the one on the Device Properties page.</p> <p data-bbox="459 743 1295 774"><b>Result:</b> The Admin context is defined and associated with a physical interface.</p> <p data-bbox="459 795 743 827">For more information, see:</p> <ul data-bbox="496 848 1214 921" style="list-style-type: none"> <li data-bbox="496 848 1214 879">• <a href="#">Add/Edit Security Context Dialog Box (PIX/ASA)</a> , on page 2313</li> <li data-bbox="496 890 1214 921">• <a href="#">Add/Edit Security Context Dialog Box (FWSM)</a> , on page 2311</li> </ul> |
| Step 3 | <p data-bbox="459 957 1255 989"><b>Define each security context, or virtual firewall, on the base appliance.</b></p> <p data-bbox="459 1010 1523 1100">In this task, you define individual security contexts, naming each, assigning a location for its configuration files, and allocating interfaces. Each security context represents a virtual firewall, and its definition includes the interfaces and range of associated VLAN IDs that are under its control.</p> <p data-bbox="459 1121 1523 1211"><b>Note</b> While the Admin context can operate as a firewall device, it is typically used as such only in single-context mode. Therefore, security contexts are treated as separate entities in this checklist.</p> <p data-bbox="459 1232 1425 1295">You cannot add new interfaces or modify the hardware Port value when defining a security context—you simply select previously defined interfaces for allocation to the context.</p> <p data-bbox="459 1316 1490 1379"><b>Result:</b> Each security context is defined and associated with a physical interface; the VLANs on which the security context will inspect traffic are also specified.</p> <p data-bbox="459 1400 743 1432">For more information, see:</p> <ul data-bbox="496 1453 1214 1526" style="list-style-type: none"> <li data-bbox="496 1453 1214 1484">• <a href="#">Add/Edit Security Context Dialog Box (PIX/ASA)</a> , on page 2313</li> <li data-bbox="496 1495 1214 1526">• <a href="#">Add/Edit Security Context Dialog Box (FWSM)</a> , on page 2311</li> </ul>                                                                           |

| Step   | Task                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4 | <p><b>Submit/deploy to generate the virtual firewalls as children of the base appliance.</b></p> <p>You must create the desired contexts on the security appliance before you can begin defining the individual settings of each context. To create contexts on the appliance, you must define them, and then either submit changes in Workflow mode, or deploy the changes to the security appliance in non-Workflow mode.</p> <p>When you create a security context, a “virtual firewall device” appears beneath the original security appliance in the Device View. Each virtual device is indicated by a related device icon with a dotted outline, and its name is the base security appliance name, underscore (_), context name. For example, the virtual device <i>asaMultiRouted_admin</i> would represent the Admin context (named “admin”) on the security appliance named “asaMultiRouted.” Similarly, <i>asaMultiRouted_security1</i> would represent the security context “security1” on the same base appliance.</p> <p><b>Result:</b> Your changes are submitted or deployed (depending on the Workflow mode), which in turn creates the Admin and security contexts as children of the base security appliance.</p> <p>For more information, see:</p> <ul style="list-style-type: none"> <li>• <a href="#">Workflow and Activities Overview</a> , on page 20</li> <li>• <a href="#">Submitting an Activity for Approval (Workflow Mode with Activity Approver)</a> , on page 159</li> <li>• <a href="#">Working with Deployment and the Configuration Archive</a> , on page 403</li> </ul> |
| Step 5 | <p><b>Define additional settings for each security context.</b></p> <p>You can now complete the definition of each security context by selecting a virtual firewall device in the Device Selector and editing available policies, such as access rules, translation options and so on.</p> <p><b>Result:</b> Each security context is fully defined, ready to operate as a virtual firewall.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Managing Security Contexts

The Security Contexts page lists security contexts configured for the selected device. You can add, edit and delete security contexts for an ASA, PIX 7.0+, or FWSM device running in multiple-context mode from this page.

**Tip** Deleting a security context from an FWSM device removes the security context from the running configuration of the device, but it does not delete the associated configuration file. This can cause problems if you later add another security context with the same name as the one previously deleted. This is a known issue for FWSM and is not connected to the behavior of Security Manager. A work-around is to use the CLI to delete the configuration file from the device.

Remember, the security appliance must be in multiple-context mode in order for you to configure contexts using Security Manager. See [Enabling and Disabling Multiple-Context Mode](#) , on page 2307 for more information.

Follow these steps to manage security contexts:

- 
- Step 1** Ensure Device View is your present application view; if necessary, click the **Device View** button on the toolbar.
- For more information on using the Device View to configure device policies, see [Managing Policies in Device View and the Site-to-Site VPN Manager](#), on page 194.
- Step 2** Select the appliance you want to configure.
- Step 3** Select **Security Contexts** in the Device Policy selector to display the Security Contexts page.
- Note** The child contexts of a multiple-mode device are represented using a different icon than firewall devices in single mode.
- Step 4** Add, edit and delete contexts, as necessary:
- To define a new context, click the **Add Row** button at the bottom of the page to open the Add Security Context box.
  - To edit an existing context, select the desired entry in the Security Contexts list and then click the **Edit Row** button at the bottom of the page to open the Edit Security Context dialog box.
  - To delete an existing context, select the desired entry in the list and then click the **Delete Row** button.
- Note** Deleting a security context here will also cause the security context device to be removed from device inventory.
- Confirm the deletion of the security context and corresponding security context device.
- Note** Except for the titles, the Add Security Context dialog box and the Edit Security Context dialog box are identical. For PIX/ASA devices, see [Add/Edit Security Context Dialog Box \(PIX/ASA\)](#), on page 2313 for more information; for FWSMs, see [Add/Edit Security Context Dialog Box \(FWSM\)](#), on page 2311 for more information.

## Add/Edit Security Context Dialog Box (FWSM)

---

**Note** From version 4.17, though Cisco Security Manager continues to support FWSM features/functionality, it does not support any bug fixes or enhancements.

---

The Add Security Context and Edit Security Context dialog boxes let you define and maintain contexts for the currently selected Firewall Service Module. (Except for their titles, the two dialog boxes are identical.)

Note that at least one security context must be designated as the Admin context.

---

**Caution** Security Manager does not support mapped (that is, “named” or “aliased”) interfaces for FWSMs. If you discover an FWSM with named interfaces and then change the related configuration, redeployment will fail. Replace any interface aliases with the appropriate VLAN IDs.

---

### Navigation Path

You can access the Add Security Context and Edit Security Context dialog boxes from the Security Contexts page, as described in [Managing Security Contexts](#), on page 2310.

**Table 833: Add/Edit Security Context Dialog Box (FWSM)**

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name             | <p>Enter a name of up to 32 characters for the context. The names System and Null (in any combination of upper- and lower-case letters) are reserved, and cannot be used.</p> <p><b>Note</b> While context names are case-sensitive on the device, they are not in Security Manager. That is, you cannot have two contexts with the same name but different capitalization in Security Manager.</p>                                                                                                                                                                                                                                                                   |
| Mode (FWSM 3.1+) | <p>Choose the mode, Router or Transparent, for this security context.</p> <p><b>Note</b> You cannot change the chosen mode in the Edit Security Context dialog box.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Admin Context    | <p>Check this box if this context is to be the Admin context for this device.</p> <p><b>Note</b> The name of the Admin context for the device is displayed below the Security Contexts table.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| VLAN IDs         | <p>Enter the VLANs assigned to this context. Use commas to separate multiple VLAN entries.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Config URL       | <p>Specify the context configuration location, as a URL-type address, by choosing a file-system protocol and then entering the path and name of the file to access for the context configuration.</p> <p>That is, choose a protocol type from the drop-down list, and then type the server name (for remote file systems), path, and file name in the related text field. For example, the combined URL for FTP has the following format:<br/>ftp://server.example.com/configs/admin.cfg .</p> <p>Available protocols are:</p> <ul style="list-style-type: none"> <li>• disk:/</li> <li>• ftp://</li> <li>• http://</li> <li>• https://</li> <li>• tftp://</li> </ul> |
| Failover Group   | <p>If this context is part of an active/active failover configuration, choose the failover group to which this context belongs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Description      | <p>Enter an optional description for the context.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Add/Edit Security Context Dialog Box (PIX/ASA)

**Note** From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any bug fixes or enhancements.

The Add Security Context and Edit Security Context dialog boxes let you define and maintain contexts for the currently selected PIX/ASA security appliance. (Except for their titles, the two dialog boxes are identical.)

Note that at least one security context must be designated as the Admin context.

### Navigation Path

You can access the Add Security Context and Edit Security Context dialog boxes from the Security Contexts page, as described in [Managing Security Contexts](#), on page 2310.

### Field Reference

*Table 834: Add/Edit Security Context Dialog Box (PIX/ASA)*

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name            | Enter a name of up to 32 characters for the context. The names System and Null (in any combination of upper- and lower-case letters) are reserved, and cannot be used.<br><br><b>Note</b> While context names are case-sensitive on the device, they are not in Security Manager. That is, you cannot have two contexts with the same name but different capitalization in Security Manager. |
| Description     | Enter an optional description for the context.                                                                                                                                                                                                                                                                                                                                               |

| ScanSafe Settings    | <p>To enable ScanSafe inspection in this context, select Enable ScanSafe Web Security. To override the license specified in the system configuration, enter a license ID in the License field; must be 32 hexadecimal characters.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Interfaces           | <p>This table lists the interfaces and subinterfaces allocated to this context, and their associated settings. These are the interfaces and subinterfaces for which the security context will inspect traffic.</p> <p>To add interfaces and subinterfaces to this context, click the Add Row button below the table to open the <a href="#">Allocate Interfaces Dialog Box (PIX/ASA only)</a>, on page 2315. You can allocate one or more interfaces, and optionally with each interface, one or a range of subinterfaces.</p> <p>To edit an allocation entry, select it and then click the Edit Row button below the table to open the Edit Interface dialog box. Note that you can edit only the Alias Name and the Show hardware properties option; you cannot change the interface/subinterface assignments. Refer to <a href="#">Allocate Interfaces Dialog Box (PIX/ASA only)</a>, on page 2315 for more information about these options.</p> <p>To remove an interface/subinterface allocation, select the appropriate row in this table and then click the Delete Row button below the table.</p> |
| Failover Group       | <p>If this context is part of an active/active failover configuration, choose the failover group to which this context belongs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Allocate Interfaces Dialog Box (PIX/ASA only)

**Note** From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any bug fixes or enhancements.

The Allocate Interfaces dialog box lets you assign an interface, and optionally one or a range of related subinterfaces, to a context, and set name-aliasing options.

## Navigation Path

You access the Allocate Interfaces dialog box from the Add Security Context and Edit Security Context dialog boxes. See for more information.

*Table 835: Allocate Interfaces Dialog Box*

| Element                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Physical Interface                  | Choose a physical interface to assign to this context.<br><br>In transparent firewall mode, you can assign only an interface that has not been allocated to another context. If you choose an interface already assigned to another context, you must also specify a subinterface.                                                                                                                                                                     |
| Sub Interface ID From/To            | Use these drop-down lists to specify a subinterface, or a range of subinterfaces; both lists present the subinterface IDs associated with the chosen Physical Interface.<br><br>To specify a single subinterface, choose the desired ID from the first list. To specify a range, if available, choose the ending ID from the second list. (In transparent firewall mode, only subinterfaces that have not been allocated to other contexts are shown.) |
| View Allocation button              | Click this button to open the View Interface Allocation dialog box, which presents a read-only list of all physical interfaces defined on this device and the security contexts and failover groups associated with each. You can use this to quickly determine current allocations without closing the Allocate Interfaces dialog box.                                                                                                                |
| Use aliased name in context         | To enable name aliasing for this interface/subinterface, check <b>Use aliased names in the security context</b> and then enter an alias in the Alias Name field.<br><br>The specified alias replaces the name of this physical interface or subinterface anywhere it would be displayed for this context—for example, the Hardware Port column on the Interfaces Page.                                                                                 |
| Alias Name                          | Enter the desired alias. An alias must start with a letter, end with a letter or digit, and have as interior characters only letters, digits, and underscores.                                                                                                                                                                                                                                                                                         |
| Suffix Range From/To                | If you specified a range of subinterfaces, these fields are available to let you specify numeric suffixes for their aliased name. The aliased name for each subinterface consists of its sequence number from this range appended to the Alias Name you provided in the previous field.<br><br>These values default to the beginning and ending subinterface ID numbers, but you can enter any valid range of numbers.                                 |
| Show hardware properties in context | Select this option to allow the <b>show interface</b> CLI command to display of physical interface properties for the context even if you defined an alias. If not selected, the show interface output includes the aliased name.                                                                                                                                                                                                                      |

## CHAPTER 60

# User Preferences

---

The User Preferences section consists of the Deployment page and the Transactional Commit page. The Deployment page provides access to the Clear XLATE on deployment option. The Transactional Commit page allows you to enable or disable the transactional commit model for access rules or NAT rules.

- [Configuring Deployment Preferences on Firewall Devices](#) , on page 2317
- [Configuring Transactional Commit Preferences on Firewall Devices](#) , on page 2318

## Configuring Deployment Preferences on Firewall Devices

Use the User Preferences Deployment page to specify deployment options for specific firewall devices. You can create a policy with the deployment options you want to use and then apply that policy to all devices that you want using those deployment settings.

---

**Step 1** Do one of the following:

- (Device view) Select **Platform > User Preferences > Deployment** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > User Preferences > Deployment** from the Policy Types selector. Right-click **Deployment** and choose **New Deployment Policy** to create a policy, or select an existing policy from the Policies selector

The Deployment page is displayed.

**Step 2** Check **Clear XLATE on deployment** if you want the translation table cleared when a configuration is deployed to this device.

Select this option to send a **clear xlate** command to the firewall before changes to access lists are made. This command clears all NAT translations. By default this option is not selected.

**Note** This option is necessary for certain commands to take effect. If these commands are changed, you should make sure this option is enabled for the device. However, clearing the translation table disconnects all current connections that use translations.

**Step 3** Click **Save** at the bottom of the page.

---

# Configuring Transactional Commit Preferences on Firewall Devices

By default, when you change a rule-based policy (such as access rules), the changes become effective immediately. However, this immediacy comes at a slight cost in performance. The performance cost is more noticeable for very large rule lists in a high connections-per-second environment, for example, when you change a policy with 25,000 rules while the ASA is handling 18,000 connections per second.

The performance is affected because the rule engine compiles rules to enable faster rule lookup. By default, the system will also search uncompiled rules when evaluating a connection attempt so that new rules can be applied; since the rules are not compiled, the search takes longer.

Beginning with ASA 9.1(5), you can change this behavior so that the rule engine uses a transactional model when implementing rule changes, continuing to use the old rules until the new rules are compiled and ready for use. Using the transactional model, performance should not drop during the rule compilation. The following table clarifies the behavioral difference.

| Model         | Before Compilation | During Compilation                                                    | After Compilation |
|---------------|--------------------|-----------------------------------------------------------------------|-------------------|
| Default       | Match old rules    | Match new rules.<br>(Connections per second rate will decrease.)      | Match new rules.  |
| Transactional | Match old rules    | Match old rules.<br>(Connections per second rate will be unaffected.) | Match new rules.  |

An additional benefit of the transactional model is that, when replacing an ACL on an interface, there is no gap between deleting the old ACL and applying the new one. This reduces the chances that acceptable connections will be dropped during the operation.

**Tip** If you enable the transactional model for a rule type, there are syslog messages to mark the beginning and the end of the compilation. These messages are numbered 780001 and following.

**Step 1** Do one of the following:

- (Device view) Select **Platform > User Preferences > Transactional Commit** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > User Preferences > Transactional Commit** from the Policy Types selector. Right-click **Transactional Commit** and choose **New Transactional Commit Policy** to create a policy, or select an existing policy from the Policies selector.

The Transactional Commit page is displayed.

**Step 2** Enable the transactional commit model for the desired features. Options include:

- Access Group

- NAT

**Step 3** Click **Save** at the bottom of the page.

# CHAPTER 61

## Managing Routers

---

---

**Note** From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any bug fixes or enhancements.

---

Cisco Security Manager supports the management and configuration of security features and other platform-specific features on Cisco IOS access security routers. You configure these features in the form of policies, each of which defines a different aspect of the configuration of the router. For a detailed explanation of the policy paradigm used by Security Manager, [Understanding Policies](#) , on page 165

You can discover the configurations that are already defined on Cisco IOS routers. The discovery process imports the device configuration into Security Manager as policies and policy objects that you can then manage as required. For more information, see [Discovering Router Policies](#) , on page 2325

---

**Note** Security Manager supports Cisco IOS Software Releases 12.3 and later. However, a limited number of policies are supported for routers running Cisco IOS Software Release 12.1 or 12.2. See [Configuring Routers Running IOS Software Releases 12.1 and 12.2](#) , on page 2325

---

By right-clicking a policy type in one of the policy selectors, you can assign a policy to a single router, share the policy among multiple routers, or unassign the policy from the device.

The following topics describe how to configure platform policies and interface policies on Cisco IOS routers:

- Interface policies:
  - [Basic Interface Settings on Cisco IOS Routers](#) , on page 2327
  - [Advanced Interface Settings on Cisco IOS Routers](#) , on page 2338
  - [IPS Module Interface Settings Page](#) , on page 2347
  - [CEF Interface Settings on Cisco IOS Routers](#) , on page 2350
  - [Dialer Interfaces on Cisco IOS Routers](#) , on page 2353
  - [ADSL on Cisco IOS Routers](#) , on page 2359
  - [SHDSL on Cisco IOS Routers](#) , on page 2366
  - [PVCs on Cisco IOS Routers](#) , on page 2372

- [PPP on Cisco IOS Routers](#) , on page 2396
- Device administration policies:
  - [AAA on Cisco IOS Routers](#) , on page 2410
  - [User Accounts and Device Credentials on Cisco IOS Routers](#) , on page 2422
  - [Bridging on Cisco IOS Routers](#) , on page 2427
  - [Time Zone Settings on Cisco IOS Routers](#) , on page 2431
  - [CPU Utilization Settings on Cisco IOS Routers](#) , on page 2434
  - [HTTP and HTTPS on Cisco IOS Routers](#) , on page 2437
  - [Line Access on Cisco IOS Routers](#) , on page 2444
  - [Optional SSH Settings on Cisco IOS Routers](#) , on page 2472

  - [802.1x on Cisco IOS Routers](#) , on page 2513
  - [Network Admission Control on Cisco IOS Routers](#) , on page 2520
- Logging policies:
  - [Logging on Cisco IOS Routers](#) , on page 2535
- Quality of Service:
  - [Quality of Service on Cisco IOS Routers](#) , on page 2551
- Routing policies:
  - [BGP Routing on Cisco IOS Routers](#) , on page 2585
  - [EIGRP Routing on Cisco IOS Routers](#) , on page 2593
  - [OSPF Routing on Cisco IOS Routers](#) , on page 2611

- [RIP Routing on Cisco IOS Routers](#) , on page 2634
- [Static Routing on Cisco IOS Routers](#) , on page 2643

---

**Note** The settings on the Policy Management page of the Security Manager Administration window determine which router platform policies can be managed with Security Manager. Any policy type that you do not select in this window does not appear on the configuration pages of Security Manager.

---

- [Configuring Routers Running IOS Software Releases 12.1 and 12.2](#) , on page 2325
- [Discovering Router Policies](#) , on page 2325

## Configuring Routers Running IOS Software Releases 12.1 and 12.2

---

**Note** From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any bug fixes or enhancements.

---

Security Manager provides limited support for routers running Cisco IOS Software Releases 12.1 and 12.2 (with the exception of the ASR 1000 Series, which supports more features). You can configure the following policies on these routers:

- Access Rules (Layer 3 only). See [Understanding Access Rules](#) , on page 715.
- Access Rule Settings. See [Understanding Access Rules](#) , on page 715.
- Interfaces. See [Basic Interface Settings on Cisco IOS Routers](#) , on page 2327.
- FlexConfigs. See [Understanding FlexConfig Policies and Policy Objects](#) , on page 340.

All other policies require Cisco IOS Software Release 12.3 or later. For more information about supported devices, see [Supported Devices and Software Versions for Cisco Security Manager](#) .

## Discovering Router Policies

You can discover the configurations of your Cisco IOS routers and import these configurations as policies into Security Manager. This makes it possible to add existing devices and manage them with Security Manager without having to manually configure each device policy by policy. For more information, see [Adding Devices to the Device Inventory](#) , on page 75.

You can discover all Cisco IOS commands that can be configured with Security Manager. Discovery ignores unsupported commands, which means that they are left intact on the device even after subsequent deployments. Additionally, in cases where Security Manager can discover the command, but not all the subcommands and keywords related to that command, the unsupported elements are ignored and left intact on the device.

You can also rediscover the configurations of devices that you are already managing with Security Manager at any time. Be aware, however, that performing rediscovery overwrites the policies that you have defined in

Security Manager, and is therefore not generally recommended. For more information, see [Discovering Policies on Devices Already in Security Manager](#), on page 179.

---

**Note** We recommend that you perform deployment immediately after you discover the policies on a Cisco IOS router, *before* you make any changes to policies or unassign policies from the device. Otherwise, the changes that you configure in Security Manager might not be deployed to the device.

---

---

**Note** If a policy that is not configured in Security Manager was configured on the device using an out-of-band method (such as the CLI) between the time of the first discovery and rediscovery, we recommend that you perform deployment immediately after rediscovery.

## CHAPTER 62

# Configuring Router Interfaces

---

---

**Note** From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any bug fixes or enhancements.

---

This chapter contains the following topics:

- [Basic Interface Settings on Cisco IOS Routers](#) , on page 2327
- [Router Interfaces Page](#) , on page 2333
- [Advanced Interface Settings on Cisco IOS Routers](#) , on page 2338
- [Advanced Interface Settings Page](#) , on page 2341
- [IPS Module Interface Settings on Cisco IOS Routers](#) , on page 2346
- [IPS Module Interface Settings Page](#) , on page 2347
- [CEF Interface Settings on Cisco IOS Routers](#) , on page 2350
- [CEF Interface Settings Page](#) , on page 2351
- [Dialer Interfaces on Cisco IOS Routers](#) , on page 2353
- [Dialer Policy Page](#) , on page 2356
- [ADSL on Cisco IOS Routers](#) , on page 2359
- [ADSL Policy Page](#) , on page 2362
- [SHDSL on Cisco IOS Routers](#) , on page 2366
- [SHDSL Policy Page](#) , on page 2367
- [PVCs on Cisco IOS Routers](#) , on page 2372
- [PVC Policy Page](#) , on page 2380
- [PPP on Cisco IOS Routers](#) , on page 2396
- [PPP/MLP Policy Page](#) , on page 2401

## Basic Interface Settings on Cisco IOS Routers

---

**Note** From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any bug fixes or enhancements.

---

You typically add interfaces to Security Manager by performing discovery, as described in [Discovering Policies](#), on page 176. After you have discovered the interfaces, you can modify the properties of each interface.

You can also use Security Manager to configure physical and virtual interfaces manually. This is useful when you modify interface configurations of existing devices, and makes it possible for you to configure all the interfaces of a device before you physically add the device to the network.

## Available Interface Types

[Table 836: Router Interface Types](#), on page 2328 describes the types of interfaces that can be configured on Cisco IOS routers.

**Table 836: Router Interface Types**

| Type            | Description                                                                                                                                                                                                                                                                                                                              |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Null            | Null interface.                                                                                                                                                                                                                                                                                                                          |
| Analysis-module | A Fast Ethernet interface that connects to the internal interface on the Network Analysis Module (NAM).<br><br><b>Note</b> You cannot configure parameters such as speed and duplex mode for this type of interface.                                                                                                                     |
| Async           | Port line used as an asynchronous interface.                                                                                                                                                                                                                                                                                             |
| ATM             | ATM interface.                                                                                                                                                                                                                                                                                                                           |
| BRI             | ISDN BRI interface. This interface configuration propagates to each B channel. B channels cannot be configured individually.<br><br><b>Note</b> You must configure a dialer interface policy for calls to be placed on a BRI interface. For more information, see <a href="#">Dialer Interfaces on Cisco IOS Routers</a> , on page 2353. |
| BVI             | Bridge-group virtual interface. BVI interfaces are used to route traffic at Layer 3 to the interfaces in a bridge group.                                                                                                                                                                                                                 |
| Content-engine  | Content engine (CE) network module interface.<br><br><b>Note</b> You cannot configure parameters such as speed and duplex mode for this type of interface. You cannot create subinterfaces for this type of interface.                                                                                                                   |
| Dialer          | Dialer interface.                                                                                                                                                                                                                                                                                                                        |
| Ethernet        | Ethernet IEEE 802.3 interface.                                                                                                                                                                                                                                                                                                           |

| Type                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Fast Ethernet        | 100-Mbps Ethernet interface.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| FDDI                 | Fiber Distributed Data Interface.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Gigabit Ethernet     | 1000-Mbps Ethernet interface.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Group-Async          | Main asynchronous interface. This interface type creates a single asynchronous interfaces to which other interfaces are associated. This one-to-many configuration enables you to configure all associated member interfaces by configuring the main interface.                                                                                                                                                                                                  |
| HSSI                 | High-Speed Serial Interface.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Loopback             | A logical interface that emulates an interface that is always up. For example, having a loopback interface on the router prevents a loss of adjacency with neighboring OSPF routers if the physical interfaces on the router go down.<br><br>The name of a loopback interface must end with a number ranging from 0-2147483647.<br><br><b>Note</b> This interface type is supported on all platforms. You can create an unlimited number of loopback interfaces. |
| Multilink            | Multilink interface. A logical interface used for multilink PPP (MLP).                                                                                                                                                                                                                                                                                                                                                                                           |
| Port channel         | Port channel interface. This interface type enables you to bundle multiple point-to-point Fast Ethernet links into one logical link. It provides bidirectional bandwidth of up to 800 Mbps.                                                                                                                                                                                                                                                                      |
| POS                  | Packet OC-3 interface on the Packet-over-SONET (POS) interface processor.                                                                                                                                                                                                                                                                                                                                                                                        |
| PRI                  | ISDN PRI interface. Includes 23/30 B-channels and one D-channel.                                                                                                                                                                                                                                                                                                                                                                                                 |
| Serial               | Serial interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Switch               | Switch interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Ten Gigabit Ethernet | 10000-Mbps Ethernet interface.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Token Ring           | Token Ring interface.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Tunnel               | Tunnel interface.<br><br><b>Note</b> You can create an unlimited number of virtual, tunnel interfaces. Valid values range from 0-2147483647.                                                                                                                                                                                                                                                                                                                     |
| VG-AnyLAN            | 100VG-AnyLAN port adapter.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| VLAN                 | Virtual LAN subinterface.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Virtual Template     | Virtual template interface. When a user dials in, a predefined configuration template is used to configure a virtual access interface; when the user is done, the virtual access interface goes down and the resources are freed for other dial-in uses.                                                                                                                                                                                                         |

## Defining Basic Router Interface Settings

When you define an interface or subinterface for a Cisco IOS router, you name it, specify how it is assigned an IP address, and optionally define other properties, such as the speed, maximum transmission unit (MTU), and the encapsulation type.

---

**Note** Basic interface settings are always local to the device on which they are configured. You cannot share this policy with other devices. You can, however, share advanced interface settings. For more information, see [Advanced Interface Settings on Cisco IOS Routers](#) , on page 2338.

---

**Related Topics**

- [Deleting a Cisco IOS Router Interface](#) , on page 2332

- 
- Step 1** In Device view, select **Interfaces** > **Interfaces** from the Policy selector.  
The [Router Interfaces Page](#) , on page 2333 is displayed.
- Step 2** To add a new interface or subinterface, click the Add Row button to open the Create Router Interface dialog box.  
To edit an existing interface or subinterface, select it in the Interfaces table, and then click the Edit Row button to open the Edit Router Interface dialog box. Refer to [Create Router Interface Dialog Box](#) , on page 2334 for descriptions of the fields in these dialog boxes.
- Step 3** Select **Enabled** to have Security Manager actively manage this interface or subinterface. If this option is deselected, the interface/subinterface definition is retained, but the interface/subinterface itself is disabled (or “shutdown”).
- Step 4** Choose **Interface** or **Subinterface** from the Type list.
- Step 5** If you are creating an interface, enter a name for the interface. You can click **Select** to open a dialog box that will help you generate a standard name based on interface type and details about the interface’s location, such as card, slot, and subinterface. For more information on using the dialog box to generate an interface name, see [Interface Auto Name Generator Dialog Box](#) , on page 2338.
- Note** When naming a BVI interface, use the bridge group number as the card number. Deployment will fail if you configure a BVI interface without configuring a corresponding bridge group.
- Step 6** If you are creating a subinterface, provide the following:
- Parent**—Choose the parent interface for this subinterface.
  - Subinterface ID**—Enter a number to identify the subinterface.
- Note** Security Manager configures serial subinterfaces as point-to-point, not multipoint.
- Step 7** To specify a **Layer Type**, choose a Level 2 (data link) or Level 3 (network) option from this list.

**Step 8** Choose a method of **IP** address assignment for this interface/subinterface, then provide additional information, as required:

- **Static IP**—Provide an **IP Address** and **Subnet Mask**.
- **DHCP**—No additional information is required.
- **PPPoE**—No additional information is required.
- **Unnumbered**—Provide the name of the interface from which an IP address is to be “borrowed.”

**Note** Layer 2 interfaces do not support IP addresses.

**Step 9** Define additional properties of the interface/subinterface:

- Use the **Negotiation** check box to enable and disable auto-negotiation for the interface.

Auto-negotiation detects the capabilities of remote devices and negotiates the best possible performance between the two devices. When Negotiation is enabled, the Fast Ethernet Duplex and Speed options are disabled.

**Note** Auto-negotiation is available only for Fast Ethernet and Gigabit Ethernet interfaces on ASR devices.

- Choose a transmission mode from the **Duplex** list. If you choose Auto, be sure the network device to which this interface is connected is set to automatically detect the transmission mode. (Auto is not available on ASRs; use auto-negotiation instead.)

**Note** You must configure a fixed speed to define the duplex value. Tunnel and loopback interfaces do not support this setting.

- Choose a transmission speed from the **Speed** list. If you choose Auto, be sure the network device to which this interface is connected is set to automatically detect the transmission speed. (Auto is not available on ASRs; use auto-negotiation instead.)
- Enter the maximum transmission unit (**MTU**), which defines the largest packet size, in bytes, that this interface can support.

**Note** Certain interface properties are set automatically, or are unavailable, depending on the interface type and the underlying port type. For example, the Speed options are available for Fast Ethernet and Gigabit Ethernet interfaces only.

**Step 10** Choose an encapsulation method from the **Encapsulation** list:

- **None**—No encapsulation; no additional parameters are required.
- (Ethernet subinterfaces only) **DOT1Q**—VLAN encapsulation, as defined by the IEEE 802.1Q standard. Provide the following VLAN parameters for this subinterface:
  - Enter a VLAN ID to associate with this subinterface.

**Note** All VLAN IDs must be unique among all subinterfaces configured on the same physical interface.

- If you are defining the 802.1Q trunk interface, select Native VLAN.

**Tip** To configure DOT1Q encapsulation on an Ethernet interface without associating a VLAN with the subinterface, enter the **vlan-id dot1q** command using CLI commands or FlexConfigs. See [Understanding FlexConfig Policies and Policy Objects](#), on page 340. Configuring VLANs on the main interface increases the number of VLANs that can be configured on the router.

- (Serial interfaces only) **Frame Relay**—IETF Frame Relay encapsulation. Provide a data-link connection identifier (DLCI) for the subinterface.

**Note** Frame relay must be configured on the parent interface.

**Note** IETF Frame Relay encapsulation provides interoperability between a Cisco IOS router and equipment from other vendors. To configure Cisco Frame Relay encapsulation, use CLI commands or FlexConfigs.

**Step 11** (Optional) Enter a description of up to 1024 characters for the interface.

**Step 12** Click **OK** to save the interface/subinterface definition and close the dialog box. The new interface is displayed on the Router Interfaces page. Subinterfaces are displayed beneath the parent interface.

## Deleting a Cisco IOS Router Interface

Although you can delete the definition of a virtual interface at any time, use this option with great care. If the interface is included in any policy definitions that exist for this router, deleting the interface causes these policy definitions to fail when they are deployed to the device.

**Note** Deleting the basic interface definition does not delete any advanced settings that are configured under **Interface > Settings > Advanced Settings**. You must delete these advanced settings separately. If you fail to do so, deployment fails.

**Note** Deleting the definition of a physical interface from the Router Interfaces page does not remove the interface from the device. If you perform this operation by mistake, you can perform rediscovery to restore the definition to Security Manager. For more information, see [Discovering Policies on Devices Already in Security Manager](#), on page 179.

**Step 1** Click the **Device View** button on the toolbar.

**Step 2** Select a router from the Device selector.

**Step 3** Select **Interfaces > Interfaces** from the Policy selector. The Router Interfaces page is displayed. See [Table 837: Router Interfaces Page](#), on page 2333 for an explanation of the fields on this page.

**Step 4** Select an interface from the table, then click the **Delete** button. The interface is deleted.

# Router Interfaces Page

Use the Router Interfaces page to view, create, edit, and delete interface definitions (physical and virtual) on a selected Cisco IOS router. The Router Interfaces page displays interfaces that were discovered by Security Manager as well as interfaces added manually after you added the device to the system.

**Note** Unlike other router policies, the Interfaces policy cannot be shared among multiple devices. The Advanced Settings policy, however, may be shared. See [Local Policies vs. Shared Policies](#), on page 167.

For more information, see [Basic Interface Settings on Cisco IOS Routers](#), on page 2327.

## Navigation Path

Select a Cisco IOS router from the Device selector, then select **Interfaces** > **Interfaces** from the Policy selector.

| Element         | Description                                                                                                                                |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Type  | The interface type. Subinterfaces are displayed indented beneath their parent interface.                                                   |
| Interface Name  | The name of the interface.                                                                                                                 |
| Enabled         | Indicates whether the interface is currently enabled (managed by Security Manager) or disabled (shutdown state).                           |
| IP Address      | The IP address of interfaces defined with a static address.                                                                                |
| IP Address Type | The type of IP address assigned to the interface—static, DHCP, PPPoE, or unnumbered. (IP address is defined by a selected interface role.) |
| Interface Role  | The interface roles that are assigned to the selected interface.                                                                           |
| Add button      | Opens the <a href="#">Create Router Interface Dialog Box</a> , on page 2334. From here you can create an interface on the selected router. |
| Edit button     | Opens the <a href="#">Create Router Interface Dialog Box</a> , on page 2334. From here you can edit the selected interface.                |

| Element       | Description                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------|
| Delete button | Deletes the selected interfaces from the table. Ensure that the interface is not being used in any other policy before deleting it. |

## Create Router Interface Dialog Box

Use the Create Router Interface dialog box to create and edit physical and virtual interfaces on the selected Cisco IOS router.

**Tip** Interface configuration is specific to the type of device. Many of the options on this page might be greyed out for specific device or interface types because they do not apply or they are not configurable.

### Navigation Path

Go to the [Router Interfaces Page](#), on page 2333, then click the **Add** or **Edit** button beneath the table.

### Field Reference

*Table 838: Create Router Interface Dialog Box*

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enabled | Whether the interface is enabled (no shutdown). If you deselect this option, the interface is created in the configuration but it is shut down.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Type    | Specifies whether you are defining an interface or subinterface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Name    | <p>Applies only to interfaces.</p> <p>The name of the interface. Enter a name manually, or click <b>Select</b> to display a dialog box for generating a name automatically. See <a href="#">Interface Auto Name Generator Dialog Box</a>, on page 2338.</p> <p>Logical interfaces require a number after the name:</p> <ul style="list-style-type: none"> <li>• The range for dialer interfaces is 0-799.</li> <li>• The range for loopback interfaces is 0-2147483647.</li> <li>• The range for BVI interfaces is 1-255.</li> <li>• The only allowed value for null interfaces is 0.</li> </ul> |

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Parent          | <p>Applies only to subinterfaces.</p> <p>The parent interface of the subinterface. Choose the parent interface from this list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Subinterface ID | <p>Applies only to subinterfaces.</p> <p>The ID number of the subinterface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| IP              | <p>The method of IP address assignment for the interface:</p> <ul style="list-style-type: none"> <li>• Static IP—Defines a static IP address and subnet mask for the interface. Enter this information in the fields that appear below the option.</li> </ul> <p><b>Note</b> You can define the mask using either dotted decimal (for example, 255.255.255.255) or CIDR notation (/32). See <a href="#">Contiguous and Discontiguous Network Masks for IPv4 Addresses</a>, on page 309.</p> <ul style="list-style-type: none"> <li>• DHCP—The interface obtains its IP address dynamically from a DHCP server.</li> <li>• PPPoE—The router automatically negotiates its own registered IP address from a central server (via PPP/IPCP). The following interface types support PPPoE: <ul style="list-style-type: none"> <li>• Async</li> <li>• Serial</li> <li>• High-Speed Serial Interface (HSSI)</li> <li>• Dialer</li> <li>• BRI, PRI (ISDN)</li> <li>• Virtual template</li> <li>• Multilink</li> </ul> </li> <li>• Unnumbered—The interface obtains its IP address from a different interface on the device. Choose an interface from the Interface list. This option can be used with point-to-point interfaces only.</li> </ul> <p><b>Note</b> Layer 2 interfaces do not support IP addresses. Deployment fails if you define an IP address on a Layer 2 interface.</p> |
| Layer Type      | <p>The OSI layer at which the interface is defined:</p> <ul style="list-style-type: none"> <li>• Unknown—The layer is unknown.</li> <li>• Layer 2—The data link layer, which contains the protocols that control the physical layer (Layer 1) and how data is framed before being transmitted on the medium. Layer 2 is used for bridging and switching. Layer 2 interfaces do not have IP addresses.</li> <li>• Layer 3—The network layer, which is primarily responsible for the routing of data in packets across logical internetwork paths. This routing is accomplished through the use of IP addresses.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Negotiation | <p>Available on ASRs; applies to Fast Ethernet and Gigabit Ethernet interfaces only.</p> <p>Auto-negotiation detects the capabilities of remote devices and negotiates the best possible performance between the two devices. When Negotiation is enabled, the Duplex and Speed options are disabled.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Duplex      | <p>The interface transmission mode:</p> <ul style="list-style-type: none"> <li>• None—The transmission mode is returned to its device-specific default setting.</li> <li>• Full—The interface transmits and receives at the same time (full duplex).</li> <li>• Half—The interface can transmit or receive, but not at the same time (half duplex). This is the default.</li> <li>• Auto—The router automatically detects and sets the appropriate transmission mode, either full or half duplex. Not available on ASRs; use auto-negotiation instead.</li> </ul> <p><b>Note</b> When using Auto mode, be sure that the port on the active network device to which you connect this interface is also set to automatically negotiate the transmission mode. Otherwise, select the appropriate fixed mode.</p> <p><b>Note</b> You can configure a duplex value only if you set the Speed to a fixed speed, not Auto.</p> <p><b>Note</b> This setting does not apply to serial, HSSI, ATM, PRI, DSL, tunnel, or loopback interfaces.</p> |
| Speed       | <p>Applies only to Fast Ethernet and Gigabit Ethernet interfaces.</p> <p>The speed of the interface:</p> <ul style="list-style-type: none"> <li>• None—The setting is not configurable on the device.</li> <li>• 10—10 megabits per second (10Base-T networks).</li> <li>• 100—100 megabits per second (100Base-T networks). This is the default for Fast Ethernet interfaces.</li> <li>• 1000—1000 megabits per second (Gigabit Ethernet networks). This is the default for Gigabit Ethernet interfaces.</li> <li>• Auto—The router automatically detects and sets appropriate interface speed. Not available on ASRs; use auto-negotiation.</li> </ul> <p><b>Note</b> When using Auto mode, be sure that the port on the active network device to which you connect this interface is also set to automatically negotiate the transmission speed. Otherwise, select the appropriate fixed speed.</p>                                                                                                                                 |
| MTU         | <p>The maximum transmission unit, which refers to the maximum packet size, in bytes, that this interface can handle.</p> <p>Valid values for serial, Ethernet, and Fast Ethernet interfaces range from 64 to 17940 bytes.</p> <p>Valid values for Gigabit Ethernet interfaces range from 1500 to 9216 bytes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Encapsulation | <p>The type of encapsulation performed by the interface:</p> <ul style="list-style-type: none"> <li>• None—No encapsulation.</li> <li>• DOT1Q—VLAN encapsulation, as defined by the IEEE 802.1Q standard. Applies only to Ethernet subinterfaces.</li> <li>• Frame Relay—IETF Frame Relay encapsulation. Applies only to serial interfaces (not serial subinterfaces).</li> </ul> <p><b>Note</b> IETF Frame Relay encapsulation provides interoperability between a Cisco IOS router and equipment from other vendors. To configure Cisco Frame Relay encapsulation, use CLI commands or FlexConfigs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| VLAN ID       | <p>Applies only to subinterfaces with encapsulation type DOT1Q.</p> <p>The VLAN ID associated with this subinterface. The VLAN ID specifies where 802.1Q tagged packets are sent and received on this subinterface; without a VLAN ID, the subinterface cannot send or receive traffic. Valid values range from 1 to 4094.</p> <p><b>Note</b> All VLAN IDs must be unique among all subinterfaces configured on the same physical interface.</p> <p><b>Tip</b> To configure DOT1Q encapsulation on an Ethernet interface without associating the VLAN with a subinterface, enter the <b>vlan-id dot1q</b> command using CLI commands or FlexConfigs. See <a href="#">Understanding FlexConfig Policies and Policy Objects</a>, on page 340. Configuring VLANs on the main interface increases the number of VLANs that can be configured on the router.</p>                                                                                                                                                                                                                                                                                                                                                                                                |
| Native VLAN   | <p>Applies only when the encapsulation type is DOT1Q and you are configuring a physical interface that is meant to serve as an 802.1Q trunk interface. Trunking is a way to carry traffic from several VLANs over a point-to-point link between two devices.</p> <p>When selected, the Native VLAN is associated with this interface, using the ID specified in the VLAN ID field. (If no VLAN ID is specified for the Native VLAN, the default is 1.) The native VLAN is the VLAN to which all untagged VLAN packets are logically assigned by default. This includes the management traffic associated with the VLAN. If no VLAN ID is defined, the default is 1.</p> <p>For example, if the VLAN ID of this interface is 1, all incoming untagged packets and packets with VLAN ID 1 are received on the main interface and not on a subinterface. Packets sent from the main interface are transmitted without an 802.1Q tag.</p> <p>When deselected, the Native VLAN is not associated with this interface.</p> <p><b>Note</b> The Native VLAN cannot be configured on a subinterface of the trunk interface. Be sure to configure the same Native VLAN value at both ends of the link; otherwise, traffic may be lost or sent to the wrong VLAN.</p> |
| DLCI          | <p>Applies only to serial subinterfaces with Frame Relay encapsulation.</p> <p>Enter the data-link connection identifier to associate with the subinterface. Valid values range from 16 to 1007.</p> <p><b>Note</b> Security Manager configures serial subinterfaces as point-to-point not multipoint.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Element     | Description                                                                                                |
|-------------|------------------------------------------------------------------------------------------------------------|
| Description | Additional information about the interface (up to 1024 characters).                                        |
| Roles       | The interface roles assigned to this interface. A message is displayed if no roles have yet been assigned. |

## Interface Auto Name Generator Dialog Box

Use the Interface Auto Name Generator dialog box to have Security Manager generate a name for the interface based on the interface type and its location in the router or switch.

### Navigation Path

Go to the [Create Router Interface Dialog Box](#), on page 2334, select **Interface** from the Type list, then click **Select** in the Name field.

### Field Reference

*Table 839: Interface Auto Name Generator Dialog Box*

| Element | Description                                                                                                                                                                                                                                                                                      |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type    | The type of interface. Your selection from this list forms the first part of the generated name, as displayed in the Result field. For more information, see <a href="#">Available Interface Types</a> , on page 2328.                                                                           |
| Card    | The card related to the interface.<br><b>Note</b> When defining a BVI interface, enter the number of the corresponding bridge group.                                                                                                                                                             |
| Slot    | The slot related to the interface.                                                                                                                                                                                                                                                               |
| Port    | The port related to the interface.<br><b>Note</b> The information you enter in these fields forms the remainder of the generated name, as displayed in the Result field.                                                                                                                         |
| Result  | The name generated by Security Manager from the information you entered for the interface type and location. The name displayed in this field is read-only.<br><b>Tip</b> After closing this dialog box, you can edit the generated name in the Create Router Interface dialog box, if required. |

## Advanced Interface Settings on Cisco IOS Routers

In addition to the basic interface definitions that you can define on the Interfaces page, Security Manager provides a method for defining selected advanced settings on interfaces that support those settings.

Unlike the basic interface settings defined on the Interface page, you can share an advanced settings policy with multiple devices. This provides a convenient method for configuring multiple devices with identical settings. See [Working with Shared Policies in Device View or the Site-to-Site VPN Manager](#), on page 201.

You can define a variety of advanced settings on a selected interface, subinterface, or interface role, including:

- Cisco Discovery Protocol (CDP) settings.
- Internet Control Message Protocol (ICMP) settings.
- Directed broadcast settings.
- Load interval for determining the average load.
- Throughput delay for use by routing protocols.
- Configuring TCP maximum segment size.
- Helper addresses for forwarding UDP broadcasts. For more information on helper addresses, see [Understanding Helper Addresses](#) , on page 2340.
- Enabling Maintenance Operation Protocol (MOP).
- Enabling virtual fragmentation reassembly (VFR).
- Enabling proxy ARP.
- Enabling NBAR protocol discovery.
- Enabling and configuring unicast reverse path forwarding (RFP).

---

**Tip** You can define these settings for multiple interfaces on a device at once by choosing an interface role instead of a specific interface. For example, if you have defined an All-Ethernets interface role, you can define identical advanced settings for every Ethernet interface on the device with a single definition. See [Understanding Interface Role Objects](#) , on page 301.

---

#### Before You Begin

- Define basic interface settings. See [Basic Interface Settings on Cisco IOS Routers](#) , on page 2327.

---

#### Step 1

Do one of the following:

- (Device view) Select **Interfaces > Settings > Advanced Settings** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > Advanced Settings** from the Policy Type selector. Select an existing policy or create a new one.

The Advanced Interface Settings page is displayed (see [Advanced Interface Settings Dialog Box](#) , on page 2342).

#### Step 2

Do one of the following:

- Click the **Add** button to add an interface or interface role to the table. In the Advanced Interface Settings dialog box, enter the name of the interface or interface role, or click **Select** to select an existing role or to create a new role.
- Select an existing entry in the table and click the **Edit** button to change its settings.

#### Step 3

Configure the advanced settings required for the selected interface. For details about each setting, see [Advanced Interface Settings Dialog Box](#) , on page 2342.

**Step 4** Click **OK** to save your definitions. Your definitions are displayed in the Advanced Interface Settings table.

## Understanding Helper Addresses

Network hosts occasionally use User Datagram Protocol (UDP) broadcasts to determine address, configuration, and name information. This presents a problem if the host is on a network segment that does not include the required server, as by default, routers do not forward UDP broadcasts beyond their subnet. You can remedy this situation by configuring the interface to forward certain classes of broadcasts to a helper address.

One common use of helper addresses is when the router acts as a relay agent for DHCP clients who need to contact a DHCP server located on a different subnet. The helper address can either represent a specific DHCP server or a network address for a segment containing multiple DHCP servers. You can also configure a helper address for each DHCP server.

In [Figure 46: Helper Addresses, on page 2340](#), hosts located on network 192.168.1.0 can use 10.44.23.7 as a helper address to forward UDP broadcasts to the other network, while hosts located on network 10.44.0.0 can use 192.168.1.19 as their helper address.

**Figure 46: Helper Addresses**

[Table 840: Default UDP Services Forwarded to Helper Addresses, on page 2340](#) lists the default UDP services that can be forwarded to helper addresses.

**Table 840: Default UDP Services Forwarded to Helper Addresses**

| Service                  | Port |
|--------------------------|------|
| BOOTP/DHCP Client        | 68   |
| BOOTP/DHCP Server        | 67   |
| DNS                      | 53   |
| NetBIOS datagram service | 138  |

| Service              | Port |
|----------------------|------|
| NetBIOS name service | 137  |
| TACACS               | 49   |
| TFTP                 | 69   |
| Time                 | 37   |

**Tip** To forward additional UDP services, use the CLI or FlexConfigs to configure the `ip forward-protocol` command. Use the `no` form of this command to prevent the forwarding of any of the default services listed in [Table 840: Default UDP Services Forwarded to Helper Addresses](#), on page 2340.

All of the following conditions must be met in order for a UDP or IP packet to use helper addresses:

- The MAC address of the received frame must be an all-ones broadcast address (ffff.ffff.ffff).
- The IP destination address must be one of the following: all-ones broadcast (255.255.255.255), subnet broadcast for the receiving interface, or major-net broadcast for the receiving interface if the `no ip classless` command is also configured.
- The IP time-to-live (TTL) value must be at least 2.
- The IP protocol must be UDP (17).

## Advanced Interface Settings Page

Use the Advanced Interface Settings page to configure advanced interface definitions (physical and virtual) on a router. Examples of advanced settings include Cisco Discovery Protocol (CDP) settings, ICMP message settings, and virtual fragment reassembly settings. You can configure settings for specific interfaces or for interface roles. The columns in the table summarize the advanced settings for an entry and are explained in [Advanced Interface Settings Dialog Box](#), on page 2342.

To configure advanced settings:

- Click the **Add** button to add an interface or interface role to the table, and fill in the Advanced Interface Settings dialog box.
- Select an entry and click the **Edit** button to edit an existing entry.
- Select an entry and click the **Delete** button to delete it.

For more information, see [Advanced Interface Settings on Cisco IOS Routers](#), on page 2338.

**Navigation Path**

- (Device view) Select **Interfaces > Settings > Advanced Settings** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > Advanced Settings** from the Policy Type selector. Right-click **Advanced Settings** to create a policy, or select an existing policy from the Shared Policy selector.

## Advanced Interface Settings Dialog Box

Use the Advanced Interface Settings dialog box to define a variety of advanced settings on a selected interface as described in the table below.

**Navigation Path**

Go to the [Advanced Interface Settings Page](#) , on page 2341, then click the **Add** or **Edit** button beneath the table.

| Element   | Description                                                                                                                                                                                                                                                                                                                                                   |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface | <p>The interface on which the advanced settings are defined. Enter the name of an interface or interface role, or click <b>Select</b> to select it. If the you want is not listed, click the <b>Create</b> button to create it.</p> <p><b>Note</b> The only advanced settings supported on Layer 2 interfaces are Max. Bandwidth, Load Interval, and CDP.</p> |

| Element                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Max Bandwidth              | The bandwidth value to communicate to higher-level protocols in kilobits per second (kbps). The value you define in this field is an informational parameter only; it does not affect the physical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Load Interval              | <p>The length of time, in seconds, used to calculate the average load on the interface. Valid values range from 30 to 600 seconds, in multiples of 30 seconds. The default is 300 seconds (5 minutes). Load interval is not supported on subinterfaces.</p> <p>Modify the default to shorten the length of time over which load averages are computed. You can do this if you want load computations to be more reactive to short bursts of traffic.</p> <p>Load data is gathered every 5 seconds. This data is used to compute load statistics, including input/output rate in bits and packets per second, load, and reliability. Load data is computed using a weighted-average calculation in which recent load data has more weight in the computation than older load data.</p> <p><b>Tip</b> You can use this option to increase or decrease the likelihood of activating a backup interface; for example, a backup dial interface may be triggered by a sudden spike in the load on an active interface.</p> |
| TCP Maximum Segment Size   | <p>The maximum segment size (MSS) of TCP SYN packets that pass through this interface. Valid values range from 500 to 1460 bytes. If you do not specify a value, the MSS is determined by the originating host.</p> <p>This option helps prevent TCP sessions from being dropped as they pass through the router. Use this option when the ICMP messages that perform auto-negotiation of TCP frame size are blocked (for example, by a firewall). We highly recommend using this option on the tunnel interfaces of DMVPN networks.</p> <p><b>Note</b> Typically, the optimum MSS is 1452 bytes. This value plus the 20-byte IP header, the 20-byte TCP header, and the 8-byte PPPoE header add up to a 1500-byte packet that matches the MTU size for the Ethernet link.</p>                                                                                                                                                                                                                                       |
| Helper Addresses           | <p>The helper addresses that are used to forward User Datagram Protocol (UDP) broadcasts that are received on this interface. Enter one or more addresses or the names of the network/host objects, or click <b>Select</b> to select an object from a list or to create a new object.</p> <p>By default, routers do not forward broadcasts outside of their subnet. Helper addresses provide a solution by enabling the router to forward certain types of UDP broadcasts as a unicast to an address on the destination subnet. For more information, see <a href="#">Understanding Helper Addresses</a>, on page 2340.</p>                                                                                                                                                                                                                                                                                                                                                                                          |
| Interface Throughput Delay | <p>The expected delay for the interface in tens of microseconds (for example, 3000 translates to 30,000 microseconds). You can enter a value between 1 and 16777215, and the default varies by the type of interface.</p> <p>Higher-level protocols might use delay information to make operating decisions. For example, IGRP can use delay information to differentiate between a satellite link and a land link. This setting is for informational purposes only and does not affect the actual delay on the interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Element                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cisco Discovery Protocol settings           | <p>Settings related to the Cisco Discovery Protocol (CDP). CDP is a media- and protocol-independent device-discovery protocol that runs on all Cisco-manufactured equipment including routers, access servers, bridges, and switches. It is primarily used to obtain protocol addresses of neighboring devices and to discover the platform of those devices. The options are:</p> <ul style="list-style-type: none"> <li>• Enable CDP—Whether to enable the Cisco Discovery Protocol (CDP) on this interface. You cannot enable CDP on ATM interfaces.</li> <li>• Log CDP Messages—On Ethernet interfaces, whether to log duplex mismatches for this interface.</li> </ul> |
| <b>ICMP Messages Settings</b>               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Enable Redirect Messages                    | Whether to enable the sending of Internet Control Message Protocol (ICMP) redirect messages if the device is forced to resend a packet through the same interface on which it was received to another device on the same subnet. Redirect messages are sent when the device wants to instruct the originator of the packet to remove it from the route and substitute a different device that offers a more direct path to the destination.                                                                                                                                                                                                                                 |
| Enable Unreachable Messages                 | <p>Whether to enable the sending of ICMP unreachable messages. Unreachable messages are sent in two circumstances:</p> <ul style="list-style-type: none"> <li>• If the interface receives a nonbroadcast packet destined for itself that uses an unknown protocol, the interface sends an ICMP unreachable message to the source.</li> <li>• If the device receives a packet that it cannot deliver to its ultimate destination because it knows of no route to the destination address, it sends an ICMP host unreachable message to the originator of the packet.</li> </ul> <p><b>Note</b> This is the only advanced setting supported by the null0 interface.</p>       |
| Enable Mask Reply Messages                  | Whether to enable the sending of ICMP mask reply messages. Mask reply messages are sent in response to mask request messages, which are sent when a device needs to know the subnet mask for a particular subnetwork.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Additional Settings</b>                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Enable Maintenance Operation Protocol (MOP) | Whether to enable MOP on the interface. You can use MOP for utility services such as uploading and downloading system software, remote testing, and problem diagnosis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Enable Virtual Fragment Reassembly (VFR)    | Whether to enable virtual fragmentation reassembly (VFR) on this interface. VFR is a feature that enables the Cisco IOS Firewall to create dynamic ACLs that can protect the network from various fragmentation attacks.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Proxy ARP                                      | Whether to enable proxy Address Resolution Protocol (ARP) on the interface. Proxy ARP, defined in RFC 1027, is the technique in which one host, usually a router, answers ARP requests intended for another machine, thereby accepting responsibility for routing packets to the real destination. Proxy ARP can help machines on a subnet reach remote subnets without configuring routing or a default gateway.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Enable NBAR Protocol Discovery                        | Whether to enable network-based application recognition (NBAR) on this interface to discover traffic and keep traffic statistics for all protocols known to NBAR. Protocol discovery provides a method to discover application protocols traversing an interface so that QoS policies can be developed and applied to them. For more information, go to:<br><a href="http://www.cisco.com/en/US/products/ps6616/products_qanda_item09186a00800a3ded.shtml">http://www.cisco.com/en/US/products/ps6616/products_qanda_item09186a00800a3ded.shtml</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Enable Directed Broadcasts ACL                        | <p>Whether to have directed broadcast packets “exploded” as a link-layer broadcast when this interface is directly connected to the destination subnet. When deselected, directed broadcast packets that are intended for the subnet to which this interface is directly connected are dropped rather than being broadcast. This is the default.</p> <p>An IP directed broadcast is an IP packet whose destination address is a valid broadcast address on a different subnet from the node on which it originated. In such cases, the packet is forwarded as if it was a unicast packet until it reaches its destination subnet.</p> <p>This option affects only the final transmission of the directed broadcast on its destination subnet; it does not affect the transit unicast routing of IP directed broadcasts.</p> <p>If you enable directed broadcasts, you can apply an ACL to determine which directed broadcasts are permitted to be broadcast on the destination subnet. All other directed broadcasts destined for the subnet to which this interface is directly connected are dropped. Enter the name of a standard or extended ACL object, or click <b>Select</b> to select an object from a list or to create a new object.</p> <p><b>Tip</b> Because directed broadcasts, and particularly ICMP directed broadcasts, have been abused by malicious persons, we recommend deselecting this option on interfaces where directed broadcasts are not needed. When you enable directed broadcasts, apply an ACL to restrict their use.</p> |
| <b>Unicast Reverse Path Forwarding (RFP) Settings</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Enable Unicast RFP                                    | <p>Whether to enable unicast reverse path forwarding (RFP) on the interface. When you enable Unicast RFP on an interface, the router examines all packets that are received on that interface. The router checks to make sure that the source address appears in the FIB, and takes action based on your unicast RFP settings. Use unicast RFP to mitigate problems caused by malformed or forged (spoofed) IP source addresses that pass through a router. Malformed or forged source addresses can indicate DoS attacks based on source IP address spoofing. For more information on unicast RFP, see the description of the <b>ip verify unicast source reachable-via</b> command in the <i>Cisco IOS Interface and Hardware Component Command Reference</i> .</p> <p>To enable unicast RFP, you must also globally enable Cisco Express Forwarding (CEF). For more information on CEF, see <a href="#">CEF Interface Settings on Cisco IOS Routers</a> , on page 2350.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Element                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode                                            | <p>How strict to make unicast RFP:</p> <ul style="list-style-type: none"> <li>• <b>Loose Mode</b>—The default. Examines incoming packets to determine whether the source address is in the Forwarding Information Base (FIB) and permits the packet if the source is reachable through any interface on the router.</li> </ul> <p>Use loose mode on interfaces where asymmetric paths allow packets from valid source networks (networks contained in the FIB). For example, routers that are in the core of an ISP network have no guarantee that the best forwarding path out of the router will be the path selected for packets returning to the router.</p> <ul style="list-style-type: none"> <li>• <b>Strict Mode</b>—Examines incoming packets to determine whether the source address is in the FIB and permits the packet only if the source is reachable through the interface on which the packet was received.</li> </ul> <p>Use strict mode on interfaces where only one path allows packets from valid source networks (networks contained in the FIB). Also, use strict mode when a router has multiple paths to a given network as long as the valid networks are switched through the incoming interfaces. Packets for invalid networks are dropped. For example, routers at the edge of the network of an ISP are likely to have symmetrical reverse paths. Strict mode is also applicable in certain multihomed situations, provided that optional Border Gateway Protocol (BGP) attributes, such as weight and local preference, are used to achieve symmetric routing.</p> |
| Allow Use Of Default Route for RFP Verification | Whether to permit Unicast RFP to successfully match on prefixes that are known through the default route when determining whether to pass packets. Normally, sources found in the FIB but only by way of the default route are dropped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Allow Self Ping                                 | <p>Whether to allow the router to ping its own interfaces. By default, when you enable Unicast RFP, packets that are generated by the router and destined to the router are dropped, thereby making certain troubleshooting and management tasks difficult to accomplish.</p> <p><b>Caution</b> Allowing self-ping opens a potential denial of service (DoS) hole.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| ACL (For Unicast RFP)                           | If you enable unicast RFP, you can apply an ACL to refine how packets are handled when a reverse path is not found. If you specify an ACL, when (and only when) a packet fails the Unicast RFP check, the ACL is checked to determine whether the packet should be dropped (using a deny statement in the ACL) or forwarded (using a permit statement in the ACL). Enter the name of a standard or extended ACL object, or click <b>Select</b> to select an object from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## IPS Module Interface Settings on Cisco IOS Routers

**Note** From version 4.17, though Cisco Security Manager continues to support IPS and IOS features/functionality, it does not support any bug fixes or enhancements.

On some routers, you can install IPS modules such as the Cisco Intrusion Prevention System Advanced Integration Module or Network Module. When installed and active, you must configure the IPS Module interface settings policy to define the following:

- The name of the interface between the module and the router.
- The failure mode of the module. If the module fails, you can configure it to allow all traffic or to deny all traffic.
- The router interfaces to monitor. You can name specific interfaces or use interface roles to cover more than one interface at a time. For example, if you have defined an All-Ethernets interface role, you can define identical monitoring settings for every Ethernet interface on the device with a single definition. See [Understanding Interface Role Objects](#) , on page 301.

**Tip** After you have defined an IPS Module interface settings policy, you can share the policy and assign it to other devices. This provides a convenient method for configuring multiple devices with identical settings. See [Working with Shared Policies in Device View or the Site-to-Site VPN Manager](#) , on page 201.

### Before You Begin

Define basic interface settings. See [Basic Interface Settings on Cisco IOS Routers](#) , on page 2327.

#### Step 1

Do one of the following:

- (Device view) Select **Interfaces > Settings > IPS Module** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > IPS Module** from the Policy Type selector. Select an existing policy or create a new one.

The IPS Module Interface Settings page is displayed. See [IPS Module Interface Settings Page](#) , on page 2347 for an explanation of the fields on this page.

#### Step 2

In the IPS Module Interface Settings fields, enter the name of the IPS interface (such as IDS-Sensor1/0) or click Select to select it from a list. Also determine whether you want to allow all traffic if the module fails (fail open) or to deny all traffic (fail closed).

#### Step 3

Identify the router interfaces that the module should monitor. Click the **Add** button below the IPS Module Service Module Monitoring Settings table to add interfaces to the list, or select an interface and click the **Edit** button to change the settings for an existing interface. Use the IPS Monitoring Information dialog box to define the interface name or role, monitoring mode, and access list (if any). For more information, see [IPS Monitoring Information Dialog Box](#) , on page 2349.

## IPS Module Interface Settings Page

**Note** From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any bug fixes or enhancements.

Use the IPS Module Interface Settings page to define the settings on the Cisco Intrusion Prevention System Advanced Integration Module or Network Module. The module must be running IPS 6.0 or later. You can define the fail mode for the IPS interface, and the interfaces that the module should monitor. Configure this policy only if the router hosts an IPS module.

---

**Caution** Cisco IOS IPS and the Cisco IPS module cannot be used together. Cisco IOS IPS must be disabled when the IPS module is installed.

---

### Navigation Path

- (Device view) Select **Interfaces > Settings > IPS Module** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > IPS Module** from the Policy Type selector. Create a new policy or select an existing policy from the Shared Policy selector.

*Table 842: IPS Module Interface Settings Page*

| Element        | Description                                                                                                                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name | The name of the IPS module interface. Enter the name or click <b>Select</b> to select the interface or interface role. If the object that you want is not listed, click the <b>Create</b> button to create it. |
| Fail Over Mode | How the module should handle traffic inspection during a module failure, either to fail open (passing all traffic without inspection) or fail closed (dropping all traffic). The default is fail open.         |

| Element                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IPS Module Service Module Monitoring Settings table | <p>The list of interfaces on the router that the IPS module should monitor.</p> <p>The table shows the name of the interface or interface role, whether monitoring is inline or promiscuous, and whether an ACL is used to filter traffic for inspection on the interface. Inline mode puts the IPS module directly into the traffic flow, allowing it to stop attacks by dropping malicious traffic before it reaches the intended target. In promiscuous mode, packets do not flow through the sensor; the sensor analyzes a copy of the monitored traffic rather than the actual forwarded packet. If the ACL is matched, the matched traffic is not inspected.</p> <ul style="list-style-type: none"> <li>• To add an interface to the table, click the Add button and fill in the <a href="#">IPS Monitoring Information Dialog Box</a> , on page 2349.</li> <li>• To edit the settings for an interface, select it and click the Edit button.</li> <li>• To delete an interface, select it and click the Delete button.</li> </ul> |

## IPS Monitoring Information Dialog Box

**Note** From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any bug fixes or enhancements.

Use the IPS Monitoring Information dialog box to add or edit the properties of interfaces to be monitored by the IPS module.

### Navigation Path

Go to the [IPS Module Interface Settings Page](#) , on page 2347, then click the **Add** or **Edit** button beneath the IPS Module Service Module Monitoring Settings table.

## CEF Interface Settings on Cisco IOS Routers

Cisco Express Forwarding (CEF) is an advanced Layer 3 IP switching technology that optimizes network performance and scalability for all kinds of networks, from those that carry small amounts of traffic to those that carry large amounts of traffic in complex patterns, such as the Internet and networks characterized by intensive web-based applications or interactive sessions. CEF is enabled by default on most Cisco IOS routers.

Typically, you do not need to configure a CEF policy unless you want to enable CEF accounting so that you can view statistics with the **show ip cef** command on the router. You would also configure the policy if you want to disable CEF, or to configure non-default CEF behavior on specific interfaces, for example, to have CEF load balance based on packets rather than source-destination packet streams.

When configuring alternate CEF settings for interfaces, you can name specific interfaces or use interface roles to cover more than one interface at a time. For example, if you have defined an All-Ethernets interface role, you can define identical CEF settings for every Ethernet interface on the device with a single definition. See [Understanding Interface Role Objects](#) , on page 301.

**Tip** After you have defined a CEF interface settings policy, you can share the policy and assign it to other devices. This provides a convenient method for configuring multiple devices with identical settings. See [Working with Shared Policies in Device View or the Site-to-Site VPN Manager](#) , on page 201.

### Before You Begin

Define basic interface settings. See [Basic Interface Settings on Cisco IOS Routers](#) , on page 2327.

- Step 1** Do one of the following:
- (Device view) Select **Interfaces > Settings > CEF** from the Policy selector.
  - (Policy view) Select **Router Interfaces > Settings > CEF** from the Policy Type selector. Select an existing policy or create a new one.

The CEF Interface Settings page is displayed. See [CEF Interface Settings Page](#) , on page 2351 for an explanation of the fields on this page.

- Step 2** If you are enabling CEF, select the accounting options you desire.

- Step 3** If you want to configure non-default behavior for certain interfaces, add them to the CEF Interface Settings table. Click the **Add** button below the table to add interfaces to the list, or select an interface and click the **Edit** button to change the settings for an existing interface. For more information about the options, see [CEF Interface Settings Dialog Box](#) , on page 2352.

## CEF Interface Settings Page

Use the CEF Interface Settings page to define the settings for Cisco Express Forwarding. CEF is an advanced Layer 3 IP switching technology that optimizes network performance and scalability for all kinds of networks, from those that carry small amounts of traffic to those that carry large amounts of traffic in complex patterns, such as the Internet and networks characterized by intensive web-based applications or interactive sessions. CEF is enabled by default on most Cisco IOS routers.

### Navigation Path

- (Device view) Select **Interfaces > Settings > CEF** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > CEF** from the Policy Type selector. Create a new policy or select an existing policy from the Shared Policy selector.

|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name          | The name of the interface or interface role for which you are configuring CEF. Enter the name or click <b>Select</b> to select the interface or interface role. If the object that you want is not listed, click the <b>Create</b> button to create it.                                                                                                                                                                                     |
| Enable CEF on Interface | Whether to enable CEF on the interface. CEF is enabled by default.                                                                                                                                                                                                                                                                                                                                                                          |
| Load Balancing          | How the interface should balance traffic, either per-destination or per-packet.<br>In per-destination load balancing, all packets for a given source-destination pair take the same path. In per-packet load balancing, packets for a given source-destination pair can take different equal-cost routes, and thus reach their destination out of order.<br><br>The default is to balance the load based on the destination of the traffic. |

# Dialer Interfaces on Cisco IOS Routers

Before you can configure a dial backup policy for a site-to-site VPN (see [Configuring Dial Backup](#), on page 1113), you must configure a dialer interface policy on the appropriate Cisco IOS router. The dialer interface policy uses dialer pools to associate the dialer interface used by dial backup with a physical BRI interface on the router. Each dialer interface is associated with a single dialer pool, which can contain one or more physical interfaces. Multiple dialer interfaces can reference the same dialer pool.

The following topics describe how to create dialer interfaces policies on Cisco IOS routers:

- [Defining Dialer Profiles](#), on page 2353
- [Defining BRI Interface Properties](#), on page 2355

## Defining Dialer Profiles

When you configure a dialer profile, you must select the interface or interface role representing the dialer interface and specify the number to be dialed. You must also assign a pool ID, which you use to reference this dialer interface when configuring the physical dialer interface. Additionally, you can modify the default timeout settings for the line.

---

**Note** IP is the only protocol supported for dialer profiles by Security Manager.

---

---

**Note** Authentication parameters for the dialer profile are defined in the PPP policy.

---

### Before You Begin

Define the virtual and physical dialer interfaces on the router. See [Basic Interface Settings on Cisco IOS Routers](#) , on page 2327.

**Note** In addition, you can optionally define interface roles for the virtual and physical dialer interfaces. See [Defining Dialer Profiles](#) , on page 2353.

### Related Topics

- [Defining BRI Interface Properties](#) , on page 2355
- [Dialer Interfaces on Cisco IOS Routers](#) , on page 2353

#### Step 1

Do one of the following:

- (Device view) Select **Interfaces > Settings > Dialer** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > Dialer** from the Policy Type selector. Select an existing policy or create a new one.

The Dialer page is displayed. See [Table 846: Dialer Page](#) , on page 2356 for a description of the fields on this page.

#### Step 2

Select a dialer profile from the upper table on the Dialer Interfaces page, then click **Edit**, or click **Add** to create a profile. The Dialer Profile dialog box appears. See [Table 847: Dialer Profile Dialog Box](#) , on page 2357 for a description of the fields in this dialog box.

#### Step 3

Enter the name of the interface or interface role that represents the virtual dialer interface, or click **Select** to select an interface role object or to create a new one. For more information, see [Specifying Interfaces During Policy Definition](#) , on page 304.

#### Step 4

Enter a name for the dialer profile. Having a name makes it easier for you to assign the correct dialer pool to the physical interface. See [Defining BRI Interface Properties](#) , on page 2355.

#### Tip

We recommend that you define a name that is logically associated with the site to which the dialer interface serves as a backup. For example, if the dialer interface is serving as a backup connection to the London site, define the name London for the dialer profile.

#### Step 5

Enter an ID number for the dialer pool to associate with this dialer interface. Each dialer interface is associated with a single pool. Multiple interfaces may, however, be associated with the same dialer pool.

#### Step 6

Enter the number of the dialer group to assign to the dialer interface.

#### Step 7

(Optional) In the Interesting Traffic ACL field, enter the name of the extended ACL object that defines which packets are permitted to initiate calls using this dialer profile, or click **Select** to select the object from a list or to create a new one. Use this option to limit the IP traffic that can make use of the dialer.

#### Step 8

Enter the dialer string, which is the phone number of the remote side of the dialer interface connection.

#### Step 9

(Optional) Modify the default timeout values (Idle Timeout and Fast Idle Timeout), if required.

#### Step 10

Click **OK** to save your definitions locally on the client and close the dialog box. The dialer profile appears in the Dialer Profile table on the Dialer page.

## Defining BRI Interface Properties

You configure the properties of the physical BRI interfaces used for dialer interface policies by selecting the appropriate interface or interface role, defining the dialer pools to which the interface belongs, and defining the ISDN switch type. It is the dialer pool that connects the physical interface with the virtual dialer interface.

---

**Note** To define other types of physical dialer interfaces, such as ATM and Ethernet, use FlexConfigs. For more information, see [Understanding FlexConfig Policies and Policy Objects](#), on page 340.

---

### Before You Begin

Define the virtual and physical dialer interfaces on the router. See [Basic Interface Settings on Cisco IOS Routers](#), on page 2327.

---

**Note** In addition, you can optionally define interface roles for the virtual and physical dialer interfaces. See [Creating Interface Role Objects](#), on page 302.

---

### Related Topics

- [Defining Dialer Profiles](#), on page 2353
- [Dialer Interfaces on Cisco IOS Routers](#), on page 2353

- 
- Step 1** Do one of the following:
- (Device view) Select **Interfaces > Settings > Dialer** from the Policy selector.
  - (Policy view) Select **Router Interfaces > Settings > Dialer** from the Policy Type selector. Select an existing policy or create a new one.
- The Dialer Interfaces page is displayed. See [Table 846: Dialer Page](#), on page 2356 for a description of the fields on this page.
- Step 2** Select a physical BRI interface from the Dialer Physical Interfaces table, then click **Edit**, or click **Add** to add an interface. The Dialer Physical Interface dialog box appears. See [Table 848: Dialer Physical Interface Dialog Box](#), on page 2358 for a description of the fields in this dialog box.
- Step 3** Enter the name of the interface or interface role that represents the physical dialer interface, or click **Select** to select an interface role object from a list or to create a new one. For more information, see [Specifying Interfaces During Policy Definition](#), on page 304.
- Step 4** Enter the names of the dialer pools to associate with the physical interface, or click **Select** to display a selector. Separate multiple entries with commas.
- Step 5** Select the ISDN switch type used by the physical interface. <Table> describes the available switch types.
- Step 6** (Optional) If you selected the Basic-DMS-100, Basic-NI, or Basic-5ess switch type, enter up to two service provider identifiers (SPIDs).
- Note** We recommend that you do not enter SPIDs for the Basic-5ess switch type, even though SPIDs are supported.

- Step 7** Click **OK** to save your definitions locally on the client and close the dialog box. The interface definition appears in the Dialer Physical Interfaces table on the Dialer Interface page.

## Dialer Policy Page

Use the Dialer page to define the relationship between physical Basic Rate Interface (BRI) and virtual dialer interfaces. You use these dialer interfaces when you configure the dial backup feature for site-to-site VPNs.

For more information, see [Dialer Interfaces on Cisco IOS Routers](#) , on page 2353.

### Navigation Path

- (Device view) Select **Interfaces > Settings > Dialer** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > Dialer** from the Policy Type selector. Right-click **Dialer** to create a policy, or select an existing policy from the Shared Policy selector.

| Element                             | Description                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                                | A descriptive name for the dialer profile. This name enables you to assign the correct dialer pool to the physical interface. You can also use the profile name as a reference to the site to which this dialer interface serves as a backup.                                                                                    |
| Interface                           | The virtual dialer interface to associate with the dialer profile. Enter the name of an interface or interface role, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.                                                                                |
| Pool ID                             | The dialer pool ID. Each pool can contain multiple physical interfaces and can be associated with multiple dialer interfaces. Each dialer interface, however, is associated with only one pool.                                                                                                                                  |
| Group                               | The group ID, which identifies the dialer group that this dialer interface uses.                                                                                                                                                                                                                                                 |
| Interesting Traffic ACL             | The extended, numbered ACL that defines which packets are permitted to initiate calls using this dialer profile. The valid ACL number range is 100 to 199.<br><br>Enter the name of the ACL object, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it. |
| Dialer String (Remote Phone Number) | The phone number of the destination that the dialer contacts.                                                                                                                                                                                                                                                                    |
| Idle Timeout                        | The default amount of idle time before an uncontested line is disconnected. The default is 120 seconds.                                                                                                                                                                                                                          |

| Element           | Description                                                                                                                                                                                                        |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Fast Idle Timeout | The default amount of idle time before a contested line is disconnected. The default is 20 seconds.<br><br>Line contention occurs when a busy line is requested to send another packet to a different destination. |

## Dialer Physical Interface Dialog Box

Use the Dialer Physical Interface dialog box to add or edit the properties that associate physical BRI interfaces with dialer interfaces.

**Note** Use FlexConfigs to define other types of physical dialer interfaces, such as ATM and Ethernet. For more information, see [Understanding FlexConfig Policies and Policy Objects](#), on page 340.

### Navigation Path

Go to the [Dialer Policy Page](#), on page 2356, then click the **Add** or **Edit** button beneath the Dialer Physical Interfaces table.

Some service providers in North America assign SPIDs to ISDN devices when you first subscribe to an ISDN service. If you are using a service provider that requires SPIDs, your ISDN device cannot place or receive calls until it sends a valid assigned SPID to the service provider when accessing the switch to initialize the connection.</p> <p>Valid SPIDs can contain up to 20 characters, including spaces and special characters.</p> <p><b>Note</b> We recommend that you do not enter a SPID for interfaces using the AT&amp;T 5ESS switch type, even though they are supported.</p>                                                                                                                                             |
| SPID2       | <p>Applies only when you select DMS-100 or NI as the switch type.</p> <p>The service provider identifier (SPID) for a second ISDN service to which the interface subscribes. Valid SPIDs can contain up to 20 alphanumeric characters (no spaces are permitted).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## ADSL on Cisco IOS Routers

Digital Subscriber Line (DSL) is a family of technologies that transports data over existing twisted-pair copper wire. DSL uses frequencies that are beyond the upper list used by POTS (plain old telephone service) to deliver broadband applications, such as multimedia and video, over the local loop (or *last mile*) that connects the telephone company's central office to customer sites.

Asymmetric Digital Subscriber Line (ADSL) is a form of DSL where the data flow downstream to customer sites is much greater than the data flow upstream to the central office (CO). This asymmetric setup is well-suited

for applications where users typically download far more information than they send, such as web surfing, video-on-demand, and remote LAN access. With ADSL, the connection speed is related to the distance between the customer site and the digital subscriber line-access multiplexer (DSLAM) that aggregates the connections from multiple customer sites onto a high-speed line.

ADSL downstream rates range from 1.5 to 9 Mbps, whereas upstream bandwidth ranges from 16 to 640 kbps. ADSL transmissions work at distances up to 18,000 feet (5,488 meters) over a single copper twisted pair. Newer versions of ADSL technology, such as ADSL2 and ADSL2+, offer even higher data rates for short distances, as well as power management and realtime performance monitoring.

ATM is used in many ADSL implementations due to its small, fixed-length cell size, which makes it suitable for carrying time-critical traffic, such as voice and video, in conjunction with other traffic. You can use Security Manager to configure ATM over DSL on a Cisco IOS router. For more information about configuring ADSL policies in Security Manager, see [Defining ADSL Settings , on page 2361](#).

To configure ADSL in Security Manager, you must do the following:

1. Configure an ATM interface or subinterface. See [Defining Basic Router Interface Settings , on page 2330](#).
2. Configure ADSL settings on the ATM interface or subinterface. See [Defining ADSL Settings , on page 2361](#).
3. Configure PVCs on the ATM interface or subinterface. See [Defining ATM PVCs , on page 2377](#).

**Note** If you perform discovery on the device, Security Manager populates the Interfaces policy with the ATM interface and subinterface and the ADSL policy with the ADSL settings for that interface. Any discovered PVCs are added to the PVC policy.

## Defining ADSL Settings

When you configure an ADSL definition in Security Manager, you must select the ATM interface on which ADSL is being defined. In addition, we highly recommend that you specify the router type or the type of WIC (WAN interface card) installed in the router. The validity of DSL policy definitions is highly dependent on the hardware. By specifying the hardware used by this policy, you enable Security Manager to properly validate the values you define and avoid deployment failures.

You can optionally specify the following parameters:

- The DSL operating mode.
- Whether to enable dynamic VC bandwidth adjustments when using Inverse Multiplexing over ATM (IMA).
- Whether certain interface cards should use a particular set of carrier tones.

Modular Cisco IOS routers may contain multiple interface cards, each of which contains a single ATM interface. You may define only one ADSL definition per interface.

#### Before You Begin

- Make sure that the device contains an ADSL ATM interface. See [Basic Interface Settings on Cisco IOS Routers](#), on page 2327.

#### Related Topics

- [Supported ADSL Operating Modes](#), on page 2360

- [ADSL on Cisco IOS Routers](#) , on page 2359
- [PVCs on Cisco IOS Routers](#) , on page 2372

- 
- Step 1** Do one of the following:
- (Device view) Select **Interfaces > Settings > DSL > ADSL** from the Policy selector.
  - (Policy view) Select **Router Interfaces > Settings > DSL > ADSL** from the Policy Type selector. Select an existing policy or create a new one.
- The ADSL page is displayed. See [Table 851: ADSL Page](#) , on page 2363 for a description of the fields on this page.
- Step 2** Click the **Add** button beneath the table to display the ADSL Settings dialog box. See [Table 852: ADSL Settings Dialog Box](#) , on page 2364 for a description of the fields in this dialog box.
- Step 3** In the ATM Interface field, enter the name of the ATM interface or interface role on which you want to define ADSL settings, or click **Select** to select an interface role or create a new one. For more information, see [Specifying Interfaces During Policy Definition](#) , on page 304.
- Note** The interface that you select must be physically present on the device; otherwise, deployment fails.
- Step 4** (Optional) Select the interface card type installed on the router.
- Note** When discovering from a live device, the correct interface card type is already displayed. If you did not perform discovery on a live device, or if Security Manager cannot detect the type of interface card installed on the device, this field displays “Unknown”.
- Step 5** (Optional) When using IMA groups, select the **Allow bandwidth change on ATM PVCs** check box to enable dynamic adjustments to VC bandwidth in response to changes in group bandwidth. If this check box is left deselected, you must make these adjustments manually.
- Step 6** (Optional) Specify the DSL operating mode for this ATM interface. See [Table 849: ADSL Cards and Supported DSL Operating Modes](#) , on page 2360 for a list of the operating modes supported for each card type.
- Step 7** (Optional) Select the **Use low tone set** check box to have the interface card use carrier tones 29 through 48.
- Step 8** Click **OK** to save your definitions locally on the client and close the dialog box. Your definitions are displayed in the ADSL table.
- Note** To edit an ADSL definition, select it from the table, then click **Edit**. To remove an ADSL definition, select it, then click **Delete**.
- Step 9** Repeat [Step 2, on page 2362](#) through [Step 8, on page 2362](#) to define ADSL settings on additional ATM interfaces. Only one ADSL definition may be defined on an interface.
- 

## ADSL Policy Page

Use the ADSL page to create, edit, and delete ADSL definitions on the ATM interfaces of the router. For more information, see [Defining ADSL Settings](#) , on page 2361.

### Navigation Path

- (Device view) Select **Interfaces > Settings > DSL > ADSL** from the Policy selector.

- (Policy view) Select **Router Interfaces > Settings > DSL > ADSL** from the Policy Type selector. Right-click **ADSL** to create a policy, or select an existing policy from the Shared Policy selector.

### Field Reference

*Table 851: ADSL Page*

| Element            | Description                                                                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ATM Interface      | The ATM interface on which ADSL settings are defined.                                                                                                                             |
| Interface Card     | The type of device or ADSL interface card on which the ATM interface resides.                                                                                                     |
| Bandwidth Change   | Indicates whether the router makes dynamic adjustments to VC bandwidth as overall bandwidth changes. (This is relevant only when IMA groups are configured on the ATM interface.) |
| DSL Operating Mode | The DSL operating mode for this interface.                                                                                                                                        |
| Tone Low           | Indicates whether the interface is using the low tone set (carrier tones 29 through 48).                                                                                          |
| Add button         | Opens the <a href="#">ADSL Settings Dialog Box</a> , on page 2363. From here you can define the ADSL settings for a selected ATM interface.                                       |
| Edit button        | Opens the <a href="#">ADSL Settings Dialog Box</a> , on page 2363. From here you can edit the selected ADSL definition.                                                           |
| Delete button      | Deletes the selected ADSL definition from the table.                                                                                                                              |

## ADSL Settings Dialog Box

Use the ADSL Settings dialog box to configure ADSL settings on a selected ATM interface.

**Note** When you configure ADSL settings, we highly recommend that you select the type of device or interface card on which the ATM interface is defined. ADSL settings are highly dependent on the hardware. Defining the hardware type in Security Manager enables proper validation of your configuration for a successful deployment to your devices.

### Navigation Path

Go to the [ADSL Policy Page](#), on page 2362, then click the **Add** or **Edit** button beneath the table.

# SHDSL on Cisco IOS Routers

Digital Subscriber Line (DSL) is a family of technologies that transports data over existing twisted-pair copper wire. DSL uses frequencies that are beyond the upper list used by POTS (plain old telephone service) to deliver broadband applications, such as multimedia and video, over the local loop (or *last mile*) that connects the telephone company's central office to customer sites.

Based on the International Telecommunications Union (ITU) G.991.2 global industry standard, symmetric high-speed digital subscriber line (SHDSL) delivers symmetrical data rates from 192 up to 2.3 Mbps on a single wire pair. It transports many types of signals, such as T1, E1, ISDN, ATM, and IP. In addition, the G.SHDSL signal has a greater distance reach from the central office than ADSL and proprietary SDSL connections.

To configure SHDSL in Security Manager, do the following:

1. Configure the SHDSL controller. See [Defining SHDSL Controllers](#), on page 2366.
2. Deploy the SHDSL policy. If ATM mode is activated, the router creates an ATM interface that corresponds to the controller upon deployment. See [Working with Deployment and the Configuration Archive](#), on page 403.
3. Rediscover the device to add the new ATM interface to Security Manager. See [Discovering Policies on Devices Already in Security Manager](#), on page 179.
4. (Optional) Create one or more subinterfaces on the ATM interface. See [Defining Basic Router Interface Settings](#), on page 2330.
5. Configure PVCs on the ATM interface or subinterface. See [Defining ATM PVCs](#), on page 2377.

---

**Note** If you perform discovery on the device, Security Manager populates the SHDSL policy with the definition of the controller and the Interfaces policy with the ATM interface and subinterface. Any discovered PVCs are added to the PVC policy.

---

## Defining SHDSL Controllers

When you configure an SHDSL controller in Security Manager, you must enter the name of the controller that is installed in the Cisco IOS router. The following settings are then applied automatically:

- ATM mode is enabled.
- The line termination is set to CPE (customer premises equipment).
- The line mode is set to Auto.

You can optionally change the line termination to CO and specify the DSL mode and line mode. In addition, you can define signal-to-noise ratio margins to improve line stability.

A Cisco IOS router may contain multiple SHDSL controllers. You may define only one SHDSL definition per controller.

**Note** When you deploy an SHDSL policy with ATM mode enabled, an ATM interface is created automatically on the router. Perform rediscovery to add the interface into Security Manager. You can then define PVCs on the ATM interface as required. See [Defining ATM PVCs](#) , on page 2377.

### Before You Begin

- Make sure that an SHDSL controller is installed on the device.

### Related Topics

- [SHDSL on Cisco IOS Routers](#) , on page 2366

- 
- Step 1** Do one of the following:
- (Device view) Select **Interfaces** > **Settings** > **DSL** > **SHDSL** from the Policy selector.
  - (Policy view) Select **Router Interfaces** > **Settings** > **DSL** > **SHDSL** from the Policy Type selector. Select an existing policy or create a new one.

The SHDSL page is displayed. See [SHDSL Policy Page](#) , on page 2367 for a description of the fields on this page.

- Step 2** Click the **Add** button beneath the table to display the SHDSL dialog box.
- Step 3** Enter the name of the controller, or click **Select** to display the utility for generating the name. See [Controller Auto Name Generator Dialog Box](#) , on page 2371.

**Note** The controller that you select must be physically present on the device; otherwise, deployment fails.

- Step 4** Define the SHDSL controller as required. For more information, see [Table 854: SHDSL Dialog Box](#) , on page 2369.
- Step 5** Click **OK** to save your definitions locally on the client and close the dialog box. Your definitions are displayed in the SHDSL table.

**Note** To edit an SHDSL controller, select it from the table, then click **Edit**. To remove an SHDSL controller, select it, then click **Delete**.

- Step 6** Repeat [Step 2, on page 2367](#) through [Step 5, on page 2367](#) to define additional SHDSL controllers. Only one definition may be defined per controller.

---

## SHDSL Policy Page

Use the SHDSL page to create, edit, and delete DSL controller definitions on the router. For more information, see [Defining SHDSL Controllers](#) , on page 2366.

### Navigation Path

- (Device view) Select **Interfaces > Settings > DSL > SHDSL** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > DSL > SHDSL** from the Policy Type selector. Right-click **SHDSL** to create a policy, or select an existing policy from the Shared Policy selector.

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name               | The name of the controller. Enter a name manually, or click <b>Select</b> to display a dialog box for generating a name. See <a href="#">Controller Auto Name Generator Dialog Box</a> , on page 2371.                                                                                                                                                                                                                                     |
| Description        | Additional information about the controller (up to 80 characters).                                                                                                                                                                                                                                                                                                                                                                         |
| Shutdown           | When selected, the DSL controller is in shutdown state. However, its definition is not deleted.<br><br>When deselected, the DSL controller is enabled. This is the default.                                                                                                                                                                                                                                                                |
| Configure ATM mode | When selected, sets the controller into ATM mode and creates an ATM interface with the same ID as the controller. This is the default. You must enable ATM mode and then perform rediscovery to configure ATM or PVCs on the device.<br><br>When deselected, ATM mode is disabled. No ATM interface is created on deployment.<br><br><b>Note</b> You cannot remove ATM mode from a controller after it has been saved in Security Manager. |
| Line Termination   | The line termination that is set for the router: <ul style="list-style-type: none"> <li>• CPE—Customer premises equipment. This is the default.</li> <li>• CO—Central office.</li> </ul>                                                                                                                                                                                                                                                   |

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DSL Mode           | <p>The DSL operating mode, including regional operating parameters, used by the controller:</p> <ul style="list-style-type: none"> <li>• [blank]—The operating mode is not defined. (When deployed, the Annex A standard for North America is used.)</li> <li>• A—Supports Annex A of the G.991.2 standard for North America.</li> <li>• A-B—Supports Annex A or Annex B. Available only when the Line Term is set to CPE. The appropriate mode is selected when the line trains.</li> <li>• A-B-ANFP—Supports Annex A or Annex B-ANFP. Available only when the Line Term is set to CPE. The appropriate mode is selected when the line trains.</li> <li>• B—Supports Annex B of the G.991.2 standard for Europe.</li> <li>• B-ANFP—Supports Annex B-ANFP (Access Network Frequency Plan).</li> </ul> <p><b>Note</b> The available DSL modes are dependent on the selected line termination.</p> |
| Line Mode settings |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Line Mode          | <p>The line mode used by the controller:</p> <ul style="list-style-type: none"> <li>• auto—The controller operates in the same mode as the other line termination (2-wire line 0, 2-wire line 1, or 4-wire enhanced). This is the default for CPE line termination.</li> <li>• 2-wire—The controller operates in two-wire mode. This is the default for CO line termination.</li> <li>• 4-wire—The controller operates in four-wire mode.</li> </ul> <p><b>Note</b> You can select Auto only when you configure the controller as the CPE.</p>                                                                                                                                                                                                                                                                                                                                                   |
| Line               | <p>Applies only when the Line Mode is defined as 2-wire.</p> <p>The pair of wires to use:</p> <ul style="list-style-type: none"> <li>• line-zero—RJ-11 pin 1 and pin 2. This is the default for CO line termination.</li> <li>• line-one—RJ-11 pin 3 and pin 4.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Exchange Handshake | <p>Applies only when the Line Mode is defined as 4-wire.</p> <p>The type of handshake mode to use:</p> <ul style="list-style-type: none"> <li>• [blank]—The handshake mode is not specified. (When deployed, the enhanced option is used.) This is the default.</li> <li>• enhanced—Exchanges handshake status on both wire pairs.</li> <li>• standard—Exchanges handshake status on the main wire pair only.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Field Reference

**Table 855: Controller Auto Name Generator Dialog Box**

| Element | Description                                                                                                                                                                                                                                                                |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type    | The type of interface. This field displays the value DSL and is read-only.                                                                                                                                                                                                 |
| Card    | The card related to the controller.                                                                                                                                                                                                                                        |
| Slot    | The slot related to the controller.                                                                                                                                                                                                                                        |
| Port    | The port related to the controller.<br><br><b>Note</b> The information you enter in these fields forms the remainder of the generated name, as displayed in the Result field.                                                                                              |
| Result  | The name generated by Security Manager from the information you entered for the controller location. The name displayed in this field is read-only.<br><br><b>Tip</b> After closing this dialog box, you can edit the generated name in the SHDSL dialog box, if required. |

# PVCs on Cisco IOS Routers

Asynchronous Transfer Mode (ATM) is an International Telecommunication Union (ITU-T) standard designed for the high-speed transfer of voice, video, and data through public and private networks using cell relay technology. A cell switching and multiplexing technology, ATM combines the benefits of circuit switching (constant transmission delay, guaranteed capacity) with those of packet switching (flexibility, efficiency for intermittent traffic). An ATM network is made up of one or more ATM switches and ATM endpoints, such as a Cisco IOS router.

There are three general types of ATM services, permanent virtual connections (PVCs), switched virtual connections (SVCs), and connectionless service. PVCs allow direct and permanent connections between sites to provide a service that is similar to a leased line. Advantages of PVCs are the guaranteed availability of a connection and that no call setup procedures are required between switches. Each piece of equipment between the source and destination must be manually provisioned for the PVC.

For more information about ATM PVCs, see:

- [Understanding Virtual Paths and Virtual Channels](#) , on page 2373
- [Understanding ATM Service Classes](#) , on page 2374

## Understanding Virtual Paths and Virtual Channels

ATM networks are fundamentally connection oriented. This means that a virtual connection needs to be established across the ATM network before any data transfer. Two types of ATM connections exist:

- Virtual path connections (VPCs), identified by a virtual path identifier (VPI).
- Virtual channel connections (VCCs), identified by the combination of a VPI and a VCI (virtual channel identifier). PVCs are a type of VCC where a permanent connection is defined between two sites.

As shown in [Figure 47: ATM Virtual Path and Virtual Channel Connections](#), on page 2373, a virtual path is a bundle of virtual channels, all of which are switched transparently across the ATM network on the basis of the common VPI. A VPC can be thought of as a bundle of VCCs with the same VPI value.

**Figure 47: ATM Virtual Path and Virtual Channel Connections**

Every cell header contains a VPI field and a VCI field, which explicitly associate a cell with a given virtual channel on a physical link. It is important to remember the following attributes of VPIs and VCIs:

- VPIs and VCIs are not addresses, such as MAC addresses used in LAN switching.
- VPIs and VCIs are explicitly assigned at each segment of a connection and, as such, have only local significance across a particular link. They are remapped, as appropriate, at each switching point.

Using the VPI/VCI identifier, the ATM layer can multiplex (interleave), demultiplex, and switch cells from multiple connections. Certain VPI/VCI identifiers are reserved for particular uses, such as the Integrated Local Management Interface (ILMI).

## Understanding ATM Service Classes

Version 4.0 of the Traffic Management Specification published by the ATM Forum defines five service classes that describe the user traffic transmitted on a network and the quality of service that a network needs to provide for that traffic. Security Manager supports the following ATM service classes:

- *Available Bit Rate (ABR)* This is a service class where ATM switches make no guarantee of cell delivery, but do guarantee a minimum bit rate and that cell loss is kept as low as possible with the use of a feedback mechanism. The ABR service category is designed for VCs that carry file transfers and other bursty, non-real-time traffic that requires a minimum amount of bandwidth. This bandwidth is specified via a minimum cell rate that must be available while the VC is configured and active. For more details, see *Understanding the Available Bit Rate (ABR) Service Category for ATM VCs* at: [http://www.cisco.com/en/US/tech/tk39/tk51/technologies\\_tech\\_note09186a00800fbc76.shtml](http://www.cisco.com/en/US/tech/tk39/tk51/technologies_tech_note09186a00800fbc76.shtml) .
- *Constant Bit Rate (CBR)* This is a service class where cells are transmitted in a continuous bitstream to meet voice and video QoS needs. The CBR service class is designed for ATM virtual circuits (VCs) that need a static amount of bandwidth that is continuously available for the duration of the active connection. An ATM VC configured as CBR can send cells at peak cell rate (PCR) at any time and for any duration. It also can send cells at a rate less than the PCR or even emit no cells. The configuration on CBR may vary with different platforms. For more details, see *Understanding the CBR Service Category for ATM VCs* at: [http://www.cisco.com/en/US/tech/tk39/tk51/technologies\\_tech\\_note09186a0080094e6a.shtml](http://www.cisco.com/en/US/tech/tk39/tk51/technologies_tech_note09186a0080094e6a.shtml) .
- *Unspecified Bit Rate (UBR)* This is a service class where the network management makes no Quality of Service (QoS) commitment. It models the best-effort service that the Internet normally provides and is suitable for applications tolerant to delay that do not require real-time responses. Examples include email, fax transmission, file transfers, Telnet, LAN and remote office interconnections. For more details, see *Understanding the UBR Service Category for ATM Virtual Circuits* at: [http://www.cisco.com/en/US/tech/tk39/tk51/technologies\\_tech\\_note09186a00800a4837.shtml](http://www.cisco.com/en/US/tech/tk39/tk51/technologies_tech_note09186a00800a4837.shtml) .
- *Unspecified Bit Rate (UBR+)* Cisco provides a variant of the UBR service class called UBR+. The main advantage of the UBR+ service class is that it allows an ATM end-system to signal a minimum cell rate to an ATM switch in a connection request, and the ATM network attempts to maintain this minimum as an end-to-end guarantee. For more details, see *Understanding the UBR+ Service Category for ATM VCs* at: [http://www.cisco.com/en/US/tech/tk39/tk51/technologies\\_tech\\_note09186a0080094b40.shtml](http://www.cisco.com/en/US/tech/tk39/tk51/technologies_tech_note09186a0080094b40.shtml) .
- *Variable Bit Rate - Non-Real Time (VBR-nrt)* This service class is used to transmit non-real-time applications that are bursty in nature. The traffic characteristics are defined in terms of the Peak Cell Rate (PCR), Sustained Cell Rate (SCR), and Minimum Burst Size (MBS). For more details, see *Understanding the VBR-nrt Service Category and Traffic Shaping for ATM VCs* at: [http://www.cisco.com/en/US/tech/tk39/tk51/technologies\\_tech\\_note09186a0080102a42.shtml](http://www.cisco.com/en/US/tech/tk39/tk51/technologies_tech_note09186a0080102a42.shtml) .
- *Variable Bit Rate - Real Time (VBR-rt)* This service class is used to transmit real-time data that is sensitive to time delays, like compressed voice over IP and video conferencing. As with VBR-nrt, VBR-rt traffic is defined in terms of a PCR, SCR, and MBS. For more details, see *Understanding the Variable Bit Rate Real Time (VBR-rt) Service Category for ATM VCs* at: [http://www.cisco.com/en/US/tech/tk39/tk51/technologies\\_tech\\_note09186a0080094cd0.shtml](http://www.cisco.com/en/US/tech/tk39/tk51/technologies_tech_note09186a0080094cd0.shtml) .

You can use these service classes to define ATM quality of service (QoS) guarantees, such as traffic shaping. Traffic shaping is the use of queues to constrain data bursts, limit peak data rate, and smooth jitter so that traffic fits within the envelope defined by the traffic contract. ATM devices use traffic shaping to adhere to the terms of the traffic contract.

## Understanding ATM Management Protocols

ATM uses two different types of signaling for tracking the status of PVCs:

- Integrated Local Management Interface (ILMI). For more information, see [Understanding ILMI](#) , on page 2375.
- Flow 4 (F4) and Flow 5 (F5) Operation, Administration, and Maintenance (OAM) cells. For more information, see [Understanding OAM](#) , on page 2376.

Security Manager can be used to enable and disable ILMI on specific PVCs and to configure F5 OAM functionality.

## Understanding ILMI

The Integrated Local Management Interface (ILMI) is a protocol defined by the ATM Forum for setting and capturing physical layer, ATM layer, virtual path, and virtual circuit parameters on ATM interfaces. ILMI facilitates network-wide autoconfiguration by enabling devices to determine the status of components at the other end of a physical link and to negotiate a common set of operational parameters to ensure interoperability. The ATM routing protocols, PNNI (Private Network to Network Interface) and IISP (Interim-Interswitch Signaling Protocol), use this information to discover and bring up a network of interconnected ATM switch routers.

When two ATM interfaces run the ILMI protocol, they exchange ILMI packets across the physical connection. These packets consist of SNMP messages as large as 484 octets. ATM interfaces encapsulate these messages in an ATM adaptation layer 5 (AAL5) trailer, segment the packet into cells, and schedule the cells for transmission. ATM interfaces use the SNMP object IDs in network functions such as permanent virtual circuit (PVC) autodiscovery, which is particularly useful in digital subscriber line (DSL) applications.

ILMI organizes managed objects into multiple information bases (MIBs), including one for link management. This MIB contains the following object groups for all ATM interfaces:

- Physical layer—ILMI 4.0 discontinues or "deprecates" earlier physical-layer ILMI values and specifies the use of the standard Interface MIB (RFC 1213).

- ATM layer—Indicates the number of available bits for VPI and VCI values in the ATM cell header, maximum number of virtual path connections (VPCs) and virtual channel connections (VCCs) allowed, number of configured PVCs, and so on.
- Virtual path connection—Indicates the up or down status of a VPC and its Quality of Service (QoS) parameters.
- Virtual channel connection—Indicates the up or down status of the VCC and its QoS parameters.

Administrators may enable or disable ILMI at will, but we highly recommend you enable it. Without ILMI, you must manually configure many of the parameters otherwise managed by ILMI for the ATM devices to operate correctly. ILMI operates over a reserved PVC of VPI=X, VCI=16.

## Understanding OAM

The Operation, Administration, and Maintenance (OAM) feature provides fault management and performance management for ATM and is based on the standard defined in ITU recommendation I.610. OAM detects network connectivity failures on a PVC and reacts by bringing down the PVC. Without OAM, a PVC would remain up after network connectivity is lost. In such a situation, routing table entries would continue to point to the PVC, resulting in lost packets.

Security Manager enables the use of F5 OAM, which operates at the virtual circuit (VC) level. To detect a failure along the PVC path on an end-device, such as a Cisco IOS router, OAM uses the following cells:

- Loopback cells—At regular intervals, routers configured for OAM send loopback cells which must be looped in the network. This looping point can be the machine at the end of the PVC (end-to-end loopback cells) or a device on the path (segment loopback cells). A failure occurs when the loopback cell fails to return to its point of origin.
- Continuity Check (CC) cells—CC cells are sent regularly by routers configured for OAM to check the integrity of the link. CC cells can be sent either end-to-end or confined to a particular segment of the PVC. Activation and deactivation cells are used to initiate and suspend continuity checking. Any connectivity failures are reported in special SNMP notifications.
- Alarm Indication Signal (AIS) cells—In the event of a failure at the physical layer, AIS cells are sent to downstream devices to report a virtual connection failure at the ATM layer. The PVC moves to the down state after a defined number of AIS cells are received and does not come up again until a defined interval passes without additional AIS cells.
- Remote Detection Indication (RDI) cells—When AIS cells are sent to warn downstream devices of a connectivity failure, RDI cells are sent upstream in response as a control and feedback mechanism for the network.

AIS/RDI cells are sent using the same VPI/VCI as the user cells on the affected PVC until the failure is resolved.

## Defining ATM PVCs

You define an ATM permanent virtual circuit (PVC) by selecting an ATM interface and then defining the following settings:

- The PVC ID.
- The type of encapsulation to use.
- Whether ILMI management is enabled on this PVC.
- Whether Inverse ARP (InARP) is used to learn the IP addresses of the destination devices.
- Options related to PPP over Ethernet (PPPoE) and PPP over ATM (PPPoA).
- Quality-of-service settings, such as traffic shaping.
- Static IP address mappings in place of InARP.

For information about defining F5 Operation, Administration, and Maintenance (OAM) management, such as loopbacks and continuity checks, on PVCs, see [Defining OAM Management on ATM PVCs](#) , on page 2379.

### Before You Begin

- When configuring ATM over DSL, make sure that you have configured either an ADSL policy (see [ADSL on Cisco IOS Routers](#) , on page 2359) or an SHDSL policy ( [SHDSL on Cisco IOS Routers](#) , on page 2366).
- Make sure that the device contains an ATM interface and subinterface. (PVCs are typically configured on ATM subinterfaces.) See [Basic Interface Settings on Cisco IOS Routers](#) , on page 2327.

---

**Note** When configuring ATM for SHDSL, the ATM interface is created when you define the SHDSL controller and enable ATM mode. You must then rediscover the device to add the ATM interface to Security Manager. See [Defining SHDSL Controllers](#) , on page 2366.

- [Understanding Policing and Shaping Parameters](#) , on page 2557
- [PVCs on Cisco IOS Routers](#) , on page 2372

---

### Step 1

Do one of the following:

- (Device view) Select **Interfaces** > **Settings** > **PVC** from the Policy selector.

- (Policy view) Select **Router Interfaces > Settings > PVC** from the Policy Type selector. Select an existing policy or create a new one.

The PVC page is displayed. See [Table 856: PVC Page , on page 2381](#) for a description of the fields on this page.

**Step 2** Click the **Add** button beneath the table to display the PVC dialog box. See [Table 857: PVC Dialog Box , on page 2382](#) for a description of the fields in this dialog box.

**Step 3** In the Interface field, enter the name of the ATM interface, ATM subinterface, or interface role on which you want to define the PVC, or click **Select** to select an interface role or to create a new one.

**Step 4** Select the type of device or DSL WAN interface card that contains the ATM interface.

**Note** We highly recommend that you define this setting to ensure the proper validation of your PVC policy, as the settings in this policy are highly hardware-dependent.

**Step 5** On the Settings tab of the PVC dialog box, define the basic settings of the PVC:

- Enter the VPI/VCI identifier and an optional text handle. If you are defining the management PVC, select the **Management PVC (ILMI)** check box.

**Note** An error occurs if two users attempt to define PVCs with the same identifiers at the same time.

- Select the type of ATM encapsulation to use. If you select aal5autopp or aal5ciscopp, you must define the virtual template to use for PPPoA, or click **Select** to display a selector. If you select aal5mux as the encapsulation type, you must select the protocol that is carried by the PVC.

**Note** Do not select an encapsulation type when defining the management PVC.

**Note** If you modify the virtual template settings on an existing PVC, you must enter the **shutdown** command followed by the **no shutdown** command on the ATM subinterface to restart the interface. This causes the newly configured parameters to take effect.

- Select the Enable ILMI check box to enable the ILMI to manage this PVC. For more information, see [Understanding ILMI , on page 2375](#).

**Note** You cannot configure the management PVC on a subinterface.

- Select the Inverse ARP check box to enable the PVC to dynamically learn the Layer 3 addresses that are required to forward traffic to those devices.

**Note** Alternatively, you can create static address mappings, as described in [Step 7, on page 2378](#).

- In the PPPoE Max Sessions field, define the maximum number of PPPoE sessions allowed on the PVC.

- In the VPN Service Name field, define the static domain name to use for PPPoA sessions on the PVC.

See [Table 858: PVC Dialog Box—Settings Tab , on page 2384](#) for a description of the fields on the Settings tab.

**Step 6** (Optional) On the QoS tab of the PVC dialog box, define the type of ATM traffic shaping to perform on the traffic carried by this PVC. Traffic shaping regulates the flow of traffic carried by the PVC by queuing traffic that exceeds the defined bit rates. See [Table 859: PVC Dialog Box—QoS Tab , on page 2387](#) for a description of the fields on the QoS tab.

**Step 7** (Optional) On the Protocol tab of the PVC dialog box, create static mappings for the IP addresses at the other end of the PVC:

- Click **Add** to display the Define Mapping dialog box. See [Table 861: Define Mapping Dialog Box , on page 2391](#) for a description of the fields in this dialog box.

- Select IP Address, then enter the address or network/host object that you want to map, or click **Select** to select a network/host object from a list or to create a new one.

- c) Click **OK**. The static mapping is displayed on the Protocol tab.
- d) Repeat [7.a, on page 2378](#) through [7.c, on page 2379](#) to define additional static mappings.

**Note** You can also use the Protocol tab to change the type of InARP to use, broadcast or non-broadcast.

**Step 8** Click **Advanced** to configure OAM management on the PVC. See [Defining OAM Management on ATM PVCs , on page 2379](#).

**Step 9** Click **OK** to save your definitions locally on the client and close the dialog box. Your definitions are displayed in the PVC table.

**Note** To edit a PVC, select it from the table, then click **Edit**. To remove a PVC, select it, then click **Delete**.

**Step 10** Repeat [Step 2, on page 2378](#) through [Step 9, on page 2379](#) to define additional PVCs.

---

## Defining OAM Management on ATM PVCs

Security Manager enables you to configure the following F5 (VC level) Operation, Administration, and Maintenance (OAM) cells for detecting PVC failures in a Cisco IOS router:

- Loopback cells
- Continuity Check (CC) cells
- Alarm Indication Signal (AIS) cells
- Remote Detection Indication (RDI) cells

You can enable and disable each of these cell types and define settings that determine how each cell type affects the PVC when a failure is detected.

### Before You Begin

- Select the ATM interface on which the PVC is defined.
- Define the general settings and the QoS settings of the PVC. See [Defining ATM PVCs , on page 2377](#).

### Related Topics

- [Defining ATM PVCs , on page 2377](#)
  - [PVCs on Cisco IOS Routers , on page 2372](#)
- 

**Step 1** In the PVC dialog box, click **Advanced** to display the PVC Advanced Settings dialog box. See [Table 862: PVC Advanced Settings Dialog Box , on page 2391](#) for a description of the fields in this dialog box.

**Step 2** Enable OAM loopback cells on the selected PVC:

- a) Click the **OAM-PVC** tab. See [Table 864: PVC Advanced Settings Dialog Box—OAM-PVC Tab , on page 2394](#) for a description of the fields on this tab.
- b) Select the **Enable OAM Management** check box.
- c) Define the frequency of loopback cell transmissions.

**Step 3** (Optional) Enable segment CC cells on the PVC:

- a) Under Segment Continuity Check, select **Configure Continuity Check**.

- b) Choose whether the router should act as the sink, source, or both. This determines the direction in which CC cells are sent.
- c) Choose whether the PVC should remain up after segment or end-to-end failures are detected.

**Note** Select **Deny Activation Requests** to have the router reject CC activation requests received from peers.

**Step 4** (Optional) Enable end-to-end CC cells on the PVC, using the procedure described in [Step 3, on page 2379](#) for segment CC cells.

**Step 5** (Optional) Configure additional loopback cell parameters:

- a) Click the **OAM** tab.
- b) Select the **Enable OAM Retry** check box, then define the down count, up count, and retry frequency. See [Table 863: PVC Advanced Settings Dialog Box—OAM Tab , on page 2392](#) for a description of the available options.

**Step 6** (Optional) Configure additional CC cell parameters:

- a) Select the **Enable** check box for segment CC cells, then define the activation count, deactivation count, and retry frequency. These fields determine how many activation and deactivation requests are sent to peers and how often the router waits between each attempt. See [Table 863: PVC Advanced Settings Dialog Box—OAM Tab , on page 2392](#) for a description of the available options.
- b) Repeat [6.a, on page 2380](#) for end-to-end CC cells.

**Step 7** (Optional) Configure AIS/RDI cells on the PVC:

- a) On the OAM tab, select the **Enable AIS-RDI Detection** check box.
- b) Define how many AIS/RDI cells are required to move the PVC to the down state.
- c) Define how many seconds must elapse without receiving AIS/RDI cells before moving the PVC to the up state.

**Step 8** Click **OK** to close the dialog box and return to PVC dialog box.

## PVC Policy Page

Use the PVC page to create, edit, and delete permanent virtual connections (PVCs) on the router. PVCs allow direct and permanent connections between sites to provide a service that is similar to a leased line. These PVCs can be used in ADSL, SHDSL, or pure ATM environments. For more information, see [Defining ATM PVCs , on page 2377](#).

### Navigation Path

- (Device view) Select **Interfaces > Settings > PVC** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > PVC** from the Policy Type selector. Right-click **PVC** to create a policy, or select an existing policy from the Shared Policy selector.

## Field Reference

**Table 856: PVC Page**

| Element        | Description                                                                                                                         |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------|
| ATM Interface  | The ATM interface on which the PVC is defined.                                                                                      |
| Interface Card | The type of device or WAN interface card on which the ATM interface resides.                                                        |
| PVC ID         | The Virtual Path Identifier (VPI) and Virtual Channel Identifier (VCI) of the PVC.                                                  |
| Settings       | Additional settings configured for the PVC, including encapsulation, the number of PPPoE sessions, and the VPN service name.        |
| QoS            | Quality-of-service settings defined for the PVC, such as traffic shaping.                                                           |
| Protocol       | The IP protocol mappings (static maps or Inverse ARP) configured for the PVC.                                                       |
| OAM            | The F5 Operation, Administration, and Maintenance (OAM) loopback, continuity check, and AIS/RDI definitions configured for the PVC. |
| OAM-PVC        | The OAM management cells that are configured for the PVC.                                                                           |
| Add button     | Opens the <a href="#">PVC Dialog Box</a> , on page 2381. From here you can define a PVC.                                            |
| Edit button    | Opens the <a href="#">PVC Dialog Box</a> , on page 2381. From here you can edit the selected PVC.                                   |
| Delete button  | Deletes the selected PVC from the table.                                                                                            |

## PVC Dialog Box

Use the PVC dialog box to configure ATM permanent virtual circuits (PVCs).

You can configure the following types of interface cards:

- Unknown—The interface card type is not defined.
- WIC-1ADSL—A 1-port ADSL WAN interface card that provides ADSL over POTS (ordinary telephone lines).
- WIC-1ADSL-I-DG—A 1-port ADSL WAN interface card that provides ADSL over ISDN with Dying Gasp support. (With Dying Gasp, the router warns the DSLAM of imminent line drops when the router is about to lose power.)
- WIC-1ADSL-DG—A 1-port ADSL WAN interface card that provides ADSL over POTS with Dying Gasp support.
- HWIC-1ADSL—A 1-port high-speed ADSL WAN interface card that provides ADSL over POTS.
- HWIC-1ADSLI—A 1-port high-speed ADSL WAN interface card that provides ADSL over ISDN.

- HWIC-ADSL-B/ST—A 2-port high-speed ADSL WAN interface card that provides ADSL over POTS with an ISDN BRI port for backup.
- HWIC-ADSLI-B/ST—A 2-port high-speed ADSL WAN interface card that provides ADSL over ISDN with an ISDN BRI port for backup.
- WIC-1-SHDSL-V2—A 1-port multiline G.SHDSL WAN interface card with support for 2-wire mode and enhanced 4-wire mode.
- WIC-1-SHDSL-V3—A 1-port multiline G.SHDSL WAN interface card with support for 2-wire mode and 4-wire mode (standard & enhanced).
- NM-1A-T3—A 1-port ATM network module with a T3 link.
- NM-1A-OC3-POM—A 1-port ATM network module with an optical carrier level 3 (OC-3) link and three operating modes (multimode, single-mode intermediate reach (SMIR), and single-mode long-reach (SMLR)).
- NM-1A-E3—A 1-port ATM network module with an E3 link.
- 857 ADSL—Cisco 857 Integrated Service Router with an ADSL interface.
- 876 ADSL—Cisco 876 Integrated Services Router with an ADSL interface.
- 877 ADSL—Cisco 877 Integrated Services Router with an ADSL interface.
- 878 888 G.SHDSL—Cisco 878 Integrated Services Router with a G.SHDSL interface.
- 1801 ADSLoPOTS—Cisco 1801 Integrated Services Router that provides ADSL over POTS.
- 1802 ADSLoISDN—Cisco 1802 Integrated Services Router that provides ADSL over ISDN.
- 1803 G.SHDSL—Cisco 1803 Integrated Services Router that provides 4-wire G.SHDSL.

### Navigation Path

Go to the [PVC Policy Page](#), on page 2380, then click the **Add** or **Edit** button beneath the table.

*Table 857: PVC Dialog Box*

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ATM Interface | <p>The ATM interface on which the PVC is defined. Enter the name of an interface, subinterface, or interface role, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p><b>Note</b> We strongly recommend not defining an interface role that includes ATM interfaces from different interface cards. The different settings supported by each card type may cause deployment to fail.</p> |

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Card  | The type of WAN interface card installed on the router or the router type. Supported card types are listed above.<br><br><b>Note</b> To ensure proper policy validation, we highly recommend that you define a value in this field. When you discover a live device, the correct interface card type will already be displayed. If you did not perform discovery on a live device, or if Security Manager cannot detect the type of interface card installed on the device, this field displays “Unknown”. |
| Settings tab    | Defines basic PVC settings, such as the VPI/VCI and encapsulation. See <a href="#">PVC Dialog Box—Settings Tab</a> , on page 2383.                                                                                                                                                                                                                                                                                                                                                                         |
| QoS tab         | Defines ATM traffic shaping and other quality-of-service settings for the PVC. See <a href="#">PVC Dialog Box—QoS Tab</a> , on page 2386.                                                                                                                                                                                                                                                                                                                                                                  |
| Protocol tab    | Defines the IP protocol mappings configured for the PVC (static maps or Inverse ARP). See <a href="#">PVC Dialog Box—Protocol Tab</a> , on page 2389.                                                                                                                                                                                                                                                                                                                                                      |
| Advanced button | Defines F5 Operation, Administration, and Maintenance (OAM) settings for the PVC. See <a href="#">PVC Advanced Settings Dialog Box—OAM Tab</a> , on page 2392.                                                                                                                                                                                                                                                                                                                                             |

## PVC Dialog Box—Settings Tab

Use the Settings tab of the PVC dialog box to configure the basic settings of the PVC, including:

- ID settings.
- Encapsulation settings.
- Whether ILMI and Inverse ARP are enabled.
- The maximum number of PPPoE sessions.
- The static domain (VPN service) name to use for PPPoA.

### Navigation Path

Go to the [PVC Dialog Box](#) , on page 2381, then click the **Settings** tab.

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PVC ID settings        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| VPI                    | <p>The virtual path identifier of the PVC. In conjunction with the VCI, identifies the next destination of a cell as it passes through a series of ATM switches on the way to its destination. Valid values for most platforms range from 0 to 255.</p> <p>For Cisco 2600 and 3600 Series routers using Inverse Multiplexing for ATM (IMA), valid values range from 0 to 15, 64 to 79, 128 to 143, and 192 to 207.</p> <p><b>Note</b> VPI/VCI values must be unique for all the PVCs configured on a selected interface. VPI/VCI values are unique to a single link only and might change as cells traverse the ATM network.</p>        |
| VCI                    | <p>The 16-bit virtual channel identifier of the PVC. In conjunction with the VPI, identifies the next destination of a cell as it passes through a series of ATM switches on the way to its destination. Valid values vary by platform. Typically, values up to 31 are reserved for special traffic (such as ILMI) and should not be used. 3 and 4 are invalid.</p> <p><b>Note</b> VPI/VCI values must be unique for all the PVCs configured on a selected interface. VPI/VCI values are unique to a single link only and might change as cells traverse the ATM network.</p>                                                           |
| Handle                 | An optional name to identify the PVC. The maximum length is 15 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Management PVC (ILMI)  | <p>Does not apply when configuring the PVC on a subinterface.</p> <p>When selected, designates this PVC as the management PVC for this ATM interface by enabling communication with the Interim Local Management Interface (ILMI). ILMI is a protocol defined by the ATM Forum for setting and capturing physical layer, ATM layer, virtual path, and virtual circuit parameters on ATM interfaces. See <a href="#">Understanding ILMI</a>, on page 2375.</p> <p>When deselected, this PVC does not act as the management PVC. This is the default.</p> <p><b>Note</b> The VPI/VCI for the management PVC is typically set to 0/16.</p> |
| Encapsulation settings |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type             | <p>Does not apply when the Management PVC (ILMI) check box is enabled.</p> <p>The ATM adaptation layer (AAL) and encapsulation type to use on the PVC:</p> <ul style="list-style-type: none"> <li>• [blank]—The encapsulation type is not defined. (When deployed, aal5snap is applied.)</li> <li>• aal2—For PVCs dedicated to AAL2 Voice over ATM. AAL2 is used for variable bit rate (VBR) traffic, which can be either realtime (VBR-RT) or non-realtime (VBR-NRT).</li> <li>• aal5autoppp—Enables the router to distinguish between incoming PPP over ATM (PPPoA) and PPP over Ethernet (PPPoE) sessions and create virtual access for both PPP types based on demand.</li> <li>• aal5ciscopp—For the proprietary Cisco version of PPP over ATM.</li> <li>• aal5mux—Enables you to dedicate the PVC to a single protocol, as defined in the Protocol field.</li> <li>• aal5nlpid—Enables ATM interfaces to work with High-Speed Serial Interfaces (HSSI) that are using an ATM data service unit (ADSU) and running ATM-Data Exchange Interface (DXI).</li> <li>• aal5snap—Supports Inverse ARP and incorporates the Logical Link Control/Subnetwork Access Protocol (LLC/SNAP) that precedes the protocol datagram. This allows multiple protocols to traverse the same PVC.</li> </ul> |
| Virtual Template | <p>The virtual template used for PPP over ATM on this PVC. Enter the name of a virtual template interface or interface role, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>When a user dials in, the virtual template is used to configure a virtual access interface. When the user is done, the virtual access interface goes down and the resources are freed for other dial-in users.</p> <p><b>Note</b> If you modify the virtual template settings on an existing PVC, you must enter the shutdown command followed by the no shutdown command on the ATM subinterface to restart the interface. This causes the newly configured parameters to take effect.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Protocol         | <p>Applies only when aal5mux is the defined encapsulation type.</p> <p>The protocol carried by the MUX-encapsulated PVC:</p> <ul style="list-style-type: none"> <li>• frame-relay—Frame-Relay-ATM Network Interworking (FRF.5) on the Cisco MC3810.</li> <li>• fr-atm-srv—Frame-Relay-ATM Service Interworking (FRF.8) on the Cisco MC3810.</li> <li>• ip—IP protocol.</li> <li>• ppp—IETF-compliant PPP over ATM. You must specify a virtual template when using this protocol type.</li> <li>• voice—Voice over ATM.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Additional settings |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Enable ILMI         | When selected, enables ILMI management on this PVC.<br>When deselected, ILMI management on this PVC is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Inverse ARP         | When selected, the Inverse Address Resolution Protocol (Inverse ARP) is enabled on the PVC.<br>When deselected, Inverse ARP is disabled. This is the default.<br>Inverse ARP is used to learn the Layer 3 addresses at the remote ends of established connections. These addresses must be learned before the virtual circuit can be used.<br><b>Note</b> Use the Protocol tab to define static mappings of IP addresses instead of dynamically learning the addresses using Inverse ARP. See <a href="#">PVC Dialog Box—Protocol Tab</a> , on page 2389. |
| PPPoE Max Sessions  | The maximum number of PPP over Ethernet sessions that are permitted on the PVC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| VPN Service Name    | The static domain name to use on this PVC. The maximum length is 128 characters.<br>Use this option when you want PPP over ATM (PPPoA) sessions in the PVC to be forwarded according to the domain name supplied, without starting PPP.                                                                                                                                                                                                                                                                                                                   |

## PVC Dialog Box—QoS Tab

Use the QoS tab of the PVC dialog box to configure the ATM traffic shaping and other quality-of-service settings of the PVC, including:

- The limit on packets placed on transmission rings.
- The QoS service.
- Whether random detection is enabled.

These settings regulate the flow of traffic over the PVC by queuing traffic that exceeds the defined allowable bit rates.

---

**Note** QoS values are highly hardware dependent. Please refer to your router documentation for additional details about the settings that can be configured on your device.

---

### Navigation Path

Go to the [PVC Dialog Box](#) , on page 2381, then click the **QoS** tab.

## Field Reference

**Table 859: PVC Dialog Box—QoS Tab**

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tx Ring Limit            | <p>The maximum number of transmission packets that can be placed on a transmission ring on the WAN interface card (WIC) or interface.</p> <p>The range of valid values depends on the type of interface card selected in the Settings tab. See <a href="#">PVC Dialog Box—Settings Tab</a> , on page 2383.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Traffic Shaping settings |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Traffic Shaping          | <p>The type of service to define on the PVC:</p> <ul style="list-style-type: none"> <li>• [null]—The bit rate is not defined.</li> <li>• ABR—Available Bit Rate. A best-effort service suitable for applications that do not require guarantees against cell loss or delays.</li> <li>• CBR—Constant Bit Rate service. Delay-sensitive data, such as voice or video, is sent at a fixed rate, providing a service similar to a leased line.</li> <li>• UBR—Unspecified Bit Rate service. A best-effort service suitable for applications that are tolerant to delay and do not require realtime responses.</li> <li>• UBR+—Unspecified Bit Rate service. Unlike UBR, UBR+ attempts to maintain a guaranteed minimum rate.</li> <li>• VBR-NRT—Variable Bit Rate - Non-Real Time service. A service suitable for non-realtime applications that are bursty in nature. VBR is more efficient than CBR and more reliable than UBR.</li> <li>• VBR-RT—Variable Bit Rate - Real Time service. A service suitable for realtime applications that are bursty in nature.</li> </ul> <p>For more information about each service class, see <a href="#">Understanding ATM Service Classes</a> , on page 2374.</p> |

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ABR     | <p>The following fields are displayed when ABR is selected as the Bit Rate:</p> <ul style="list-style-type: none"> <li>• PCR—The peak cell rate in kilobits per second (kbps). It specifies the maximum value of the ABR.</li> <li>• MCR—The minimum cell rate in kilobits per second (kbps). It specifies the minimum value of the ABR.</li> </ul> <p>The ABR varies between the MCR and the PCR. It is dynamically controlled using congestion control mechanisms.</p>                                                                                                                                                                                              |
| CBR     | <p>The following field is displayed when CBR is selected as the Bit Rate:</p> <ul style="list-style-type: none"> <li>• Rate—The constant bit rate (also known as the average cell rate) for the PVC in kilobits per second (kbps). An ATM VC configured for CBR can send cells at this rate for as long as required.</li> </ul>                                                                                                                                                                                                                                                                                                                                       |
| UBR     | <p>The following field is displayed when UBR is selected as the Bit Rate:</p> <ul style="list-style-type: none"> <li>• PCR—The peak cell rate for output in kilobits per second (kbps). Cells in excess of the PCR may be discarded.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                       |
| UBR+    | <p>The following fields are displayed when UBR+ is selected as the Bit Rate:</p> <ul style="list-style-type: none"> <li>• PCR—The peak cell rate for output in kilobits per second (kbps). Cells in excess of the PCR may be discarded.</li> <li>• MCR—The minimum guaranteed cell rate for output in kilobits per second (kbps). Traffic is always allowed to be sent at this rate.</li> </ul> <p><b>Note</b> UBR+ requires Cisco IOS Software Release 12.4(2)XA or later, or version 12.4(6)T or later.</p>                                                                                                                                                         |
| VBR-NRT | <p>The following fields are displayed when VBR-NRT is selected as the Bit Rate:</p> <ul style="list-style-type: none"> <li>• PCR—The peak cell rate for output in kilobits per second (kbps). Cells in excess of the PCR may be discarded.</li> <li>• SCR—The sustained cell rate for output in kilobits per second (kbps). This value, which must be lower than or equal to the PCR, represents the maximum rate at which cells can be transmitted without incurring data loss.</li> <li>• MBS—The maximum burst cell size for output. This value represents the number of cells that can be transmitted above the SCR but below the PCR without penalty.</li> </ul> |

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VBR-RT          | <p>The following fields are displayed when VBR-RT is selected as the Bit Rate:</p> <ul style="list-style-type: none"> <li>• Peak Rate—The peak information rate for realtime traffic in kilobits per second (kbps).</li> <li>• Average Rate—The average information rate for realtime traffic in kilobits per second (kbps). This value must be lower than or equal to the peak rate.</li> <li>• Burst—The burst size for realtime traffic, in number of cells. Configure this value if the PVC carries bursty traffic.</li> </ul> <p>These values configure traffic shaping between realtime traffic (such as voice and video) and data traffic to ensure that the carrier does not discard realtime traffic, for example, voice calls.</p> |
| IP QoS settings |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Random Detect   | <p>When selected, enables Weighted Random Early Detection (WRED) or VIP-distributed WRED (DWRED) on the PVC.</p> <p>When deselected, WRED and DWRED are disabled. This is the default.</p> <p>WRED is a queue management method that selectively drops packets as the interface becomes congested. See <a href="#">Tail Drop vs. WRED</a> , on page 2555.</p>                                                                                                                                                                                                                                                                                                                                                                                |

## PVC Dialog Box—Protocol Tab

Use the Protocol tab of the PVC dialog box to add, edit, or delete the protocol mappings configured for the PVC. You may configured static mappings or Inverse ARP (broadcast or nonbroadcast) for each PVC, but not both.

**Note** IP is the only protocol supported by Security Manager for protocol mapping on ATM networks. You cannot define protocol mappings on the Management PVC (ILMI).

### Navigation Path

Go to the [PVC Dialog Box](#) , on page 2381, then click the **Protocol** tab.

| Delete button       | Deletes the selected mapping from the table.                                                                         |

## Define Mapping Dialog Box

Use the Define Mapping dialog box to configure the IP protocol mappings to use on the ATM PVC. Mappings are required by the PVC to discover which IP address is reachable at the other end of a connection. Mappings can either be learned dynamically using Inverse ARP (InARP) or defined statically. Static mappings are best suited for simple networks that contain only a few nodes.

---

**Note** Inverse ARP is only supported for the aal5snap encapsulation type. See [PVC Dialog Box—Settings Tab](#) , on page 2383.

---

---

**Tip** Use the CLI or FlexConfigs to configure mappings for protocols other than IP.

---

### Navigation Path

Go to the [PVC Dialog Box—Protocol Tab](#) , on page 2389, then click **Add** or **Edit**.

|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Options        | <p>The type of IP protocol mapping to use:</p> <ul style="list-style-type: none"> <li>• IP Address—Select this option when using static mapping. Enter the address or the name of a network/host object, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.</li> <li>• InARP—Inverse ARP. Select this option when using dynamic mapping. This allows the PVC to resolve its own network addresses without configuring a static map. Dynamic mappings age out and are refreshed periodically every 15 minutes by default.</li> </ul> <p><b>Note</b> InARP can be used only when aal5snap is the defined encapsulation type for the PVC. See <a href="#">PVC Dialog Box—Settings Tab</a> , on page 2383.</p> |
| Broadcast Options | <p>Indicates whether to use this map entry when sending IP broadcast packets (such as EIGRP updates):</p> <ul style="list-style-type: none"> <li>• Broadcast—The map entry is used for broadcast packets.</li> <li>• No Broadcast—The map entry is used only for unicast packets.</li> <li>• None—Broadcast options are disabled.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## PVC Advanced Settings Dialog Box

Use the PVC Advanced Settings dialog box to configure F5 Operation, Administration, and Maintenance (OAM) functionality on an ATM PVC. OAM is used to detect connectivity failures at the ATM layer.

For more information, see [Defining OAM Management on ATM PVCs](#) , on page 2379.

### Navigation Path

Go to the [PVC Dialog Box](#) , on page 2381, then click **Advanced**.

| Element     | Description                                                                                                                                |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| OAM-PVC tab | Enables OAM loopbacks and connectivity checks on the PVC. See <a href="#">PVC Advanced Settings Dialog Box—OAM-PVC Tab</a> , on page 2394. |

## PVC Advanced Settings Dialog Box—OAM Tab

Use the OAM tab of the PVC Advanced Settings dialog box to define:

- The number of loopback cell responses that move the PVC to the down or up state.
- The number of alarm indication signal/remote defect indication (AIS/RDI) cells that move the PVC to the down or up state.
- The number and frequency of segment/end continuity check (CC) activation and deactivation requests that are sent on this PVC.

For more information, see [Defining OAM Management on ATM PVCs](#) , on page 2379.

**Note** The settings defined in this tab are dependent on the settings defined in the OAM-PVC tab. See [PVC Advanced Settings Dialog Box—OAM-PVC Tab](#) , on page 2394.

### Navigation Path

Go to the [PVC Advanced Settings Dialog Box](#) , on page 2391, then click the **OAM** tab.

| Element          | Description                                                                                                                                                                                                                                                               |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Retry settings   |                                                                                                                                                                                                                                                                           |
| Enable OAM Retry | When selected, OAM management settings can be defined.<br>When deselected, OAM management settings cannot be defined.<br><b>Note</b> If Enable OAM Management is deselected in the OAM-PVC tab, these settings are saved in the device configuration but are not applied. |
| Down Count       | The number of consecutive, unreceived, end-to-end loopback cell responses that cause the PVC to move to the down state. The default is 3.                                                                                                                                 |
| Up Count         | The number of consecutive end-to-end loopback cell responses that must be received in order to move the PVC to the up state. The default is 5.                                                                                                                            |

| Element                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Retry Frequency                      | <p>The interval between loopback cell verification transmissions in seconds. The default is 1 second.</p> <p>If a PVC is up and a loopback cell response is not received within the specified interval (as defined in the Frequency field of the PVC-OAM tab), loopback cells are transmitted at the frequency defined here to verify whether the PVC is down. If the number of consecutive cells that do not receive a response matches the defined down count, the PVC is moved to the down state.</p> |
| AIS-RDI settings                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Enable AIS-RDI Detection             | <p>When selected, alarm indication signal (AIS) cells and remote defect indication (RDI) cells are used to report connectivity failures at the ATM layer of the PVC.</p> <p>When deselected, AIS/RDI cells are disabled.</p> <p>AIS cells notify downstream devices of the connectivity failure. The last ATM switch then generates RDI cells in the upstream direction towards the device that sent the original failure notification.</p>                                                              |
| Down Count                           | The number of consecutive AIS/RDI cells that cause the PVC to go down. Valid values range from 1 to 60. The default is 1.                                                                                                                                                                                                                                                                                                                                                                                |
| Up Count                             | The number of seconds after which a PVC is brought up if no AIS/RDI cells are received. Valid values range from 3 to 60 seconds. The default is 3.                                                                                                                                                                                                                                                                                                                                                       |
| Segment Continuity Check settings    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Enable Segment Continuity Check      | <p>When selected, OAM F5 continuity check (CC) activation and deactivation requests are sent to a device at the other end of a segment.</p> <p>When deselected, segment CC activation and deactivation requests are disabled.</p> <p><b>Note</b> If Configure Continuity Check is deselected in the OAM-PVC tab, these settings are saved in the device configuration but are not applied.</p>                                                                                                           |
| Activation Count                     | The maximum number of times that the activation request is sent before the receipt of an acknowledgement. Valid values range from 3 to 600. The default is 3.                                                                                                                                                                                                                                                                                                                                            |
| Deactivation Count                   | The maximum number of times that the deactivation request is sent before the receipt of an acknowledgement. Valid values range from 3 to 600. The default is 3.                                                                                                                                                                                                                                                                                                                                          |
| Retry Frequency                      | The interval between activation/deactivation retries, in seconds. The default is 30 seconds.                                                                                                                                                                                                                                                                                                                                                                                                             |
| End-to-End Continuity Check settings |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Element                            | Description                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable End-to-End Continuity Check | <p>When selected, OAM F5 continuity check (CC) activation and deactivation requests are sent to a device at the other end of the PVC.</p> <p>When deselected, segment CC activation and deactivation requests are disabled.</p> <p><b>Note</b> If Configure Continuity Check is deselected in the OAM-PVC tab, these settings are saved in the device configuration but are not applied.</p> |
| Activation Count                   | The maximum number of times that the activation request is sent before the receipt of an acknowledgement. Valid values range from 3 to 600. The default is 3.                                                                                                                                                                                                                                |
| Deactivation Count                 | The maximum number of times that the deactivation request is sent before the receipt of an acknowledgement. Valid values range from 3 to 600. The default is 3.                                                                                                                                                                                                                              |
| Retry Frequency                    | The interval between activation/deactivation retries, in seconds. The default is 30 seconds.                                                                                                                                                                                                                                                                                                 |

## PVC Advanced Settings Dialog Box—OAM-PVC Tab

Use the OAM-PVC tab of the PVC Advanced Settings dialog box to enable loopback cells and connectivity checks (CCs) on the PVC. These functions test the connectivity of the virtual connection.

For more information, see [Defining OAM Management on ATM PVCs , on page 2379](#).

---

**Note** Use the OAM tab to define additional settings related to the settings on this tab. See [PVC Advanced Settings Dialog Box—OAM Tab , on page 2392](#).

---

### Navigation Path

Go to the [PVC Advanced Settings Dialog Box , on page 2391](#), then click the **OAM-PVC** tab.

## PPP on Cisco IOS Routers

The Point-to-Point Protocol (PPP), as defined in RFC 1661, provides a method for transporting packets between two devices or hosts using physical or logical links. PPP is a Layer 2 data-link protocol that can work with multiple Layer 3 network-layer protocols, including IP, IPX, and AppleTalk.

PPP is used in many common scenarios, such as:

- Connecting remote users to a central network over dial-in connections.
- Connecting the gateway of an enterprise network to an ISP for internet access.
- Connecting two LANs (for example, a central office and a branch office) to exchange data between them.

PPP connectivity is established in stages:

1. First, a Link Control Protocol (LCP) establishes, configures, and tests the data-link connection.
2. (Optional) Authentication verifies the identity of the two parties.
3. A family of Network Control Protocols (NCPs) establishes and configures the necessary network-layer protocols.

The PPP policy in Security Manager provides a method for configuring selected parameters that are negotiated between the two nodes during the LCP stage, including authentication (typically CHAP or PAP) and Multilink PPP (MLP). For more information about MLP, see [Defining Multilink PPP Bundles](#), on page 2400.

The following topics describe the tasks you perform to create PPP policies on Cisco IOS routers:

- [Defining PPP Connections](#), on page 2398
- [Defining Multilink PPP Bundles](#), on page 2400

## Understanding Multilink PPP (MLP)

MLP, as defined in RFC 1990, is a method for splitting, recombining, and sequencing datagrams across multiple logical data links. MLP was originally designed to exploit multiple bearer channels in ISDN, but it can be used whenever multiple PPP links connect two systems, including asynchronous links.

MLP spreads inbound and outbound traffic across multiple physical WAN links (known collectively as a bundle) while providing the following benefits:

- Packet fragmentation and reassembly
- Proper sequencing
- Multivendor interoperability
- Load balancing

As shown in [Figure 48: Multilink PPP](#), on page 2397, traffic routed across an MLP link is fragmented, with the fragments being sent across the different physical links. At the remote end of the link, the fragments are reassembled and forwarded to the next hop toward their ultimate destination. By using multiple physical links, MLP provides a way to temporarily use the additional bandwidth afforded by these links.

**Figure 48: Multilink PPP**

Every MLP bundle is controlled by a single interface, the bundle director, which is a virtual-access interface. This interface is created in the background when the bundle is first created. The physical interface becomes part of the bundle that is managed by the bundle director. Bundles are also used when you create a multilink group consisting of a multilink interface and its associated serial interfaces, which is a setup that is often found in static, leased-line environments.

MLP uses an endpoint discriminator to identify the system transmitting a packet. By default, this discriminator is based on the hostname of the router, but it can also be based on other criteria, such as the IP address or MAC address of the interface, a telephone number, or a user-defined string. If the endpoint discriminator matches the discriminator of an existing link, the new link is added to the matching bundle. If no match exists, a new bundle is created. When authentication is used, a new bundle is established whenever there is a mismatch in either the discriminator or the authentication information exchanged between the two nodes.

## Defining PPP Connections

When you define a PPP connection, the first step is to select the interface on which PPP should be enabled. You must select one of the following interface types:

- Async
- Group-Async
- Serial
- High-Speed Serial Interface (HSSI)
- Dialer
- BRI, PRI (ISDN)
- Virtual template
- Multilink

You cannot define PPP connections on:

- Subinterfaces.
- Serial interfaces with Frame Relay encapsulation.
- Virtual template interfaces defined as Ethernet or tunnel types (serial is supported).

---

**Note** You cannot configure PPP on serial interfaces that are configured for Frame Relay encapsulation. See [Defining Basic Router Interface Settings](#) , on page 2330.

---

**Note** Deployment might fail if you define PPP on a virtual template that is also used in an 802.1x policy. See [Defining 802.1x Policies](#) , on page 2516.

You can select one or more authentication protocols and define when authentication should be performed.

In addition, you can configure the authentication and authorization methods to use when performing AAA on a remote security server. You can either define a default method list to use for all PPP connections on the device or define a customized method list that applies to a specific connection.

#### Before You Begin

- Make sure that the device contains an interface on which PPP can be configured. See [Basic Interface Settings on Cisco IOS Routers](#) , on page 2327.

#### Related Topics

- [Defining Multilink PPP Bundles](#) , on page 2400
- [PPP on Cisco IOS Routers](#) , on page 2396

#### Step 1

Do one of the following:

- (Device view) Select **Interfaces** > **Settings** > **PPP/MLP** from the Policy selector.
- (Policy view) Select **Router Interfaces** > **Settings** > **PPP/MLP** from the Policy Type selector. Select an existing policy or create a new one.

The PPP/MLP page is displayed. See [PPP/MLP Policy Page](#) , on page 2401 for a description of the fields on this page.

#### Step 2

Click the **Add** button beneath the table to display the PPP dialog box.

#### Step 3

In the Interface field, enter the name of the interface or interface role on which you want to define the PPP connection, or click **Select** to select an interface role from a list or to create a new one.

#### Step 4

(Optional) On the PPP tab, define authentication for the PPP connection:

- a) Select one or more authentication protocols.
- b) Select one or more authentication options. These options determine when to perform authentication (callin, callout, and callback), whether to use one-time passwords, and whether to allow a mobile station in a PDSN configuration to receive Simple IP and Mobile IP services without using CHAP or PAP.

**Note** The Call Back option only enables authentication during callback. Use the CLI or FlexConfigs to configure the callback feature on the device.

- c) See [PPP Dialog Box—PPP Tab](#) , on page 2403 for a description of the fields on this tab.

#### Step 5

(Optional) When using a remote AAA server to perform authentication, select Default List or Custom Method List in the Authenticate Using field, then define the methods to use in the Prioritized Method List field.

**Note** If you modify the default list, your changes affect all PPP connections on the devices that use this list. If you leave this field blank, authentication is performed using the local database on the device.

#### Step 6

(Optional) When using a remote AAA server to perform authorization, select AAA Policy Default List or Custom Method List, then define the methods to use in the Prioritized Method List field.

**Note** If you choose AAA Policy Default List, the device uses the default authorization methods defined in the AAA policy. See [Defining AAA Services](#) , on page 2412.

**Step 7** (Optional) Define the username and password to send in response to PAP authentication requests.

**Note** If you entered the encrypted version of the password, select the **Encrypted** check box.

**Step 8** (Optional) Define a different hostname to send in all CHAP challenges and responses in place of the router's own hostname.

**Note** If you entered the encrypted version of the password, select the **Encrypted** check box.

**Step 9** (Optional) To enable Multilink PPP on this connection, click the **MLP** tab. See [Defining Multilink PPP Bundles](#) , on page 2400.

**Step 10** Click **OK** to save your definitions locally on the client and close the dialog box. Your definitions are displayed in the PPP table.

**Note** To edit a PPP connection, select it from the table, then click **Edit**. To remove a PPP connection, select it, then click **Delete**.

**Step 11** Repeat [Step 2, on page 2399](#) to [Step 10, on page 2400](#) to define PPP connections on additional interfaces. Only one PPP connection may be defined on an interface.

## Defining Multilink PPP Bundles

You enable Multilink PPP (MLP) on the selected interface by selecting the check box at the top of the Multilink tab in the PPP dialog box. You can optionally enable Multiclass Multilink PPP (MCMP), which prevents delay-sensitive traffic from fragmentation, and interleaving, which enables packets to be interspersed among the fragments of larger packets. If you want to restrict a serial interface to a specific bundle, you can select the multilink interface that represents that bundle.

In addition, you can optionally modify the following default settings:

- The maximum fragment delay.
- The endpoint discriminator that identifies the router when negotiating the use of MLP.
- The maximum receive reconstructed unit (MRRU) permitted by the router and its peers.
- The maximum queue depth for first-in, first-out (FIFO) and non-FIFO queues.

### Before You Begin

- Select the interface on which the PPP connection should be enabled.

### Related Topics

- [Defining PPP Connections](#) , on page 2398
- [PPP on Cisco IOS Routers](#) , on page 2396

**Step 1** In the PPP dialog box, click the **MLP** tab. See [PPP Dialog Box—MLP Tab](#) , on page 2406 for a description of the fields on this tab.

**Step 2** Select the **Enable Multilink Protocol (MLP)** check box.

**Step 3** (Optional) Configure one or more of the following options:

- a) Whether to enable the multiclass feature that prevents delay-sensitive traffic from being fragmented. This is achieved by placing delay-sensitive traffic in a separate class from regular traffic.
- b) Whether to enable the interleaving of packets among the fragments of larger packets on the MLP bundle.
- c) Whether to restrict the physical link to joining only a designated multilink-group (defined by selecting a multilink interface). If a peer at the other end of the link tries to join a different bundle, the connection is severed.
- d) Whether to modify the default amount of time required to transmit a fragment on the MLP bundle. The default is 30 milliseconds.

**Note** If you enable interleaving without defining a fragment delay, the default delay of 30 seconds is configured. This value does not appear in Security Manager or in the device configuration.

**Step 4** (Optional) Under Endpoint, modify the default endpoint discriminator used on the MLP bundle.

The endpoint discriminator is used to identify the router on the MLP bundle. The default endpoint discriminator is either the globally configured hostname, or the PAP username or CHAP hostname (depending on the authentication protocol being used), if you configured those values on the PPP tab. See [Defining PPP Connections](#), on page 2398.

**Step 5** (Optional) In the MRRU fields, modify the default maximum packet size that the router (local) or the peer (remote) is capable of receiving.

**Step 6** (Optional) Modify the default maximum size of link transmit queues when using FIFO and non-FIFO (QoS) queuing.

**Step 7** Click **OK** to close the dialog box. Your definitions are displayed on the PPP page.

---

## PPP/MLP Policy Page

Use the PPP/MLP page to create, edit, and delete PPP connections on the router. For more information, see [Defining PPP Connections](#), on page 2398.

### Navigation Path

- (Device view) Select **Interfaces > Settings > PPP/MLP** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > PPP/MLP** from the Policy Type selector. Right-click **PPP/MLP** to create a policy, or select an existing policy from the Shared Policies selector.

|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface      | The interface that is configured for PPP/MLP.                                                                                                       |
| Authentication | The types of authentication used on the PPP connection.                                                                                             |
| Authorization  | The method list used for AAA authorization on the PPP connection.                                                                                   |
| Multilink      | Indicates whether Multilink PPP (MLP) is enabled on this PPP connection.                                                                            |
| Endpoint       | The type of default endpoint discriminator to use when negotiating the use of MLP with the peer.                                                    |
| Multiclass     | Indicates whether the Multiclass Multilink PPP (MCMP) feature is enabled on this PPP connection.                                                    |
| Group          | The number of the multilink-group interface to which the physical link is restricted.                                                               |
| Interleave     | Indicates whether the PPP multilink interleave feature is enabled on this PPP connection.                                                           |
| Add button     | Opens the <a href="#">PPP Dialog Box</a> , on page 2402. From here you can define the authentication and multilink settings for the PPP connection. |
| Edit button    | Opens the <a href="#">PPP Dialog Box</a> , on page 2402. From here you can edit the selected PPP connection.                                        |
| Delete button  | Deletes the selected PPP connection from the table.                                                                                                 |

## PPP Dialog Box

Use the PPP dialog box to configure PPP connections on the router. When you configure a PPP connection, you can define the type of authentication and authorization to perform and define multilink parameters.

### Navigation Path

Go to the , then click the **Add** or **Edit** button beneath the table.

| Hostname                     | By default, the router uses its hostname to identify itself to the peer. If required, you can enter a different hostname to use for all CHAP challenges and responses. For example, use this field to specify a common alias for all routers in a rotary group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Secret                       | The secret used to compute the response value for any CHAP challenge from an unknown peer. Enter the secret again in the Confirm field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Encrypted Secret             | When selected, this indicates that the password you entered is already encrypted. When deselected, this indicates that the password you entered is in clear text.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Authorization settings       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authorize Using | <p>AAA authorization settings for the PPP connection:</p> <ul style="list-style-type: none"> <li>• AAA Policy Default List—Uses the default authorization method list that is defined in the device's AAA policy. See <a href="#">AAA Policy Page , on page 2414</a>.</li> <li>• Prioritized Method List—Defines a sequential list of methods to be queried when authorizing a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select it. Use the up and down arrows to define the order in which selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</li> </ul> <p>The device tries initially to authorize users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p><b>Note</b> Leave this field blank to perform authorization using the local database on the router.</p> |

## PPP Dialog Box—MLP Tab

Use the MLP tab of the PPP dialog box to define Multilink PPP (MLP) parameters for the selected PPP connection.

### Navigation Path

Go to the [PPP Dialog Box , on page 2402](#), then click the **MLP** tab.

| Element                     | Description                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Multilink PPP (MLP)  | <p>When selected, MLP is enabled on this PPP connection.</p> <p>When deselected, MLP is disabled.</p>                                                                                                                                                                                                                                                          |
| Allow Multiple Data Classes | <p>When selected, enables multiple data classes on the MLP bundle. Delay-sensitive traffic is placed into Class 1, where it can be interleaved but never fragmented. Normal data traffic is placed into Class 0, which is subject to fragmentation just as regular multilink packets are.</p> <p>When deselected, all traffic is subject to fragmentation.</p> |

| Element                                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Interleaving of Packets Among Fragments of Larger Packets | <p>When selected, enables the interleaving of packets among the fragments of larger packets on the MLP bundle.</p> <p><b>Note</b> If you enable interleaving without defining a fragment delay, the default delay of 30 seconds is configured. This value does not appear in Security Manager or in the device configuration.</p> <p>When deselected, interleaving is disabled.</p> <p><b>Note</b> Serial interfaces do not support interleaving.</p>                                                                                                                                                                                                                                                                                             |
| Multilink Group                                                  | <p>Applies only to serial, Group-Async, and multilink interfaces.</p> <p>Restricts the physical link to the selected multilink-group interface. Enter the name of a multilink interface or interface role, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>This option is typically used in static leased-line environments, where the remote systems to which the device's serial lines are connected are known in advance.</p> <p>In effect, this option dedicates a specific interfaces to a particular user, even when that user is not connected. If a peer at the other end of the link tries to join a different bundle, the connected is severed.</p> |
| Maximum Fragment Delay                                           | <p>The maximum amount of time that should be required to transmit a fragment on the MLP bundle. Valid values range from 1 to 1000 milliseconds.</p> <p>Fragment size is determined by the defined fragment delay and the bandwidth of the links.</p> <p><b>Note</b> Serial interfaces do not support this feature.</p>                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Endpoint Type           | <p>The identifier used by the router when transmitting packets on the MLP bundle:</p> <ul style="list-style-type: none"> <li>• [null]—Negotiation is conducted without using an endpoint discriminator. (No CLI command is generated.)</li> <li>• Hostname—The hostname of the router. This option is useful when multiple routers are using the same username to authenticate but have different hostnames.</li> <li>• IP—A defined IP address. Enter the address or the name of a network/host object, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.</li> <li>• MAC—The MAC address of a specific interface. Enter the name of the interface or interface role, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.</li> <li>• None—Negotiation is conducted without using an endpoint discriminator. (The relevant CLI command is generated, but no endpoint discriminator is provided.) This option is useful when the router is connected to a malfunctioning peer that does not handle the endpoint discriminator properly.</li> <li>• Phone—An E.164-compliant telephone number. Enter the number in the field displayed.</li> <li>• String—A character string. Enter the string in the field displayed.</li> </ul> <p>The default endpoint discriminator is either the globally configured hostname, or the PAP username or CHAP hostname (depending on the authentication protocol being used), if you have configured those values on the PPP tab.</p> |
| MRRU Local Peer         | <p>The maximum receive reconstructed unit (MRRU) value of the local peer. This value represents the maximum size packet that the local router is capable of receiving.</p> <p>Valid values range from 128 to 16384 bytes. The default is the maximum transmission unit (MTU) of the multilink group interface and 1524 bytes for all other interfaces.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| MRRU Remote Peer        | <p>The maximum receive reconstructed unit (MRRU) value of the remote peer. This value represents the maximum size packet that the remote peer is capable of receiving.</p> <p>Valid values range from 128 to 16384 bytes. The default is 1524 bytes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Maximum FIFO Queue Size | <p>The maximum queue depth when the bundle uses first-in, first-out (FIFO) queuing. Valid values range from 2 to 255 packets. The default is 8.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Maximum QoS Queue Size  | <p>The maximum queue depth when the bundle uses non-FIFO queuing. Valid values range from 2 to 255 packets. The default is 2.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## CHAPTER 63

# Router Device Administration

---

**Note** From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any bug fixes or enhancements.

## AAA on Cisco IOS Routers

**Note** From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any bug fixes or enhancements.

Authentication, authorization, and accounting (AAA) network security services provide the primary framework through which you set up access control on your Cisco IOS router. Use the AAA policy in Security Manager to enable AAA functionality on Cisco IOS routers and to configure default AAA settings. The default settings that you define in this policy can be used in other policies, such as HTTP and line access (console and VTY) policies. Enabling AAA functionality is a prerequisite for any device policy that makes use of AAA, including NAC, SDP, and 802.1x.

For more information about AAA, see:

- [Supported Authorization Types](#) , on page 2410
- [Supported Accounting Types](#) , on page 2411
- [Understanding Method Lists](#) , on page 2411

To configure a AAA policy, see:

- [Defining AAA Services](#) , on page 2412

### Related Topics

- [Understanding AAA Server and Server Group Objects](#) , on page 254
- [Line Access on Cisco IOS Routers](#) , on page 2444

## Supported Authorization Types

AAA authorization enables you to limit the services available to an authenticated user. Security Manager supports the following types of authorization:

- **Network**—Authorizes various types of network connections, such as PPP, SLIP, and ARAP.
- **EXEC**—Authorizes the launching of EXEC (CLI) sessions.
- **Command**—Authorizes the use of all EXEC mode commands that are associated with specific privilege levels.

When authorization is enabled, the router uses information retrieved from the user's profile to configure the user session. The profiles are located either in the local user database or on a security server. Users are granted access to a requested service only if the profile allows it.

## Supported Accounting Types

AAA accounting enables you to track the services the users are accessing and the amount of network resources that they are consuming. Security Manager supports the following accounting types:

- **Connection**—Records information about all outbound connections made from this device, such as Telnet, local-area transport (LAT), TN3270, packet assembler/disassembler (PAD), and rlogin connections.

For example, a RADIUS connection accounting record for an outbound Telnet connection includes such information as the port and IP address of the network access server (NAS), the start and end times of the connection, the identity of the user, and the number of packets that were transmitted during the session.

- **EXEC**—Records information about user EXEC (CLI) sessions on the devices, including the username, date, start and stop times, and the IP address of the NAS. For dial-in users, the record includes the telephone number from which the call originated.
- **Command**—Records information about the EXEC commands executed on the device by users with specific privilege levels. Each command accounting record includes a list of the commands executed for that privilege level, the date and time each command was executed, and the name of the user who executed it.

For each accounting type, you can choose whether you want to generate an accounting record at the start and end of each user session or only at the end.

When AAA accounting is enabled, the router sends accounting records of user activity to the TACACS+ or RADIUS security server. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. This data can later be analyzed for network management, client billing, and auditing purposes.

## Understanding Method Lists

A method list is a sequential list describing the methods to use to perform a particular AAA function. In Security Manager, you define method lists by selecting AAA server groups, which are reusable objects that typically contain one or more AAA servers running the same protocol, such as RADIUS or TACACS+.

Method lists enable you to designate one or more security protocols to be used for each AAA function, thus ensuring a backup system if the initial method fails.

---

**Note** Security Manager also contains predefined AAA server group objects for using the enable password or a local database. See [Predefined AAA Authentication Server Groups](#) , on page 258.

---

For each AAA function, the device initially uses the first method defined in the list. If that method fails to respond, the device selects the next method in the list. This process continues until there is successful communication with a listed method, or all methods defined in the method list are exhausted.

---

**Note** The device attempts to communicate with the next listed method only when there is no response from the previous method. If the AAA service fails at any point in this cycle—meaning that the security server or local username database responds by denying the user access or services—the process stops and no other methods are attempted.

---

## Defining AAA Services

To define AAA services on a Cisco IOS router, you must first enable AAA functionality on the router. After you do this, you can define the kind of functionality (authentication, authorization, and accounting) that you want the device to implement. You must define a method list for each function, including lists for each type of authorization and accounting that you enable.

For example, if you want to configure EXEC authorization and command authorization, you must define one method list for EXEC authorization and other method lists for each privilege level on which command authorization is performed.

---

**Note** If you use RADIUS for authentication, you must use the same RADIUS server group for authorization as well.

---

#### Related Topics

- [Understanding Method Lists](#) , on page 2411
- [AAA on Cisco IOS Routers](#) , on page 2410
- [Understanding AAA Server and Server Group Objects](#) , on page 254

**Step 1**

Do one of the following:

- (Device view) Select **Platform > Device Admin > AAA** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > AAA** from the Policy Type selector. Select an existing policy or create a new one.

The AAA page is displayed. See [AAA Policy Page , on page 2414](#) for a description of the fields on this page.

**Step 2**

Define which login authentication methods to use on users who access the device:

- a) On the Authentication tab (see [AAA Page—Authentication Tab , on page 2415](#)), select the **Enable Device Login Authentication** check box.
- b) Enter the names of one or more AAA server group objects (up to four) in the Prioritized Method List field, or click **Select** select the object from a list or to create a new one. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used.

**Note** If you select None as a method, it must appear as the last method in the list.

**Step 3**

(Optional) In the Maximum Number of Attempts field, define the maximum number of unsuccessful authentication attempts to allow before a user is locked out.

**Step 4**

(Optional) Define which authorization methods to use on users who have been successfully authenticated:

- a) Click the **Authorization** tab on the AAA page. See [Table 871: AAA Page—Authorization Tab , on page 2416](#) for a description of the fields on this tab.
- b) Define method lists for one or more of the following types of authorization:
  - Network
  - EXEC
  - Command—Click the **Add** button to display the Command Authorization dialog box (see [Command Authorization Dialog Box , on page 2418](#)). From here, you can select a privilege level and the method list to apply to it.

For more information about these authorization types, see [Supported Authorization Types , on page 2410](#).

**Note** RADIUS uses the same server for authentication and authorization. Therefore, if you use define a RADIUS method list for authentication, you must define the same method list for authorization.

**Step 5**

(Optional) Define which accounting methods to use on the activities performed by users:

- a) Click the **Accounting** tab on the AAA page. See [Table 873: AAA Page—Accounting Tab , on page 2419](#) for a description of the fields on this tab.
- b) Define method lists for one or more of the following types of accounting:
  - Connection
  - EXEC
  - Command—Click the **Add** button to display the Command Accounting dialog box (see [Command Accounting Dialog Box , on page 2421](#)). From here, you can select a privilege level and the method list to apply to it.

For more information about these accounting types, see [Supported Accounting Types , on page 2411](#).

- c) For each accounting type defined above, select a value from the Accounting Process Notices list. This defines when to create an accounting record, at the beginning and end of the user process or only at the end.

- d) For each accounting type defined above, select the **Enable broadcast to multiple servers** check box if you want accounting information sent simultaneously to the first server in each AAA server group defined in the method list.

## AAA Policy Page

Use the AAA page to define the default authentication, authorization, and accounting methods to use on the router. You do this by configuring method lists, which define which methods to use and the sequence in which to use them.

**Note** You can use the method lists defined in this policy as default settings when you configure AAA on the router's console port and VTY lines. See [Console Policy Page , on page 2451](#) and [VTY Policy Page , on page 2459](#).

### Navigation Path

- (Device view) Select **Platform > Device Admin > AAA** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > AAA** from the Policy Type selector. Right-click **AAA** to create a policy, or select an existing policy from the Shared Policy selector.

## AAA Page—Authentication Tab

Use the Authentication tab of the AAA page to define the methods used to authenticate users who access the device. Authentication methods are defined in a method list, which define the security protocols to use, such as LDAP, RADIUS, and TACACS+.

**Note** You can use the method list defined in this policy on the console and VTY lines that are used to communicate with the device. See [Console Policy Page , on page 2451](#) and [VTY Line Dialog Box—Authentication Tab , on page 2464](#).

### Navigation Path

Go to the [AAA Policy Page , on page 2414](#), then click the **Authentication** tab.

| Prioritized Method List            | Defines a sequential list of methods to be queried when authenticating a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.<br><br>The device tries initially to authenticate users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.<br><br>Supported methods include Line, Local, Kerberos, LDAP, RADIUS, TACACS+, and None.<br><br><b>Note</b> If you select None as a method, it must appear as the last method in the list. |

| Element                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum Number of Attempts | <p>The maximum number of unsuccessful authentication attempts before a user is locked out. This feature is disabled by default. Valid values range from 1 to 65535.</p> <p><b>Note</b> From the standpoint of the user, there is no distinction between a normal authentication failure and an authentication failure due to being locked out. The system administrator has to explicitly clear the status of a locked-out user using <b>clear</b> commands.</p> |

## AAA Page—Authorization Tab

Use the Authorization tab of the AAA page to define the type of authorization services to enable on the device and the methods to use for each type. Security Manager supports the following types of authorization:

- Network—Authorizes various types of network connections, such as PPP.
- EXEC—Authorizes the launching of EXEC sessions.
- Command—Authorizes the use of all EXEC mode commands that are associated with specific privilege levels.

**Note** You can use the method lists defined in this policy on the console and VTY lines that are used to communicate with the device. See [Console Policy Page](#) , on page 2451 and [VTY Line Dialog Box—Authentication Tab](#) , on page 2464.

### Navigation Path

Go to the [AAA Policy Page](#) , on page 2414, then click the **Authorization** tab.

| Prioritized Method List                  | Defines a sequential list of methods to be queried when authorizing a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.<br><br>The device tries initially to authorize users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.<br><br>Supported methods include LDAP, RADIUS, TACACS+, Local, and None.<br><br><b>Note</b> RADIUS uses the same server for authentication and authorization. Therefore, if you use define a RADIUS method list for authentication, you must define the same method list for authorization.<br><br><b>Note</b> If you select None as a method, it must appear as the last method in the list. |
| EXEC Authorization settings              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Edit button                              | Opens the <a href="#">Command Authorization Dialog Box</a> , on page 2418. From here you can edit the command authorization definition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Delete button                            | Deletes the selected command authorization definitions from the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Command Authorization Dialog Box

Use the Command Authorization dialog box to define which methods to use when authorizing the EXEC commands that are associated with a given privilege level. This enables you to authorize all commands associated with a specific privilege level, from 0 to 15.

### Navigation Path

From the [AAA Page—Authorization Tab](#), on page 2416, click the **Add** button beneath the Command Authorization table.

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Privilege Level         | The privilege level for which you want to define a command accounting list. Valid values range from 0 to 15.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Prioritized Method List | <p>Defines a sequential list of methods to be used when authorizing a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to authorize users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p>Supported methods include TACACS+, Local, and None.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> |

## AAA Page—Accounting Tab

Use the Accounting tab of the AAA page to define the type of accounting services to enable on the device and the methods to use for each type. Security Manager supports the following types of accounting:

- Connection—Records information about all outbound connections made from this device.
- EXEC—Records information about user EXEC sessions on the devices, including the username, date, start and stop times, and the IP address.

- **Command**—Records information about the EXEC commands executed on the device by users with specific privilege levels.

In addition, you use the Accounting page to determine when accounting records should be generated and whether they should be broadcast to more than one AAA server.

**Note** You can use the method lists defined in this policy on the console and VTY lines that are used to communicate with the device. See [Console Policy Page](#), on page 2451 and [VTY Line Dialog Box—Authentication Tab](#), on page 2464.

### Navigation Path

Go to the [AAA Policy Page](#), on page 2414, then click the **Accounting** tab.

|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Connection Accounting settings  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Enable Connection Accounting    | When selected, enables the recording of information about outbound connections (such as Telnet) made over this device, using the methods defined in the method list.<br><br>When deselected, connection accounting is not performed.                                                                                                                                                                                                                                                                       |
| Generate Accounting Records for | Defines when the device sends an accounting notice to the accounting server: <ul style="list-style-type: none"> <li>• <b>Start and Stop</b>—Generates accounting records at the beginning and the end of the user process. The user process begins regardless of whether the accounting server receives the “start” accounting record.</li> <li>• <b>Stop Only</b>—Generates an accounting record at the end of the user process only.</li> <li>• <b>None</b>—Disables this type of accounting.</li> </ul> |

| Element                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Prioritized Method List               | <p>Defines a sequential list of methods to be queried when creating connection accounting records for a user. Enter the names of one or more AAA server group objects (up to 10 for IOS 12.4(22)T+, otherwise up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>Supported methods include LDAP, RADIUS, and TACACS+.</p> |
| Enable Broadcast to Multiple Servers  | <p>When selected, enables the sending of accounting records to multiple AAA servers. Accounting records are sent simultaneously to the first server in each AAA server group defined in the method list. If the first server is unavailable, failover occurs using the backup servers defined within that group.</p> <p>When deselected, accounting records are sent only to the first server in the first AAA server group defined in the method list.</p>                                                                                         |
| EXEC Accounting Settings              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Enable CLI/EXEC Operations Accounting | <p>When selected, enables the recording of basic information about user EXEC sessions, using the methods defined in the method list.</p> <p>When deselected, EXEC accounting is not performed.</p>                                                                                                                                                                                                                                                                                                                                                  |
| Generate Accounting Records for       | See <a href="#">Table 547: Cat6k Block VLAN Dialog Box</a> , on page 1775.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Prioritized Method List               | <p>Defines a sequential list of methods to be queried when creating connection accounting records for a user. Enter the names of one or more AAA server group objects (up to 10 for IOS 12.4(22)T+, otherwise up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p>                                                             |
| Enable Broadcast to Multiple Servers  | <p>When selected, enables the sending of accounting records to multiple AAA servers. Accounting records are sent simultaneously to the first server in each AAA server group defined in the method list. If the first server is unavailable, failover occurs using the backup servers defined within that group.</p>                                                                                                                                                                                                                                |
| Command Accounting settings           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Privilege Level                       | The privilege level to which the command authorization definition applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Generate Accounting Records for       | The points in the process where the device sends an accounting notice to the accounting server.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Enable Broadcast                      | Whether accounting records are broadcast to multiple servers simultaneously.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Prioritized Method List               | The method list to use when authorizing users with this privilege level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Add button                            | Opens the <a href="#">Command Accounting Dialog Box</a> , on page 2421 . From here you can configure a command accounting definition.                                                                                                                                                                                                                                                                                                                                                                                                               |

| Element       | Description                                                                                                                       |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Edit button   | Opens the <a href="#">Command Accounting Dialog Box</a> , on page 2421. From here you can edit the command accounting definition. |
| Delete button | Deletes the selected command accounting definitions from the table.                                                               |

## Command Accounting Dialog Box

Use the Command Accounting dialog box to define which methods to use when recording information about the EXEC commands that are executed for a given privilege level. Each accounting record includes a list of the commands executed for that privilege level, as well as the date and time each command was executed, and the name of the user who executed it.

### Navigation Path

From the [AAA Page—Accounting Tab](#) , on page 2418, click the **Add** button beneath the Command Accounting table.

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Privilege Level                 | The privilege level for which you want to define a command accounting list. Valid values range from 0 to 15.                                                                                                                                                                                                                                                                                                                                                                             |
| Generate Accounting Records for | Defines when the device sends an accounting notice to the accounting server: <ul style="list-style-type: none"> <li>• Start and Stop—Generates accounting records at the beginning and the end of the user process. The user process begins regardless of whether the accounting server receives the “start” accounting record.</li> <li>• Stop Only—Generates an accounting record at the end of the user process only.</li> <li>• None—No accounting records are generated.</li> </ul> |

| Element                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Prioritized Method List              | <p>Defines a sequential list of methods to be used when creating accounting records for a user. Enter the names of one or more AAA server group objects (up to 10 for IOS 12.4(22)T+, otherwise up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to perform accounting using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p>TACACS+ is the only supported method, but you can select multiple AAA server groups configured with TACACS+.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> |
| Enable Broadcast to Multiple Servers | <p>When selected, enables the sending of accounting records to multiple AAA servers. Accounting records are sent simultaneously to the first server in each AAA server group defined in the method list. If the first server is unavailable, failover occurs using the backup servers defined within that group.</p> <p>When deselected, accounting records are sent only to the first server in the first AAA server group defined in the method list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## User Accounts and Device Credentials on Cisco IOS Routers

Accounts and credential policies define the contact information for accessing the router, including the privilege level provided to each user account. You can configure as many user accounts as required. However, the user account that Security Manager uses to connect to the router is always the one configured in the Device Properties page.

Additionally, you use device access policies to define the enable or enable secret password required to access privileged EXEC mode. This is the mode required to make any configuration changes on the router.

**Note** If you use this policy to define a password, be careful later not to unassign this policy without assigning a replacement policy before your next deployment. If you deploy a device access policy that removes this password and the device contains a different type of password not known to Security Manager, such as a line console password, you will not be able to configure this device in the future. This is because the device reverts to this unknown password if Security Manager removes the enable password that it had previously configured.

## Defining Accounts and Credential Policies

This procedure describes how to define a device access policy on a Cisco IOS router. If the username that you configured on the Device Properties page to connect to the router (see [Viewing or Changing Device Properties , on page 107](#)) matches one of the user accounts you defined in this policy, Security Manager updates the device credentials according to your policy definition.

If you change the password for the user defined in the device properties, which Security Manager uses to deploy configurations to the device, or change the enable password, Security Manager uses the existing credentials defined in the device properties to log into the device and deploy changes. After successful deployment, the device properties are then changed to use your new settings. For more information on credentials in device properties, see [Device Credentials Page , on page 112](#).

---

**Note** You can discover encrypted passwords, but any password you enter must be in clear text. If you discover an encrypted password and then modify it, the password is saved as clear text.

---

### Related Topics

- [User Accounts and Device Credentials on Cisco IOS Routers , on page 2422](#)

---

### Step 1

Do one of the following:

- (Device view) Select **Platform > Device Admin > Accounts and Credentials** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Accounts and Credentials** from the Policy Type selector. Select an existing policy or create a new one.

The Accounts and Credentials page is displayed. See [Table 875: Accounts and Credentials Page , on page 2425](#) for a description of the fields on this page.

### Step 2

Enter the password for switching to privileged EXEC mode on the router:

- a) Select **Enable Password** or **Enable Secret Password**. The Enable Secret Password option offers better security than the Enable Password option by storing the password using MD5 encryption. This option is useful in environments in which the password crosses the network or is stored on a TFTP server.

**Note** After you set an enable secret password, you can switch to an enable password only if the enable secret is disabled or an older version of Cisco IOS software is being used, such as when running an older rxboot image.

- b) Enter a password, then enter it again in the Confirm field. The password that you enter must be in clear text. If you are configuring the enable secret password, the password is encrypted on deployment.

### Step 3

(Optional) Select the **Enable Password Encryption Service** check box to encrypt all passwords on the device. This includes, for example, the enable password, username passwords, authentication key passwords, console and VTY line access passwords, and BGP neighbor passwords.

We recommend using this feature to help prevent unauthorized individuals from viewing the passwords in your configuration file.

**Note** This option does not provide a high level of security and should not be used as a substitute for additional network security measures.

**Step 4** To define new user accounts for the router:

- a) Click the **Add** button under the table to display the User Accounts dialog box.
- b) Enter the details for the new user. See [Table 876: User Account Dialog Box](#) , on page 2426 for a description of the available fields.
- c) Click **OK** to save your definitions locally on the client and close the dialog box. Your definitions are displayed in the User Accounts table.

**Note** To edit a user account, select it from the User Accounts table, then click **Edit**. To remove a user account, select it, then click **Delete**.

**Caution** While deleting a user account, Cisco Security Manager times out and deployment fails. To avoid this, you can set up Security Manager to download despite an error. Enable **Allow Download on Error** in **Tools > Administrator > Deployments** in the Configuration Manager.

---

## Accounts and Credentials Policy Page

Use the Accounts and Credentials page to define the enable password or enable secret password assigned to the router. In addition, you can define a list of usernames that can be used to access the router.

For more information, see [Defining Accounts and Credential Policies](#) , on page 2423.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Accounts and Credentials** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Accounts and Credentials** from the Policy Type selector. Right-click **Accounts and Credentials** to create a policy, or select an existing policy from the Shared Policy selector.

| Element                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Secret Password             | <p>The enable secret password for entering privileged EXEC mode on the router. This option offers better security than the Enable Password option.</p> <p>The enable secret password can contain between 1-25 alphanumeric characters. The first character must be a letter. Spaces are allowed, but leading spaces are ignored. Question marks are also allowed.</p> <p><b>Note</b> You can discover an encrypted password, but any password you enter must be in clear text. If you modify an encrypted password, it is saved as clear text.</p> <p><b>Note</b> After you set an enable secret password, you can switch to an enable password only if the enable secret is disabled or an older version of Cisco IOS software is being used, such as when running an older rxboot image.</p> |
| Enable Password                    | <p>The enable password for entering privileged EXEC mode on the router.</p> <p>The enable password can contain between 1-25 alphanumeric characters. The first character must be a letter. Spaces are allowed, but leading spaces are ignored. Question marks are also allowed.</p> <p><b>Note</b> You must enter the password in clear text.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Enable Password Encryption Service | <p>When selected, encrypts all passwords on the device, including the enable password (which is otherwise saved in clear text).</p> <p>For example, use this option to encrypt username passwords, authentication key passwords, console and VTY line access passwords, and BGP neighbor passwords. This command is primarily used for keeping unauthorized individuals from viewing your passwords in your configuration file.</p> <p>When deselected, device passwords are stored unencrypted in the configuration file.</p> <p><b>Note</b> This option does not provide a high level of network security. You should also take additional network security measures.</p>                                                                                                                    |
| User Accounts Table                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Username                           | The username that can be used to access the router. The username must be a single word up to 64 characters in length. Spaces and quotation marks are not allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Encryption                         | Indicates whether password information for the user is encrypted using MD5 encryption.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Privilege Level                    | The privilege level assigned to the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Add button                         | Opens the <a href="#">User Account Dialog Box</a> , on page 2426. From here you can define a user account.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Element       | Description                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------|
| Edit button   | Opens the <a href="#">User Account Dialog Box</a> , on page 2426. From here you can edit the selected user. |
| Delete button | Deletes the selected user accounts from the table.                                                          |

## User Account Dialog Box

Employ the User Account dialog box to define a username and password combination that can be used by Security Manager to access the router. You can also define the privilege level of the user account, which determines whether you can configure all commands on this router or only a subset of them.

**Note** Remember—there may be additional user accounts defined on the router using other methods, such as the CLI.

### Navigation Path

Go to the [Accounts and Credentials Policy Page](#) , on page 2424, then click the **Add** or **Edit** button beneath the table.

### Field Reference

*Table 876: User Account Dialog Box*

| Element                    | Description                                                                                                                                                                |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Username                   | The username for accessing the router.                                                                                                                                     |
| Password                   | The password for accessing the router with this user account.<br><b>Note</b> You can discover an encrypted password, but any password you enter must be in clear text.     |
| Confirm                    | Confirms the password for this user account.                                                                                                                               |
| Encrypt password using MD5 | When selected, uses MD5 encryption to encrypt the password for this user account. This is the default.<br>When deselected, the password is sent to the router unencrypted. |

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Privilege Level | <p>The privilege level assigned to the user account. Valid values range from 0 to 15:</p> <ul style="list-style-type: none"> <li>• 0—Grants access to these commands only: <b>disable</b>, <b>enable</b>, <b>exit</b>, <b>help</b>, and <b>logout</b>.</li> <li>• 1—Enables nonprivileged access to the router (normal EXEC-mode use privileges).</li> <li>• 15—Enables privileged access to the router (traditional enable privileges).</li> </ul> <p><b>Note</b> Levels 2-14 are not normally used in a default configuration, but custom configurations can be created by moving commands that are normally at level 15 to a lower level and commands that are normally at level 1 to a higher level. You can configure the privilege levels of commands using the CLI or by defining a FlexConfig.</p> |

## Bridging on Cisco IOS Routers

Bridging policies enable you to perform transparent bridging (as specified in RFC 1286) on selected interfaces that you have configured to function as a bridge group. Security Manager supports integrated routing and bridging, which makes it possible to route a specific protocol between routed interfaces and bridge groups, or route a specific protocol between bridge groups. Local or unroutable traffic can be bridged among the bridged interfaces in the same bridge group, while routable traffic can be routed to other routed interfaces or bridge groups, as shown in [Figure 49: Transparent Bridging, on page 2427](#).

Using integrated routing and bridging, you can:

- Switch packets from a bridged interface to a routed interface.
- Switch packets from a routed interface to a bridged interface.
- Switch packets within the same bridge group.

**Figure 49: Transparent Bridging**

- [Bridge-Group Virtual Interfaces](#) , on page 2428

## Bridge-Group Virtual Interfaces

Because bridging takes place at the data link layer and routing takes place at the network layer, they have different protocol configuration models. With IP, for example, bridge group interfaces belong to the same network and have a collective IP network address. In contrast, each routed interface represents a distinct network and has its own IP network address. Integrated routing and bridging uses the concept of a bridge-group virtual interface (BVI) to enable these interfaces to exchange packets for a given protocol. As shown in [Figure 50: Bridge-Group Virtual Interface, on page 2428](#), the interface number assigned to the BVI corresponds to the bridge group that the BVI represents. This number serves as the link between the virtual interface and the bridge group.

**Figure 50: Bridge-Group Virtual Interface**

When you enable routing for a given protocol on the BVI, packets coming from a routed interface that are destined for a host in a bridged domain are routed to the BVI and then forwarded to the corresponding bridged interface. All traffic routed to the BVI is forwarded to the corresponding bridge group as bridged traffic. All routable traffic received on a bridged interface is routed to other routed interfaces as if it is coming directly from the BVI.

**Note** BVI interfaces are configured using the Interfaces policy. See [Defining Basic Router Interface Settings , on page 2330](#). The BVI interface must have a corresponding bridge group with the same number; otherwise, deployment will fail.

**Note** When the bridge group contains more than two interfaces, add a BVI interface to the group to help prevent unicast flooding, which is a potential security issue.

## Defining Bridge Groups

You define a bridge group by selecting the L3 interfaces that are part of the bridge group and assigning the group a number. All bridge groups in Security Manager perform integrated routing and bridging on IP traffic only and use the standard Spanning Tree Protocol (IEEE 802.1D).

---

**Note** Use CLI commands or FlexConfigs to bridge other protocols, such as AppleTalk or IPX, and to use other spanning tree protocols, such as VLAN-Bridge. Concurrent routing and bridging is not supported.

---

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Device Admin > Bridging** from the Policy selector.
  - (Policy view) Select **Router Platform > Device Admin > Bridging** from the Policy Type selector. Select an existing policy or create a new one.
- The Bridging page is displayed. See [Table 877: Bridging Page](#) , on page 2430 for a description of the fields on this page.
- Step 2** Click the **Add** button under the table to display the Bridge Group dialog box. See [Table 878: Bridge Group Dialog Box](#) , on page 2431 for a description of the fields in this dialog box. From here you can define a bridge group.
- Step 3** Enter a number to identify the bridge group.
- Step 4** Enter the names of the interfaces and interface roles that are part of the bridge group, or click **Select** to select an interface role or to create a new one. For more information, see [Specifying Interfaces During Policy Definition](#) , on page 304.
- You can select most Layer 3 interfaces, except X.25 and Integrated Services Digital Network (ISDN) bridged interfaces and certain types of logical interfaces (such as loopback, tunnel, null, and BVI). Each interface can be included in only one bridge group.
- You can select a LAN subinterface only if the parent interface is configured with Inter-Switch Link (ISL) or 802.1Q encapsulation.
- Step 5** Click **OK** to save your definitions locally on the client and close the dialog box. The bridge group is displayed in the table on the Bridging page.
- Note** To edit a bridge group, select it from the Groups table, then click **Edit**. To remove a bridge group, select it, then click **Delete**.
- 

## Bridging Policy Page

Use the Bridging page to define bridge groups that can perform integrated routing and bridging on the router. For more information, see [Defining Bridge Groups](#) , on page 2428.

#### Navigation Path

- (Device view) Select **Platform > Device Admin > Bridging** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Bridging** from the Policy Type selector. Right-click **Bridging** to create a policy, or select an existing policy from the Shared Policy selector.

# Time Zone Settings on Cisco IOS Routers

The local time on a Cisco IOS router is typically set using the clock set command in the CLI command or by dynamically deriving the time from an NTP server. You can adjust these time settings by defining the time zone in which the router resides and the start and end dates of Daylight Saving Time (DST) in that time zone.

## Related Topics

- [Defining Time Zone and DST Settings](#) , on page 2431
- [NTP on Cisco IOS Routers](#) , on page 2507

## Defining Time Zone and DST Settings

Security Manager enables you to define the time zone in which a Cisco IOS router is located. You can also define the start and end dates for Daylight Saving Time (DST).

## Related Topics

- [Defining NTP Servers](#) , on page 2507
- [Time Zone Settings on Cisco IOS Routers](#) , on page 2431

### Step 1

Do one of the following:

- (Device view) Select **Platform > Device Admin > Clock** from the Policy selector.

- (Policy view) Select **Router Platform > Device Admin > Clock** from the Policy Type selector. Select an existing policy or create a new one.

The Clock page is displayed. See [Table 879: Clock Page , on page 2433](#) for a description of the fields on this page.

- Step 2** Select the time zone in which the router is located. Time zones are listed according the number of hours behind or ahead of Greenwich Mean Time (GMT).
- Step 3** (Optional) Select the method for determining the start and end dates for DST:
- Set by Date—Select this option when DST starts and ends on fixed dates. Continue with [Step 4, on page 2432](#).
  - Set by Day—Select this option when DST starts and ends on days whose specific dates vary from year to year. Continue with [Step 5, on page 2432](#).
  - None—Select this option when DST is not used.
- Step 4** (When Set by Date is selected) Define the fixed dates when DST starts and ends:
- Under Start, click the calendar icon, then click the appropriate date.
  - Select the hour and minute from the displayed lists.
  - Repeat steps a and b to configure the end date and time.
- Step 5** (When Set by Day is selected) Select the **Specify Recurring Time** check box if you want to define a DST period *other* than the default, which is the period used throughout most of the United States.
- Step 6** (When Specify Recurring Time is selected) Define the start and end of DST:
- Under Start, select the month when DST begins.
  - Select the week of the month (1, 2, 3, 4, first, or last).
  - Select the day of the week.
  - Select the hour and minute from the displayed lists. For example, if DST begins at 1:00 a.m. on the last Sunday of each March, select March, last, Sunday, 1, and 00.
  - Repeat Steps a through d to configure the end date and time.

## Clock Policy Page

Use the Clock page to configure the time zone in which the router is located and the settings for Daylight Saving Time (DST). For more information, see [Time Zone Settings on Cisco IOS Routers , on page 2431](#).

**Tip** You can configure the local time on the router by defining an NTP policy or by configuring the **clock set** command using the CLI.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Clock** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Clock** from the Policy Type selector. Right-click **Clock** to create a policy, or select an existing policy from the Shared Policy selector.

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Specify Recurring Time | <p>When selected, the router implements DST according to the dates and times specified in this policy.</p> <p>When deselected, the router implements DST according to the schedule used throughout most of the United States.</p>                                                                                                                                                                                                                                        |
| Start                  | <p>The relative date and time when daylight savings time begins:</p> <ul style="list-style-type: none"> <li>• Month—Select the month.</li> <li>• Week—Select the week of the month (1, 2, 3, 4, first, or last).</li> <li>• Weekday—Select the day of the week.</li> <li>• Hour—Select the hour.</li> <li>• Minute—Select the minute.</li> </ul> <p>For example, if DST begins at 1:00 a.m. on the last Sunday of each March, select March, last, Sunday, 1, and 00.</p> |
| End                    | <p>The relative date and time when daylight savings time ends:</p> <ul style="list-style-type: none"> <li>• Month—Select the month.</li> <li>• Week—Select the week of the month (1, 2, 3, 4, first, or last).</li> <li>• Weekday—Select the day of the week.</li> <li>• Hour—Select the hour.</li> <li>• Minute—Select the minute.</li> </ul>                                                                                                                           |

## CPU Utilization Settings on Cisco IOS Routers

The CPU policy configures settings relating to CPU utilization. This policy provides you with methods for monitoring CPU resources and tracking processes that exceed a predetermined level of utilization.

---

**Note** The CPU policy is supported on routers running Cisco IOS Software Release 12.3(14)T or later.

---

### Related Topics

- [Defining CPU Utilization Settings](#), on page 2434

## Defining CPU Utilization Settings

You can use Security Manager to modify the following default CPU utilization settings:

- The size of the CPU history table.

- The size of the extended CPU load history table.
- Whether to enable the automatic CPU Hog profiling.

In addition, you can optionally define:

- The CPU utilization level that causes a process to be included in the history table.
- The types of CPU utilization thresholds to enable. For each type of threshold, you can determine the threshold values that trigger notifications.

---

#### Step 1

Do one of the following:

- (Device view) Select **Platform** > **Device Admin** > **CPU** from the Policy selector.
- (Policy view) Select **Router Platform** > **Device Admin** > **CPU** from the Policy Type selector. Select an existing policy or create a new one.

The CPU page is displayed.

#### Step 2

(Optional) Define the CPU utilization settings of the router, as required. See [Table 880: CPU Page](#) , on page 2436 for a description of the available fields.

---

## CPU Policy Page

Use the CPU page to configure settings related to router CPU utilization, including the thresholds for sending log messages, the size of the CPU history table, and whether to enable automatic CPU Hog profiling.

For more information, see [Defining CPU Utilization Settings](#) , on page 2434.

### Navigation Path

- (Device view) Select **Platform** > **Device Access** > **CPU** from the Policy selector.
- (Policy view) Select **Router Platform** > **Device Access** > **CPU** from the Policy Type selector. Right-click **CPU** to create a policy, or select an existing policy from the Shared Policy selector.

## HTTP and HTTPS on Cisco IOS Routers

Security Manager enables you to configure HTTP and HTTPS over Secure Socket Layer (known as HTTP over SSL or HTTPS) server functionality on Cisco IOS routers. This feature provides SSL version 3.0 support for the HTTP 1.1 server.

A secure HTTP connection means that data sent to and received from an HTTP server are encrypted before being sent out over the internet. HTTP with SSL encryption provides a secure connection to allow such functions as configuring a router from a web browser.

In addition to providing access to the device via the Cisco web browser user interface, HTTP and HTTPS are used by device management applications, such as the Cisco Router and Security Device Manager (SDM), to communicate with the device.

### Related Topics

- [Defining HTTP Policies](#) , on page 2438

## Defining HTTP Policies

When you define an HTTP policy, you can:

- Enable and disable HTTP and SSL functionality on the router.
- Specify the ports used by each protocol.
- Optionally define a standard, numbered ACL that restricts access to the device using these protocols.

In addition, you can define the methods of AAA authentication and authorization methods to perform on users.

You must use caution when defining an HTTP policy, as your settings may affect communication between Security Manager (as well as other management applications that use these protocols) and the device.

---

**Note** As a general rule, Cisco IOS routers that have been discovered by Security Manager already have HTTPS enabled because Security Manager uses SSL as the default protocol for communicating with them. See [Setting Up SSL on Cisco IOS Routers](#) , on page 58.

---

### Before You Begin

- Enable AAA services on the router. See [Defining AAA Services](#) , on page 2412.

### Related Topics

- [HTTP and HTTPS on Cisco IOS Routers](#) , on page 2437

### Step 1

Do one of the following:

- (Device view) Select **Platform** > **Device Admin** > **Device Access** > **HTTP** from the Policy selector, then click the **Setup** tab in the work area.
- (Policy view) Select **Router Platform** > **Device Admin** > **Device Access** > **HTTP** from the Policy Type selector. Select an existing policy or create a new one.

The HTTP Setup tab is displayed. See [Table 881: HTTP Page—Setup Tab](#) , on page 2440 for a description of the fields on this tab.

### Step 2

Select the check boxes to enable HTTP and SSL (HTTPS) server functionality on the router.

**Note** If SSL is disabled (or if the HTTP policy as a whole is unassigned), Security Manager cannot communicate with the device after deployment unless you change the transport protocol for this device to SSH. This setting can be found in Device Properties. See [Managing Device Communication Settings and Certificates](#) , on page 458.

**Tip** We recommend that you disable HTTP when SSL is enabled. This is required to ensure only secure connections to the server.

### Step 3

(Optional) Modify the default ports used by HTTP (80) and HTTPS (443).

### Step 4

(Optional) In the Allow Connection From field, enter the name of the standard, numbered ACL object that specifies which addresses can use HTTP and HTTPS on this device, or click **Select** to select the ACL object from a list or to create

a new one. Use this option to restrict access to these protocols. For more information about creating standard ACL objects, see [Creating Standard Access Control List Objects](#), on page 284

**Note** Make sure that the ACL you select permits the Security Manager server; otherwise, communication with the device is lost.

**Step 5** (Optional) On the AAA tab, modify the default type of authentication to perform on users who attempt to access the device using HTTP or HTTPS. Options include AAA, Enable Password (default), Local Database, and TACACS.

If you select AAA, continue with [Step 6, on page 2439](#); otherwise, continue with [Step 8, on page 2439](#).

**Note** The TACACS option applies only to devices using an IOS software version prior to 12.3(8).

See [Table 882: HTTP Page—AAA Tab](#), on page 2442 for a description of the fields on the AAA tab.

**Step 6** Select the authentication method to perform on users:

- If you want to use the default AAA login authentication methods defined in the device's AAA policy (see [Defining AAA Services](#), on page 2412), do *not* select the Enable Device Login Authentication check box. Continue with [Step 7, on page 2439](#).

- If you want to define a method list especially for this policy, do the following:

- a) Select the **Enable Device Login Authentication** check box.
- b) Under Prioritized Method List, enter the names of the AAA server groups to use for authentication, or click **Select** to select the AAA server groups from a list or to create new ones. Use the up and down arrows in the selector to define the order in which you want to apply these authentication methods.

**Note** Make sure that Security Manager users are defined on the AAA servers; otherwise communication with the device is lost.

**Step 7** Select the authorization method to perform on users who use HTTP or HTTPS to begin an EXEC session:

- If you want to use the default AAA authorization methods defined in the device's AAA policy, do *not* select the Enable CLI/EXEC Operations Authorization check box. Continue with [Step 8, on page 2439](#).
- If you want to define a method list especially for this policy, select the **Enable CLI/EXEC Operations Authorization** check box, then define the method list.

**Note** If you leave this option deselected, make sure that EXEC authorization is enabled in the router's AAA policy. Otherwise, you will be unable to connect to the device via HTTP or HTTPS (SSL). This applies to Security Manager as well as other applications, such as SDM. See [Defining AAA Services](#), on page 2412.

**Step 8** (Optional) Create command authorization definitions for specific privilege levels:

- a) Click the **Add** button under the Command Authorization Override table. The Command Authorization Override dialog box is displayed. See [Table 883: Command Authorization Dialog Box](#), on page 2444 for a description of the fields in this dialog box.
- b) Configure the command authorization definition as required.
- c) Click **OK**. The dialog box closes and the authorization method is displayed in the Command Authorization Override table.
- d) Repeat [8.a, on page 2439](#) through [8.c, on page 2439](#) to create additional command authorization definitions.

# HTTP Policy Page

Use the HTTP page to configure HTTP and HTTPS access on the router. You can configure HTTP policies on a Cisco IOS router from the following tabs on the HTTP policy page:

- [HTTP Page—Setup Tab](#) , on page 2440
- [HTTP Page—AAA Tab](#) , on page 2441

For more information, see [HTTP and HTTPS on Cisco IOS Routers](#) , on page 2437.

## Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > HTTP** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Device Access > HTTP** from the Policy Type selector. Right-click **HTTP** to create a policy, or select an existing policy from the Shared Policy selector.

## HTTP Page—Setup Tab

Use the Setup tab of the HTTP page to enable HTTP and HTTP over Secure Socket Layer (HTTP over SSL or HTTPS) on the router. You can optionally limit access to these protocols to the addresses defined in an access control list.

---

**Note** As a general rule, Cisco IOS routers that have been discovered by Security Manager already have HTTPS enabled because Security Manager uses SSL as the default protocol for communicating with them. See [Setting Up SSL on Cisco IOS Routers](#) , on page 58.

---

## Navigation Path

Go to the [HTTP Policy Page](#) , on page 2440, then click the **Setup** tab.

|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable CLI/EXEC Operations Authorization | <p>Applies only when AAA is selected as the authentication method.</p> <p>When selected, EXEC authorization is based on the methods defined in the Prioritized Method List field. This type of authorization determines whether the user is permitted to open an EXEC (CLI) session.</p> <p>When deselected, the default EXEC authorization list defined in the router's AAA policy is used. See <a href="#">AAA Page—Authorization Tab</a> , on page 2416.</p> <p><b>Note</b> If you leave this option deselected, make sure that EXEC authorization is enabled in the router's AAA policy. Otherwise, you will be unable to connect to the device via HTTP or HTTPS (SSL). This applies to Security Manager as well as other applications, such as SDM and the device's web interface.</p>                                                        |
| Prioritized Method List                  | <p>Applies only when the Enable CLI/EXEC Operations Authorization check box is selected.</p> <p>Defines a sequential list of methods to be queried when authorizing a user to open an EXEC (CLI) session. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to authorize users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> |
| Command Authorization settings           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Privilege Level                          | The privilege level to which the command authorization definition applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Prioritized Method List                  | The method list to use when authorizing users with this privilege level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Add button                               | Opens the <a href="#">Command Authorization Override Dialog Box</a> , on page 2443. From here you can configure a command authorization definition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Edit button                              | Opens the <a href="#">Command Authorization Override Dialog Box</a> , on page 2443. From here you can edit the command authorization definition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Delete button                            | Deletes the selected command authorization definitions from the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Command Authorization Override Dialog Box

Use the Command Authorization Override dialog box to define which methods to use when authorizing the EXEC commands that are associated with a given privilege. This enables you to authorize all commands associated with a specific privilege level, from 0 to 15.

### Navigation Path

From the [HTTP Page—AAA Tab](#), on page 2441, click the **Add** button beneath the Command Authorization Override table.

| Privilege Level         | The privilege level for which you want to define a command accounting list. Valid values range from 0 to 15.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Prioritized Method List | <p>Defines a sequential list of methods to be used when authorizing a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to authorize users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p>Supported methods include TACACS+, Local, and None.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> |

## Line Access on Cisco IOS Routers

Security Manager enables you to configure command line access (also called EXEC access) to a router using the following methods:

- Console port—Physical connection via a standard RS232 cable for local access. For more information, see:
  - [Defining Console Port Setup Parameters](#), on page 2445
  - [Defining Console Port AAA Settings](#), on page 2446
- VTY lines—Virtual terminal lines for remote access, typically using protocols such as Telnet, SSH, or rlogin. For more information, see:
  - [Defining VTY Line Setup Parameters](#), on page 2447
  - [Defining VTY Line AAA Settings](#), on page 2449

After you configure and deploy these policies, you can use these lines to communicate with individual devices directly when you want to configure or diagnose them using the CLI.

## Defining Console Port Setup Parameters

The console port on a router is generally used for local system access by an administrator with physical access to the device. By default, the console port is set up as follows:

- All permitted users have privileged access to the router, including all configuration commands (privilege level 15).
- The line is disconnected after 10 minutes without user input.
- Incoming connections are not permitted.
- Outgoing connections support Telnet only.

In addition to modifying any of the default settings, you can optionally define the following settings:

- The password for accessing the console.
- Whether to disable all EXEC sessions on the console.
- Incoming and outgoing ACLs that restrict the connections that are permitted on the console.
- Whether VRF connections are permitted on the console.

### Related Topics

- [Line Access on Cisco IOS Routers](#) , on page 2444

---

**Step 1** Do one of the following:

- (Device view) Select **Platform > Device Admin > Device Access > Line Access > Console** from the Policy selector, then click the **Setup** tab in the work area.
- (Policy view) Select **Router Platform > Device Admin > Device Access > Line Access > Console** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Setup** tab.

The Console Setup tab is displayed. See [Table 884: Console Page—Setup Tab](#) , on page 2452 for a description of the fields on this tab.

**Step 2** (Optional) Enter the password for accessing the console port, then enter it again in the Confirm field.

**Step 3** (Optional) Modify the default (15) granted to users of the console port. See [Console Page—Authorization Tab](#) , on page 2454.

**Step 4** (Optional) Select the **Disable all the EXEC sessions to the router via this line** check box to prevent any incoming connections via the console.

**Note** Selecting this option blocks all access to the device via the console port.

**Step 5** (Optional) Modify the default timeout after which the line is disconnected if no user input is detected.

**Note** Setting this value to 0 disables the timeout. Disabling the timeout could compromise the security of your network.

**Step 6** (Optional) Specify which protocols can be used for outbound connections on the console port:

- All—All supported protocols are permitted.
- None—No protocols are permitted.
- Protocol—Enables one or more of the following protocols: SSH, Telnet, and rlogin.

**Note** You must configure AAA authentication on devices where the console port permits the SSH and rlogin protocols. See [Defining Console Port AAA Settings , on page 2446](#).

**Step 7** (Optional) Enter the names of ACLs that restrict incoming and outgoing connections between the device and the addresses in these lists, or click **Select** to select the ACL object or to create a new one. At the top of the selector, in the Type field, select the ACL type as either Standard or Extended.

**Step 8** (Optional) Click the **AAA** tab to define authentication, authorization, and accounting settings for the console port. See [Defining Console Port AAA Settings , on page 2446](#).

## Defining Console Port AAA Settings

By default, authentication, authorization, and accounting are not performed on the console port. When you configure one or more of these access control options, you can either make use of the default method lists defined in the device's AAA policy or define a custom method list containing one or more AAA methods.

### Related Topics

- [Defining Console Port Setup Parameters , on page 2445](#)
- [Line Access on Cisco IOS Routers , on page 2444](#)

**Step 1** Do one of the following:

- (Device view) Select **Platform > Device Admin > Device Access > Line Access > Console** from the Policy selector, then click the **Authentication** tab in the work area.
- (Policy view) Select **Router Platform > Device Admin > Device Access > Line Access > Console** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Authentication** tab.

The Console Authentication tab is displayed.

**Step 2** (Optional) Select the authentication method to perform on users who attempt to access the console line.

See [Table 885: Console Page—Authentication Tab , on page 2454](#) for a description of the fields on the Authentication tab.

**Note** If you select local authentication, preview the full configuration before deployment to make sure that the **aaa new-model** command is not configured by another policy (for example, by configuring a method list in the AAA policy) or is already configured on the device itself.

**Step 3** (Optional) On the Authorization tab, select the authorization method to perform on users who access the console line and begin an EXEC session.

See [Table 886: Console Page—Authorization Tab , on page 2455](#) for a description of the fields on the Authorization tab.

**Note** RADIUS uses the same server for authentication and authorization. Therefore, if you use define a RADIUS method list for authentication, you must define the same method list for authorization.

- Step 4** (Optional) Create command authorization definitions for specific privilege levels:
- Click the **Add** button under the Commands Authorization table. The Command Authorization dialog box is displayed. See [Table 894: Command Authorization Dialog Box—Line Access , on page 2470](#) for details.
  - Configure the command authorization definition as required.
  - Click **OK**. The dialog box closes and the authorization method is displayed in the Commands Authorization table.
  - Repeat [6.a, on page 2447](#) through [6.c, on page 2447](#) to create additional command authorization definitions.
- Step 5** (Optional) On the Accounting tab, select the EXEC and connection accounting methods to perform on users who access the console line.
- See [Table 887: Console Page—Accounting Tab , on page 2456](#) for a description of the fields on this tab.
- Step 6** (Optional) Create command accounting definitions for specific privilege levels:
- Click the **Add** button under the Commands Accounting table. The [Command Accounting Dialog Box—Line Access , on page 2471](#) is displayed.
  - Configure the command accounting definition as required.
  - Click **OK**. The dialog box closes and the accounting method is displayed in the Commands Accounting table.
  - Repeat [6.a, on page 2447](#) through [6.c, on page 2447](#) to create additional command accounting definitions.

---

## Defining VTY Line Setup Parameters

All Cisco IOS routers are configured by default with five VTY lines (labeled 0-4) that have the following settings:

- All permitted users have privileged access to the router, including all configuration commands (privilege level 15).
- VTY lines are disconnected after 10 minutes without user input.
- Incoming connections are not permitted.
- Outgoing connections support Telnet only.

You can use Security Manager to modify the default settings on these five VTY lines or to configure additional lines (up to a maximum of 16). In addition, you can optionally configure the following settings on each line:

- The password for accessing the line.
- Whether to disable all EXEC sessions on the line.
- Incoming and outgoing ACLs that restrict the connections that are permitted on the line.
- Whether VRF connections are permitted on the line.

### Defining Groups of VTY Lines

You can configure multiple VTY lines as a contiguous group, which enables you to define identical settings for all the lines in the group with one procedure. All the lines within the group must fall within one of two ranges, 0-4 or 6-15. The group cannot overlap these two ranges.

The rules for configuring VTY line 5 are as follows. Line 5 can be part of the same definition as lines 0-4 only when there are no lines configured above line 5. If there are lines configured above line 5, you cannot

include line 5 in the definition for lines 0-4, even if their configurations are the same. Line 5 *can* be included in the definition of the lines above line 5 if their configurations are the same.

For example, if lines 0-5 all share one configuration and lines 6-9 have a different configuration, you need to create three definitions—one definition for lines 0-4, a second definition for line 5, and a third definition for lines 6-9.

**Note** When you configure VTY lines, bear in mind that users are assigned a line at random when they connect to the device.

**Note** You can create only one definition per VTY line. An error is displayed if you create a VTY line definition that overlaps an existing definition.

**Note** If you use Security Manager to configure the default VTY lines (0-4), your definition overrides the default settings on the device. If you later delete this definition from Security Manager, the input protocol settings are retained and the other default settings are restored. This ensures that you always have VTY lines available for remote access to the device.

**Note** You can use the CLI or FlexConfigs to configure additional VTY lines on devices that support more than 16 lines.

### Related Topics

- [Line Access on Cisco IOS Routers](#) , on page 2444

### Step 1

Do one of the following:

- (Device view) Select **Platform** > **Device Admin** > **Device Access** > **Line Access** > **VTY** from the Policy selector.
- (Policy view) Select **Router Platform** > **Device Admin** > **Device Access** > **Line Access** > **VTY** from the Policy Type selector. Select an existing policy or create a new one.

The VTY page is displayed. See [Table 888: VTY Lines Page](#) , on page 2459 for a description of the fields on this page.

### Step 2

Click the **Add** button beneath the Lines table, or select a line definition and then click the **Edit** button. The Setup tab of the VTY Lines dialog box is displayed. See [Table 889: VTY Line Dialog Box](#) , on page 2461 for a description of the fields on this tab.

### Step 3

Enter the relative line number of the VTY line. If you are configuring a group of VTY lines, enter the first and last numbers of the group in the fields provided.

### Step 4

(Optional) Enter the password for accessing the console line, then enter it again in the Confirm field.

### Step 5

(Optional) Modify the default Privilege (15) granted to users of this VTY line (or group of lines).

- Step 6** (Optional) Select the **Disable all the EXEC sessions to the router via this line** check box to prevent any incoming connections over this VTY line (or group of lines).
- Step 7** (Optional) Modify the default timeout after which the line is disconnected if no user input is detected.
- Note** Setting this value to 0 to disables the timeout. Disabling the timeout could cause abandoned sessions to block available VTY lines. It can also compromise the security of your network.
- Step 8** (Optional) Specify which protocols can be used for inbound and outbound connections on this VTY line (or group of lines):
- All—All supported protocols are permitted.
  - None—No protocols are permitted.
  - Protocol—Enables one or more of the following protocols: SSH, Telnet, and rlogin.
- Caution** Setting the inbound connections setting to None might prevent Security Manager from connecting to the device after deployment.
- Note** You must configure AAA authentication when the VTY line permits the SSH and rlogin protocols. See [Defining VTY Line AAA Settings , on page 2449](#).
- Step 9** (Optional) Enter the names of ACLs that restrict incoming and outgoing connections between the device and the addresses in these lists, or click **Select** to select an ACL object from a list or to create a new one. You can choose from standard or extended ACLs.
- Tip** Defining an inbound ACL is a good way to reserve a VTY line for administrative access only.
- Step 10** (Optional) Click the **AAA** tab to define authentication, authorization, and accounting settings for this VTY line (or group of lines). See [Defining VTY Line AAA Settings , on page 2449](#).
- Step 11** Click **OK** to save your definitions locally on the client and close the dialog box. Your definitions are displayed in the Lines table.
- Note** To remove a VTY line definition, select it, then click **Delete**. If you delete a VTY line from an IOS device, any subsequent lines are also deleted. For example, if the device contains lines 0-9 and you delete line 5, lines 6-9 are deleted as well. If you delete the definition for lines 0-4 from Security Manager, the router retains the inbound protocol definition and restores the other default settings for these lines on the device. This ensures that five VTY lines are always available.

---

## Defining VTY Line AAA Settings

By default, authentication, authorization, and accounting are not performed on VTY lines. When you configure one or more of these access control options, you can either make use of the default method lists defined in the device's AAA policy or define a custom method list containing one or more AAA methods.

### Before You Begin

- Define the basic parameters of the VTY line or group of VTY lines. See [Defining VTY Line Setup Parameters , on page 2447](#).

### Related Topics

- [Defining VTY Line Setup Parameters , on page 2447](#)

- [Line Access on Cisco IOS Routers](#) , on page 2444

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Device Admin > Device Access > Line Access > VTY** from the Policy selector.
  - (Policy view) Select **Router Platform > Device Admin > Device Access > Line Access > VTY** from the Policy Type selector. Select an existing policy or create a new one.

The VTY page is displayed. See [Table 888: VTY Lines Page](#) , on page 2459 for a description of the fields on this page.

- Step 2** Select a VTY line definition in the Lines tables, click the **Edit** button to display the VTY Line dialog box, then click the **Authentication** tab.

- Step 3** (Optional) Select the authentication method to perform on users who attempt to access the VTY line.

See [Table 891: VTY Line Dialog Box—Authentication Tab](#) , on page 2465 for a description of the fields on this tab.

**Note** If you select local authentication, preview the full configuration before deployment to make sure that the **aaa new-model** command is not configured by another policy (for example, by configuring a method list in the AAA policy) or is already configured on the device itself.

- Step 4** (Optional) On the Authorization tab, select the authorization method to perform on users who access the VTY line and begin an EXEC session.

See [Table 892: VTY Line Dialog Box—Authorization Tab](#) , on page 2466 for a description of the fields on the Authorization tab.

**Note** RADIUS uses the same server for authentication and authorization. Therefore, if you use define a RADIUS method list for authentication, you must define the same method list for authorization.

- Step 5** (Optional) Create command authorization definitions for specific privilege levels:

- Click the **Add** button under the Commands Authorization table. The [Command Authorization Override Dialog Box](#) , on page 2443 is displayed.
- Configure the command authorization definition as required.
- Click **OK**. The dialog box closes and the authorization method is displayed in the Commands Authorization table.
- Repeat [5.a, on page 2450](#) through [5.c, on page 2450](#) to create additional command authorization definitions.

- Step 6** (Optional) On the Accounting tab, select the EXEC and connection accounting methods to perform on users who attempt to access the VTY line.

See [Table 893: VTY Line Dialog Box—Accounting Tab](#) , on page 2467 for a description of the fields on the Accounting tab.

- Step 7** (Optional) Create command accounting definitions for specific privilege levels:

- Click the **Add** button under the Commands Accounting table. The [Command Accounting Dialog Box—Line Access](#) , on page 2471 is displayed.
  - Configure the command accounting definition as required.
  - Click **OK**. The dialog box closes and the accounting method is displayed in the Commands Accounting table.
  - Repeat [7.a, on page 2450](#) through [7.c, on page 2450](#) to create additional command accounting definitions.
-

# Console Policy Page

Use the Console page to configure access to the router over the console port. You can configure console policies on a Cisco IOS router from the following tabs on the Console policy page:

- [Console Page—Setup Tab](#) , on page 2451
- [Console Page—Authentication Tab](#) , on page 2453
- [Console Page—Authorization Tab](#) , on page 2454
- [Console Page—Accounting Tab](#) , on page 2456

For more information, see [Line Access on Cisco IOS Routers](#) , on page 2444.

## Navigation Path

- (Device view) Select **Platform** > **Device Admin** > **Device Access** > **Line Access** > **Console** from the Policy selector.
- (Policy view) Select **Router Platform** > **Device Admin** > **Device Access** > **Line Access** > **Console** from the Policy Type selector. Right-click **Console** to create a policy, or select an existing policy from the Shared Policy selector.

Table 884: Console Page—Setup Tab

| Element                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Password                                                  | <p>The password for accessing the console port.</p> <p>The password is case sensitive and can contain up to 80 alphanumeric characters. The first character cannot be a number. Spaces are not allowed.</p> <p>Enter the password again in the Confirm field.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Privilege Level                                           | <p>The privilege level assigned to users connected to the console port. Valid values range from 0 to 15:</p> <ul style="list-style-type: none"> <li>• 0—Grants access to these commands only: <b>disable</b>, <b>enable</b>, <b>exit</b>, <b>help</b>, and <b>logout</b>.</li> <li>• 1—Enables nonprivileged access to the router (normal EXEC-mode use privileges).</li> <li>• 15—Enables privileged access to the router (traditional enable privileges).</li> </ul> <p><b>Note</b> Levels 2-14 are not normally used in a default configuration, but custom configurations can be created by moving commands that are normally at level 15 to a lower level and commands that are normally at level 1 to a higher level. You can configure the privilege levels of commands using the CLI or by defining a FlexConfig.</p> <p><b>Note</b> If you do not define a value, level 1 is assigned by default. This value does not appear in the device configuration.</p> |
| Disable all the EXEC sessions to the router via this line | <p>When selected, disables EXEC sessions over this line. Select this option when you want to allow only an outgoing connection on the console. This option is useful for keeping the console port free from unsolicited incoming data that can tie up the line.</p> <p>When deselected, EXEC sessions are enabled on the console port. This is the default.</p> <p><b>Note</b> Selecting this option blocks all access to the device via the console port.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Exec Timeout                                              | <p>The amount of time (in seconds) that the EXEC command interpreter waits to detect user input on the console port. If no input is detected, the line is disconnected. Valid values range from 0 to 2147483. The default is 600 (10 minutes). Setting the value to 0 disables the timeout.</p> <p><b>Note</b> Although the timeout is defined in seconds, it appears in the CLI in the format [mm ss].</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Element                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Output Protocols                 | <p>The protocols that you can use for outgoing connections on the console port:</p> <ul style="list-style-type: none"> <li>• All—All supported protocols are permitted. Supported protocols include LAT, MOP, NASL, PAD, rlogin, SSH, Telnet, and V.120.</li> <li>• None—No protocols are permitted. This makes the port unusable by outgoing connections.</li> <li>• Protocol—Enables one or more of the following protocols: <ul style="list-style-type: none"> <li>• SSH—Secure Shell protocol.</li> <li>• Telnet—Standard TCP/IP terminal emulation protocol.</li> <li>• rlogin—UNIX rlogin protocol.</li> </ul> </li> </ul> <p><b>Note</b> SSH and rlogin require that you configure AAA authentication. See <a href="#">Console Page—Authentication Tab , on page 2453</a>.</p> <p><b>Note</b> Not all IOS Software Versions support rlogin as an output protocol.</p> |
| Inbound Access List              | The name of the ACL object that restricts incoming connections on the console port. Enter the name of the ACL object, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Permit VRF Interface Connections | Applies only when an inbound ACL is defined on the console port. When selected, accepts incoming connections from interfaces that belong to a VRF. When deselected, rejects incoming connections from interfaces that belong to a VRF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Outbound Access List             | The name of the ACL object that restricts outgoing connections on the console port. Enter the name of an ACL object, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Console Page—Authentication Tab

Use the Authentication tab of the Console page to define the AAA authentication methods to perform on users who attempt to access the console port.

### Navigation Path

Go to the [Console Policy Page , on page 2451](#), then click the **Authentication** tab.

**Table 885: Console Page—Authentication Tab**

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authenticate Using      | <p>Authentication settings for the console port:</p> <ul style="list-style-type: none"> <li>• None—Authentication is not performed. This is the default.</li> <li>• Local Database—Uses the local username database for authentication.</li> <li>• AAA Policy Default List—Uses the default authentication method list that is defined in the device's AAA policy. See <a href="#">AAA Page—Authentication Tab</a> , on page 2415.</li> <li>• Custom Method List—Uses the authentication methods specified in the Authentication Method List field.</li> </ul> <p><b>Note</b> If you select local authentication, preview the full configuration before deployment to make sure that the <b>aaa new-model</b> command is not configured by another policy (for example, by configuring a method list in the AAA policy) or is already configured on the device itself.</p> |
| Prioritized Method List | <p>Applies only when Custom Method List is selected as the authentication method.</p> <p>Defines a sequential list of methods to be queried when authenticating a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to authenticate users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p>                                                       |

## Console Page—Authorization Tab

Use the Authorization tab of the Console page to define the EXEC and command authorization methods to perform on users who access the console port.

**Note** You must enable AAA services on the router to use this feature; otherwise, deployment will fail. See [Defining AAA Services](#) , on page 2412.

### Navigation Path

Go to the [Console Policy Page](#) , on page 2451, then click the **Authorization** tab.

| Authorize EXEC Operations Using | <p>The authorization method that determines whether a user is allowed to run an EXEC session:</p> <ul style="list-style-type: none"> <li>• None—Authorization is not performed. This is the default.</li> <li>• AAA Policy Default List—Uses the default authorization method list that is defined in the device's AAA policy. See <a href="#">AAA Page—Authorization Tab</a> , on page 2416.</li> <li>• Custom Method List—Uses the authorization methods specified in the EXEC Method List field.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Prioritized Method List         | <p>Applies only when Custom Method List is selected as the EXEC method.</p> <p>Defines a sequential list of methods to be queried when authorizing a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to authorize users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> <p><b>Note</b> RADIUS uses the same server for authentication and authorization. Therefore, if you use define a RADIUS method list for authentication, you must define the same method list for authorization.</p> |

| Edit button   | Opens the <a href="#">Command Authorization Dialog Box—Line Access</a> , on page 2470. From here you can edit the command authorization definition. |
| Delete button | Deletes the selected command authorization definitions from the table.                                                                              |

## Console Page—Accounting Tab

Use the Accounting tab of the Console page to define the EXEC, connection, and command accounting methods to perform on users who access the console port.

---

**Note** You must enable AAA services on the router to use this feature; otherwise, deployment will fail. See [Defining AAA Services](#), on page 2412.

---

### Navigation Path

Go to the [Console Policy Page](#), on page 2451, then click the **Accounting** tab.

| Element                         | Description                                                                                                                                      |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| Privilege Level                 | The privilege level to which the command authorization definition applies.                                                                       |
| Generate Accounting Records for | The points in the process where the device sends an accounting notice to the accounting server.                                                  |
| Enable Broadcast                | Whether accounting records are broadcast to multiple servers simultaneously.                                                                     |
| Prioritized Method List         | The method list to use when authorizing users with this privilege level.                                                                         |
| Add button                      | Opens the <a href="#">Command Accounting Dialog Box—Line Access</a> , on page 2471. From here you can configure a command accounting definition. |
| Edit button                     | Opens the <a href="#">Command Accounting Dialog Box—Line Access</a> , on page 2471. From here you can edit the command accounting definition.    |
| Delete button                   | Deletes the selected command accounting definitions from the table.                                                                              |

## VTY Policy Page

Use the VTY page to configure up to 16 VTY lines for remote access to the router. In addition to configuring individual lines, you can configure a group of lines that share the same definition.

For more information, see [Line Access on Cisco IOS Routers](#), on page 2444.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > Line Access > VTY** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Device Access > Line Access > VTY** from the Policy Type selector. Right-click **VTY** to create a policy, or select an existing policy from the Shared Policy selector.

### Field Reference

*Table 888: VTY Lines Page*

| Element | Description                                                                                                                |
|---------|----------------------------------------------------------------------------------------------------------------------------|
| Line    | The relative line number of the VTY line. This field may also contain multiple VTY lines configured as a contiguous group. |

| Element                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Line/Line Group Parameters |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Input Protocols            | The protocols that you can use for incoming connections on the VTY line.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Output Protocols           | The protocols that you can use for outgoing connections on the VTY line.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Privilege Level            | The privilege level assigned to users.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Exec Timeout               | The amount of time the EXEC command interpreter waits until user input is detected.                                                                                                                                                                                                                                                                                                                                                                                                                |
| Inbound ACL                | The ACL used to limit inbound traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Outbound ACL               | The ACL used to limit outbound traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Authentication             | The type of AAA authentication used.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Authorization              | The types of AAA authorization used.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Accounting                 | The types of AAA accounting used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| VTY Line Page Buttons      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Add button                 | Opens the <a href="#">VTY Line Dialog Box</a> , on page 2460. From here you can define a VTY line or line group.                                                                                                                                                                                                                                                                                                                                                                                   |
| Edit button                | Opens the <a href="#">VTY Line Dialog Box</a> , on page 2460. From here you can edit the VTY line or line group.                                                                                                                                                                                                                                                                                                                                                                                   |
| Delete button              | <p>Deletes the selected VTY lines from the table.</p> <p>If you delete a VTY line from an IOS device, any subsequent lines are also deleted. For example, if the device contains lines 0-9 and you delete line 5, lines 6-9 are deleted as well.</p> <p><b>Note</b> If you delete any of the default VTY lines (0-4) on the device, the input protocol settings are retained and the other default settings are restored. This helps prevent you from cutting off remote access to the device.</p> |

## VTY Line Dialog Box

Use the VTY Line dialog box to configure one or more VTY lines (up to 16) that enable remote users to access the router. When you configure a VTY line, you can define the type of authentication and authorization to perform on users who access the lines.

### Navigation Path

Go to the [VTY Policy Page](#) , on page 2459, then click the **Add** or **Edit** button beneath the table.

| Element            | Description                                                                                                                                                    |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Setup tab          | Defines the basic configuration of the VTY line or line group. See <a href="#">VTY Line Dialog Box—Setup Tab</a> , on page 2461.                               |
| Authentication tab | Defines the type of AAA authentication to perform on users who access the VTY line. See <a href="#">VTY Line Dialog Box—Authentication Tab</a> , on page 2464. |
| Authorization tab  | Defines the types of AAA authorization to perform on users who access the VTY line. See <a href="#">VTY Line Dialog Box—Authorization Tab</a> , on page 2465.  |
| Accounting tab     | Defines the types of AAA accounting to perform on users who access the VTY line. See <a href="#">VTY Line Dialog Box—Accounting Tab</a> , on page 2467.        |

## VTY Line Dialog Box—Setup Tab

Use the Setup tab of the VTY Line dialog box to define the basic parameters of the VTY line. This includes the password for accessing the line, the privilege level assigned to users, the protocols that are permitted on the line, and the ACLs that limit access.

### Navigation Path

Go to the [VTY Line Dialog Box](#) , on page 2460, then click the **Setup** tab.

| Element                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Starting VTY Line Number                                  | <p>The relative line number of the VTY line. If you are configuring a group of VTY lines, enter the number of the first line in the group. Valid values range from 0 to 15.</p> <p><b>Note</b> Although different routers support a different number of VTY lines (from four to several thousand), Security Manager supports a maximum of 16 lines per device. You cannot configure the same line number more than once.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Ending VTY Line Number                                    | <p>Applies only when configuring a group of lines.</p> <p>The relative line number of the last VTY line in the group.</p> <p><b>Note</b> When you configure a group of lines, all the lines in the group must fall within one of two ranges, 0-4 or 6-15.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Password                                                  | <p>The password for accessing this VTY line.</p> <p>The password is case sensitive and can contain up to 80 alphanumeric characters. The first character cannot be a number. Spaces are not allowed.</p> <p>Enter the password again in the Confirm field.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Privilege Level                                           | <p>The privilege level assigned to users on this VTY line. Valid values range from 0 to 15:</p> <ul style="list-style-type: none"> <li>• 0—Grants access to these commands only: <b>disable</b>, <b>enable</b>, <b>exit</b>, <b>help</b>, and <b>logout</b>.</li> <li>• 1—Enables nonprivileged access to the router (normal EXEC-mode use privileges).</li> <li>• 15—Enables privileged access to the router (traditional enable privileges).</li> </ul> <p><b>Note</b> Levels 2-14 are not normally used in a default configuration, but custom configurations can be created by moving commands that are normally at level 15 to a lower level and commands that are normally at level 1 to a higher level. You can configure the privilege levels of commands using the CLI or by defining a FlexConfig.</p> <p><b>Note</b> If you do not define a value, level 1 is assigned by default. This value does not appear in the device configuration.</p> |
| Disable all the EXEC sessions to the router via this line | <p>When selected, EXEC sessions are disabled over this line. Select this option when you want to allow only an outgoing connection on this line. This option is useful for keeping a particular line free from unsolicited incoming data that can tie up the line.</p> <p>When deselected, EXEC sessions are enabled over this line. This is the default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Exec Timeout     | <p>The amount of time (in seconds) that the EXEC command interpreter waits to detect user input on the line. If no input is detected, the line is disconnected. Valid values range from 0 to 2147483. The default is 600 (10 minutes). Setting the value to 0 disables the timeout.</p> <p><b>Note</b> Although the timeout is defined in seconds, it appears in the CLI in the format [mm ss].</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Input Protocols  | <p>The protocols that you can use for incoming connections on this line:</p> <ul style="list-style-type: none"> <li>• All—All supported protocols are permitted. Supported protocols include LAT, MOP, NASI, PAD, rlogin, SSH, Telnet, and V.120.</li> <li>• None—No protocols are permitted. This makes the port unusable by incoming SSH, Telnet, and rlogin connections.</li> </ul> <p><b>Note</b> Setting the input protocols setting to None might prevent Security Manager from connecting to the device after deployment. The device can still be managed using SSL, if SSL is enabled in the HTTP policy. See <a href="#">HTTP Page—Setup Tab , on page 2440</a>.</p> <ul style="list-style-type: none"> <li>• Protocol—Enables one or more of the following protocols: <ul style="list-style-type: none"> <li>• SSH—Secure Shell protocol.</li> <li>• Telnet—Standard TCP/IP terminal emulation protocol.</li> <li>• rlogin—UNIX rlogin protocol.</li> </ul> </li> </ul> <p><b>Note</b> SSH and rlogin require that you configure AAA authentication. See <a href="#">VTY Line Dialog Box—Authentication Tab , on page 2464</a>.</p> <p><b>Note</b> Not all IOS Software Versions support rlogin as an input protocol.</p> |
| Output Protocols | <p>The protocols that you can use for outgoing connections on this line:</p> <ul style="list-style-type: none"> <li>• All—All supported protocols are permitted. Supported protocols include LAT, MOP, NASI, PAD, rlogin, SSH, Telnet, and V.120.</li> <li>• None—No protocols are permitted. This makes the port unusable by outgoing connections.</li> <li>• Protocol—Enables one or more of the following protocols: <ul style="list-style-type: none"> <li>• SSH—Secure Shell protocol.</li> <li>• Telnet—Standard TCP/IP terminal emulation protocol.</li> <li>• rlogin—UNIX rlogin protocol.</li> </ul> </li> </ul> <p><b>Note</b> SSH and rlogin require that you configure AAA authentication. See <a href="#">VTY Line Dialog Box—Authentication Tab , on page 2464</a>.</p> <p><b>Note</b> Not all IOS Software Versions support rlogin as an output protocol.</p>                                                                                                                                                                                                                                                                                                                                                        |

| Element                          | Description                                                                                                                                                                                                                                 |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inbound Access List              | The name of the ACL object that restricts incoming connections on this line. Enter the name of the ACL object, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it. |
| Permit VRF Interface Connections | Applies only when an inbound ACL is defined on this line.<br>When selected, accepts incoming connections from interfaces that belong to a VRF.<br>When deselected, rejects incoming connections from interfaces that belong to a VRF.       |
| Outbound Access List             | The name of the ACL object that restricts outgoing connections on this line. Enter the name of the ACL object, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it. |

## VTY Line Dialog Box—Authentication Tab

Use the Authentication tab of the VTY Line dialog box to define the authentication methods to perform on users who attempt to access the selected VTY line or group of lines.

### Navigation Path

Go to the [VTY Line Dialog Box](#) , on page 2460, then click the **Authentication** tab.

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authenticate Using      | <p>Authentication settings for the VTY line:</p> <ul style="list-style-type: none"> <li>• None—Authentication is not performed. This is the default.</li> <li>• Local Database—Uses the local username database for authentication.</li> <li>• AAA Policy Default List—Uses the default authentication method list that is defined in the device's AAA policy. See <a href="#">AAA Page—Authentication Tab</a> , on page 2415.</li> <li>• Custom Method List—Uses the authentication methods specified in the Prioritized Method List field.</li> </ul> <p><b>Note</b> If you select local authentication, preview the full configuration before deployment to make sure that the <b>aaa new-model</b> command is not configured by another policy (for example, by configuring a method list in the AAA policy) or is already configured on the device itself.</p> |
| Prioritized Method List | <p>Applies only when Custom Method List is selected as the authentication method.</p> <p>Defines a sequential list of methods to be queried when authenticating a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to authenticate users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p>                                                |

## VTY Line Dialog Box—Authorization Tab

Use the Authorization tab of the VTY Line dialog box to define the EXEC and command authorization methods to perform on users who access the selected VTY line or group of lines.

**Note** You must enable AAA services on the router to use this feature; otherwise, deployment will fail. See [Defining AAA Services](#) , on page 2412.

### Navigation Path

Go to the [VTY Line Dialog Box](#) , on page 2460, then click the **Authorization** tab.

| Edit button   | Opens the <a href="#">Command Authorization Dialog Box—Line Access</a> , on page 2470. From here you can edit the command authorization definition. |
| Delete button | Deletes the selected command authorization definitions from the table.                                                                              |

## VTY Line Dialog Box—Accounting Tab

Use the Accounting tab of the VTY Line dialog box to define the EXEC, connection, and command accounting methods to perform on users who access the selected VTY line or group of lines.

**Note** You must enable AAA services on the router to use this feature; otherwise, deployment will fail. See [Defining AAA Services](#) , on page 2412.

### Navigation Path

Go to the [VTY Line Dialog Box](#) , on page 2460, then click the **Accounting** tab.

| Delete button                   | Deletes the selected command accounting definitions from the table.                                                                              |

## Command Authorization Dialog Box—Line Access

Use the Command Authorization dialog box to define which methods to use when authorizing the EXEC commands that are associated with a given privilege. This enables you to authorize all commands associated with a specific privilege level, from 0 to 15.

### Navigation Path

From the [Console Page—Authorization Tab](#), on page 2454 or the [VTY Line Dialog Box—Authorization Tab](#), on page 2465, click the **Add** button beneath the Command Authorization table.

|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Prioritized Method List | <p>Applies only when the Custom Method List option is selected.</p> <p>Defines a sequential list of methods to be queried when authorizing a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to authorize users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> |

## Command Accounting Dialog Box—Line Access

Use the Command Accounting dialog box to define which methods to use when recording information about the EXEC commands that are executed for a given privilege. Each accounting record includes a list of the commands executed for that privilege level, as well as the date and time each command was executed, and the name of the user who executed it.

### Navigation Path

From the [Console Page—Accounting Tab](#), on page 2456 or the [VTY Line Dialog Box—Accounting Tab](#), on page 2467, click the **Add** button beneath the Command Accounting table.

| Enable Broadcast to Multiple Servers | <p>Applies only when Custom Method List is selected.</p> <p>When selected, enables the sending of accounting records to multiple AAA servers. Accounting records are sent simultaneously to the first server in each AAA server group defined in the method list. If the first server is unavailable, failover occurs using the backup servers defined within that group.</p> <p>When deselected, accounting records are sent only to the first server in the first AAA server group defined in the method list.</p>                                                                                                                                                                                                                                                                                                        |

## Optional SSH Settings on Cisco IOS Routers

Secure Shell (SSH) is an application and a protocol that uses encryption to provide secure communication between a client and server. You can use SSH to connect remotely to a Cisco IOS router over a VTY line and establish an EXEC session. SSH is the recommended replacement for other protocols, such as Telnet and rlogin, in environments where security is a concern.

All Cisco IOS routers are required to have SSH configured before they can be added to Security Manager. This is because Security Manager uses SSH (in addition to SSL) to communicate with them. The SSH policy provides a way to modify selected default settings and configure selected optional settings.

### Related Topics

- [Defining Optional SSH Settings](#) , on page 2473
- [Understanding Device Communication Requirements](#) , on page 55

- [Setting Up SSH , on page 60](#)

## Defining Optional SSH Settings

SSH is configured by default with the following settings:

- Both SSH version 1 and SSH version 2 are supported.
- The negotiation phase is terminated if not completed successfully after 120 seconds.
- The router tries 3 times to authenticate SSH clients before disconnecting.

You can use Security Manager to modify these default settings and optionally configure the following settings:

- The source interface for SSH packets.
- The name of the RSA key pair to use.
- Whether to regenerate the key during the next deployment.

### Before You Begin

- Make sure that SSH is enabled on the router. See [Understanding Device Communication Requirements , on page 55](#).
- Make sure that the VTY lines on the router allow inbound SSH traffic. See [Defining VTY Line Setup Parameters , on page 2447](#).
- Make sure that a hostname and domain name are configured on the router (unless you plan to use a different RSA key pair). You can use the CLI or the Hostname policy in Security Manager for this purpose. See [Hostnames and Domain Names on Cisco IOS Routers , on page 2487](#).

### Related Topics

- [Optional SSH Settings on Cisco IOS Routers , on page 2472](#)
- [Setting Up SSH , on page 60](#)

---

### Step 1

Do one of the following:

- (Device view) Select **Platform > Device Admin > Device Access > Secure Shell** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Device Access > Secure Shell** from the Policy Type selector. Select an existing policy or create a new one.

The Secure Shell page is displayed. See [Secure Shell Policy Page , on page 2474](#) for a description of the fields on this page.

### Step 2

(Optional) Modify the following default settings:

- a) The version of SSH to support.
- b) The timeout for completing the negotiation phase of the SSH connection.
- c) The number of times to attempt authentication of the SSH client.

**Step 3** (Optional) In the Source Interface field, enter the name of the interface or interface role whose address should be used as the source interface for all SSH packets sent to SSH clients, or click **Select** to select an interface role object from a list or to create a new one. The source interface must have an IP address.

If you do not enter a value in this field, the address of the closest interface to the destination is used.

**Step 4** (Optional) Enter the name of the RSA key pair to use for SSH connections. If you do not enter a value in this field, the router uses the key pair that is based on the hostname and domain name.

**Tip** Use the CLI command `show crypto key mypubkey rsa` to display the names and values of each key pair configured on the device.

**Step 5** (Optional) Select the **Regenerate Key During Deployment** check box if you want the router to regenerate the RSA key pair used for SSH. This option is useful if you believe that the secrecy of the keys might be compromised. Enter the size of the modulus to use to regenerate the keys.

**Note** You must remember to return to this policy after deployment to deselect the check box. If you do not do this, a new key is generated during each deployment.

**Note** This option requires interaction with the device during deployment. Therefore, you should use it only when deploying to live devices, not when deploying to a file.

**Note** A key pair must already exist on the device *before* you select this option; otherwise, deployment will fail. (This will typically be the case, since IOS routers must have SSH enabled to be added to Security Manager.)

## Secure Shell Policy Page

Use the Secure Shell page to change the default SSH settings on the router and to define additional optional settings, if required.

For more information, see [Optional SSH Settings on Cisco IOS Routers](#) , on page 2472.

**Note** You must configure SSH on the device using CLI commands before adding the device to Security Manager. This is because Security Manager uses SSH (as well as SSL) to communicate with Cisco IOS routers. For more information, see [Setting Up SSH](#) , on page 60.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > Secure Shell** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Device Access > Secure Shell** from the Policy Type selector. Right-click **Secure Shell** to create a policy, or select an existing policy from the Shared Policy selector.

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SSH Version            | <p>The version of SSH to use when connecting to the router:</p> <ul style="list-style-type: none"> <li>• 1 and 2—SSH version 1 and SSH version 2. This is the default.</li> <li>• 1—SSH version 1 only.</li> <li>• 2—SSH version 2 only.</li> </ul>                                                                                                                                                                      |
| Timeout                | <p>The amount of time the router should wait for the SSH client to respond during the negotiation phase before disconnecting. The default value (and the maximum) is 120 seconds.</p> <p><b>Note</b> After negotiation finishes and the EXEC session begins, the timeout configured for the VTY line applies. See <a href="#">VTY Line Dialog Box—Setup Tab</a> , on page 2461.</p>                                      |
| Authentication Retries | <p>The number of times the router attempts to authenticate SSH clients. Valid values range from 0 to 5. The default is 3.</p>                                                                                                                                                                                                                                                                                            |
| Source Interface       | <p>The source address for all SSH packets sent to the SSH client.</p> <p>If you do not define a value in this field, the address of the closest interface to the destination (that is, the output interface through which SSH packets are sent) is used.</p> <p>Enter the name of an interface or interface role, or click <b>Select</b> to select the object from a list or to create a new one.</p>                    |
| RSA Key Pair           | <p>The name of the RSA key pair to use for SSH connections.</p> <p>If you do not enter a value, the router uses the RSA key pair generated from its hostname and domain name. This is the default.</p> <p><b>Tip</b> Use the CLI command <b>show crypto key mypubkey rsa</b> to display the names and values of each key pair configured on the device. These are the valid names that can be entered in this field.</p> |

| Element                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Regenerate Key During Deployment | <p>When selected, regenerates the RSA key pair on the router during the next deployment. This option is useful if you are concerned that the secrecy of the keys might be compromised.</p> <p>When deselected, a new key pair is not generated.</p> <p><b>Note</b> This check box is <i>not</i> deselected automatically after deployment. If you do not return to this policy to deselect the check box, the key is regenerated each time you deploy.</p> <p><b>Note</b> This option requires interaction with the device during deployment. Therefore, you should use it only when deploying to live devices, not when deploying to a file.</p> <p><b>Note</b> A key pair must already exist on the device <i>before</i> you select this option; otherwise, deployment will fail. (This will typically be the case, since IOS routers must have SSH enabled in order to be added to Security Manager.)</p> |
| Modulus Size                     | <p>Applies only when the Regenerate Key check box is selected.</p> <p>The size of the modulus used to generate a new key pair. A larger modulus is more secure but takes longer to generate. Valid values range from 360 to 2048 bits. The default is 1024 bits.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## SNMP on Cisco IOS Routers

Simple Network Management Protocol (SNMP) defines a standard way for network management stations or workstations to monitor the health and status of many types of devices, including switches, routers, and firewall devices. It comprises a protocol, a database-structure specification, and a set of management data objects. Each SNMP device or member is part of a *community*, which determines the access that each device has (read-only or read-write).

SNMP obtains information from the managed device through a Management Information Base (MIB). The MIB is a database of code blocks called MIB objects, each of which controls one specific function. The MIB object comprises MIB variables, which define the MIB object name, description, default value, and so forth. MIB objects are structured hierarchically in a MIB tree.

SNMP policies enable you to configure the behavior of the SNMP agent running on the router. The agent sends unsolicited information back to the SNMP host as events occur. These unsolicited messages, which are generated in response to significant, predetermined events on the router, are called traps.

The following topics describe the tasks you perform to create SNMP policies on Cisco IOS routers:

- [Defining SNMP Agent Properties](#), on page 2476
- [Enabling SNMP Traps](#), on page 2478

## Defining SNMP Agent Properties

When you define the properties of the SNMP agent, you must define the community string and community string type, as well as the address and properties of the SNMP host that receives the traps.

SNMP community strings are embedded passwords to MIBs, which store data about the router's operation and are meant to be available to authenticated remote users. Two types of community strings exist: "public" community strings, which provide read-only access to all objects in the MIB (except community strings themselves), and "private" community strings, which provide read-write access to all objects in the MIB (except community strings).

SNMP hosts receive the traps generated by the router. You must define the address, password, and port number for accessing the SNMP host, as well as the SNMP version being used. Security Manager supports SNMP version 1, version 2c (also called "community-based SNMP") and version 3, which offers authentication and encryption.

#### Related Topics

- [SNMP on Cisco IOS Routers](#) , on page 2476

---

#### Step 1

Do one of the following:

- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Device Access > SNMP** from the Policy Type selector. Select an existing policy or create a new one.

The SNMP page is displayed. See [Table 897: SNMP Page](#) , on page 2479 for a description of the fields on this page.

#### Step 2

Define the community string needed to access the MIB:

- Under Permissions, click **Add** to display the Permission dialog box.
- Define the string. See [Table 898: Permission Dialog Box](#) , on page 2480 for a description of the available fields.
- Click **OK** to save your definitions locally on the client and close the dialog box. Your definitions are displayed in the Permissions table.

**Note** A warning is displayed if you attempt to edit or delete a community string that is in use by an SNMP host. If you continue with the operation, the device creates a private, read-only string that matches the definition for the host in the Trap Receiver table.

#### Step 3

Define the SNMP host that receives the traps generated by the SNMP agent:

- Under Trap Receiver, click **Add** to display the Trap Receiver dialog box.
- Define the host. See [Trap Receiver Dialog Box](#) , on page 2481 for a description of the available fields.
- Click **OK** to save your definitions locally on the client and close the dialog box. Your definitions are displayed in the Trap Receiver table.

#### Step 4

Under SNMP Server Properties, enter the location and contact information for the administrator responsible for routers configured with this SNMP policy.

This definition, which is text-only and does not affect the operation of the router, provides useful information to the manager of the SNMP host when the manager investigates a particular trap.

#### Step 5

Click **Configure Traps** to display the SNMP Traps dialog box, which is used to select which traps to enable on the router. For more information, see [Enabling SNMP Traps](#) , on page 2478.

---

## Enabling SNMP Traps

The router immediately sends notifications, also called SNMP traps, to the designated SNMP host (management station) when a defined condition occurs, such as a link up, link down, or a syslog event.

To enable SNMP traps, select the check box next to each relevant trap. Certain check boxes activate multiple, related traps.

---

**Note** Each trap that you enable consumes system resources. To lessen the impact on system performance, select only those traps that you need for network monitoring.

---

### Related Topics

- [SNMP on Cisco IOS Routers](#) , on page 2476

---

**Step 1** Open the SNMP page for defining SNMP server policies on Cisco IOS routers, as described in [Defining SNMP Agent Properties](#) , on page 2476.

**Step 2** On the SNMP page, click **Configure Traps**. The SNMP Traps dialog box is displayed.

**Step 3** Select the check box next to each type of trap to enable. The traps are divided into the following four categories:

- Standard SNMP traps (for example, Authentication, Cold Start, and Warm Start).
- ISAKMP traps (related to Phase 1 of the IPsec process).
- IPsec traps (related to Phase 2 of the IPsec process).
- Other traps (includes syslog messages, protocol-related notifications, and CPU usage warnings).

See [Table 900: SNMP Traps Dialog Box](#) , on page 2483 for a description of the available traps.

**Note** You must add command-line interface (CLI) commands to fully implement the IP multicast and CPU traps. One method available for entering these commands is by using FlexConfigs. See [Understanding FlexConfig Policies and Policy Objects](#) , on page 340.

**Tip** Click **Select All** to enable all traps displayed in the dialog box or **Deselect All** to disable all the traps.

**Step 4** Click **OK** to save your definitions locally on the client and close the dialog box.

**Tip** To configure SNMP traps not included in this dialog box, define a FlexConfig.

---

## SNMP Policy Page

Use the SNMP page to configure the parameters necessary to send traps from the router to a designated SNMP host. These traps are unsolicited messages that notify the SNMP host of important events occurring on the router.

For more information, see [Defining SNMP Agent Properties](#) , on page 2476.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Device Access > SNMP** from the Policy Type selector. Right-click **SNMP** to create a policy, or select an existing policy from the Shared Policy selector.

*Table 897: SNMP Page*

| Element                       | Description                                                                                                                                                |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Permissions table             |                                                                                                                                                            |
| Community String              | The community string used for accessing the router's MIB.                                                                                                  |
| Type                          | The community string type—read-only or read-write.                                                                                                         |
| ACL                           | The standard ACL that defines the IP addresses permitted to access the router's MIB.                                                                       |
| Add button                    | Opens the <a href="#">Permission Dialog Box</a> , on page 2480. From here you can enter the community string and type required to generate traps.          |
| Edit button                   | Opens the <a href="#">Permission Dialog Box</a> , on page 2480. From here you can edit the selected permissions profile.                                   |
| Delete button                 | Deletes the selected permissions profiles from the table.                                                                                                  |
| Trap Receiver table           |                                                                                                                                                            |
| Host IP Address               | The IP address of the SNMP host receiving the traps generated by the router.                                                                               |
| SNMP Version                  | The SNMP version being used by the router.                                                                                                                 |
| UDP Port                      | The UDP port that is being used by the SNMP host.                                                                                                          |
| Add button                    | Opens the <a href="#">Trap Receiver Dialog Box</a> , on page 2481. From here you can define the SNMP host that receives the traps generated by the router. |
| Edit button                   | Open the <a href="#">Trap Receiver Dialog Box</a> , on page 2481. From here you can edit the selected SNMP host.                                           |
| Delete button                 | Deletes the selected SNMP hosts from the table.                                                                                                            |
| Additional fields and buttons |                                                                                                                                                            |

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNMP Server Properties | <p>The name and contact information of the system administrator responsible for the SNMP server/agent (that is, the router). The person managing the SNMP host can use this information when tracking down the source of unusual events.</p> <p>The maximum length of each of these properties is 255 characters, including spaces.</p> <p><b>Note</b> The values entered in these fields are text-only and do not affect the operation of the router.</p> |
| Configure Traps button | <p>Opens a dialog box for selecting which SNMP traps the router should generate. See <a href="#">SNMP Traps Dialog Box</a> , on page 2482.</p>                                                                                                                                                                                                                                                                                                             |

## Permission Dialog Box

Use the Permission dialog box to define the community string and string type required by the SNMP policy. The community string is an embedded password for accessing the Management Information Base (MIB) that stores operational data about the router.

### Navigation Path

Go to [SNMP Policy Page](#) , on page 2478, then click the **Add** or **Edit** button beneath the Permissions table.

*Table 898: Permission Dialog Box*

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Community String     | The community string for accessing the router's MIB. String length ranges from 1 to 128 characters.                                                                                                                                                                                                                                                                                                                                                                         |
| Access Control Lists | <p>Applies only to routers running Cisco IOS Software Release 12.3(2)T and up (T-train) or any 12.4 version.</p> <p>The standard ACL containing the IP addresses that can access the router's MIB. Defining an ACL provides an additional layer of security by limiting the source addresses that can make use of the community string.</p> <p>Enter the name of a standard ACL object, or click <b>Select</b> to select the object from a list or to create a new one.</p> |

| Element    | Description                                                                                                                     |
|------------|---------------------------------------------------------------------------------------------------------------------------------|
| Read-Write | This community string type provides read-write access to all objects in the MIB (except community strings).                     |
| Read-Only  | This community string type provides read-only access to all objects in the MIB (except community strings). This is the default. |

## Trap Receiver Dialog Box

Use the Trap Receiver dialog box to define the SNMP hosts that receive traps generated by the router. This includes defining the version of SNMP to use.

### Navigation Path

Go to the [SNMP Policy Page](#) , on page 2478, then click the **Add** or **Edit** button beneath the Trap Receiver table.

*Table 899: Trap Receiver Dialog Box*

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Host IP Address  | The IP address of the SNMP host receiving the traps generated by the router. Enter an IP address or the name of a network/host object, or click <b>Select</b> to select the object from a list or to create a new one.                                                                                                                                                                                                                                          |
| SNMP Version     | The version of SNMP to use—version 1, version 2c, or version 3.                                                                                                                                                                                                                                                                                                                                                                                                 |
| Community String | Applies only when version 1 or version 2c is selected.<br><br>The password required to access the SNMP host. Enter the string again in the Confirm field.<br><br><b>Note</b> We recommend that you use one of the strings defined in the Permissions table as the password to the SNMP host. You may, however, enter a different password. String length ranges from 1 to 128 characters. Your entry does not appear in the Permissions table and is read-only. |

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User Name       | <p>Applies only when version 3 is selected.</p> <p>The password required to access the SNMP host. Enter the string again in the Confirm field.</p> <p><b>Note</b> We recommend that you use one of the strings defined in the Permissions table as the password to the SNMP host. You may, however, enter a different password. String length ranges from 1 to 128 characters. Your entry does not appear in the Permissions table and is read-only.</p> |
| SNMPv3 Security | <p>Applies only when version 3 is selected.</p> <p>The level of security to apply to SNMP traffic:</p> <ul style="list-style-type: none"> <li>• No MD5, No DES—No packet authentication.</li> <li>• MD5 (auth)—MD5 authentication, but no encryption.</li> <li>• DES (priv)—MD5 authentication and DES encryption.</li> </ul>                                                                                                                            |
| UDP Port        | <p>The port number for the SNMP host. The default is 162. Valid values range from 0 to 65535.</p>                                                                                                                                                                                                                                                                                                                                                        |

## SNMP Traps Dialog Box

Use the SNMP Traps dialog box to select the events in the router that should generate SNMP traps. To lessen possible degradation of system performance, select only those traps that are needed for network monitoring purposes.

---

**Tip** You can configure SNMP traps not included in this dialog box by defining FlexConfigs. For more information, see [Understanding FlexConfig Policies and Policy Objects](#) , on page 340.

---

### Navigation Path

Go to the [SNMP Policy Page](#) , on page 2478, then click **Configure Traps**.

## Field Reference

Table 900: SNMP Traps Dialog Box

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Standard SNMP Traps | <p>Enables or disables standard SNMP traps. Options are:</p> <ul style="list-style-type: none"> <li>• Cold start—Sends a trap when the router reinitializes in a way that could change the configuration of the SNMP agent (or any other trap-receiving entity).</li> <li>• Warm start—Sends a trap when the router reinitializes in a way that does not change the configuration of the SNMP agent (or any other trap-receiving entity).</li> <li>• Authentication—Sends a trap if an SNMP request from the SNMP host fails because of an invalid community string.</li> </ul>                                                                                                                                          |
| IPsec Traps         | <p>Enables or disables individual IPsec-related traps. Options are:</p> <ul style="list-style-type: none"> <li>• Cryptomap—Sends a trap when a crypto map entry is added to, or removed from, the device's crypto map set. Additionally, this option sends a trap when a crypto map set is attached to, or detached from, an active interface.</li> <li>• Too Many SAs—Sends a trap if an attempt is made to create a security association (SA) when there is insufficient memory on the device.</li> <li>• Tunnel—Sends a trap when an IPsec Phase 2 tunnel becomes active or inactive.</li> </ul> <p>For more information, see <a href="#">Understanding IPsec Proposals for Site-to-Site VPNs</a> , on page 1166.</p> |
| ISAKMP Traps        | <p>Enables or disables individual Internet Security Association and Key Exchange Protocol (ISAKMP) traps. Options are:</p> <ul style="list-style-type: none"> <li>• Policy—Sends a trap when an ISAKMP policy is created or deleted.</li> <li>• Tunnel—Sends a trap when a Phase 1 IKE tunnel becomes active or inactive.</li> </ul> <p>For more information, see <a href="#">Understanding IKE</a> , on page 1151.</p>                                                                                                                                                                                                                                                                                                  |

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Other Traps         | <p>Enables or disables additional SNMP traps. Options are:</p> <ul style="list-style-type: none"> <li>• Syslog—Sends syslog messages to the SNMP host.</li> <li>• TTY—Sends Cisco-specific notifications when a Transmission Control Protocol (TCP) connection closes.</li> <li>• BGP—Sends notifications when Border Gateway Protocol (BGP) state changes occur. See <a href="#">BGP Routing on Cisco IOS Routers</a> , on page 2585.</li> <li>• IP Multicast—(Applicable to multicast routers only) Sends a trap if the router fails to receive a defined number of heartbeat packets from heartbeat sources within a defined time interval.</li> </ul> <p>If you select IP Multicast, you must also manually configure the <b>ip multicast heartbeat</b> command on the device to configure the multicast address and heartbeat limits. You can use FlexConfigs to do this.</p> <ul style="list-style-type: none"> <li>• CPU—Sends a trap when CPU usage rises and remains above an upper threshold or falls and remains below a lower threshold.</li> </ul> <p>If you select CPU, you must also manually configure the <b>process cpu threshold type</b> command on the device to configure the thresholds. You can use FlexConfigs to do this.</p> <ul style="list-style-type: none"> <li>• HSRP—Sends Hot Standby Routing Protocol (HSRP) notifications.</li> </ul> |
| Select All button   | Enables all the SNMP traps displayed in the dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Deselect All button | Disables all the SNMP traps displayed in the dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## DNS on Cisco IOS Routers

The Domain Name System (DNS) is a distributed database in which you can map hostnames to IP addresses through the DNS protocol from a DNS server. Each unique IP address can have an associated hostname. DNS is what makes it possible to connect to hosts without having to know the 32-bit IP address of that host. The DNS server takes the provided hostname and translates it into the appropriate IP address.

In addition to the translation provided by remote DNS servers, you can configure Cisco IOS routers with a local host table containing static mappings of hosts to IP addresses. When commands such as connect, telnet, and ping are used, the router checks this host table before querying the DNS servers, which speeds the translation process.

By default, the DNS feature is enabled on all Cisco IOS routers.

## Defining DNS Policies

When you define a DNS policy in Security Manager, you can specify the remote DNS servers used by the router for hostname-to-address translations. In addition, you can define a static host table that contains local translations used exclusively by this device. Having selected addresses in this type of cache can speed the translation process by eliminating the need to query the DNS servers.

### Related Topics

- [DNS on Cisco IOS Routers](#) , on page 2484

---

#### Step 1

Do one of the following:

- (Device view) Select **Platform > Device Admin > DNS** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > DNS** from the Policy Type selector. Select an existing policy or create a new one.

The DNS page is displayed. See [Table 901: DNS Page](#) , on page 2486 for a description of the fields on this page.

#### Step 2

In the Servers field, enter the addresses of the DNS servers (up to 6) that can perform hostname-to-address translations for the router. You can use a combination of addresses and network/host objects, or click **Select** to display a selector. For more information, see [Specifying IP Addresses During Policy Definition](#) , on page 316.

**Tip** If the network you want is not listed in the selector, click the **Create** button or the **Edit** button in the selector to display the [Add or Edit Network/Host Dialog Box](#) , on page 312. From here you can create a network/host object to use in the policy.

#### Step 3

(Optional) In the Hosts field, enter the static host mappings that you want to define in the router's host table:

- a) Click **Add** to display the [IP Host Dialog Box](#) , on page 2486.
- b) Enter the hostname to translate.
- c) Enter up to three addresses or network/host objects, or click **Select** to display a selector. These are the addresses to which the router translates the hostname.
- d) Click **OK**. The mapping is displayed in the Hosts field on the DNS page.
- e) Repeat [3.a, on page 2485](#) through [3.d, on page 2485](#) to add more hosts to the host table.

**Note** To edit a host mapping, select the definition from the Hosts field, then click **Edit**. To remove a host mapping, select it, then click **Delete**.

#### Step 4

(Optional) Deselect the **Domain Lookup** check box to disable DNS functionality on the router.

---

## DNS Policy Page

Use the DNS policy page to define the local IP host table and the Domain Name System (DNS) servers that the router should use for translating hostnames to IP addresses. You can also prevent the router from performing DNS lookups by disabling the DNS feature.

### Navigation Path

- (Device view) Select **Platform > Device Admin > DNS** from the Policy selector.

- (Policy view) Select **Router Platform > Device Admin > DNS** from the Policy Type selector. Right-click **DNS** to create a policy, or select an existing policy from the Shared Policy selector.

| Domain Lookup | When selected, the router performs lookups on the defined DNS servers. This is the default.<br><br>When deselected, lookups on remote DNS servers are disabled.                                                                                                                                                                                                                                                                                                                                                           |

## IP Host Dialog Box

Use the IP Host dialog box to configure the host table on the router. This is the table of static, local mappings that the router uses to translate hostnames to IP addresses. If the router does not find the required entry in the host table, it queries the DNS servers that are defined on the DNS page.

### Navigation Path

Go to the [DNS Policy Page](#) , on page 2485, then click **Add** under Hosts.

|-----------|-----------------------------------------------------------|
| Host Name | The hostname to include in the router's local host table. |

| Element   | Description                                                                                                                                                                                                                                    |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Addresses | The addresses to associate with the hostname. Enter one or more addresses or network/host objects, or click <b>Select</b> to select an object from a list or to create a new object. You can define a maximum of three addresses per hostname. |

## Hostnames and Domain Names on Cisco IOS Routers

The Hostname policy configures the hostname and domain name of the selected router. After you deploy this policy, any changes that you made to the hostname and domain name are reflected in the Device Properties page (see [Viewing or Changing Device Properties](#), on page 107).

### Related Topics

- [Defining Hostname Policies](#), on page 2487

## Defining Hostname Policies

When you define a hostname policy, Security Manager updates the hostname and domain name fields in the Device Properties dialog box after deployment. See [Viewing or Changing Device Properties](#), on page 107.

### Related Topics

- [Hostnames and Domain Names on Cisco IOS Routers](#), on page 2487

---

### Step 1

Do one of the following:

- (Device view) Select **Platform > Device Admin > Hostname** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Hostname** from the Policy Type selector. Select an existing policy or create a new one.

The Hostname page is displayed. See [Table 903: Hostname Page](#), on page 2488 for a description of the fields on this page.

### Step 2

Enter the hostname for the router. Names must start with a letter, end with a letter or digit, and include only letters, digits, and hyphens. The maximum length is 63 characters.

### Step 3

Enter the domain name for the router. The router uses this domain name for RSA key generation and in policies when you do not enter the fully-qualified domain name.

---

## Hostname Policy Page

Use the Hostname page to define the hostname and domain name assigned to the router. For more information, see [Defining Hostname Policies](#), on page 2487.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Hostname** from the Policy selector.

- (Policy view) Select **Router Platform > Device Admin > Hostname** from the Policy Type selector. Right-click **Hostname** to create a policy, or select an existing policy from the Shared Policy selector.

| Domain Name | The default domain name of the router. The maximum length is 63 characters.<br>The router uses this domain name for RSA key generation and in policies when you do not enter the fully-qualified domain name (FQDN). |

## Memory Settings on Cisco IOS Routers

The Memory policy configures settings relating to router memory. This policy provides you with methods for monitoring memory consumption, including the ability to generate notification messages when available memory drops below predefined thresholds.

---

**Note** The Memory policy is supported on routers running Cisco IOS Software Release 12.3(14)T or later.

---
